#### Notices

Knowledge and best practice in this field are constantly changing. As new research and experience broaden our understanding, changes in research methods, professional practices, or medical treatment may become necessary.

Practitioners and researchers must always rely on their own experience and knowledge in evaluating and using any information, methods, compounds, or experiments described herein. In using such information or methods they should be mindful of their own safety and the safety of others, including parties for whom they have a professional responsibility.

With respect to any drug or pharmaceutical products identified, readers are advised to check the most current information provided (i) on procedures featured or (ii) by the manufacturer of each product to be administered, to verify the recommended dose or formula, the method and duration of administration, and contraindications. It is the responsibility of practitioners, relying on their own experience and knowledge of their patients, to make diagnoses, to determine dosages and the best treatment for each individual patient, and to take all appropriate safety precautions.

To the fullest extent of the law, neither the Publisher nor the authors, contributors, or editors, assume any liability for any injury and/or damage to persons or property as a matter of products liability, negligence or otherwise, or from any use or operation of any methods, products, instructions, or ideas contained in the material herein.

# **INTRODUCTION**

### INTRODUCTION

Mosby's Drug Reference for Health Professions is designed as a concise, easy-to-use resource for drug information for the busy health care professional. The information is provided in a standardized monograph format. A number of important new medications have been introduced in the past few years, and these have been incorporated into this guide, which contains a concise overview of over 900 generic and over 2400 brand-name medications widely used in medical practice. This latest edition will be a welcome addition to any health care professional's drug reference library and will be used often for its practicality, currency, and quick summaries of essential drug facts.

#### **DETAILS OF THE CONTENTS**

*Essential drug information in a userfriendly format.* The bulk of this handbook contains an alphabetical listing of drug entries by generic name. Drug entries include the following:

- *Generic and brand name*. Drug entries are categorized by generic name alphabetically, followed by marketed product names.
- Category and schedule. The U.S. FDA pregnancy risk category, as well as pertinent information regarding over-the-counter (OTC) status and U.S. DEA Controlled Substance Schedules, is listed. State DEA schedules may vary from the U.S. listing; practitioners should refer to their state laws regarding any variations.
- *Classification*. Each entry highlights important pharmacologic, chemical, and/or therapeutic use classifications.
- *Mechanism of action*. A brief pharmacologic description of the

actions of the drug is given, followed by a brief statement of therapeutic effect.

- *Pharmacokinetics.* A relevant, yet concise, summary of the absorption, distribution, metabolism, and excretion characteristics is provided for each entry.
- Availability. Dosage forms currently approved for marketing in the United States are listed. Users should note that this information may change frequently. Users are encouraged to speak with their pharmacists regarding local drug availability, since marketing status and shortages of drug products may occur frequently in practice.
- Indications and dosages. Approved indications, routes, and dosages for approved populations of use are provided in a concise format. Pediatric and geriatric data are included when available. When specified, dosages for hepatic and renal impairment are also provided.
- *Contraindications.* Contraindications are listed as provided in manufacturer labeling, indicating circumstances under which a drug should not be used.
- Interactions. Common interactions with drugs, herbal and dietary supplements, and food are provided in a quick-reference format so that practitioners can easily screen medication profiles. New interaction data are often published as new drugs enter the market or are used widely in the intended populations, so the information presented may not always reflect the most current data. Practitioners are encouraged to use the information provided to

screen for important interactions but also consider the need for other sources.

- *Diagnostic test effects.* This section provides a brief summary of both the expected and the potential effects that a drug has on commonly monitored laboratory testing (e.g., blood chemistry, renal function, liver function, and hematologic testing), as well as any known assay interference. When a therapeutic range is defined for a drug, it will also be presented in this section.
- IV incompatibilities and IV compatibilities. Medications that are used intravenously must approached with caution, be especially with respect to the use of other parenteral medications. In these sections, the user is presented with common and well-known incompatibilities and published compatibilities with other medications at the Y-site. However, these data often depend on concentration and method of administration and are constantly updated. New incompatibility data may emerge at any time. The user is encouraged to always consult specialized resources for incompatibility new information before mixing or infusing any parenteral medication. The information provided is not meant to be inclusive but rather to be exemplary of the concerns with regard to IV incompatibility. This information is clarified with icons representing compatibilities and incompatibilities.
- *Side effects.* The health care professional will appreciate the prioritized presentation of side effects. This section provides an understanding of the general frequency of commonly reported side effects

noted in clinical trials. Although the included frequencies are not always reflective of the frequencies seen once a drug is on the market, the guide provides a basic understanding of side effects that are expected, frequent, occasional, or rare, including estimated percentages associated with the definitions. Although not meant to be absolutely inclusive, this guide includes the more commonly reported reactions in each category that are likely to be causally associated with a given drug.

- Serious reactions. Most practitioners would like to have a good understanding of those reactions that, because of their severity and potentially life-threatening nature, would require prompt intervention or lead to hospitalization. This section highlights those side effects, apart from other reactions, that often require specialized warnings or alerts. The practitioner is encouraged to always check these listings when reviewing an entry.
- Precautions and considerations. Using a practice-oriented format for health care professionals, this section very concisely summarizes the most relevant concepts in considerations for prescribing and monitoring a drug in given patient populations, including those who are pregnant or breastfeeding, as well as children and the elderly. The user of this guide will gain practical advice for monitoring drug effects during treatment and will appreciate the care-focused context of the information.
- *Storage.* The proper storage of medications, and their stability, is a concern in health care and patient home environments. Proper storage helps ensure that

appropriate drug effects will be maintained. This section quickly summarizes proper storage for each entry.

Administration. A concise summary of administering each dosage form is provided for the practitioner. Proper administration technique helps ensure that desired medication effects are attained. When known, techniques for limiting side effects during administration are highlighted. Alerts to hazards are also presented for important medications, such as chemotherapy.

*Appendices.* Quick reference guides to FDA pregnancy categories and normal laboratory values are provided.

*Electronic Resources*. Register for free resources at www.mosby drugref.com. The following assets are available:

 Audio drug name pronunciations and an audio glossary (including definitions) in MP3 format.

- · Full-color pill atlas.
- Additional generic drug monographs.
- Monographs for herbal remedies, compound drugs, and OTC drugs.
- Generic-to-trade-name reference table.
- · Medication math exercises.
- Information on drugs of abuse and general anesthetics.
- English-Spanish translations of common medication-related phrases.

#### SUMMARY

When it comes to providing quality information, *Mosby's Drug Reference for Health Professions* is an important and practical resource. The spectrum of drug entries, the current information, and health care professional tips will be invaluable to providing patient and client care.

Abacavir

ah-bah'cah-veer ★ 🐏 Ziagen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiretroviral, nucleoside analog

# **MECHANISM OF ACTION**

An antiretroviral that inhibits the activity of HIV-1 reverse transcriptase by competing with the natural substrate deoxyguanosine-5'-triphosphate (dGTP) and by its incorporation into viral DNA. *Therapeutic Effect:* Inhibits viral DNA growth.

#### PHARMACOKINETICS

Rapidly and extensively absorbed after PO administration. Protein binding: 50%. Widely distributed, including to CSF and erythrocytes. Metabolized in the liver to inactive metabolites. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 1.5 h.

# AVAILABILITY

Tablets: 300 mg. Oral Solution: 20 mg/mL.

#### INDICATIONS AND DOSAGES HIV infection (in combination with

 HIV Intection (in combination with other antiretrovirals)
 PO

Adults. 300 mg twice a day or 600 mg once daily. Children (3 mo and older). 8 mg/kg twice a day. Maximum: 300 mg twice a day.

#### Dosage in hepatic impairment Mild impairment

Adults: 200 mg twice a day.

Moderate to Severe Impairment Contraindicated.

# CONTRAINDICATIONS

Hypersensitivity to abacavir or its components. Moderate to severe hepatic impairment.

# INTERACTIONS

#### Drug

Ethanol: Increased abacavir levels. Methadone: Methadone levels may be increased.

Herbal None known. Food None known.

# SIDE EFFECTS

#### Frequent

Adults: Nausea, nausea with vomiting, diarrhea, decreased appetite. Children: Nausea with vomiting, fever, headache, diarrhea, rash. Occasional

#### Adults: Insomnia. Children: Decreased appetite.

# SERIOUS REACTIONS

• A hypersensitivity reaction may be life threatening. Signs and symptoms include fever, rash, fatigue, intractable nausea and vomiting, severe diarrhea, abdominal pain, cough, pharyngitis, and dyspnea.

• Life-threatening hypotension may occur.

• Lactic acidosis and severe hepatomegaly may occur.

#### PRECAUTIONS & CONSIDERATIONS

Serious and sometimes fatal hypersensitivity reactions have been associated with abacavir therapy. Hypersensitivity reactions to abacavir may be characterized by constitutional symptoms such

as achiness, fatigue, or generalized malaise; fever; GI symptoms, including abdominal pain, diarrhea, nausea, or vomiting; rash; and respiratory symptoms, including cough, dyspnea, or pharyngitis. Abacavir therapy should be discontinued if hypersensitivity is suspected. Abacavir therapy should never be restarted following a hypersensitivity reaction. A Med Guide and warning card that provide information about recognition of hypersensitivity reactions should be dispensed with each new prescription and refill. Screen all patients before initiation of abacavir therapy for the presence of the HLA-B\*5701 allele. Patients showing a positive result should have an abacavir allergy recorded and should NOT receive the medication; use in HLA-B\*5701-positive patients is not recommended and is considered only with close medical supervision and under exceptional circumstances when the potential benefit outweighs the risk. Due to inconclusive data, use with caution in patients with heart disease or other cardiac risk factors. Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogs alone or in combination, including abacavir and other antiretrovirals. Fat redistribution has also been observed in patients receiving antiretroviral therapy. It is unknown if abacavir is harmful in pregnancy. An Antiretroviral Pregnancy Registry is available at 1-800-258-4263. It is unknown if abacavir is excreted in human milk, but the drug is secreted into the milk of lactating rats. Because of both the potential for HIV transmission and the potential for serious adverse reactions in

nursing infants, mothers should be instructed not to breastfeed.

#### Storage

Store at room temperature. Abacavir solution may also be stored in the refrigerator, but it should be protected from freezing.

#### Administration

Abacavir may be taken with or without food. Abacavir should always be used in combination with other antiretroviral agents. However, do not give with Epzicom or Trizivir, which both contain abacavir and result in duplication and overdosage.

#### Abatacept

a-bat′ah-cept

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Immunosuppressives, biologic response modifiers, fusion proteins, disease modifying antirheumatic drug (DMARD)

#### **MECHANISM OF ACTION**

An immunologic agent that decreases T cell proliferation by blocking the CD28 interaction between antigen-presenting cells and T cells. *Therapeutic Effect:* Reduces symptoms of rheumatoid arthritis and slows progression of destruction of joints.

#### PHARMACOKINETICS

Used IV or SC. Bioavailability roughly 78% with SC administration. *Half-life:* 14.3 days.

#### AVAILABILITY

*Powder for IV Infusion:* 250 mg. *SC Injection Solution:* 125 mg.

# INDICATIONS AND DOSAGES Rheumatoid arthritis

IV INFUSION Adults. Weight > 100 kg: 1000 mg q2wk times 2 (i.e., a dose at weeks 0, 2, and 4), then 1000 mg q4wk starting at week 8.

*Weight 60-100 kg:* 750 mg q2wk times 2 (i.e., a dose at weeks 0, 2, and 4), then 750 mg q4wk starting at week 8.

Weight < 60 kg: 500 mg q2wk times 2 (i.e., a dose at weeks 0, 2, and 4), then 500 mg q4wk starting at week 8.

SC

Adults. 125 mg SC within a day after the single IV loading dose at week 0, then 125 mg SC once weekly. Weekly SC injections may be initiated without an IV loading dose for patients who are unable to receive an infusion. NOTE: If transition from IV infusion therapy to SC, simply give first SC dose instead of the next scheduled IV dose.

#### Juvenile idiopathic arthritis (JIA) IV INFUSION

Children and Adolescents  $\geq 6$  yr. Weight > 100 kg: 1000 mg q2wk times 2 (i.e., a dose at weeks 0, 2, and 4), then 1000 mg q4wk. Weight 75-100 kg: 750 mg q2wk times 2 (i.e., a dose at weeks 0, 2, and 4), then 750 mg q4wk starting at week 8.

 $Weight < 75 \ kg: 10 \ mg/kg \ q2wk \ times$ 2 (i.e., a dose at weeks 0, 2, and 4), then 10 mg/kg q4wk starting at week 8.

# CONTRAINDICATIONS

Hypersensitivity to drug, active serious infection or sepsis.

# INTERACTIONS

#### Drug

Atropine, scopolamine: Caution, additive depressive effects on mucociliary transport.

#### Immunosuppressive agents:

Caution; additive immunosuppressive and infection risk.

Live-virus vaccines: Avoid concurrent use and do not use within 3 months of abatacept treatment. TNF modifiers/certain specialized biologics (e.g., certolizumab, etanercept, anakinra, alefacept, golimumab, infliximab, adalimumab): Avoid concurrent

use due to increased risk of serious infection.

# **DIAGNOSTIC TEST EFFECTS**

Maltose in IV infusion solution can cause false readings for blood glucose on the day of infusion with certain blood glucose monitors.

# IV INCOMPATIBILITIES

Do not mix or infuse with any other medications.

# SIDE EFFECTS

**Frequent (≥ 10%)** 

Headache, upper respiratory tract infection, sore throat, and nausea. **Occasional (1%-10%)** 

Dizziness, cough, back pain, hypertension, dyspepsia, UTI, rash, pain in extremity. Diarrhea, fever, and abdominal pain have been reported in children. **Rare (< 1%)** 

Infections such as pneumonia, herpes zoster, bronchitis, localized infections, also dyspnea or vasculitis. Infusion-related reactions causing discontinuation are rare.

# SERIOUS REACTIONS

• Rare reactions include hypersensitivity reactions, anaphylaxis.

• Serious infections requiring hospitalization.

• Like other biologics, the relation of this drug to potential development of future malignancy is not clear.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with maltose hypersensitivity, since product contains it. Caution is warranted in patients with increased infection risk such as those with chronic infections, history of recurrent infections or hepatitis, high risk for malignancy, diabetes, and the elderly. Patients with COPD may be more likely to experience respiratory events such as cough or dyspnea. It is unknown whether abatacept crosses the placenta in humans, but is does cross in animals. It is unknown if abatacept is distributed in breast milk. The safety and efficacy have not been established in children under 6 yr of age.

Avoid contact with infected individuals and situations that might increase the risk for infection. Notify the physician of any signs of infection or malignancy.

#### Storage

Store unopened vials for IV use and SC injection syringes in the refrigerator and protected from light. Do not freeze. Once diluted, may store IV infusion at room temperature or refrigerated. Use diluted infusion within 24 h.

#### Administration

For IV infusion preparation, use sterile water for injection (SWI) to dilute the vial; use the siliconefree syringe provided with the vial. Slowly inject 10 mL of SWI into the vial, with the needle facing the vial sidewall. Swirl gently to dissolve the contents; do not shake or vigorously agitate the vial to avoid foaming. The reconstituted solution should be clear and colorless to slightly vellow. Do not use if it is discolored, cloudy, or contains undissolved material. Before use as infusion, the patient's dose must be further diluted to 100 mL with 0.9% NaCl

as follows. From a 100 mL infusion bag or bottle, withdraw a volume of 0.9% NaCl injection, equal to the volume of the reconstituted abatacept solution required for the patient's dose. Slowly add the dose from the vial(s) into the infusion bag or bottle using the same siliconefree disposable syringe provided with each vial. Gently mix. Do not shake. The final concentration of abatacept in the bag or bottle will depend upon the amount of drug added, but will be no more than 10 mg/mL. Discard any unused portions in the vials immediately. Do not use infusion if any particulate matter or discoloration is observed. Administer the IV infusion over 30 minutes with an infusion set and a sterile, nonpyrogenic, low protein-binding filter (pore size of 0.2-1.2 µm).

For SC use, use only the SC injection prefilled syringes; these syringes are NOT to be used intravenously or to prepare IV infusions. A patient may self-inject the drug SC if properly trained by a health care provider. Do not use syringes with particulate matter or discoloration; the solution should be clear and colorless to pale yellow. Allow to reach room temperature. Pinch the skin and hold firmly, injecting at 45-degree angle with dart-like motion. Inject the full amount in the syringe (1 mL) SC, which provides 125 mg of abatacept (see manufacturer's syringe administration instructions). The front of the thigh is a recommended site. The abdomen and upper arms are alternate sites; avoid the 2-inch area around the navel. Injection sites should be rotated and at least 1 inch away from a previous site. Never inject into areas where the skin is tender, bruised, red, or hard.

# Abciximab

ab-six′ih-mab ★ ReoPro

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Monoclonal antibodies, platelet inhibitors, platelet glycoprotein IIb/IIIa inhibitor

# **MECHANISM OF ACTION**

A glycoprotein IIb/IIIa receptor inhibitor that rapidly inhibits platelet aggregation by preventing the binding of fibrinogen to GP IIb/IIIa receptor sites on platelets. *Therapeutic Effect:* Prevents platelet aggregation. Prevents acute cardiac ischemic complications.

# PHARMACOKINETICS

Rapidly cleared from plasma. Initial-phase half-life is < 10 min; second-phase half-life is 30 min. Platelet function generally returns within 48 h.

# AVAILABILITY

Injection: 2 mg/mL (5-mL vial).

# INDICATIONS AND DOSAGES

# Percutaneous coronary intervention (PCI)

IV

Adults. 0.25 mg/kg IV bolus 10-60 min before PCI, then continuous IV infusion of 0.125 mcg/kg/min (maximum 10 mcg/min) for 12 h. > Unstable angina when PCI is

#### planned within 24 h IV

*Adults.* 0.25 mg/kg, followed by 18- to 24-h infusion of 10 mcg/min, ending 1 h after procedure.

# CONTRAINDICATIONS

Active internal bleeding, arteriovenous malformation or aneurysm, bleeding diathesis, history of cerebrovascular accident (CVA) within the past 2 yr or CVA with residual neurologic defect, hypersensitivity to any product component or to murine proteins, oral anticoagulant use within the past 7 days unless PT is  $\leq 1.2$  times control, history of vasculitis, intracranial neoplasm, prior IV dextran use before or intent to use during PTCA, recent surgery or trauma (within the past 6 wks), recent (within the past 6 wks or less) GI or genitourinary bleeding, thrombocytopenia (≤ 100,000 cells/µL), and severe uncontrolled hypertension.

#### INTERACTIONS Drug

Anticoagulants, including heparin, and thrombolytics: May increase risk of hemorrhage. Platelet aggregation inhibitors (such as aspirin, clopidogrel, dextran): May increase risk of bleeding. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

Increases activated clotting time (ACT), aPTT, and PT. Decreases platelet count.

# IV INCOMPATIBILITIES

Administer in separate line; no other medication should be added to infusion solution.

# SIDE EFFECTS

# Frequent (> 10%)

Nausea (16%), hypotension (12%), back pain (17%), chest pain (11%).

#### Occasional (4%-9%)

Vomiting, minor bleeding, headache. Rare (< 4%)

Bradycardia, confusion, dizziness, pain, peripheral edema, thrombocytopenia, urinary tract infection.

#### SERIOUS REACTIONS

 Major bleeding complications may occur. If complications occur, stop the infusion immediately. Major bleeding can include intracranial hemorrhage and stroke.

Hypersensitivity reaction may occur.

• Thrombocytopenia may be severe in up to 1% of patients.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with persons who weigh < 75 kg, those who are over age 65, those who have a history of GI disease, and those who are receiving aspirin, heparin, or thrombolytics. Also use abciximab cautiously in those who have had a PTCA within 12 h of the onset of signs and symptoms of acute myocardial infarction, who have had a prolonged PTCA ( $\geq$  70 min), or who have had a failed PTCA because they are at increased risk for bleeding. It is unknown whether abciximab is distributed in breast milk. Safety and efficacy have not been established in children. There is an increased risk of bleeding in elderly patients. An electric razor and soft toothbrush should be used to prevent bleeding.

Notify the physician of signs of bleeding, including black or red stool, coffee-ground emesis, red or dark urine, or red-speckled mucus from cough. Assess for preexisting blood abnormalities, aPTT, platelet count, and PT before abciximab infusion, 2-4 h after treatment, and 24 h after treatment or before discharge, whichever is first. Signs and symptoms of hemorrhage, including a decrease in BP, increase in pulse rate, abdominal or back pain, and severe headache, should be monitored. Laboratory test results, including ACT, aPTT, platelet count, and PT, should also be assessed. Females' menstrual discharge should be determined and monitored for increase.

#### Storage

Store unopened vials refrigerated at 35.6-46.6° F. Do not freeze. Do not shake.

#### Administration

Solution for injection normally appears clear and colorless. Do not shake. Discard any unused portion or any preparation that contains opaque particles. Avoid IM injections and venipunctures; also avoid using indwelling urinary catheters and nasogastric tubes. Expect to discontinue heparin 4 h before the arterial sheath is removed. Stop aboiximab and heparin infusion if serious bleeding uncontrolled by pressure occurs.

For the IV bolus, withdraw the necessary amount into a syringe. Filter the bolus injection using a sterile, nonpyrogenic, low proteinbinding 0.25- or 5-µm syringe filter. For the IV infusion, withdraw the neccessary amount into a syringe. Inject into 250 mL of sterile 0.9% NaCl or D5W (for example, 10 mg in 250 mL equals a concentration of 40 mcg/mL). Filter either upon admixture using a sterile, nonpyrogenic, low protein-binding 0.2- or 5-um syringe filter OR upon administration using an in-line, sterile, nonpyrogenic, low proteinbinding 0.2- or 0.22-µm filter. Infuse at the calculated rate via a continuous infusion pump. Discard any unused portion at the end of the infusion.

A

Give in separate IV line; do not add other medications to infusion. While femoral artery sheath is in position, maintain patient on complete bed rest with the head of bed elevated at 30 degrees. Maintain the affected limb in straight position. After the sheath has been removed, apply femoral pressure for 30 min, either manually or mechanically; then apply a pressure dressing. Bed rest should be maintained for 6-8 h after the sheath is removed or the drug is discontinued, whichever is later.

# Abiraterone

a'bir-a'te-rone Zytiga Do not confuse Zytiga with Potiga or Xgeva.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Antineoplastics, antiandrogens

# **MECHANISM OF ACTION**

Androgen biosynthesis inhibitor. Drug inhibits 17  $\alpha$ -hydroxylase/ C17,20-lyase (CYP17) and the formation of dehydroepiandrosterone (DHEA) and androstenedione, which are precursors of testosterone. Also may cause increased mineralocorticoid production by the adrenals. *Therapeutic Effect:* Suppresses androgen production and decreases the growth of prostate carcinoma.

# PHARMACOKINETICS

Exposure (AUC) increases up to 10-fold when taken with meals; take on empty stomach. Highly

protein bound > 99%. Metabolized in the liver by CYP3A4 to inactive metabolites. Mostly excreted in feces. Not affected by renal function. *Half-life*:  $12 \pm 5$  h (increased in hepatic impairment).

# AVAILABILITY

Tablets: 250 mg.

#### INDICATIONS AND DOSAGES Metastatic castration-resistant prostatic carcinoma in those who have received prior treatment with docetaxel

PO

*Adults, Elderly.* 1000 mg once daily. For use in combination with prednisone 5 mg PO twice daily.

Dosage in hepatic impairment Moderate hepatic impairment (Child-Pugh Class B): Reduce to 250 mg once daily.

Hepatotoxicity occurring during treatment: HOLD dose until recovery (see manufacturer-specific instructions for monitoring and restarting therapy); restart at reduced dose. Discontinue if patient develops severe hepatotoxicity.

# CONTRAINDICATIONS

Hypersensitivity to the drug; severe hepatic impairment; pregnancy or females who may become pregnant.

# INTERACTIONS

#### Drug

CYP2D6 substrates (e.g., dextromethorphan, thioridazine):

Abiraterone decreases metabolism of these drugs via CYP2D6; those with narrow therapeutic indexes should be avoided.

Strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin, ritonavir, many others): May increase abiraterone levels; use with caution. CYP3A4 inducers (e.g.,

rifampin, bosentan, barbiturates, carbamazepine, phenytoin): May reduce abiraterone levels; use with caution.

#### Herbal

Chaparral, comfrey, eucalyptus, germander, Jin Bu Huan, kava kava, pennyroyal, skullcap, valerian: May increase risk of hepatotoxicity.

#### Food

Do not give dose with food; increases abiraterone levels.

#### DIAGNOSTIC TEST EFFECTS

Reduces potassium, phosphorous, and testosterone levels; may increase blood pressure. May elevate liver function tests. Changes in serum prostate specific antigen (PSA) levels may be observed but have not been shown to correlate with clinical benefit.

#### SIDE EFFECTS

#### Frequent ( $\geq 5\%$ )

Arthralgia, hypokalemia, hypophosphatemia, edema or fluid retention, myalgia, hot flush, diarrhea, UTI, cough, hypertension, arrhythmia, urinary frequency, nocturia, dyspepsia, and upper respiratory tract infection.

#### Occasional (< 5%)

Chest pain or discomfort, heart failure.

#### SERIOUS REACTIONS

· Hepatic toxicity.

• Adrenal insufficiency, particularly in times of stress.

· Cardiac arrhythmia.

#### **PRECAUTIONS & CONSIDERATIONS**

Abiraterone is not used in pregnant or nursing women or in children. Use with caution in patients with a history of cardiovascular disease. Abiraterone may cause hypertension, hypokalemia, and fluid retention as a consequence of increased mineralocorticoid levels resulting from CYP17. Use caution with heart failure, recent MI, or ventricular arrhythmia. Patients with NYHA Class III or IV heart were excluded from clinical trials. Monitor blood pressures, potassium levels, and fluid retention at least once a month. Control hypertension and correct hypokalemia before and during treatment.

Adrenocortical insufficiency has been reported during treatment, following interruption of daily steroids, and/or with concurrent infection or stress (trauma, surgery, etc). Use caution. Symptoms and signs of adrenocortical insufficiency may be masked by adverse reactions associated with mineralocorticoid excess often seen in patients treated with abiraterone. Increased dosage of corticosteroids may be indicated.

Because of hepatic impairment risk, monitor liver function tests (LFTs) and bilirubin prior to the start of treatment, every week for the first month, every 2 weeks for the following 2 months, and monthly thereafter. Follow manufacturerrecommended adjustments in monitoring should LFT elevations occur. If elevations in LFTs to greater than 5 times upper limit of normal (ULN) or total bilirubin greater than 3 times ULN occur, discontinue the drug and do not re-treat.

#### Storage

Store at room temperature. Administration

CAUTION: Women who are pregnant or who may become pregnant should not touch the tablets without protection, such as gloves. Administer tablets whole; patient should swallow intact with water on an empty stomach. Do NOT take with food. No food should be eaten by the patient for at least 2 hours before the dose and for 1 hour after the dose is taken.

#### Acamprosate

ah-cam'pro-sate

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Alcohol-abuse deterrent

#### **MECHANISM OF ACTION**

Actual mechanism unknown; may facilitate balance between GABA and glutamate neurotransmitter systems in the CNS to decrease alcohol craving.

#### PHARMACOKINETICS

Partially absorbed from the GI tract. Steady-state levels reached within 5 days of dosing; Protein binding negligible. *Half-life:* 20-33 h. Does not undergo metabolism; excreted unchanged in urine.

# AVAILABILITY

Tablets, Enteric-Coated: 333 mg.

# INDICATIONS AND DOSAGES

Maintenance of alcohol abstinence in alcohol-dependent patients who are abstinent at initiation of treatment PO

*Adults, Elderly.* 666 mg three times a day with or without food.

#### Dosage in renal impairment

CrCl 30-49 mL/min: Decrease to 333 mg PO three times a day.

 $CrCl \le 30 \text{ mL/min: Contraindicated.}$ 

#### CONTRAINDICATIONS

Hypersensitivity. Severe renal impairment (creatinine clearance of  $\leq 30$  mL/min).

#### INTERACTIONS

#### Drug

Antidepressants: May cause weight gain or loss. Naltrexone: May increase acamprosate exposure, but no dose adjustment recommended. Herbal

None known.

Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent (17%) Diarrhea. Occasional (4%-6%) Insomnia, asthenia, fatigue, anxiety, flatulence, nausea, depression, pruritus.

#### Rare (1%-3%)

Dizziness, anorexia, paraesthesia, diaphoresis, dry mouth.

# SERIOUS REACTIONS

· Suicidal ideation/suicide attempts.

#### PRECAUTIONS & CONSIDERATIONS

Be aware that acamprosate does not eliminate or diminish withdrawal symptoms. Acamprosate helps maintain abstinence only when used as part of a treatment program that includes counseling and support. Use during pregnancy or breastfeeding only if benefit exceeds risk; drug has been teratogenic in animal studies and the drug is excreted in the milk of rats at concentrations similiar to those of blood; unknown if excreted in human milk. The safety and efficacy of acamprosate have not

Acamprosate (Generic Name), Campral (Brand Name)

#### 10 Acarbose

been established in children. Agerelated renal impairment may require a dosage adjustment in elderly patients. Dizziness may occur. Avoid tasks that require mental alertness or motor skills until response to the drug has been established. Watch for unusual changes in mood or behavior as adverse events related to suicidal tendencies sometimes noted.

BUN and serum creatinine levels should be obtained before beginning treatment. Pattern of daily bowel activity should be assessed during therapy.

#### Storage

Store at room temperature.

#### Administration

Do not crush or break enteric-coated tablets. Take acamprosate without regard to food. However, persons who regularly eat three meals a day may be more compliant with the drug regimen if instructed to take acamprosate with food.

Treatment is initiated as soon as possible after the period of EtOH withdrawal, when the patient is abstinent, and is maintained even if the patient relapses.

#### Acarbose

a-car'bose

★ Precose Glucobay Do not confuse Precose with PreCare.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Oral antidiabetic agents,  $\alpha$ -glucosidase inhibitors

#### **MECHANISM OF ACTION**

An  $\alpha$ -glucosidase inhibitor that delays digestion of carbohydrates, resulting in a smaller rise in blood glucose concentration after meals. *Therapeutic Effect:* Lowers postprandial hyperglycemia.

#### PHARMACOKINETICS

Limited (< 2%) oral absorption, absorbed dose excreted in urine, metabolized in the GI tract and major portion of dose excreted in feces; systemic exposure increased sixfold in subjects with severe renal impairment.

#### AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg.

# INDICATIONS AND DOSAGES Diabetes Mellitus Type 2

Use as single drug or in combination with insulin or oral hypoglycemics (sulfonylureas, metformin) when diet is ineffective in controlling blood glucose levels.

PO

Adults, Elderly. Initially, 25 mg 3 times a day with first bite of each main meal. Increase at 4- to 8-wk intervals. Maximum: For patients weighing more than 60 kg, 100 mg 3 times a day; for patients weighing 60 kg or less, 50 mg 3 times a day.

#### CONTRAINDICATIONS

Chronic intestinal diseases associated with marked disorders of digestion or absorption, cirrhosis, colonic ulceration, conditions that may deteriorate as a result of increased gas formation in the intestine, diabetic ketoacidosis, hypersensitivity to acarbose, inflammatory bowel disease, partial intestinal obstruction or predisposition to intestinal obstruction, significant renal dysfunction (serum creatinine level  $\geq 2$  mg/dL).

Acarbose (Generic Name), Precose (Brand Name)

#### **INTERACTIONS**

#### Drug

# Digestive enzymes, intestinal absorbents (such as charcoal):

Reduces effects of acarbose; avoid concomitant use.

**Digoxin:** May affect bioavailability of oral digoxin, and dose adjustment may be needed.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT levels (SGPT).

#### SIDE EFFECTS

Side effects diminish in frequency and intensity over time.

#### Frequent

Transient GI disturbances: flatulence (77%), diarrhea (33%), abdominal pain (21%).

#### SERIOUS REACTIONS

• Elevated liver transaminases may occur. May cause jaundice.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with fever or infection and in those who have had surgery or trauma because these states may cause loss of glycemic control. Acarbose use is not recommended during pregnancy. It is unknown if acarbose is distributed in breast milk. Safety and efficacy have not been established in children. Hypoglycemia may be difficult to recognize in the elderly.

Food intake and blood glucose should be monitored before and during therapy. A 1-h postprandial glucose may be helpful in optimizing dosage during initial treatment. Glycosylated hemoglobin and AST (SGOT) levels should also be assessed. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy. Patients should be advised to have oral glucose (dextrose) available to treat hypoglycemia if also treated with a sulfonylurea or insulin, since, acarbose delays/inhibits breakdown of table sugar, making it ineffective for the rapid treatment of hypoglycemia. **Storage** 

#### Do not store above 25° C (77° F). Protect from moisture. Keep container tightly closed.

#### Administration

Take acarbose with the first bite of each main meal. Do not skip or delay meals. If a meal is skipped, then the acarbose dose for that meal should be omitted.

#### Acebutolol

a-se-byoo'toe-lole ★ Sectral ★ Novo-Acebutolol, Rhotral

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in second or third trimester)

**Classification:** Antihypertensives, antiarrhythmics, class II, β-adrenergic blockers

#### MECHANISM OF ACTION

A  $\beta_1$ -adrenergic blocker that competitively blocks  $\beta_1$ -adrenergic receptors in cardiac tissue. Reduces the rate of spontaneous firing of the sinus pacemaker and delays AV conduction. *Therapeutic Effect:* Slows heart rate, decreases cardiac

Acebutolol (Generic Name)

output, decreases BP, and exhibits antiarrhythmic activity.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (hypo-	1-1.5 h	2-8 h	24 h
tensive)			

Well absorbed from the GI tract. Protein binding: 26%. Undergoes extensive first-pass liver metabolism to active metabolite. Eliminated via bile, secreted into GI tract via intestine, and excreted in urine. Removed by hemodialysis. *Half-life*: 3-4 h; metabolite, 8-13 h.

#### AVAILABILITY

Capsules: 200 mg, 400 mg.

# INDICATIONS AND DOSAGES Mild to moderate hypertension PO

*Adults*. Initially, 400 mg/day in 1 or 2 divided doses. Range: Up to 1200 mg/day in 2 divided doses. Usual maintenance: 400-800 mg/day. *Elderly*. Initially, 200-400 mg/day. Maximum: 800 mg/day.

#### Ventricular arrhythmias PO

*Adults*. Initially, 200 mg q12h. Increase gradually to 600-1200 mg/day in 2 divided doses. *Elderly*. Initially, 200-400 mg/day. Maximum: 800 mg/day.

#### • **Dosage in renal impairment** Dosage is modified based on creatinine clearance.

#### **Creatinine %**

Clearance (mL/min)	Usual Dosage	
25-49	Reduce dose by 50%	
< 25	Reduce dose by 75%	

#### **OFF-LABEL USES**

Treatment of chronic angina pectoris, post-myocardial infarction.

#### CONTRAINDICATIONS

Cardiogenic shock, second- and third-degree heart block, overt heart failure, severe bradycardia.

#### INTERACTIONS

#### Drug

**Diuretics, other antihypertensives, especially catecholamine-depleting drugs:** May increase hypotensive effect of acebutolol.

Antidiabetic agents: May mask symptoms of hypoglycemia and prolong hypoglycemic effect of insulin and oral hypoglycemics. α-adrenergic agonists: Increased risk of hypertensive reaction.

**NSAIDs:** May blunt antihypertensive response.

#### Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase antinuclear antibody titer and alkaline phosphatase, bilirubin, BUN, serum creatinine, HDL, lipoproteins, potassium, AST (SGOT), ALT (SGPT), triglyceride, and uric acid levels.

#### SIDE EFFECTS

#### Frequent

Hypotension manifested as dizziness, nausea, diaphoresis, headache, cold extremities, fatigue, constipation, or diarrhea.

#### Occasional

Insomnia, urinary frequency, impotence or decreased libido.

#### Rare

Rash, arthralgia, myalgia, confusion (especially in elderly patients), altered taste.

#### SERIOUS REACTIONS

 Overdose may produce profound bradycardia and may cause heart failure symptoms.  Abrupt withdrawal may result in diaphoresis, palpitations, headache, and tremors; may cause severe effects such as to precipitate CHF or MI in patients with heart disease; thyroid storm in those with thyrotoxicosis

· Anaphalactic reactions.

Hypoglycemia may occur in patients with previously controlled diabetes. May mask select symptoms of hypoglycemia such as tachycardia.
Thrombocytopenia, with unusual bleeding or bruising, occurs rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with bronchospastic disease, diabetes, hyperthyroidism, impaired renal or hepatic function, inadequate cardiac function, and peripheral vascular disease. Acebutolol readily crosses the placenta and is distributed in breast milk. Acebutolol use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, or hypothermia during childbirth. No age-related precautions have been noted in children, and dosages have not been established. Use cautiously in elderly patients, who may have age-related peripheral vascular disease. B-blockade can precipitate or aggravate the symptoms of arterial insufficiency in patients with peripheral or mesenteric vascular disease. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval.

Monitor BP for hypotension; respiratory status for shortness of breath; pattern of daily bowel activity and stool consistency; ECG for arrhythmias; and pulse for quality, rate, and rhythm during treatment. If pulse rate is 60 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as excessive fatigue, prolonged dizziness, decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and sudden weight gain, should also be assessed. Notify physician if these occur.

Storage

Store at room temperature.

#### Administration

Acebutolol may be taken without regard to meals. Do not abruptly discontinue the drug.

#### Acetaminophen

ah-seet'ah-min-oh-fen ★ Apra, Feverall, Genapap, Mapap, Ofirmev, Tylenol, Tylenol Arthritis Pain, Tylenol Extra Strength, Tylenol Meltaways Atasol, Tempra Do not confuse with Fiorinal,

Hycodan, Indocin, Percodan, or Tuinal.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (PO and rectal); Category C (IV) OTC (oral, rectal) Rx (injectable)

**Classification:** Analgesics, nonnarcotic, antipyretics

#### MECHANISM OF ACTION

A central analgesic whose exact mechanism is unknown but appears to inhibit prostaglandin synthesis in the CNS and, to a lesser extent, block pain impulses through peripheral action. Acetaminophen acts centrally on the hypothalamic heat-regulating center, producing peripheral vasodilation (heat loss, sweating). *Therapeutic Effect:* Results in antipyresis. Produces analgesic effect.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15-30 min	1-1.5 h	4-6 h
IV	15 min	15 min	2-3 h

Rapidly, completely absorbed from GI tract; rectal absorption variable. Protein binding: 20%-50%. Widely distributed to most body tissues. Metabolized in liver; excreted in urine. Removed by hemodialysis. *Half-life:* 1-4 h (half-life is increased in those with liver disease, elderly, neonates; decreased in children).

# AVAILABILITY

Caplet: 500 mg. Caplet, Extended Release: 650 mg. Capsule: 500 mg. Intravenous Infusion: 10 mg/mL. Oral Solution: 160 mg/5 mL. Oral Solution, Extra Strength: 500 mg/15 mL. Rectal Suppository: 80 mg, 120 mg, 325 mg, 650 mg. Oral Suspension: 160 mg/5 mL. Tablet: 325 mg, 500 mg. Tablet, Chewable: 80 mg, 160 mg. Tablet, Disintegrating: 80 mg, 160 mg.

# INDICATIONS AND DOSAGES

# Analgesia and antipyresis PO

*Adults, Elderly.* 325-650 mg q4-6h or 1 g 3-4 times/day. Maximum: 4 g/day. *Children.* 10-15 mg/kg/dose q4-6h as

needed. Maximum: 5 doses/24 h.

Neonates. 10-15 mg/kg/dose q6-8h as needed. RECTAL Adults. 650 mg q4-6h. Maximum: 6 doses/24 h. Children. 10-15 mg/kg/dose q4-6h as needed. Maximum: no more than 6 doses/24 h and not to exceed 75 mg/kg/day. Neonates. 10-15 mg/kg/dose q6-8h as needed. INTRAVENOUS INFUSION. Adults and Adolescents  $\geq 50 \text{kg}$ :1000 mg q  $\geq$  6h or 650 mg q4h. Maximum: 4 g/day. Minimum dosing interval of 4 h. Adults and Adolescents <50 kg and Children  $\geq 2$  years: 15 mg/kg q6h or 12.5 mg/kg q4h. Maximum: 75 mg/

kg/day. Minimum dosing interval of 4 h.

# CONTRAINDICATIONS

Hypersensitivity. Also, selftreatment is not recommended by those with active alcoholism, liver disease, or viral hepatitis, all of which increase the risk of hepatotoxicity.

# INTERACTIONS

#### Drug

Alcohol (chronic use), hepatotoxic medications (e.g., phenytoin), and any CYP2E1 inducers: May increase risk of hepatotoxicity with prolonged high dose or single toxic dose.

**Warfarin:** Most data indicate significant interaction not likely; however, any time a new medication, such as acetaminophen, is added and taken regularly, INR monitoring is recommended.

#### Herbal

Chaparral: Potential hepatotoxicity; avoid use.

**Comfrey:** Potential hepatotoxicity; avoid use.

### **DIAGNOSTIC TEST EFFECTS**

May increase serum bilirubin, SGOT (AST), and SGPT (ALT). Therapeutic serum level: 10-30 mcg/ mL; toxic serum level: > 200 mcg/ mL at 4 h post acute ingestion. Must use nomogram to determine risk of toxicity. During chronic supratherapeutic use, toxicity is usually assumed if level is > 10 mcg/ mL and AST or ALT elevated.

#### IV INCOMPATIBILITIES

No other modication should be added to infusion solution/vial or the adminitration line.

Diazepam and chlorpromazine HCL are incompatible.

#### SIDE EFFECTS

Rare Hypersensitivity reaction.

#### SERIOUS REACTIONS

#### Hepatotoxicity

• Acetaminophen toxicity is the primary serious reaction.

• Early signs and symptoms of acetaminophen toxicity include anorexia, nausea, diaphoresis, and generalized weakness within the first 12 to 24 h.

• Later signs of acetaminophen toxicity include vomiting, right upper quadrant tenderness, and elevated liver function tests within 48-72 h after ingestion.

• The antidote to acute acetaminophen toxicity is acetylcysteine (Mucomyst), and it should be administered as soon as possible following toxic dose.

#### **PRECAUTIONS & CONSIDERATIONS**

While acute overdose may cause severe hepatic toxicity, chronic overuse of acetaminophen may also cause significant liver injury. Caution is warranted with liver disease, G6PD deficiency, phenylketonuria, sensitivity to acetaminophen, and severe impaired renal function. Adult dose should not exceed 4 g per day. Chronic alcoholics should limit intake to 2 g or less per day. Acetaminophen crosses the placenta and is distributed in breast milk. Acetaminophen is routinely used in all stages of pregnancy and appears safe for short-term use. There are no agerelated precautions noted in children or in elderly patients. Be aware that children may receive repeat doses 4-5 times a day to a maximum of 5 doses in 24 h. Neonates, if treated with acetaminophen, need reduced dosages compared to other children, especially with IV form. Safety and efficacy of IV form not established in children or infants less than 2 yr old. Withhold the drug and contact the physician if respirations are 12/min or lower (20/min or lower in children).

Consult with the physician before using acetaminophen in children under 2 yr of age; oral use for more than 5 days in children, more than 10 days in adults, or fever lasting more than 3 days. Severe or recurrent pain or high, continuous fever, which may indicate a serious illness, should be monitored.

#### Storage

Store at room temperature. Avoid high heat, excessive humidity, and freezing. Suppositories may be refrigerated if needed; do not freeze. Do not refrigerate or freeze infusion vials. Administration

Oral: Take oral acetaminophen without regard to meals. Tablets may be crushed. Shake oral suspension well before each use. Be sure to use oral dose syringe for infants and young children to ensure accurate dose.

Rectal: Remove wrapper and moisten suppository with cold water before inserting well up into the rectum.

IV: For 1000 mg doses, use aseptic technique and insert a vented IV set through the septum of the 100 mL vial. May give without further dilution. Do not use if particulate matter or discoloration is present. Administer IV over 15 minutes. Do NOT add other medications to the vial or infusion device

For weight-based doses < 1000 mg: Withdraw the appropriate dose using aseptic technique from an intact sealed vial and place dose in a separate empty, sterile container (e.g., glass bottle, plastic IV container, or syringe) for IV infusion. Discard any remaining solution in the original vial. Administer IV over 15 minutes using a syringe pump or other suitable infusion device. Monitor the end of the infusion to prevent an air embolism. Once an infusion vial has been penetrated, use within 6 h.

# Acetazolamide

ah-seat-ah-zole'ah-myd → Diamox, Diamox Sequels → Acetazolam Do not confuse with acetohexamide.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Diuretic, anticonvulsant, carbonic anhydrase inhibitors

#### **MECHANISM OF ACTION**

A carbonic anhydrase inhibitor that reduces formation of hydrogen and bicarbonate ions from carbon dioxide and water by inhibiting, in proximal renal tubule, the enzyme carbonic anhydrase, thereby promoting renal excretion of sodium, potassium, bicarbonate, water. *Ocular:* Reduces rate of aqueous humor formation, lowers intraocular pressure. *Therapeutic Effect:* Produces anticonvulsant activity by retarding neuronal conduction in the brain; produces a diuretic effect generally.

#### PHARMACOKINETICS

SR: Absorption 3-6 h; onset 2 h; peak activity attained 3-6 h; duration 18-24 h. IR: Absorption 1-4 h; onset 1-1.5 h; peak activity attained 1-4 h; duration 8-12 h. IV: Onset 2 min; peak activity attained 15 min; duration 4-5 h. Excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 2.4-5.8 h.

#### AVAILABILITY

*Capsules, Sustained Release:* 500 mg (Diamox Sequels). *Powder for Injection; Lyophilized:* 500 mg. *Tablets:* 125 mg, 250 mg.

#### INDICATIONS AND DOSAGES Chronic simple (open-angle) glaucoma

PO

*Adults.* 250 mg 1-4 times/day, not to exceed 1 g/day. *Extended-Release:* 500 mg 1-2 times/day usually given in morning and evening, not to exceed 1 g/day.

# Secondary glaucoma, preop treatment of closed-angle glaucoma (short term)

*Adults*. Initially 500 mg; then 125-250 mg q4h.

*Adults*. 500 mg IV for acute lowering of IOP in patients unable to take

Acetazolamide (Generic Name)

PO. If needed, may repeat the dose in 2-4 h.

#### Drug-induced edema PO/IV

*Adults*. 250-375 mg daily for 1-2 days, alternating with a day of rest.

# Epilepsy

PO

*Adults.* Optimum range is 375-1000 mg/day in 1-4 divided doses, unless given with another anticonvulsant therapy where initial dosage should be 250 mg/day.

#### • Acute mountain sickness PO

*Adults.* 500-1000 mg/day in divided doses using tablets or sustained-release capsules. If possible, begin 24-48 h before ascent; continue at least 48 h at high altitude.

#### Diuresis in CHF

PO/IV

*Adults.* Initially 250-375 mg (5 mg/kg) every morning, then given on alternate days or for 2 days alternating with 1 day of rest. Use lowest effective dosage.

#### Dosage in renal impairment (immediate release products only)

Creatinine Clearance (mL/min)	Dosage Interval
10-50	q12h
Less than 10	Avoid use

# CONTRAINDICATIONS

Hypersensitivity to acetazolamide, product components, or to other sulfonamides; severe renal disease, hepatic cirrhosis, decreased sodium or potassium serum levels, adrenal insufficiency, hypochloremic acidosis, severe pulmonary obstruction with increased risk of acidosis. Long-term use is contraindicated in patients with chronic noncongestive angle-closure glaucoma.

# INTERACTIONS

# Drug (not limited to the following)

Phenytoin: May increase serum concentrations of phenytoin. Primidone: May decrease serum

concentrations of primidone. **Quinidine:** May decrease urinary excretion of quinidine and increase effects.

**Salicylates:** May increase risk of acetazolamide accumulation and toxicity including CNS depression and metabolic acidosis.

Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase ammonia, bilirubin, glucose, chloride, uric acid, calcium. May decrease bicarbonate, potassium. May cause false-positive results for urinary protein with Albustix®, Labstix®, Albutest®, Bumintest®; interferes with HPLC theophylline assay and uric acid assay.

# IV INCOMPATIBILITIES

Multivitamin injection, TPN.

# **IV COMPATIBILITIES**

Dextran, pantoprazole (Protonix), ranitidine (Zantac).

# SIDE EFFECTS

#### Frequent

Drowsiness, dizziness; loss of appetite; transient myopia; unusually tired/weak; increased urination/ frequency; altered taste (metallic); nausea; numbness or tingling in extremities, lips, mouth.

#### Occasional

Depression, drowsiness, skin rash; uticaria.

#### Rare

Photosensitivity, confusion, tinnitus, severe muscle weakness, bruising; hearing disturbances.

#### SERIOUS REACTIONS

Long-term therapy may result in acidosis.

• Nephrotoxicity/hepatotoxicity occurs occasionally, manifested as dark urine/stools, pain in lower back, jaundice, dysuria, crystalluria, renal colic/calculi.

 Bone marrow depression may be manifested as aplastic anemia, thrombocytopenia, thrombocytopenic purpura, leukopenia, agranulocytosis, hemolytic anemia.

 Rare but serious hypersensitivity reactions similar to sulfonamides;
 Stevens-Johnson syndrome; toxic epidermal necrolysis and anaphylaxis.

#### PRECAUTIONS & CONSIDERATIONS

Advise patient to stop taking acetazolamide immediately and to contact his or her health care provider if any of the following symptoms occur: sore throat, unexplained fever, pallor, purpura, hematuria, unusual bleeding or bruising; blood in urine; tingling or tremors in hands or feet; hearing changes; flank or loin pain.

Caution is warranted in patients being treated for glaucoma; intraocular pressures should be measured and documented in the patient's record before starting therapy and periodically during therapy. When the patient is using acetazolamide to prevent symptoms from high-altitude sickness, advise patient that if rapid ascent causes high-altitude sickness, rapid descent is necessary.

It is unknown if acetazolamide crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children. Acetazolamide may cause drowsiness. Avoid alcohol and performing tasks that require mental alertness or motor skills. Patient should avoid unnecessary exposure to sunlight and artificial tanning.

#### Storage

Store oral dosage forms and unopened injection at room temperature. Reconstituted solution for injection may be stored up to 12 h at room temperature and for 3 days under refrigeration.

#### Administration

IM administration is not recommended because of pain secondary to the alkaline pH. Reconstitute with at least 5 mL of sterile water to provide a solution containing not more than 100 mg/mL. The preferred route is direct IV injection. Recommended rate of administration is 100-500 mg/min for IV push; not to exceed 500 mg/min. May further dilute if necessary in 50 mL of either D5W or 0.9% NaCl for IV infusion administration over 15-30 min. Do not administer if particulate matter, cloudiness, or discoloration is noted.

Give oral acetazolamide with food. Do not crush, chew, or swallow contents of long-acting capsule. Capsules may be opened and the contents sprinkled on soft food.

#### **Acetic Acid**

a-cee'tik as'id ★ Borofair, VoSol Do not confuse with salicylic acid.

#### CATEGORY AND SCHEDULE.

Pregnancy Risk Category: C

**Classification:** Anti-infectives, otics, dermatologic and bladder irrigation

#### **MECHANISM OF ACTION**

The mechanism by which acetic acid exerts its antibacterial and antifungal actions is unknown. *Therapeutic Effect:* Antibacterial and antifungal.

#### PHARMACOKINETICS

Unknown.

#### AVAILABILITY

Solution (Irrigation): 0.25%. Solution (Otic): 2%.

# INDICATIONS AND DOSAGES Superficial infections of the external auditory canal

TOPICAL (EXTERNAL OTIC) Adults, Elderly, Children. Carefully remove all cerumen and debris to allow acetic acid to contact infected surfaces directly. To promote continuous contact, insert a wick saturated with acetic acid into the ear canal; the wick may also be saturated after insertion. Instruct the patient to keep the wick in for at least 24 h and to keep it moist by adding 3-5 drops of acetic acid every 4-6 h. The wick may be removed after 24 h, but the patient should continue to instill 5 drops of acetic acid 3 or 4 times daily thereafter, for as long as indicated. Dosing should be tapered gradually after apparent response to avoid relapse.

#### Dermatologic irrigation

For irrigation of skin sites as required, usually a 0.25% solution used 2 or 3 times per day.

#### Bladder irrigation

For continuous irrigation of the urinary bladder with 0.25% irrigation, the rate approximates urine flow rates of 500-1500 mL/24 h; for periodic irrigation of an indwelling catheter to maintain patency, about 50 mL of 0.25% irrigation is required.

#### CONTRAINDICATIONS

Hypersensitivity to acetic acid or any of the ingredients. Perforated tympanic membrane is frequently considered a contraindication to the use of any medication in the external ear canal.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Occasional Stinging or burning. Rare

Local irritation, superinfection, hematuria, systemic acidosis.

#### SERIOUS REACTIONS

- · Superinfection with prolonged use.
- Discontinue promptly if

sensitization or irritation occurs.

#### **PRECAUTIONS & CONSIDERATIONS**

Acidosis may occur with systemic absorption of irrigation solution. It is unknown whether acetic acid crosses the placenta or is distributed into breast milk. No age-related precautions have been noted in children or the elderly. Discontinue otic solution if sensitization or irritation occurs.

Transient burning or stinging may be noted when first instilled into acutely inflamed areas.

#### Storage

Unopened irrigations and otic solution may be stored at room temperature. Once irrigation opened, use contents promptly. Policies usually dictate discarding open irrigation solution within 24-28 h.

#### Administration

Insert saturated wick of cotton into the ear canal and leave for at least 24 h, keeping moist by adding 3-5 drops every 4-6 h. For maintenance, instill drops as long as indicated.

# Acetylcysteine

a-see-til-sis'tay-een ★ Acetadote, Mucomyst ◆ Parvolex Do not confuse acetylcysteine with acetylcholine.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antidotes, mucolytics

#### **MECHANISM OF ACTION**

An intratracheal respiratory inhalant that splits the linkage of mucoproteins, reducing the viscosity of pulmonary secretions. Protects against acetaminophen-induced hepatotoxicity by maintaining or restoring glutathione levels or by acting as an alternate substrate for conjugation with, and thus detoxification of. the toxic acetaminophen reactive metabolite. Therapeutic Effect: Facilitates the removal of pulmonary secretions by coughing, postural drainage, mechanical means, Protects against acetaminophen overdoseinduced hepatotoxicity.

#### PHARMACOKINETICS

Low oral bioavailability. *Half-life:* 11 h (newborns), 5.6 h (adults).

#### AVAILABILITY

Injection (Acetadote): 20% (200 mg/mL). Inhalation Solution (Mucomyst): 10% (100 mg/mL), 20% (200 mg/mL).

# INDICATIONS AND DOSAGES

 Adjunctive treatment of viscid mucus secretions from chronic bronchopulmonary disease and for pulmonary complications of cystic fibrosis

#### NEBULIZATION

Adults, Elderly, Children. 3-5 mL (20% solution) 3-4 times a day or 6-10 mL (10% solution) 3-4 times a day. Range: 1-10 mL (20% solution) q2-6h or 2-20 mL (10% solution) q2-6h. Infants. 1-2 mL (20%) or 2-4 mL (10%) 3-4 times a day.

#### Treatment of viscid mucus secretions in patients with a tracheostomy

INTRATRACHEAL *Adults, Children.* 1-2 mL of 10% or 20% solution instilled into tracheostomy q1-4h.

Acetaminophen overdose

PO (ORAL SOLUTION 5%) Adults, Elderly, Children. Loading dose of 140 mg/kg, followed in 4 h by maintenance dose of 70 mg/kg q4h for 17 additional doses (unless acetaminophen assay reveals nontoxic level). Repeat dose if emesis occurs within 1 h of administration. IV (ACETADOTE) Adults, Elderly, Children. 150 mg/ kg infused over 60 min, then 50 mg/ kg infused over 4 h, then 100 mg/kg

# infused over 16 h. OFF-LABEL USES

Prevention of renal damage from dyes given during certain diagnostic tests (such as CT scans). PO or IV *Adults, Elderly.* 600-1200 mg twice a day for 4 doses starting the day

before the procedure.

#### CONTRAINDICATIONS

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Inhalation: Stickiness on face, transient unpleasant odor.

#### Occasional

Inhalation: Increased bronchial secretions, throat irritation, nausea, vomiting, rhinorrhea. IV: Nausea, vomiting, flushing,

pruritus, rash, tachycardia.

#### Rare

Inhalation: Rash. Oral: Facial edema, bronchospasm, wheezing. IV: Drowsiness, chills, fever, urticaria.

#### SERIOUS REACTIONS

• Large doses may produce severe nausea and vomiting.

• Anaphylactoid reactions with flushing and erythema reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with bronchial asthma and in elderly or debilitated patients with severe respiratory insufficiency. Maintain adequate hydration. A disagreeable color may emanate from the solution during initial administration, but it disappears quickly.

If bronchospasm occurs, discontinue treatment; notify the physician. A bronchodilator may be needed. Assess respiratory rate, depth, rhythm, and type (such as abdominal or thoracic) and color, consistency, and amount of sputum. **Storage** 

Injectable solution: Store at room temperature. Following reconstitution with D5W, solution is stable for 24 h at room temperature. A color change may occur in opened vials (light purple) but does not affect the safety or efficacy.

Inhalation solution: Store at room temperature; once opened, store under refrigeration and use within 96 h. Use diluted solutions within 1 h. A color change may occur in opened vials (light purple) but does not affect the safety or efficacy.

#### Administration

To create the oral solution, dilute 20% solution with water or soft drinks to create a 5% concentration. Use within 1 h. Soft drinks and the use of a straw will best enhance palatability; water is best used if given via NG tube. When administering the solution by nebulizer, avoid contact with those parts of the equipment that contain copper, iron, or rubber because the drug will react with these materials on contact. For inhalation, may administer either undiluted or diluted with 0.9% NaCl.

For adults  $\geq$  40 kg: For IV use, give 3 infusions of different strengths: first dose (150 mg/kg) in 200 mL D5W and infused over 15 min, second dose (50 mg/kg) in 500 mL D5W and infused over 4 h, third dose (100 mg/kg) in 1000 mL D5W and infused over 16 h.

For children and adults < 40 kg: Dilutions are adjusted. Consult prescribing information.

#### Acitretin

a-si-tre'tin 🖈 🍟 Soriatane

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Dermatologics, systemic retinoids, antipsoriatics

#### **MECHANISM OF ACTION**

A second-generation retinoid that adjusts factors influencing epidermal proliferation, RNA/ DNA synthesis, controls glycoprotein, and governs immune response. *Therapeutic Effect:* Regulates keratinocyte growth and differentiation.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Food increases the rate of absorption. Protein binding: > 99%. Metabolized in liver. Excreted in bile and urine. Not removed by hemodialysis. *Half-life:* 49 h. With alcohol consumption, acitretin is converted to etretinate, which has a half-life of 120 days.

#### AVAILABILITY

*Capsules:* 10 mg, 17.5 mg, 22.5 mg, 25 mg (Soriatane).

# INDICATIONS AND DOSAGES

# Psoriasis

PO

Adults, Elderly. 25-50 mg/day as a single dose with main meal. Maintenance: 25-50 mg/day after the initial response is noted. Lower doses are required in patients receiving phototherapy. Continue until lesions have resolved.

# **OFF-LABEL USES**

Treatment of nonpsoriatic dermatoses, keratinization disorders, Darier's disease, palmoplantar keratoses, lichen planus; children with lamellar ichthyosis, nonbullous and bullous ichthyosiform erythroderma, Sjögren-Larsson syndrome; should be prescribed only by physicians knowledgeable in the use of systemic retinoids.

# CONTRAINDICATIONS

Pregnancy or those who intend to become pregnant within 3 yr following discontinuation of therapy, severely impaired liver or kidney function, chronic abnormal elevated lipid levels, concomitant use of methotrexate or tetracyclines, ingestion of alcohol (in females of reproductive potential), hypersensitivity to acitretin, etretinate, or other retinoids, sensitivity to parabens (used as preservative in gelatin capsule).

#### INTERACTIONS Drug

Alcohol: May prevent elimination of acitretin by conversion of drug to etretinate. Females must *not* drink alcohol during or for 2 mo after stopping treatment with acitretin. "Minipill" oral contraceptive: May interfere with contraceptive effect. Methotrexate: May increase risk of hepatotoxicity. Contraindicated. Tetracyclines: May increase risk

of increased intracranial pressure. Contraindicated.

**Sulfonylureas:** May potentiate blood glucose lowering.

**Phenytoin:** May increase phenytoin free levels via decreased protien binding.

Vitamin A: May increase risk of vitamin A toxicity.

#### Herbal

**St. John's wort:** May increase risk of unplanned pregnancy as a result of lessening of effects of hormonal contraceptives.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase triglycerides, SGOT (AST), SGPT (ALT). May decrease HDL (high density lipoprotein). May alter blood glucose control. Triglycerides and LFTs should be monitored at 1- to 2-wk intervals until response to drug is estabilished.

#### SIDE EFFECTS Frequent

Lip inflammation, alopecia, skin peeling, shakiness, dry eyes, rash, hyperesthesia, paresthesia, sticky skin, dry mouth, epistaxis, dryness/ thickening of conjunctiva.
#### Occasional

Eye irritation, brow and lash loss, sweating, chills, sensation of cold, flushing, edema, blurred vision, diarrhea, nausea, thirst.

#### SERIOUS REACTIONS

• Benign intracranial hypertension (pseudotumor cerebri) occurs rarely.

• Hepatotoxicity with clinical jaundice.

- Teratogen
- · Ossification abnormalities.
- · Thromboembolic risk.
- · Hepatotoxicity with clinical jaundice.
- · Night blindness.

• Potential for severe emotional lability or depression.

#### **PRECAUTIONS & CONSIDERATIONS**

A Med Guide is dispensed with each prescription and refill. Female patients must sign a required informed consent agreement due to the risk for birth defects. Caution is warranted with impaired hepatic or renal function and in those with elevated cholesterol/triglycerides. Safety and efficacy have not been established in children. Be aware that acitretin should be avoided in elderly patients with renal impairment. Decreased tolerance to contact lenses may develop. Follow a cholesterolfree diet for best results. Depression and other psychiatric symptoms such as aggression or thoughts of self-harm have occurred during therapy with systemic retinoids, including acitretin. Significant changes in liver function tests occur in up to 1/3 of patients; monitor closely. Photosensitivity may occur.

Be aware that acitretin is contraindicated in pregnant women. Women should not take acitretin if pregnant or planning to become pregnant within the next 3 yr. Two pregnancy tests with negative results must be obtained before starting treatment. Two forms of birth control must be used for 1 mo before beginning with acitretin, during treatment, and 3 yr after treatment. Acitretin has teratogenic effects. An agreement/informed consent must be signed before treatment begins.

Patients should not donate blood during and for at least 3 yr after completing acitretin therapy so that women of childbearing potential do not receive blood from patients receiving acitretin.

#### Storage

Store at room temperature. Protect from light and high humidity.

#### Administration

Give with main meal of the day or milk. Remind female patients not to drink alcohol.

#### Acyclovir

ay-sye'kloe-ver Zovirax Do not confuse with Zostrix, Zyvox.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Antivirals

#### MECHANISM OF ACTION

A synthetic nucleoside that converts to acyclovir triphosphate, becoming part of the DNA chain. *Therapeutic Effect*: Interferes with DNA synthesis and viral replication. Virustatic.

#### PHARMACOKINETICS

Poorly absorbed from the GI tract; minimal absorption following topical application. Protein binding: 9%-36%. Widely distributed. Penetrates CSF levels roughly 13%-52% those of plasma. Partially metabolized unchanged in liver.

Acyclovir (Generic Name)

#### 24 Acyclovir

Excreted primarily unchanged in urine. Removed by hemodialysis. *Half-life:* 2.5 h (increased in impaired renal function).

#### AVAILABILITY

Capsules: 200 mg. Tablets: 400 mg, 800 mg. Injection (lyophilized powder for reconstitution): 50 mg/mL once reconstituted. Oral Suspension: 200 mg/5 mL. Injection, Solution: 25 mg/mL.

Cream: 5%. Ointment: 5%.

# INDICATIONS AND DOSAGES

# Genital herpes (initial episode) IV

*Adults, Elderly, Children 12 yr and older.* 5 mg/kg q8h for 5 days. PO

Adults, Elderly, Children 12 yr and older. 200 mg q4h 5 times a day. TOPICAL (OINTMENT)

Cover all lesions every 3 h, 6 times a day for 7 days. Begin as soon as signs and symptoms appear.

#### Genital herpes (recurrent)

Less than 6 episodes per year: PO

*Adults, Elderly, Children 12 yr and older.* 200 mg q4h 5 times a day for 5 days.

6 episodes or more per year: PO

*Adults, Elderly, Children 12 yr and older.* 400 mg 2 times a day or 200 mg 3-5 times a day for up to 12 mo.

#### Herpes labialis (cold sores), recurrent

#### TOPICAL (CREAM)

*Adults, Children 12 yr and older.* Apply 5 times per day for 4 days (i.e., during the prodrome or when lesions appear).

#### Herpes simplex mucocutaneous IV

Adults, Elderly, Children 12 yr and older. 5 mg/kg/dose q8h for 7 days.

*Children younger than 12 yr.* 10 mg/kg q8h for 7 days.

#### Herpes simplex neonatal IV

*Children younger than 4 mo.* 10 mg/kg q8h for 10 days.

#### Herpes simplex encephalitis IV

Adults, Elderly, Children 12 yr and older. 10 mg/kg q8h for 10 days. Children 3 mo to younger than 12 yr. 20 mg/kg q8h for 10 days.

# Herpes zoster (caused by varicella) IV

Adults, Elderly, Children 12 yr and older. 10 mg/kg q8h for 7 days. Children younger than 12 yr. 20 mg/ kg q8h for 7 days.

# Herpes zoster (shingles)

#### PO

*Adults, Elderly, Children 12 yr and older.* 800 mg q4h 5 times a day for 7-10 days.

# Varicella (chickenpox)

#### PO

Adults, Elderly, Children older than 12 yr or children 2-12 yr, weighing 40 kg or more. 800 mg 4 times a day for 5 days.

*Children 2-12 yr, weighing* < 40 kg. 20 mg/kg 4 times a day for

5 days. Maximum: 800 mg/dose.

#### Dosage in renal impairment

Dosage and frequency are modified based on severity of infection and degree of renal impairment. PO

#### If normal dose is 800 mg 5 times/ day, decrease to 800 mg q12h. If normal dose is 200 mg 5 times/day or 400 mg q12h, decrease dose to 200 mg q12h.

IV

# Creatinine<br/>Clearance<br/>(mL/min)Dosage<br/>Dosage %Dosage<br/>Interval> 501008 h25-5010012 h

Creatinine Clearance (mL/min)	Dosage %	Dosage Interval
10-25	100	24 h
< 10	50	24 h

# **OFF-LABEL USES**

Treatment of herpes simplex ocular infections, infectious mononucleosis.

#### CONTRAINDICATIONS

Hypersensitivity to acyclovir or valacyclovir.

# INTERACTIONS

#### Drug

Nephrotoxic medications (such as aminoglycosides): May increase the risk of drug-induced nephrotoxicity. **Probenecid:** May increase acyclovir half-life.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum creatinine concentrations.

# IV INCOMPATIBILITIES

In general, do not mix any other drugs in an acyclovir syringe. Acyclovir has as many incompatibilities as compatibilities. Caution should be used with any administration at a Y-site. Ampicillin/Sulbactam (Unasyn), aztreonam (Azactam), caffeine citrate (Cafcit), cefepime (Maxipime), ciprofloxacin (Cipro), diazepam (Valium), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), haloperidol lactate, hydroxyzine, levofloxacin (Levaquin), meropenem (Merrem IV), midazolam (Versed), nitroprusside, ondansetron (Zofran), pentamidine, phenytoin (Dilantin), piperacillin, potasium phosphate, quinupristin-dalfopristin (Synercid), tacrolimus (Prograf), tazobactam (Zosyn), TPN verapamil.

# **IV COMPATIBILITIES**

Allopurinol (Alloprim), amikacin (Amikin), ampicillin, cefazolin (Ancef), cefotaxime (Claforan), ceftazidime (Fortaz), ceftriaxone (Rocephin), cimetidine (Tagamet), clindamycin (Cleocin), famotidine (Pepcid), fluconazole (Diflucan), gentamicin, heparin, hydromorphone (Dilaudid), imipenem (Primaxin), lorazepam (Ativan), magnesium sulfate, methylprednisolone (Solu-Medrol), metoclopramide (Reglan), metronidazole (Flagyl), morphine, multivitamins, potassium chloride, propofol (Diprivan), ranitidine (Zantac), vancomycin.

# SIDE EFFECTS

#### Frequent

Parenteral (7%-9%): Phlebitis or inflammation at IV site, nausea, vomiting.

Topical ointment (28%): Burning, stinging.

#### Occasional

Parenteral (3%): Pruritus, rash, urticaria.

Oral (6%-12%): Malaise, nausea. Topical ointment (4%): Pruritus. Rare

Oral (1%-3%): Vomiting, rash, diarrhea, headache. Parenteral (1%-2%): Confusion, hallucinations, seizures, tremors. Topical (< 1%): Rash.

# SERIOUS REACTIONS

• Rare hypersensitivity, such as Stevens-Johnson syndrome, anaphylaxis, angioedema.

 Rapid parenteral administration, excessively high doses, or fluid and electrolyte imbalance may produce renal failure exhibited by such signs and symptoms as abdominal pain, decreased urination, decreased appetite, increased thirst, nausea, and vomiting.

• Extravasation may cause tissue necrosis.

 Thrombotic thrombocytopenic purpura/hemolytic uremic syndrome (TTP/HUS) in immunocompromised patients may be fatal.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with concurrent use of nephrotoxic agents, dehydration, fluid and electrolyte imbalance, neurologic abnormalities, or renal or hepatic impairment. Acyclovir crosses the placenta and is distributed in breast milk. In the elderly, age-related renal impairment may require dosage adjustment. Females should have a Pap smear at least annually because of the increased risk of cervical cancer in women with genital herpes. Avoid touching lesions with fingers to prevent spreading infection to new sites.

History of allergies, particularly to acyclovir, should be obtained before treatment. Herpes simplex lesions should be assessed before treatment to compare baseline with treatment effect. IV site should be assessed for signs and symptoms of phlebitis, including heat, pain, or red streaking over the vein. Cutaneous lesions should be evaluated for signs of effective drug treatment. Adequate ventilation as well as hydration should be maintained. Appropriate isolation precautions should be maintained in persons with chickenpox and disseminated herpes zoster. Storage

Store capsules, tablets, cream, ointment, suspension at room temperature. Store vials at room temperature. Reconstituted vial solutions of 50 mg/mL will remain stable for 12 h at room temperature. Refrigeration of reconstituted solution may cause a precipitate that will redissolve at room temperature. IV infusion (piggyback) is stable for 24 h at room temperature. Yellow discoloration does not affect potency. Administration

Oral: Shake suspension well before administration. Take without regard to food.

Topical: Use finger cot or rubber glove to apply topical acyclovir. Avoid eye contact.

IV: Add 10 mL sterile water for injection to each 500-mg vial or 20 mL sterile water for injection to each 1000-mg vial for final concentration of 50 mg/mL. Do not use bacteriostatic water for injection containing benzyl alcohol or parabens because this will cause a precipitate to form. Shake well until solution is clear. Further dilute with at least 100 mL D5W or 0.9% NaCl. Final concentration should be  $\leq 7 \text{ mg}/$ mL. Neonatal doses are usually diluted in preservative-free NS, to a concentration of 5 mg/mL.

Infuse over at least 1 h because renal tubular damage may occur with too-rapid administration. Maintain adequate hydration during infusion and for 2 h following IV administration. Use syringe pump for neonatal administration.

# Adalimumab

ah-dah-lim′you-mab ★ ➡ Humira Do not confuse with Humulin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Diseasemodifying antirheumatic drugs, immunomodulators, monoclonal antibodies, tumor necrosis factor (TNF) modulators

# MECHANISM OF ACTION

A monoclonal antibody that binds specifically to TNF- $\alpha$ , blocking its interaction with cell surface TNF receptors. *Therapeutic Effect*: Reduces inflammation, tenderness, and swelling for various inflammatory diseases; slows or prevents progressive destruction of joints in rheumatoid arthritis.

# PHARMACOKINETICS

Time to peak serum concentration 131 h. *Half-life:* 10-20 days.

# AVAILABILITY

Pediatric Injection: 20 mg/0.4 mL in prefilled syringes.

*Injection:* 40 mg/0.8 mL in prefilled syringes or prefilled pens.

# INDICATIONS AND DOSAGES

#### Ankylosing spondylitis SC

Adults. 40 mg every other week.

# Crohn's disease

SC

*Adults.* 160 mg initially on day 1 (given as four 40-mg injections in 1 day or as two 40-mg injections per day for 2 consecutive days), followed by 80 mg 2 wks later (day 15). Two weeks later (day 29), begin a maintenance dosage of 40 mg every other week.

#### Juvenile idiopathic arthritis SC

*Children 4-17 yr of age.* Weight-based dosing. For patients weighing 15 kg to < 30 kg, the dose is 20 mg every other week. For patients weighing 30 kg or more, the dose is 40 mg every other week.

# Plaque psoriasis

#### SC

*Adults.* 80 mg initial dose (given as two 40-mg injections on day 1), followed by 40 mg every other week starting 1 wk after the initial dose.

# Psoriatic arthritis

SC

Adults. 40 mg every other week.

Rheumatoid arthritis

SC

*Adults, Elderly.* 40 mg every other week. Dose may be increased to 40 mg/wk in those not taking methotrexate.

# CONTRAINDICATIONS

Active infections.

#### INTERACTIONS Drug

Abatacept: Concomitant use not recommended. Increased risk of serious infections with combined use. Anakinra: Concomitant use not recommended. Increased risk of serious infections with combined use.

Methotrexate: Reduces the absorption of adalimumab by 29%-40%, but dosage adjustment is unnecessary if given concurrently. **Rilonacept:** Concomitant use not recommended. Increased risk of serious infections with combined use.

Vaccines, live: Use not recommended. Altered immune response. Increased risk of secondary transmission of infection from vaccine.

# DIAGNOSTIC TEST EFFECTS

May increase levels of blood cholesterol, other lipids, liver aminotransferases, creatine phosphokinase, and serum alkaline phosphatase.

# SIDE EFFECTS

Frequent (20%)

Injection site reactions: erythema, pruritus, pain, and swelling. Occasional (9%-12%)

Headache, rash, sinusitis, nausea.

#### Rare (5%-7%)

Abdominal or back pain, hypertension.

#### SERIOUS REACTIONS

Rare reactions include hypersensitivity reactions, neurologic events, respiratory tract infections, bronchitis, UTIs, and more serious infections (such as pneumonia, tuberculosis, cellulitus, pyelonephritis, and septic arthritis).
TNF blockers are associated with an increased risk of secondary malignancy (lymphomas, skin cancers). Hepatosplenic T-cell lymphoma (HSTCL), a rare lymphoma, has been reported in young patients with inflammatory bowel disease.

#### **PRECAUTIONS & CONSIDERATIONS**

Serious infections, sepsis, tuberculosis, and opportunistic infections have occurred during therapy with TNF blockers, including adalimumab. Patients should be screened for active or recent infection tuberculosis risk factors, and latent tuberculosis infection before initiating therapy. Closely monitor patients developing an infection during therapy. Use of adalimumab may increase the risk of reactivation of hepatitis B virus in patients who are chronic carriers of the virus. Caution is warranted with cardiovascular disease, demyelinating disorders, history of sensitivity to monoclonal antibodies, preexisting or recent onset of CNS disturbances, in elderly patients, and in pregnant women. It is unknown whether adalimumab is excreted in breast milk. The safety and efficacy of adalimumab have not been established in children younger than 4 yr of age. Cautious use in the elderly is necessary because they are at increased risk for serious infection and malignancy.

Avoid receiving live vaccines during adalimumab treatment. Syringe needle cover contains latex; avoid contact if sensitive to latex.

Laboratory values, particularly serum alkaline phosphatase levels, should be monitored before and during therapy. Therapeutic response, such as improved grip strength, increased joint mobility, reduced joint tenderness, and relief of pain, stiffness, and swelling, should also be assessed.

#### Storage

Refrigerate adalimumab. Do not freeze. Protect from light; store in original carton until administration. Administration

For subcutaneous use, rotate injection sites on thighs and abdomen. Do not shake the injection. Administer each injection at least 1 inch from previous site. Never inject drug into bruised, hard, red, or tender areas. Do not inject within 2 inches of the navel. Discard any unused portion. Injection site reactions generally occur in the first month of treatment and decrease with continued therapy.

Adapalene a-dap'ah-leen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Dermatologics, retinoids

#### **MECHANISM OF ACTION**

Binds to retinoic acid receptors in cell nuclei modulating cell differentiation, keratinization. Possesses anti-inflammatory properties. *Therapeutic Effect:* Normalizes differentiation of follicular epithelial cells.

# PHARMACOKINETICS

Absorption through the skin is low. Trace amount found in plasma following topical application. Excreted primarily by biliary route.

#### AVAILABILITY

*Gel:* 0.1%, 0.3%. *Cream:* 0.1%. *Lotion:* 0.1%.

# INDICATIONS AND DOSAGES

Acne vulgaris TOPICAL

Adults, Elderly, Children > 12 yr. Apply to affected area once daily at bedtime after washing.

# CONTRAINDICATIONS

Hypersensitivity to adapalene, vitamin A, or any components. Do not use if patient has current sunburn. Wait until fully recovered.

# INTERACTIONS

#### Drug

Quinolones, phenothiazines, sulfonamides, sulfonylureas, tetracyclines, thiazide diuretics: Adapalene may increase the effects of these photosensitizing agents. Benzoyl peroxide, salicylic acid, sulfur, resorcinol, alcohol: Additive local irritation when used with adapalene.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Erythema, scaling, dryness, pruritus, burning (likely to occur first 2-4 wks, lessens with continued use). Occasional

Skin irritation, stinging, sunburn, acne flares, erythema, photosensitivity, xerosis.

#### SERIOUS REACTIONS

• Concurrent use of other potential irritating topical products (soaps, cleansers, aftershave, cosmetics) may produce severe topical irritation.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with eczema and seborrheic dermatitis. Adapalene has not been studied in pregnant women. It is unknown whether adapalene enters the breast milk. Safety and efficacy have not been established in children younger than 12 yr or in elderly patients.

A burning sensation, stinging, dryness, itching, or redness of the skin may occur, especially during the first month of use. Other skin products such as hair-removal products, shaving creams with a large amount of alcohol, other acne medications, and certain soaps and cleansers may irritate the skin while using adapalene. Minimize sun exposure.

# Storage

Store at room temperature. Administration

Apply a small amount as a thin film once a day, at least 1 h before bedtime. Apply the medicine to dry, clean areas affected by acne. Rub in gently and well. Avoid contact with eyes, lips, angles of the nose, and mucous membranes. Do not apply to cuts, abrasions, eczematous skin, or sunburned skin.

Adefovir Dipivoxil ah-deh'foh-veer dye-piv-ox'il Hepsera

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Antiretroviral, nucleoside reverse transcriptase inhibitor

Adefovir dipivoxil (Generic Name), Hepsera (Brand Name)

# **MECHANISM OF ACTION**

An antiviral that inhibits the enzyme DNA polymerase in the hepatitis B virus, causing DNA chain termination after its incorporation into viral DNA. *Therapeutic Effect:* Prevents replication of the hepatitis B virus.

### PHARMACOKINETICS

Prodrug converted to adefovir. Excreted in urine. *Half-life:* 7 h (increased in impaired renal function).

#### AVAILABILITY

Tablets: 10 mg.

#### INDICATIONS AND DOSAGES

 Chronic hepatitis B in patients with normal renal function PO

Adults, Elderly. 10 mg once a day.

## Chronic hepatitis B in patients with impaired renal function (adults)

Adults, Elderly with creatinine clearance 20-49 mL/min. 10 mg q48h.

Adults, Elderly with creatinine clearance 10-19 mL/min. 10 mg q72h. Adults, Elderly on hemodialysis. 10 mg every 7 days following dialysis.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

#### Drug

**Ibuprofen:** Increases adefovir bioavailability and plasma concentration.

Dofetilide, tenofovir, or any combination drugs containing tenofovir: Adefovir competes for renal elimination, raising levels of these drugs. Do not use together. Metformin: Adefovir may compete for renal elimination. May increase risk of lactic acidosis.

Nephrotoxic drugs: Watch for increased risk of renal effects.

### **DIAGNOSTIC TEST EFFECTS**

May increase serum amylase, serum creatinine, AST (SGOT) and ALT (SGPT) levels.

#### SIDE EFFECTS

Frequent (13%) Asthenia. Occasional (4%-9%) Headache, abdominal pain, nausea, flatulence. Rare (3%) Diarrhea, dyspepsia.

# SERIOUS REACTIONS

• Nephrotoxicity (characterized by increased serum creatinine and decreased serum phosphorus levels) is a treatment-limiting toxicity of adefovir therapy.

• Lactic acidosis and severe hepatomegaly occur rarely, particularly in those who are overweight, in combination with other antiretrovirals, or in female patients.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with impaired renal function and known risk factors for liver disease and in elderly patients. Baseline renal function laboratory values should be obtained before therapy begins and routinely thereafter. Adjust adefovir dosage with preexisting renal insufficiency. Obtain HIV antibody assay before adefovir therapy begins because unrecognized or untreated HIV infection may result in an emergence of HIV resistance. Not approved for use in children less than 12 yr. It is not known if adefovir causes fetal harm during pregnancy. In general, breastfeeding while on treatment is not recommended.

! Notify the physician immediately if unusual muscle pain, stomach pain with nausea and vomiting, cold feeling in arms and legs, or dizziness occurs. These signs and symptoms may signal the onset of lactic acidosis. Notify physician if yellow skin color or yellowing of the whites of the eyes or other unusual signs or symptoms occur. Reliable forms of contraception should be used.

Patients should be advised not to stop taking the drug suddenly, as this can cause a worsening of hepatitis that may be sudden. Treatment does not reduce the risk of transmission of HBV to others through sexual contact or blood contamination.

#### Storage

Store at room temperature. Administration

Give adefovir without regard to food. Give as prescribed. Give at the same time each day. If missed, give as soon as possible that day. Do not take more than 1 does per day.

# Adenosine

ah-den'oh-seen 🗙 Adenocard, Adenoscan

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antiarrhythmics, diagnostics, nonradioactive

# **MECHANISM OF ACTION**

A cardiac agent that slows impulse formation in the SA node and conduction time through the AV node. Adenosine also acts as a diagnostic aid in myocardial perfusion imaging or stress echocardiography. *Therapeutic Effect:* Depresses left ventricular function and restores normal sinus rhythm.

#### PHARMACOKINETICS

Rapidly cleared from blood after IV administration, metabolized to cyclic AMP and inosine primarily by red blood cells and vascular endothelial cells. *AMP half-life:* < 10 seconds.

# AVAILABILITY

Injection (Adenocard): 3 mg/mL in 2-mL, 4-mL syringes. Injection (Adenoscan): 3 mg/mL in 20-mL, 30-mL vials.

#### INDICATIONS AND DOSAGES Paroxysmal supraventricular tachycardia (PSVT)

RAPID IV BOLUS

Adults, Elderly. Initially, 6 mg given over 1-2 seconds. If first dose does not convert within 1-2 min, give 12 mg; may repeat 12-mg dose in 1-2 min if no response has occurred.

*Children*. Initially 0.1 mg/kg (maximum: 6 mg). If ineffective, may give 0.2 mg/kg (maximum 12 mg).

#### Diagnostic testing

IV INFUSION Adults. 140 mcg/kg/min for 6 min.

#### CONTRAINDICATIONS

Atrial fibrillation or flutter, secondor third-degree AV block or sick sinus syndrome (except with functioning pacemaker), ventricular tachycardia.

#### INTERACTIONS

#### Drug

**Carbamazepine:** May increase degree of heart block caused by adenosine.

**Dipyridamole:** May increase effect of adenosine.

**Methylxanthines** (e.g., caffeine, theophylline): May decrease the effect of adenosine.

#### Food

**Caffeine:** May decrease effect of adenosine. Avoid dietary caffeine 12-24 h before adenosine stress testing.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Any solution other than 0.9% NaCl lactated Ringer's, D5LR, or D5W.

#### 🗏 IV COMPATIBILITIES

Abciximab (ReoPro).

#### SIDE EFFECTS

Frequent (12%-18%) Facial flushing, dyspnea. Occasional (2%-7%) Headache, nausea, light-headedness,

chest pressure.

#### Rare (≤ 1%)

Numbness or tingling in arms; dizziness; diaphoresis; hypotension; palpitations; chest, jaw, or neck pain.

#### SERIOUS REACTIONS

• May produce short-lasting heart block or transient new arrhythmias.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with arrhythmias at the time of conversion, asthma, heart block, and hepatic and renal failure. Additional caution is advised in elderly patients who may be at increased risk for severe bradycardia or AV block.

Facial flushing, headache, and nausea may occur, but these symptoms will resolve. Notify the physician if chest pain, pounding, or palpitations or difficulty breathing or shortness of breath occurs. Before administering adenosine, the arrhythmia should be identified on a 12-lead ECG. Heart rate and rhythm on a continuous cardiac monitor and the apical pulse rate, rhythm, and quality should be assessed. BP, respirations, intake and output, and electrolytes should also be monitored. **Storage** 

Solution may be stored at room temperature and normally appears clear. Crystallization occurs if solution is refrigerated. If crystallization occurs, dissolve crystals by warming to room temperature. Discard unused portion. Administration

Administer undiluted very rapidly, over 1-2 seconds, directly into vein, or if using an IV line, use the port closest to the insertion site. If the IV line is infusing fluid other than 0.9% NaCl, flush the line first before administering adenosine. Follow the rapid bolus injection with a rapid 0.9% NaCl flush.

IV infusion (diagnostic use): Administer undiluted using a syringe pump or volumetric infusion pump.

#### Albendazole

all-ben'dah-zole ★ Albenza

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anthelmintic, systemic

#### **MECHANISM OF ACTION**

A benzimidazole carbamate anthelmintic that degrades parasite cytoplasmic microtubules, irreversibly blocks cholinesterase secretion and glucose uptake in helminth and larvae (depletes glycogen, decreases ATP production, depletes energy). Vermicidal. *Therapeutic Effect:* Immobilizes and kills worms.

Albendazole (Generic Name), Albenza (Brand Name)

# Agalsidase beta

a-gal'si-daze bay'tah ★ Fabrazyme ★ Fabrazyme, Replagal

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Enzymes, metabolic

# **MECHANISM OF ACTION**

An enzyme that treats Fabry disease, an X-linked genetic disorder, by catalyzing the hydrolysis of glycosphingolipids, reducing their accumulation in the kidneys' capillary endothelium and other body tissues. *Therapeutic Effect:* Provides an exogenous source of  $\alpha$ -galactosidase A, an enzyme, missing in those with Fabry disease.

#### PHARMACOKINETICS

Nonlinear pharmacokinetics. *Half-life:* 45-102 min, dose-dependent.

#### AVAILABILITY

*Powder for Injection:* 5 mg, 35 mg (5 mg/mL when reconstituted).

#### INDICATIONS AND DOSAGES

Fabry disease
 IV INFUSION
 Adults, Elderly. 1 mg/kg q2wk.

#### CONTRAINDICATIONS

None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Do not mix any other medications with agalsidase beta.

# SIDE EFFECTS

Expected (45%-52%)

Infusion reactions (rigors, fever, headache).

Frequent (21%-38%)

Rhinitis, nausea, anxiety, pharyngitis, edema, skeletal pain.

#### Occasional (14%-17%)

Temperature change sensation, hypotension, pallor, paresthesia, pruritus, urticaria, bronchitis. Rare (7%-10%)

Depression, arthralgia, dyspepsia, laryngitis, sinusitis.

#### SERIOUS REACTIONS

Serious infusion reactions, such as tachycardia, hypertension, throat tightness, chest pain, dyspnea, vomiting, lip edema, and rash, occur frequently.
Other serious reactions include bradycardia, arrhythmias, vertigo, nephrotic syndrome, CVA, and cardiac arrest.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with fever, compromised cardiac function, moderate to severe hypertension, and renal impairment. The product contains mannitol, so caution should be observed in patients stating a mannitol hypersensitivity.

#### Storage

Store vials in the refrigerator. Allow them to reach room temperature before reconstitution, which takes about 30 min. The reconstituted and diluted solution should be used immediately; if this is not possible, the solution may be stored in the refrigerator for 24 h.

#### Administration

Pretreatment antipyretics should be administered. Reconstitute each 37-mg vial by slowly injecting 7.2 mL of sterile water for injection. Roll and tilt gently. Do not shake or agitate. Before adding the reconstituted solution to 500 mL 0.9% NaCl, remove an equal volume from the 500-mL infusion bag, and then add the agalsidase beta to the 500-mL 0.9% NaCl infusion bag. Administer at a rate of no more than 0.25 mg/min (15 mg/h). Expect to decrease the infusion rate if an infusion reaction occurs. If no reaction occurs, the infusion rate may be increased in increments of 0.05-0.08 mg/min (3-5 mg/h). Plan to decrease the infusion rate or temporarily stop the infusion if a reaction occurs. As prescribed, give additional antipyretics, antihistamines, or steroids to alleviate symptoms. Patients with compromised cardiac function should be closely monitored because they are at increased risk for severe complications from infusion reactions.

# A

# PHARMACOKINETICS

Poorly and variably absorbed from GI tract. Widely distributed, cyst fluid, including CSF. Protein binding: 70%. Extensively metabolized in liver. Primarily excreted in bile. Not removed by hemodialysis. *Half-life*: 8-12 h (prolonged in impaired hepatic function).

# AVAILABILITY

Tablets: 200 mg (Albenza).

# INDICATIONS AND DOSAGES

# Neurocysticercosis

PO

Adults, Elderly weighing  $\geq 60$  kg. 400 mg 2 times/day. Give for 8 to 30 days.

*Adults, Elderly weighing < 60 kg.* 15 mg/kg/day, given in two divided doses (maximum 800 mg/day). Give for 8 to 30 days.

# Cystic hydatid

PO

Adults, Elderly weighing  $\geq 60 \text{ kg.}$ 400 mg 2 times/day for 28 days, rest 14 days, repeat for 2 more cycles. Adults, Elderly weighing < 60 kg. 15 mg/kg/day given in two divided doses (maximum 800 mg/day) for 28 days, rest 14 days, repeat for 2 more cycles.

# **OFF-LABEL USES**

Giardiasis, microsporidiosis, taeniasis, gnathostomiasis, liver flukes, trichuriasis.

# CONTRAINDICATIONS

Hypersensitivity to albendazole, benzimidazoles, or any component of the formulation.

# INTERACTIONS

#### Drug

**Cimetidine, dexamethasone, praziquantel:** May increase albendazole concentration. **Theophylline:** Active treatment may decrease theophylline levels, and levels may rise when albendazole discontinued.

#### Herbal

**Ginseng:** May increase intestinal elimination of albendazole. Leads to decreased intestinal effectiveness. **Food** 

**Grapefruit juice:** May increase risk of albendazole adverse effects.

# DIAGNOSTIC TEST EFFECTS

May decrease total white blood cell (WBC) count. Monitor liver function tests.

# SIDE EFFECTS

#### Frequent

Neurocysticercosis: Nausea, vomiting, headache. Hydatid: Abnormal liver function tests, abdominal pain, nausea, vomiting.

#### Occasional

Neurocysticercosis: Increased intracranial pressure, meningeal signs.

Hydatid: Headache, dizziness, alopecia, fever.

# SERIOUS REACTIONS

• Granulocytopenia or pancytopenia occurs rarely.

- In the presence of cysticercosis, drug may produce retinal damage in presence of retinal lesions.
- · Hepatoxicity is rare.

• Patients being treated for neurocysticercosis may experience seizures.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with liver impairment or biliary obstruction. Bone marrow suppression may occur. It is unknown whether albendazole is excreted in breast milk. Safety and efficacy data are limited for children, particularly children younger than 6 yr. Expect to use the smallest dose necessary to achieve optimal results. There are no age-related precautions noted in elderly patients. Fecal specimens should be obtained 3 wks after treatment. Patients being treated for neurocysticercosis should receive corticosteroid and anticonvulsant therapy, as indicated.

If fever, chills, sore throat, unusual bleeding or bruising, rash, or hives occurs, notify the physician. All patients should have monitoring of CBC and transaminases before therapy and every 2 wks during therapy. Patients should be advised to avoid becoming pregnant while on therapy and for 1 mo after completing therapy. Therapy should be initiated after a negative pregnancy test. Use in pregnancy only if no alternative therapy is appropriate.

#### Administration

Take albendazole with meals. Fatty meals are preferred. For young children, the tablets should be crushed or chewed and swallowed with a drink of water. Mixing the dose with applesauce or pudding may help ease administration.

#### **Albumin, Human**

al-byew'min ★ Albuminar, Albutein, Buminate, Plasbumin ★ Alburex Do not confuse with albuterol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Plasma expanders

#### MECHANISM OF ACTION

A plasma protein fraction that acts as a blood volume expander. *Therapeutic Effect:* Provides temporary increase in blood volume; reduces hemoconcentration and blood viscosity.

#### PHARMACOKINETICS

Distributed throughout extracellular fluid. *Half-life:* 15-20 days.

#### AVAILABILITY

Injection: 5%, 20%, 25%.

#### INDICATIONS AND DOSAGES

NOTE: In general, 5% solutions are used in hypovolemic patients: 25% solutions in those who are fluid or sodium restricted.

# Hypovolemia

IV

Adults, Elderly. Initially, 25 g; may repeat in 15-30 min. Maximum: 250 g within 48 h. *Children*. 0.5-1 g/kg/dose (10-20 mL/kg/dose of 5% albumin). Maximum: 6 g/kg/day.

# Hypoproteinemia

IV

*Adults, Elderly.* 25 g IV. May repeat in 15-30 min. Maximum: 250 g in 48 h. *Children.* 0.5-1 g/kg/dose (10-20 mL/kg/dose of 5% albumin). Repeat in 1-2 days.

#### Burns

#### IV

Adults, Elderly, Children. Initially, give large volumes of crystalloid infusion to maintain plasma volume. After 24 h, give 25 g, then adjust dosage to maintain plasma albumin concentration of 2-2.5 g/100 mL.

#### Cardiopulmonary bypass IV

Adults, Elderly. 5% or 25% albumin with crystalloid to maintain plasma albumin concentration of 2.5 g/100 mL.

#### Acute nephrosis, nephrotic syndrome IV

Adults, Elderly. 25 g of 25% injection, with diuretic once a day for 7-10 days.

#### Hemodialysis

IV Adults, Elderly. 100 mL (25 g) of 25% albumin. > Hyperbilirubinemia,

# erythroblastosis fetalis

IV Infants. 1 g/kg 1-2 h before transfusion.

#### CONTRAINDICATIONS

Heart failure, history of allergic reaction to albumin level, hypervolemia, normal serum albumin, pulmonary edema, severe anemia.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase concentration.

# IV INCOMPATIBILITIES

Intravenous lipid emulsion (Liposyn), micafungin (Mycamine), midazolam (Versed), vancomycin (Vancocin), verapamil, protein hydrolysates, amino acid solutions, alcohol-containing solutions.

# 🗏 IV COMPATIBILITIES

Diltiazem (Cardizem), lorazepam (Ativan), whole blood, plasma, 0.9% NaCl, D5W, sodium lactate.

#### SIDE EFFECTS

#### Rare

High dose in repeated therapy: altered vital signs, chills, fever, increased salivation, nausea, vomiting, urticaria, tachycardia.

# SERIOUS REACTIONS

 Fluid overload may occur, marked by increased BP and distended neck veins. Neurologic changes that may occur include headache, weakness, blurred vision, behavioral changes, incoordination, and isolated muscle twitching. Pulmonary edema may also occur, evidenced by rapid breathing, rales, wheezing, and coughing.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal impairment, hypertension, normal serum albumin level, poor heart function, and pulmonary disease. It is unknown whether albumin crosses the placenta or is distributed in breast milk. No agerelated precautions have been noted in children or in elderly patients.

Notify the physician of difficulty breathing, itching, or rash. BP for hypertension or hypotension, intake and output, and skin for flushing and urticaria should be monitored. Signs and symptoms of fluid overload, hypovolemia, and pulmonary edema should be assessed frequently. Storage

Store at room temperature. Albumin normally appears as a clear, brownish, odorless, and moderately viscous fluid. Do not use if the solution has been frozen, appears turbid, or contains sediment or if the vial has been open 4 h or longer.

#### Administration

Dosage is based on the condition; duration of administration is based on the response. Make a 5% solution from 25% solution by adding 1 part 25% solution to 4 parts 0.9% NaCl (preferred) or D5W. Do not use sterile water for injection because life-threatening acute renal failure and hemolysis can occur. Give by IV infusion. Rate varies depending on therapeutic use, blood volume, and concentration of the solute. Give 5% solution at 5-10 mL/min. Give 25% at a usual rate of 2-3 mL/min. A slower rate (1 mL/min) is recommended in patients with normal blood volume. Administer 5% solution undiluted: administer 25% solution undiluted or diluted with 0.9% NaCl (preferred) or D5W. May give without regard to patient's blood group or Rh factor type.

# Albuterol

al-byoo'ter-ole AccuNeb, Proair HFA, Proventil HFA, Ventolin HFA, VoSpire ER Airomir, Apo-Salvent, Ventodisk Do not confuse albuterol with Albutein or atenolol, or Proventil with Prinivil. Also known as salbutamol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Respiratory agents, adrenergic agonists, bronchodilators, short-acting  $\beta_2$  agonist

#### **MECHANISM OF ACTION**

A sympathomimetic that stimulates  $\beta_2$ -adrenergic receptors in the lungs, resulting in relaxation of bronchial smooth muscle. *Therapeutic Effect:* Relieves bronchospasm and reduces airway resistance.

# PHARMACOKINETICS

Route	Onset (min)	Peak (h)	Duration (h)
P0	15-30	2-3	4-6
PO (extended- release)	30	2-4	12
Inhalation	5-15	0.5-2	2-5

Rapidly, well absorbed from the GI tract; gradually absorbed from the bronchi after inhalation. Metabolized in the liver. Primarily excreted in urine. *Half-life:* 2.7-5 h (PO); 3.8 h (inhalation).

# AVAILABILITY

Syrup: 2 mg/5 mL. Tablet: 2 mg, 4 mg. Tablets (Extended-Release [VoSpire ER]): 4 mg, 8 mg. Inhalation (HFA Aerosol [Proventil, Ventolin]): 90 mcg/spray. Inhalation Solution (AccuNeb): 0.63 mg/3 mL, 1.25 mg/3 mL. Inhalation Solution: 0.021%, 0.042%, 0.083%, 0.5%.

#### INDICATIONS AND DOSAGES • Bronchospasm PO

Adults, Children older than 12 yr. 2-4 mg 3-4 times a day. Maximum: 8 mg 4 times/day. Elderly. 2 mg 3-4 times a day. Maximum: 8 mg 4 times a day. Children 6-12 vr. 2 mg 3-4 times a day. Maximum: 24 mg/day. PO (EXTENDED-RELEASE) Adults, Children older than 12 vr. 4-8 mg q12h. Children 6-12 yr. 4 mg q12h. INHALATION Adults, Elderly, Children older than 12 vr. 1-2 puffs by metered dose inhaler q4-6h as needed. Children 4-12 yr: 1-2 puffs 4 times a day. NEBULIZATION Adults, Elderly, Children older than 12 vr. 2.5 mg 3-4 times a day. Children 2-12 vr. 0.63-1.25 mg 3-4 times a day. Exercise-induced bronchospasm

INHALATION Adults, Elderly, Children 4 yr and older: 2 puffs 15-30 min before exercise.

#### **OFF-LABEL USES**

Acute treatment of hyperkalemia.

# CONTRAINDICATIONS

History of hypersensitivity to sympathomimetics, particularly albuterol or levalbuterol.

# INTERACTIONS

#### Drug

**β-blockers:** Antagonize effects of albuterol.

Albuterol (Generic Name)

**Digoxin:** May increase the risk of arrhythmias.

**Diuretics:** Hypokalemia associated with diuretic may worsen with albuterol. Monitor potassium levels.

MAOIs, tricyclic antidepressants:

May potentiate cardiovascular effects. Potential for hypertensive crisis.

#### Food

**Caffeine:** Limit use of caffeine, increased CNS stimulation.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose level. May decrease serum potassium level.

#### SIDE EFFECTS

#### Frequent

Headache (27%); nausea (15%); restlessness, nervousness, tremors (20%); dizziness (< 7%); throat dryness and irritation, pharyngitis (< 6%); BP changes, including hypertension (3%-5%); heartburn, transient wheezing (< 5%).

#### Occasional (2%-3%)

Insomnia, asthenia, altered taste. Inhalation: Cough, bronchial irritation.

#### Rare

Somnolence, diarrhea, dry mouth, flushing, diaphoresis, anorexia.

#### SERIOUS REACTIONS

 Excessive sympathomimetic stimulation may produce palpitations, extrasystole, tachycardia, chest pain, a slight increase in BP followed by a substantial decrease, chills, diaphoresis, and blanching of skin.
 Too-frequent or excessive use may

lead to decreased bronchodilating effectiveness and severe, paradoxical bronchoconstriction.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disease,

diabetes mellitus, hypertension, glaucoma, seizure disorders, and hyperthyroidism. Albuterol appears to cross the placenta; it is unknown whether albuterol is distributed in breast milk. Albuterol may inhibit uterine contractility. The safety and efficacy of this drug have not been established in children < 2 yr of age (syrup, nebulizer solution), < 4 yr of age (inhaler), or < 6 yr of age (tablets). Elderly patients may be more prone to tremors and tachycardia because of increased sensitivity to sympathomimetics. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea.

Pulse rate and quality, 12-lead ECG, respiratory rate, depth, rhythm and type, ABG, and serum potassium levels should be monitored. Storage

#### Store at room temperature. Use nebulization solution within 1 wk of opening foil pouch.

#### Administration

Do not crush or break extendedrelease tablets. Take albuterol without regard to food.

For inhalation, shake the container well before inhalation. Prime before first use or if inhaler has not been used for 2 wks. Wait 2 min before inhaling the second dose to allow for deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness. Take no more than 2 inhalations at any one time because excessive use may decrease the drug's effectiveness or produce paradoxical bronchoconstriction.

For nebulizer use, dilute 0.5 mL of 0.5% solution to a final volume of 3 mL with 0.9% NaCl to provide 2.5 mg. Administer over 5-15 min.

The nebulizer should be used with compressed air or oxygen  $(O_2)$  at a rate of 6-10 L/min. NOTE: Lower concentrations of nebulization solution require no dilution before nebulizer administration.

# Albuterol; Ipratropium

al-byoo'ter-ole; eye-pra-troep'ee-um ★ Combivent, DuoNeb, Combivent Respimat

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Bronchodilator, short-acting  $\beta$ -agonist and anticholinergic combination

# **MECHANISM OF ACTION**

Ipratropium is an anticholinergic that blocks the action of acetylcholine at parasympathetic sites in bronchial smooth muscle; combined with albuterol, a short-acting  $\beta_2$ -agonist that dilates bronchioles. *Therapeutic Effect:* Bronchodilation and inhibition of secretions; especially beneficial in COPD and refractory asthma.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	1-3 min	1-2 h	4-6 h

Usually minimal systemic absorption after inhalation with intended use.

# AVAILABILITY

Oral inhalation aerosol (Combivent): 14.7-g canister delivering 90 mcg albuterol base/18 mcg ipratropium per actuation. Nebulizer solution (DuoNeb): Each 3-ml vial contains 2.5 mg albuterol base and 0.5 mg of ipratropium. Oral inhalation spray (Combivent Respimat): Each actuation contains 100 mcg of albuterol base and 20 mcg of ipratropium.

# INDICATIONS AND DOSAGES

Bronchospasm, maintenance
treatment, associated with COPD
INHALATION AEROSOL

(COMBIVENT)

Adults, Elderly. 2 puffs 4 times per day. Patient may take additional puffs as required but maximum is 12 puffs/ day.

INHALATION (COMBIVENT RESPIMAT)

Adults, Elderly. 1 actuation 4 times per day. Patient may take 2 additional actuations if needed, but maximum is 6 sprays/day. Not yet marketed.

NEBULIZATION (DUONEB) *Adults, Elderly:* One 3-mL vial 4 times per day via nebulization (up to 2 additional doses allowed per day, if needed).

# **OFF-LABEL USES**

Acute bronchospasm or asthma, adjunctive.

# CONTRAINDICATIONS

History of hypersensitivity to sympathomimetics, particularly albuterol or levalbuterol; hypersensitivity to atropine or related drugs, hypersensitivity to soy lecithin or related food products like soybean or peanuts.

# INTERACTIONS Drug

Anticholinergic agents: May increase risk of adverse events. β-blockers: Antagonize effects of albuterol.

# Cromolyn nebulizer solution:

Avoid mixing these drugs because they form a precipitate. **Diuretics:** Hypokalemia associated with diuretic may worsen with albuterol. Monitor potassium levels. **MAOIs, tricyclic antidepressants:** May potentiate cardiovascular effects. Potential for hypertensive crisis.

# **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose level. May decrease serum potassium level.

# SIDE EFFECTS

# Frequent

Bronchitis or upper respiratory infection.

# Occasional (1%-10%)

Headache; nausea; restlessness, nervousness, tremors; dizziness; throat and mouth dryness, pharyngitis; heartburn, transient wheezing; cough; insomnia; asthenia, altered taste, palpitations, tachycardia.

# Rare

Hypotension, chest pain, urine retention, flushing, diaphoresis; hypokalemia.

# SERIOUS REACTIONS

• Worsening of angle-closure glaucoma, acute eye pain, and hypotension occur rarely.

• Chest pain, arrhythmia, palpitations, hypotension.

• Paradoxical acute bronchospasm that can be life threatening; usually reported with first use of a new canister.

• Excessive sympathomimetic stimulation may produce palpitations, extrasystole, tachycardia, chest pain, a slight increase in BP followed by a substantial decrease, chills, diaphoresis, and blanching of skin. Rare reports of serious

hypersensitivity reactions, including anaphylaxis.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disease, diabetes mellitus, glaucoma, benign prostatic hypertrophy, bladder neck obstruction, hypertension, seizure disorders, and hyperthyroidism. Albuterol appears to cross the placenta and may inhibit uterine contractility; use this combination product in pregnancy only if clearly needed. It is not known if the drugs are excreted in breast milk. The safety and efficacy of this drug have not been established in children. Elderly patients may be more prone to tremors and tachycardia because of increased sensitivity to sympathomimetics.

Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Pulse rate and quality, respiratory rate, depth, rhythm and type, ABG levels, and serum potassium levels should be monitored as required. Lips and fingernails should be examined for hypoxemia. Clinical improvement should also be evaluated.

# Storage

Store inhalers at room temperature. Do not expose canister to high temperatures or flame, as the contents are under pressure and may burst. For nebulizer solution, store at room temperature protected from light before use (keep vials in the foil pouch/carton).

# Administration

For oral inhalation and for Combivent, shake the container well before inhalation. Prime before first use or if inhaler has not been used for 24 h (3 test sprays into the air). Wait 2 min before inhaling the second dose to allow for deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness.

Take no more than 2 inhalations at any one time. Replace dust cap after use.

NOTE: Different administration instructions for Combivent Respimat spray will apply, but as of publication, this dose form was not yet marketed.

For nebulization, no mixing or dilution is needed. Use a new vial for each nebulizer treatment. Administer as directed using a jet nebulizer connected to an air compressor with an adequate air flow, equipped with a mouthpiece or suitable face mask over approximately 15 min.

#### Alcaftadine al-kaf'ta-deen

📩 🙀 Lastacaft

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antihistamines, H<sub>1</sub> blockers, ophthalmics

#### **MECHANISM OF ACTION**

An antihistamine that blocks histamine release from mast cells, reducing vascular permeability and activation of eosinophils. *Therapeutic Effect:* Relieves symptoms associated with allergic conjunctivitis, such as redness, itching, and excessive tearing.

#### PHARMACOKINETICS

Median peak plasma concentrations occur within 15 minutes, and very little drug is systemically absorbed with topical ocular use. Duration of ocular effect is 16 hours or more.

#### AVAILABILITY

Ophthalmic Solution: 0.25%.

# INDICATIONS AND DOSAGES Allergic conjunctivitis

OPHTHALMIC Adults, Elderly, Children 2 yr or older: 1 drop into each eye once a day.

#### CONTRAINDICATIONS

History of hypersensitivity.

#### INTERACTIONS

None known; separate use from other ophthalmics by several minutes.

#### SIDE EFFECTS

#### Common

Eye redness and pruritus, temporary stinging or irritation on instillation. **Occasional** 

Nasopharyngitis, headache.

#### SERIOUS REACTIONS

• Not expected. Very rarely, hypersensitivity, usually manifested as a local ocular reaction.

#### PRECAUTIONS & CONSIDERATIONS

For ophthalmic use only. Safety and efficacy have not been established in children younger than 2 yr. There are no data in pregnant or lactating women, but animal studies reveal no evidence of fetal harm. The preservative in the solution, benzalkonium chloride, may be

# Aldesleukin

al-des-lew'kin Proleukin Also known as interleukin-2 or IL-2. Do not confuse interleukin-2 with interferon 2.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antineoplastics, biologic response modifier

# **MECHANISM OF ACTION**

A biological response modifier that acts like human recombinant interleukin-2, promoting proliferation, differentiation, and recruitment of T and B cells, lymphokine-activated and natural cells, and thymocytes. *Therapeutic Effect:* Enhances cytolytic activity in lymphocytes.

# PHARMACOKINETICS

Primarily distributed into plasma, lymphocytes, lungs, liver, kidney, and spleen. Metabolized to amino acids in the cells lining the kidneys. *Half-life:* 85 min.

# AVAILABILITY

*Powder for Injection:* 22 million units (1.3 mg).

# **INDICATIONS AND DOSAGES**

# Metastatic melanoma, metastatic renal cell carcinoma IV

*Adults.* 600,000 units/kg q8h for 14 doses; followed by 9 days of rest, then another 14 doses for a total of 28 doses per course. Course may be repeated after rest period of at least 7 wks from date of hospital discharge.

# **OFF-LABEL USES**

Treatment of colorectal cancer, Kaposi sarcoma, non-Hodgkin lymphoma.

# CONTRAINDICATIONS

Abnormal pulmonary function or thallium stress test results, organ allografts, retreatment in those who experience any of the following toxicities: bowel ischemia or perforation, coma, or toxic psychosis lasting longer than 48 h, GI bleeding requiring surgery, intubation lasting more than 72 h, pericardial tamponade, renal dysfunction requiring dialysis for longer than 72 h, repetitive or difficult-to-control seizures; angina, MI, recurrent chest pain with ECG changes, sustained ventricular tachycardia, uncontrolled or unresponsive cardiac rhythm disturbances.

# INTERACTIONS

#### Drug

Antihypertensives: May increase hypotensive effect.

Cardiotoxic, hepatotoxic,

myelotoxic, or nephrotoxic

medications: May increase the risk of toxicity.

**Glucocorticoids:** May decrease the effects of aldesleukin.

**Interferon-α:** May increase the risk of myocardial injury, including myocardial infarction, myocarditis, ventricular hypokinesia, and severe rhabdomyolysis.

Iodinated contrast media:

Administration subsequent to aldesleukin associated with acute, atypical adverse reactions within hours of contrast media.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May decrease serum calcium, magnesium, phosphorus, potassium, and sodium levels.

# IV INCOMPATIBILITIES

5-fluorouracil (5-FU), ganciclovir (Cytovene), lorazepam (Ativan), pentamidine (Pentam), prochlorperazine (Compazine), promethazine (Phenergan), rituximab (Rituxan), trastuzumab (Herceptin).

# IV COMPATIBILITIES

Amikacin, calcium gluconate, fluconazole (Diflucan), gentamicin, magnesium sulfate, metoclopramide, morphine, ondansetron (Zofran), ranitidine (Zantac), tobramycin, vancomycin.

#### SIDE EFFECTS/ADVERSE REACTIONS

Side effects are generally selflimiting and reversible within 2-3 days after discontinuing therapy.

# Frequent (48%-89%)

Fever, chills, nausea, vomiting, hypotension, diarrhea, oliguria or anuria, mental status changes, irritability, confusion, depression, sinus tachycardia, pain (abdominal, chest, back), fatigue, dyspnea, pruritus.

#### **Occasional (17%-47%)**

Edema, erythema, rash, stomatitis, anorexia, weight gain, infection (urinary tract infection, injection site, catheter tip), dizziness. Rare (4%-15%)

#### Dry skin, sensory disorders (vision, speech, taste), dermatitis, headache, arthralgia, myalgia, weight loss, hematuria, conjunctivitis, proteinuria.

# SERIOUS REACTIONS

· Anemia, thrombocytopenia, and leukopenia occur commonly.

· GI bleeding and pulmonary edema occur occasionally.

· Capillary leak syndrome results in hypotension (systolic pressure < 90 mm Hg or a 20-mm Hg drop from baseline systolic pressure), extravasation of plasma proteins and fluid into extravascular space, and loss of vascular tone. It may result in cardiac arrhythmias, angina, MI, and respiratory insufficiency.

· Other rare reactions include fatal malignant hyperthermia, cardiac arrest, CVA, pulmonary emboli, bowel perforation, gangrene, and severe depression leading to suicide.

# **PRECAUTIONS & CONSIDERATIONS**

Restrict aldesleukin therapy to patients with normal cardiac and pulmonary function as determined by thallium stress testing and pulmonary function testing. Extreme caution should be used in patients with a history of cardiac or pulmonary disease even if they have normal thallium stress and pulmonary function test results. Also use the drug cautiously with fixed requirements for large volumes of fluid (such as those with hypercalcemia) or a history of seizures. Aldesleukin use should be avoided in patients of either sex who do not practice effective contraception. The safety and efficacy of aldesleukin have not been established in children. Elderly patients may require cautious use of the drug because of age-related renal impairment. They are also less able to tolerate drug-related toxicities.

Notify the physician of difficulty urinating, black tarry stools, pinpoint red spots on skin, bruising, fever,

signs of local infection, sore throat, or unusual bleeding from any site. Treat persons with bacterial infection and those with indwelling central lines with antibiotic therapy before beginning aldesleukin therapy. A negative CT scan for CNS metastasis must be obtained before beginning therapy. Immediately report any symptoms of depression or suicidal ideation. CBC, electrolytes, liver and renal function, amylase concentration, BP, mental status, intake and output, extravascular fluid accumulation, platelet count, pulse oximetry values, and weight should be assessed. Notify physician of somnolence or lethargy, as drug may need to be withheld.

Consider the use of medications to reduce aldesleukin side effects: NSAIDs/antipyretics starting before first dose to reduce fever, meperidine to control rigors associated with fever, H<sub>2</sub> antagonists/ PPIs to reduce gastrointestinal (GI) bleeding/irritation, antiemetics and antidiarrheals, hydroxyzine or diphenhydramine for pruritic rashes, and antibiotic prophylaxis.

#### Storage

Refrigerate—do not freeze unopened vials. The reconstituted solution is stable for 48 h at room temperature or refrigerated (refrigerated is preferred).

#### Administration

! Withhold the drug in patients who exhibit moderate to severe lethargy or somnolence because

continued administration may result in coma. Protocols are available from the manufacturer to hold doses for multiple types of organ dysfunction, including oliguria, hepatic dysfunction, respiratory or cardiac compromise, CNS changes, GI irritation or bleeding, or skin rashes. The protocols also indicate when treatment courses may be continued. Aldesleukin should be administered only in a hospital setting with availability of an intensive care facility and specialists skilled in cardiopulmonary or intensive care medicine.

For IV use, reconstitute the 22-million-unit vial with 1.2 mL sterile water for injection to provide a concentration of 18 million units/ mL. Do not use bacteriostatic water for injection or 0.9% NaCl. During reconstitution, direct the diluent at the side of the vial. Swirl the content gently; do not shake to avoid foaming. Further dilute the dose in 50 mL D5W and infuse over 15 min. Do not use an in-line filter. Warm the solution to room temperature before infusion. Closely monitor the patient for a drop in mean arterial BP, a sign of capillary leak syndrome. Continued treatment may result in edema, pleural effusion, mental status changes, and significant hypotension (systolic pressure < 90 mm Hg or a 20 mm Hg drop from baseline systolic pressure).

absorbed by soft contact lenses; remove before use.

#### Storage

Store at room temperature.

# Administration

Wash hands before use. Be careful not to touch dropper tip to any surface, including eyelids, to avoid contamination. Remove contact lenses before use (they may be reinserted after 10 min). Tilt head back and instill the solution in the conjunctival sac of the affected eye. Close the eye; then press gently on the lacrimal sac for 1 min.

# Alclometasone

al-kloe-met'a-sone ★ Aclovate **Do not confuse with Accolate.** 

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Corticosteroids, topical, dermatologics

# **MECHANISM OF ACTION**

Topical corticosteroids exhibit anti-inflammatory, antipruritic, and vasoconstrictive properties. Clinically, these actions correspond to decreased edema, erythema, pruritus, plaque formation, and scaling of the affected skin. Low- to medium-potency topical corticosteroid.

#### PHARMACOKINETICS

Approximately 3% is absorbed during an 8-h period. Metabolized in the liver. Excreted in the urine.

# AVAILABILITY

*Cream, as Dipropionate:* 0.05% (Aclovate).

*Ointment, as Diproprionate:* 0.05% (Aclovate).

#### INDICATIONS AND DOSAGES

Corticosteroid-responsive dermatoses: atopic dermatitis, contact dermatitis, dermatitis, discoid lupus erythematosus, eczema, exfoliative dermatitis, granuloma annulare, lichen planus, lichen simplex, polymorphous light eruption, pruritus, psoriasis, Rhus dermatitis, seborrheic dermatitis, xerosis TOPICAL

Adults, Elderly, Children 1 yr and older. Apply a thin film to the affected area 2-3 times a day.

# CONTRAINDICATIONS

Hypersensitivity to alclometasone, other corticosteroids, or any of its components.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Frequent

The most common side effect is transient mild skin irritation consisting of mild burning, pruritus, or erythema. Others include, maculopapular rash, xerosis.

#### Occasional

Acneiform rash, contact dermatitis, folliculitis, glycosuria, growth inhibition, headache, hyperglycemia, infection, miliaria, papilledema, skin atrophy, skin hypopigmentation, skin ulcer, striae, telangiectasia.

#### Rare

Adrenocortical insufficiency, increased intracranial pressure, pseudotumor cerebri, impaired wound healing, Cushing syndrome, HPA suppression, skin ulcers, tolerance, withdrawal, visual impairment, ocular hypertension, cataracts.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with pregnancy. It is unknown whether alclometasone is distributed in breast milk. Alclometasone should not be used for diaper dermatitis. Children are more susceptible to HPA axis suppression than adults. There are no age-related precautions noted for elderly patients. Avoid use on herpetic lesions; avoid use as monotherapy on sites with bacterial or fungal infections.

#### Storage

Store at room temperature. Administration

Do not use occlusive dressings unless directed by physician. Apply a thin film topically to affected area 2-3 times daily. Massage gently until medication disappears.

# Alefacept

ale'fah-cept

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

#### Classification:

Immunosuppressives, biologic response modifiers, fusion proteins

# **MECHANISM OF ACTION**

An immunologic agent that interferes with the activation of T lymphocytes by binding to the lymphocyte antigen, thus reducing the number of circulating T lymphocytes. *Therapeutic Effect:* Prevents T cells from becoming overactive, which may help reduce symptoms of chronic plaque psoriasis.

#### PHARMACOKINETICS

Bioavailability 63% with IM administration. *Half-life:* 270 h.

# AVAILABILITY

*Powder for Injection:* 15 mg. Alefacept is distributed to physicians' offices and specialty pharmacies, with administration intended in the physician's office.

# INDICATIONS AND DOSAGES Plaque psoriasis

IM

*Adults, Elderly.* 15 mg once weekly for 12 wks. Retreatment for one additional cycle acceptable after 12 wks of rest.

# CONTRAINDICATIONS

HIV infection, history of systemic malignancy, concurrent use of immunosuppressive agents or phototherapy, active serious infection or sepsis.

Hypersensitivity to drug or hamster proteins.

# INTERACTIONS

#### Drug

**Immunosuppressives:** Caution due to additive immunosuppression and infection risk.

Live-virus vaccines: Avoid concurrent use.

# DIAGNOSTIC TEST EFFECTS

Decreases serum T-lymphocyte levels. Monitor CD4+ T-lymphocyte counts before and weekly during the 12-wk treatment period. Withhold the dose if the CD4+ count is < 250 cells/ $\mu$ L. Discontinue treatment if the count remains below 250 cells/ $\mu$ L for 1 mo. May increase serum AST (SGOT) and ALT (SGPT) levels.

# A

# Alemtuzumab

al-em-two'zoo-mab 📩 Campath 🙅 MabCampath

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antineoplastics, monoclonal antibodies

# MECHANISM OF ACTION

Binds to CD52, a cell surface glycoprotein, found on the surface of all B and T lymphocytes, most monocytes, macrophages, natural killer cells, and granulocytes. *Therapeutic Effect:* Produces cytotoxicity, reducing tumor size.

# PHARMACOKINETICS

*Half-life:* 11 h after the first dose and 6 days after the last dose. Peak and trough levels rise during first few weeks of therapy and approach steady state by about wk 6.

# AVAILABILITY

Solution for Injection: 30 mg/3 mL.

# INDICATIONS AND DOSAGES

#### B-cell chronic lymphocytic leukemia in patients who have been treated with alkylating agents and failed fludarabine therapy

# IV INFUSION

Adults, Elderly. Initially, 3 mg/day as a 2-h infusion. When the 3-mg daily dose is tolerated (with only low-grade or no infusionrelated toxicities), increase daily dose to 10 mg. When the 10 mg/ day dose is tolerated, maintenance dose may be initiated. Ability to go to maintenance dose usually achieved in 3-7 days. *Maintenance:* 30 mg given 3 times/ wk on alternate days (such as Monday, Wednesday, and Friday or Tuesday, Thursday, and Saturday) for up to 12 wks.

# CONTRAINDICATIONS

Active systemic infections, history of hypersensitivity or anaphylactic reaction to the drug, or to hamster proteins.

# INTERACTIONS

# Drug

Live-virus vaccines: May potentiate viral replication, increase side effects, and decrease the patient's antibody response to the vaccine.

# Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin level, platelet count, and WBC count.

# IV INCOMPATIBILITIES

Do not mix alemtuzumab with any other medications.

# SIDE EFFECTS

#### Frequent

Rigors (86%-89%), tremors (86%), fever (85%), nausea (54%), vomiting (41%), rash (40%), fatigue (34%), hypotension (32%), urticaria (30%), pruritus (14%-24%), skeletal pain, headache (24%), diarrhea (22%), anorexia (20%).

# Occasional (<10%)

Myalgia, dizziness, abdominal pain, throat irritation, vomiting, neutropenia, rhinitis, bronchospasm, urticaria.

# SERIOUS REACTIONS

• Neutropenia occurs in 85% of patients, anemia occurs in 80% of

patients, and thrombocytopenia occurs in 72% of patients.

• Serious infection risk due to bone marrow suppression.

 Serious infusion-related reactions may occur.

· A rash occurs in 40% of patients.

 Respiratory toxicity, manifested as dyspnea, cough, bronchitis, pneumonitis, and pneumonia, occurs in 16%-26% of patients.

#### **PRECAUTIONS & CONSIDERATIONS**

Alemtuzumab has the potential to cause depletion of B- and T-lymphocytes in the fetus. Effective contraception is recommended during and for 6 mo after treatment for women of childbearing potential and men of reproductive potential. Discontinue breastfeeding during treatment and for at least 3 mo after the last dose. The safety and efficacy of alemtuzumab have not been established in children. No age-related precautions have been noted in the elderly. Vaccinations and contact with anyone who has recently received a live-virus vaccine should be avoided. Crowds and those with known infection should also be avoided.

Infusion-related reactions, including chills, fever, hypotension, and rigors, which usually occur 30 min to 2 h after starting the first infusion, should be monitored; these reactions may be resolved by slowing the drip rate. Signs and symptoms for hematologic toxicity, including excessive fatigue or weakness, ecchymosis, fever, signs of local infection, sore throat, or unusual bleeding from any site, should be assessed. CBC should be monitored frequently during and after therapy to assess for anemia, neutropenia, and thrombocytopenia. Prophylactic therapy against PCP pneumonia and herpes viral infections is recommended upon initiation of therapy and for at least 2 mo following the last dose or until CD4+ counts are ≥ 200 cells/µL (whichever is later). **Storage** 

Refrigerate ampules before dilution. Do not freeze. Use the solution within 8 h after dilution. The diluted solution may be stored at room temperature or refrigerated. Discard the solution if it becomes discolored or contains particulate matter.

#### Administration

CAUTION: Although data are not specifically available for alemtuzumab, observe usual procedures for preparation, administeration, and disposal of cytotoxic drugs.

! Expect to pretreat with 650 mg of acetaminophen and 50 mg of diphenhydramine before each infusion to prevent infusion-related side effects.

Withdraw the needed amount from the vial into a syringe. Inject it into 100-mL 0.9% NaCl or D5W. Gently invert the bag to mix the contents; do not shake it. Give the 100-mL solution as a 2-h IV infusion. Do not give alemtuzumab by IV push or bolus.

# IV INCOMPATIBILITIES

Do not mix alefacept with any other medications. Do not reconstitute it with any diluent other than that supplied by the manufacturer.

# SIDE EFFECTS

#### Frequent

Injection site pain and inflammation. Occasional (3%-10%) Chills, lymphopenia. Rare (2% or less) Pharyngitis, dizziness, cough, nausea, myalgia.

# SERIOUS REACTIONS

 Rare reactions include hypersensitivity reactions, infusion reactions, liver injury, lymphopenia, malignancies, and serious infections requiring hospitalization (such as abscess, pneumonia, and postoperative wound infection).
 Coronary artery problems or disorder and MI occur in fewer than 1% of patients.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with chronic infections, history of recurrent infections, high risk for malignancy, and in elderly patients. It is unknown whether alefacept crosses the placenta or is distributed in breast milk. The safety and efficacy of this drug have not been established in children. Cautious use is necessary in elderly patients because they are at increased risk for infections and certain malignancies. Avoid contact with infected individuals and situations that might increase the risk for infection.

Notify the physician of any signs of infection or malignancy. **Storage** 

Store unopened vials in the refrigerator protected from light. Do

not freeze. Use the drug immediately after reconstitution or within 4 h if refrigerated. Discard unused portion within 4 h of reconstitution.

# Administration

For IM administration, withdraw 0.6 mL of the supplied diluent and, with the needle pointed at the sidewall of the vial, slowly inject the diluent into the vial of alefacept. Swirl the vial gently to dissolve the contents; do not shake or vigorously agitate the vial to avoid excessive foaming. The reconstituted solution should be clear and colorless to slightly yellow. Do not use if it becomes discolored or cloudy or contains undissolved material.

For IM use, final concentration is 15 mg/0.5 mL. Inject the full 0.5 mL of solution. Use a different IM site for each new IM injection at least 1 inch from an old site, avoiding tender, bruised, red, or hard areas.

# Alendronate

ah-len'dro-nate ★ ● Fosamax Do not confuse Fosamax with Flomax.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Bisphosphonates

# **MECHANISM OF ACTION**

A bisphosphonate that inhibits normal and abnormal bone resorption, without retarding mineralization. *Therapeutic Effect:* Leads to significantly increased bone mineral density; reverses the progression of osteoporosis.

# PHARMACOKINETICS

Poorly absorbed after oral administration; oral bioavailability

Alendronate (Generic Name), Fosamax (Brand Name)

#### 44 Alendronate

< 1%. Protein binding: 78%. After oral administration, rapidly taken into bone, with uptake greatest at sites of active bone turnover. Excreted in urine. *Terminal halflife:* > 10 yr (reflects release from skeleton as bone is resorbed).

# AVAILABILITY

*Tablets:* 5 mg, 10 mg, 35 mg, 40 mg, 70 mg. *Oral Solution:* 70 mg/75 mL.

#### INDICATIONS AND DOSAGES

Osteoporosis (in men)

PO Adults, Elderly. 10 mg once a day in the morning, or 70 mg once weekly.

#### Glucocorticoid-induced osteoporosis

PO Adults, Elderly. 5 mg once a day in the morning.

Postmenopausal women not

*receiving estrogen.* 10 mg once a day in the morning.

# Postmenopausal osteoporosis

PO (TREATMENT)

*Adults, Elderly.* 10 mg once a day in the morning or 70 mg once weekly. PO (PREVENTION)

Adults, Elderly. 5 mg once a day in the morning or 35 mg once weekly.

# Paget disease

PO

*Adults, Elderly.* 40 mg once a day in the morning for 6 mo; then wait 6 mo before considering retreatment.

#### CONTRAINDICATIONS

Abnormalities of the esophagus that delay esophageal emptying, such as stricture or achalasia; hypocalcemia; inability to stand or sit upright for at least 30 min; renal impairment (CrCl < 35 mL/min); sensitivity to alendronate or phosphonates; patients with aspiration risk.

# INTERACTIONS

#### Drug

Antacids, calcium supplements, multivitamins, mineral supplements, iron salts: Reduce absorption of alendronate; separate times of administeration by giving at least 30 min after alendronate. Aspirin: May increase GI disturbances. IV ranitidine: May double the bioavailability of alendronate. Proton-pump inhibitors (PPls): May reduce efficacy of alendronate. Herbal None known. Food Beverages other than plain water, dietary supplements, food:

May interfere with absorption of alendronate.

# DIAGNOSTIC TEST EFFECTS

Reduces serum calcium and serum phosphate concentrations. Significantly decreases serum alkaline phosphatase level in patients with Paget disease.

# SIDE EFFECTS

Frequent (7%-8%)

Back pain, abdominal pain. Occasional (2%-3%) Nausea, abdominal distention, constipation, diarrhea, flatulence. Rare (< 2%) Rash.

#### SERIOUS REACTIONS

• Overdose causes hypocalcemia, hypophosphatemia, and significant GI disturbances.

 Esophageal irritation occurs if alendronate is not given with 6-8 oz of plain water or if the patient lies down within 30 min of drug administration.

 Severe and occasionally debilitating bone, joint, or muscle pain. Rare reports of atypical femur fractures. Osteonecrosis of the jaw.

• More data needed; possible increased risk of esophageal cancer.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypocalcemia or vitamin D deficiency and in patients with GI disease, including dysphagia, frequent heartburn, GI reflux disease, hiatal hernia, and ulcers. Alendronate may cause decreased maternal weight gain and incomplete fetal ossification and delay delivery. It is unknown whether alendronate is excreted in breast milk. Do not give to women who are breastfeeding. Safety and efficacy of alendronate have not been established in children. No age-related precautions have been noted for elderly patients.

Consider beginning weight-bearing exercises and modifying behavioral factors, such as reducing alcohol consumption and stopping cigarette smoking. Plan to correct hypocalcemia and vitamin D deficiency, if present, before starting alendronate therapy. Patients should be taking adequate calcium and vitamin D supplementation during treatment. Serum electrolytes, including serum alkaline phosphatase and serum calcium levels, should be monitored. Administration

! Give at least 30 min before the first food, beverage, or medication of the day.

Expected benefits occur only when alendronate is taken with a full glass (6-8 oz) of plain water first thing in the morning and at least 30 min before the first food, beverage, or medication of the day. Taking alendronate with beverages other than plain water, including mineral water, orange juice, and coffee, significantly reduces absorption of the medication. I Do not lie down for at least 30 min after taking the medication. Remaining upright helps the drug move quickly to the stomach and reduces the risk of esophageal irritation.

# Alfuzosin

al-few-zoe'sin ★ Uroxatral 🍨 Xatral

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B; however, this drug is not indicated for use in women.

**Classification:** Antiadrenergics, α-blocking, peripheral

# **MECHANISM OF ACTION**

An  $\alpha$ -1 antagonist that targets receptors around bladder neck and prostate capsule. *Therapeutic Effect:* Relaxes smooth muscle and improves urinary flow and symptoms of prostatic hyperplasia.

# PHARMACOKINETICS

Bioavailability 49% following meal; reduced 50% in fasting state. Peak levels reached in 8 h. Protein binding: 90%. Extensively metabolized in the liver. Primarily excreted in urine. *Half-life:* 3-9 h.

# AVAILABILITY

Tablets (Extended-Release): 10 mg.

#### INDICATIONS AND DOSAGES • Benign prostatic hyperplasia PO

Adult men. 10 mg once a day, approximately 30 min after same meal each day.

# CONTRAINDICATIONS

History of hypersensitivity to alfuzosin; moderate to severe hepatic insufficiency (Child Pugh Class B and C); potent CYP3A4 inhibitors (itraconazole, ketoconazole, ritonavir).

Alfuzosin (Generic Name), Uroxatral (Brand Name)
### INTERACTIONS

#### Drug

Antihypertensive agents, nitrates: Increased potential for hypotension. Cimetidine: May increase alfuzosin

blood concentration.

**CYP3A4 inducers:** May reduce alfuzosin levels, decrease effect.

**CYP3A4 inhibitors:** May increase alfuzosin levels and increase side effects; potent inhibitors (e.g., itraconazole, ketoconazole, ritonavir) are contraindicated.

#### Other α-blockers, such as doxazosin, prazosin, tamsulosin, and terazosin: May increase the

 $\alpha$ -blockade effects of both drugs. Herbal

None known.

#### Food

Food increases extent of absorption.

### **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

### Frequent (6%-7%)

Dizziness, headache, malaise. Occasional (4%) Dry mouth.

#### Rare (2%-3%)

Nausea, dyspepsia (such as heartburn and epigastric discomfort), diarrhea, orthostatic hypotension, tachycardia, drowsiness.

### SERIOUS REACTIONS

 Ischemia-related chest pain or QT prolongation may occur rarely.
 α-blockers associated with Intraoperative Floppy Iris Syndrome during cataract surgery.

- · Priapism (very rare).
- Toxic skin eruptions (very rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with coronary artery disease,

hepatic impairment, known history of QT-interval prolongation, orthostatic hypotension, severe renal impairment, or under general anesthesia. Alfuzosin is not indicated for use in women and children. No age-related precautions have been noted for elderly patients.

Dizziness and light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established. Notify the physician if headache occurs.

#### Administration

Take after the same meal each day. The extended-release tablet should not be crushed or chewed.

### Aliskiren

a-lis-kye'ren ★ Tekturna 🖤 Rasilez

### **CATEGORY AND SCHEDULE**

Pregnacy Risk Category: C (first trimester) and D (second and third trimesters)

*Classification:* Antihypertensive, renin inhibitor

### **MECHANISM OF ACTION**

A direct renin inhibitor that decreases plasma renin activity and inhibits the conversion of angiotensinogen to angiotensin I. *Therapeutic Effect:* Reduced blood pressure.

### PHARMACOKINETICS

Poorly absorbed; oral bioavailability 2.5%; high-fat meal reduced extent of absorption 71%. Metabolized by CYP3A4. *Half-life:* 24 h.

#### AVAILABILITY

Tablets: 150 mg, 300 mg.

Aliskiren (Generic Name), Tekturna (Brand Name)

# INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults.* 150 mg once daily, may increase to 300 mg once daily after 2 wks.

### CONTRAINDICATIONS

Previous hypersensitivity or angioedema from the drug. Do NOT use aliskiren with ARBs or ACEIs in patients with diabetes.

### INTERACTIONS

#### Drug

**Cyclosporine:** May increase aliskiren concentrations; concomitant use not recommended.

Itraconazole: May increase aliskiren: concentrations; concomitant use not recommended.

ACE inhibitors or angiotensin receptor blockers: Additive effects on renin–angiotensin–aldosterone may increase risk or renal effects, hyperkalemia or other problems; use cautiously.

**Furosemide:** May reduce furosemide concentrations, reducing furosemide activity.

Potassium-sparing diuretics, potassium supplements, salt substitutes containing potassium, or other drugs that increase potassium: Caution is advised. Herbal

None known.

#### Food

High-fat meal reduces the extent of absorption; aliskiren should be administered consistently with regard to meals.

### DIAGNOSTIC TEST EFFECTS

May increase serum creatinine and BUN, serum potassium, serum uric acid, and creatine kinase; may reduce hemoglobin and hematocrit.

### SIDE EFFECTS

Occasional (> 2%) Diarrhea.

Rare (< 2%)

Abdominal pain, angioedema, cough, dyspepsia, edema, GI reflux, gout, hypotension, hyperkalemia, rash, renal stones.

### SERIOUS REACTIONS

· Angioedema, seizures.

### **PRECAUTIONS & CONSIDERATIONS**

Use in pregnancy can cause injury and death to the developing fetus. Discontinue as soon as possible if pregnancy occurs. Safety and effectiveness have not been established in pediatric patients. No age-related precautions noted in elderly patients. Use with caution in patients with severe renal impairment; not recommended for patients with type 2 diabetes and concomitant renal impairment due to higher risk for adverse outcomes.

#### Storage

Store at room temperature; protect from moisture.

#### Administration

Administer consistently with regard to meals. Antihypertensive effect at a given dose generally observed by 2 wks. May be taken with other antihypertensives.

### Alitretinoin

ah-lee-tret′ih-noyn ★ Panretin ◆ Panretin, Toctino

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

Classification: Topical retinoid

### **MECHANISM OF ACTION**

Binds to and activates all known retinoid receptors. Once activated, receptors act as transcription factors, regulating genes that control cellular differentiation and proliferation. *Therapeutic Effect*: Inhibits growth of Kaposi sarcoma (KS) cells.

#### PHARMACOKINETICS

Minimally absorbed following topical administration; plasma concentrations not detectable.

### AVAILABILITY

Gel: 0.1%.

#### INDICATIONS AND DOSAGES • Kaposi sarcoma skin lesions

TOPICAL

*Adults*. Initially, apply twice a day to lesions. May increase to 3 or 4 times a day.

### **OFF-LABEL USES**

Cutaneous T-cell lymphomas.

#### CONTRAINDICATIONS

Hypersensitivity to retinoids or alitretinoin ingredients; when systemic therapy is required (more than 10 new KS lesions in the previous month, symptomatic pulmonary KS, symptomatic visceral involvement, symptomatic lymphedema).

#### INTERACTIONS

#### Drug

**DEET insect repellant:** Alitretinoin increases DEET systemic absorption; do not use DEET products.

#### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent (3%-77%)

Rash (erythema, scaling, irritation, redness, dermatitis), itching,

exfoliative dermatitis (flaking, peeling, desquamation, exfoliation), stinging, tingling, edema, skin disorders (scabbing, crusting, drainage).

#### SERIOUS REACTIONS

• Severe local skin reaction (intense erythema, edema, vesiculation) may limit treatment.

### PRECAUTIONS & CONSIDERATIONS

Avoid pregnancy, and discontinue breastfeeding when used. Safety and efficacy are unknown for children and patients older than 65 yr. Do not use products containing DEET. May cause photosensitivity; minimize exposure of treated areas to sunlight and sunlamps.

#### Storage

Store at room temperature. Administration

Apply sufficient gel to cover the lesion with a generous coating. Allow gel to dry for 3-5 min before covering with clothing. Do not cover with occlusive dressings. Avoid bathing, showering, and swimming for 3 h after application. Because unaffected skin may become irritated, avoid application of the gel to healthy skin surrounding the lesions. In addition, do not apply the gel on or near mucosal surfaces of the body. If application site toxicity occurs, the application frequency can be reduced. If severe irritation occurs, application of drug can be discontinued for a few days until the symptoms subside.

A response of KS lesions may be seen as soon as 2 wks after initiation of therapy, but most patients require longer application. With continued application, further benefit may be attained. Some patients have required more than 14 wks to respond. Continue alitretinoin gel as long as the patient is benefiting.

### A

### Allopurinol

al-oh-pure'ih-nole ★ Aloprim, Zyloprim ◆ Alloprin Do not confuse Zyloprim with ZORprin.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antigout agents, purine analogs, antihyperuricemic

### **MECHANISM OF ACTION**

A xanthine oxidase inhibitor that decreases uric acid production by inhibiting xanthine oxidase, an enzyme. *Therapeutic Effect:* Reduces uric acid concentrations in both serum and urine.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO/IV	2-3 days	1-3 wks	1-2 wks

Well absorbed from the GI tract. Widely distributed. Metabolized in the liver to active metabolite. Excreted primarily in urine. Removed by hemodialysis. *Half-life:* 1-3 h; metabolite, 12-30 h.

### AVAILABILITY

Tablets (Zyloprim): 100 mg, 300 mg. Powder for Injection (Aloprim): 500 mg.

### INDICATIONS AND DOSAGES

#### For primary or secondary gout (tophi, arthritis, uric acid, lithiasis, etc.)

PO

Adults, Children older than 10 yr. Initially, 100 mg/day; may increase by 100 mg/day at weekly intervals. Maximum: 800 mg/day. Maintenance: 100-200 mg 2-3 times a day or 300 mg/day.

### To prevent uric acid nephropathy during chemotherapy

*Adults.* Initially, 600-800 mg/day, given in divided doses, starting 2-3 days before initiation of chemotherapy or radiation therapy. *Children 6-10 yr.* 100 mg 3 times a day or 300 mg once a day. Reassess at 48 h.

*Children* < 6 yr. 50 mg 3 times a day. IV

*Adults.* 200-400 mg/m<sup>2</sup>/day beginning 24-48 h before initiation of chemotherapy.

*Children*. 200 mg/m<sup>2</sup>/day. Maximum: 600 mg/day.

Recurrent calcium oxalate calculi PO

*Adults.* 200-300 mg/day. *Elderly.* Initially, 100 mg/day, gradually increased until optimal uric acid level is reached.

#### Dosage in renal impairment (adults)

Dosage is modified based on creatinine clearance.

Creatinine Clearance (mL/ min)	Dosage Adjustment
10-20	200 mg/day
3-9	100 mg/day
< 3	100 mg at extended
	intervals

### CONTRAINDICATIONS

Asymptomatic hyperuricemia, history of severe hypersensitivity reactions to allopurinol.

### INTERACTIONS

#### Drug

ACE inhibitors: May increase risk of hypersensitivity reactions. Amoxicillin, ampicillin: May increase incidence of rash.

Allopurinol (Generic Name)

Azathioprine, mercaptopurine: May increase therapeutic effect and toxicity of azathioprine and mercaptopurine.

**Cyclophosphamide:** May increase cyclophosphamide myelosuppressive effect, increasing risk of bleeding and infection.

Warfarin: May increase anticoagulant effect of coumarins. Thiazide diuretics: May decrease renal elimination of allopurinol. Monitor need for dose adjustment.

Herbal

None known.

Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase BUN, serum creatinine, serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

### IV INCOMPATIBILITIES

Amikacin (Amikin), amphotericin B, carmustine (BiCNU), cefotaxime (Claforan), chlorpromazine (Thorazine), cimetidine (Tagamet), clindamycin (Cleocin), cytarabine (Ara-C), dacarbazine (DTIC), daunorubicin, diphenhydramine (Benadryl), doxorubicin (Adriamycin), doxycycline (Vibramycin), droperidol (Inapsine), floxuridine, fludarabine (Fludara), gentamicin (Garamycin), haloperidol (Haldol), hydroxyzine (Vistaril), idarubicin (Idamycin), imipenem-cilastatin (Primaxin), mechlorethamine, meperidine (Demerol), methylprednisolone (Solu-Medrol), metoclopramide (Reglan), minocycline, nalbuphine, netilmicin, ondansetron (Zofran), prochlorperazine (Compazine), promethazine (Phenergan), sodium bicarbonate, streptozocin (Zanosar), tobramycin (Nebcin), vinorelbine (Navelbine).

### **IV COMPATIBILITIES**

Bumetanide (Bumex), calcium gluconate, furosemide (Lasix), heparin, hydromorphone (Dilaudid), lorazepam (Ativan), morphine, potassium chloride.

#### SIDE EFFECTS

#### Occasional

Oral: Somnolence, unusual hair loss. IV: Rash, nausea, vomiting.

### Rare

Diarrhea, headache.

### SERIOUS REACTIONS

! Pruritic maculopapular rash possibly accompanied by malaise, fever, chills, joint pain, nausea, and vomiting should be considered a toxic reaction.

• Severe hypersensitivity may follow appearance of rash.

• Bone marrow depression, hepatic toxicity, peripheral neuritis, and acute renal failure occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with CHF, diabetes mellitus, hypertension, and impaired renal or hepatic function. It is unknown whether allopurinol crosses the placenta. Allopurinol is excreted in breast milk; use only when clearly needed in nursing women. No age-related precautions have been noted in children or in elderly patients. The drug should be discontinued if rash or other evidence of allergic reaction appears. Avoid tasks that require mental alertness or motor skills until response to the drug has been established.

High fluid intake (3000 mL/day) should be encouraged; intake and output should be monitored; output should be at least 2000 mL/day. Urine for cloudiness and unusual color and odor, CBC, liver function tests, and serum uric acid levels should also be assessed. Signs and symptoms of a therapeutic response, including improved joint range of motion and reduced redness, swelling, and tenderness, should be evaluated.

### Storage

Store unreconstituted vials at room temperature. Store reconstituted infusion at room temperature; give within 10 h. Do not refrigerate. Do not use if precipitate forms or solution is discolored.

#### Administration

May take with or immediately after meals or milk. Drink enough fluid daily to maintain a urine output of 2 L/day, if possible. Administer dosages > 300 mg/day in divided doses. It may take 1 wk or longer for the full therapeutic effect of the drug to be evident.

For IV use, reconstitute 500-mg vial with 25 mL sterile water for injection, which produces a clear, almost colorless solution (concentration of 20 mg/mL). Further dilute with 0.9% NaCl or D5W as desired, with a final maximum concentration of 6 mg/mL. Infuse over 30-60 min.

### Almotriptan

al-moe-trip'tan Axert Axert Do not confuse Axert with Antivert.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Selective serotonin receptor agonists, antimigraine agents

#### MECHANISM OF ACTION

A serotonin receptor agonist that binds selectively to vascular receptors, producing a vasoconstrictive effect on cranial blood vessels. Therapeutic Effect: Produces relief of migraine headache.

### PHARMACOKINETICS

Well absorbed after PO administration; bioavailability 70%. Metabolized by MAO type A and CYP3A4 and 2D6, excreted in urine (40% as unchanged drug). Half-life: 3-4 h.

#### **AVAILABILITY**

Tablets: 6.5 mg, 12.5 mg.

## INDICATIONS AND DOSAGES

#### Migraine headache PO

Adults, Elderly, and Children  $\geq$  12 vr. 6.25-12.5 mg. If headache improves but then returns, dose may be repeated after 2 h. Maximum: 25 mg/24 h.

#### Dosage in hepatic or renal impairment (CrCl < 30 mL/min)

Recommended initial dose is 6.25 mg and maximum daily dose is 12.5 mg.

### CONTRAINDICATIONS

Arrhythmias associated with conduction disorders, hemiplegic or basilar migraine, ischemic heart disease (including angina pectoris, history of MI, silent ischemia, and Prinzmetal's angina), uncontrolled hypertension, cerebrovascular disease, stroke, or TIAs, peripheral vascular disease including ischemic bowel disease. Use within 24 h of ergotamine-containing preparation or another serotonin receptor agonist; use within 14 days of MAOIs, Wolff-Parkinson-White syndrome.

#### INTERACTIONS Drug

**Ergotamine-containing** medications: May produce a vasospastic reaction. Do not use almotriptan within 24 h of ergot drug.

Almotriptan (Generic Name), Axert (Brand Name)

Erythromycin, itraconazole, ketoconazole, ritonavir: May increase the almotriptan plasma level. MAOIs: Risk of serotonin syndrome. Do not take within 2 wks of MAOI treatment. SSRIs/SNRIs (citalopram, desvenlafaxine, duloxetine, escitalopram, fluoxetine, fluvoxamine, paroxetine, sertraline, venlafaxine): May produce weakness, hyperreflexia, and incoordination; serotonin syndrome.

#### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent (>1%)

Nausea, dry mouth, paresthesia, flushing.

#### Occasional (<1%)

Changes in temperature sensation, asthenia, dizziness, chest pain, neck pain, back pain, vision changes, hypertension.

#### SERIOUS REACTIONS

Excessive dosage may produce tremor, red extremities, reduced respirations, cyanosis, seizures, chest pain, and serotonin syndrome.
Serious arrhythmias occur rarely

in patients with hypertension or diabetes, obese patients, smokers, and those with a strong family history of coronary artery disease. • Hypertensive crisis, stroke.

#### Hypertensive ensis, subke.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with controlled hypertension, mild to moderate hepatic or renal impairment, and cardiovascular risk factors. It is unknown whether almotriptan is distributed in breast milk. The safety and efficacy of almotriptan have not been established in children younger than 12 yr. No age-related precautions have been noted in elderly patients. Tasks that require mental alertness or motor skills should be avoided.

Notify the physician immediately if palpitations, pain or tightness in the chest or throat, or pain or weakness in the extremities occurs. Migraines and associated symptoms, including nausea and vomiting, photophobia, and phonophobia (sound sensitivity), should be assessed before and during treatment. **Storage** 

Store at room temperature.

### Administration

If headache comes back after the first dose, give a second dose as long as 2 h or more have elapsed since initial dose. If pain unrelieved after first dose, do not give a second dose; check with prescriber. Do not exceed dose limits per each 24 h.

#### Alosetron

a-low'seh-tron Lotronex Do not confuse Lotronex with Lovenox

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Selective serotonin receptor antagonist, neuroenteric modulator

#### **MECHANISM OF ACTION**

A serotonin (5-HT<sub>3</sub>) receptor antagonist that mediates abdominal pain, bloating, nausea, vomiting, peristalsis, and secretory reflexes. *Therapeutic Effect:* Alleviates diarrhea, reduces gastric pain.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Extensively metabolized in liver. Excreted primarily in urine and, to a lesser extent, in feces. *Half-life:* 1.5 h.

#### AVAILABILITY

Tablets: 0.5 mg, 1 mg.

#### INDICATIONS AND DOSAGES

 Irritable bowel syndrome (IBS), diarrhea predominant, severe and unresponsive to other treatments PO

Adult women. 0.5 mg twice a day. If after 4 wks the dose is well tolerated but does not adequately control IBS symptoms, may increase to 1 mg twice a day. Maximum: 2 mg/day. Discontinue in patients without an adequate response after 4 wks of treatment at a dose of 1 mg twice daily.

### CONTRAINDICATIONS

Constipation; concomitant fluvoxamine; diverticulitis (active or history of); GI bleeding, obstruction, or perforation; history of ischemic colitis, ulcerative colitis, or Crohn's disease; history of severe or chronic constipation or sequelae from constipation; severe hepatic impairment; thrombophlebitis; unable to understand or comply with required patient-physician agreement.

#### INTERACTIONS

#### Drug

**Apomorphine:** May enhance hypotensive effect of apomorphine; contraindicated.

**Fluvoxamine:** Substantially increases alosetron concentrations; contraindicated.

**CYP1A2 inhibitors:** May increase levels and effects of alosetron; use with caution. Potent CYP1A2 inhibitors (e.g., enoxacin, mexilitene, zileuton) should be avoided unless clinically necessary. **CYP3A4 inhibitors:** May increase levels and effects of alosetron; use with caution.

#### Hydralazine, isoniazid,

procainamide: Alosetron might inhibit metabolism of these drugs.

### DIAGNOSTIC TEST EFFECTS

None.

#### SIDE EFFECTS

Frequent (29%) Constipation.

Occasional (2%-10%)

Nausea, GI or abdominal discomfort or pain, abdominal distention, hemorrhoids, regurgitation and reflux. **Rare** (<1%)

Sedation, abnormal dreams, anxiety, hypertension, clinical depression.

### SERIOUS REACTIONS

• Acute ischemic colitis and serious complications of constipation have resulted in the rare need for blood transfusions and surgery or have caused death.

#### **PRECAUTIONS & CONSIDERATIONS**

A Med Guide is required with each prescription/refill. The patient must agree with and sign the required forms prior to receiving the drug.

Caution is warranted with hepatic function impairment. Be aware alosetron is indicated for use in women only. The safety and efficacy of this drug have not been established in men. It is unknown whether alosetron is excreted in breast milk. The safety and efficacy of alosetron have not been established in children. Caution is advised for elderly patients, who may be at greater risk for complications of constipation.

Urgency and diarrhea may be reduced within 1 wk of treatment, but the drug's full therapeutic effects may not occur for up to 4 wks. Persistent constipation may require interruption of treatment or drug management. Notify the physician or nurse if bloody diarrhea, severe constipation, or a sudden worsening of stomach pain occurs. Therapy should be discontinued immediately in patients developing constipation or symptoms of ischemic colitis; therapy should not be resumed in patients developing ischemic colitis. Pattern of daily bowel activity and stool consistency should be monitored. Adequate hydration should be maintained.

Only physicians enrolled in the manufacturer's prescribing program may prescribe alosetron. Program stickers must be affixed to all prescriptions.

#### Storage

Store at room temperature. Protect from light and moisture.

Administration

Take alosetron without regard to food.

#### Alprazolam

al-pray'zoe-lam Alprazolam Intensol, Niravam, Xanax, Xanax XR Apo-Alpraz, Xanax TS Do not confuse alprazolam with lorazepam, or Xanax with Tenex or Zantac.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

*Classification:* Anxiolytics, benzodiazepines, sedatives/hypnotics

#### MECHANISM OF ACTION

A benzodiazepine that enhances the action of the inhibitory neurotransmitter γ-aminobutyric acid in the brain. *Therapeutic Effect:* Produces anxiolytic effect from its CNS depressant action.

#### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 80%. Metabolized in the liver primarily by CYP3A4. Primarily excreted in urine. Minimal removal by hemodialysis. *Half-life*: 11-16 h.

#### AVAILABILITY

*Oral Solution:* 1 mg/mL. *Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg. *Tablets (Extended-Release):* 0.5 mg, 1 mg, 2 mg, 3 mg. *Tablets (Orally Disintegrating):* 0.25 mg, 0.5 mg, 1 mg, 2 mg.

# INDICATIONS AND DOSAGES Anxiety disorders PO

Adults (immediate release). Initially, 0.25-0.5 mg 3 times a day. May titrate q3-4 days. Maximum: 4 mg/ day in divided doses. Elderly, Debilitated Patients. Patients with hepatic disease or low serum albumin. Initially, 0.25 mg 2-3 times a day. Gradually increase to optimum therapeutic response.

#### Anxiety with depression PO

Adults. 2.5-3 mg/day in divided doses.

#### Panic disorder

PO, IMMEDIATE RELEASE Adults. Initially, 0.5 mg 3 times a day. May increase at 3- to 4-day intervals. Range: 5-6 mg/day. *Elderly*. Initially, 0.125-0.25 mg 2 times a day; may increase in 0.125-mg increments until desired effect attained. PO, EXTENDED RELEASE Alert to switch from immediaterelease to extended-release form, give total daily dose (immediate release) as a single daily dose of extended-release form.

Alprazolam (Generic Name), Xanax (Brand Name)

A

*Adults*. Initially, 0.5-1 mg once a day. May titrate at 3- to 4-day intervals. Range: 3-6 mg/day. *Elderly*. Initially, 0.5 mg once a day.

#### CONTRAINDICATIONS

Hypersensitivity to alprazolam or other benzodiazepines. Acute alcohol intoxication with depressed vital signs, acute angle-closure glaucoma, concurrent use of itraconazole or ketoconazole.

### INTERACTIONS

#### Drug

Alcohol, other CNS depressants: Potentiate effects of alprazolam and may increase sedation.

CYP3A4 inhibitors, cimetidine, erythromycin, fluvoxamine, nefazodone, oral contraceptives, propoxyphene, protease inhibitors (e.g., ritonavir): May inhibit metabolism and increase serum concentrations of alprazolam; use with caution.

**CYP3A4 inducers, carbamazepine:** May induce metabolism and decrease serum concentration of alprazolam.

### Indinavir itraconazole,

**ketoconazole:** Increase alprazolam serum concentration; contraindicated.

#### Imipramine, desipramine:

Alprazolam may increase serum concentrations of these drugs; clinical effects uncertain.

#### Herbal

Gotu kola, kava kava, valerian: May increase CNS depressant effect of alprazolam.

**St. John's wort:** Increases alprazolam clearance; decreases alprazolam half-life from 12 h to 6 h. **Food** 

**Grapefruit, grapefruit juice:** May inhibit alprazolam's metabolism. **High-fat meal:** May alter the rate, but not extent, of absorption.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

Frequent (> 10%)

Ataxia; light-headedness; somnolence; headache, dry mouth. Occasional

Confusion, blurred vision, hypotension, nausea, syncope. Rare

Behavioral problems such as anger, impaired memory, depressed mood, paradoxical reactions such as insomnia, nervousness, or irritability.

### SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal and muscle cramps, diaphoresis, vomiting, and seizures.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

• Blood dyscrasias have been reported rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with impaired renal or hepatic function or in patients with severe debilitating illness such as myasthenia gravis or severe COPD. Dizziness and drowsiness may occur. Change positions slowly from recumbent, to sitting, before standing to prevent dizziness. Alcohol, tasks that require mental alertness or motor skills, and smoking should also be avoided. Women on long-term therapy should use effective contraception during therapy and notify the physician immediately if they become or may be pregnant. Breastfeeding is not recommended; benzodiazepines are excreted in human milk and infant can become lethargic.

#### Storage

Store at room temperature. Keep tightly closed. Keep orally disintegrating tablet in bottle until time of administration and protect from moisture.

#### Administration

Take alprazolam without regard to food. Crush tablets as needed. Mix concentrated oral solution with liquids or semisolid foods (e.g., water, juice, soda or soda-like beverages, applesauce, pudding). Use the calibrated dropper to measure doses.

Handle orally disintegrating tablets with dry hands. If only half an orally disintegrating tablet is used, the other half should be discarded because it might not remain stable.

Take extended-release tablets once a day; swallow tablets whole and do not break, chew, or crush tablets.

### Alteplase

al'te-plase

Activase, Cathflo Activase Do not confuse alteplase or Activase with Altace. Also do not confuse Activase with Cathflo Activase

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Thrombolytics, tissue plasminogen activator

#### **MECHANISM OF ACTION**

A tissue plasminogen activator that acts as a thrombolytic by binding to the fibrin in a thrombus and converting entrapped plasminogen to plasmin. This process initiates fibrinolysis. *Therapeutic Effect:*  Degrades fibrin clots, fibrinogen, and other plasma proteins.

#### PHARMACOKINETICS

Rapidly metabolized in the liver. Primarily excreted in urine. Approximately 80% present in plasma cleared within 10 min.

#### AVAILABILITY

Powder for Injection (Activase Cathflo): 2 mg. Powder for Injection (Activase): 50 mg, 100 mg.

# INDICATIONS AND DOSAGES Acute MI

IV INFUSION

Adults weighing > 67 kg. 100 mg over 90 min, starting with 15-mg bolus over 1-2 min, then 50 mg over 30 min, then 35 mg over 60 min. Or a 3-h infusion, giving 60 mg over first hour (6-10 mg as bolus over 1-2 min), 20 mg over second hour, and 20 mg over third hour.

Adults weighing 67 kg or less. 100 mg over 90 min, starting with 15-mg bolus, then 0.75 mg/kg over 30 min (maximum: 50 mg), then 0.5 mg/kg over 60 min (maximum: 35 mg). Or 3-h infusion of 1.25 mg/kg giving 60% of dose over first hour (6%-10% as 1- to 2-min bolus), 20% over second hour, and 20% over third hour.

#### • Acute pulmonary emboli IV INFUSION

*Adults.* 100 mg over 2 h. Institute or reinstitute heparin near end or immediately after infusion when aPTT or thrombin time (TT) returns to twice normal or less.

#### Acute ischemic stroke IV INFUSION

Adults. 0.9 mg/kg over 60 min (10% total dose as initial IV bolus over 1 min). Administered within 3-4.5 h of symptoms onset. Do not exceed 90 mg total dose.

### **Alprostadil**

al-pros'ta-dil Caverject, Caverject Impulse, Edex, Muse, Prostin VR Pediatric Do not confuse alprostadil with alprazolam.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Naturally occurring prostaglandin (E1, PGE1)

#### **MECHANISM OF ACTION**

A prostaglandin that directly affects vascular and ductus arteriosus smooth muscle and relaxes trabecular smooth muscle. *Therapeutic Effect:* Causes vasodilation; dilates cavernosal arteries, allowing blood flow to and entrapment in the lacunar spaces of the penis.

#### PHARMACOKINETICS

Rapidly metabolized and cleared from the body by urinary excretion. *Half-life:* 5-10 min.

#### AVAILABILITY

Injection (Prostin VR Pediatric): 500 mcg/mL. Injection, Aqueous (Caverject): 10 mcg/mL, 20 mcg/mL, 40 mcg/mL. Powder for Injection (Caverject, Edex): 5 mcg, 10 mcg, 20 mcg, 40 mcg. Powder for Injection (Caverject Impulse): 10 mcg, 20 mcg. Urethral Pellet (Muse): 125 mcg, 250 mcg, 500 mcg, 1000 mcg.

#### INDICATIONS AND DOSAGES Maintain patency of ductus arteriosus

IV INFUSION (PROSTIN VR PEDIATRIC ONLY) Neonates. Initially, 0.05-0.1 mcg/kg/ min. Maintenance: 0.01-0.4 mcg/kg/ min. Use lowest possible dose that maintains response. Maximum: 0.4 mcg/kg/min.

#### Impotence

URETHRAL PELLET (MUSE) Adult. Initial dose 125-250 mcg, maintenance dose individualized. Maximum: 2 systems per 24 h. INTRACAVERNOSAL (CAVERJECT, EDEX) Adults. Dosage is individualized. Initial dose titrated in physician's office. Initial dose is 1.25 or 2.5 mcg.

### CONTRAINDICATIONS

Hypersensitivity. Not for use in women. Conditions predisposing to priapism (sickle cell anemia, multiple myeloma, leukemia, venous thrombosis); anatomic deformation of penis, penile implants. The intracavernosal injection is contraindicated if penile angulation, cavernosal fibrosis, or Peyronie disease is present. The urethral suppository is contraindicated in urethral stricture, balanitis, Peyronie disease, or acute or chronic urethritis. There are no specific contraindications to use of alprostadil in neonates.

#### INTERACTIONS Drug

Anticoagulants, including heparin, thrombolytics: May increase the risk of bleeding. Sympathomimetics: May decrease the effect of alprostadil. Vasodilators: May increase risk of hypotension. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase blood bilirubin levels. May decrease glucose, serum calcium, and serum potassium levels.

#### IV INCOMPATIBILITIES

Do not mix with any other drugs.

#### SIDE EFFECTS

#### Frequent

Intracavernosal (1%-4%): Penile pain (37%), prolonged erection, hypertension, localized pain, penile fibrosis, injection site hematoma or ecchymosis, headache, respiratory infection, flu-like symptoms. Intraurethral (3%): Penile pain (36%), urethral pain or burning, testicular pain, urethral bleeding, headache, dizziness, respiratory infection, flu-like symptoms. Systemic (> 1%): Fever, seizures, flushing, bradycardia, hypotension, tachycardia, apnea, diarrhea. Occasional

Intracavernosal (< 1%): Hypotension, pelvic pain, back pain, dizziness, cough, nasal congestion. Intraurethral (< 3%): Fainting, sinusitis, back and pelvic pain. Systemic (< 1%): Anxiety, lethargy, myalgia, arrhythmias, respiratory depression, anemia, bleeding, thrombocytopenia, hematuria.

#### SERIOUS REACTIONS

· Systemic overdose is manifested as apnea, flushing of the face and arms, and bradycardia. Occurs in neonates often (10%), especially in those of low birth weight (< 2 kg). · Cardiac arrest and sepsis occur

rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with coagulation defects, polycythemia, severe hepatic disease, and thrombocythemia. Be aware that erection should occur within 2-5 min of administration. Notify the physician if erection lasts for

longer than 4 h or becomes painful. Alprostadil should not be used if sexual partner is pregnant unless a condom barrier is being used.

Use with caution in neonates with bleeding tendencies. Arterial pressure by auscultation, Doppler transducer, or umbilical artery catheter should be monitored with ductus arteriosus Infusion rate should be decreased immediately if a significant decrease in arterial pressure occurs. Continuous cardiac monitoring should be performed. Heart sounds, femoral pulse (to monitor lower extremity circulation), and respiratory status should be assessed. In addition, signs and symptoms of hypotension should be monitored and BP. ABG values, and temperature should be assessed. Apnea usually appears during the first hour of infusion. If apnea or bradycardia occurs, infusion should be discontinued immediately and the physician should be notified.

#### Storage

Store aqueous injection (Caverject) in the freezer until dispensed; once dispensed store in freezer up to 3 mo. May be kept in refrigerator for up to 7 days; once refrigerated, it must be used within 7 days or discarded: do not refreeze. Once the ampule is removed from the foil wrapper, it must be used immediately after allowing to warm to room temperature or discarded. Open ampules of alprostadil injection must be used immediately. Alprostadil lyophilized powder (Caverject) should be stored in a refrigerator until dispensed. Once dispensed it can be stored at room temperature for up to 3 mo. Reconstituted solution should be used within 24 h when stored at room temperature. Do not refrigerate or freeze reconstituted solution. Alprostadil dual-chamber system (Caverject Impulse) and cartridges (Edex) should be stored at

room temperature. Refrigerate Muse pellet unless used within 14 days. Store the pediatric parenteral form in refrigerator. Dilute drug before administration. Prepare fresh dose every 24 h and discard unused portions.

#### Administration

! Doses > 40 mcg (Edex) or 60 mcg (Caverject) are not recommended. ! *Pediatric injection:* Give by continuous IV infusion or through umbilical artery catheter placed at ductal opening. Prepare continuous IV infusion by diluting 1 mL of alprostadil containing 500 mcg,

with D5W or 0.9% NaCl to yield a solution containing 2-20 mcg/mL. Diluting volumes can range from 25 to 250 mL, depending on the patient and the available infusion device. Infuse the lowest possible dose over the shortest possible time. Decrease the infusion rate immediately if a significant decrease in arterial pressure is noted via auscultation, Doppler transducer, or umbilical artery catheter. Discontinue the infusion immediately if signs and symptoms of overdose, such as apnea and bradycardia, occur.

#### Central venous catheter clearance

IV (CATHFLO ONLY) Adults, Elderly, Children (weighing 30 kg or more). 2 mg; may repeat

after 2 h if catheter function not restored.

*Children weighing 10-30 kg.* Instill 110% of the internal lumen volume of the catheter, not to exceed 2 mg in 2 mL. May repeat after 2 h if catheter function is not restored.

### **OFF-LABEL USES**

Coronary thrombolysis.

#### CONTRAINDICATIONS

Active internal bleeding, AV malformation or aneurysm, bleeding diathesis, intracranial neoplasm, intracranial or intraspinal surgery or trauma, recent (within past 2 mo) cerebrovascular accident, severe uncontrolled hypertension; additional contraindication in acute stroke includes evidence of intracranial hemorrhage on pretreatment evaluation, suspicion of subarachnoid hemorrhage, history of intracranial hemorrhage, seizure at onset of stroke.

### INTERACTIONS

#### Drug

Anticoagulants, including heparin: May increase risk of hemorrhage. Nitroglycerin: May decrease alteplase concentrations, thereby reducing alteplase effect. Platelet aggregation inhibitors, including aspirin, NSAIDs, abciximab, ticlopidine: May increase the risk of bleeding. Herbal

Cat's claw, dong quai, evening primrose, feverfew, red clover, horse chestnut, garlic, green tea, ginseng, ginkgo: Can have antiplatelet activity, may increase risk of bleeding.

#### Food

None known.

### DIAGNOSTIC TEST EFFECTS

Decreases plasminogen and fibrinogen levels during infusion, which decreases clotting time (and confirms the presence of lysis).

### IV INCOMPATIBILITIES

Do not add other medications to the container of alteplase solution or administer other medications through the same IV line. Incompatible with dobutamine, dopamine, heparin, nitroglycerin.

### **IV COMPATIBILITIES**

Eptifibatide (Integrelin), lidocaine, metoprolol (Lopressor), propranolol (Inderal).

### SIDE EFFECTS

Frequent

Superficial bleeding at puncture sites, decreased BP.

#### Occasional

Allergic reaction, such as rash or wheezing; bruising. GI bleeding (5%), GU bleeding (4%), and ecchymosis (1%). Retroperitoneal bleeds, epistaxis, and gingival bleeding reported in < 1%.

#### SERIOUS REACTIONS

• Severe internal hemorrhage may occur. Intracranial hemorrhage may cause death. Do not use doses > 150 mg due to increased risk.

 Lysis of coronary thrombi may produce atrial or ventricular arrhythmias or stroke.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with recent (within past 10 days) major surgery or GI bleeding, organ biopsy, trauma, cerebrovascular disease, cardiopulmonary resuscitation,

#### 58 Aluminum Chloride Hexahydrate

diabetic retinopathy, endocarditis, left heart thrombus, occluded AV cannula at infected site, severe hepatic or renal disease, thrombophlebitis, in elderly patients, and in pregnant women or within the first 10 postpartum days. Alteplase is used only when the benefit to the mother outweighs the risk to a fetus. Also, it is unknown whether alteplase crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children (Activase) or in children < 2 yror weighing < 10 kg (Activase Cathflo). In elderly patients, there is an increased risk of bleeding. Patients must be carefully selected and monitored. An electric razor and a soft toothbrush should be used to reduce the risk of bleeding.

Immediately report signs of bleeding, such as oozing from cuts or gums. Serum creatine kinase (CK), CK-MB concentrations, 12-lead ECG, electrolyte levels, hematocrit, platelet count, TT, aPTT, PT, and fibrinogen levels should be evaluated before therapy starts. BP and pulse and respiration rates should be checked every 15 min until stable; then check hourly. Continuous cardiac monitoring should be performed. **Storage** 

Store 50-mg and 100-mg vials at room temperature or in refrigerator. Protect from light. Solution is stable for 8 h after reconstitution. Discard unused portion. Store 2-mg vials in refrigerator.

#### Administration

Reconstitute immediately before use with sterile water for injection. Reconstitute 100-mg vial with 100 mL sterile water for injection (50-mg vial with 50 mL sterile water for injection) without preservative to provide a concentration of 1 mg/mL. May dilute further with equal volume of D5W or 0.9% NaCl to provide a concentration of 0.5 mg/mL. Gently swirl or slowly invert vial; avoid excessive agitation. After reconstitution, solution normally appears colorless to pale yellow. Give by IV infusion via infusion pump. (See individual dosages above.) If minor bleeding occurs at puncture site, apply pressure for 30 seconds; if unrelieved, apply a pressure dressing. If uncontrolled hemorrhage occurs, discontinue the infusion immediately. Slowing the rate of infusion may worsen the hemorrhage. Avoid undue pressure when injecting the drug into the catheter because the catheter can rupture or expel a clot into circulation.

See manufacturer's directions for reconstitution and catheter instillation of Activase Cathflo.

#### Aluminum Chloride Hexahydrate

a-loo'mi-num klor'ide heks-a-hye'drate ★ Drysol, Hypercare

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiperspirants

#### **MECHANISM OF ACTION**

Aluminum salts cause an obstruction of the distal sweat gland. This obstruction causes metal ions to precipitate with mucopolysaccharides, damaging epithelial cells along the lumen of the duct and forming a plug to block sweat output. *Therapeutic Effect:* Results in decreased secretion of the sweat glands.

### Aluminum Hydroxide 59

### PHARMACOKINETICS

Not known.

### AVAILABILITY

*Topical Solution:* 20% (Drysol, Hypercare).

### INDICATIONS AND DOSAGES

Antiperspirant

TOPICAL Adults, Elderly, Children 12 yr and older. Apply to each underarm once a day at bedtime.

### Hyperhidrosis

#### TOPICAL

*Adults, Elderly, Children 12 yr and older.* Apply to affected areas once a day at bedtime.

### CONTRAINDICATIONS

Hypersensitivity to aluminum chloride or any one of its components.

### INTERACTIONS

Drug None known. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

Frequent Itching, burning, tingling sensation. Occasional Rash.

### SERIOUS REACTIONS

• Hypersensitivity reaction, such as rash, may occur.

### **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether aluminum chloride hexahydrate crosses the placenta or is distributed in breast milk. These products may be harmful to cotton fibers and certain metals.

Skin may become irritated during use. Aluminum chloride hexahydrate should not be applied to broken, irritated, or recently shaved skin. Do not use other antiperspirants or deodorants during treatment.

### Administration

Aluminum chloride hexahydrate is for external use only. It should be applied to dry skin. The treated area should be covered with a sheet of plastic wrap held in place with a snug T-shirt to avoid aluminum chloride hexahydrate rubbing off at night. The next morning, discard the plastic wrap if used and wash the skin with a mild soap. Excessive sweating may be stopped after 2 or more treatments; thereafter, apply 1-2 times/wk or as needed.

### **Aluminum Hydroxide**

a-loo'mi-num hye-drox'ide

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

**Classification:** Gastrointestinals, vitamins/minerals

### **MECHANISM OF ACTION**

An antacid that reduces gastric acid by binding with phosphate in the intestine and is then excreted as aluminum carbonate in feces; decreased serum phosphate levels may result in increased absorption of calcium. The drug also has astringent and adsorbent properties. *Therapeutic Effect:* Neutralizes or increases gastric pH; reduces phosphate levels in urine, preventing

#### 60 Aluminum Hydroxide

formation of phosphate urinary calculi; reduces the serum phosphate level; decreases the fluidity of stools.

#### AVAILABILITY

Suspension: 600 mg/5 mL (Alternagel), 320 mg/5 mL.

## INDICATIONS AND DOSAGES Antacid

PO

*Adults, Elderly.* 500-1500 mg 3-6 times daily, between meals and at bedtime.

# Hyperphosphatemia PO

*Adults, Elderly.* Initially, 300-600 mg 3 times a day with meals. *Children.* 50-150 mg/kg/day in divided doses q4-6h.

#### CONTRAINDICATIONS

Hypophosphatemia.

#### INTERACTIONS

Drug Bisphosphonates, iron preparations, isoniazid, ketoconazole, phenytoin, quinolones, tetracyclines, alumimun hydroxide: May decrease absorption of this drug. Methenamine: May decrease effects of the methenamine. Salicylate: May increase salicylate excretion. Herbal None known. Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase the serum gastrin level and systemic and urinary pH. May decrease the serum phosphate level.

#### SIDE EFFECTS

#### Frequent

Chalky taste, mild constipation, abdominal cramps.

#### Occasional

Nausea, vomiting, speckling, or whitish discoloration of stools.

#### SERIOUS REACTIONS

• Prolonged constipation may result in intestinal obstruction.

• Excessive or chronic use may produce hypophosphatemia manifested as anorexia, malaise, muscle weakness, or bone pain, which may result in osteomalacia and osteoporosis.

• Prolonged use may produce urinary calculi.

 Prolonged or excessive use, especially in neonates or those with renal failure, may produce aluminum toxicity encephalopathy.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with Alzheimer's disease, chronic diarrhea, cirrhosis, constipation, dehydration, edema, fecal impaction, fluid restrictions, gastric outlet obstruction, GI or rectal bleeding, heart failure, impaired renal function, low sodium diets, symptoms of appendicitis, and in elderly patients. Aluminum hydroxide is rarely used as an antacid or phosphate binder in children; other agents are considered safer. Elderly patients may be at increased risk of constipation and fecal impaction.

Stool discoloration may occur but will resolve when the drug is discontinued. Adequate hydration should be maintained. Pattern of daily bowel activity and stool consistency and serum aluminum, calcium, phosphate, and uric acid levels should be monitored.

#### Administration

Take aluminum hydroxide 1-3 h after meals and at bedtime when used as an antacid. Expect the dosage to be individualized based on the antacid's neutralizing or phosphate-binding capacity. Shake the suspension well before use. Do not take other oral drugs within 1-2 h of antacid administration.

### Alvimopan

al-vi-moe'pan

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Gastrointestinal agents, peripheral µ-opioid receptor antagonist

#### **MECHANISM OF ACTION**

Antagonizes the peripheral effects of opioids on GI motility and secretion by competitively binding to GI tract  $\mu$ -opioid receptors. Achieves this effect without reversing the central analgesic effects of  $\mu$ -opioid agonists. *Therapeutic Effect*: Reduces physiologic ileus postoperatively and helps maintain GI motility to enhance surgical recovery and diet tolerance, and can reduce time to discharge.

#### PHARMACOKINETICS

Limited systemic bioavailability (roughly 6%) and does not cross the blood-brain barrier. Protein binding: 80%. Mostly excreted by biliary secretion and via unabsorbed drug passing in the feces. Some drug hydrolyzed by gut microflora to a metabolite. Metabolite is excreted in feces and urine. *Half-life*: 10-18 h (range for alvimopan and metabolite). Accumulation may occur with chronic dosing in hepatic or severe renal impairment.

#### AVAILABILITY

Capsules: 12 mg.

#### INDICATIONS AND DOSAGES

 Postoperative ileus: to accelerate GI recovery time following partial large or small bowel resection with primary anastomosis

*Adults.* 12 mg PO for 1 dose within 30 min and up to 5 h before surgery; then 12 mg twice daily beginning the day after surgery. Maximum duration of 7 days or until hospital discharge (e.g., maximum total therapy = 15 doses).

#### CONTRAINDICATIONS

Patients who have taken therapeutic doses of opioids for more than 7 consecutive days immediately prior to this drug.

#### INTERACTIONS Drug

Methylnaltrexone: Shares similar mechanism of action to alvimopan; potential for additive GI effects. Drugs that strongly inhibit p-glycoprotein (e.g., verapamil, cyclosporine, amiodarone, itraconazole, quinine, spirinolactone, quinidine, diltiazem): Alvimopan has not been studied with these drugs; potential for altered alvimopan activity.

Herbal and Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS

#### Frequent (3%-10%)

Constipation, flatulence, dyspepsia, anemia, hypokalemia, back pain, urinary retention.

#### Occasional (1%-2%)

Diarrhea, abdominal pain, cramping.

#### Rare (<1%)

Nausea and vomiting. See Serious Reactions.

#### SERIOUS REACTIONS

 There were more reports of MI (usually 1-4 mo after treatment) in those treated with alvimopan (0.5 mg twice daily) compared with placebo in one study of patients receiving opioids for chronic pain. The results have not been noted in other controlled studies. A causal relationship with the drug has not been established.

#### **PRECAUTIONS & CONSIDERATIONS**

Alvimopan is available only to hospitals that enroll in the ENTEREG Access Support and Education (E.A.S.E.) program. The program limits use of alvimopan to short-term, inpatient use; patients will not receive more than 15 doses and the drug will not be dispensed to patients after they have been discharged from the hospital. Not recommended for use in patients undergoing surgery for complete bowel obstruction. Those who have received opiates in the days prior to surgery are likely to be more sensitive to the effects of this drug. Use caution in patients with mild or moderate hepatic or renal impairment; not recommended in those with severe hepatic impairment (Child-Pugh class C) or if end-stage renal disease (CrCl < 10 mL/min or ESRD) is present. There are no data in pregnant women; animal studies do not show teratogenic effects. It is unknown if the drug is excreted in human breast milk, but it is detected in the milk of lactating rats. The safety and efficacy of alvimopan have not been established in children.

Monitor bowel sounds, stool frequency, serum potassium, hemoglobin/hematocrit, and patient pain scales. Watch for reduction in bloating, abdominal distention, and for the passage of flatus, which are signs of therapeutic effectiveness. Report diarrhea, nausea, vomiting, or increased abdominal pain to physician.

#### Storage

Store capsules at controlled room temperature, in the original carton. Administration

Preoperative dose usually given in fasting state. May administer subsequent doses without regard to meals. In-hospital use only; not for outpatients

### Amantadine Hydrochloride

a-man'ta-deen hi-droh-klor'ide ★ Symmetrel ▲ Med-Amantadine, PMS-Amantadine Do not confuse amantadine with amiodarone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, antivirals

#### **MECHANISM OF ACTION**

A dopaminergic agonist that blocks the uncoating of influenza A virus, preventing penetration into the host and inhibiting M2 protein in the assembly of progeny virions. Amantadine also blocks the reuptake of dopamine into presynaptic neurons and causes direct stimulation of postsynaptic receptors. *Therapeutic Effect:* Antiviral and antiparkinsonian activity.

#### PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Protein binding: 67%. Widely distributed. Primarily

Amantadine Hydrochloride (Generic Name)

excreted in urine. Minimally removed by hemodialysis. *Half-life:* 16 h (increased in the elderly and in impaired renal function).

#### AVAILABILITY

*Capsule:* 100 mg. *Syrup:* 50 mg/5 mL. *Tablets:* 100 mg.

#### INDICATIONS AND DOSAGES > Prevention and symptomatic treatment of respiratory illness due to influenza A virus

NOTE: Due to increased resistance, the CDC recommends that amantadine no longer be used for treatment or prophylaxis of influenza A in the United States until susceptibility is reestablished.

#### PO

Adults  $\ge 65$  yr. 100 mg/day. Adults and children 13-64 yr. 200 mg/day or 100 mg twice a day. Children 10-12 yr. 5 mg/kg/day up to 200 mg/day in 2 divided doses. Children 1-9 yr. 5 mg/kg/day in 2 divided doses (up to 150 mg/day).

#### Parkinson's disease, extrapyramidal symptoms PO

*Adults, Elderly.* Initially, 100 mg once daily. May increase to 100 mg twice daily, if necessary, after at least 1 wk. Occasionally, patient might need 300-400 mg/day in divided doses, but this is rare.

Dosage in renal impairment
 Dose and frequency are modified
 based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage	
30-50	200 mg first day; 100 mg/day thereafter	
15-29	200 mg first day; 100 mg on alternate days	
< 15	200 mg every 7 days	

#### CONTRAINDICATIONS

Hypersensitivity to amantadine, rimantadine, or any product ingredients.

### INTERACTIONS

#### Drug

Alcohol: May increase CNS effects, including dizziness, confusion, light-headedness, and orthostatic hypotension.

Anticholinergics, antihistamines, phenothiazine, tricyclic antidepressants: May increase anticholinergic effects of amantadine.

**Hydrochlorothiazide, triamterene:** May increase amantadine blood concentration and risk for toxicity.

**Live attenuated influenza vaccine:** Avoid use of vaccine within 2 wks before or 48 h after amantadine; may reduce vaccine response.

#### Herbal None known. Food None known.

### **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

#### Frequent (5%-10%)

Nausea, dizziness, poor concentration, insomnia, nervousness.

#### Occasional (1%-5%)

Orthostatic hypotension, anorexia, headache, livedo reticularis (reddish blue, netlike blotching of skin), blurred vision, urine retention, dry mouth or nose, depression, anxiety and irritability, hallucinations, somnolence, abnormal dreams, agitation.

#### Rare

Vomiting, irritation or swelling of eyes, rash, visual disturbances.

#### SERIOUS REACTIONS

• CHF, leukopenia, and neutropenia occur rarely.

Hyperexcitability, seizures, and ventricular arrhythmias may occur.
Neuroleptic malignant syndrome has occurred upon rapid dose reduction or withdrawal.

· Suicide, suicidal ideation or attempt.

 Changes in behavior, such as impulse control symptoms (uncontrollable urges, such as sexual or gambling).

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cerebrovascular disease, CNS depression, impulse control disorder, CHF, history of seizures, liver disease, orthostatic hypotension, peripheral edema, psychosis, recurrent eczematoid dermatitis, renal dysfunction, and those receiving CNS stimulants. Avoid use in patients with untreated angle-closure glaucoma. There have been reports of suicidal ideation and suicide attempts in patients with and without a history of psychiatric illness. May exacerbate psychiatric symptoms in patients with a history of psychiatric illness. Teratogenic effects observed in animal studies and impaired fertility observed in animal studies and humans. It is distributed into breast milk; use is not recommended in breastfeeding. There are no safety or efficacy data in children < 1 yr of age. Elderly patients may exhibit increased sensitivity to amantadine's anticholinergic effects. In elderly patients, age-related decreased renal function may require dosage adjustment. Avoid alcohol and taking any medications, including over-the-counter (OTC) drugs, without first consulting the physician.

Skin should be monitored for peripheral edema, blotching, or rash. Dizziness should be monitored. Food tolerance and episodes of nausea and vomiting should be evaluated. If new symptoms, especially blurred vision, dizziness, nausea or vomiting, and skin blotching or rash, occur, notify the physician. Get up slowly from a sitting or lying position. Do not drive, use machinery, or engage in other activities that require mental acuity if dizziness or blurred vision occurs.

#### Administration

Use of 2 divided doses may reduce CNS side effects. May take without regard to food. Administer nighttime dose several hours before bedtime to prevent insomnia. Continue therapy for the full length of treatment and evenly space drug doses around the clock.

#### Ambrisentan

am-bri-sen′tan ★ Letairis ◆ Volibris

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Endothelin antagonist, vasodilator

#### **MECHANISM OF ACTION**

Endothelin receptor antagonist with greater selectivity for the endothelin B receptor than the endothelin B receptor. Stimulation of endothelin receptors is associated with vasoconstriction. Endothelin levels are increased in pulmonary arterial hypertension and correlate with increased mean right arterial pressure and disease severity. *Therapeutic Effect:* Symptomatic improvement in pulmonary artery hypertension and reduced rate of clinical worsening.

#### PHARMACOKINETICS

Rapidly absorbed; peak concentrations reached within 2 h. Highly plasma protein bound: 99%. Nonrenal elimination. *Half-life*: 9 h.

### A

### Ambenonium

am-be-noe'nee-um ★ Mytelase

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Cholinesterase inhibitors

Ambenonium (Generic Name), Mytelase (Brand Name)

### **MECHANISM OF ACTION**

A cholinesterase inhibitor that enhances and prolongs cholinergic function by increasing the concentration of acetylcholine through inhibition of the hydrolysis of acetylcholine. *Therapeutic Effect:* Increases muscle strength in myasthenia gravis.

### PHARMACOKINETICS

Poorly absorbed after PO administration. Onset of action observed within 20-30 min.

### AVAILABILITY

Tablets: 10 mg (Mytelase).

# INDICATIONS AND DOSAGES Myasthenia gravis PO

*Adults.* Initially, 5 mg PO 3 or 4 times per day; gradually increase at intervals of 48 h or more to individual response.

Usual maintenance dose 5-25 mg 3 or 4 times a day; however, some rare patients may require 50-75 mg PO 3 or 4 times per day; watch for cholinergic effects.

### CONTRAINDICATIONS

Known hypersensitivity to ambenonium. Not recommended in patients receiving routine administration of atropine or other belladonna derivatives. Not recommended in patients receiving mecamylamine.

### INTERACTIONS

#### Drug

Atropine: Suppresses GI side effects; may mask the symptoms of ambenonium overdose.

#### Herbal

None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent

Abdominal pain, diarrhea, increased salivation, lacrimation, miosis, sweating, and vomiting.

#### Occasional

Anxiety, blurred vision, and urinary urgency.

### Rare

Trembling, difficulty moving or controlling movement of the tongue, neck, or arms.

### SERIOUS REACTIONS

 Overdosage may result in cholinergic crisis, characterized by severe nausea, vomiting, diarrhea, increased salivation, diaphoresis, bradycardia, hypotension, flushed skin, stomach pain, respiratory depression, seizures, and paralysis of muscles. • Increasing muscle weakness of myasthenia gravis may occur. Antidote: 0.5-1 mg IV atropine sulfate with other supportive treatment.

#### PRECAUTIONS & CONSIDERATIONS

Not recommended if mechanical GI obstruction is present. Caution is warranted in patients with asthma, bladder outflow obstruction, bradycardia, COPD, recent coronary occlusion, vagotonia, hyperthyroidism, cardiac arrhythmias, Parkinson disease, and a history of peptic ulcer disease. It is unknown whether ambenonium crosses the placenta or is excreted in breast milk. Safety and efficacy of ambenonium have not been established in children. Anticholinergic insensitivity may develop; reduce or withhold ambenonium until the patient becomes sensitive again. Cholinergic reaction, such as diaphoresis, dizziness, excessive salivation, feeling of facial warmth, GI cramping or discomfort, lacrimation, pallor, trembling or difficulty moving or controlling movement of the tongue, neck, or arms, and urinary urgency should be reported.

#### Storage

Store at room temperature away from light and moisture.

#### Administration

Ambenonium should be given after food in divided doses at the same times each day.

### AVAILABILITY

Tablets: 5 mg, 10 mg.

#### INDICATIONS AND DOSAGES

#### Pulmonary Arterial Hypertension PO

*Adult.* Initiate at 5 mg once daily, consider increasing to 10 mg once daily if 5 mg tolerated.

#### CONTRAINDICATIONS

Pregnancy. Idiopathic pulmonary fibrosis (IPF).

#### INTERACTIONS

#### Drug

**Cyclosporine:** May increase ambristentan concentrations and effects; use with caution.

### CYP3A4 potent inhibitors

(e.g., itraconazole, ketoconazole):

May increase ambrisentan concentrations and effects; use with caution.

**CYP2C19 potent inhibitors** (e.g., **omeprazole):** May increase ambrisentan concentrations and effects; use with caution.

#### Herbal

**St. John's wort:** May reduce abrisentan concentrations and effects; avoid concomitant use. **Food** 

**Grapefruit juice:** May increase ambrisentan concentrations and effects.

#### DIAGNOSTIC TEST EFFECTS

Decreased hemoglobin (> 15%) increased liver aminotransferases (ALT, AST).

#### SIDE EFFECTS

Frequent (> 10%) Peripheral edema, headache. Occasional (1%-10%)

Nasal congestion, sinusitis, flushing, palpitations, abdominal pain, constipation, decreased hemoglobin, increased hepatic transaminases, dyspnea.

### SERIOUS REACTIONS

• Hypersensitivity, including angioedema.

- · Symptomatic anemia.
- Pulmonary edema may indicate veno-occlusive disease.

• Fluid retention may cause decompensated heart failure.

#### PRECAUTIONS & CONSIDERATIONS

Ambrisentan is only available through a restricted distribution system because of the risks of serious liver toxicity and birth defects. The name of the program is Letairis Education and Access Program (LEAP). A Med Guide must be dispensed with every prescription and refill.

Treat women of childbearing potential only after a negative pregnancy test. Women of childbearing potential must use two reliable methods of contraception unless a nonhormonal IUD is in place. Monthly pregnancy tests are required. It is not known whether ambrisentan is distributed in breast milk; breastfeeding is not recommended.

Ambrisentan is not recommended in patients with moderate or severe hepatic impairment. Liver aminotransferases should be monitored monthly; discontinue therapy if elevated to 5 times the upper limit of normal or if elevations are accompanied by increases in bilirubin or signs or symptoms of liver dysfunction.

Monitor hemoglobin at initiation, 1 mo after initiation, and periodically thereafter; reductions in hemoglobin levels have been

#### 66 Amcinonide

observed within the first few weeks of therapy.

Safety and efficacy have not been established in pediatric patients. Peripheral edema occurs more frequently in elderly patients.

#### Storage

Store at room temperature in the original blister packaging.

#### Administration

May be taken with or without food. Tablets should not be split, crushed, or chewed. Take at about the same time each day.

### Amcinonide

am-sin'oh-nide

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiinflammatory, steroidal, topical

#### **MECHANISM OF ACTION**

Topical corticosteroids have antiinflammatory, antipruritic, and vasoconstrictive properties. The exact mechanism of the antiinflammatory process is unclear. Amcinonide is categorized as a high-potency topical corticosteroid. *Therapeutic Effect:* Reduces or prevents tissue response to inflammatory process. Highpotency fluorinated corticosteroid.

#### PHARMACOKINETICS

Well absorbed systemically. Large variation in absorption among sites: forearm 1%, scalp 4%, forehead 7%, scrotum 36%. Greatest penetration occurs at groin, axillae, and face. Protein binding in varying degrees. Metabolized in liver. Primarily excreted in urine.

#### AVAILABILITY

*Cream:* 0.1%. *Lotion:* 0.1%. *Ointment:* 0.1%.

### INDICATIONS AND DOSAGES

 Corticosteroid-responsive dermatoses

TOPICAL *Adults, Elderly*. Apply sparingly 2-3 times/day.

#### CONTRAINDICATIONS

History of hypersensitivity to amcinonide or other corticosteroids; use on face, groin, or axilla.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Uncommon under usual use.

#### SIDE EFFECTS

Frequent

Itching, redness, irritation, burning. Occasional

Dryness, folliculitis, hypertrichosis, acneiform eruptions,

hypopigmentation, perioral dermatitis. Rare

Allergic contact dermatitis, maceration of the skin, secondary infection, skin atrophy. Systemic: Absorption more likely with occlusive dressings or extensive application in young children.

#### SERIOUS REACTIONS

• The serious reactions of longterm therapy and the addition of occlusive dressings are reversible hypothalamic-pituitaryadrenal (HPA) axis suppression, manifestations of Cushing syndrome, hyperglycemia, and glucosuria.
Abruptly withdrawing the drug after long-term therapy may require supplemental systemic corticosteroids.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is necessary when using amcinonide over large surface areas, prolonged use, and the addition of occlusive dressings. Long-term therapy and the addition of occlusive dressings can lead to reversible hypothalamic-pituitary-adrenal (HPA) axis suppression, manifestations of Cushing syndrome, hyperglycemia, and glucosuria. Children may absorb larger amounts and may be more susceptible to toxicity. It is unknown whether amcinonide is distributed in breast milk.

Signs of a rash in addition to fever and sore throat should be reported. Sunlight should be avoided.

#### Administration

Amcinonide should be applied sparingly to the skin and rubbed gently into affected area. Apply after bath or shower for best absorption, and do not cover the area with any coverings, plastic pants, or tight diapers unless instructed. Occlusive dressings may be used in the management of psoriasis or recalcitrant conditions. Avoid contact with eyes.

### Amikacin

am-i-kay'sin ★ Amikin Do not confuse with Amicar or Kineret.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antibiotics, aminoglycosides

#### MECHANISM OF ACTION

An aminoglycoside antibiotic that irreversibly binds to protein on bacterial ribosomes. *Therapeutic Effect:* Interferes with protein synthesis of susceptible bacterial microorganisms.

#### PHARMACOKINETICS

Rapid, complete absorption after IM administration. Protein binding: 0%-10%. Widely distributed (does not cross the blood-brain barrier, low concentrations in CSF). Excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 2-4 h (increased in impaired renal function and neonates; decreased in cystic fibrosis and burn or febrile patients).

#### AVAILABILITY

Injection: 50 mg/mL, 250 mg/mL.

#### INDICATIONS AND DOSAGES

NOTE: Parenteral doses determined using ideal body weight (IBW), except in obesity where IBW is adjusted for best calculation of dose.

#### Uncomplicated urinary tract infections

IV, IM

Adults, Elderly. 250 mg q12h.

 Moderate to severe infections IV, IM

*Adults, Elderly.* 15 mg/kg/day in divided doses q8-12h. Maximum 1.5 g/day.

Children, Infants. 15 mg/kg/day in divided doses q8h.

*Neonates.* 10 mg/kg loading dose, followed by 7.5 mg/kg q12h.

▶ **Dosage in renal impairment** Dosage and frequency are modified based on the degree of renal impairment and serum drug concentration. After a loading dose of 5-7.5 mg/kg, the maintenance

### A

### Amifostine

am-ih-fos'teen ★ Ethyol Do not confuse Ethyol with ethanol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Cytoprotective, radioprotective

### **MECHANISM OF ACTION**

An antineoplastic adjunct and cytoprotective agent that is converted to an active metabolite by alkaline phosphatase in tissues. The active metabolite binds to and detoxifies metabolites of cisplatin. These actions occur more readily in normal tissues than in tumor tissue. *Therapeutic Effect*: Reduces the toxic effect of the chemotherapeutic agent cisplatin.

### PHARMACOKINETICS

Rapidly cleared from plasma. Converted in tissue to active free thiol metabolite. Tissue uptake highest in bone marrow, skin, GI mucosa, salivary glands. *Half-life*: Distribution half-life < 1 min; elimination half-life 8 min. Less than 10% remains in plasma 6 min after drug administration.

### AVAILABILITY

Lyophilized Powder for Injection: 500 mg.

### INDICATIONS AND DOSAGES

 To reduce cumulative renal toxicity from repeated administration of cisplatin in patients with advanced ovarian cancer
 IV

Adults. 910 mg/m<sup>2</sup> once a day as 15-min infusion, beginning 30 min

before chemotherapy. A 15-min infusion is better tolerated than extended infusions. If the full dose cannot be administered, dose for subsequent cycles should be 740 mg/m<sup>2</sup>.

#### Treatment of postoperative radiation-induced xerostomia in patients with head and neck cancer IV

*Adults.* 200 mg/m<sup>2</sup> once a day as 3-min infusion, starting 15-30 min before radiation therapy.

### CONTRAINDICATIONS

Sensitivity to aminothiol compounds or mannitol.

### INTERACTIONS

### Drugs

**Antihypertensives:** Increased risk of hypotension; interrupt antihypertensive therapy for at least 24 h before amifostine administration.

### DIAGNOSTIC TEST EFFECTS

May lower serum calcium levels with multiple doses.

### IV INCOMPATIBILITIES

Do not mix with any other drugs or solutions except those with established compatibility. Acyclovir, amphotericin B, cefoperazone, cisplatin, ganciclovir, hydroxyzine HCl, mycophenolate mofetil, prochlorperazine, quinupristindalfopristin (Synercid).

### **IV COMPATIBILITIES**

Per manufacturer, compatibility only established with 0.9% NaCl and NaCl with other additives.

### SIDE EFFECTS

#### Frequent (> 10%)

Transient reduction in BP (usually starts 14 min into infusion, lasts about 6 min and returns to normal in 5-15 min); severe nausea, vomiting.

#### Occasional

Flushing or feeling of warmth or chills or feeling of coldness; dizziness, hiccups, sneezing, somnolence.

#### Rare

Clinically relevant hypocalcemia, mild rash.

#### SERIOUS REACTIONS

 A pronounced drop in BP may require temporary cessation of amifostine and fluid resuscitation.
 Serious cutaneous reactions.

scholas culture and the scholar schola

• Anaphylaxis, arrhythmias, seizures, syncope.

· Hypocalcemia.

#### PRECAUTIONS & CONSIDERATIONS

Patients should be well hydrated. Monitor BP frequently during infusion and as clinically indicated following completion of infusion. Safety not established in patients with cardiovascular disease, in elderly patients, in lactating women, or in children. Antiemetic medications should be administered before and in conjunction with amifostine. Interrupt antihypertensive therapy 24 h preceding amifostine administration. chemotherapeutic effect of the treatments for which it is indicated to accompany; the drug should not be used in other situations for other chemotherapy or radiation except in a clinical trial.

Patients should be closely assessed for cutaneous reactions before each dose. Therapy should be permanently discontinued for serious or severe cutaneous reactions or cutaneous reactions associated with fever or other constitutional symptoms.

#### Storage

Store unreconstituted vials at room temperature. Reconstituted solution is stable for up to 5 h at room temperature or up to 24 h in the refrigerator. The infusion solution prepared in polyvinylchloride bags at concentrations of 5-40 mg/mL is stable for up to 5 h at room temperature or 24 h in the refrigerator.

#### Administration

Reconstitute each vial with 9.7 mL normal saline. The concentration in the vial is 500 mg/10 mL. The needed drug dose is then further diluted with 0.9% NaCl injection in PVC bags at concentrations ranging from 5-40 mg/mL. Before chemotherapy, amifostine should be administered as a 15-min infusion. Before radiation therapy, amifostine should be administered as a 3-min infusion.

#### 68 Amikacin

dose and frequency are based on serum creatinine levels and creatinine clearance and are adjusted based on therapeutic drug monitoring.

Once-daily dose strategy

Common off-label dosing strategies use a "once-daily" dose of 15 mg/ kg and then adjust the frequency of administration according to serum levels and medically accepted dosing nomograms.

#### CONTRAINDICATIONS

Hypersensitivity to amikacin, other aminoglycosides (cross-sensitivity), or their components.

#### INTERACTIONS

#### Drug

**Loop diuretics:** May increase the risk of ototoxicity because both agents have the potential to cause ototoxicity and potent diuretics may alter amikacin concentrations.

Nephrotoxic medications, other aminoglycosides, ototoxic medications: May increase the risk of nephrotoxicity or ototoxicity. Neuromuscular blockers: May enhance neuromuscular blockade.

#### DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, BUN, serum creatinine, serum LDH, SGOT (AST), and SGPT (ALT) levels. May decrease serum calcium, magnesium, potassium, and sodium concentrations. Therapeutic peak serum level is 15-35 mcg/mL, and therapeutic trough is < 4-8 mcg/mL, depending on infection severity and site of infection. Toxic peak concentration is > 35 mcg/mL, and toxic trough serum level is > 10 mcg/mL.

#### IV INCOMPATIBILITIES

Amphotericin B, ampicillin, azathioprine (Imuran), azithromycin (Zithromax IV), cefazolin (Ancef), diazepam, folic acid, ganciclovir, heparin, Hetastarch 6%, indomethacin, pentobarbital, phenytoin (Dilantin), propofol (Diprivan), sulfamethoxazole/ trimethoprim, thiopental, trastuzumab (Herceptin).

#### 🗏 IV COMPATIBILITIES

Amiodarone (Cordarone), aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), cimetidine (Tagamet), ciprofloxacin (Cipro), clindamycin (Cleocin), diltiazem (Cardizem), enalapril (Vasotec), esmolol (BreviBloc), fluconazole (Diflucan), furosemide (Lasix), levofloxacin (Levaquin), lorazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, ondansetron (Zofran), potassium chloride, ranitidine (Zantac), vancomycin.

#### SIDE EFFECTS

#### Frequent

IM: Pain, induration. IV: Phlebitis, thrombophlebitis. Occasional

Hypersensitivity reactions (rash, fever, urticaria, pruritus).

#### Rare

Neuromuscular blockade (difficulty breathing, drowsiness, weakness).

#### SERIOUS REACTIONS

 Serious reactions may include nephrotoxicity (as evidenced by reduced urine output, decreased appetite, nausea, vomiting, increased BUN and serum creatinine levels, and decreased creatinine clearance); and ototoxicity (as evidenced by tinnitus, dizziness, and loss of hearing).

 Neuromuscular blockade and weakness occur rarely.

#### Amiloride Hydrochloride 69

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with patients with 8th cranial nerve (vestibulocochlear nerve) impairment, decreased renal function, myasthenia gravis, and Parkinson disease. Amikacin readily crosses the placenta, and small amounts are distributed in breast milk. It may produce fetal nephrotoxicity. Neonates and premature infants may be more susceptible to amikacin toxicity because of their immature renal function. Elderly patients are at increased risk for amikacin toxicity because of age-related renal impairment as well as an increased risk for hearing loss. Signs and symptoms of superinfection, particularly changes in the oral mucosa, diarrhea, and genital or anal pruritus, should be monitored. Safety for treatment periods exceeding 14 days has not been established.

Determine the history of allergies, especially to aminoglycosides and sulfites. Expect to correct dehydration before beginning aminoglycoside therapy. Establish the baseline hearing acuity before beginning therapy. Obtain a specimen for culture and sensitivity testing before giving the first dose. Therapy may begin before test results are known. Urinalysis results to detect casts, RBCs, WBCs, and decreased specific gravity should be monitored. Expect to monitor peak and trough serum amikacin levels. Be alert for ototoxic and neurotoxic side effects.

#### Storage

Store vials at room temperature. Solutions normally appear clear but may become pale yellow; the yellow color does not affect the drug's potency. Discard the solution if a precipitate forms or dark discoloration occurs. Intermittent IV infusion (piggyback) is stable for 24 h at room temperature.

#### Administration

For intermittent IV infusion (piggyback), dilute each 500 mg with 100 mL of 0.9% NaCl or D5W. Infuse over 30-60 min for adults and older children. Dilution volumes for younger children and infants must be individualized. Infuse over 60-120 min for infants and young children.

For IM injection, administer slowly to minimize patient discomfort. Injections administered into the gluteus maximus are less painful than those given in the lateral aspect of the thigh.

### Amiloride Hydrochloride

a-mill'oh-ride hi-droh-klor'ide Midamor Do not confuse with amiodarone or amlodipine.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Diuretics, potassium sparing

#### **MECHANISM OF ACTION**

A guanidine derivative that acts as a potassium-sparing diuretic, antihypertensive, and antihypokalemic by directly interfering with sodium reabsorption in the distal tubule. *Therapeutic Effect:* Increases sodium and water excretion and decreases potassium excretion.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2 h	6-10 h	24 h

Incompletely absorbed from GI tract. Protein binding: Minimal. Primarily

Amiloride Hydrochloride (Generic Name)

excreted in urine; partially eliminated in feces. *Half-life:* 6-9 h.

## AVAILABILITY

Tablets: 5 mg.

## INDICATIONS AND DOSAGES

 To treat hypertension and congestive heart failure and to counteract potassium loss induced by other diuretics PO

*Adults.* 5-10 mg/day, up to 20 mg/day. *Elderly.* Initially, 5 mg/day or every other day.

#### Dosage in renal impairment

#### Creatinine

Clearance (mL/min)	Dosage
10-50	50% of normal
< 10	Avoid use

## **OFF-LABEL USES**

Liver cirrhosis and nephrotic syndrome.

## CONTRAINDICATIONS

Hypersensitivity; use of potassium supplements except if serious hypokalemia present, acute or chronic renal insufficiency, anuria, diabetic nephropathy, patients on other potassium-sparing diuretics, serum potassium > 5.5 mEq/L.

## INTERACTIONS

#### Drug

ACE inhibitors, including captopril, and potassium-sparing diuretics: May increase potassium levels. Anticoagulants, including heparin: May decrease effect of anticoagulants, including heparin.

**Drospirenone:** May increase potassium levels.

**Lithium:** May decrease lithium clearance and increase risk of lithium toxicity.

NSAIDs: May decrease antihypertensive effect. Herbal Licorice: May cause potassium loss. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN, calcium excretion, and glucose, serum creatinine, serum magnesium, serum potassium, and uric acid levels. May decrease serum sodium levels.

## SIDE EFFECTS

### Frequent (3%-8%)

Headache, nausea, diarrhea, vomiting, decreased appetite.

## Occasional (1%-3%)

Dizziness, constipation, abdominal pain, weakness, fatigue, cough, impotence, hyperkalemia.

## Rare (<1%)

Tremors, vertigo, confusion, nervousness, insomnia, thirst, dry mouth, heartburn, shortness of breath, increased urination, hypotension, rash.

## SERIOUS REACTIONS

• Severe hyperkalemia may produce irritability, anxiety, a feeling of heaviness in the legs, paresthesia of hands, face, and lips, hypotension, bradycardia, tented T waves, widening of QRS, and ST depression.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiopulmonary disease, diabetes mellitus, or liver insufficiency, BUN > 30 mg/dL or serum creatinine > 1.5 mg/dL, and in elderly and debilitated patients. Be aware that it is unknown whether amiloride crosses the placenta or is distributed in breast milk. There are no age-related precautions noted in children. In elderly patients, age-related decreased renal function increases the risk of hyperkalemia and may require caution. Incidence of hyperkalemia is increased when administered without a kaliuretic diuretic. Be aware a high-potassium diet and potassium supplements can be dangerous, especially with liver or kidney problems.

Notify the physician of signs and symptoms of hyperkalemia: confusion; difficulty breathing; irregular heartbeat; nervousness; numbness of the hands, feet, or lips; unusual tiredness; and weakness in the legs. BP, vital signs, electrolytes, intake and output, weight, and potassium levels should be monitored before and during treatment. A baseline 12-lead ECG should also be obtained.

#### Storage

Store at controlled room temperature; protect from light and moisture.

#### Administration

Take with food. Therapeutic effect of the drug takes several days to begin and can last for several days after the drug is discontinued.

## **Aminocaproic Acid**

a-mee-noe-ka-proe'ik as'id ★ Amicar Do not confuse Amicar with amikacin, Amikin, or Omacor.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Hemostatic

#### MECHANISM OF ACTION

A systemic hemostatic that acts as an antifibrinolytic and antihemorrhagic

by inhibiting the activation of plasminogen activator substances. *Therapeutic Effect:* Prevents fibrinolysis.

## PHARMACOKINETICS

Mean peak concentration reached within 1-2 h. Primarily excreted unchanged in the urine (65%). *Half-life:* 2 h.

#### AVAILABILITY

*Tablets:* 500 mg, 1000 mg. *Injection:* 250 mg/mL.

## INDICATIONS AND DOSAGES Acute bleeding

PO, IV INFUSION Adults, Elderly. 4-5 g over first hour; then 1-1.25 g/h. Continue for 8 h or until bleeding is controlled. Maximum: 30 g/24 h. *Children.* 3 g/m<sup>2</sup> over first hour; then 1 g/m<sup>2</sup>/h. Maximum: 18 g/m<sup>2</sup>/24 h.

#### **OFF-LABEL USES**

Prevention of recurrence of subarachnoid hemorrhage, prevention of hemorrhage in hemophiliacs following dental surgery.

#### CONTRAINDICATIONS

Evidence of active intravascular clotting process, disseminated intravascular coagulation without concurrent heparin therapy, hematuria of upper urinary tract origin (unless benefit outweighs risk); newborns (parenteral form).

## INTERACTIONS

#### Drug

#### Oral contraceptives, estrogens:

May increase clotting factors leading to a hypercoaguable state.

## DIAGNOSTIC TEST EFFECTS

May elevate serum potassium level.

Aminocaproic Acid (Generic Name), Amicar (Brand Name)

## IV INCOMPATIBILITIES

Sodium lactate. Do not mix with other medications. Do not give with Factor IX complexes or anti-inhibitor coagulant complexes.

#### SIDE EFFECTS

#### Occasional

Nausea, diarrhea, cramps, decreased urination, decreased BP, dizziness, headache, muscle fatigue and weakness, myopathy, bloodshot eyes.

## SERIOUS REACTIONS

 Too-rapid IV administration produces hypotension, tinnitus, rash, arrhythmias, unusual fatigue, and weakness.

• Rarely, a grand mal seizure occurs, generally preceded by weakness, dizziness, and headache.

• Intrarenal obstruction and acute renal failure.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hyperfibrinolysis, skeletal muscle weakness, and impaired cardiac, hepatic, or renal function. No information is available concerning the distribution of aminocaproic acid in breast milk. There is no documented evidence of age-related problems in children; however, injectable contains benzyl alcohol and is not recommended for use in newborns. Although no elderlyrelated problems have been noted, cautious use is advised because of the risk of age-related renal impairment, which may require dosage reduction. Women may experience an increase in menstrual flow.

Notify the physician of red or dark urine, muscular pain or weakness, abdominal or back pain, gingival bleeding, black or red stool, coffeeground vomitus, or blood-tinged mucus from cough. BP, heart rate and rhythm, and pulse rate, serum creatine kinase, and AST (SGOT) levels should be monitored.

#### Storage

Store tablets and solution at room temperature; keep tightly closed. Do not freeze solution.

Store injection at room temperature. Administration

! Expect to administer a reduced dose if the patient has cardiac, renal, or hepatic impairment.

For IV use, dilute each 1 g in up to 50 mL 0.9% NaCl, D5W, Ringer's solution, or sterile water for injection. Do not use sterile water for injection in those with subarachnoid hemorrhage. Do not give by direct injection. Give only by IV infusion. Infuse 5 g or less over the first hour in 250 mL of solution. Give each succeeding 1 g over 1 h in 50-100 mL of solution. Monitor for hypotension during the infusion. Be aware that rapid infusion may produce arrhythmias, including bradycardia.

## Aminophylline

am-in-ofPi-lin Phyllocontin Do not confuse aminophylline with amitriptyline or ampicillin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Bronchodilators, xanthine derivatives

## **MECHANISM OF ACTION**

A xanthine derivative that acts as a bronchodilator by directly relaxing smooth muscle of the bronchial airways and pulmonary blood vessels. *Therapeutic Effect:* Relieves bronchospasm and increases vital capacity.

Aminophylline (Generic Name)

## PHARMACOKINETICS

Aminophylline is rapidly converted to theophylline. See theophylline monograph.

## AVAILABILITY

Tablets: 100 mg, 200 mg. Injection (aminophylline): 25 mg/mL.

## INDICATIONS AND DOSAGES

Note that aminophylline dose equals theophylline dose divided by 0.8. Doses should be calculated based on ideal body weight.

Theophylline is usually preferred for oral dosages.

#### Chronic bronchospasm PO

Adults, Elderly, Children weighing more than 45 kg. Aminophylline 380 mg/day divided every 6-8 h, after 3 days if tolerated may increase to aminophylline 507 mg/ day divided every 6-8 h, and after 3 additional days if tolerated and increased dose is necessary may increase to aminophylline 760 mg/ day divided every 6-8 h. Maximum dose is theophylline 400 mg/day in adults with risk factors for reduced clearance or when concentration monitoring is not feasible.

#### Acute bronchospasm in patients not currently taking theophylline PO

Adults, children older than 1 yr. Initially, loading dose of aminophylline 6.25 mg/kg, then maintenance dosage of oral theophylline based on patient group (shown below).

Patient Group	Maintenance Theophylline Dosage*
Healthy, nonsmoking adults	3 mg/kg q8h
Elderly patients, patients with cor pulmonale	2 mg/kg q8h

Patient Group	Maintenance Theophylline Dosage*
Patients with CHF or hepatic disease	1-2 mg/kg q12h
Children 9-16 yr, young adult smokers	3 mg/kg q6h
Children 1-8 yr	4 mg/kg q6h

\*Convert dose to aminophylline equivalent if using aminophylline. Aminophylline dose equals theophylline dose divided by 0.8.

#### IV INFUSION

Adults, Children older than 1 yr. Initially, loading dose of 6 mg/kg (aminophylline); maintenance dosage of aminophylline based on patient group (shown next).

Patient Group	Maintenance Aminophylline Dosage
Healthy, nonsmoking adults	0.7 mg/kg/h
Elderly patients, patients with cor pulmonale, CHF, or hepatic impairment	0.25 mg/kg/h
Children 13-16 yr	0.7 mg/kg/h
Children 9-12 yr, young adult smokers	0.9 mg/kg/h
Children 1-8 yr	1-1.2 mg/kg/h
Children 6 mo to 1 yr	0.6-0.7 mg/kg/h
Children 6 wks to 6 mo	0.5 mg/kg/h
Neonates	5 mg/kg q12h

#### Acute bronchospasm in patients currently taking theophylline PO, IV

Adults, children older than 1 yr. Obtain serum theophylline level. If not possible and patient is in respiratory distress and not experiencing toxic effects, may give theophylline 2.5 mg/kg dose. Maintenance: Dosage based on peak serum theophylline concentration, clinical condition, and presence of toxicity.

## CONTRAINDICATIONS

History of hypersensitivity to caffeine or xanthine.

## INTERACTIONS

#### Drug

β-blockers: May decrease the effects of aminophylline.

Cimetidine, ciprofloxacin, erythromycin, fluvoxamine, norfloxacin, tacrine, zileuton: May increase theophylline blood concentration and risk of aminophylline toxicity.

#### **Phenytoin, primidone, rifampin:** May increase theophylline

metabolism.

Smoking: May decrease theophylline blood concentration. Food

Charcoal-broiled foods; highprotein, low-carbohydrate diet: May decrease the theophylline blood level.

## DIAGNOSTIC TEST EFFECTS

None known. Measure serum theophylline level to guide all dosage adjustments.

## IV INCOMPATIBILITIES

Amiodarone (Cordarone), ciprofloxacin (Cipro), dobutamine (Dobutrex), epinephrine, hydroxyzine, magnesium sulfate, norepinephrine, ondansetron (Zofran).

## **IV COMPATIBILITIES**

Aztreonam (Azactam), ceftazidime (Fortaz), dopamine, fluconazole (Diflucan), heparin, morphine, potassium chloride.

## SIDE EFFECTS

#### Frequent

Altered smell (during IV administration), nausea, restlessness, tachycardia, tremor.

## Occasional

Heartburn, vomiting, headache, mild diuresis, insomnia, behaviroal alterations.

## SERIOUS REACTIONS

 Too-rapid IV administration or excessive dosage may produce theophylline toxicity, noted by persistent, repetitive nausea and vomiting, hypotension with accompanying faintness, light-headedness, palpitations, tachycardia, hyperventilation, angina-like pain, seizures, ventricular fibrillation, and cardiac standstill.

## **PRECAUTIONS & CONSIDERATIONS**

Monitor signs and symptoms of theophylline toxicity, as well as serum drug levels, often to ensure appropriate dosage. Caution is warranted with diabetes mellitus; glaucoma; hypertension; hyperthyroidism; cardiac, renal, or hepatic impairment; peptic ulcer disease; and seizure disorder. Aminophylline crosses the placenta and small amounts of the drug may be distributed in breast milk and cause irritability in the breastfeeding infant. Use the drug cautiously in children < 1 yr. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Smoking, charcoal-broiled foods, and a high-protein, low-carbohydrate diet may decrease the theophylline level.

Pulse rate and quality; respiratory rate, depth, rhythm, and type; ABG levels; and serum potassium levels should be monitored. Peak serum concentration should be obtained 1 h after an IV dose, 1-2 h after an immediate-release dose, and 3-8 h after a sustained-release dose. Serum

A

trough level should be obtained just before the next dose. Lips and fingernails should be assessed for signs of hypoxemia, such as a blue or gray color in light-skinned patients and a gray color in dark-skinned patients.

## Storage

Store injection vials at room temperature. Do not use if crystals are present.

Store tablets and oral solution at room temperature. Protect from light and moisture.

#### Administration

Take oral aminophylline with food to avoid GI distress.

Discard the solution for injection if it contains a precipitate. For IV use, give loading dose diluted in 100-200 mL of D5W or 0.9% NaCl. Prepare maintenance dose in larger-volume parenteral infusion. Usual concentration for maintenance infusion is 1 mg/mL. Do not exceed a flow rate of 25 mg/min for either piggyback or infusion. Administer loading dose over 20-30 min. Use an infusion pump or microdrip to regulate IV administration.

## **Aminosalicylic Acid**

a-mee-noe-sal-i-sil'ik as'id Paser

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antitubercular anti-infective

### **MECHANISM OF ACTION**

An antitubercular agent active against *M. tuberculosis.* Thought to exhibit competitive antagonism

of folic acid synthesis. *Therapeutic Effect:* Bacteriostatic activity in susceptible microorganisms.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 50%-60%. Widely distributed (including CSF). Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 1.1-1.62 h.

#### AVAILABILITY

*Packet Granules:* 4 g/packet granules (Paser).

#### INDICATIONS AND DOSAGES

 Tuberculosis in combination with other agents; most commonly used for multi-drug resistant TB (MDR-TB) PO

*Adults, Elderly.* 4 g in divided doses 3 times/day.

*Children.* 150 mg/kg/day in divided doses 3 times/day. Maximum: 12 g/day.

#### **OFF-LABEL USES**

Crohn's disease, hyperlipidemia, ulcerative colitis.

#### CONTRAINDICATIONS

End-stage renal disease, hypersensitivity to aminosalicylic acid products.

#### INTERACTIONS

#### Drug

**Cyanocobalamin:** May decrease cyanocobalamin absorption. **Digoxin:** May decrease digoxin absorption.

**Isoniazid:** May increase isoniazid serum levels.

## DIAGNOSTIC TEST EFFECTS

May alter bilirubin levels in urinalysis. Lowered blood cell counts; reduction in prothrombin.

## SIDE EFFECTS

#### Occasional

Abdominal pain, diarrhea, nausea, vomiting.

#### Rare

Hypersensitivity reactions, hepatotoxicity, thrombocytopenia.

## SERIOUS REACTIONS

• Hypersensitivity reactions: fever, skin eruptions including exfoliative dermatitis, infectious mononucleosis-like, or lymphomalike symdrome.

 Blood dyscrasias: leukopenia, agranulocytosis, thrombocytopenia, Coombs' positive hemolytic anemia.

• Rarely, jaundice, hepatitis, pericarditis, hypoglycemia, optic neuritis, encephalopathy, vasulitis.

#### PRECAUTIONS & CONSIDERATIONS

Patients with aspirin-sensitive asthma and nasal polyps may be more likely to experience sensitivity reactions. Precaution is necessary with liver insufficiency, peptic ulcer disease, impaired renal function, and congestive heart failure. It is unknown whether aminosalicylic acid crosses the placenta or is excreted in breast milk. There are no age-related precautions noted in children or in elderly patients. Be aware that skeleton of the granules may appear in the stool.

Liver function should be monitored during therapy. Symptoms of hepatitis as evidenced by anorexia, dark urine, fatigue, jaundice, nausea, vomiting, and weakness should be assessed. If hepatitis is suspected, withhold the drug and notify the physician promptly.

#### Storage

Store in refrigerator or freezer.

#### Administration

May sprinkle granules on acidic food such as applesauce or yogurt or mix with acidic drink such as tomato, orange, grapefruit, grape, cranberry, or apple juice or fruit punch. Granules must be swirled in drink since they will not dissolve. Care must be taken to maintain the enteric coating; in the presence of gastric acid, unprotected aminosalicylic acid is converted to a known hepatotoxin. Discard medication if the package is swollen or the granules are dark brown or purple.

## Amiodarone

a-mee'oh-da-rone Cordarone, Pacerone **Do not confuse amiodarone with** amiloride or amantadine, or Cordarone with Cardura.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

Classification: Antiarrhythmics, class III

## **MECHANISM OF ACTION**

A cardiac agent that prolongs duration of myocardial cell action potential and refractory period by acting directly on all cardiac tissue. Decreases AV and sinus node function. *Therapeutic Effect:* Suppresses arrhythmias.

## PHARMACOKINETICS

Route	Onset	Steady State	Duration
PO	3 days to 3 wks	1 wk to 5 mo	7-50 days after discontin- uation

Slowly, variably absorbed from GI tract; oral bioavailability is 35%-65%. Protein binding: 96%.

Amiodarone (Generic Name), Pacerone (Brand Name)

Extensively metabolized by CYP3A4 and CYP2C8 to active metabolite. Excreted via bile; not removed by hemodialysis. *Half-life*: 26-107 days; metabolite, 61 days.

## AVAILABILITY

Tablets (Cordarone): 200 mg. Tablets (Pacerone): 100 mg, 200 mg, 400 mg. Injection (Cordarone): 50 mg/mL.

### INDICATIONS AND DOSAGES

## Life-threatening recurrent ventricular fibrillation or hemodynamically unstable ventricular tachycardia

Adults, Elderly. Initially, load with (unless patient has been on IV treatment) 800-1600 mg/day in 2-4 divided doses for 1-3 wks. After arrhythmia is controlled or side effects occur, reduce to 600-800 mg/ day for about 4 wks. Maintenance: 200-600 mg/day with a usual maintenance dose of 400 mg/day. IV INFUSION

*Adults*. Initially, 150 mg over 10 min, then 360 mg over 6 h; then 540 mg over 18 h. May continue at 0.5 mg/min for up to 2-3 wks regardless of age or renal or left ventricular function.

## **OFF-LABEL USES**

ACLS protocol for ventricular arrhythmias. Treatment and prevention of supraventricular arrhythmias and symptomatic atrial flutter refractory to conventional treatment.

## CONTRAINDICATIONS

Bradycardia-induced syncope (except in the presence of a pacemaker), cardiogenic shock, second- and third-degree AV block, severe hepatic disease, severe sinus-node dysfunction; hypersensitivity to amiodarone or its components, including iodine.

#### INTERACTIONS Drug

Antiarrhythmics: May increase cardiac effects.

Azole antifungals, fluoroquinolones, macrolides, ranolazine, thioridazine, vardenafil, ziprasidone: Risk of cardiac arrhythmias, including torsades de pointes, may be increased.

β-blockers, oral anticoagulants: May increase effect of β-blockers and oral anticoagulants. Cyclosporine: Increased cyclosporine concentrations. Digoxin, phenytoin: May increase drug concentration and risk of toxicity of digoxin and phenytoin. Lovastatin: Increased risk of myopathy/rhabdomyolysis; limit lovastatin dose to 40 mg/day. Protease inhibitors: Increased amiodarone concentrations/ toxicity; ritonavir and nelfinavir are contraindicted with amiodarone. Simvastatin: Increased risk of myopathy/rhabdomyolysis; limit simvastatin dose to 20 mg/day. Warfarin: Increased anticoagulant effect; closely monitor International Normalized Ratio. Herbal

St. John's wort: May reduce amiodarone concentrations. Food

All foods: Food increases the rate and extent of absorption. Dose consistently with regard to meals. Grapefruit juice: Increased amiodarone concentrations; avoid grapefruit juice.

## DIAGNOSTIC TEST EFFECTS

May increase antinuclear antibody titers and AST (SGOT), ALT (SGPT), and serum alkaline phosphatase levels. May cause changes in ECG and thyroid function test results. Therapeutic serum level is 0.5-2.5 mcg/mL, but is not well correlated with efficacy as a result of long half-life of drug.

## IV INCOMPATIBILITIES

Aminophylline, ampicillin/sulbactam (Unasyn), argatroban, atenolol, cefamandole, cefazolin (Ancef), ceftazidime (Fortaz), digoxin (Lanoxin), doxorubicin, ertapenem (Invanz), heparin, imipenem/ cilastatin (Primaxin), levofloxacin, (Levaquin), mezlocillin, micafungin (Mycamine), paclitaxel, piperacillin/ tazobactam (Zosyn), potassium phosphate, sodium acetate, sodium bicarbonate, sodium phosphate

## IV COMPATIBILITIES

Dobutamine (Dobutrex), dopamine (Intropin), furosemide (Lasix), insulin (regular), labetalol (Normodyne), lidocaine, midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), phenylephrine (Neo-Synephrine), potassium chloride, vancomycin.

## SIDE EFFECTS

#### Expected

Corneal microdeposits are noted in almost all patients treated for more than 6 mo (can lead to blurry vision). Frequent (> 3%)

Parenteral: Hypotension, nausea, fever, bradycardia. Oral: Constipation, headache, decreased appetite, nausea, vomiting, paresthesias, photosensitivity, muscular incoordination, hypothyroidism, malaise, fatigue, tremor, abnormal liver function tests.

#### Occasional (< 3%)

Oral: Bitter or metallic taste, decreased libido, dizziness, facial flushing, blue-gray coloring of skin (face, arms, and neck), blurred

vision, bradycardia, asymptomatic corneal deposits, hyperthyroidism. Rare (<1%)

Oral: Rash, vision loss, blindness, peripheral neuropathy.

#### SERIOUS REACTIONS

· Serious, potentially fatal pulmonary toxicity (alveolitis, pulmonary fibrosis, pneumonitis, acute respiratory distress syndrome) may begin with progressive dyspnea and cough with crackles, decreased breath sounds, pleurisy, CHF.

· Amiodarone may worsen existing arrhythmias or produce new arrhythmias (called proarrhythmias).

· Hepatotoxicity may occur.

· May induce hyper- or hypothyroidism.

#### PRECAUTIONS & CONSIDERATIONS

A Med Guide must be dispensed with every prescription and refill. For life-threatening arrhythmias: patients are hospitalized during initiation of therapy due to drug toxocity.

Caution is warranted with thyroid disease. Amiodarone crosses the placenta and is distributed in breast milk; it adversely affects fetal development. Safety and efficacy of amiodarone have not been established in children. Elderly patients may be more sensitive to amiodarone's effects on thyroid function and may experience increased incidence of ataxia or other neurotoxic effects. Amiodarone may cause photosensitivity; wear sunscreen and sun-protective clothing. Signs and symptoms of pulmonary toxicity, including progressively worsening cough and dyspnea, should be assessed. Dosage should be discontinued or reduced if toxicity occurs.

Chest x-ray, ECG, pulmonary function tests, liver enzyme tests, AST, ALT, and serum alkaline phosphatase level should be obtained at baseline and during therapy. Apical pulse and BP should be assessed immediately before giving amiodarone. Withhold the medication and notify the physician if the pulse rate is 60 beats/min or lower or the systolic BP is < 90 mm Hg. Pulse rate for bradycardia, an irregular rhythm, and quality should be monitored. ECG for changes such as widening of the ORS complex and prolonged PR and OT intervals should be assessed; notify the physician of significant interval changes. Signs and symptoms of hyperthyroidism, such as difficulty breathing, bulging eyes (exophthalmos), eyelid edema, frequent urination, hot and dry skin, and weight loss, and signs and symptoms of hypothyroidism, such as cool and pale skin, lethargy, night cramps, periorbital edema, and pudgy hands and feet should also be monitored.

## Storage

Store unopened vials at room temperature. Protect from light.

Store tablets at room temperature. Administration

#### For oral use, take with meals to reduce GI distress. Dose consistently with regard to meals. Tablets may be crushed if necessary.

! IV infusion concentrations > 3 mg/mL can cause peripheral vein phlebitis.

For IV administration, use glass or polyolefin containers for dilution. Avoid evacuated glass containers. Dilute the loading dose of 150 mg in 100 mL D5W to yield a solution of 1.5 mg/mL. Dilute the maintenance dose of 900 mg in 500 mL D5W to yield a solution of 1.8 mg/mL. Avoid a concentration exceeding 2 mg/mL unless a central venous catheter is used. Administer with a volumetic infusion pump. When possible, administer through central venous catheter used only for amiodarone. Use an in-line filter.

## Amitriptyline

a-mee-trip'ti-leen Elavil Levate, Novo-Triptyn Do not confuse amitriptyline with aminophylline or nortriptyline, or Elavil with Equanil or Mellaril.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, tricyclic

## **MECHANISM OF ACTION**

A tricyclic antidepressant that blocks the reuptake of neurotransmitters, including norepinephrine and serotonin, at presynaptic membranes, thus increasing their availability at postsynaptic receptor sites. Also has strong anticholinergic activity. *Therapeutic Effect:* Relieves depression.

## PHARMACOKINETICS

Rapidly and well absorbed from the GI tract. Protein binding: 90%. Undergoes first-pass metabolism in the liver. Nortriptyline is an active metabolite. Metabolites excreted in urine. Minimal removal by hemodialysis. *Half-life*: 10-26 h.

## AVAILABILITY

*Tablets:* 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

Amitriptyline (Generic Name)

## PO

*Adults.* Initially, 25-75 mg/day as a single dose at bedtime or in divided doses. May gradually increase up to 300 mg/day. Titrate to lowest effective dosage. *Elderly.* Initially, 10-25 mg at bedtime. May increase by 10-25 mg at weekly intervals. Range: 25-150 mg/day.

## **OFF-LABEL USES**

Relief of neuropathic pain, such as that experienced by patients with diabetic neuropathy or postherpetic neuralgia; treatment of bulimia nervosa.

## CONTRAINDICATIONS

Acute recovery period after MI; use within 14 days of MAOIs, hypersensitivity.

## INTERACTIONS

#### Drug

Antithyroid agents: May increase the risk of agranulocytosis. Cimetidine, valproic acid: May increase amitriptyline blood concentration and risk of toxicity. Clonidine, guanadrel: May decrease the effects of these drugs. CNS depressants (including alcohol, anticonvulsants, barbiturates, phenothiazines, and sedative-hypnotics): May increase CNS and respiratory depression and the hypotensive effects of

amitriptyline. **CYP2D6 inhibitors:** May increase amitriptyline blood concentrations and risk of toxicity.

**MAOIs:** May increase the risk of neuroleptic malignant syndrome, seizures, hypertensive crisis, and hyperpyresis. Contraindicated for concomitant use. Make sure at least 14 days elapse between the use of MAOIs and amitriptyline.

**Phenothiazines:** May increase the sedative and anticholinergic effects of amitriptyline.

**Sympathomimetics:** May increase the risk of cardiac effects.

Herbal

**St. John's wort:** May decrease amitriptyline concentration.

## DIAGNOSTIC TEST EFFECTS

May alter blood glucose levels and ECG readings. Therapeutic serum drug level is 120-250 ng/mL; toxic serum drug level is > 500 ng/mL.

## SIDE EFFECTS

#### Frequent

Dizziness, somnolence, dry mouth, orthostatic hypotension, headache, increased appetite, weight gain, nausea, unusual fatigue, unpleasant taste.

#### Occasional

Blurred vision, confusion, constipation, hallucinations, delayed micturition, eye pain, arrhythmias, fine muscle tremors, parkinsonian syndrome, anxiety, diarrhea, diaphoresis, heartburn, insomnia. **Rare** 

Hypersensitivity, alopecia, tinnitus, breast enlargement, photosensitivity.

## SERIOUS REACTIONS

• Overdose may produce confusion, seizures, severe somnolence, arrhythmias, fever, hallucinations, agitation, dyspnea, vomiting, and unusual fatigue or weakness.

 Abrupt discontinuation after prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams. • Blood dyscrasias and cholestatic jaundice occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

A Med Guide should be dispensed with every prescription and refill.

Caution is warranted with cardiovascular disease, diabetes mellitus, angle-closure glaucoma, hiatal hernia, history of seizures, history of urine retention or urinary obstruction, hyperthyroidism, increased intraocular pressure, hepatic or renal disease, benign prostatic hyperplasia, and schizophrenia. Amitriptyline crosses the placenta and is minimally distributed in breast milk. Not approved for use in children < 12 yrs of age. Children are more sensitive to an acute overdose and are at increased risk for amitriptyline toxicity. In addition, antidepressants have been associated with an increased risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders. Elderly patients are more sensitive to the drug's anticholinergic effects and are at increased risk for amitriptyline toxicity.

Anticholinergic, sedative, and hypotensive effects may occur, but tolerance usually develops to these effects. Because dizziness may occur, change positions slowly, and avoid alcohol and tasks that require alertness or motor skills. CBC and blood chemistry profile should be obtained before and periodically during therapy, especially with long-term use. BP and pulse rate should be monitored to detect for arrhythmias and hypotension.

## Administration

Take oral amitriptyline tablets with food or milk if GI distress occurs. Do

not abruptly discontinue the drug. Full therapeutic effect may be noted in 2-4 wks.

Bedtime once-daily administration may increase compliance and limit side effects.

## Amlodipine

am-low'di-peen Norvasc Do not confuse amlodipine with amiloride, or Norvasc with Navane or Vascor.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Calcium channel blockers, antianginal, antihypertensive

#### MECHANISM OF ACTION

A calcium channel blocker that inhibits calcium movement across cardiac and vascular smooth-muscle cell membranes. *Therapeutic Effect:* Relieves angina by dilating coronary arteries, peripheral arteries, and arterioles. Decreases total peripheral vascular resistance and BP by vasodilation.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5-1 h	6-12 h	24 h

Slowly absorbed from the GI tract. Protein binding: 93%. Extensively metabolized in the liver; active drug and metabolites excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 30-50 h (increased in elderly patients and in those with liver cirrhosis).

Amlodipine (Generic Name), Norvasc (Brand Name)

#### AVAILABILITY

Tablets: 2.5 mg, 5 mg, 10 mg.

## INDICATIONS AND DOSAGES

## Hypertension

PO

*Adults*. Initially, 5 mg/day as a single dose. Maximum: 10 mg/day. *Elderly and Debilitated Patients*. Initially, 2.5 mg/day as a single dose. Titrate to 5 mg/day if needed. *Children 6-17 yr*. 2.5-5 mg/day as a single dose.

# Angina (chronic stable or vasospastic)

PO

*Adults.* 5-10 mg/day as a single dose. *Elderly.* 5 mg/day as a single dose. Maximum: 10 mg.

Dosage in hepatic impairment
 For adults and elderly patients, give
 2.5 mg/day for hypertension;
 5 mg/day for angina.

#### CONTRAINDICATIONS

Severe hypotension, known sensitivity to amlodipine.

#### INTERACTIONS

#### Drug

**Diltiazem:** May increase amlodipine exposure.

**Strong CYP3A4 inducers:** May decrease amlodipine levels.

**Strong CYP3A4 inhibitors:** May increase amlodipine exposure.

#### Herbal

St. John's wort: May decrease amlodipine levels.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent (> 5%) Peripheral edema, headache, flushing. Occasional (1%-5%)

Dizziness, palpitations, nausea, unusual fatigue or weakness (asthenia).

#### Rare (<1%)

Chest pain, bradycardia, orthostatic hypotension.

## SERIOUS REACTIONS

 Overdose may produce excessive peripheral vasodilation and marked hypotension with reflex tachycardia.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with aortic stenosis, CHF, and impaired hepatic function. Expect to adjust dosage in hepatic impairment. It is unknown whether amlodipine crosses the placenta or is distributed in breast milk. The safety and efficacy of amlodipine have not been established in children younger than 6 yr of age. Elderly patients are more sensitive to amlodipine's hypotensive effects, and its half-life may be increased in these patients. Tasks that require alertness and motor skills should be avoided until drug effects are known.

Asthenia or headache may occur. Apical pulse, BP, and renal and liver function test results should be monitored before and during therapy. Skin should be assessed for flushing and peripheral edema, especially behind the medial malleolus and the sacral area.

#### Administration

Amlodipine may be taken without regard to food. Do not abruptly discontinue amlodipine.

## **Ammonium Lactate**

ah-moe'nee-um lack'tate ★ Amlactin, Lac-Hydrin, Lac-Hydrin Five, LAC-Lotion ◆ Dermalac

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

Classification: Dermatologics

## **MECHANISM OF ACTION**

Lactic acid is an α-hydroxy acid that influences hydration, decreases corneocyte cohesion, reduces excessive epidermal keratinization in hyperkeratotic conditions, and induces synthesis of mucopolysaccharides and collagen in photodamaged skin. The exact mechanism is not known. *Therapeutic Effect:* Increases hydration of the skin.

#### PHARMACOKINETICS

Not known.

#### AVAILABILITY

Cream: 12% (Amlactin). Lotion: 5% (Lac-Hydrin Five), 12% (Amlactin, Lac-Hydrin. LAC-Lotion).

## INDICATIONS AND DOSAGES

 Treatment of ichthyosis vulgaris and xerosis

*Adults, Elderly, Children.* Apply sparingly and rub into area thoroughly twice daily.

## CONTRAINDICATIONS

Hypersensitivity to ammonium lactate.

## INTERACTIONS

#### Drug

**Calcipotriene:** May decrease the effects of calcipotriene.

### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

### Occasional (2%-15%)

Burning, stinging, rash, itching, dry skin.

## PRECAUTIONS & CONSIDERATIONS

Ammonium lactate should not be used on broken skin or in areas of infection, and do not apply to the face, inguinal areas, or abraded skin. It is not known whether ammonium lactate is distributed in breast milk. Safety and efficacy have not been established in children younger than 2 yr of age. Treated skin areas may be sensitive to sunlight (UV) exposure. **Storage** 

#### Store at room temperature. Administration

Gently cleanse area before application. Shake lotion well before application. Use occlusive dressings only as ordered. Apply sparingly and rub into area thoroughly. Avoid contact with the eyes and mucous membranes.

## Amoxapine

a-moks'a-peen **Do not confuse with atomoxetine** or atropine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antidepressants, cyclic

#### MECHANISM OF ACTION

A cyclic antidepressant that blocks the reuptake of neurotransmitters, such as norepinephrine and serotonin, at CNS presynaptic membranes, increasing their availability at postsynaptic receptor sites. The metabolite 7-OH-amoxapine has significant dopamine receptor blocking activity similar to that of haloperidol. *Therapeutic Effect:* Produces antidepressant effects.

## PHARMACOKINETICS

Rapidly, well absorbed from the GI tract. Protein binding: 90%. Metabolized in liver. Excreted in urine and feces. *Half-life:* 8 h.

Amoxapine (Generic Name)

## Amobarbital

am-oh-bar'bi-tal Amytal Sodium

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: II

**Classification:** Barbiturates, preanesthetics, sedatives/ hypnotics

## **MECHANISM OF ACTION**

A barbiturate that depresses the sensory cortex, decreases motor activity, and alters cerebellar function. *Therapeutic Effect:* Produces drowsiness, sedation, and hypnosis.

## PHARMACOKINETICS

Protein binding: 60%. Metabolized in liver primarily by the hepatic microsomal enzyme system. Primarily excreted in urine. *Half-life:* 16-40 h.

## AVAILABILITY

*Powder for Injection:* 500 mg (Amytal Sodium).

## INDICATIONS AND DOSAGES

Preanesthetic sedative IM/IV

Adults, Children 6 yr and older: 65-200 mg single dose. Alternatively, use a weight-based dose: 3-5 mg/kg/dose.

#### Short-term treatment of insomnia IM/IV

*Adults.* 65-200 mg at bedtime. *Elderly.* Not recommended. *Children older than 6 yr.* 2-3 mg/kg/ dose at bedtime.

## **OFF-LABEL USES**

Refractory seizures.

## CONTRAINDICATIONS

History of manifest or latent porphyria, marked liver dysfunction, marked respiratory disease in which dyspnea or obstruction is evident, and hypersensitivity to amobarbital products.

## INTERACTIONS

#### Drug

Anticoagulants, steroids: May decrease the effects of anticoagulants and steroids.

## Anticonvulsants, barbiturates, benzodiazepines, valproic acid:

May increase the metabolism of anticonvulsants, barbiturates, benzodiazepines, and valproic acid. **CNS depressants:** May increase respiratory depression and hypotension.

Corticosteroids, doxycycline, griseofulvin: May decrease the effect of corticosteroids, doxycycline, and griseofulvin. MAOIs: Increased hypotensive or prolonged activity of barbiturate. Herbal

Kava kava, valerian: May increase CNS depression.

St. John's wort: May decrease the effects of amobarbital sodium.

**Ethanol:** May increase CNS depression.

## DIAGNOSTIC TEST EFFECTS

May falsely elevate phenobarbital levels when measured with EMIT(R) system.

## IV INCOMPATIBILITIES

Atracurium, cefazolin (Ancef), cephalothin, chlorpromazine (Thorazine), cimetidine (Tagamet), clindamycin (Cleocin), codeine, dimenhydrinate, diphenhydramine (Benadryl), droperidol, hydrocortisone, hydroxyzine (Vistaril), insulin, isoproterenol (Isuprel), levorphanol (Levo-Dromaron), meperidine (Demerol), methadone (Dolophine), methyldopa (Aldomet), morphine, norepinephrine (Levophed), pancuronium, penicillin G (Bicillin), pentazocine (Talwin), phytonadione (AquaMEPHYTON), procaine (Novocain), prochlorperazine (Compazine), streptomycin, succinylcholine (Anectine), vancomycin.

## **IV COMPATIBILITIES**

Amikacin, aminophylline.

## SIDE EFFECTS

#### Frequent

Somnolence, headache, confusion, dizziness; bradycardia, hypotension may lead to syncope.

## Occasional

Nausea, vomiting, visual abnormalities, such as spots before eyes, difficulty focusing, blurred vision, dry mouth or pharynx, tongue irritation, water retention, increased sweating, constipation, or diarrhea.

## SERIOUS REACTIONS

 Overdosage results in severe respiratory depression, skeletal muscle flaccidity, bronchospasm, cardiovascular disturbances, such as congestive heart failure (CHF), hypotension or hypertension, arrhythmias, cold and clammy skin, cyanosis, and coma.

• May cause CNS depression or paradoxic CNS reactions.

• Tolerance may occur with repeated use.

• Extravasation may cause local tissue damage.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is necessary in patients with impaired cardiac, liver, or

renal function. Amobarbital crosses the placenta and is distributed in breast milk. Teratogenic effects have been reported after firsttrimester exposure; withdrawal reactions have been observed in infants following third-trimester exposure. Behavioral changes are more likely to occur in children and elderly patients. Monitor BP for hypotension, level of sedation, and pulse for bradycardia as well as respiratory rate and rhythm. Change positions slowly to avoid orthostatic hypotension. Tasks that require mental alertness or motor skills should be avoided.

#### Storage

Store at room temperature. Once reconstituted, no more than 30 min should pass from the time the vial is opened and the contents are used as the drug/solution hydrolyzes upon exposure to air. Discard any unused portion.

#### Administration

IM: Administer deeply into a large muscle. Reconstitute 500 mg with 2.5 mL of sterile water for injection to give a solution of 200 mg/mL for IM use. Do not use more than 5 mL at any single site (may cause tissue damage). Maximum: 500 mg. IV: Use only when IM administration is not feasible; reserve IV route for hospitalized patients with close observation. Administer by slow IV injection. For IV use, reconstitute 500 mg with 5 mL of sterile water for injection to give a concentration of 100 mg/ mL. Do not use solution that has not become clear within 5 min of addition of diluent. The rate of IV injection should not exceed 50 mg/min in adults to prevent sudden respiratory depression, apnea, and hypotension.

### AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg, 150 mg.

## INDICATIONS AND DOSAGES Depression

#### PO

*Adults.* 50 mg 2-3 times/day. May increase to 100 mg 2-3 times/day. Maximum: 300 mg/day (outpatient); higher doses have been used rarely (inpatient). *Elderly.* Initially, 25 mg at bedtime.

May increase by 25 mg/day q3-7 days.

## CONTRAINDICATIONS

Acute recovery period following myocardial infarction (MI), within 14 days of MAOI ingestion, hypersensitivity to dibenzoxazepine compounds.

## INTERACTIONS

#### Drug

Alcohol, CNS depressants: May increase CNS and respiratory depression and amoxapine's hypotensive effects.

**CYP2D6 inhibitors, such as cimetidine, quinidine, fluoxetine, sertraline, paroxetine:** May increase amoxapine blood concentration and risk of side effects. Sufficient time must elapse before initiating amoxapine in a patient withdrawing from fluoxetine treatment (at least 5 wks may be necessary).

**Clonidine, guanadrel:** May decrease the effects of clonidine and guanadrel.

#### Fluoroquinolones,

sympathomimetics: May increase cardiac effects.

**MAOIs:** May increase the risk of convulsions, hyperpyresis, and hypertensive crisis. Contraindicated.

**Nefopam:** May increase risk of seizures.

**Phenothiazines:** Similar metabolic pathways and clinical activity, increased CNS, anticholinergic, and hypotensive effects.

## Herbal

**St. John's wort:** May increase risk of serotonin syndrome. **Food** 

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum glucose levels.

## SIDE EFFECTS

#### Frequent

Drowsiness, fatigue, xerostomia, constipation, weight gain.

#### Occasional

Nausea, dizziness, headache, confusion, nervousness, restlessness, insomnia, edema, tremor, blurred vision, aggressiveness, muscle weakness.

#### Rare

Paradoxical reactions (agitation, restlessness, nightmares, insomnia, extrapyramidal symptoms, particularly fine hand tremor), laryngitis, seizures.

## SERIOUS REACTIONS

 High dosage may produce cardiovascular effects, including severe postural hypotension, dizziness, tachycardia, palpitations, arrhythmias, and seizures. High dosage may also result in altered temperature regulation, such as hyperpyrexia or hypothermia.

 Abrupt withdrawal from prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

• Extrapyramidal reactions, neuroleptic malignant syndrome, and tardive dyskinesia may

A

occur as a result of the dopamine receptor blocking activity of the metabolite.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cardiac conduction disturbances, cardiovascular disease, hyperthyroidism, seizure disorders, and urinary retention and in persons taking thyroid replacement therapy. Be aware that amoxapine is distributed in breast milk. Safety and effectiveness have not been established in children < 16 yr of age. Antidepressants have been associated with an increased risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders.

Expect to use lower dosages in elderly patients. Higher dosages are not tolerated well and increase the risk of toxicity in elderly patients. Blurred vision, drowsiness, constipation, and dry mouth may occur during therapy. Change positions slowly to avoid postural hypotension. Avoid alcohol and tasks that require mental alertness or motor skills. Tolerance usually develops to amoxapine's anticholinergic effects, postural hypotension, and sedative effects. The risk of tardive dyskinesia must be considered when contemplating chronic use.

#### Storage

Store at room temperature. Administration

Once dose is established, may be taken as a single dose usually at bedtime, usually without food. May be taken with food to improve GI tolerability. Doses > 300 mg/day should be taken in divided doses.

## Amoxicillin

Tylox.

a-mox'i-sill-in ★ Amoxil, Moxatag ▲ Apo-Amoxi, Novamoxin, Nu-Amoxi **Do not confuse amoxicillin with amoxapine, Diamox, Trimox, or** 

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antibiotics, penicillins, aminopenicillins

## **MECHANISM OF ACTION**

A penicillin that inhibits bacterial cell wall synthesis. *Therapeutic Effect:* Bactericidal in susceptible microorganisms.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 20%. Partially metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 1-1.3 h (increased in impaired renal function).

## AVAILABILITY

Capsules: 250 mg, 500 mg. Powder for Oral Suspension: 125 mg/5 mL, 200 mg/5 mL, 250 mg/5 mL, 400 mg/5 mL. Tablets: 250 mg, 500 mg, 875 mg. Tablets, Chewable: 125 mg, 200 mg, 250 mg, 400 mg. Tablets, Extended-Release (Moxatag): 775 mg.

## INDICATIONS AND DOSAGES

#### Ear, nose, throat, genitourinary, skin, and skin-structure infections PO

*Adults, Elderly, Children weighing more than 40 kg.* 250-500 mg q8h or 500-875 mg (tablets) twice a day.

Amoxicillin (Generic Name)

#### 86 Amoxicillin

Adults, Children 12 yr of age and older. 775 mg once daily (tonsillitis/ pharyngitis due to *Streptococcus pyogenes*).

Children weighing < 40 kg. 20-45 mg/kg/day in divided doses q8-12h.

#### Lower respiratory tract infections PO

Adults, Elderly, Children weighing more than 40 kg. 500 mg q8h or 875 mg (tablets) twice a day. Children weighing < 40 kg. 40 mg/kg/day in divided doses q8h or 45 mg/kg/day in divided doses q12h.

#### Acute, uncomplicated gonorrhea PO

*Adults.* 3 g one time with 1 g probenecid. Follow with tetracycline or erythromycin therapy.

Prepubertal children 2 yr and older. 50 mg/kg plus probenecid 25 mg/kg as a single dose. Do not use in children < 2 yr old.

#### Sinusitis (high-dose regimen, children)

PO

*Children*. 45-90 mg/kg/day in divided doses q12h.

#### Acute otitis media PO

*Children*. 80-90 mg/kg/day in divided doses q12h.

### Helicobacter pylori infection PO

*Adults, Elderly.* 1 g given two or three times per day for 14 days (in combination with other antibiotics).

## Prevention of endocarditis PO

*Adults, Elderly.* 2 g 1 h before procedure.

*Children.* 50 mg/kg 1 h before procedure.

#### Usual neonatal and young infant dosage

Infants younger than 3 mo, Neonates. 20-30 mg/kg/day in divided doses q12h.

#### Dosage in renal impairment (adults)

Dosage interval is modified based on creatinine clearance. Creatinine clearance 10-30 mL/min. 250-500 mg q12h. Creatinine clearance < 10 mL/min.

250-500 mg q24h.

## **OFF-LABEL USES**

Treatment of dental-related infection, Lyme disease, and typhoid fever.

## CONTRAINDICATIONS

Hypersensitivity to any penicillin.

## INTERACTIONS

#### Drug

**Allopurinol:** May increase incidence of rash.

**Methotrexate:** May reduce the renal clearance of methotrexate.

**Oral contraceptives:** May decrease effectiveness of oral contraceptives.

**Probenecid:** May increase amoxicillin blood concentration. **Warfrain:** Amoxicillin co-use may increase INR. Monitor.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum LDH, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May cause a positive direct Coombs' test.

## SIDE EFFECTS

#### Frequent

GI disturbances (mild diarrhea, nausea, or vomiting), headache, oral or vaginal candidiasis.

#### Occasional

Generalized rash, urticaria.

## SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

## Amoxicillin/Clavulanate 87

• Severe hypersensitivity reactions, including anaphylaxis and acute interstitial nephritis, occur rarely.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with antibiotic-associated colitis or a history of allergies, especially to cephalosporins. Amoxicillin crosses the placenta, appears in cord blood and amniotic fluid, and is distributed in breast milk in low concentrations. Amoxicillin administration may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. Immature renal function in neonates and young infants may delay renal excretion of amoxicillin. Age-related renal impairment may require dosage adjustment in elderly patients.

History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold amoxicillin and promptly notify the physician if rash or diarrhea occurs. A high percentage of patients with infectious mononucleosis have developed rash during amoxicillin therapy. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting, should be monitored.

#### Storage

Store capsules or tablets at room temperature. After reconstitution, the oral suspension is stable for 14 days either at room temperature or refrigerated. Refrigeration is preferred.

## Administration

Chew or crush chewable tablets thoroughly before swallowing. Take amoxicillin capsules, tablets, chewable tablets, and suspension without regard to food; extendedrelease tablets should be taken within 1 h of finishing a meal. Take evenly around the clock and continue for the full course of treatment. Suspension may be mixed with formula, milk, fruit juice, ginger ale, or cold drinks; administered immediately after mixing. Consume the entire dose.

## Amoxicillin/ Clavulanate

a-mox'i-sill-in clav-u-lan'ate ★ AmoClan, Augmentin, Augmentin ES 600, Augmentin XR ➡ Apo-Amoxi Clav, Clavulin Do not confuse with amoxapine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, penicillins, aminopenicillins, plus a β-lactamase inhibitor.

## **MECHANISM OF ACTION**

Amoxicillin inhibits bacterial cell wall synthesis, while clavulanate inhibits bacterial β-lactamase. *Therapeutic Effect:* Amoxicillin is bactericidal in susceptible microorganisms. Clavulanate protects amoxicillin from enzymatic degradation.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 20%. Partially metabolized in the liver. Primarily

Amoxicillin/Clavulanate (Generic Name), Augmentin (Brand Name)

excreted in urine. Removed by hemodialysis. *Half-life:* 1-1.3 h (increased in impaired renal function).

## AVAILABILITY

Powder for Oral Suspension: 125 mg/31.25 mg per 5 mL, 200 mg/28.5 mg per 5 mL, 250 mg/62.5 mg per 5 mL, 400 mg/57 mg per 5 mL, 600 mg/42.9 mg per 5 mL. Tablets: 250 mg/125 mg, 500 mg/125 mg, 875 mg/125 mg. Tablets (Extended-Release, Augmentin XR): 1000 mg/62.5 mg. Tablets (Chewable): 200 mg/28.5 mg, 250 mg/62.5 mg, 400 mg/57 mg.

## INDICATIONS AND DOSAGES

NOTE: Weight-based dosing is based on amoxicillin component.

#### Mild to moderate infections PO

Adults, Elderly, Children weighing more than 40 kg. 250 mg q8h or 500 mg q12h.

*Children weighing* < 40 kg. 20 mg/ kg/day in divided doses q8h or 25 mg/kg/day in divided doses q12h.

## Respiratory tract, sinusitis, and other severe infections

Adults, Elderly, Children weighing more than 40 kg. 500 mg q8h or 875 mg q12h.

*Children weighing < 40 kg.* 40 mg/ kg/day in divided doses q8h or 45 mg/kg/day in divided doses q12h. PO (AUGMENTIN XR)

*Adults.* Usual dose 2 tablets q12h for community acquired pneumonia.

## Otitis media

PO

*Children.* 90 mg/kg/day in divided doses q12h for 10 days.

## • Usual neonate dosage PO

Neonates, Infants younger than 3 mo. 30 mg/kg/day in divided doses q12h.

## Dosage in renal impairment (adults)

Dosage and frequency are modified based on creatinine clearance. Creatinine clearance 10-30 mL/min: 250-500 mg q12h. Creatinine clearance < 10 mL/min: 250-500 mg q24h.

## **OFF-LABEL USES**

Treatment of dental-related infections, periodontitis.

## CONTRAINDICATIONS

Hypersensitivity to any penicillins, history of cholestatic jaundice/hepatic function impairment associated with amoxicillin/clavulanate; extended-release formulation also contraindicated in severe renal impairment (CrCl < 30 mL/min) and in hemodialysis patients.

## INTERACTIONS

Drug

**Allopurinol:** May increase incidence of rash.

**Methotrexate:** May reduce the renal clearance of methotrexate.

**Oral contraceptives:** May decrease effects of oral contraceptives.

**Probenecid:** May increase amoxicillin and clavulanate blood concentration.

Warfarin: Amoxicillin co-use may increase INR. Monitor.

## DIAGNOSTIC TEST EFFECTS

May increase serum AST (SGOT) and ALT (SGPT) levels. May cause a positive direct Coombs' test.

## SIDE EFFECTS

## Frequent

GI disturbances (mild diarrhea, nausea, vomiting), headache, oral or vaginal candidiasis.

#### Occasional

Generalized rash, urticaria.

#### Amphetamine; Dextroamphetamine 89

#### SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Severe hypersensitivity reactions, including anaphylaxis and acute interstitial nephritis, occur rarely.

· Hepatotoxicity (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with antibiotic-associated colitis or a history of allergies, especially to cephalosporins. Amoxicillin and clavulanate cross the placenta, appear in cord blood and amniotic fluid, and are distributed in breast milk in low concentrations. Amoxicillin and clavulanate may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. Immature renal function in neonates and young infants may delay renal excretion of amoxicillin and clavulanate. Age-related renal impairment may require dosage adjustment in elderly patients.

History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. Severe diarrhea with abdominal pain. blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting, should be monitored.

#### Storage

Store capsules or tablets at room temperature. After reconstitution, the oral suspension is stable for 10 days refrigerated.

#### Administration

! Drug dosage is expressed in terms of amoxicillin. Dosage forms cannot be interchanged based on amoxicillin component alone; must also consider clavulanate content.

May be taken without regard to meals; however, absorption is enhanced and tolerability improved when taken at the start of a meal. Chew or crush chewable tablets thoroughly before swallowing. Shake oral suspension well prior to each use. Extended-release tablets should not be crushed or chewed. Space doses evenly around the clock and continue for the full course of treatment.

## Amphetamine; Dextroamphetamine

am-fet'ah-meen ★ ▲ Adderall, Adderall XR **Do not confuse Adderall with** Inderal.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Adrenergic agonists, amphetamines, central nervous system stimulants, ADHD agents

#### MECHANISM OF ACTION

A sympathomimetic amine that produces CNS and respiratory stimulation, mydriasis, bronchodilation, a pressor response, and contraction of the urinary sphincter. Directly affects  $\alpha$  and  $\beta$ receptor sites in peripheral system. Enhances release of norepinephrine by blocking reuptake, inhibiting

Amphetamine; Dextroamphetamine (Generic Name), Adderall (Brand Name)

monoamine oxidase. May also modulate serotonergic pathways. *Therapeutic Effect:* Increases motor activity, mental alertness; decreases drowsiness, fatigue. Improves attention span, decreases distractability, and decreases impulsivity.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 20%. Widely distributed (including CSF). Metabolized in liver. Excreted in urine. Unknown if removed by hemodialysis. *Half-life:* 9-14 h.

## AVAILABILITY

Adderall XR Capsules (Extended-Release): 5 mg, 10 mg, 15 mg, 20 mg, 25 mg, 30 mg. Tablets: 5 mg, 7.5 mg, 10 mg, 12.5 mg, 15 mg, 20 mg, 30 mg.

## INDICATIONS AND DOSAGES ADHD

PO

*Adults.* 5-20 mg 1-3 times/day. *Adults, Children older than 12 yr.* Initially, 5 mg twice a day. Increase by 10 mg at weekly intervals until therapeutic response achieved. Usual maximum: 60 mg/day.

*Children 6-12 yr.* Initially, 5 mg twice a day. Increase by 5 mg/day at weekly intervals until therapeutic response achieved. Usual maximum: 40 mg/day.

*Children 3-6 yr.* Initially, 5 mg once or twice a day. Increase by 5 mg/day at weekly intervals until therapeutic response achieved.

#### Extended-release capsules

NOTE: Patients (adults and children) already taking divided doses of Adderall immediate-release tablets may switch to Adderall XR once daily at the same total daily dose. *Adults*. Usual 5-20 mg once daily. Maximum: 30 mg/day. *Children 6 yr and older.* Initially, 5-10 mg once daily. Increase by 5 or 10 mg weekly to effective dose. Maximum: 30 mg/day. *Children < 6 yr.* Do not use extended

## release.

#### Narcolepsy PO

*Adults.* 5-20 mg 1-3 times/day. *Children older than 12 yr.* Initially, 5 mg twice a day. Increase by 10 mg at weekly intervals until therapeutic response achieved. Usual maximum: 60 mg/day.

*Children 6-12 yr.* Initially, 5 mg once or twice a day. Increase by 5 mg/day at weekly intervals until therapeutic response achieved. Usual maximum: 60 mg/day.

## **OFF-LABEL USES**

Depression, obsessive-compulsive disorder.

## CONTRAINDICATIONS

Advanced arteriosclerosis, agitated states, glaucoma, history of drug abuse, history of hypersensitivity to sympathomimetic amines, hyperthyroidism, moderate to severe hypertension, symptomatic cardiovascular disease, during use of an MAOI or within 14 days following discontinuation of an MAOI.

## INTERACTIONS

#### Drug

β-**blockers:** May increase risk of bradycardia, heart block, and hypertension.

**CNS stimulants:** May increase the effects of amphetamine. Concurrent use of other CNS stimulants not recommended.

**Digoxin:** May increase the risk of arrhythmias with this drug.

**MAOIs:** May prolong and intensify the effects of amphetamine.

May cause hypertensive crisis.

Contraindicated.

**Meperidine:** May increase the risk of hypotension, respiratory depression, seizures, and vascular collapse.

#### Tricyclic antidepressants:

May increase cardiovascular effects. GI antacids and sodium

## bicarbonate and urinary

alkalinizers: Increase amphetamine absorption and decrease urinary elimination, respectively. Avoid concurrent use.

Methenamine and urinary acidifiers: Increase amphetamine elimination.

**Lithium:** Antagonize effect of amphetamines; concurrent use not recommended.

#### **Dietary Supplement**

Melatonin: Potential for additive neurologic and cardiac effects.

#### DIAGNOSTIC TEST EFFECTS

May increase plasma corticosteroid concentrations.

#### SIDE EFFECTS

#### Frequent

Irregular pulse, decreased appetite, increased motor activity, talkativeness, nervousness, mild euphoria, insomnia.

#### Occasional

Headache, chills, dry mouth, GI distress, worsening depression in patients who are clinically depressed, tachycardia, palpitations, chest pain.

#### SERIOUS REACTIONS

 Overdose may produce skin pallor or flushing, arrhythmias, and psychosis.

 Abrupt withdrawal following prolonged administration of high dosage may produce lethargy (may last for weeks).

 Prolonged administration to children with ADHD may produce a temporary suppression of normal weight and height patterns.
Any cardiac symptoms should prompt immediate evaluation.
Serious heart effects (rare) include sudden death, MI, stroke, and cardiomyopathy.

## **PRECAUTIONS & CONSIDERATIONS**

Med Guide is required with each prescription and refill. Sudden cardiac death has been reported at usual doses in those with structural cardiac abnormalities and should generally not be used in such patients. Even those with mild hypertension should be approached cautiously. There is a risk for drug dependency. Precaution is necessary with acute stress reaction, emotional instability, history of drug dependence, seizures, and in elderly and debilitated patients and those who are tartrazinesensitive. Amphetamine crosses the placenta and is distributed in breast milk. Use in pregnancy may be associated with teratogenic effects, premature delivery, low birthweight, and infant withdrawal symptoms. Children may be more susceptible to develop abdominal pain, anorexia, decreased weight, and insomnia. A thorough cardiovascular assessment is recommended before initiation of therapy in pediatric patients; assessment should include medical history, family history, and physical examination with consideration of ECG testing. There are no age-related precautions noted for elderly patients.

Decreased appetite, dizziness, dry mouth, or pronounced nervousness may be experienced. Tasks that require mental alertness or motor skills should be avoided until the effects of the drug are determined.

#### Storage

Store at room temperature. Protect from light. Keep tightly closed. Administration

Do not take in late afternoon or evening because the drug can cause insomnia. The first dose is given upon awakening.

Do not crush, chew, or cut XR form. XR form may be opened and sprinkled on 1 tsp of applesauce; entire dose is swallowed immediately without chewing the beads.

#### Amphotericin B/ Amphotericin B Cholesteryl/ Amphotericin B Lipid Complex/ Liposomal Amphotericin B

am-foe-ter'i-sin bee ★ Abelcet, AmBisome, Amphocin, Amphotec

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Antifungals

## **MECHANISM OF ACTION**

An antifungal and antiprotozoal that is generally fungistatic but may become fungicidal with high dosages or very susceptible microorganisms. This drug binds to sterols in the fungal cell membrane. Lipid-based formulations deliver higher drug concentrations to sites of infection and reduced levels in normal tissues. *Therapeutic Effect:* Increases fungal cell-membrane permeability, allowing loss of potassium and other cellular components. Fungicidal.

#### PHARMACOKINETICS

Protein binding: 90%. Widely distributed. Metabolic fate unknown. Excreted slowly over weeks to months by the kidneys. Approximately 40% of a given dose is excreted in the first 7 days. Minimal removal by hemodialysis. Amphotec and Abelcet are not dialyzable. *Half-life:* amphotericin B desoxycholate, 24 h (increased in neonates and children); Amphotec, 26-28 h; Abelcet, 7.2 days; AmBisome, 100-153 h.

## AVAILABILITY

Injection, Powder for Reconstitution: (Amphotec): 50 mg, 100 mg. Injection, Powder for Reconstitution (AmBisome, Amphocin, amphotericin B desoxycholate): 50 mg. Injection, Suspension (Abelcet): 5 mg/mL.

#### INDICATIONS AND DOSAGES

NOTE: Amphotericin B products are not interchangeable.

Cryptococcosis; blastomycosis; systemic candidiasis; disseminated forms of moniliasis, coccidioidomycosis, and histoplasmosis; zygomycosis; sporotrichosis; aspergillosis IV INFUSION (AMPHOTERICIN B DESOXYCHOLATE) Adults, Elderly. Dosage based on patient tolerance and severity of infection. Initially, 1-mg test dose is given over 20-30 min. If test dose is tolerated, 5-mg dose may be given the same day. Subsequently, dosage is increased by 5 mg q12-24h until desired daily dose is reached. Alternatively, if test dose is tolerated, 0.25 mg/kg is given on same day and 0.5 mg/kg on second day; then dosage is increased until desired

daily dose is reached. Common dose:D1 mg/kg/day up to 1.5 mg/kg everydiother day. Maximum: 1.5 mg/kg/day.N*Children.* Test dose of 0.1 mg/kg/indose (maximum 1 mg) is infusedSiover 20-60 min. If test dose ishtolerated, initial dose of 0.4 mg/kgN

may be given on same day; dosage is then increased in 0.25-mg/kg increments as needed. Maintenance dose: 0.25-1 mg/kg/day.

#### Invasive fungal infections unresponsive to or intolerant of amphotericin B.

IV INFUSION (ABELCET) Adults, Children. 5 mg/kg once daily at rate of 2.5 mg/kg/h.

Empiric treatment of fungal infections in patients with febrile neutropenia; aspergillosis, candidiasis, or cryptococcosis in patients with renal impairment and those who have experienced toxicity or treatment failure with amphotericin B desoxycholate

IV INFUSION (AMBISOME) Adults, Children. 3-5 mg/kg once daily over 2 h. Doses up to 6 mg/ kg/day used for cryptococcal meningitis.

 Invasive aspergillosis in patients with renal impairment and those who have experienced toxicity or treatment failure with amphotericin B desoxycholate

IV INFUSION (AMPHOTEC) Adults, Children. 3-4 mg/kg once daily over 2-4 h.

## CONTRAINDICATIONS

Hypersensitivity to amphotericin B or specific components of the various products.

## INTERACTIONS

Drug

**Bone marrow depressants:** May increase the risk of anemia.

**Digoxin:** May increase the risk of digoxin toxicity from hypokalemia. **Nephrotoxic medications:** May increase the risk of nephrotoxicity. **Steroids:** May cause severe hypokalemia.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum alkaline phosphatase, serum creatinine, serum SGOT (AST), and SGPT (ALT) levels. May decrease serum calcium, magnesium, and potassium levels.

## IV INCOMPATIBILITIES

NOTE: Many drugs are incompatible with amphotericin B. Always check specialized references for compatibility. Some incompatibilities include:

Abelcet, AmBisome, Amphotec: Do not mix with any other drug, diluent, or solution.

Amphotericin B desoxycholate: Allopurinol (Aloprim), amifostine (Ethyol), aztreonam (Azactam), calcium gluconate, cefepime (Maxipime), cimetidine (Tagamet), ciprofloxacin (Cipro), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Adriamycin), enalapril (Vasotec), etoposide (VP-16), filgrastim (Neupogen), fluconazole (Diflucan), fludarabine (Fludara), foscarnet (Foscavir), gemcitabine (Gemzar), magnesium sulfate, meropenem (Merrem IV), ondansetron (Zofran), paclitaxel (Taxol), piperacillin and tazobactam (Zosyn), potassium chloride, propofol (Diprivan), vinorelbine (Navelbine).

## **IV COMPATIBILITIES**

Do not mix with saline solutions, other medications, or electrolytes or preservatives.
## SIDE EFFECTS

#### **Frequent (> 10%)**

Abelcet: Chills, fever, increased serum creatinine level, multiple organ failure.

AmBisome: Hypokalemia, hypomagnesemia, hyperglycemia, hypocalcemia, edema, abdominal pain, back pain, chills, chest pain, hypotension, diarrhea, nausea, vomiting, headache, fever, rigors, insomnia, dyspnea, epistaxis, increased hepatic or renal function test results. Amphotec: Chills, fever, hypotension, tachycardia, increased

serum creatinine level, hypokalemia, bilirubinemia.

Amphotericin B desoxycholate: Fever, chills, headache, anemia, hypokalemia, hypomagnesemia, anorexia, malaise, generalized pain, nephrotoxicity.

#### SERIOUS REACTIONS

• Cardiovascular toxicity (as evidenced by hypotension, ventricular fibrillation, and anaphylaxis) occurs rarely.

 Altered vision and hearing, seizures, hepatic failure, coagulation defects, multiple organ failure, and sepsis may be noted.

#### **PRECAUTIONS & CONSIDERATIONS**

Due to potential toxicities, reserved for serious and potentially lifethreatening fungal infections. Caution is warranted with renal impairment and in combination with antineoplastic therapy. Drug is prescribed only for progressive, potentially fatal fungal infection. Keep in mind that conventional amphotericin, amphotericin B desoxycholate, is more nephrotoxic than the alternative formulations of amphotericin B, including Albecet, AmBisome, and Amphotec. Amphotericin B crosses the placenta, and it is unknown whether amphotericin B is distributed in breast milk. There are no agerelated precautions noted in children or in elderly patients.

History of allergies, especially to amphotericin B and sulfites, should be determined before giving the drug. Be aware that other nephrotoxic medications should be avoided, if possible. Antiemetics, antihistamines, antipyretics, or small doses of corticosteroids may be given before or during amphotericin administration to help control adverse reactions. Monitor for infusion reactions or drug intolerance as indicated.

#### Storage

Refrigerate Albecet as unreconstituted solution. Albecet reconstituted solution is stable for 48 h if refrigerated and 6 h at room temperature.

Refrigerate AmBisome as unreconstituted solution. AmBisome reconstituted solution of 4 mg/mL is stable for 24 h. AmBisome reconstituted solution concentration of 1-2 mg/mL is stable for 6 h.

Store Amphotec as unreconstituted solution at room temperature. Amphotec reconstituted solution and solution diluted for infusion are stable for 24 h if refrigerated.

Refrigerate conventional amphotericin B as unreconstituted solution. The reconstituted solution is stable for 24 h at room temperature or 7 days if refrigerated. Diluted solution  $\leq 0.1$  mg/mL should be used promptly. Do not use the solution if it is cloudy or contains a precipitate. Protect from light.

#### Administration

Amphotericin products are not interchangeable. To prevent inadvertent overdose with amphotericin B, verify product name and dosage if dose exceeds 1.5 mg/kg. For IV use, observe strict aseptic technique because no bacteriostatic agent or preservative is present. For all products: Do not mix with saline solutions. Use dextrose solutions only for preparing infusions. All products should be infused using controlled infusion devices. Acute infusion reactions may occur any time during these infusions; generally diminish with subsequent doses BP, pulse, respirations, and temperature should be monitored twice every 15 min, then every 30 min for the duration of the infusion to assess for adverse reactions. These include abdominal pain, anorexia, chills, fever, nausea, shaking, and vomiting. If signs and symptoms of adverse reactions occur, slow the infusion and give prescribed drugs to provide symptomatic relief. For a severe reaction or for symptomatic relief, stop the infusion and notify the physician.

Shake Abelcet 20-mL (100-mg) vial gently until contents are dissolved. Withdraw required Abelcet dose using a 5-µm filter needle supplied by manufacturer. Inject Abelcet dose into D5W; 4 mL D5W is required for each 1 mL (5 mg) to obtain final concentration of 1 mg/mL. Double concentration for pediatric and fluid-restricted patients (2 mg/mL). Infuse Abelcet over 2 h by slow IV infusion. Shake the contents if the infusion is > 2 h. Reconstitute each 50-mg AmBisome vial with 12 mL sterile water for injection to provide concentration of 4 mg/mL. Shake AmBisome vial vigorously for 30 seconds. Then withdraw the required AmBisome dose and empty the syringe contents through a 5-µm filter into an infusion of D5W to provide final concentration of 1-2 mg/mL. Infuse AmBisome over 2 h by slow IV infusion.

Add 10 mL sterile water for injection to each 50-mg Amphotec vial to provide a concentration of 5 mg/mL. Shake the Amphotec vial gently. Further dilute Amphotec vial only with D5W using specific amount recommended by manufacturer to provide concentration of 0.16-0.83 mg/mL. Infuse Amphotec over 2-4 h by slow IV infusion.

Rapidly inject 10 mL sterile water for injection to each 50-mg amphotericin B desoxycholate vial to provide concentration of 5 mg/mL. Immediately shake amphotericin B desoxycholate vial until the solution is clear. Further dilute each 1 mg amphotericin B desoxycholate in at least 10 mL D5W to provide a concentration of 0.1 mg/mL. Be aware that the potential for thrombophlebitis may be less with the use of pediatric scalp vein needles or by adding dilute heparin solution, as prescribed. Infuse conventional amphotericin over 2-6 h by slow IV infusion.

## **Ampicillin Sodium**

am-pi-sill'in soe'dee-um Novo-Ampicillin, Apo-Ampi, Nu-Ampi Do not confuse ampicillin with

aminophylline, Imipenem, or Unipen.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, penicillins, aminopenicillins

### MECHANISM OF ACTION

A penicillin that inhibits cell wall synthesis in susceptible microorganisms. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: 28%. Widely distributed. Partially metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 1-1.5 h (increased in impaired renal function).

## AVAILABILITY

*Capsules:* 250 mg, 500 mg. *Powder for Oral Suspension:* 125 mg/5 mL, 250 mg/5 mL. *Powder for Injection:* 125 mg, 250 mg, 500 mg, 1 g, 2 g.

#### INDICATIONS AND DOSAGES

## Respiratory tract, skin, and skinstructure infections

Adults, Elderly, Children weighing more than 40 kg. 250-1000 mg q6h. Children weighing < 20 kg. 50-100 mg/kg/day in divided doses q6h. IV, IM

*Adults, Elderly, Children weighing more than 40 kg.* 500-1000 mg q6h. *Children weighing < 40 kg.* 25-50 mg/kg/day in divided doses q6h.

#### Bacterial meningitis, septicemia IV, IM

*Adults, Elderly.* 2 g q4h or 3 g q6h. *Children.* 100-200 mg/kg/day in divided doses q3-4h.

## Uncomplicated gonococcal infections

PO

*Adults.* 3.5 g one time with 1 g probenecid.

#### Perioperative prophylaxis IV, IM

*Adults, Elderly.* 2 g 30 min before procedure. May repeat in 8 h. *Children.* 50 mg/kg 30 min before procedure. May repeat in 8 h.

#### Usual neonatal dosage

*Neonates 7-28 days old.* 75 mg/kg/ day in divided doses q8h up to 200 mg/kg/day in divided doses q6h. *Neonates 0-7 days old.* 50 mg/kg/day in divided doses q12h up to 150 mg/kg/day in divided doses q8h.

 Dosage in renal impairment (adults)

Creatinine Clearance (mL/min)	% of Normal Dosage
10-30	Give q6-12h
< 10	Give q12h

#### CONTRAINDICATIONS

Hypersensitivity to any penicillin.

#### INTERACTIONS

#### Drug

**Allopurinol:** May increase incidence of rash.

**Oral contraceptives:** May decrease effectiveness of oral contraceptives. **Probenecid:** May increase ampicillin blood concentration.

Herbal

None known.

### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels. May cause a positive direct Coombs' test.

## IV INCOMPATIBILITIES

Amikacin (Amikin), aminophylline, amphotericin B, caspofungin (Cancidas), codeine, diazepam, diltiazem, dobutamine, dopamine, fluconazole (Diflucan), gentamicin, lansoprazole (Prevacid), lorazepam, midazolam (Versed), nitroprusside, ondansetron (Zofran), phenytoin, promethazine (Phenergan), sodium bicarbonate, tobramycin, verapamil.

## 🗏 IV COMPATIBILITIES

Calcium gluconate, cefepime (Maxipime), famotidine (Pepcid), furosemide (Lasix), heparin,

#### SIDE EFFECTS

#### Frequent

Pain at IM injection site, GI disturbances (mild diarrhea, nausea, vomiting), oral or vaginal candidiasis. Occasional

Generalized rash, urticaria, phlebitis or thrombophlebitis (with IV administration), headache.

#### Rare

Dizziness, seizures (especially with IV therapy).

#### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Severe hypersensitivity reactions, including anaphylaxis and acute interstitial nephritis, occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with antibiotic-associated colitis or a history of allergies, especially to cephalosporins. Ampicillin readily crosses the placenta, appears in cord blood and amniotic fluid, and is distributed in breast milk in low concentrations. Ampicillin may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. Immature renal function in neonates and young infants may delay renal excretion of ampicillin. Keep in mind that high dosages may be needed for neonatal meningitis. Age-related renal impairment may require dosage adjustment for elderly patients.

History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. A high incidence of rash has been observed in patients with infectious mononucleosis treated with ampicillin. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes in oral mucosa, and vomiting, should be monitored. Intake and output, renal function tests, urinalysis, and the injection sites should be assessed. Storage

Store capsules at room temperature. After reconstitution, the oral solution is stable for 7 days at room temperature or 14 days if refrigerated. Refrigeration is preferred. An IV solution diluted with 0.9% NaCl is stable for 2-8 h at room temperature or 3 days if refrigerated. An IV solution diluted with D5W is stable for 2 h at room temperature or 3 h if refrigerated. Discard the IV solution if a precipitate forms. The reconstituted solution for IM injection is stable for 1 h.

#### Administration

Give oral forms 1 h before or 2 h after meals for maximum absorption. Shake oral solution well before use.

For IV injection, dilute each 250or 500-mg vial with 5 mL sterile water for injection and each 1- or 2-g vial with 10 mL. For intermittent IV infusion (piggyback), further dilute with 50-100 mL 0.9% NaCl or D5W. Administer each 125-, 250-, or 500-mg dose over 3-5 min and each 1- to 2-g dose over 10-15 min. Infuse

#### 98 Ampicillin/Sulbactam

intermittent IV infusion (piggyback) over 20-30 min. Because of the potential for hypersensitivity and anaphylaxis, start the initial dose at a few drops per minute, increase the dosage slowly to the prescribed rate, and stay with the patient for the first 10-15 min. Then assess every 10 min during the infusion for signs and symptoms of hypersensitivity or anaphylaxis. Expect to switch to the oral route as soon as possible.

For IM use, reconstitute each vial with sterile water for injection or bacteriostatic water for injection. Consult individual ampicillin vials or package insert for specific volumes of diluent. Inject the drug deep into a large muscle mass.

#### Ampicillin/ Sulbactam

am′pi-sill-in/sul-bac′tam ★ Unasyn

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, penicillins, aminopenicillins, plus a β-lactamase inhibitor

#### MECHANISM OF ACTION

Ampicillin inhibits bacterial cell wall synthesis, whereas sulbactam inhibits bacterial  $\beta$ -lactamase. *Therapeutic Effect:* Ampicillin is bactericidal in susceptible microorganisms. Sulbactam protects ampicillin from enzymatic degradation.

#### PHARMACOKINETICS

Protein binding: 28%-38%. Widely distributed. Partially metabolized in the liver. Primarily excreted in urine.

Removed by hemodialysis. *Half-life:* 1 h (increased in impaired renal function).

#### AVAILABILITY

*Powder for Injection:* 1.5 g (ampicillin 1 g/sulbactam 500 g), 3 g (ampicillin 2 g/sulbactam 1 g).

#### INDICATIONS AND DOSAGES

Skin/skin-structure, intra-

abdominal, and gynecologic infections IV, IM

Adults, Elderly, Children > 40 kg. 1.5 g (1 g ampicillin/500 mg sulbactam) to 3 g (2 g ampicillin/1 g sulbactam) q6h.

*Children 1-12 yr and < 40 kg.* 150-300 mg/kg/day in divided doses q6h.

#### Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance and the severity of the infection.

#### Creatinine

Clearance (mL/min)	Adult Dosage
> 30	1.5-3 g q6-8h
15-29	1.5-3 g q12h
5-14	1.5-3 g q24h
< 5	Not recommended

#### **OFF-LABEL USES**

Treatment of pneumonia or aspiration pneumonia; alternative for pelvic inflammatory disease.

#### CONTRAINDICATIONS

Hypersensitivity to any penicillin.

#### INTERACTIONS

#### Drug

Allopurinol: May increase incidence of rash.

**Oral contraceptives:** May decrease effectiveness of oral contraceptives. **Probenecid:** May increase ampicillin blood concentration.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum LDH, alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels. May cause a positive direct Coombs' test.

#### IV INCOMPATIBILITIES

Acyclovir, aminophylline, amphotericin B, caspofungin (Cancidas), ciprofloxacin (Cipro), diazepam, diltiazem (Cardizem), dobutamine, dopamine, fluconazole (Diflucan), idarubicin (Idamycin), lansoprazole (Prevacid), lorazepam, midazolam (Versed), nitroprusside, ondansetron (Zofran), phenytoin, promethazine (Phenergan), sargramostim (Leukine), sodium bicarbonate, tobramycin, verapamil.

#### SIDE EFFECTS

#### Frequent

Diarrhea and rash (most common), urticaria, pain at IM injection site, thrombophlebitis with IV administration, oral or vaginal candidiasis.

#### Occasional

Nausea, vomiting, headache, malaise, urine retention.

#### SERIOUS REACTIONS

 Severe hypersensitivity reactions, including anaphylaxis, acute interstitial nephritis, and blood dyscrasias, may occur.

· Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

Overdose may produce seizures.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with antibiotic-associated colitis or a history of allergies, especially to cephalosporins. Ampicillin and sulbactam readily cross the placenta, appear in cord blood and amniotic fluid, and are distributed in breast milk in low concentrations. Ampicillin and sulbactam may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. The safety and efficacy of ampicillin and sulbactam have not been established in children younger than 1 yr. Agerelated renal impairment may require dosage adjustment in elderly patients.

History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. A high incidence of rash has been observed in patients with infectious mononucleosis treated with ampicillin. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting, should be monitored. Intake and output, renal function tests, urinalysis, and the injection sites should be assessed. Storage

Store at room temperature prior to reconstitution. When reconstituted with 0.9% NaCl, the IV solution is stable for 8 h at room temperature or 48 h if refrigerated. Stability may differ with other diluents. Discard the IV solution if a precipitate forms. Administration

For IV injection, dilute with 10-20 mL sterile water for injection. For intermittent IV infusion (piggyback), further dilute with 50-100 mL D5W or 0.9% NaCl. Administer IV injection slowly, over 10-15 min. Administer intermittent IV infusion

(piggyback) over 15-30 min. Because of the potential for hypersensitivity and anaphylaxis, start the initial dose at a few drops per minute and then increase the dose slowly to the ordered rate. Stay with the patient for the first 10-15 min; then check every 10 min during the infusion for signs and symptoms of hypersensitivity or anaphylaxis.

For IM use, reconstitute each 1.5-g vial with 3.2 mL or each 3-g vial with 6.4 mL of sterile water for injection to provide a concentration of 250 mg ampicillin/125 mg sulbactam per milliliter. Administer the injection deep into a large muscle mass within 1 h of preparation.

#### **Amyl Nitrite**

am'il nye'trite ★ Amyl Nitrite Do not confuse with nitrates or inhaled ammonia spirits.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antianginal; nitrates, vasodilators

#### **MECHANISM OF ACTION**

A nitrite vasodilator that relaxes smooth muscles. Reduces afterload and improves vascular supply to the myocardium. *Therapeutic Effect:* Dilates coronary arteries, improves blood flow to ischemic areas within myocardium. Following inhalation, systemic vasodilation occurs.

#### PHARMACOKINETICS

The vapors are absorbed rapidly through the pulmonary alveoli and metabolized rapidly. Partially excreted in the urine.

#### AVAILABILITY

*Inhalation:* 0.3 mL glass ampule (amyl nitrite).

## INDICATIONS AND DOSAGES Acute relief of angina pectoris

NASAL INHALATION

*Adults, Elderly.* Place crushed ampule to nostrils and have patient inhale 2 to 6 inhalations of the vapors. May repeat in 3 to 5 min if needed. Call emergency if pain is not relieved after 1 dose, even though repeat dose will be given.

#### **OFF-LABEL USES**

Cyanide toxicity.

#### CONTRAINDICATIONS

Closed-angle glaucoma, cerebral hemorrhage or recent head injury, postural hypotension, hypersensitivity to nitrites.

#### INTERACTIONS

#### Drug

Sildenafil and other phosphodiesterase inhibitors (e.g., tadalafil, vardenafil): May increase hypotensive effects. Contraindicated.

#### Herbal

None known.

#### Food

Ethanol: May increase hypotensive effects.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Headache (may be severe) occurs mostly in early therapy, diminishes rapidly in intensity, usually disappears during continued treatment; transient flushing of face and neck; dizziness (especially if patient is standing immobile or is in a warm environment); weakness; postural hypotension.

## Occasional

Nausea, rash, vomiting. Skin contact may cause dermatitis and irritation. **Rare** 

Involuntary passage of urine and feces, restlessness, weakness.

## SERIOUS REACTIONS

• Large doses may produce hemolytic anemia or methemoglobinemia.

• Severe postural hypotension manifested by fainting, pulselessness, cold or clammy skin, and profuse sweating may occur.

• Tolerance may occur with repeated, prolonged therapy.

• High dose tends to produce severe headache and may cause cerebral ischemia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute MI, blood volume depletion from diuretic therapy, glaucoma (contraindicated in closed-angle glaucoma), liver or renal disease, severe anemia, and systolic BP < 90 mm Hg. Test for apical pulse and blood pressure before amyl nitrite is administered and periodically after dose. Facial or neck flushing should be reported.

It is unknown whether amyl nitrite crosses the placenta or is distributed in breast milk. Safety and efficacy of amyl nitrite have not been established in children. Elderly patients are more susceptible to the hypotensive effects of amyl nitrite, and age-related renal impairment may require cautious use. **Storage** 

Store at room temperature and protect from light. Keep the drug container away from heat and moisture.

#### Administration

Ampules for inhalation should be used at the first sign of angina. Wrap

ampule in woven sterile gauze. Crush amyl nitrite ampule with fingers and hold to the nostrils for inhalation of vapors. Wave under the nose; patient should inhale 1-6 times. May repeat in 3-5 min.

#### Anagrelide ah-na'greh-lide

Agrylin Agrylin

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Platelet countreducing agent

## MECHANISM OF ACTION

A hematologic agent that reduces platelet production and prevents platelet shape changes caused by plateletaggregating agents. *Therapeutic Effect:* Inhibits platelet aggregation.

## PHARMACOKINETICS

After oral administration, plasma concentration peaks within 1 h. Extensively metabolized. Primarily excreted in urine. *Half-life:* 1.3 h.

## AVAILABILITY

Capsules: 0.5 mg, 1 mg.

## INDICATIONS AND DOSAGES

## Thrombocythemia secondary to myeloproliferative disorders PO

Adults, Elderly. Initially, 0.5 mg 4 times a day or 1 mg twice a day. Adjust to lowest effective dosage, increasing by up to 0.5 mg/day or less in any 1 wk. Maximum: 10 mg/ day or 2.5 mg/dose.

*Children 7 yr of age or older*. Initially 0.5 mg/day. Adjust to lowest effective dose, increasing by up to 0.5 mg/day or less in any 1 wk. Maximum: 10 mg/day or 2.5 mg/dose.

## **Dose in hepatic impairment** PO

Initially 0.5 mg/day. Adjust to lowest effective dose, increasing by up to 0.5 mg/day or less in any 1 wk. Do not use in severe hepatic impairment.

#### CONTRAINDICATIONS

Severe hepatic impairment.

#### **INTERACTIONS**

#### Drug

Other platelet inhibitors: May increase risk for bleeding. **Rasagiline:** Anagrelide may theoretically reduce rasagiline metabolism.

#### Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase liver enzymes (ASR, ALT) (rare). Will lower platelet count; monitor every 2 days during the first week of treatment and at least weekly thereafter until maintenance reached.

## SIDE EFFECTS

#### **Frequent (≥ 10%)**

Headache, palpitations, diarrhea, abdominal pain, nausea, flatulence, bloating, asthenia, pain, dizziness.

#### **Occasional (5% to < 10%)**

Tachycardia, chest pain, vomiting, paresthesia, peripheral edema, anorexia, dyspepsia, rash.

## Other (< 5%)

Confusion, insomnia, hemorrhage, increased liver enzymes, bruising, vision changes, constipation, GI distress.

## SERIOUS REACTIONS

• Angina, heart failure, and arrhythmias occur rarely.

 Progressive dyspnea with pulmonary infiltrates may indicate interstitial lung disease (e.g., allergic alveolitis, interstitial pneumonitis) that may require drug discontinuation.

 Potential for worsening of renal impairment, interstitial nephritis, or renal failure.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cardiac disease and hepatic or renal impairment. It is unknown whether anagrelide crosses the placenta or is distributed in breast milk. Anagrelide may cause fetal harm; it is not recommended in pregnant women. Strongly urge women to use contraceptives while taking anagrelide. Age-related precautions have not been observed in pediatric patients. Use anagrelide cautiously in elderly patients, who may have age-related cardiac disease and decreased renal and hepatic function.

Hemoglobin, hematocrit, and platelet and WBC counts should be obtained before treatment. Skin should be monitored for bruises or petechiae, and catheter and needle sites should be inspected for bleeding. Persons with suspected heart disease should be assessed for tachycardia, palpitations, and signs and symptoms of CHF, such as dyspnea. If progressive dyspnea and/or pulmonary infiltrates occur, these may indicate interstitial lung disease.

#### Storage

Store at room temperature. Protect from light.

#### Administration

Take without regard to food. Platelet count should respond within 7-14 days of beginning therapy.

#### Anakinra 103

## Anakinra

an-a-kin'ra ★ ♪ Kineret Do not confuse with amikacin.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Diseasemodifying antirheumatic drugs, interleukin-receptor antagonists

## **MECHANISM OF ACTION**

An interleukin-1 (IL-1) receptor antagonist that blocks the binding of IL-1, a protein that is a major mediator of joint disease and is present in excess amounts in patients with rheumatoid arthritis. *Therapeutic Effect:* Inhibits the inflammatory response.

## PHARMACOKINETICS

No accumulation of anakinra in tissues or organs was observed after daily subcutaneous doses. Excreted in urine. *Half-life:* 4-6 h.

## AVAILABILITY

Prefilled Injection: 100 mg/0.67 mL syringe.

## INDICATIONS AND DOSAGES

## Rheumatoid arthritis

SC

Adults, Elderly. 100 mg/day, given at same time each day.

## Renal impairment

Creatinine clearance < 30 mL/min: Consider decreasing the dose to q48h (every other day).

## CONTRAINDICATIONS

Known hypersensitivity to *Escherichia coli*–derived proteins, anakinra, or product components; do not initiate if active infection.

## INTERACTIONS

## Drug

**Live-virus vaccines:** Avoid because of potential risk of infection.

## DIAGNOSTIC TEST EFFECTS

May decrease WBC, platelet, and absolute neutrophil counts.

## SIDE EFFECTS

## Frequent (> 10%)

Injection site ecchymosis, erythema, and inflammation; infection; headache.

## Occasional

Nausea, diarrhea, abdominal pain, neutropenia.

## SERIOUS REACTIONS

 Infections, including upper respiratory tract infection, sinusitis, flu-like symptoms, and cellulitis, have been noted.

 Neutropenia may occur, particularly when anakinra is used

in combination with tumor necrosis factor-blocking agents.

• Hypersensitivity and anaphylactoid reactions.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with asthma and renal impairment. Asthmatics are at increased risk for serious infection, and those with renal impairment are at increased risk for a toxic reaction. It is unknown whether anakinra is distributed in breast milk. The safety and efficacy of anakinra have not been established in children. Use anakinra cautiously in elderly patients, who may experience age-related renal impairment. Avoid contact with infected individuals and situations that might increase risk for infection.

Neutrophil count should be monitored before therapy begins, monthly for 3 mo during therapy, and then quarterly for up to 1 yr. Evaluate for inflammatory reactions, especially during the first 4 wks of therapy. Inflammation is uncommon after the first month of therapy. Storage

Keep the drug refrigerated. Do not freeze or shake it. Protect from light. Administration

There may be trace amounts of small, translucent/white protein particles in the solution. Do not use if solution is discolored or cloudy. If particles appear excessive in a syringe, do not use it. Give by subcutaneous injection; recommended sites are outer upper arms, abdomen (except within 2 inches of navel), front middle thigh, or outer buttocks. Use a new site for each injection and do not inject into an area that is tender, red, bruised, scarred, or hard. Do not inject lose to a vein.

## Anastrozole

an-as'troe-zole Arimidex Do not confuse Arimidex with Imitrex.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Aromatase inhibitors, hormones/hormone modifiers

#### **MECHANISM OF ACTION**

Decreases the circulating estrogen level by inhibiting aromatase, the enzyme that catalyzes the final step in estrogen production. *Therapeutic Effect:* Inhibits the growth of breast cancers that are stimulated by estrogens.

#### PHARMACOKINETICS

Well absorbed into systemic circulation (absorption not affected by food). Protein binding: 40%. Extensively metabolized in the liver. Eliminated by biliary system and, to a lesser extent, kidneys. *Mean half-life:* 50 h in postmenopausal women. Steadystate plasma levels reached in about 7 days.

#### AVAILABILITY

Tablets: 1 mg.

#### INDICATIONS AND DOSAGES

 First-line, second-line, and adjuvant treatment of hormonally responsive breast cancer
 PO
 Adults, Elderly. 1 mg once a day.

#### CONTRAINDICATIONS

Hypersensitivity to drug. Pregnancy.

#### INTERACTIONS

Drug

Estrogen-containing products:

May reduce anastrozole therapeutic effect.

**Tamoxifen:** May reduce anastrozole concentrations.

Herbal

Black cohosh, hops, licorice, red clover, thyme, and dong quai: Avoid herbals with potential estrogenic activity. Food

#### rooa

None known.

## DIAGNOSTIC TEST EFFECTS

May elevate serum GGT level in patients with liver metastasis. May increase serum LDL, serum alkaline phosphate, AST (SGOT), ALT (SGPT), and total cholesterol levels. May reduce bone mineral density.

Anastrozole (Generic Name)

#### SIDE EFFECTS

#### Frequent

Asthenia, nausea, headache, hot flashes, back pain, vomiting, cough, diarrhea, fatigue, emotional lability. Occasional (4%-6%)

Constipation, abdominal pain, anorexia, bone pain, pharyngitis, dizziness, rash, dry mouth, peripheral edema, pelvic pain, depression, chest pain, paresthesia.

#### Rare (1%-2%)

Weight gain, diaphoresis, persistent vaginal bleeding.

### SERIOUS REACTIONS

Thrombophlebitis and thromboembolism occur rarely.
Hypersensitivity, including anaphylactoid reactions and Stevens-

Johnson syndrome. • Ischemic cardiovascular events

• Ischemic cardiovascular events (rare).

· Hepatitis with jaundice.

• Decresed bone mineral density and increased osteoporosis risk.

#### PRECAUTIONS & CONSIDERATIONS

Anastrozole is indicated only for postmenopausal women. Women who are or may be pregnant should not use anastrozole because the drug crosses the placenta and may cause fetal harm. Pregnancy should be excluded before therapy begins. It is unknown whether anastrozole is excreted in breast milk. The safety and efficacy of anastrozole have not been established in children. No agerelated precautions have been noted in elderly patients.

Potential side effects, including dizziness and weakness, may occur. Notify the physician if asthenia, hot flashes, and nausea or diarrhea become unmanageable.

#### Storage

Store at room temperature.

#### Administration

Take orally without regard to food.

### Anidulafungin ann-id-yoo-la-fun'jin

★ 👾 Eraxis

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Antifungal, echinocandins

## **MECHANISM OF ACTION**

An antifungal that inhibits the synthesis of 1,3-β-D-glucan, an essential component of the fungal cell wall. *Therapeutic Effect:* Fungicidal.

### PHARMACOKENETICS

Protein binding: 84%. Metabolism in the liver has not been observed. Approximately 30% eliminated in feces; < 1% excreted in the urine. *Half-life:* 26.5 h.

## AVAILABILITY

Lyophilized Powder for Injection: 50 mg, 100 mg.

## INDICATIONS AND DOSAGES Candidemia

IV

*Adults.* 200 mg loading dose on day 1, followed by 100 mg daily thereafter. Continue for at least 14 days after the last positive culture.

## Esophageal candidiasis IV

*Adults.* 100 mg loading dose on day 1, followed by 50 mg daily for a minimum of 14 days and for at least 7 days following resolution of symptoms.

#### 106 Anthralin

*Children.* Safety and efficacy have not been established.

#### CONTRAINDICATIONS

Hypersensitivity to anidulafungin or its components.

#### INTERACTIONS

#### Drug

**Cyclosporine:** May increase anidulafungin concentrations, but no dose adjustment needed.

## **DIAGNOSTIC TEST EFFECTS**

Increased liver function test values.

#### IV INCOMPATIBILITIES

Do not mix with other medications. Specific known incompatibilities include diazepam, ertapenem (Invanz), magnesium sulfate, pemetrexed (Alimta), phenytoin, potassium phosphate, sodium bicarbonate, sodium phosphate.

#### SIDE EFFECTS

#### Occasional (2%-10%)

Diarrhea, hypokalemia, abnormal liver function.

## Rare (< 2%)

Rash, urticaria, flushing, pruritus, dyspnea, hypotension, deep vein thrombosis.

#### SERIOUS REACTIONS

 Histamine-mediated symptoms, including rash, urticaria, flushing, pruritus, dyspnea, and hypotension, have been reported and may be related to infusion rate.

#### PRECAUTIONS & CONSIDERATIONS

Caution in patients with preexisting hepatic impairment and neutropenia. Abnormal liver function test results have been observed in patients treated with anidulafungin. Clinical hepatic abnormalities have been observed in patients with preexisting hepatic impairment or concomitant medical conditions. Teratogenic effects observed in animal studies; use in pregnancy only if clearly needed. Use with caution in breastfeeding. Safety and effectiveness have not been established in pediatric patients.

#### Storage

Store unopened vials in refrigerator. After reconstitution, vial solution may be kept up to 1 h in refrigerator prior to preparing infusion. Infusion solution may be kept refrigerated but should be used within 24 h of preparation. Do not freeze.

#### Administration

For IV infusion only after appropriate dilution. Reconstitute each 50-mg vial with 15 mL of sterile water for injection (SWI) or each 100-mg vial with 30 mL of SWI. Concentration will be 3.33 mg/mL. Further dilute vial contents with D5W or 0.9 NaCl to a final infusion concentration of 0.77 mg/mL. Infuse IV at a rate not to exceed 1.1 mg/min.

## Anthralin

anth-rah'lin Dritho-Creme HP, Dritho-Scalp, Micanol, Psoriatec Do not confuse with Antagon, Antabuse, or Andriol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Dermatologic agents, antipsoriatic

#### **MECHANISM OF ACTION**

A topical agent that binds DNA, inhibiting synthesis of nucleic protein, and reduces mitotic activity.

#### Anthralin 107

#### PHARMACOKINETICS

Poorly absorbed systemically but excellent epidermal absorption. Auto-oxidized to inactive metabolites—danthrone and dianthrone. Rapid urinary excretion, so significant levels do not accumulate in the blood or other tissues. *Half-life:* 6 h.

#### AVAILABILITY

*Cream:* 0.5% (Dritho-Scalp), 1% (Dritho-Creme HP, Micanol, Psoriatec).

## INDICATIONS AND DOSAGES Psoriasis

TOPICAL

Adults, Elderly. Apply in a thin layer to affected areas once daily. For conventional therapy, the treatment is left on 8-12 h (preferably overnight) before showering/bathing. Shortcontact therapy has application time that is gradually increased from 5-10 min to 20-30 min daily before bathing.

#### **OFF-LABEL USES**

Inflammatory linear verrucous epidermal nevus.

#### CONTRAINDICATIONS

Acute psoriasis where inflammation is present, erythroderma, hypersensitivity to anthralin.

## INTERACTIONS

#### Drug

**Topical corticosteroids:** Because psoriasis may worsen upon discontinuation of long-term topical corticosteroid therapy, allow 1 wk between discontinuation of corticosteroid therapy and initiation of anthralin therapy.

#### Herbal

None known.

#### Food

None known.

#### SIDE EFFECTS

Frequent Irritation. Rare Staining of the skin or fingernails.

#### SERIOUS REACTIONS

• Hypersensitivity reaction, such as burning, erythema, and dermatitis, may occur.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in renal disease. Patch test should be obtained to rule out the possibility of allergy versus an irritation reaction. It is unknown whether anthralin crosses the placenta and is detected in breast milk. Safety and effectiveness have not been determined for use in children. Severe irritation or edema should be reported.

#### Administration

For external use only. Apply only to the skin affected with psoriasis. Do not apply to face or genitalia areas. For skin application, apply sparingly only to psoriatic lesions and rub gently and carefully into the skin until absorbed. For scalp application, comb hair to remove scalar debris, wet hair, and, after suitably parting, rub cream well into the lesions, taking care to prevent the cream from spreading onto the forehead or neck. Wash hands thoroughly after using because anthralin may stain skin, hair, and fabric. After prescribed time, rinse area where applied with cool or lukewarm water only. Avoid hot water and soap or shampoo as they could cause product to stain or irritate. Following anthralin removal, the area can be cleaned with usual soap or shampoo.

#### Antihemophilic Factor (Factor VIII, AHF)

Advate, Alphanate, Helixate FS, Hemofil M, Humate-P, Koate DVI, Kogenate FS, Monarc M, Monoclate-P, Recombinate **Do not confuse with Alfenta.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antihemophilic agents, blood clotting factors

#### **MECHANISM OF ACTION**

An antihemophilic agent that assists in conversion of prothrombin to thrombin, essential for blood coagulation. Replaces missing clotting factor. *Therapeutic Effect:* Produces hemostasis; corrects or prevents bleeding episodes.

#### AVAILABILITY

*Injection:* Actual number of AHF units is listed on each vial and varies from brand to brand.

#### INDICATIONS AND DOSAGES

 Treatment and prevention of bleeding in patients with hemophilia A factor VIII deficiency, hypofibrinogenemia, von Willebrand disease

IV

Adults, Elderly, Children. Dosage is highly individualized and is based on patient's weight, severity of bleeding, and coagulation studies.

#### **OFF-LABEL USES**

Treatment of disseminated intravascular coagulation.

#### CONTRAINDICATIONS

Hypersensitivity to mouse, hamster, or bovine protein, or to porcine or

murine factor, depending on product source.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Do not mix with other IV solutions or medications.

## SIDE EFFECTS

#### Occasional

Allergic reaction, including fever, chills, urticaria, wheezing, hypotension, nausea, feeling of chest tightness; stinging at injection site; dizziness; dry mouth; headache; altered taste.

#### SERIOUS REACTIONS

• There is a risk of transmitting viral hepatitis and other viral illnesses with product derived from pooled human plasma.

• Intravascular hemolysis and acute hemolytic anemia may occur if large or frequent doses are used with blood group A, B, or AB.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with hepatic disease and in those with blood type A, B, or AB. If large doses are given with these blood types, expect to monitor hematocrit and direct Coombs' test to check for hemolytic anemia. If hemolytic anemia occurs, expect to give transfusions with type O blood. Avoid overinflating cuff when monitoring BP. Take BP manually, avoiding automatic BP cuffs. Electric razor and soft toothbrush should be used to prevent bleeding. Notify the physician of abdominal or back pain, gingival bleeding, black or red stool, coffee-ground emesis, dark or red urine, or red-speckled mucus from cough. IV site should be monitored for oozing. Vital signs should also be monitored throughout therapy.

#### Storage

Store in the refrigerator. Do not freeze. Some products allow storage at room temperature for up to 6 mo. Administration

For IV use, refer to individual products for reconstitution and IV infusion requirements, as products vary. Warm concentrate and diluent to room temperature. Gently agitate or rotate to dissolve. Do not shake vigorously. Complete dissolution may take 5-10 min. Filter before administering. Use plastic syringes. A controlled infusion device is often used. Administer IV at a rate of approximately 2 mL/min. Some products allow infusion up to 10 mL/min.

## Apomorphine

aye-poe-more'feen Apokyn

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, dopaminergics

## MECHANISM OF ACTION

An antiparkinsonian agent that stimulates postsynaptic dopamine receptors in the brain. *Therapeutic Effect:* Relieves signs and symptoms of Parkinson disease and improves motor function.

#### PHARMACOKINETICS

Rapidly absorbed after subcutaneous administration. Protein binding: 99.9%. Widely distributed. Rapidly eliminated from plasma. Not detected in urine or secretions. *Half-life:* 41-45 min.

## AVAILABILITY

*Injection:* 10 mg/mL in cartridges to be used with injection pen.

## INDICATIONS AND DOSAGES

 Acute, intermittent treatment of hypomobility ("off" episodes) associated with advanced Parkinson disease

#### SC

Adults, Elderly: Initially, 0.2 mL (2 mg) used "as needed" to treat an acute "off" episode; may be increased in 0.1-mL (1-mg) increments every few days. Maximum: 0.6 mL (6 mg). Initial doses are determined by administering test doses in-clinic where a medical professional can closely monitor BP pre-dose and at 20, 40, and 60 min post dose. No more than 1 dose per "off" episode should be administered. Doses > 0.6 mL (6 mg), total daily doses > 2 mL (20 mg), and dosing more than 5 times per day are not recommended. Rotate injection sites.

NOTE: Apomorphine should be given with an antinauseant but NOT a serotonin 5-HT3 antagonist (contraindicated). Trimethobenzamide is recommended for nausea at a dose of 300 mg 3 times daily started 3 days before the initial dose of apomorphine and continued for at least the first 2 mo of therapy to combat nausea.

#### Dose in renal impairment

Test dose and starting dose should be reduced to 0.1 mL (1 mg).

#### CONTRAINDICATIONS

Concurrent use of 5-HT3 antagonists such as alosetron, dolasetron, granisetron, ondansetron, or palonosetron; hypersensitivity to apomorphine or any of the product ingredients (sodium metabisulfite); IV administration.

## Antithymocyte Globulin, Equine

an'tye-thye'moe-site glob'yoo-lin Atgam Do not confuse Atgam with Ativan.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Immune globulins, immunosuppressant

#### **MECHANISM OF ACTION**

A biological response modifier that acts as a lymphocyte selective immunosuppressant, reducing the number and altering the function of T lymphocytes, which are responsible for cell-mediated and humoral immunity. Lymphocyte immune globulin N also stimulates the release of hematopoietic growth factors. *Therapeutic Effect:* Prevents allograft rejection; treats aplastic anemia.

#### PHARMACOKINETICS

Onset rapid, absorption  $T_{max}$  is 5 days. Elimination mean half-life is 5.7 days. *Half-life:* 2.7-8.7 days.

#### AVAILABILITY

Injection: 250 mg/5 mL.

#### INDICATIONS AND DOSAGES

## To delay onset of renal graft allograft rejection

*Adults, Elderly, Children.* 15 mg/kg/ day for 14 days, then every other day for a total of 21 doses in 28 days. First dose within 24 h before or after transplantation.

### Treatment of renal allograft rejection

IV

Adults, Elderly, Children. First dose can be delayed until the diagnosis

of the first rejection episode. Then give 10-15 mg/kg/day for 14 days, then every other day for a total of 21 doses. Maximum: 21 doses.

#### Renal allograft recipients IV

Adults, Elderly. 10-30 mg/kg/day. Children. 5-25 mg/kg/day.

## Aplastic anemia

IV

Adults, Elderly, Children. 10-20 mg/kg once a day for 8-14 days, then every other day for a total of 21 doses.

#### **OFF-LABEL USES**

Immunosuppressant in bone marrow, heart, and liver transplants, treatment of pure red cell aplasia, multiple sclerosis, myasthenia gravis, and scleroderma.

### CONTRAINDICATIONS

Systemic hypersensitivity reaction to previous injection of lymphocyte immune globulin N or other equine gamma globulin preparations.

## INTERACTIONS

Drug Immunosuppressants: May increase risk of infection developing. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May alter renal function test results.

## IV INCOMPATIBILITIES

No information is available for Y-site administration.

## SIDE EFFECTS

#### Frequent

Fever (51%), thrombocytopenia (30%), rash, chills (16%), leukopenia (14%), systemic infection (13%).

#### Occasional (5%-10%)

Serum sickness-like reaction, dyspnea, apnea, arthralgia, chest pain, back pain, flank pain, nausea, vomiting, diarrhea, phlebitis.

#### SERIOUS REACTIONS

• Thrombocytopenia may occur but is generally transient.

• A severe hypersensitivity reaction, including anaphylaxis, occurs rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

! Lymphocyte immune globulin should be administered by physicians experienced in immunosuppressive treatment of renal transplant or aplastic anemia. Adequate laboratory and support equipment should be available.

Although rare, there is a risk of transmitting human and equine blood-based infections, particularly Creutzfeldt-Jakob disease.

Caution is warranted with concurrent immunosuppressive therapy. Immediately notify the physician of chest pain, rapid or irregular heartbeat, shortness of breath, wheezing, or swelling of the face or throat, which may occur during the IV infusion. Avoid exposure to people with colds or infections, and notify the physician as soon as signs or symptoms of infection, thrombocytopenia, or leukopenia develop. Dosage adjustments should be considered in patients with profound bone marrow suppression.

Although risk of hypersensitivity is rare, hypersensitivity can occur at any time during therapy. Serum sickness, although rare, could occur within the first 6-18 days of therapy. Experience with children is limited; it has been administered safely to a small number of renal allograft pediatric recipients and aplastic anemia pediatric patients at dosages comparable to those used in adults.

Before administration, test the patient with an intradermal injection of 0.1 mL of a freshly prepared 1:1000 dilution of lymphocyte immune globulin in normal saline and a contralateral NaCl injection as control.

#### Storage

Keep the drug refrigerated before and after dilution. Discard the diluted solution after 24 h. Protect from freezing.

#### Administration

Do not use intradermally, subcutaneously, intramuscularly, intra-arterially, or by IV bolus.

An intradermal test dose is recommended prior to beginning treatment (see prescribing information from manufacturer).

For IV use, dilute the total daily dose with 0.9% NaCl, as prescribed, to a final concentration of no more than 4 mg/mL. Gently rotate the diluted solution; avoid shaking it. Use a 0.2- to 1-micron filter, and infuse the total daily dose over at least 4 h. To prevent chemical phlebitis, avoid using a peripheral vein for IV infusion. Instead, expect to use a central venous catheter, a Groshong catheter, or a peripherally inserted central catheter. Avoid contact of the undiluted lymphocyte immune globulin with air. Expect to monitor frequently for chills, fever, erythema, and pruritus. An order for prophylactic antihistamines or corticosteroids should be obtained to treat these potential side effects.

#### INTERACTIONS

#### Drug

## Alosetron, dolasetron, granisetron,

ondansetron, palonosetron: May produce profound hypotension and loss of consciousness. Contraindicated.

## Butyrophenones, metoclopramide, phenothiazines, thioxanthenes:

Decrease the effectiveness of apomorphine.

**CNS depressants:** May increase CNS depressant effects.

#### Antihypertensives, vasodilators: Increased risk of hypotension and adverse events.

## Drugs that prolong QT interval:

Increased risk of QT interval prolongation and torsades de pointes.

#### Food

Alcohol: Can worsen side effects; avoid.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase level.

## SIDE EFFECTS

#### Common (≥ 2%)

Injection site discomfort, nausea, vomiting, headache, dizziness, falls, syncope, hypersalivation, pallor, yawning, diaphoresis, somnolence, chest pain, rhinorrhea, orthostatic hypotension, dyskinesia or worsening dyskinesia, frequent erections, hallucinations.

## Rare (< 2%)

Psychosis, stomatitis, altered taste, intense urges, such as gambling or inappropriate sexual urges.

#### SERIOUS REACTIONS

 Respiratory depression or CNS stimulation (characterized by tachypnea, bradycardia, or persistent vomiting) may occur. • Cardiovascular events, such as prolonged QT interval, angina, ischemic events.

• Falling asleep suddenly during activities of daily living, which can be potentially dangerous.

Priapism.

 Behavioral changes may be severe, e.g., paranoia, delusions, hallucinations, impulse control issues (gambling, sexual), confusion, aggressive behavior, agitation, disorientation and delirium.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with asthma, cardiac decompensation, cardiovascular or cerebrovascular disease, concomitant use of alcohol, antihypertensives or vasodilators, hypotension, sleep disorders, and renal impairment. Caution should also be used in persons prone to nausea and vomiting and those susceptible to QT/QTc prolongation, such as persons with hypokalemia, hypomagnesemia, bradycardia, genetic predisposition, or concomitant use of drugs that prolong the OTc interval. It is unknown whether apomorphine is distributed in breast milk. The safety and efficacy of apomorphine have not been established in children. Elderly patients are more likely to develop hallucinations and confusion and to experience falls, cardiovacular events, and respiratory disorders. Patients should use caution when driving or operating machinery until the effects of the drug are known.

Monitor BP; be alert for postural instability due to orthostasis or dyskinesia. If patients falls asleep during activities where they would normally be alert, notify prescriber.

#### Storage

Store at room temperature. Administration

! Do not use intravenously. The manufacturer recommends expressing the dose of apomorphine in milliliters (mL) not milligrams (mg) to avoid confusion.

When initiating treatment, expect patient to be receiving an appropriate antiemetic (trimethobenzamide) to curb nausea and vomiting. A test dose is given initially, with both supine and standing BP checked predose and at 20-, 40-, and 60-min post dose. Apomorphine is administered subcutaneously via use of a multidose-containing dosing pen. Follow directions carefully for use of the dosing pen and cartridges.

## Apraclonidine Hydrochloride

ap-ra-kloe'ni-deen hi-droh-klor'-ide Do not confuse with, clomiphene, Klonopin, Lodine, or quinidine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Selective  $\alpha_2$ -adrenergic agonist

## **MECHANISM OF ACTION**

An ocular  $\alpha$ -adrenergic agent that is relatively selective for  $\alpha_2$  receptor agonist. *Therapeutic Effect:* Reduces intraocular pressure.

## PHARMACOKINETICS

Onset of action occurs within 1 h. The duration of a single dose is about 12 h. *Half-life:* 8 h.

### AVAILABILITY

Ophthalmic Solution: 0.5%, 1%.

## INDICATIONS AND DOSAGES

#### Glaucoma

OPHTHALMIC *Adults, Elderly.* Instill 1 drop of 0.5% solution to affected eye(s) 3 times a day.

#### Intraocular hypertension post laser surgery

OPHTHALMIC

*Adults, Elderly.* Instill 1 drop of 1% solution in operative eye(s) 1 h before surgery and 1 drop postoperatively.

## CONTRAINDICATIONS

Hypersensitivity to apraclonidine or clonidine or any component of the formulation; MAO inhibitor therapy.

## DRUG INTERACTIONS

MAO inhibitors: Concomitant use contraindicated.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent (5%-15%)

Eye discomfort, hyperemia, pruritus, dry mouth.

#### Occasional (1%-5%)

Headache, constipation, dizziness, somnolence, conjunctivitis, changes in visual acuity, mydriasis, ocular inflammation.

#### Rare

Nasal decongestion.

#### SERIOUS REACTIONS

- · Allergic reaction occurs rarely.
- Peripheral edema and arrhythmias have been reported.

#### PRECAUTIONS & CONSIDERATIONS

Tachyphylaxis frequently develops. Use with caution in patients with

#### 112 Aprepitant

impaired renal or liver function, depression, cardiovascular disease, cerebrovascular disease, Raynaud disease, or thromboangiitis obliterans and in patients receiving concomitant cardiovascular drugs. Safety and effectiveness have not been established in pediatric patients. No unique precautions have been identified in elderly patients.

#### Storage

Store at room temperature.

#### Administration

Wait 5 min between instillation of other ophthalmic agents. Use nasolacrimal occlusion to reduce systemic exposure.

### Aprepitant

ap-re'pi-tant Emend Do not confuse aprepitant with fosaprepitant.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiemetics/ antivertigo, substance P antagonists

#### **MECHANISM OF ACTION**

A selective human substance P and neurokinin-1 (NK1) receptor antagonist that inhibits chemotherapy-induced nausea and vomiting centrally in the chemoreceptor trigger zone. *Therapeutic Effect:* Prevents the acute and delayed phases of chemotherapyinduced emesis, including vomiting caused by high-dose cisplatin.

#### PHARMACOKINETICS

Crosses the blood-brain barrier. Extensively metabolized in the liver. Eliminated primarily by liver metabolism (not excreted renally). Half-life: 9-13 h.

#### AVAILABILITY

Capsules: 80 mg, 125 mg.

#### INDICATIONS AND DOSAGES • Prevention of chemotherapy-

## induced nausea and vomiting

Adults, Elderly. 125 mg 1 h before chemotherapy on day 1 and 80 mg once a day in the morning on days 2 and 3. Given as part of regimens that include a steroid and a 5-HT3 antagonist.

## Prevention of postoperative nausea and vomiting

*Adults, Elderly.* 40 mg within 3 h before induction of anesthesia.

#### CONTRAINDICATIONS

Hypersensitivity, concurrent use of pimozide (Orap), cisapride.

#### INTERACTIONS

#### Drug

Alprazolam, docetaxel, etoposide, ifosfamide, imatinib, irinotecan, midazolam, paclitaxel, triazolam, vinblastine, vincristine, vinorelbine: May increase the plasma concentrations of these drugs.

Antifungals, clarithromycin, diltiazem, nefazodone, nelfinavir, ritonavir: Increase aprepitant plasma concentration.

**Carbamazepine, phenytoin, rifampin:** Decrease aprepitant plasma concentration.

**Contraceptives:** May decrease the effectiveness of estrogen or progestin contraceptives. Alternative or back-up methods of contraception should be used during treatment and for 1 mo following the last dose of aprepitant.

Aprepitant (Generic Name), Emend (Brand Name)

**Corticosteroids:** Increase levels of systemic corticosteroids. If the patient is also receiving a steroid, expect to reduce the IV steroid dose by 25% and the oral dose by 50%. **Paroxetine:** May decrease the effectiveness of either drug. **Warfarin:** May decrease the effectiveness of warfarin. **Herbal** 

**St. John's wort:** May decrease aprepitant levels.

#### Food

**Grapefruit juice:** May increase aprepitant concentrations.

#### DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum creatinine, AST (SGOT), and ALT (SGPT) levels. May produce proteinuria.

#### SIDE EFFECTS

**Frequent (10%-17%)** Fatigue, nausea, hiccups, diarrhea,

constipation, anorexia.

Occasional (4%-8%)

Headache, dizziness, dehydration, heartburn.

Rare (≤ 3%)

Abdominal pain, epigastric discomfort, gastritis, tinnitus, insomnia.

#### SERIOUS REACTIONS

• Neutropenia and mucous membrane disorders occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution in hepatic impairment. It is unknown whether aprepitant crosses the placenta or is distributed in breast milk. The safety and efficacy of aprepitant have not been established in children. No agerelated precautions have been noted in elderly patients.

Nausea and vomiting should be relieved shortly after drug administration. Notify the physician if headache or persistent vomiting occurs. Pattern of daily bowel activity and stool consistency should be assessed.

#### Storage

Store at room temperature in original package.

### Administration

As prescribed prior to chemotherapy, aprepitant is given with corticosteroids and a serotonin (5-HT3) antagonist.

Take aprepitant orally without regard to food.

#### Arformoterol Tartrate

ar-for-moe'ter-ole tar'trate ★ Brovana

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Adrenergic agonist, bronchodilators, long-acting  $\beta_2$  agonist (LABA)

#### **MECHANISM OF ACTION**

A long-acting  $\beta_2$  agonist that stimulates adrenergic receptors in bronchial smooth muscle, causing relaxation of smooth muscle. *Therapeutic Effect:* Produces bronchodilation.

#### PHARMACOKENETICS

Primarily absorbed by the pulmonary system following inhalation. Protein binding: 52%-65%. Primarily metabolized by glucuronidation. Primarily excreted in urine; partial elimination in feces. *Half-life*: 26 h.

#### AVAILABILITY

Solution for Nebulization: 15 mcg/ 2 mL.

## INDICATIONS AND DOSAGES COPD

ORAL INHALATION *Adults.* 15 mcg (2 mL) twice a day by nebulization.

#### CONTRAINDICATIONS

Hypersensitivity to arformoterol, racemic formoterol, or its components. Do not use as monotherapy for asthma; drug is not indicated for asthma.

#### DRUG INTERACTIONS

#### Drug

 $\beta$ -blockers: May interfere with each other's effects.

Methylxanthines (e.g., aminophylline, theophylline), steroids, diuretics: May potentiate hypokalemic effects.

Tricyclic antidepressants, drugs that prolong QT interval: May potentiate cardiovascular effects.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional (2%-10%)

Pain, chest pain, back pain, sinusitis, rash, leg cramps, dyspnea, peripheral edema.

#### Rare (< 2%)

Oral candidiasis, pulmonary congestion.

#### SERIOUS REACTIONS

• May increase the risk of asthmarelated death.

• May exacerbate cardiovascular conditions including arrhythmias and hypertension.

 Hypersensitivity reactions including urticaria, angioedema, rash, bronchospasm, and anaphylaxis may occur.

## PRECAUTIONS & CONSIDERATIONS

Monotherapy with arformoterol may increase risk of asthma-related events, such as hospitalization or mortality; not indicated for asthma. Caution is warranted in patients with cardiovascular disease, hypertension, a seizure disorder, and thyrotoxicosis. It is unknown whether arformoterol crosses the placenta or is distributed in breast milk. The safety and efficacy of arformoterol have not been established in children. The nebulizar solution is approved only in adults. Elderly patients may be more prone to tachycardia and tremor because of increased sensitivity to sympathomimetics. Drink plenty of fludis to decrease the thickness of lung secreations. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Pulse rate and quality, ECG, respiratory rate, depth, rhythm, and type, ABG, and serum potassium levels should be monitored. Keep a log of measurements peak flow readings. Storage

Before dispensing, store in protective foil pouch in the refrigerator. After dispensing, unopened foil pouches may be stored at room temperature up to 6 wks. Remove from foil pouch immediately before use. Solution should be colorless; discard any vial that is not.

#### Administration

Administered with a standard jet nebulizer connected to an air compressor. May be administered with mouthpiece or face mask. Administer undiluted; do not mix with other medications in nebulizer.

#### Argatroban 115

## A

## Argatroban

ar-gat'tro-ban Acova Do not confuse with Aggrastat or Orgaran.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Anticoagulants, thrombin inhibitors

## **MECHANISM OF ACTION**

A direct thrombin inhibitor that reversibly binds to thrombin-active sites. Inhibits thrombin-catalyzed or thrombin-induced reactions, including fibrin formation, activation of coagulant factors V, VIII, and XIII; also inhibits protein C formation and platelet aggregation. *Therapeutic Effect:* Produces anticoagulation.

## PHARMACOKINETICS

Following IV administration, distributed primarily in extracellular fluid. Protein binding: 54%. Metabolized in the liver. Primarily excreted in the feces, presumably through biliary secretion. *Half-life*: 39-51 min.

## AVAILABILITY

Injection: 100 mg/mL.

#### INDICATIONS AND DOSAGES > To prevent and treat heparininduced thrombocytopenia IV INFUSION

Adults, Elderly. Initially, 2 mcg/kg/ min administered as a continuous infusion. After initial infusion, dose may be adjusted until steady state aPTT is 1.5-3 times initial baseline value, not to exceed 100 seconds. Maximum dose: 10 mcg/kg/min.

### During percutaneous coronary intervention

## IV INFUSION

Adults, Elderly. Initially, give a loading dose of 350 mcg/kg by slow IV injection over 3-5 min, follow with IV infusion of 25 mcg/kg/min. ACT checked in 5-10 min following bolus. If ACT is < 300 seconds, give additional bolus 150 mcg/kg, increase infusion to 30 mcg/kg/min. If ACT is > 450 seconds, decrease infusion to 15 mcg/kg/min. Once ACT of 300-450 seconds achieved, proceed with procedure.

Dosage in hepatic impairment

Adults (HIT). Decrease initial dose to 0.5 mcg/kg/min; adjust as indicated. Adults (PCI) with significant hepatic impairment (AST or  $ALT \ge 3$  times ULN): Do not use.

## CONTRAINDICATIONS

Overt major bleeding, hypersensitivity.

## INTERACTIONS

#### Drug

Antiplatelet agents, thrombolytics, other anticoagulants: May increase the risk of bleeding. All parenteral anticoagulants should be discontinued before administration of argatroban. There is an increased risk of intracranial bleeding when used concomitantly with thrombolytic therapy.

### Herbal

Feverfew, red clover, horse chestnut, garlic, green tea, ginseng, ginkgo: Can have antiplatelet activity, may increase risk of bleeding.

## DIAGNOSTIC TEST EFFECTS

Increases aPTT, International Normalized Ratio, and PT. Also increases activated clotting time (ACT).

#### IV INCOMPATIBILITIES

Do not mix with other medications or solutions. Specific incompatibilities include amiodarone.

#### SIDE EFFECTS

#### Frequent (3%-8%)

Dyspnea, hypotension, chest pain, fever, diarrhea, nausea, pain, vomiting, infection, cough, minor bleeding, bruising, GI bleed.

#### SERIOUS REACTIONS

Ventricular tachycardia and atrial fibrillation occur occasionally.
Major bleeding and sepsis occur

• Major bleeding and sepsis occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with congenital or acquired bleeding disorders, hepatic impairment, severe hypertension, and ulcerations. Also, use argatroban cautiously immediately following administration of spinal anesthesia, lumbar puncture, and major surgery. It is unknown whether argatroban is excreted in breast milk; use in breastfeeding is not recommended. Safety and efficacy of argatroban have not been established in children younger than 18 yr of age. No agerelated precautions have been noted in elderly patients. An electric razor and soft toothbrush should be used to prevent bleeding.

Notify the physician of abdominal pain, bleeding at surgical site, black or red stool, coffee-ground vomitus, red or dark urine, or blood-tinged mucus from cough. Activated clotting time, aPTT, PT, platelet count, BP, pulse rate, and menstrual flow should be monitored.

#### Storage

Before reconstitution, store at room temperature. Following

reconstitution, the solution is stable for 24 h at room temperature and for 48 h if refrigerated. Avoid exposing the solution to direct sunlight. Discard the solution if it appears cloudy or has an insoluble precipitate.

#### Administration

Before infusion, dilute the solution 100-fold in 0.9% NaCl, D5W, or lactated Ringer's solution to provide a final concentration of 1 mg/mL. Mix the solution by repeatedly inverting the bag for 1 min. Following reconstitution, the solution may briefly appear hazy because of formation of microprecipitates. These rapidly dissolve when the solution is mixed. Administer as an IV infusion.

#### **Aripiprazole**

ara-pip'rah-zole ★ ▲ Abilify **Do not confuse Abilify with Ambien.** 

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

#### **MECHANISM OF ACTION**

An antipsychotic agent that provides partial agonist activity at dopamine and serotonin  $(5-HT_{1A})$  receptors and antagonist activity at serotonin  $(5-HT_{2A})$  receptors. *Therapeutic Effect*: Diminishes schizophrenic behavior and stabilizes mood swings in bipolar disorder and autism.

## PHARMACOKINETICS

Well absorbed through the GI tract. Protein binding: 99% (primarily albumin). Reaches steady levels

Aripiprazole (Generic Name), Abilify (Brand Name)

in 2 wks. Metabolized in the liver. Eliminated primarily in feces and, to a lesser extent, in urine. Not removed by hemodialysis. *Half-life:* 75 h (increased in CYP2D6 poor metabolizers).

### AVAILABILITY

Injection Solution: 7.5 mg/mL. Oral Solution: 1 mg/mL. Tablets, Orally Disintegrating: 10 mg, 15 mg. Tablets: 2 mg, 5 mg, 10 mg, 15 mg, 20 mg, 30 mg.

#### INDICATIONS AND DOSAGES

#### Acute agitation associated with schizophrenia or bipolar disorder IM

*Adults.* 9.75 mg as a single dose (range 5.25-15 mg); repeated doses may be given at intervals of at least 2 h to a maximum of 30 mg/day.

#### • Bipolar disorder PO

Adults, Elderly. 15 mg once daily. May increase to 30 mg once daily. Children 10 yr of age and older: 2 mg daily for 2 days, followed by 5 mg daily for 2 days with a further increase to a target dose of 10 mg daily; subsequent dose increases may be made in 5-mg increments up to a maximum dose of 30 mg/day.

#### Depression, adjunctive therapy PO

*Adults, Elderly.* Initial dose of 2-5 mg/day, with adjustments of 5 mg/day at intervals of at least 1 wk. Usual dose range 2-15 mg/day.

#### Schizophrenia

#### PO

Adults, Elderly. Initially, 10-15 mg once a day. May increase up to 30 mg/day. At least 2 wks should elapse between dosage adjustments. Adolescents 13 yr of age and older: 2 mg daily for 2 days, followed by 5 mg daily for 2 days with a further increase to a target dose of 10 mg daily; subsequent dose increases may be made in 5-mg increments up to a maximum of 30 mg/day.

## Irritabillity associated with autistic disorder

*Children 6 yr of age and older.* Initially, 2 mg once daily. Increase to 5 mg/day, with subsequent increases to 10 mg/day or a maximum of 15 mg/day if needed. Increase by no more than 5 mg/wk.

#### Dosage adjustments (all populations)

Patients receiving strong inhibitors of CYP3A4 or inhibitors of CYP2D6 OR if genotype is a poor metabolizer (PM) of CYP2D6: Reduce to 50% of the usual dose. If receiving drugs from each category or if receiving an inhibitory drug and also a PM, then reduce to 25% of usual dose initially. Patients receiving strong CYP3A4

*inducers:* Consider up to a doubling of aripiprazole dose.

#### **OFF-LABEL USES**

Schizoaffective disorder.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

#### Drug

Carbamazepine: May decrease the aripiprazole blood concentration. Strong CYP3A4, CY2D6

## inhibitors, such as fluoxetine, ketoconazole, quinidine,

paroxetine: May increase the aripiprazole blood concentration and dose adjustments are required. Herbal

**St. John's wort:** May decrease aripiprazole levels.

Kava kava, valerian: May incease CNS depression.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (5%-11%)

Weight gain, headache, insomnia, vomiting, agitation.

#### Occasional (3%-4%)

Light-headedness, nausea, akathisia, somnolence.

#### Rare (2% or less)

Blurred vision, constipation, asthenia or loss of energy and strength, anxiety, fever, rash, cough, rhinitis, orthostatic hypotension, hyperglycemia.

#### SERIOUS REACTIONS

 Extrapyramidal symptoms and neuroleptic malignant syndrome occur rarely.

• Serious allergic reactions (e.g., anaphylaxis) occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cardiovascular or cerebrovascular diseases (because it may induce hypotension), dementia-related psychosis (increased risk of death with use of atypical antipsychotics), history of seizures or conditions that may lower the seizure threshold (such as Alzheimer's disease), hepatic or renal impairment, and Parkinson disease (because of potential for exacerbation). Use with caution in patients with diabetes or with risk factors for diabetes. CNS depressants and alcohol should be avoided during therapy. It is unknown whether aripiprazole crosses the placenta. Because this drug may be distributed in breast milk, female patients should avoid breastfeeding during therapy. The safety and efficacy of aripiprazole have not been established in children < 6 yr of age. Antidepressants have

been observed to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders. Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death. Most deaths appear to be either CV (e.g., heart failure, sudden death) or infectious (e.g., pneumonia) in nature.

Extrapyramidal symptoms and tardive dyskinesia, manifested as chewing or puckering of the mouth, puffing of the cheeks, or tongue protrusion, should be monitored. BP, pulse rate, weight, and therapeutic response should also be monitored. Hydration and hypovolemia should be corrected before beginning therapy.

#### Storage

Store at room temperature. Administration

#### Take oral aripiprazole without regard to food. For Discmelt tablets, keep in blister package until time of use; remove tablet with dry hands. Place on tongue and let dissolve; may be taken with liquid only if needed. Use a calibrated device to measure the oral solution.

Injection is for IM use only. Inject slowly into deep muscle mass.

#### Armodafinil

are-moe-daf'i-nil

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: IV

**Classification:** Central nervous system (CNS) stimulants

Armodafinil (Generic Name), Nuvigil (Brand Name)

## **Arsenic Trioxide**

ar'sen-ik try-ox'ide ★ Trisenox **Do not confuse with Trimox.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, miscellaneous

#### **MECHANISM OF ACTION**

An antineoplastic that produces morphologic changes and DNA fragmentation in promyelocytic leukemia cells. *Therapeutic Effect:* Produces cell death.

#### AVAILABILITY

Injection: 1 mg/mL in glass ampules.

## INDICATIONS AND DOSAGES Acute promyelocytic leukemia

IV INFUSION

Adults, Elderly, Children 5 yr of age and older. Induction: 0.15 mg/kg/ day until bone marrow remission. Begin consolidation treatment. Do not exceed 60 induction doses. 3-6 wks after completion of induction therapy, 0.15 mg/kg/day for 25 doses over a period of up to 5 wks.

#### CONTRAINDICATIONS

Hypersensitivity to arsenic.

#### INTERACTIONS

#### Drug

Amphotericin B, diuretics: May produce electrolyte imbalances. Antiarrhythmics, thioridazine: May prolong QT interval.

## DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin levels, serum calcium and magnesium

levels, and platelet and WBC counts. May increase AST (SGOT) and ALT (SGPT) levels.

#### **IV INCOMPATIBILITIES**

Do not mix arsenic trioxide with any other medications.

#### SIDE EFFECTS

#### Expected (50%-75%)

Nausea, cough, fatigue, fever, headache, vomiting, abdominal pain, tachycardia, diarrhea, dyspnea.

### Frequent (30%-43%)

Dermatitis, insomnia, edema, rigors, prolonged QT interval, sore throat, pruritus, arthralgia, paresthesia, anxiety.

#### Occasional (20%-28%)

Constipation, myalgia, hypotension, epistaxis, anorexia, dizziness, sinusitis.

#### Occasional (8%-15%)

Ecchymosis, nonspecific pain, weight gain, herpes simplex, wheezing, flushing, diaphoresis, tremor, hypertension, palpitations, dyspepsia, eye irritation, blurred vision, asthenia, diminished breath sounds, crackles.

#### Rare

Confusion, petechiae, dry mouth, oral candidiasis, incontinence, rhonchi.

#### SERIOUS REACTIONS

• Seizures, GI hemorrhage, renal impairment or failure, pleural or pericardial effusion, hemoptysis, and sepsis occur rarely.

 Prolonged QT interval, complete AV block, unexplained fever, dyspnea, weight gain, and effusion are evidence of arsenic toxicity. If arsenic toxicity is apparent, stop arsenic trioxide treatment and begin steroid treatment as ordered.

• About 3% of patients get APL differentiation syndrome.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cardiac abnormalities and renal impairment. Arsenic trioxide is distributed in breast milk and may cause fetal harm. It should not be used by pregnant or breastfeeding women.

Notify the physician if confusion, muscle weakness, fever, vomiting, difficulty breathing, or rapid pulse rate occurs. CBC, creatinine, 12-lead ECG, liver function test results, blood chemistry values, serum electrolyte levels (hypokalemia is more common than hyperkalemia), and blood glucose levels (hyperglycemia is more common than hypoglycemia) should be assessed before and during therapy.

#### Storage

Store the drug at room temperature. The diluted solution is stable for 24 h at room temperature and 48 h if refrigerated.

#### Administration

CAUTION: Observe usual procedures for preparation, administration, and disposal of cytotoxic drugs. ! A central venous line is not required for administration of arsenic; the drug may be infused

through a peripheral line. After withdrawing the drug from ampule, dilute it with 100-250 mL D5W or 0.9% NaCl. Infuse the solution intravenously over 1-2 h. The duration of the infusion may be extended up to 4 h.

## **MECHANISM OF ACTION**

An  $\alpha_1$ -agonist (R-enantiomer of modafinil) that may bind to dopamine reuptake carrier sites, increasing  $\alpha$  activity and decreasing  $\omega$ ,  $\tau$ , and  $\beta$  brain wave activity. Effects appear to be similar to sympathomimetics, such as the amphetamines. *Therapeutic Effect:* Promotes wakefulness, although exact mechanism is unknown.

### PHARMACOKINETICS

Well absorbed. Widely distributed. Hydrolyzed and metabolized in the liver. Less than 10% excreted in the urine. Unknown if removed by hemodialysis. *Half-life*: 15 h.

#### AVAILABILITY

Tablets: 50 mg, 150 mg, 250 mg.

#### INDICATIONS AND DOSAGES

#### Narcolepsy and obstructive sleep apnea/hypopnea syndrome (OSAHS)

PO

*Adults, Elderly, Adolescents 17 yr and older.* 150-250 mg once daily in the morning. Consider lower doses in the elderly.

#### Shift-work sleep disorder PO

*Adults*. Give 150 mg once daily roughly 1 hr prior to the scheduled work shift.

#### Dosage in hepatic impairment

Reduce normal dosage (usually by up to 50%) in those with moderate to severe liver disease.

#### CONTRAINDICATIONS

Hypersensitivity to modafinil or armodafinil.

## INTERACTIONS

#### Drug

## Antifungals, erythromycins, other CYP3A4 isoenzyme inhibitors:

Increase armodafinil concentrations and may necessitate armodafinil dose reduction.

Cyclosporine, hormonal contraceptives, theophylline: May decrease plasma concentrations of these drugs; nonhormonal contraception is recommended during treatment.

Diazepam, phenytoin, propranolol, clomipramine, warfarin, and other CYP2C19 substrates: May increase

plasma concentrations of these drugs. For warfarin, monitor INR closely.

Other CNS stimulants: May increase CNS stimulation.

#### Herbal

None known.

#### Food

Alcohol: Manufacturer recommends avoidance.

#### DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Anxiety, insomnia, nausea, dizziness, headache, nervousness.

#### Occasional

Anorexia, diarrhea, dry mouth or skin, muscle stiffness, polydipsia, rhinitis, paresthesia, tremor, vomiting, palpitations. Agitation, excitation, hypertension, and insomnia may occur.

#### SERIOUS REACTIONS

• Psychiatric symptoms such as hallucinations, delusions, unusual moods or behaviors, and aggression may occur.

A

• Serious rash, including Stevens-Johnson syndrome, TEN, and eosinophilia.

• Serious hypersensitivity including angioedema (rare).

#### PRECAUTIONS & CONSIDERATIONS

Those with hepatic or renal impairment or physiologic changes due to aging may require decreased dosage. Caution is warranted in patients with a history of clinically significant mitral valve prolapse, left ventricular hypertrophy, psychiatric illness, substance abuse, or seizures. Nonhormonal contraceptive methods should be used during therapy and 1 mo afterward because armodafinil decreases the effectiveness of hormonal contraceptives. It is unknown whether the drug is excreted in breast milk: caution is warranted in lactation. Use caution when giving the drug to pregnant women. The safety and efficacy of this drug have not been established in children younger than 17 yr; children may have an increased risk of serious rash.

Dizziness may occur, so tasks that require mental alertness and motor skills should be avoided until response to the drug is established. Sleep pattern should be assessed throughout therapy.

#### Storage

Store tablets at room temperature. Administration

Take armodafinil without regard to food once daily. If treating narcolepsy, dose is taken as single dose in the morning. In patients with shift-work sleep disorder, the dose is taken 1 h before the start of the work shift.

#### Artemether/ Lumefantrine

ar-tem'e-ther/loo-me-fan'treen ★ ♪ CoArtem

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

**Classification:** Antimalarial, antiprotozoal

#### MECHANISM OF ACTION

Both drugs are active against the erythrocytic stages of *P. falciparum* and *P. vivax*. The antimalarial activity of artemether may involve free radical damage to membrane systems in the parasite during the asexual developmental states. Both inhibit nucleic acid and protein synthesis. Synergistic effects limit parasite resistance. *Therapeutic Effect:* Rapid clearance of most *Plasmodium* species from the blood. In the treatment of *P. vivax*, additional agents are required to ensure cure.

#### PHARMACOKINETICS

Both drugs highly bound to human serum proteins. Artemether is rapidly eliminated from plasma with a half-life of 2-3 h The main route of metabolism is via the CYP3A4/5 isoenzymes. The biologically active metabolite, DHA, is formed primarily via CYP3A4/5. The half-life of lumefantrine is 3-6 days. Due to this slow elimination, lumefantrine exposure increases after each dose and reaches a peak on day 3 of therapy. Lumefantrine metabolism is mainly catalyzed by the CYP3A4 isoenzyme, and glucuronidation occurs after oxidative biotransformation

#### AVAILABILITY

*Tablets:* Artemether 20 mg/ lumefantrine 120 mg.

# INDICATIONS AND DOSAGES Treatment of malaria PO

Adults, Adolescents, and Children weighing > 35 kg. 4 tablets as a single dose PO upon diagnosis, then again after 8 h, and then 4 tablets PO twice daily (am and pm) for the next 2 days (total course of 24 tablets). Adults, Adolescents, and Children weighing  $\geq 25$  kg and < 35 kg. 3 tablets per dose PO upon diagnosis, then again after 8 h, and then 3 tablets PO twice daily (am and pm) for the next 2 days (total course of 18 tablets).

Children weighing  $\geq 15$  kg and < 25 kg. 2 tablets per dose PO upon diagnosis, then again after 8 h, and then 2 tablets PO twice daily (am and pm) for the next 2 days (total course of 12 tablets).

Children and Infants 2 mo of age and older and  $\geq$  5 kg and < 15 kg. 1 tablet per dose PO upon diagnosis, then again after 8 h, and then 1 tablet PO twice daily (morning and evening) for the next 2 days (total course of 6 tablets).

#### CONTRAINDICATIONS

Hypersensitivity to artemether, lumefantrine, or any components of the product.

#### INTERACTIONS

#### Drug

Drugs that prolong the QT interval (e.g., class IA [quinidine, procainamide, disopyramide] or class III [amiodarone, sotalol] antiarrhythmics; antipsychotics [pimozide, ziprasidone]; macrolide antibiotics; fluoroquinolones; azole antifungals; terfenadine; **astemizole; or cisapride):** Additive risk of cardiac effects; avoid use of artemether/lumefantrine.

#### Hormonal contraceptives:

Artemether/lumefantrine may reduce contraceptive effect; nonhormonal methods are recommended.

**CYP3A4 inhibitors:** May increase the levels and effects of artemether/lumefantrine.

Antiretroviral therapy: Variable effects; may reduce antiretroviral activity; may increase levels of artemether/lumefantrine. Caution advised.

CYP2D6 substrates (selected β-blockers, flecainide, fluoxetine, paroxetine, risperidone, thioridazine, tricyclic

antidepressants, venlafaxine):

Lumefantrine may increase the levels and effects of CYP2D6 substrates. **Halofantrine:** May increase risk of cardiac effects; do not administer within 1 mo of each other.

### Herbal

None known. Food

**Grapefruit juice:** Avoid grapefruit juice as it may increase drug levels in the blood.

#### DIAGNOSTIC TEST EFFECTS

Increase in LFTs, increased hematocrit, changes in platelet count or white blood cell count may occasionally occur. May prolong QTc interval of EKG.

## SIDE EFFECTS

#### Frequent

Mild transient headaches, nausea, dizziness, weakness, loss of appetite, arthralgia, myalgia, fatigue, chills, fever, palpitations.

#### Occasional

Vomiting, diarrhea, tinnitus, dyspepsia, tremor, ataxia, somnolence, mood changes.
#### Rare

Urticaria, bullous skin rashes.

#### SERIOUS REACTIONS

 QT prolongation resulting in ECG changes and risk for torsade de pointes.

• Allergic reactions including serious skin rashes, anaphylaxis, angioedema.

#### **PRECAUTIONS & CONSIDERATIONS**

Avoid use in patients with known QT prolongation or cardiac arrhythmia, those with hypokalemia or hypomagnesemia, and those taking other drugs that prolong the QT interval. Other antimalarials should not be given concomitantly, unless there is no other treatment option, due to limited safety data. Do NOT give with halofantrine or within 1 mo of each other, due to potential cardiac risks. The drugs have not been studied in patients with renal or hepatic impairment. Use with caution in the elderly. Use with caution during lactation, as the drug may pass to breast milk. Avoid administration in pregnancy if possible as use of the drug may result in fetal loss or a potential for birth defects, especially in the first trimester. Fetal defects have been reported when artemisinins are administered to animals. Females should be advised to use nonhormonal contraception during the month of administration, due to a potential to decrease the efficacy of hormonal birth control methods.

Monitor the patient for resolution of signs and symptoms and drug tolerance; if the patient vomits up a dose twice, then the prescriber should be contacted for a change in orders. Adequate food intake is a must to avoid recrudescence. This drug combination has not been studied for effectiveness to prevent malaria.

#### Storage

Store tablets at room temperature; close tightly and protect from moisture.

#### Administration

Take the tablets with food. Patients with acute malaria are frequently averse to food. Encourage patient to resume normal eating as soon as possible as this improves absorption of the drugs and limits the chance for treatment failure and relapse. For patients who are unable to swallow the tablets. such as infants and children, the tablets may be crushed and mixed with a small amount of water (1 to 2 tsp) immediately prior to use. Follow dose whenever possible by food/drink (e.g., milk, formula, pudding, broth, etc.). In the event of vomiting within 1 to 2 h of administration, give a repeat dose. If the repeat dose is vomited, switch to an alternative antimalarial for treatment.

#### Ascorbic Acid (Vitamin C)

a-skor'bic as'id ★ ▲ Acerola C, Ascor-L, Cenolate, Vicks Vitamin C Orange Drops

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A (C if used in doses above recommended daily allowance, or if injectable forms used) OTC, injectable, Rx only

*Classification:* Vitamins, water-soluble vitamins

# **MECHANISM OF ACTION**

Assists in collagen formation and tissue repair and is involved in oxidation-reduction reactions and other metabolic reactions. *Therapeutic Effect:* Involved in carbohydrate use and metabolism, as well as synthesis of carnitine, lipids, and proteins. Preserves blood vessel integrity.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 25%. Oxidation is the primary method of metabolism to inactive metabolites; drug and metabolites excreted in the urine. Removed by hemodialysis.

# AVAILABILITY

Capsules: 500 mg, 1 g. Capsules (Controlled-Release): 500 mg, 1 g. Oral Solution: 500 mg/5 mL. Lozenge: 25 mg. Tablets: 100 mg, 250 mg, 500 mg, 1 g. Tablets (Chewable): 100 mg, 250 mg, 500 mg, 1000 mg. Tablets (Controlled-Release): 500 mg, 1 g, 1500 mg. Injection: 500 mg/mL.

# INDICATIONS AND DOSAGES

 Dietary supplement (ranges within Reference Daily Intake)

Adults, Elderly. 50-200 mg/day. Children. 35-100 mg/day.

## Scurvy

PO

Adults, Elderly. 100-250 mg 1-2 times a day. Children. 100-300 mg/day in divided doses.

# **OFF-LABEL USES**

Control of idiopathic methemoglobinemia acidification of urine.

#### CONTRAINDICATIONS

None known.

# INTERACTIONS

#### Drug

**Deferoxamine:** Vitamin C often used adjunctively with deferoxamine; however, to avoid interaction, must not be started until at least 1 mo of initial deferoxamine treatment for iron toxicity. See manufacturer recommendations.

**Warfarin:** No interaction unless high doses of vitamin C given (e.g., grams per day); if high doses given, then may interfere with anticoagulant effect.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May decrease urinary pH. May increase urine, uric acid, and urine oxalate levels. Patients with diabetes may obtain false reading of urinary glucose test. Interferes with aminedependent stool occult blood tests and may cause false negative results. Avoid using within 72 h of testing.

# IV INCOMPATIBILITIES

Aminophylline, azathioprine, ceftazidime (Fortaz), ceftriaxone (Rocephin), dantrolene, diazepam, erythromycin, hydralazine, inamrinone, midazolam, nitroprusside, pentobarbital, phenytoin.

# 🗏 IV COMPATIBILITIES

Calcium gluconate, heparin, TPN.

#### SIDE EFFECTS Rare

Abdominal cramps, nausea, vomiting, diarrhea, increased urination with doses exceeding 1 g. Parenteral: Flushing, headache, dizziness, sleepiness or insomnia, soreness at injection site.

#### SERIOUS REACTIONS

 Ascorbic acid may acidify urine, leading to crystalluria.

• Large doses of IV ascorbic acid may lead to deep vein thrombosis.

• Abrupt discontinuation after prolonged use of large doses may produce rebound ascorbic acid deficiency.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, patients with a history of renal calculi, and persons on sodium-restricted diet. Ascorbic acid crosses the placenta and is excreted in breast milk. Large doses of ascorbic acid taken during pregnancy may produce rebound scurvy in neonates. No age-related precautions have been noted in children or in elderly patients. Eating foods rich in vitamin C, including citrus fruits, green peppers, brussels sprouts, rose hips, spinach, strawberries, and watercress, is encouraged.

Clinical improvement, such as improved wound healing, should be assessed. Signs and symptoms of recurring vitamin C deficiency, including bleeding gums, digestive difficulties, gingivitis, poor wound healing, and arthralgia, should also be monitored.

#### Storage

Oral dosage forms: Store at room temperature. Protect from moisture.

Refrigerate injection vials and protect them from freezing and sunlight.

#### Administration

Take oral ascorbic acid without regard to food. Reduce the

dosage gradually because abrupt discontinuation may produce rebound deficiency.

Injection used only when oral route not amenable. Injection may be given undiluted or may be diluted in D5W, 0.9% NaCl, or lactated Ringer's solution. For IV push, dilute with an equal volume of D5W or 0.9% NaCl and infuse over 10 min. For IV solution, infuse over 4-12 h.

May also be given IM or SC.

# Asenapine

a-sen'a-peen ★ 🐏 Saphris

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

#### MECHANISM OF ACTION

A dibenzepin derivative that antagonizes dopamine  $(D_2)$  and serotonin (5-HT<sub>2A</sub>) receptors. No affinity for muscarinic receptors. Produces central nervous system (CNS) depressant effects. *Therapeutic Effect*: Diminishes manifestations of psychotic symptoms.

#### PHARMACOKINETICS

Bioavailability approx. 35% after SL administration. Food and water interfere with absorption. Protein binding: 95%. Extensively distributed throughout the body. Direct glucuronidation by UGT1A4 and oxidative metabolism by predominantly CYP1A2 are the primary metabolic pathways. Undergoes extensive metabolism in

Asenapine (Generic Name), Saphris (Brand Name)

the liver. Excreted in urine and feces. *Half-life:* Roughly 24 h.

#### AVAILABILITY

Sublingual Tablets (Saphris): 5 mg, 10 mg.

## INDICATIONS AND DOSAGES

Schizophrenia

SL

Adults. 5 mg twice daily. • Acute bipolar mania

#### SL

*Adults.* 10 mg twice daily. May reduce to 5 mg twice daily if target dose not tolerated.

#### Bipolar Disorder (maintenance adjunct to lithium or valproate) SL

*Adults*. Initially, 5 mg twice daily. May increase to maximum: 10 mg twice daily.

Patients with hepatic impairment Do not use in patients with severe hepatic impairment.

# CONTRAINDICATIONS

Hypersensitivity to the drug.

#### INTERACTIONS

#### Drug

#### Alcohol, other CNS depressants: May increase CNS depressant effects.

Antihypertensives: May increase the hypotensive effects of these drugs.

Fluvoxamine and other strong CYP1A2 inhibitors: May increase the asenapine blood concentration; coadminister with caution.

**Paroxetine:** Asenapine may increase paroxetine concentrations; coadminister with caution.

# Dopamine agonists, levodopa:

Asenapine may antagonize the effects of these drugs.

Drugs that prolong the QT interval (e.g., class IA [quinidine, procainamide, disopyramide] or class III [amiodarone, sotalol] antiarrhythmics; antipsychotics [pimozide, ziprasidone]; macrolide antibiotics; fluoroquinolones; azole antifungals; terfenadine; astemizole; or cisapride): Potential additive risk of cardiac effects; avoid co-use when possible.

#### Herbal

None known.

#### Food

Taking food or drink within the first 10 min of taking asenapine will reduce absorption significantly. **Alcohol:** Avoidance is recommended.

# **DIAGNOSTIC TEST EFFECTS**

May significantly increase serum GGT, prolactin, AST (SGOT), and ALT (SGPT) levels, cholesterol or triglycerides, blood glucose. Reductions in WBC count (rare).

# SIDE EFFECTS

#### Frequent (5%-11%)

Weight gain, headache, insomnia, vomiting, constipation, dizziness, somnolence

#### Occasional (3%-4%)

Nausea, akathisia, alterations in taste, anxiety, fatigue, arthralgia.

#### Rare (2% or less)

Blurred vision, asthenia, fever, rash, cough, rhinitis, orthostatic hypotension, hyperglycemia, dysphagia, indigestion, irritability.

#### SERIOUS REACTIONS

Hypersensitivity (e.g., angioedema, anaphylaxis)

• Extrapyramidal symptoms and neuroleptic malignant syndrome occur rarely.

- · Seizures occur rarely.
- · Development of diabetes.
- · QT prolongation (rare).
- Agranulocytosis, leukopenia, neutropenia (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiovascular or cerebrovascular diseases, hypotension, history of seizures or conditions that may lower the seizure threshold (such as Alzheimer's disease), hepatic or renal impairment, and Parkinson's disease. Use with caution in patients with diabetes or with risk factors for diabetes. CNS depressants and alcohol should be avoided during therapy. It is unknown whether asenapine crosses the placenta. Because this drug may be distributed in breast milk, female patients should avoid breastfeeding during therapy. The safety and efficacy of asenapine have not been established in children. Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death. Most deaths appear to be either CV (e.g., heart failure, sudden death) or infectious (e.g., pneumonia) in nature.

Extrapyramidal symptoms and tardive dyskinesia, manifested as chewing or puckering of the mouth, puffing of the cheeks, or tongue protrusion, should be monitored. BP, pulse rate, weight, and therapeutic response should also be monitored. Dehydration, electrolyte disturbances, and hypovolemia should be corrected before beginning therapy.

Drowsiness may occur. Tasks requiring mental alertness or motor skills should be avoided until the effects of the drug are known. Dehydration, particularly during exercise; exposure to extreme heat; and concurrent use of medications that cause dry mouth or other drying effects should also be avoided. A healthy diet and exercise program should be maintained to prevent weight gain. Notify the physician of extrapyramidal symptoms. BP, CBC, and therapeutic response should be assessed. Rapid postural changes should be avoided due to possible development of orthostatic hypotension. Symptoms including sore tongue, problems eating or swallowing, fever, or infection need to be reported immediately.

#### Storage

Store at room temperature. Keep sublingual tablets in blister package until time of use.

#### Administration

Tablets are fragile, so do not push them through the blister packaging. Place under tongue without water and allow to completely dissolve, without swallowing. Do not crush or chew the tablets. Patients should be instructed to not eat or drink for 10 min after administration.

#### Aspirin/ Acetylsalicylic Acid

as'pir-in/ah-seet'il-sill-ic as'id Bayer, Bufferin, Ecotrin, Halfprin, St. Joseph's Asaphen, Entrophen, Lowprin, Rivasa Do not confuse aspirin with Aricept, Afrin, or Asendin, or Ecotrin with Edecrin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if full dose used in third trimester) OTC

**Classification:** Analgesics, nonnarcotic, antipyretics, salicylates

#### MECHANISM OF ACTION

A nonsteroidal salicylate that inhibits prostaglandin synthesis, acts on the

# Asparaginase

a-spare'a-gi-nase ★ Elspar ▲ Erwinase, Kidrolase Do not confuse with pegaspargase.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antineoplastics, enzymes

# **MECHANISM OF ACTION**

An enzyme that inhibits DNA, RNA, and protein synthesis by breaking down asparagine, thus depriving tumor cells of this essential amino acid. Cell cycle-specific for G<sub>1</sub> phase of cell division. *Therapeutic Effect:* Kills leukemic cells.

# PHARMACOKINETICS

Metabolized by the reticuloendothelial system through slow sequestration. *Half-life:* 39-49 h IM; 8-30 h IV.

# AVAILABILITY

*Powder for Injection:* 10,000 International Units.

# INDICATIONS AND DOSAGES Acute lymphocytic leukemia

(usual dosages) IV OR IM Adults, Elderly, Children. 6000 International Units/m<sup>2</sup> IM or IV 3 times a week, usually as part of multi-agent chemotheraphy.

# CONTRAINDICATIONS

History of hypersensitivity to asparaginase, history of pancreatitis, serious thrombosis, or serious hemorrhagic events with prior asparaginase treatment.

# INTERACTIONS

#### Drug

Antigout medications: May decrease the effects of these drugs. Anticoagulants: Additive bleeding risk.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

**Methotrexate:** May block effects of methotrexate if doses are not timed appropriately.

#### Steroids, vincristine: May

increase the risk of neuropathy and disturbances of erythropoiesis; may enhance hyperglycemic effect of asparaginase.

#### Herbal and Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase BUN, blood ammonia, and blood glucose levels; serum alkaline phosphatase, bilirubin, uric acid, AST (SGOT), and ALT (SGPT) levels; platelet count; PT; activated partial thromboplastin time; and thrombin time. May decrease blood-clotting factors (including antithrombin, plasma fibrinogen, and plasminogen) as well as serum albumin, calcium, and cholesterol levels.

# IV INCOMPATIBILITIES

Not widely studied; Y-site administrations with other medications not recommended.

#### SIDE EFFECTS Frequent

Allergic reaction (rash, urticaria, arthralgia, facial edema, hypotension, respiratory distress) pancreatitis (severe stomach pain, nausea, and vomiting).

#### Occasional

CNS effects (confusion, drowsiness, depression, anxiety, and fatigue), stomatitis, hypoalbuminemia or uric acid nephropathy (manifested as edema of feet or lower legs), hyperglycemia.

#### Rare

Hyperthermia (including fever or chills), thrombosis, seizures.

#### SERIOUS REACTIONS

• CNS thrombosis and other serious thrombotic events; discontinue drug if occurs.

• Pancreatitis may be fulminant or fatal and requires drug discontinuation.

- · Coagulopathy and bleeding.
- Hepatotoxicity usually occurs within 2 wks of initial treatment.

 The risk of an allergic reaction, including anaphylaxis, increases after repeated therapy.

· Myelosuppression may be severe.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with diabetes mellitus, current or recent chickenpox, gout, herpes zoster, infection, hepatic or renal impairment, and in those who have recently had cytotoxic or radiation therapy. Asparaginase use should be avoided during pregnancy. especially during the first trimester, and during breastfeeding. No age-related precautions have been noted in children or the elderly. Immunizations and coming in contact with those who have recently received a live-virus vaccine should be avoided.

! Expect to discontinue asparaginase at the first sign or symptom of renal failure (oliguria, anuria) or pancreatitis (abdominal pain, nausea and vomiting, elevated serum amylase and lipase levels). Adequate hydration should be maintained to help prevent kidney problems.

Signs and symptoms of hematologic toxicity, such as excessive fatigue and weakness, ecchymosis, fever, signs of local infection, sore throat, and unusual bleeding from any site, should be assessed. Baseline CNS function should be assessed and a comprehensive blood chemistry should be obtained before therapy begins and whenever more than 1 wk has elapsed between doses.

#### Storage

Refrigerate unopened vials; do not freeze. Reconstituted solutions are stable for 8 h if refrigerated.

# Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

! Asparaginase dosage is individualized based on clinical response and the tolerance of the drug's adverse effects. When administering this drug in combination therapy, consult specific protocols for optimum dosage and sequence of drug administration.

Keep antihistamines, epinephrine, IV corticosteroid, and oxygen equipment readily available before administering asparaginase. Observe patients for 1 h after administration of the drug, especially during repeat doses, in case allergic reaction occurs.

If gelatinous, fiber-like particles develop in the solution, remove them by using a 5-µm filter during administration. For IV use, reconstitute the 10,000-unit vial with 5 mL sterile water for injection or 0.9% NaCl to provide a concentration of 2000 International Units/mL. Shake gently to ensure complete dissolution. Vigorous shaking will produce foam and cause some loss of potency. For IV injection, administer asparaginase solution into the tubing of freeflowing IV solution of D5W or 0.9% NaCl over at least 30 min. For IV infusion, further dilute with up to 1000 mL D5W or 0.9% NaCl. For IM use, add 2 mL 0.9% NaCl to 10,000-unit vial to provide a concentration of 5000 International Units/mL. Administer no more than 2 mL at any one site. hypothalamus heat-regulating center, and interferes with the production of thromboxane A, a substance that stimulates platelet aggregation. *Therapeutic Effect:* Reduces inflammatory response and intensity of pain; decreases fever; inhibits platelet aggregation.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	2-4 h	24 h

Rapidly and completely absorbed from GI tract; enteric-coated absorption delayed; rectal absorption delayed and incomplete. Protein binding: High. Widely distributed. Rapidly hydrolyzed to salicylate. *Half-life:* 15-20 min (aspirin); 2-3 h (salicylate at low dose); more than 20 h (salicylate at high dose).

# AVAILABILITY

Chewing Gum: 227 mg. Tablets: 162 mg, 325 mg, 500 mg, 650 mg. Tablets, Chewable: 81 mg. Tablets, Enteric-Coated: 81 mg, 325 mg, 500 mg, 650 mg. Suppository: 300 mg, 600 mg.

# INDICATIONS AND DOSAGES

Analgesia, fever

PO, RECTAL Adults, Elderly. 325-1000 mg q4-6h. Children. 10-15 mg/kg/dose q4-6h. Maximum: 4 g/day.

#### Anti-inflammatory PO

Adults, Elderly. Initially, 2.4-3.6 g/ day in divided doses; then 3.6-5.4 g/day.

# Juvenile rheumatoid arthritis

*Children.* Initially, 60-90 mg/kg/day in divided doses; then 80-100 mg/kg/day. Adjust to target salicylate concentration of 15-30 mg/dL.

# Suspected myocardial infarction (MI)

#### PO

*Adults, Elderly.* 160-325 mg as soon as the MI is suspected, then daily for 30 days after the MI.

# Prevention of MI

PO

Adults, Elderly. 75-325 mg/day.

# Prevention of stroke after transient ischemic attack

PO

Adults, Elderly. 50-325 mg/day.

# Kawasaki disease

#### PO

*Children.* 80-100 mg/kg/day in divided doses during acute phase, then decrease to 3-5 mg/kg/day for maintenance. Discontinue after 6 wks if no cardiac abnormalities; otherwise continue.

## Coronary artery bypass graft PO

Adults, Elderly. 75-325 mg/day starting 6 h following procedure.

#### Percutaneous transluminal coronary angioplasty PO

Adults, Elderly. 80-325 mg/day starting 2 h before procedure.

#### Stent implantation PO

*Adults, Elderly.* 325 mg 2 h before implantation and 160-325 mg daily thereafter.

# Carotid endarterectomy

Adults, Elderly. 81-325 mg/day preoperatively and daily thereafter.

# Acute ischemic stroke

#### PO

Adults, Elderly. 160-325 mg/day, initiated within 48 h in patients who are not candidates for thrombolytics and are not receiving systemic anticoagulation.

# **OFF-LABEL USES**

Prevention of thromboembolism, treatment of Kawasaki disease.

# CONTRAINDICATIONS

Allergy to tartrazine dye, bleeding disorders, GI bleeding or ulceration, hepatic impairment, history of hypersensitivity to aspirin or NSAIDs, children/teenagers with chickenpox or flu-like symptoms.

# INTERACTIONS

#### Drug

Alcohol, NSAIDs: May increase the risk of adverse GI effects, including ulceration. NSAIDs may negate cardioprotective effects of ASA.

Antacids, urinary alkalinizers: Increase the excretion of aspirin.

Anticoagulants, heparin, thrombolytics: Increase the risk of bleeding.

**Insulin, oral antidiabetics:** May increase the effects of these drugs (with large doses of aspirin).

Methotrexate, zidovudine: May increase the risk of toxicity of these drugs.

Nephrotoxic medications, vancomycin: May increase the risk of toxicity.

#### Platelet aggregation inhibitors, valproic acid: May increase the risk of bleeding.

**Probenecid, sulfinpyrazone:** May decrease the effects of these drugs. **Herbal** 

None known.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May alter serum alkaline phosphatase, uric acid, AST (SGOT), and ALT (SGPT) levels. May prolong PT and bleeding time. May decrease serum cholesterol, serum potassium, and T3 and T4 levels. The therapeutic aspirin level for antiarthritic effect is 20-30 mg/dL; the toxic level is > 30 mg/dL.

# SIDE EFFECTS

#### Occasional

GI distress (including abdominal distention, cramping, heartburn, and mild nausea); allergic reaction (including bronchospasm, pruritus, and urticaria).

# SERIOUS REACTIONS

• High doses of aspirin may produce GI bleeding and gastric mucosal lesions.

• Dehydrated, febrile children may experience aspirin toxicity quickly. Reye's syndrome may occur in children with chickenpox or the flu.

• Low-grade toxicity characterized by tinnitus, generalized pruritus (possibly severe), headache, dizziness, flushing, tachycardia, hyperventilation, diaphoresis, and thirst.

• Marked toxicity is characterized by hyperthermia, restlessness, seizures, abnormal breathing patterns, respiratory failure, and coma.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with chronic renal insufficiency, vitamin K deficiency, and the "aspirin triad" of asthma, nasal polyps, and rhinitis. Aspirin readily crosses the placenta and is distributed in breast milk. Pregnant women should not take aspirin during the last trimester of pregnancy because the drug may prolong gestation and labor and cause adverse effects in the fetus, such as premature closure of the ductus arteriosus, low birth weight, hemorrhage, stillbirth, and death. Caution should be used giving aspirin to children with acute febrile illness. Do not give aspirin to children with chickenpox or the flu because this increases their risk of developing Reye's syndrome. Know

that behavioral changes and vomiting may be early signs of Reye's syndrome. Lower aspirin dosages are recommended for elderly patients because they are more susceptible to aspirin toxicity. Withhold the drug and contact the physician if respirations are 12/min or lower (20/min or lower in children). Alcohol and NSAIDs should be avoided because of increased risk of GI bleeding.

Notify the physician if ringing in the ears (tinnitus) or persistent abdominal or GI pain occurs. Temperature should be taken just before and 1 h after giving the drug. Urine pH should be monitored for signs of sudden acidification, indicated by a pH of 5.5-6.5: sudden acidification may cause the serum salicylate level to greatly increase, leading to toxicity. Be aware the antiinflammatory effect should occur within 1-3 wks.

#### Storage

Store tablets at room temperature, tightly closed. Protect from moisture. Refrigerate suppositories. Administration

Do not give aspirin to children or teenagers with chickenpox or the flu because this increases their risk of developing Reye's syndrome. Do not use aspirin that smells of vinegar because this odor indicates chemical breakdown of the drug. Do not crush or break enteric-coated or extendedrelease tablets. Take aspirin with water, milk, or meals if GI distress occurs.

For rectal use, if the suppository is too soft, refrigerate it for 30 min or run cold water over the foil wrapper. Remove foil wrapper before use. Moisten the suppository with cold water before inserting it well into the rectum. Atazanavir Sulfate

ah-tah-zan'ah-veer sul'fate Reyataz **Do not confuse Reyataz with Retavase.** 

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antiretroviral, HIV-1 protease inhibitor

# **MECHANISM OF ACTION**

An antiviral that acts as an HIV-1 protease inhibitor, selectively preventing the processing of viral precursors found in cells infected with HIV-1. *Therapeutic Effect:* Prevents the formation of mature HIV virions.

## PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 86%. Extensively metabolized in the liver. Excreted primarily in urine and, to a lesser extent, in feces. *Half-life:* 5-8 h.

# AVAILABILITY

*Capsules:* 100 mg, 150 mg, 200 mg, 300 mg.

# INDICATIONS AND DOSAGES HIV-1 infection (therapy-naïve)

▶ HIV-1 infection (therapy-naïve) PO Adults, Elderly. 400 mg once a day with food. If given with ritonavir, dosage is 300 mg once daily. Children 6-17 yr of age (15 kg to < 25 kg). 150 mg with ritonavir; 80 mg once a day with food. Children 6-17 yr of age (25 to < 32 kg). 200 mg with ritonavir; 100 mg once a day with food. Children 6-17 yr of age (32 to 39 kg). 250 mg with ritonavir; 100 mg once a day with food.

Atazanavir Sulfate (Generic Name), Reyataz (Brand Name)

*Children 6-17 yr of age (at least 40 kg).* 300 mg with ritonavir; 100 mg once a day with food.

# HIV-1 infection (therapy-naïve; concurrent therapy with efavirenz, tenofovir, H<sub>2</sub> receptor antagonist, or proton-pump inhibitor)

*Adults, Elderly.* 300 mg atazanavir with 100 mg ritonavir as a single daily dose with food.

# HIV-1 infection (treatment-experienced) PO

*Adults, Elderly.* 300 mg with ritonavir (Norvir) 100 mg once a day.

Children 6-17 yr of age (25 to < 32 kg). 200 mg with ritonavir; 100 mg once a day with food.

*Children 6-17 yr of age (32 to 39 kg).* 250 mg with ritonavir;

100 mg once a day with food. *Children 6-17 yr of age (at least 40 kg).* 300 mg with ritonavir; 100 mg once a day with food.

#### HIV-1 infection (treatmentexperienced; concurrent therapy with H<sub>2</sub> receptor antagonist) PO

*Adults, Elderly.* 300 mg with ritonavir; 100 mg as a single daily dose with food.

#### HIV-1 infection (treatmentexperienced; concurrent therapy with H<sub>2</sub> receptor antagonist and tenofovir)

PO

*Adults, Elderly.* 400 mg with ritonavir; 100 mg as a single daily dose with food.

#### HIV-1 infection in patients with moderate hepatic impairment PO

Adults, Elderly. 300 mg once a day with food.

 HIV-1 infection in treatmentnaïve patients with end-stage renal disease managed with hemodialysis

#### PO

*Adults, Elderly.* 300 mg with ritonavir; 100 mg once a day with food.

# CONTRAINDICATIONS

Hypersensitivity, concurrent use with cisapride, ergot derivatives, indinavir, irinotecan, lovastatin, midazolam, pimozide, rifampin, simvastatin, triazolam, and St. John's wort.

# INTERACTIONS

#### Drugs

Antacids, didanosine, buffered medications: Take atazanavir 2 h before or 1 h after. Amiodarone, clarithromycin,

cyclosporine, ergot derivatives, fentanyl, fluticasone, irinotecan, lapatinib, lovastatin, midazolam, rifabutin, sildenafil, simvastatin, sirolimus, tacrolimus, tadalafil, tenofovir, trazodone, triazolam, vardenafil: May increase concentrations of these drugs and increase risk of toxicity.

 $H_2$  receptor antagonists: Take atazanavir with or 10 h after the  $H_2$ antagonist.

Nevirapine, tenofovir: May reduce atazanavir concentrations.

**Proton-pump inhibitor:** Take 12 h prior to atazanavir in therapy naïve; avoid use with atazanavir in treatment-experienced patients.

β-blockers, calcium channel blockers, cisapride, clarithromycin, pimozide, ranolazine: Increased risk of arrhythmias.

Warfarin: Increased risk of bleeding; monitor INR. Herbal

# **St. John's wort:** May reduce atazanavir concentrations. Contraindicated.

#### Food

All foods: Atazanavir bioavailability increased when taken with food.

# DIAGNOSTIC TEST EFFECTS

Increased amylase, bilirubin, cholesterol, CPK, glucose, hepatic transaminases, lipase, triglycerides; decreased hemoglobin, neutrophils.

#### SIDE EFFECTS

**Frequent (> 10%)** 

Nausea, rash, cough, headache. Occasional (2%-10%)

Dizziness, jaundice, vomiting, depression, diarrhea, abdominal pain, fever, lipodystrophy, peripheral neuropathy, hyperbilirubinemia. **Rare** 

Insomnia, fatigue, back pain.

#### SERIOUS REACTIONS

• A severe hypersensitivity reaction (marked by angioedema and chest pain) and jaundice may occur.

· Nephrolithiasis.

• Lactic acidosis occurs rarely but can be fatal. Early signs and symptoms include hyperventilation, myalgia, malaise, and somnolence.

- · Hepatotoxicity.
- Hypersensitivity reactions with serious rashes.
- · AV conduction problems.
- · Hyperbilirubinemia.

# PRECAUTIONS & CONSIDERATIONS

Prolongs PR interval. Use with caution in preexisting conduction disorders, diabetes mellitus, hyperglycemia, hepatic impairment, and renal impairment. Monitor liver function, HBV infection, and redistribution of body fat. Pregnant patients are more at risk for lactic acidosis and hyperbilirubinemia; alternatives to atazanavir are recommended in pregnancy. Because of the potential HIV transmission, instruct mothers not to breastfeed. Safety and efficacy not established in children < 6 yr. Avoid use in infants < 3 mo due to risk of kernicterus.

#### Storage

Store at room temperature. Administration Administer with food. Swallow capsules whole.

# Atenolol

a-ten'oh-lol Tenormin Tenormin, Apo-Atenol **Do not confuse atenolol with albuterol or timolol.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antihypertensives,  $\beta_1$ -adrenergic blocker

# **MECHANISM OF ACTION**

A  $\beta_1$ -adrenergic blocker that acts as an antianginal, antiarrhythmic, and antihypertensive agent by blocking  $\beta_1$ -adrenergic receptors in cardiac tissue. *Therapeutic Effect:* Slows sinus node heart rate, decreasing cardiac output and BP. Decreases myocardial oxygen demand.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	1 h	2-4 h	24 h

Incompletely absorbed from the GI tract. Protein binding: 6%-16%. Minimal liver metabolism. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 6-7 h (increased in impaired renal function).

#### AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg.

Atenolol (Generic Name)

# INDICATIONS AND DOSAGES Hypertension

# PO

*Adults*. Initially, 25-50 mg once a day. May increase dose up to 100 mg once a day.

*Elderly.* Usual initial dose, 25 mg a day.

*Children*. Initially, 0.5-1 mg/kg/dose given once a day. Range: 0.5-1.5 mg/kg/day. Maximum: 2 mg/kg/day or 100 mg/day.

#### Angina pectoris PO

*Adults*. Initially, 50 mg once a day. May increase dose up to 200 mg once a day.

*Elderly.* Usual initial dose, 25 mg a day. Range same as for adults.

## Dosage in renal impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Maximum Dosage and Interval	
15-35	50 mg/day	
< 15	25 mg/day	

# **OFF-LABEL USES**

Improved survival in diabetics with heart disease; treatment of hypertrophic cardiomyopathy, pheochromocytoma, and syndrome of mitral valve prolapse; prevention of migraine, thyrotoxicosis, and tremors.

# CONTRAINDICATIONS

Cardiogenic shock, overt heart failure, second- or third-degree heart block, severe bradycardia.

# INTERACTIONS

#### Drug

**Cimetidine:** May increase atenolol blood concentration.

#### Diuretics, other antihypertensives:

May increase hypotensive effect of atenolol.

Insulin, oral hypoglycemics: May mask symptoms of hypoglycemia and prolong hypoglycemic effect of insulin and oral hypoglycemics. NSAIDs: May decrease antihypertensive effect of atenolol. Sympathomimetics, xanthines: May mutually inhibit effects. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum antinuclear antibody titer and BUN, glucose, serum creatinine, potassium, lipoprotein, triglyceride, and uric acid levels.

# SIDE EFFECTS

Atenolol is generally well tolerated, with mild and transient side effects. **Frequent** 

Hypotension manifested as cold extremities, constipation or diarrhea, diaphoresis, dizziness, fatigue, headache, and nausea.

#### Occasional

Insomnia, flatulence, urinary frequency, impotence or decreased libido, mental depression. **Rare** 

Rash, arthralgia, myalgia, confusion (especially in the elderly), altered taste.

# SERIOUS REACTIONS

• Overdose may produce profound bradycardia and hypotension.

- Abrupt atenolol withdrawal may result in diaphoresis, palpitations, headache, and tremors.
- Atenolol administration may precipitate CHF or MI in patients with cardiac disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those

with existing peripheral vascular disease.

• Hypoglycemia may occur in patients with previously controlled diabetes.

• Thrombocytopenia, manifested as unusual bruising or bleeding, occurs rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with bronchospastic disease, diabetes, hyperthyroidism, impaired renal or hepatic function, inadequate cardiac function, and peripheral vascular disease. Atenolol readily crosses the placenta and is distributed in breast milk. Atenolol use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, and hypothermia during childbirth. No age-related precautions have been noted in children. Use cautiously in elderly patients, who may have age-related peripheral vascular disease and impaired renal function. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval.

Orthostatic hypotension may occur, so rise slowly from a lying to sitting position and dangle the legs from the bed momentarily before standing. Notify the physician of confusion, depression, dizziness, rash, or unusual bruising or bleeding. BP for hypotension, respiratory status for shortness of breath, and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 60 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as decreased urine output, distended

neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed.

#### Storage

Store at room temperature. Administration

Take oral atenolol without regard to meals. Crush tablets if necessary. Do not abruptly discontinue the drug. Compliance is essential to control angina and hypertension.

#### Atomoxetine

at'o-mox-e-teen Strattera Do not confuse atomoxetine with atorvastatin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Selective norepinephrine reuptake inhibitors, ADHD agents

#### MECHANISM OF ACTION

A norepinephrine reuptake inhibitor that enhances noradrenergic function by selective inhibition of the presynaptic norepinephrine transporter. *Therapeutic Effect:* Improves attention span, decreases distractability, and decreases impulsivity.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 98% (primarily to albumin). Metabolized in the liver by CYP2D6. Eliminated primarily in urine and, to a lesser extent, in feces. Not removed by hemodialysis. *Half-life:* 4-5 h in general population. Patients with poor metabolizer status for CYP2D6 and those with liver disease have

Atomoxetine (Generic Name), Strattera (Brand Name)

increased AUC and half-life, up to 24 h.

## AVAILABILITY

*Capsules:* 10 mg, 18 mg, 25 mg, 40 mg, 60 mg, 80 mg, 100 mg.

#### INDICATIONS AND DOSAGES ADHD PO

Adults, Children weighing 70 kg and more. 40 mg once a day. May increase after at least 3 days to 80 mg as a single daily dose or in divided doses. Maximum: 100 mg. Children weighing < 70 kg. Initially,

0.5 mg/kg/day. May increase after at least 3 days to 1.2 mg/kg/day. Maximum: 1.4 mg/kg/day or 100 mg.

### ADHD with concomitant therapy with CYP2D6 strong inhibitors (fluoxetine, paroxetine, quinidine) or in known poor CYP2D6 metabolizers PO

Adults, Children weighing 70 kg and more. 40 mg once a day. Only increase to usual target dose of 80 mg/day if symptoms fail to improve after 4 wks and initial dose is well tolerated. *Children weighing* < 70 kg. Initially, 0.5 mg/kg/day. Only increase to usual target dose of 1.2 mg/kg/day if symptoms fail to improve after 4 wks and initial dose is well tolerated.

#### Dosage in hepatic impairment

Expect to administer 50% of normal atomoxetine dosage to patients with moderate hepatic impairment and 25% of normal dosage to those with severe hepatic impairment.

# CONTRAINDICATIONS

Angle-closure glaucoma, hypersensitivity, use with or within 14 days of MAOIs, pheochromocytoma. Do not use in patients with severe cardiovascular disorders (e.g., cardiomyopathy, arrhythmias, structural heart disease, or cerebrovascular disease), which could deteriorate with increases in blood pressure (e.g., 15-20 mm Hg) or heart rate (20 bpm).

# INTERACTIONS

#### Drug

Albuterol: Cardiovascular effects of albuterol may be potentiated. CYP2D6 inhibitors, such as fluoxetine, paroxetine, quinidine: May increase atomoxetine blood concentration. Adjust dose. MAOIs: May increase the risk of toxic effects. Contraindicated. Pressor agents (e.g., dopamine, dobutamine) or other drugs that increase blood pressure: Avoid atomoxetine use if these are needed due to effects on BP and heart rate. Herbal None known.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

Rarely may cause laboratory abnormalities consistent with liver injury, such as markedly increased LFTs and bilirubin levels.

# SIDE EFFECTS

#### Frequent

Headache, dyspepsia, nausea, vomiting, dry mouth, fatigue, decreased appetite, dizziness, altered mood.

#### Occasional

Tachycardia, hypertension, weight loss, delayed growth in children, irritability. **Rare** 

Insomnia, sexual dysfunction in adults, fever, aggressiveness, hostility.

# SERIOUS REACTIONS

- · Hepatotoxicity.
- Priapism.
- · Urine retention or urinary

hesitance may occur.

# A

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiovascular disease tachycardia, hypertension, moderate or severe hepatic impairment, and a risk of urine retention. Be aware that concurrent use of pressor medications that can increase heart rate or BP should be avoided. It is unknown whether atomoxetine is excreted in breast milk. The safety and efficacy of atomoxetine have not been established in children younger than 6 yr. A thorough cardiovascular assessment is recommended before initiation of therapy in pediatric patients; assessment should include medical history, family history, and physical examination with consideration of ECG testing. Atomoxetine increased the risk of suicidal ideation in short-term studies in children or adolescents with ADHD. Age-related cardiovascular or cerebrovascular disease and hepatic or renal impairment may increase the risk of side effects in elderly patients.

Dizziness may occur, so avoid tasks that require mental alertness and motor skills. Notify the physician if fever, irritability, palpitations, or vomiting occurs. BP, pulse rate, mood changes, urine output, and fluid and electrolyte status should be monitored.

# Storage

Store at room temperature. Administration

Take atomoxetine without regard to food. Take the last daily dose of atomoxetine early in the evening to avoid insomnia. Swallow capsules whole. Do not chew, crush, or open.

# Atorvastatin

a-tor'va-sta-tin ★ ▲ Lipitor **Do not confuse Lipitor with** Levatol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

#### Classification:

Antihyperlipidemics, HMG CoA reductase inhibitors

#### **MECHANISM OF ACTION**

An antihyperlipidemic that inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. *Therapeutic Effect*: Decreases LDL and VLDL cholesterol and plasma triglyceride levels; increases HDL cholesterol concentration.

#### PHARMACOKINETICS

Poorly absorbed from the GI tract. Protein binding is > 98%. Metabolized in the liver. Minimally eliminated in urine. Plasma levels are markedly increased in chronic alcoholic hepatic disease but are unaffected by renal disease. *Half-life*: 14 h.

#### **AVAILABILITY**

Tablets: 10 mg, 20 mg, 40 mg, 80 mg.

# INDICATIONS AND DOSAGES

 Hyperlipidemia, reduction of risk of myocardial infarction (MI), angina revascularization procedures, or stroke in patients with certain risk factors

# PO

*Adults, Elderly.* Initially, 10-40 mg a day given as a single dose. Dose range: 10-80 mg/day. Increase at 2- to 4-wk intervals to maximum of 80 mg/day.

Atorvastatin (Generic Name), Lipitor (Brand Name)

Children 10-17 yr. Initially, 10 mg/ day, may increase to 20 mg/day. Familial hypercholesterolemia PO

*Children 10-17 yr.* Initially, 10 mg/day. May increase to 20 mg/day.

Dosages in patients taking cyclosporine, clarithromycin, or taking a combination of ritonavir plus saquinavir or lopinavir Limit initial dose to 10 mg/day.

# CONTRAINDICATIONS

Active hepatic disease, lactation, pregnancy, unexplained elevated liver function test results, rhabdomyolysis, hypersensitivity.

# INTERACTIONS

#### Drug

Antacids, colestipol: Decrease atorvastatin absorption.

**Gemfibrozil, nicotinic acid:** Increase the risk of myopathy or rhabdomyolysis.

#### Cyclosporine, erythromycin, itraconazole, protease inhibitors, clarithromycin, diltiazem:

CYP3A4 inhibitors increase atorvastatin blood concentration and increase the risk of myopathy or rhabdomyolysis.

**Digoxin:** Increased digoxin levels. **Herbal** 

**St. John's wort:** May reduce atorvastatin concentrations.

#### Food

**Fiber, oat bran, pectin:** May reduce atorvastatin absorption; separate time of administration.

**Grapefruit juice:** May increase the bioavailability of atorvastatin resulting in an increased risk of myopathy or rhabdomyolysis. Avoid.

# DIAGNOSTIC TEST EFFECTS

May increase serum CK and transaminase concentrations.

# SIDE EFFECTS

Atorvastatin is generally well tolerated. Side effects are usually mild and transient.

Frequent (16%)

Headache. Occasional (2%-5%)

Myalgia, rash or pruritus, allergy. Rare (1%-2%)

Flatulence, dyspepsia, reversible cognitive impairment or depression, hair loss, may worsen glucose tolerance and increase HbA1C.

## SERIOUS REACTIONS

• Cataracts may develop, and photosensitivity may occur.

• Hepatotoxicity or rhabdomyolysis occur rarely.

• Hypersensitivity, such as bullous rash or anaphylaxis, reported rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with a history of hepatic disease, hypotension, major surgery, severe acute infection, substantial alcohol consumption, trauma, those receiving anticoagulant therapy, and those with severe acute infection, uncontrolled seizures, or severe endocrine, electrolyte, or metabolic disorders. Atorvastatin is distributed in breast milk and is contraindicated during lactation. It is contraindicated during pregnancy because it may produce skeletal malformation. Pregnancy should be determined before beginning therapy. Safety and efficacy of atorvastatin have not been established in children younger than 10 yr of age. No agerelated precautions have been noted in elderly patients.

Notify the physician of headache, malaise, pruritus, or rash. Laboratory results and serum cholesterol and triglyceride levels and hepatic function test results should be documented before therapy. Serum cholesterol and triglyceride levels should be monitored periodically during therapy. Be aware that diet is an important part of treatment.

## Storage

Store at room temperature.

# Administration

May be taken without regard to food. Do not break film-coated tablets. Administer at any time of day but at a consistent time daily.

# Atovaquone

a-toe'va-kwone

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiprotozoals

# **MECHANISM OF ACTION**

A systemic anti-infective that inhibits the mitochondrial electrontransport system at the cytochrome bc1 complex (complex III), which interrupts nucleic acid and adenosine triphosphate synthesis. *Therapeutic Effect*: Antiprotozoal and antipneumocystic activity.

# PHARMACOKINETICS

Absorption increased with a highfat meal. Protein binding: > 99%. Metabolized in liver. Primarily excreted in feces. *Half-life*: 2-3 days.

# AVAILABILITY

Oral Suspension: 750 mg/5 mL.

# INDICATIONS AND DOSAGES Pneumocystis carinii pneumonia (PCP) PO

Adults, adolescents 13 yr of age and older. 750 mg twice a day with food for 21 days.

# Prevention of PCP

### PO

Adults, adolescents 13 yr of age and older. 1500 mg once a day with food.

# **OFF-LABEL USES**

Malaria, babesiosis, toxoplasmosis.

# CONTRAINDICATIONS

Development or history of potentially life-threatening allergic reaction to the drug.

# INTERACTIONS

# Drug

Rifampin or rifabutin: May

decrease atovaquone blood concentration and increase rifampin blood concentration.

# Herbal

None known.

#### Food

Ingestion with a fatty meal increases absorption.

# DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, amylase, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels.

# SIDE EFFECTS

Frequent (> 10%)

Rash, nausea, diarrhea, headache, vomiting, fever, insomnia, cough. Occasional (< 10%)

# Abdominal discomfort, thrush, pruritus, dizziness, asthenia, anemia, neutropenia.

# SERIOUS REACTIONS

· Anemia occurs rarely.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted with chronic diarrhea, hepatic disease, malabsorption syndromes, and severe PCP and in elderly patients, who require close monitoring because of age-related cardiac, hepatic, and renal impairment. Safety and effectiveness have not been established in pediatric patients < 13 yr of age.

Notify the physician if diarrhea, rash, or other new symptoms occur. Pattern of daily bowel activity and stool consistency and skin for rash should be monitored. Hemoglobin levels, intake and output, and renal function should be assessed. Medical history for problems that may interfere with the drug's absorption, such as GI disorders, (e.g., significant diarrhea,vomiting), should be determined before beginning therapy.

#### Storage

Store at room temperature. Do not freeze.

#### Administration

Shake suspension well before using. Administer with meals. Failure to administer with meals may cause lack of response to treatment. Take atovaquone for the full course of treatment.

#### Atropine

a'troe-peen ★ Atreza, Atropen, Atropine Sulfate, Isopto-Atropine, SalTropine Do not confuse with Akarpine or Aplisol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antiarrhythmics, anticholinergics, antidotes, cycloplegics, mydriatics, ophthalmics, preanesthetics

#### **MECHANISM OF ACTION**

An acetylcholine antagonist that inhibits the action of acetylcholine by competing with acetylcholine for common binding sites on muscarinic receptors, which are located on exocrine glands, cardiac and smoothmuscle ganglia, and intramural neurons. This action blocks all muscarinic effects. *Therapeutic Effect:* Decreases GI motility and secretory activity and genitourinary muscle tone (ureter, bladder); produces ophthalmic cycloplegia and mydriasis.

#### PHARMACOKINETICS

Rapidly absorbed after oral administration. Crosses blood-brain barrier. Renally eliminated. Not removed by hemodialysis. *Half-life:* 2.5 h.

#### AVAILABILITY

Injection: 0.05 mg/mL, 0.1 mg/mL, 0.4 mg/mL, 1 mg/mL. Injection (Autoinjectors): 0.25 mg, 0.5 mg, 1 mg, 2 mg. Ophthalmic Ointment: 1%. Ophthalmic Solution: 1%. Tablets: 0.4 mg.

# INDICATIONS AND DOSAGES

# Asystole, slow pulseless electrical activity

Adults, Elderly. 1 mg; may repeat q3-5min up to total dose of 0.04 mg/kg. Normal maximum: 3 mg total.

#### Preanesthetic

IV/IM/SC Adults, Elderly. 0.4-0.6 mg 30-60 min preoperatively. Children weighing 5 kg or more. 0.01-0.02 mg/kg/dose to maximum of 0.4 mg/dose. Children weighing < 5 kg. 0.02 mg/kg/dose 30-60 min preoperatively.

# Bradycardia

#### IV

Adults, Elderly. 0.5-1 mg q5min not to exceed 2 mg or 0.04 mg/kg. *Children.* 0.02 mg/kg with a minimum of 0.1 mg to a maximum of 0.5 mg in children and 1 mg in adolescents. May repeat in 5 min. Maximum total dose: 1 mg in children, 2 mg in adolescents.

# Reduction salivation and bronchial secretions

#### PO

Adults. 0.4 mg.

*Children.* Weight-based doses: 7-16 lb, 0.1 mg; 17-24 lb, 0.15 mg; 24-40 lb, 0.2 mg; 40-65 lb, 0.3 mg; 65-90 lb, 0.4 mg; over 90 lb, 0.4 mg.

# Cycloplegia/mydriasis OPHTHALMIC

*Adults.* 1 drop of solution in the eye 3 times a day or small amount of ointment in the eye once or twice daily.

#### Organophosphate nerve agent or insecticide poisoning

IM (AUTO-INJECTOR) Adults, Elderly, and Children > 41kg or over 10 yr of age. 2 mg; may repeat up to 3 doses as directed until under medical care. Children 18-41 kg or roughly 4-10 yr of age. 1 mg; may repeat up to 3 doses as directed. Children 7-18 kg or roughly 6 mo-4 yr of age. 0.5 mg; may repeat up to 3 doses as directed. Infants < 7 kg or < 6 mo of age. 0.25 mg; may repeat up to 3 doses as directed.

# CONTRAINDICATIONS

Generally contraindicated in patients with glaucoma, pyloric stenosis, or prostatic hypertrophy, except in doses usually used for preanesthesia or when emergency exists (e.g., nerve agent poisoning or ACLS protocol).

# INTERACTIONS

#### Drug

Antacids, antidiarrheals: May decrease absorption of atropine. Anticholinergics: May increase effects of atropine. Ketoconazole: May decrease absorption of ketoconazole. Potassium chloride: May increase severity of GI lesions (wax matrix) due to slowing DI transit. Herbal and Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# **IV INCOMPATIBILITIES**

Pantoprazole, phenytoin, thiopental sodium.

# **IV COMPATIBILITIES**

Diphenhydramine (Benadryl), droperidol (Inapsine), fentanyl (Sublimaze), glycopyrrolate (Robinul), heparin, hydromorphone (Dilaudid), midazolam (Versed), morphine, potassium chloride.

# SIDE EFFECTS

#### Frequent

Dry mouth, nose, and throat that may be severe; decreased sweating, constipation, irritation at subcutaneous or IM injection site.

#### Occasional

Swallowing difficulty, blurred vision, bloated feeling, impotence, urinary hesitancy.

#### Rare

Allergic reaction, including rash and urticaria; mental confusion or excitement, particularly in children, fatigue.

# SERIOUS REACTIONS

• Overdosage may produce tachycardia; palpitations; hot, dry, or flushed skin; absence of bowel sounds; increased respiratory rate; nausea; vomiting; confusion; somnolence; slurred speech; dizziness; and CNS stimulation. • Overdosage may also produce psychosis as evidenced by agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, and delusions, followed by depression.

# PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used with autonomic neuropathy, diarrhea, known and suspected GI infections, and mild to moderate ulcerative colitis. Caution is also warranted with CHF, COPD, coronary artery disease, esophageal reflux or hiatal hernia associated with reflux esophagitis, gastric ulcer, hepatic or renal disease, hypertension, hyperthyroidism, and tachyarrhythmias. Use atropine cautiously in the elderly and in infants.

Warm, dry, flushing feeling may occur upon administration. The patient should urinate before taking this drug to reduce the risk of urine retention. BP, pulse rate, temperature, pattern of daily bowel activity and stool consistency, intake and output, and skin turgor and mucous membranes should be assessed. **Storage** 

Store at room temperature.

#### Administration

! Notify physician and expect to discontinue atropine immediately if blurred vision, dizziness, or increased pulse rate occurs. For IV use, give the drug rapidly, to prevent paradoxical slowing of the heart rate. Give undiluted or diluted in 10 mL of sterile water for injection. Atropine may also be given by IM or subcutaneous injection. Autoinjectors are used for emergency field use; remove victim from contaminated area and then follow manufacturer instructions for IM use.

Oral tablets are usually given 30 min prior to meals.

# Auranofin

ah-ran'oh-fin ★ ➡ Ridaura Do not confuse Ridaura with Cardura.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

# Classification: Disease-

modifying antirheumatic drugs, gold compounds

# **MECHANISM OF ACTION**

Gold compounds that alter cellular mechanisms, collagen biosynthesis, enzyme systems, and immune responses. *Therapeutic Effect:* Suppress synovitis in the active stage of rheumatoid arthritis.

#### PHARMACOKINETICS

Auranofin (29% gold): Moderately absorbed from the GI tract. Protein binding: 60%. Rapidly metabolized. Primarily excreted in urine. *Half-life:* 21-31 days.

#### AVAILABILITY

Capsules (Ridaura): 3 mg.

#### 

*Adults, Elderly.* 6 mg/day as a single or 2 divided doses. If there is no response in 6 mo, may increase to 9 mg/day in 3 divided doses.

Auranofin (Generic Name), Ridaura (Brand Name)

### CONTRAINDICATIONS

Bone marrow aplasia, history of gold-induced pathologies (including blood dyscrasias, exfoliative dermatitis, necrotizing enterocolitis, and pulmonary fibrosis), severe blood dyscrasias.

#### INTERACTIONS

#### Drug

Bone marrow depressants; hepatotoxic and nephrotoxic medications: May increase the risk of aurothioglucose toxicity.

**Penicillamine:** May increase the risk of hematologic or renal adverse effects.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin level, hematocrit, and WBC and platelet counts. May increase urine protein level. May alter liver function test results.

# SIDE EFFECTS

#### Frequent

Diarrhea (50%), pruritic rash (26%), abdominal pain (14%), stomatitis (13%), nausea (10%).

# SERIOUS REACTIONS

 Signs and symptoms of gold toxicity, the primary serious reaction, include decreased hemoglobin level, decreased granulocyte count (< 150,000/mm<sup>3</sup>), proteinuria, hematuria, stomatitis, blood dyscrasias (anemia, leukopenia [WBC count < 4000/mm<sup>3</sup>], thrombocytopenia, and eosinophilia), glomerulonephritis, nephrotic syndrome, and cholestatic jaundice.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with blood dyscrasias, compromised cerebral or cardiovascular circulation, eczema, a history of sensitivity to gold compounds, marked hypertension, renal or liver impairment, severe debilitation, Sjögren syndrome in rheumatoid arthritis, and systemic lupus erythematosus. Auranofin crosses the placenta and is distributed in breast milk. These drugs should be used only when their benefits outweigh the possible risks to the fetus. Safety and effectiveness have not been established in children. Use these drugs cautiously in patients who may have age-related renal impairment. Avoid exposure to sunlight, which may turn skin gray or blue. Oral hygiene should be diligently maintained to help prevent stomatitis.

Notify the physician if GI symptoms (nausea, vomiting, or abdominal cramps), metallic taste, sore mouth, pruritus, or rash occurs. Pattern of daily bowel activity and stool consistency, urine for hematuria and proteinuria, CBC (particularly hemoglobin level, hematocrit, and WBC and platelet counts), renal and liver function tests (especially BUN level and serum alkaline phosphatase, creatinine, AST [SGOT], and ALT [SGPT] levels), skin for rash, and oral mucous membranes for stomatitis should be monitored. Therapeutic response, including improved grip strength, increased joint mobility, reduced joint tenderness, and relief of pain, stiffness, and swelling, should also be assessed.

#### Storage

At controlled room temperature.

#### Administration

Take without regard to food. Taking with food may help GI tolerance. Therapeutic response to the drug may occur in 3-6 mo.

# Azathioprine

ay-za-thye'oh-preen Azasan, Imuran Apo-Azathioprine, Teva-Azathioprine Do not confuse azathioprine with azacitidine or Azulfidine, or Imuran with Elmiron or Imferon.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Diseasemodifying antirheumatic drugs, immunosuppressives

# MECHANISM OF ACTION

An immunologic agent that antagonizes purine metabolism and inhibits DNA, protein, and RNA synthesis. *Therapeutic Effect:* Suppresses cell-mediated hypersensitivities; alters antibody production and immune response in transplant recipients; reduces the severity of arthritis symptoms.

# AVAILABILITY

Tablets (Azasan): 75 mg, 100 mg. Tablets (Imuran): 50 mg. Injection: 100 mg vial.

#### INDICATIONS AND DOSAGES Adjunct in prevention of renal allograft rejection

PO, IV Adults, Elderly, Children. 3-5 mg/kg/day on day of transplant, then 1-3 mg/kg/day as maintenance dose.

#### Rheumatoid arthritis PO

*Adults*. Initially, 1 mg/kg/day as a single dose or in 2 divided doses. May increase by 0.5 mg/kg/day after 6-8 wks at 4-wk intervals up to maximum of 2.5 mg/kg/day. Maintenance: Lowest effective dosage. May decrease dose by 0.5 mg/kg or 25 mg/day q4wk (while other therapies, such as rest, physiotherapy, and salicylates, are maintained).

*Elderly*. Initially, 1 mg/kg/day (50-100 mg); may increase by 25 mg/day until response or toxicity.

# • Dosage in renal impairment Dosage is modified based on

creatinine clearance.

Dose
75% of usual dose
50% of usual dose

# **OFF-LABEL USES**

Treatment of biliary cirrhosis, chronic active hepatitis, glomerulonephritis, inflammatory bowel disease, inflammatory myopathy, multiple sclerosis, myasthenia gravis, nephrotic syndrome, pemphigoid, pemphigus, polymyositis, systemic lupus erythematosus.

#### CONTRAINDICATIONS

Pregnant patients with rheumatoid arthritis.

#### INTERACTIONS

#### Drug

ACE inhibitors: May increase risk of anemia and severe leukopenia.

Azathioprine (Generic Name)

Allopurinol: May increase activity and risk of toxicity of azathioprine. Anticoagulants: May decrease anticoagulant activity.

**Bone marrow depressants:** May increase myelosuppression.

Live-virus vaccines: May potentiate virus replication, increase the vaccine's side effects, and decrease the patient's antibody response to the vaccine.

Other immunosuppressants: May increase the risk of infection.

Herbal

None known.

Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May decrease serum albumin, Hgb, and serum uric acid levels. May increase serum alkaline phosphatase, amylase, bilirubin, AST (SGOT), and ALT (SGPT) levels.

# IV INCOMPATIBILITIES

Aminoglycosides, ampicillin, ampicillin-sulbacatam (Unasyn), bumetanide (Bumex), calcium chloride, cephalosporins, diazepam, diphenhydramine, dopamine, dobutamine, epinephrine, hydrocortisone, imipenem-cilastatin (Primaxin), magnesium sulphate, meperidine, methylparabens, midazolam (Versed), ondansetron (Zofran), phenol, phenytoin, propylparabens, promethazine, vancomycin, and many others.

# SIDE EFFECTS

#### Frequent

Nausea, vomiting, anorexia (particularly during early treatment and with large doses). Occasional

#### Dech

Rash.

#### Rare

Severe nausea and vomiting with diarrhea, abdominal pain, hypersensitivity reaction.

# SERIOUS REACTIONS

 Immunosuppressives are associated with a risk of secondary malignancy (e.g., lymphoma skin cancers).

• Significant leukopenia and thrombocytopenia may occur, particularly in those undergoing kidney transplant rejection. Increased risk of serious infection.

· Hepatotoxicity occurs rarely.

# **PRECAUTIONS & CONSIDERATIONS**

Azathioprine should be used cautiously in immunosuppressed patients, those who have undergone previous treatment for rheumatoid arthritis with alkylating agents (such as chlorambucil, cyclophosphamide, and melphalan), and patients with current or recent chickenpox. Avoid pregnancy during treatment.

Notify the physician if abdominal pain, fever, mouth sores, sore throat, or unusual bleeding occurs. CBC (especially platelet count) and liver function tests should be monitored weekly during the first month of therapy, twice monthly during the second and third months of treatment, and monthly thereafter. The dosage should be reduced or discontinued if the WBC count falls rapidly. Therapeutic response, including improved grip strength, increased joint mobility, reduced joint tenderness, and relief of pain, stiffness, and swelling, should be assessed in rheumatoid arthritis patients.

#### Storage

Store the tablets at room temperature. Store the parenteral form at room temperature. After reconstitution, the IV solution is stable for 24 h at room temperature.

# Azacitidine 143.e1

# Α

# Azacitidine

ay-zah-sigh'tih-deen ★ ➡ Vidaza **Do not confuse azacitidine with azathioprine.** 

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastics, antimetabolites

# **MECHANISM OF ACTION**

An antineoplastic agent that exerts a cytotoxic effect on rapidly dividing cells by causing demethylation of DNA in abnormal hematopoietic cells in the bone marrow. *Therapeutic Effect:* Restores normal function to tumorsuppressor genes regulating cellular differentiation and proliferation.

# PHARMACOKINETICS

Rapidly absorbed after subcutaneous administration. Metabolized by the liver. Eliminated in urine. *Half-life:* 4 h.

# AVAILABILITY

Powder for Injection: 100 mg.

# INDICATIONS AND DOSAGES

#### Myelodysplastic syndrome IV. SC

*Adults, Elderly.* 75 mg/m<sup>2</sup>/day for 7 days every 4 wks. Dosage may be increased after 2 cycles to 100 mg/m<sup>2</sup> if initial dose is insufficient and toxicity is manageable.

# **OFF-LABEL USES**

Acute myelogenous leukemia, chronic myelogenous leukemia.

# CONTRAINDICATIONS

Advanced malignant hepatic tumors, hypersensitivity to the drug or to mannitol.

# INTERACTIONS

#### Drug

**Bone marrow suppressants:** May increase myelosuppression.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

# DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin level, hematocrit, and WBC, RBC, and platelet counts. May increase serum creatinine and potassium levels.

# SIDE EFFECTS

#### Frequent (29%-71%)

Nausea, vomiting, fever, diarrhea, fatigue, injection site erythema, constipation, ecchymosis, cough, dyspnea, weakness.

# Occasional (16%-26%)

Rigors, petechiae, injection site pain, pharyngitis, arthralgia, headache, limb pain, dizziness, peripheral edema, back pain, erythema, epistaxis, weight loss, myalgia.

# Rare (8%-13%)

Anxiety, abdominal pain, rash, depression, tachycardia, insomnia, night sweats, stomatitis.

# SERIOUS REACTIONS

• Hematologic toxicity, manifested most commonly as anemia, leukopenia, neutropenia, and thrombocytopenia, is a common adverse effect.

- Hepatotoxicity.
- · Nephrotoxicity.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal impairment. Azacitidine may be embryotoxic, causing developmental abnormalities in the fetus. Barrier contraception should be used while receiving azacitidine. Men should not try to father a child while on treatment. Women of childbearing age should avoid becoming pregnant while taking azacitidine. Breastfeeding while taking azacitidine should be avoided. The safety and efficacy of azacitidine have not been established in children. Age-related renal impairment may increase the risk of renal toxicity in elderly patients.

Notify the physician of nausea and vomiting, bleeding, and any signs of infection, including fever and flu-like symptoms. Blood counts should be obtained before each dosing cycle to monitor the response and assess for drug toxicity.

#### Storage

Store vials at room temperature. The reconstituted solution may be stored for up to 1 h at room temperature or up to 8 h if refrigerated. After removing from refrigeration, allow the drug suspension to return to room temperature and use it within 30 min.

#### Administration

CAUTION: Observe usual precautions for preparations, handling,

administration, and disposal of cytotoxic drugs.

For subcutaneous administration, use strict aseptic technique when preparing the drug. Reconstitute azacitidine with 4 mL sterile water for injection. The reconstituted suspension will appear cloudy. Divide doses > 4 mL equally into two syringes. To resuspend the contents, invert the syringe 2 or 3 times and roll it between your palms for 30 seconds immediately before administration. For SC injection, rotate injection sites among the abdomen, upper arm, and thigh for each injection. Administer each new injection at least 1 inch from a previous injection site. If azacitidine comes into contact with skin, immediately wash with soap and water.

For IV infusion: Dilute the appropriate dose in 50-100 mL of 0.9% NaCl or lactated Ringer's injection. Administer IV infusion over 10-40 min; infusion must be completed within 1 h of reconstitution.

#### Administration

Take oral azathioprine during or after meals to reduce the risk of GI disturbances. The drug's therapeutic response may take up to 12 wks to appear.

For IV use, reconstitute the 100-mg vial with 10 mL sterile water for injection to provide a concentration of 10 mg/mL. Swirl the vial gently to dissolve the solution. The solution may be further diluted in 50 mL or more of either D5W or 0.9% NaCl. Infuse the solution over 30-60 min (range is 5 min to 8 h).

# **Azelaic Acid**

aye-zeh-lay'ick as'id ★ Azelex, Finacea, Finevin ◆ Finacea

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Topical antimicrobial, antiacne

# **MECHANISM OF ACTION**

The exact mechanism of action of azelaic acid is not known. Possesses antimicrobial activity against *Propionibacterium acnes* and *Staphylococcus epidermidis*. *Therapeutic Effect*: Inhibits microbial cellular protein synthesis.

#### PHARMACOKINETICS

Minimal absorption after topical administration. Metabolized in liver. Excreted in urine as unchanged drug. *Half-life:* 12 h.

# AVAILABILITY

Cream: 20%. Gel: 15%.

# INDICATIONS AND DOSAGES Mild to moderate acne

TOPICAL

*Adults, Adolescents.* Apply cream to affected area twice daily (morning and evening).

#### Mild to moderate rosacea TOPICAL

*Adults.* Apply gel to affected area twice daily (morning and evening).

# CONTRAINDICATIONS

Hypersensitivity to azelaic acid or any component of the formulation.

# DRUG INTERACTIONS

Drug None known. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Occasional

Pruritus, stinging, burning, tingling, erythema, dryness, rash, peeling, irritation, contact dermatitis.

#### Rare

Worsening of asthma, vitiligo depigmentation, small depigmented spots, hypertrichosis, reddening (signs of keratosis pilaris), exacerbation of recurrent cold sore, fever blister, or oral herpes simplex.

# SERIOUS REACTIONS

• None reported.

# PRECAUTIONS & CONSIDERATIONS

Monitor for early signs of hypopigmentation, particularly in patients with dark complexions. Storage

Store at room temperature.

# Administration

For external use only. Massage a thin layer into the affected area. Avoid contact with the eyes, mouth, and mucous membranes. Cosmetics may be applied after the gel has dried.

# Azelastine

a'zel-ah-steen Astelin, Astepro, Optivar **Do not confuse Optivar with Optiray.** 

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antihistamines, H<sub>1</sub> histamine antoganist, inhalation, ophthalmics

# **MECHANISM OF ACTION**

An antihistamine that competes with histamine for histamine receptor sites on cells in the blood vessels, GI tract, and respiratory tract. *Therapeutic Effect*: Relieves symptoms associated with seasonal allergic rhinitis such as increased mucus production and sneezing and symptoms associated with allergic conjunctivitis, such as redness, itching, and excessive tearing.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
Nasal spray	0.5-1 h	2-3 h	12 h
Ophthalmic	N/A	3 min	8 h

Well absorbed through nasal mucosa. Primarily excreted in feces. *Half-life:* 22 h.

# AVAILABILITY

Nasal Spray (Astelin): 137 mcg/ spray.

*Ophthalmic Solution (Optivar):* 0.05%. *Nasal Spray (Astepro):* 205.5 mcg/ spray.

# INDICATIONS AND DOSAGES Allergic rhinitis

NASAL (ASTELIN SPRAY) Adults, Elderly, Children 12 yr and older. 1-2 sprays in each nostril twice a day.

*Children 5-11 yr.* 1 spray in each nostril twice a day.

NASAL (ASTEPRO SPRAY) *Adults, Elderly, Children 12 yr and older.* 1-2 sprays in each nostril twice a day OR 2 sprays per nostril once daily.

# Allergic conjunctivitis

OPHTHALMIC Adults, Elderly, Children 3 yr or older. 1 drop into affected eye twice a day.

# CONTRAINDICATIONS

History of hypersensitivity.

# INTERACTIONS

Drug

Alcohol, other CNS depressants: May increase CNS depression. Cimetidine: May increase azelastine blood concentration but only when azelastine given orally. Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May suppress flare and wheal reactions to antigen skin testing unless drug is discontinued 4 days before testing.

# SIDE EFFECTS

Frequent (15%-20%) Headache, bitter taste.

#### Rare

Nasal burning, paroxysmal sneezing.
Ophthalmic: Transient eye burning or stinging, bitter taste, headache.

#### SERIOUS REACTIONS

• Epistaxis occurs rarely with nasal administration.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with renal impairment. It is unknown whether azelastine crosses the placenta or is distributed in breast milk. Azelastine has been shown to cause developmental toxicity when given orally to mice, rats, and rabbits; use in pregnancy only if necessary. The safety and efficacy of azelastine have not been established in children younger than 3 yr. No agerelated precautions have been noted in elderly patients. Avoid drinking alcoholic beverages during therapy. **Storage** 

## Store at room temperature.

#### Administration

For intranasal use, prime the pump with 4 sprays or until a fine mist appears before using the nasal spray the first time. After the first use and if the pump has not been used for 3 or more days, prime the pump with 2 sprays or until a fine mist appears. To administer the spray, clear nasal passages as much as possible before use. Tilt head slightly forward. Insert the applicator tip into one nostril, pointing the tip toward the nasal passage and away from the nasal septum. While holding the other nostril closed, spray into the nostril and inhale at the same time to deliver the drug as high into the nasal passages as possible. Repeat in the other nostril. Wipe the applicator tip with a clean, damp tissue and replace cap immediately after use. Avoid spraying nasal drug into the eyes.

For ophthalmic use, tilt head back and instill the solution in the conjunctival sac of the affected eye. Close the eye; then press gently on the lacrimal sac for 1 min.

## Azilsartan a-zil-sar'-tan

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antihypertensives, angiotensin II receptor antagonists

#### MECHANISM OF ACTION

An angiotensin II receptor, type AT<sub>1</sub>, antagonist that blocks vasoconstrictor and aldosteronesecreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT<sub>1</sub> receptors. *Therapeutic Effect:* Causes vasodilation, decreases peripheral resistance, and decreases BP.

#### **PHARMACOKINETICS**

Protein binding: > 99%. Peak concentrations within 3 hours. Metabolized in the liver by CYP2C9. Metabolites recovered in feces and in urine. Not removed by hemodialysis. *Half-life:* 11 h.

#### AVAILABILITY

Tablets: 40 mg, 80 mg.

# INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults, Elderly.* Initially, 80 mg once per day. Consider 40 mg/day starting dose in patients on high doses of diuretics.

## CONTRAINDICATIONS

Hypersensitivity to the drug.

## INTERACTIONS

## Drug

**Diuretics:** Produces additive hypotensive effects; may cause azotemia.

Eplerenone, drospirenone, potassium-sparing diuretics, potassium supplements: Increased serum potassium and risk for hyperkalemia.

Lithium: Elevated lithium concentrations and risk of toxic effects.

**NSAIDs:** May increase risk for renal dysfunction, and may attenuate blood pressure lowering.

## Herbal

#### Ma Huang, hawthorn: May

increase blood pressure or produce other cardiac effects.

## Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum creatinine, and potassium levels. Rarely alters hemoglobin, hematocrit, WBC, or platelet counts.

## SIDE EFFECTS

## Common (> 2%)

Diarrhea.

#### Occasional

Hypotension, nausea, asthenia, fatigue, muscle spasm, dizziness, postural dizziness, cough.

#### Rare

Increases in serum creatinine, hyperkalemia.

## SERIOUS REACTIONS

• Anaphylactoid reactions, angioedema (rare).

#### PRECAUTIONS & CONSIDERATIONS

Azilsartan has not been studied in patients with severe hepatic impairment. Patients who are volume-depleted or salt-depleted are at increased risk for hypotension. Caution is warranted in patients with renal impairment, renal artery stenosis and in those receiving potassium-sparing diuretics or potassium supplements, or with severe congestive heart failure; these patients may be more susceptible to renal function deterioration. Monitor electrolytes and renal function during treatment. It is unknown whether azilsartan is distributed in breast milk; discontinue nursing or the drug. Azilsartan can cause fetal harm, particularly during the second and third trimester of pregnancy. When pregnancy is detected, discontinue as soon as possible. Safety and efficacy of azilsartan have not been established in children. No age-related precautions have been noted in elderly patients. Dizziness may occur. Tasks that require mental alertness or motor skills should be avoided. Notify the physician if fever or sore throat occurs. Apical pulse and BP should be assessed immediately before each dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the person in the supine position with feet slightly elevated and notify the physician. Serum electrolyte levels, liver and renal function tests, urinalysis, and pulse rate should be assessed. Maintain adequate hydration; exercising outside during hot weather should be approached with caution to decrease the risk of dehydration and hypotension.

#### Storage

Store at room temperature, tightly closed. Keep in original container. Protect from moisture and light.

## Administration

Azilsartan may be given concurrently with other antihypertensives. Take without regard to meals.

## **Azithromycin**

ay-zi-thro-mye'sin ★ ▲ Zithromax, Zithromax TRI-PAK, Zithromax Z-PAK, Zmax Do not confuse azithromycin with erythromycin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, macrolides

## **MECHANISM OF ACTION**

A macrolide antibiotic that binds to ribosomal receptor sites of susceptible organisms, inhibiting RNA-dependent protein synthesis. *Therapeutic Effect:* Bacteriostatic or bactericidal, depending on the drug dosage.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 7%-50%. Widely distributed. Eliminated primarily unchanged by biliary excretion. *Half-life:* 68 h.

## AVAILABILITY

Ophthalmic Solutions: 1%. Oral Suspension: 100 mg/5 mL, 200 mg/5 mL. Oral Suspension, Extended-Release Zmax: 2 g. Tablets: 250 mg, 500 mg, 600 mg. Tri-Pak: 500 mg (3 tablets), Z-Pak: 250 mg (6 tablets). Injection: 500 mg.

## INDICATIONS AND DOSAGES

#### Respiratory tract, skin, and skin-structure infections PO

*Adults, Elderly.* 500 mg once, then 250 mg/day for 4 days.

Children 6 mo and older. 10 mg/kg once (maximum 500 mg), then 5 mg/kg/day for 4 days (maximum 250 mg).

## Single-dose treatment of community-acquired pneumonia

PO (EXTENDED-RELEASE SUSPENSION ONLY) Adults and Children ≥ 34 kg. 2g single dose; give at least 1 h before or 2 h after a meal. May also use for adults (only) for sinusitis. Children weighing 5 to < 34 kg. 60 mg/kg single dose; give at least 1 h before or 2 h after a meal. See manufacturer-specific dosing table. Acute bacterial exacerbations of

## COPD

PO

Adults. 500 mg/day for 3 days.

#### Otitis media PO

*Children 6 mo and older.* 10 mg/kg once (maximum 500 mg), then 5 mg/kg/day for 4 days (maximum 250 mg). Single dose: 30 mg/kg. Maximum: 1500 mg. Three-day regimen: 10 mg/kg/day as single daily dose. Maximum: 500 mg/day.

#### Pharyngitis, tonsillitis PO

*Children older than 2 yr.* 12 mg/kg/ day (maximum 500 mg) for 5 days.

#### Chancroid PO

Adults, Elderly. 1 g as single dose. Children. 20 mg/kg as single dose. Maximum: 1 g.

## Treatment of Mycobacterium avium complex (MAC)

PO

*Adults, Elderly.* 500 mg/day in combination.

*Children*. 5 mg/kg/day (maximum 250 mg) in combination.

## Prevention of MAC

PO

Adults, Elderly. 1200 mg/wk alone or with rifabutin.

Azithromycin (Generic Name)

*Children.* 5 mg/kg/day (maximum 250 mg) or 20 mg/kg/wk (maximum 1200 mg) alone or with rifabutin.

## Nongonococcal urethritis and cervicitis due to Chlamydia trachomatis

PO

Adults. 1 g as a single dose. Gonococcal urethritis

#### PO

*Adults.* 2 g as a single dose, but CDC does not recommend due to severe GI distress.

# Bacterial conjunctivitis OPHTHALMIC

Adults, Elderly, Children 1 yr and older. 1 drop in the affected eye twice daily, 8-12 h apart for the first 2 days, then instill 1 drop in the affected eye once daily for the next 5 days.

# • Usual pediatric dosage PO

*Children older than 6 mo.* 10 mg/kg once (maximum 500 mg) then 5 mg/kg/day for 4 days (maximum 250 mg).

## Usual parenteral dosage (community-acquired pneumonia, PID)

## IV

*Adults.* 500 mg/day, followed by oral therapy to complete the course of treatment. Usually IV given for at least 2 days.

## **OFF-LABEL USES**

Chlamydial infections, gonococcal pharyngitis, uncomplicated gonococcal infections of the cervix, urethra, and rectum, dental-related infections, pertussis, alternative for ophthalmia neonatorum prophylaxis (Azasite).

## CONTRAINDICATIONS

Hypersensitivity to azithromycin or other macrolide antibiotics or history of cholestatic jaundice/hepatic dysfunction associated with prior use of azithromycin.

## INTERACTIONS

#### Drug

Aluminum- or magnesiumcontaining antacids: May decrease azithromycin blood concentration. Carbamazepine, cyclosporine, theophylline, warfarin: May rarely increase the plasma concentrations of these drugs.

Drugs that prolong the QT interval (e.g., class IA [quinidine procainamide, disopyramide] or class III [dofetilide, amiodarone, sotalol]) antiarrhythmics; antipsychotics (pimozide, phenothiazines, ziprasidone); fluroquinolones; azole antifungals; terfenadine; astemizole; or cisapride, others; Potential risk of cardial effects; use of caution. Herbal None known.

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum CK, AST (SGOT), and ALT (SGPT) levels.

## IV INCOMPATIBILITIES

Amikacin, aztreonam (Azactam), cephalosporins, clindamycin (Cleocin), famotidine (Pepcid), fentanyl, furosemide, gentamicin, imipenem-cilastin (Primaxin), morphine, potassium chloride, quinupristin-dalfopristin (Synercid), ticarcillin-claculanate (Timentin), tobramycin.

## **IV COMPATIBILITIES**

None known; don't mix with other medications.

## SIDE EFFECTS

#### Occasional

PO, IV: Nausea, vomiting, diarrhea, abdominal pain.

Ophthalmic: Eye irritation, burning, staining.

#### Rare

PO, IV: Headache, dizziness, allergic reaction.

## SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Acute interstitial nephritis occurs rarely.

• Cholestatic jaundice, hepatic necrosis, or other hepatotoxicity occurs rarely.

• QT prolongation and potential for serious arrhythmias (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal dysfunction. Determine whether there is a history of hepatitis or allergies to azithromycin or other macrolides before beginning therapy. Avoid use when possible if history of prolonged OT interval or ongoing proarrhythmic conditions (e.g., hypokalemia or hypomagnesemia), clinically significant bradycardia, of if receiving Class IA or Class III antiarrhythmic agents. Elderly patients may be more susceptible to these effects. It is unknown whether azithromycin is distributed in breast milk. The safety and efficacy of azithromycin have not been established in children younger than 16 yr for IV use and younger than 6 mo for oral use. No age-related precautions have been noted in elderly patients with normal renal function.

GI discomfort, nausea, or vomiting should be assessed. Evaluate for signs and symptoms of superinfection, including genital or anal pruritus, sore mouth or tongue, and moderate to severe diarrhea. Correct any preexisting electrolyte imbalance before treatment. Monitor for changes in the heart rate or rhythm, especially with IV therapy. Assess for signs and symptoms of hepatotoxicity, such as abdominal pain, fever, GI disturbances, and malaise. Liver function tests should be monitored. **Storage** 

Store the oral suspension at room temperature. The immediate-release suspension is stable for 10 days after reconstitution. The extended-release suspension should be consumed within 12 h of reconstitution. Store injection vials at room temperature. After reconstitution, the injectable solution is stable for 24 h at room temperature or 7 days if refrigerated. Store unopened ophthalmic solution in refrigerator. Once opened, store in refrigerator or at room temperature for up to 14 days.

#### Administration

Note that the extended-release oral suspension is not interchangable with other azithromycin dose forms. Give immediate-release tablets without regard to food; tolerability may be improved by administration with food. Do not administer the oral suspension with food. Give it at least 1 h before or 2 h after a meal. Take the oral suspension with 8 oz of water at least 1 h before or 2 h after consuming any food or beverages. Azithromycin should be taken 1 h before or 2 h after antacids. Space doses evenly around the clock and continue taking for the full course of treatment.

For IV use, reconstitute each 500mg vial with 4.8 mL sterile water for injection to provide a concentration of 100 mg/mL. Shake well to ensure dissolution. Further dilute the solution with 250 or 500 mL 0.9% NaCl or D5W to provide a final concentration of 2 mg/mL or 1 mg/mL, respectively. Infuse the drug over 60 min.

Shake ophthalmic solution before each use.

## Aztreonam

az-tree′oo-nam ★ Azactam, Cayston ◆ Cayston

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibacterial, monobactams

## **MECHANISM OF ACTION**

A monobactam antibiotic that inhibits bacterial cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Completely absorbed after IM administration. Protein binding: 56%-60%. Partially metabolized by hydrolysis. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life*: 1.4-2.2 h (increased in impaired renal or hepatic function).

## AVAILABILITY

Injection Powder for Reconstitution: 500 mg, 1 g, 2 g. Injection Powder Inhalation Solution: 75 mg.

# INDICATIONS AND DOSAGES Urinary tract infections

IV, IM Adults, Elderly. 500 mg to 1 g q8-12h.

 Moderate to severe systemic infections IV, IM Adults, Elderly. 1-2 g q8-12h. ▶ Severe or life-threatening infections IV

Adults, Elderly. 2 g q6-8h.

## Cystic fibrosis

## IV

*Children.* 50 mg/kg/dose q6-8hr up to 200 mg/kg/day. Maximum: 8g/day. NEBULIZER INHALATION *Adults and Children 7 years and older:* 75 mg nebulized 3 times daily for 28 days then 28 days off. Give each dose at least 4 h apart; administer a bronchodilator before nebulizing aztreonam.

## Mild to severe infections in children

#### IV

Children. 30 mg/kg q6-8hr. Maximum: 120 mg/kg/day. Neonates. 60-120 mg/kg/day q6-12h.

#### • **Dosage in renal impairment** Dosage and frequency are modified based on creatinine clearance and the severity of the infection.

## Creatinine

Clearance (mL/min)	Adult Dosage
10-30	1-2 g initially, then ½ usual dose at usual intervals
< 10	1-2 g initially; then ¼ usual dose at
	usual intervals

## **OFF-LABEL USES**

Treatment of bone and joint infections.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

Drug None known.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. Produces a positive direct Coombs' test.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin (Fungizone), azithromycin (Zithromax), daunorubicin (Cerubidine), ganciclovir (Cytovene), lorazepam (Ativan), metronidazole (Flagyl), nafcillin, vancomycin (Vancocin).

## **IV COMPATIBILITIES**

Aminophylline, ampicillin, bumetanide (Bumex), calcium gluconate, cefazolin, cimetidine (Tagamet), clindamycin, diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), famotidine (Pepcid), furosemide (Lasix), gentamicin, heparin, hydromorphone (Dilaudid), insulin (regular), magnesium sulfate, morphine, potassium sulfate, propofol (Diprivan), tobramycin.

## SIDE EFFECTS

#### Occasional (< 3%)

Discomfort and swelling at IM injection site, nausea, vomiting, diarrhea, rash.

## Rare (<1%)

Phlebitis or thrombophlebitis at IV injection site, abdominal cramps, headache, hypotension.

#### SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

Severe hypersensitivity reactions, including anaphylaxis, occur rarely.
Nebulized soultion may cause bronchospasm; therefore pretreat with bronchodilator.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal impairment or a history of allergies, especially to antibiotics. Aztreonam crosses the placenta and is distributed in amniotic fluid and in low concentrations in breast milk. The safety and efficacy of aztreonam have not been established in children < 9 mo old. Age-related renal impairment may require a dosage adjustment in the elderly. History of allergies, especially to antibiotics, should be determined before giving aztreonam. Cross-reactivity of aztreonam is extremely rare, but give with caution if a history of serious hypersensitivity to beta-lactams.

GI discomfort, nausea, and vomiting may occur. Pattern of daily bowel activity and stool consistency and skin for rash should be assessed. Signs and symptoms of phlebitis, such as heat, pain, red streaking over the vein, and pain at the IM injection site, should also be assessed. Be alert for signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, vomiting, diarrhea, fever, sore throat, and ulceration or changes of oral mucosa.

#### Storage

Store vials at room temperature. The solution normally appears colorless to light yellow. After reconstitution, the solution is stable for 48 h at room temperature and 7 days if refrigerated. Discard the solution if a precipitate forms. Discard unused portions of solution. After reconstitution for IM injection, the solution is stable for 48 h at room temperature and 7 days if refrigerated.

## Administration

For IV push, dilute each gram with 6-10 mL of sterile water for injection. Administer IV push, over 3-5 min. For intermittent IV infusion, further dilute with 50-100 mL of D5W or 0.9% NaCl. Administer IV infusion over 20-60 min.

For IM use, shake the vial immediately and vigorously after adding the diluent. Inject the drug deep into a large muscle mass.

Do not reconstitute aztreonam for inhalation until ready to use. Use the diluent supplied by manufacturer and squeeze contents into the aztreonam vial. Gently swirl until dissolved. Give bronchodilator prior to aztreonam nebulizer. For patients taking multiple inhaled therapies, use bronchodilator first, then mucolytic, and then aztreonam. Administer via an Altera Nebulizer System only. Do not mix with any other drugs. Administration typically takes 2-3 min.

## **Bacitracin**

bass-i-tray'sin ★ Baci-IM ▲ Baciject, Bacitin Do not confuse bacitracin with Bactrim or Bactroban.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Rx/OTC

*Classification:* Anti-infective, polypeptide antibiotics

## **MECHANISM OF ACTION**

An antibiotic that interferes with plasma membrane permeability and inhibits bacterial cell wall synthesis in susceptible bacteria. *Therapeutic Effect:* Bacteriostatic. Primarily active against gram-positive organisms.

## **PHARMACOKINETICS**

Poorly absorbed from mucous membranes or intact or denuded skin. Rapidly and completely absorbed following IM administration. Not absorbed with bladder irrigation but can be absorbed with mediastinal or peritoneal lavage. Excreted slowly by glomerular filtration.

## AVAILABILITY

*Powder for Injection:* 50,000 units. *Ophthalmic Ointment:* 500 units/g. *Topical Ointment:* 500 units/g.

# INDICATIONS AND DOSAGES Superficial ocular infections

OPHTHALMIC Adults: ½-inch ribbon in conjunctival sac q3-4h.

## Skin abrasions, superficial skin infections

## TOPICAL

*Adults, Children.* Apply to affected area 1-5 times/day.

## Surgical treatment and prophylaxis

IRRIGATION (OFF-LABEL USE) Adults, Elderly. 50,000-150,000 units, as needed; typically dissolved in 1000 mL sterile NS or sterile water for irrigation.

#### Pneumonia and empyema caused by susceptible staphylococci IM

Infants weighing < 2500 g. 900 units/kg/24 h in 2-3 divided doses. Infants weighing more than 2500 g. 1000 units/kg/24 h in 2-3 divided doses.

## CONTRAINDICATIONS

None known.

## INTERACTIONS

#### Drug

Aminoglycosides, polymyxin B, colistin, cisplatin, amphotericin B, foscarnet, vancomycin, others: Avoid concurrent use of other nephrotoxic medications when possible when bacitracin is given

systemically.

Neuromuscular blockers: Systemic use during surgery may increase or prolong skeletal muscle relaxation of neuromuscular blockers.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

## Rare

IM: Rash, nausea, vomiting, pain at injection site. Ophthalmic: Burning, itching, redness, swelling, pain. Topical: Hypersensitivity reaction (allergic contact dermatitis, burning, inflammation, pruritus).

## SERIOUS REACTIONS

• Severe hypersensitivity reactions, including apnea and hypotension, occur rarely.

 Renal failure due to glomerular and tubular necrosis (occurs commonly with systemic use but may also occur with topical irrigation).

## **PRECAUTIONS & CONSIDERATIONS**

When administering a fixedcombination product containing bacitracin, be familiar with the side effects of each of the product's drug components. History of allergies, especially to bacitracin, should be determined before giving the drug.

Burning, itching, increased irritation, and rash should be reported immediately. Be alert for signs and symptoms of hypersensitivity, such as burning, inflammation, and pruritus. When using preparations containing corticosteroids, closely monitor the patient for any unusual signs or symptoms because corticosteroids may mask clinical signs.

Monitor renal function closely with use of the injectable. Maintain adequate hydration. Discontinue therapy if renal toxicity occurs. **Storage** 

Topical and ophthalmic products may be stored at room temperature. Store unreconstituted powder for injection in refrigerator. Reconstituted solutions are stable for 1 wk when stored in the refrigerator. Topical irrigations may be stored for up to 3 days.

#### Administration

For ophthalmic use, place a gloved finger on the lower eyelid and pull it out until a pocket is formed between the eye and lower lid. Place  $\frac{1}{2}$  to  $\frac{1}{2}$ inch of the ointment in the pocket. Close the eye gently for 1-2 min and roll the eyeball to increase the drug's contact with the eye. Remove excess ointment around the eye with a tissue.

For IM use, dilute powder for injection with NS containing 2% procaine HCl to a concentration between 5000 and 10,000 units/mL. Diluents containing parabens should not be used as they cause cloudy solutions or precipitate formation. IM injections should be given in the upper outer quadrant of the buttocks, alternating right and left and avoiding multiple injections in the same region.

## **Baclofen**

bak'loe-fen Lioresal Do not confuse baclofen with Bactroban or Beclovent.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Skeletal muscle relaxant, central acting

## **MECHANISM OF ACTION**

A direct-acting skeletal muscle relaxant that inhibits transmission of reflexes at the spinal cord level. *Therapeutic Effect:* Relieves muscle spasticity.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 30%. Partially metabolized in the liver. Primarily excreted in urine. *Half-life:* 2.5-4 h; intrathecal: 1.5 h.

#### AVAILABILITY

Tablets: 10 mg, 20 mg. Intrathecal Injection: 50 mcg/mL, 500 mcg/mL, 2000 mcg/mL.

Baclofen (Generic Name)

## PO

В

Adults. Initially, 5 mg 3 times/day. May increase by 15 mg/day at 3-day intervals. Range: 40-80 mg/day. Maximum: 80 mg/day. Elderly. Initially, 5 mg 2-3 times/day. May gradually increase dosage. USUAL MAINTENANCE INTRATHECAL DOSAGE NOTE: Initial titration and close monitoring are required. Maintenance doses vary, these represent general ranges only. Adults, Elderly, Children older than 12 yr: 100-700 mcg/day. Children 12 yr and younger. 100-300 mcg/day.

## **OFF-LABEL USES**

Treatment of trigeminal neuralgia, hiccups.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Morphine epidural (when intrathecal baclofen used): Increased risk for hypotension or dyspnea.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose level and serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

## Frequent (>10%)

Transient somnolence, asthenia, dizziness, light-headedness, nausea, vomiting.

## Occasional (2%-10%)

Headache, paresthesia, constipation, anorexia, hypotension, confusion, nasal congestion, rash.

## Rare (<1%)

Paradoxical CNS excitement or restlessness, slurred speech, tremor, dry mouth, diarrhea, nocturia, impotence.

## SERIOUS REACTIONS

 Abrupt discontinuation of baclofen may produce hallucinations and seizures and rebound spasticity (may be severe on abrupt withdrawal of intrathecal).

· Overdose results in blurred vision, seizures, myosis, mydriasis, severe muscle weakness, strabismus, respiratory depression, and vomiting.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with diabetes mellitus, epilepsy, impaired renal function, preexisting psychiatric disorders, and a history of CVA. Baclofen is distributed in breast milk; avoidance of breastfeeding is recommended. Due to a potential for adverse fetal effects, use is not recommended during pregnancy. The safety and efficacy of baclofen have not been established in children younger than 12 yr for the oral, and 4 yr for intrathecal, forms. Elderly patients may require decreased dosage because of agerelated renal impairment. They are also at increased risk for CNS toxicity, manifested as confusion, hallucinations, depression, and sedation.

Drowsiness may occur but is usually diminished with continued therapy. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills. Blood counts and liver and renal function tests should be obtained periodically for those on

long-term therapy. Therapeutic response, such as decreased intensity of skeletal muscle pain, should be assessed. For patients receiving intrathecal baclofen, watch for symptoms that may indicate overdose; the patient should be taken immediately to a hospital for assessment and emptying of the pump reservoir and appropriate management if such symptoms occur.

## Storage

*Oral:* Room temperature. Keep tightly closed. *Intrathecal:* Do not freeze. Do not heat sterilize.

#### Administration

Take baclofen without regard to food. Crush tablets as needed. Do not abruptly discontinue the drug after long-term therapy.

Prior to pump implantation and initiation of chronic infusion of baclofen intrathecal, patients must demonstrate a positive clinical response to a bolus dose administered intrathecally in a screening trial. After the screening trial, a pump specifically approved for baclofen intrathecal injection administration is implanted and filled. Physicians must be adequately trained/educated in chronic intrathecal infusion therapy.

For patients requiring dilutions of medication other than the available manufacturer concentrations, the drug must be diluted with preservative-free NS. During periodic refills of the pump, the daily dose may be increased by no more than 5%-20% to maintain adequate symptom control. The daily dose may be reduced by 10%-20% if side effects occur.

## **Balsalazide**

ball-sal'a-zide ★ Colazal Do not confuse Colazal with Clozaril.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** GI anti-inflammatory, 5-aminosalicylates

#### **MECHANISM OF ACTION**

A 5-aminosalicylic acid derivative that changes intestinal microflora, altering prostaglandin production and inhibiting function of natural killer cells, mast cells, neutrophils, and macrophages. *Therapeutic Effect*: Diminishes inflammatory effect in colon.

## PHARMACOKINETICS

Drug reaches colon intact; bacterial azoreductases release 5-aminobenzyl-*B*-analine and mesalamine (active metabolite); low, variable systemic absorption; peak concentration 1-2 h, protein binding  $\approx$ 99%; < 1% renal excretion; most excreted in feces (65%).

#### AVAILABILITY

Capsules: 750 mg.

# INDICATIONS AND DOSAGES Ulcerative colitis PO

Adults, Elderly. Three 750-mg capsules 3 times/day for 8-12 wks. Children 5-17 yr: Three 750-mg capsules 3 times/day or one 750-mg capsule 3 times/day for 8 wks.

Balsalazide (Generic Name)

## CONTRAINDICATIONS

Hypersensitivity to 5-aminosalicylates, and salicylates.

## INTERACTIONS

#### Drug

6-mercaptopurine or thioguanine:

Balsalazide may inhibit action of TPMT, an enzyme that metabolizes these chemotherapies, and may increase risk of bone marrow suppression/toxicity.

Warfarin: Rare reports of increased INR; monitor.

#### Herbal

None known. Food None known.

## SIDE EFFECTS

#### Frequent (6%-8%)

Headache, abdominal pain, nausea, diarrhea.

#### Occasional (2%-4%)

Vomiting, arthralgia, rhinitis, insomnia, fatigue, flatulence, coughing, dyspepsia.

#### Rare

Constipation, dry mouth, myalgia, flu-like symptoms, alopecia.

## SERIOUS REACTIONS

· Liver toxicity occurs rarely.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with renal disease or renal impairment. Notify the physician if abdominal pain, severe headache or chest pain, or unresolved diarrhea occurs. Watch for any worsening of ulcerative colitis symptoms. Patients with pyloric stenosis may have prolonged gastric retention of the drug. Serum chemistry laboratory values, including BUN, alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels, should be obtained before treatment.

#### Storage

Store at room temperature. Administration

May administer without regard to food. For patients with difficulty swallowing, the capsules may be opened and the contents sprinkled on applesauce and immediately consumed. The contents may be chewed if necessary. Teeth and tongue staining may occur in some patients taking balsalazide sprinkled on applesauce.

## **Becaplermin**

beh-cap'lear-min Regranex Do not confuse Regranex with Repronex or Granulex.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Topical wound repair, recombinant human platelet-derived growth factor

## **MECHANISM OF ACTION**

A platelet-derived growth factor that heals open wounds. *Therapeutic Effect:* Promotes chemotactic recruitment and proliferation of cells involved in wound repair and enhances the formation of granulation tissue.

## PHARMACOKINETICS

Minimal systemic absorption when applied to wounds; bioavailability roughly 3%.

## AVAILABILITY

Gel: 0.01% (Regranex).

## INDICATIONS AND DOSAGES

 Diabetic foot ulcer and decubitus ulcers

## Basiliximab

bay-zul-ix'ah-mab ★ 🍁 Simulect Do not confuse with daclizumab.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

## Classification:

Immunosuppressives, monoclonal antibodies

## MECHANISM OF ACTION

A monoclonal antibody that binds to and blocks the receptor of interleukin-2, a protein that stimulates the proliferation of T lymphocytes, which play a major role in organ transplant rejection. Therapeutic Effect: Prevents lymphocytic activity and impairs response of the immune system to antigens, which prevents acute renal transplant rejection.

## PHARMACOKINETICS

Half-life: Adults, 4-10 days; children, 5-17 days.

## AVAILABILITY

Powder for Injection: 10 mg, 20 mg.

## INDICATIONS AND DOSAGES

Prevention of acute organ rejection in patients receiving a kidney transplant, with cyclosporine and corticosteriods

IV

Adults, Elderly, Children weighing 35 kg or more. 20 mg within 2 h before transplant surgery and 20 mg 4 days after transplant.

Children weighing < 35 kg. 10 mg within 2 h before transplant surgery and 10 mg 4 days after transplant.

## **OFF-LABEL USES**

Prevention of acute organ rejection following liver transplant.

## CONTRAINDICATIONS

Hypersensitivity to basiliximab, murine proteins, or any component of the formulation such as mannitol hypersensitivity.

#### INTERACTIONS Drug

Live-virus vaccines: Defer until immune function improves.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum cholesterol, creatinine, and uric acid levels. May decrease platelet count and serum magnesium and phosphate levels. May increase or decrease blood glucose, hematocrit, hemoglobin level, and serum calcium and potassium levels.

## IV INCOMPATIBILITIES

Specific information is not available. Do not infuse other drugs through the same IV line.

## SIDE EFFECTS

#### **Frequent (> 10%)**

GI disturbances (constipation, diarrhea, dyspepsia), CNS effects (dizziness, headache, insomnia, tremor), respiratory tract infection, dysuria, acne, leg or back pain, peripheral edema, hypertension. Occasional (3%-10%)

Angina, neuropathy, abdominal distention, tachycardia, rash, hypotension, urinary disturbances (urinary frequency, genital edema, hematuria), arthralgia, hirsutism, myalgia.

## B

## SERIOUS REACTIONS

• Serious hypersensitivity, including anaphylactic shock; risk increases with repeat cycles.

· Capillary-leak syndrome.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with infection and a history of malignancy. It is unknown whether basiliximab crosses the placenta or is distributed in breast milk. Basiliximab is not recommended for breastfeeding or pregnant women; avoid pregnancy. No age-related precautions have been noted in children or in elderly patients.

Notify the physician of fever, sore throat, unusual bleeding or bruising, difficulty breathing or swallowing, itching, rapid heartbeat, rash, swelling of lower extremities, or weakness. BUN, blood glucose, serum calcium, creatinine, alkaline phosphatase, potassium, uric acid levels, vital signs, particularly BP and pulse rate, should be assessed before and during therapy. Patients previously administered basiliximab should only be reexposed with extreme caution. **Storage** 

Refrigerate unopened vials. Do not freeze. Use drug within 4 h after reconstitution (within 24 h if refrigerated).

#### Administration

Discard the solution if a precipitate forms. Reconstitute 10-mg vial with 2.5 mL, and 20-mg vial with 5 mL, of sterile water for injection. Shake gently to dissolve. If administered as injection, further dilution is not needed. Dilute 10 mg in 25 mL or 20 mg in 50 mL of 0.9% NaCl or D5W if going to give as IV infusion. Gently invert to avoid foaming. Infuse over 20-30 min.

## **BCG, Intravesical**

bee cee jee in'tra-ves-i-cal ★ TheraCys, Tice BCG ◆ OncoTICE, ImmuCyst

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antineoplastics, biological response modifiers

## MECHANISM OF ACTION

An antineoplastic that produces a local inflammatory reaction with histiocytic and leukocytic infiltration in the urinary bladder. *Therapeutic Effect:* Decreases superficial cancerous lesions in the urinary bladder.

#### AVAILABILITY

*Vials:* 50 mg (Tice BCG), 81 mg (TheraCys).

## INDICATIONS AND DOSAGES

Treatment and prevention of bladder carcinoma in situ; prophylaxis of primary or recurrent stage Ta and/or T1 papillary tumors following transurethral resection INTRAVESICAL (THERACYS) Adults, Elderly. One dose in 50 mL 0.9% NaCl once weekly for 6 wks, then repeated 3, 6, 12, 18, and 24 mo after initial treatment. Begin 7-14 days after biopsy or transurethral resection. INTRAVESICAL (TICE BCG) Adults, Elderly. One dose in 50 mL 0.9% NaCl once weekly for 6 wks; may repeat once. Thereafter, continue monthly for 6-12 mo.

## CONTRAINDICATIONS

Hypersensitivity. Compromised immune system, concurrent corticosteroid or immunosuppressive therapy, fever from infection or undetermined cause, HIV infection, active tuberculosis, or urinary tract infection.

#### INTERACTIONS Drug

Bone marrow depressants, immunosuppressants: May decrease the immune response and increase the risk of osteomyelitis and disseminated BCG infection.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

#### DIAGNOSTIC TEST EFFECTS

Falsely positive tuberculin reaction.

#### SIDE EFFECTS

#### Frequent

Dysuria, urinary frequency, hematuria, hypersensitivity reaction (manifested as malaise, fever, chills).

#### Occasional

Cystitis, urinary urgency, nausea, vomiting, anorexia, diarrhea, myalgia, arthralgia.

## SERIOUS REACTIONS

 Disseminated BCG infection is usually characterized by a fever higher than 103° F (or persistently higher than 101° F for more than 2 days), chills, and severe malaise.

#### PRECAUTIONS & CONSIDERATIONS

BCG is an infectious agent. Instillation of the drug with an actively bleeding mucosa may promote systemic BCG infection. Postpone for at least 1 wk following transurethral resection, biopsy, traumatic catheterization, or gross hematuria.

Before beginning treatment, establish renal status; obtain a urine specimen for culture and sensitivity tests to rule out a urinary tract infection; determine medications the person is taking concurrently, especially corticosteroids and immunosuppressants; and determine whether the person has compromised immune system, has a fever, or is HIV positive. Immunizations and coming in contact with those who have recently received a livevirus vaccine should be avoided during BCG treatment. Use is not recommended during pregnancy, and it is advisable to discontinue breastfeeding during treatment.

Notify the physician if blood in urine, chills, fever, frequent or painful urination, joint pain, or nausea or vomiting occurs. Renal status should be diligently monitored. Dysuria, hematuria, urinary frequency, and urinalysis should be assessed to check for urinary tract infection.

#### Storage

Store vials in refrigerator. Store reconstituted solution in refrigerator and use within 2 h.

#### Administration

Be aware that BCG contains live, attenuated mycobacteria. Treat the drug as infectious material, and use protective gear when reconstituting it. Avoid contact with the drug if immunocompromised. Prepare intravesical product in a biological safety cabinet and handle using aseptic technique. All equipment and supplies used should be disposed of as biohazards. Do not prepare parenteral drugs in areas where BCG has been prepared.

For intravesical use, reconstitute the powder immediately before administration. Discard any unused portion within 2 h of reconstitution. After adding diluent to the powder, gently swirl the solution, or repeatedly inject and withdraw the solution from the vial until the

#### 158.e4 BCG, Intravesical

solution is mixed. Avoid vigorous shaking, which could cause foaming.

Wear gloves, gown, and mask to avoid inadvertent exposure to BCG organisms while administering the solution. Patients should not drink liquids for 4 h prior to treatment and should empty their bladder prior to BCG administration.

The drug is instilled via gravity flow through a urethral catheter. During the first hour of drug administration, the patient should lie in different positions (supine, prone, and both sides) for 15 min each to allow the drug to come in contact with all parts of the bladder. The patient should try to retain the solution for 2 h after instillation to avoid spraying or splashing the infected urine. All urine should be disinfected when expelled within 6 h of drug instillation with an equal volume of 5% hypochlorite solution (undiluted household bleach) and allowed to stand 15 min before flushing.

## TOPICAL

Adults, Elderly. Apply once daily and leave in place for 12 h before removal (see Administration). Amount to be applied is calculated in cm according to ulcer size; each square cm of ulcer surface will require roughly a 0.25-cm length of gel squeezed from a 15-g tube.

## CONTRAINDICATIONS

Neoplasms at site of application, hypersensitivity to becaplermin or any component of the formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Occasional Local rash near ulcer.

## SERIOUS REACTIONS

• An increase in mortality due to secondary malignancy; risk increased in those treated with > 3 tubes.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used on wounds showing exposed joints, tendons, ligaments, or bones. It is unknown whether becaplermin crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children < 16 yr of age. There are no agerelated precautions noted in elderly patients.

#### Storage

Refrigerate gel. Do not freeze.

#### Administration

Measure gel on a clean, nonabsorbable surface. Transfer to ulcer and spread as a thin, continuous layer onto the ulcer. Cover site with saline-moistened dressing for approx. 12 h. Remove and wash any residual gel from ulcer and replace with new gauze pad moistened with 0.9% NaCl until next application. Dose requires recalculation weekly or biweekly, depending on the rate of change in the width and length of ulcer.

## Beclomethasone Dipropionate

be-kloe-meth'a-sone di-pro'pi-o-nate ★ Beconase AQ, QVAR ★ Rivanase AQ **Do not confuse Beconase AQ** with baclofen.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Corticosteroids, halogenated

## **MECHANISM OF ACTION**

An adrenocorticosteroid that prevents or controls inflammation by controlling the rate of protein synthesis, decreasing migration of polymorphonuclear leukocytes and fibroblasts, and reversing capillary permeability. *Therapeutic Effect:* Inhalation: Inhibits bronchoconstriction, produces smooth muscle relaxation, decreases mucus secretion. Intranasal: Decreases response to seasonal and perennial allergens.

## PHARMACOKINETICS

Rapidly absorbed from pulmonary, nasal, and GI tissue. Undergoes extensive first-pass metabolism in the liver. Protein binding: 87%. Primarily eliminated in feces. *Half-life*: 15 h.

## AVAILABILITY

*Oral Inhalation (QVAR):* 40 mcg per inhalation, 80 mcg/inhalation. *Nasal spray (Beconase AQ):* 42 mcg/spray.

## INDICATIONS AND DOSAGES

 Long-term control of bronchial asthma, reduces need for oral corticosteroid therapy for asthma ORAL INHALATION

Adults, Elderly, Children 12 yr and older. 40-160 mcg twice a day. Maximum: 320 mcg twice a day. Children 5-11 yr. 40 mcg twice a day. Maximum: 80 mcg twice a day.

#### Relief of seasonal or perennial rhinitis, prevention of nasal polyp recurrence after surgical removal, treatment of nonallergic rhinitis NASAL INHALATION

Adults, Children older than 12 yr. 1-2 sprays in each nostril twice a day.

*Children 6-12 yr.* 1 spray in each nostril twice a day. May increase up to 2 sprays in each nostril twice a day.

## CONTRAINDICATIONS

Hypersensitivity to beclomethasone, status asthmaticus.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Inhalation (4%-14%): Throat irritation, dry mouth, hoarseness, cough. Intranasal: Nasal burning, mucosal dryness.

#### Occasional

Inhalation (2%-3%): Localized fungal infection (thrush). Intranasal: Nasal-crusting epistaxis, sore throat, ulceration of nasal mucosa. **Rare** 

Inhalation: Transient bronchospasm, esophageal candidiasis. Intranasal: Nasal and pharyngeal candidiasis, eye pain.

## SERIOUS REACTIONS

• An acute hypersensitivity reaction, as evidenced by urticaria, angioedema, and severe bronchospasm, occurs rarely.

• A transfer from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.

• Potential adrenal insufficiency if used to replace systemic corticosteriod use.

• Signs and symptoms of hypercorticism, Cushing's syndrome, HPA supression.

• Nasal septum perforation with chronic use and improper technique.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cirrhosis, glaucoma, hypothyroidism, osteoporosis, tuberculosis, and untreated systemic infections. Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery, or nasal trauma until healing has occurred. It is unknown whether beclomethasone crosses the placenta or is distributed in breast milk. In children, prolonged treatment and high doses may decrease cortisol secretion and the short-term growth rate. No age-related precautions have been noted in elderly patients.

Those receiving beclomethasone by inhalation should maintain fastidious oral hygiene; notify the physician or nurse if sore throat or mouth develops. If using a bronchodilator inhaler concomitantly with a steroid inhaler, use the bronchodilator several minutes before using the corticosteroid to help the steroid penetrate into the bronchial tree. Those using beclomethasone intranasally should notify the physician if nasal irritation occurs or if symptoms, such as sneezing, fail to improve. Persons who are using drugs that suppress the immune system are more susceptible to infections than healthy individuals are.

#### Storage

Store respiratory inhalation and nasal spray at room temperature.

#### Administration

For inhalation, first shake the container well. Exhale completely and place the mouthpiece between the lips. Inhale and hold the breath for as long as possible before exhaling. Allow at least 1 min between inhalations. Rinse mouth after each use. Do not change the beclomethasone dosage schedule or stop taking the drug abruptly; taper dosage gradually under medical supervision.

For intranasal use, clear nasal passages as much as possible. The first time the nasal spray is used, or if it has not been used for 7 days, prime the pump by spraying away from others into the air; press down and release 6 times or until a fine mist appears. Insert the spray tip into the nostril, pointing toward the nasal passages, away from the nasal septum. Spray beclomethasone into the nostril while holding the other nostril closed, and at the same time, inhale through the nose to deliver the medication as high into the nasal passages as possible. Do not change the beclomethasone dosage schedule or stop taking the drug abruptly; taper dosage gradually under medical supervision.

## **Belimumab**

be-lim′ue-mab ★ ➡ Benlysta

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Immunomodulators, monoclonal antibodies

## **MECHANISM OF ACTION**

A monoclonal antibody that inhibits B lymphocyte stimulator (BLyS), a B-cell survival factor, and prevents BLys binding to B cell receptors. B cell survival, including autoreactive B cell survival, is inhibited. Further, the differentiation of B cells into immunoglobulin-producing plasma cells is reduced. *Therapeutic Effect:* Reduces symptoms of systemic lupus erythmatosis (SLE).

#### PHARMACOKINETICS

Minimal data. Distribution half-life is 1.75 days. Moderate and severe renal impairment had little effect on expected parameters. *Terminal half-life*: 19.4 days.

#### AVAILABILITY

*Powder for injection:* Each 5-mL vial delivers 120 mg of belimumab. Each 20-mL vial delivers 400 mg of belimumab.

## INDICATIONS AND DOSAGES

 SLE (active, autoantibodypositive patients receiving standard therapy) NOTE: Not recommended in those with severe active lupus nephritis or central nervous system lupus. Do not use with other biologics or intravenous cyclophosphamide. IV INFUSION

*Adults.* 10 mg/kg every 2 weeks for the first 3 doses; and then maintenance at 4-week intervals thereafter.

## CONTRAINDICATIONS

Previous anaphylaxis or other serious hypersensitivity with belimumab.

## **INTERACTIONS**

#### Drug

**Live Vaccines:** Should not be given for 30 days before or concurrently during therapy.

#### Other biologics; IV

cyclophosphamide: Not studied; co-use not recommended.

#### Herbal and Food

**Echinacea:** Avoid in patients taking immunologic treatments.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease WBC count (leukocytes).

## **IV INCOMPATIBILITIES**

Incompatible with dextrosecontaining solutions. Do not mix or infuse with any other drugs.

## SIDE EFFECTS

Frequent (≥ 5%)

Nausea, diarrhea, pyrexia, nasopharyngitis, bronchitis, insomnia, pain in extremity, depression, migraine, and pharyngitis. Occasional (1%-5%)

Cystitis, leukopenia, viral gastroenteritis; development of neutralizing antibodies; infusionrelated reactions.

## SERIOUS REACTIONS

• Hypersensitivity reactions can include anaphylaxis, hypotension, dyspnea, angioedema, pruritus, and urticaria and may have overlap with infusion reactions.

- · Serious infections.
- Depression may include suicidal ideation.

 In clinical trials, more deaths occurred in the belimumab treatment group than the placebo group.
 Etiologies included infection, cardiovascular disease, and suicide.

• Unstudied for potential to increase risk of secondary malignancy.

## **PRECAUTIONS & CONSIDERATIONS**

No dosage adjustment is recommended in patients with renal impairment. Use with caution in patients with hepatic disease. African-American patients may not respond as well as other patients to treatment. Serious infections have occurred during therapy with similar immunosuppressive therapies. Patients should be screened for active or recent infection before initiating therapy, and should promptly report signs of infectious illness. Closely monitor for a developing infection during therapy. Consider interrupting treatment if an infection develops. Caution is warranted with cardiovascular disease, history of sensitivity to monoclonal antibodies, preexisting depression, or mental illness. Depression and suicidality have been reported. Patients should be instructed to contact their health care provider if they experience new or worsening depression, suicidal thoughts, or other mood changes. It is unknown whether belimumab affects pregnancy or is excreted in breast milk. A pregnancy registry is available. Safety and efficacy have not been established in children. Cautious use in the elderly is necessary because

they are at increased risk for serious infection and malignancy. Patients should avoid receiving live vaccines during treatment.

Monitor blood pressure, heart rate, and other vitals during and for a time after the infusion, since hypersensitivity and infusion-related reactions are possible. Therapeutic response, as measured by standard clinical measures for SLE and disease flare frequency, should be assessed. **Storage** 

Refrigerate the unopened vials. Do not freeze. Protect from light; store in original carton until preparation of infusion. The reconstituted solution of belimumab, if not used immediately, should be stored protected from direct light and refrigerated at  $36-46^{\circ}$ F (2-8° C). Avoid exposure to heat. The infusion diluted in normal saline may be stored under refrigeration or at room temperature, but the total time from reconstitution of the vial to completion of infusion should not exceed 8 hours.

#### Administration

To prepare the infusion: First, remove from the refrigerator and allow to stand 10 to 15 minutes for the vial to reach room temperature. Reconstitute the vial; the reconstituted solution will contain a concentration of 80 mg/mL belimumab. Reconstitute the 120-mg vial with 1.5 mL sterile water for injection (SWI). Reconstitute the 400-mg vial with 4.8 mL SWI. Minimize foaming by gently directing the SWI toward the side of the vial. Gently swirl for 60 seconds. Continue to gently swirl the vial for 60 seconds every 5 min until fully dissolved; do not shake. The process may take up to 30 min. Protect from light. Once reconstitution is complete, the solution should be opalescent and colorless to pale yellow, and without particles. Small air bubbles

are expected and acceptable. Must be further diluted before IV infusion. Dilute only in 0.9% NaCl injection to a volume of 250 mL. From a 250-mL infusion bag or bottle of normal saline, withdraw and discard a volume equal to the volume of the reconstituted solution of belimumab required for the patient's dose. Then add the required dose into the infusion bag or bottle. Gently invert the bag or bottle to mix the solution. Any unused solution in the vials must be discarded. Visually inspect for particulate matter and discoloration prior to administration, whenever solution and container permit. Discard the solution if any particulate matter or discoloration is observed. Prior to IV infusion, consider premedication (e.g., acetaminophen, diphenhydramine) of the patient to help prevent infusion reactions and hypersensitivity reactions. Infuse the diluted infusion over a period of 1 hour. The infusion rate may be slowed or interrupted if the patient develops an infusion reaction. Discontinue immediately if the patient experiences a serious hypersensitivity reaction. Monitor patient for an appropriate period of time after infusion completes.

#### Belladonna Alkaloids; Phenobarbital

bell-a-don'a al'kuh-loydz Donnatal, Donnatal Extentabs, Medi-Tal, Antispasmodic Elixir

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Anticholinergic, antispasmodic, gastrointestinal

Belladonna Alkaloids; Phenobarbital (Generic Name)

## MECHANISM OF ACTION

Competitive inhibitors of the muscarinic actions of acetylcholine act at receptors located in exocrine glands, smooth and cardiac muscle, and intramural neurons. Composed of 3 main constituents: atropine, scopolamine, and hyoscyamine. Scopolamine exerts greater effects on the CNS, eye, and secretory glands than the constituents atropine and hyoscyamine. Atropine exerts more activity on the heart, intestine, and bronchial muscle and exhibits a more prolonged duration of action compared with scopolamine. Hyoscyamine exerts similar actions to atropine but has more potent central and peripheral nervous system effects. Therapeutic Effect: Peripheral anticholinergic and antispasmodic action, mild sedation.

## PHARMACOKINETICS

None known.

## AVAILABILITY

#### **Combination products:**

*Tablets:* Hyoscyamine sulfate 0.1037 mg, atropine sulfate 0.0194 mg, scopolamine hydrobromide 0.0065 mg, and phenobarbital 16.2 mg (Donnatal). *Tablets, Extended Release:* Hyoscyamine sulfate 0.3111 mg, atropine sulfate 0.0582 mg, scopolamine hydrobromide 0.0195 mg, and phenobarbital 48.6 mg (Donnatal Extentabs).

*Elixir:* Hyoscyamine sulfate 0.1037 mg, atropine sulfate 0.0194 mg, scopolamine hydrobromide 0.0065 mg, and phenobarbital 16.2 mg per 5 mL (Antispasmodic, Donnatal).

## INDICATIONS AND DOSAGES Irritable bowel syndrome, acute enterocolitis

NOTE: FDA has not evaluated for safety and efficacy; it is "possibly

effective." No children's dose is presented here, despite manufacturer labeling, due to lack of FDA approval. PO (IMMEDIATE-RELEASE DOSAGE FORMS) *Adults.* 1-2 tablets 3-4 times daily or 1-2 tsp of elixir 3-4 times daily according to conditions and severity of symptoms. PO (EXTENDED-RELEASE TABLETS) *Adults.* 1 tablet every 12 h; may give every 8 h if needed.

#### CONTRAINDICATIONS

Narrow-angle glaucoma, obstructive uropathy, obstructive disease of tract, paralytic ileus, intestinal atony of the elderly or debilitated patient, tachycardia, acute myocardial ischemia, unstable cardiovascular status in acute hemorrhage, severe ulcerative colitis, especially if complicated by toxic megacolon, myasthenia gravis, hiatal hernia associated with reflux esophagitis, hypersensitivity to any component of the formulation, acute intermittent porphyria.

#### INTERACTIONS Drug

NOTE: Phenobarbital increases the metabolism of many medications, including hormonal contraceptives, antiretroviral medications for HIV, theophylline, warfarin, and other narrow-therapeutic index drugs. **Oral medications:** Belladonna decreases gastric emptying time therefore affecting absorption of orally administered agents. Anticholinergic drugs: May enhance anticholinergic effect. Tricyclic antidepressants: May enhance anticholinergic effect. **Cisapride:** Atropine may decrease effects of cisapride.

Antiarrhythmics: May result in additive antivagal effects on atrioventricular nodal conduction. Alcohol: May result in additive CNS depression.

Cholinesterase inhibitors for dementia: Belladonna alkaloids may counteract the actions of these drugs. Herbal

Anticholinergic herbs: May enhance anticholinergic effect. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Dry mouth, urinary retention, flushing, pupillary dilation, constipation, confusion, redness of the skin, flushing, dry skin, allergic contact dermatitis, headache, excitement, agitation, dizziness, light-headedness, drowsiness, unsteadiness, confusion, slurred speech, sedation, hyperreflexia, convulsions, vertigo, coma, mydriasis, photophobia, blurred vision, dilation of pupils.

## Rare

Hallucinations, acute psychosis, Stevens-Johnson syndrome, photosensitivity.

## SERIOUS REACTIONS

 Signs and symptoms of overdose include headache, nausea, vomiting, blurred vision, dilated pupils, hot and dry skin, dizziness, dryness of the mouth, difficulty in swallowing, and CNS stimulation, coma.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with ulcerative colitis or intestinal disease, coronary artery disease, dehydration, diarrhea caused by poisoning, Down syndrome, acute dysentery, glaucoma, hepatic and renal function impairment, hiatal hernia, prostatic hyperplasia, urinary retention, asthma, COPD, and brain damage. Belladonna alkaloids cross the placenta and are distributed into breast milk. Consider additional or alternative methods of contraception or higherdose hormonal contraceptives since phenobarbital may interfere with hormonal contraceptive efficacy. Safety and efficacy have not been established in children vounger than 6 yr. Infants and young children may be more susceptible to adverse effects of belladonna alkaloids. Elderly patients may be more susceptible to the anticholinergic effects; avoid use in this population.

Constipation, difficulty urinating, decreased sweating, drowsiness, dry mouth, increased heart rate, headache, orthostatic hypotension may occur. Change positions slowly to avoid lightheadedness. Avoid alcohol, CNS depressants, and tasks that require mental alertness.

#### Storage

Store at room temperature. Administration

Dose should be adjusted to the needs of the individual to assume symptomatic control with minimum adverse effects. Do not crush, cut, or chew extendedrelease tablets.

## Belladonna and Opium

bell-a-don'a **Do not confuse B&O (an abbreviation for belladonna and opium) with Beano.** 

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Analgesics, narcotic, anticholinergics

#### **MECHANISM OF ACTION**

Anticholinergic alkaloids that inhibit the action of acetylcholine at postganglionic (muscarinic) receptor sites. Opium contains more than 20 alkaloids, such as morphine (10%), narcotine (6%), papaverine (1%), and codeine (0.5%). Morphine depresses cerebral cortex, hypothalamus, and medullary centers. *Therapeutic Effect:* Decreases digestive secretions, increases GI muscle tone, reduces GI force, reduces ureteral spasm, and alters pain perception and emotional response to pain.

## PHARMACOKINETICS

Onset of action occurs within 30 min. Absorption is dependent on body hydration. Oxidative dealkylation produces active compounds that impart analgesia. Morphine is conjugated in the liver to form the 3-glucuronide, which passes into the bile and is reabsorbed and excreted in the urine.

## AVAILABILITY

*Suppository:* 16.2 mg belladonna extract/30 mg opium, 16.2 mg belladonna extract/60 mg opium.

## INDICATIONS AND DOSAGES

 Pain associated with ureteral spasm not responsive to conventional analgesics RECTAL

Adults, Elderly. 1 suppository 1-2 times/day. Maximum: 4 doses/day.

## CONTRAINDICATIONS

Glaucoma, severe renal or hepatic disease, bronchial asthma, respiratory depression, convulsive disorders, acute alcoholism, premature labor, hypersensitivity to belladonna or opium or product components.

#### INTERACTIONS Drug

Alcohol, CNS depressants: May increase CNS or respiratory depression, hypotension. Anticholinergics: May increase the effects of belladonna and opium. Phenothiazines: May decrease the antipsychotic effects of these drugs. Cholinesterase inhibitors for dementia: Belladonna alkaloids may counteract the actions of these drugs.

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum SGOT (AST) and SGPT (ALT) levels.

## SIDE EFFECTS

#### Frequent

Dry mouth, nose, skin, and throat; decreased sweating; constipation; irritation at site of administration; drowsiness; urinary retention; palpitation; dizziness.

#### Occasional

Blurred vision, bloated feeling, drowsiness, headache, intolerance to light, nervousness, and flushing.

## Rare

Faintness, pruritus, urticaria.

## SERIOUS REACTIONS

 Respiratory depression, increased intraocular pain, loss of memory, orthostatic hypotension, tachycardia, and ventricular fibrillation rarely occur.

• Tolerance to the drug's analgesic effect and physical dependence may occur with repeated use.

#### **PRECAUTIONS & CONSIDERATIONS**

True addiction may result from opium usage. Extreme caution should be used with acute alcoholism, anoxia, CNS depression, hypercapnia, respiratory depression or dysfunction, seizures, shock, and untreated myxedema. Caution is also warranted with acute abdominal conditions, Addison's disease, chronic obstructive pulmonary disease (COPD), hypothyroidism, impaired liver function, increased intracranial pressure, prostatic hypertrophy, and urethral stricture. It is unknown whether belladonna and opium cross the placenta or are distributed in breast milk. Children may be more susceptible to respiratory depression; not recommended for use in children < 12 yr of age. Elderly patients may also be more susceptible to respiratory depression, and the drug may cause paradoxical excitement. Age-related prostatic hypertrophy or obstruction and renal impairment may increase the risk of urinary retention, and dosage adjustment is recommended for elderly patients. Alcohol, tasks that require mental alertness and motor skills, hot baths, and saunas should be avoided. Storage

# Store at room temperature. Do not refrigerate and protect from

not refrigerate and protect from moisture.

## Administration

Remove wrapper. Moisten finger and suppository before rectal insertion.

## **Benazepril**

be-naze'a-pril Lotensin Do not confuse benazepril with Benadryl, or Lotensin with Loniten or lovastatin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensive agents, angiotensin-converting enzyme inhibitors

## **MECHANISM OF ACTION**

An ACE inhibitor that decreases the rate of conversion of angiotensin I to angiotensin II, a potent vasoconstrictor. Reduces peripheral arterial resistance. *Therapeutic Effect:* Lowers BP.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	2-4 h	24 h

Partially absorbed from the GI tract. Protein binding: 97%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Minimal removal by hemodialysis. *Half-life:* 35 min; metabolite 10-11 h.

## AVAILABILITY

Tablets: 5 mg, 10 mg, 20 mg, 40 mg.

#### INDICATIONS AND DOSAGES • Hypertension (monotherapy) PO

Benazepril (Generic Name)

*Adults*. Initially, 10 mg/day. Maintenance: 20-40 mg/day as single dose or in 2 divided doses. Maximum: 80 mg/day. *Elderly*. Initially, 5-10 mg/day. Range: 20-40 mg/day. *Children 6 yr of age and older*. Initially 0.2 mg/kg once daily (maximum: initially 5 mg/day). Maintenance: 0.1-0.6 mg/kg once daily. Maximum: 0.6 mg/kg (40 mg)/day.

# Hypertension (combination therapy)

#### PO

*Adults*. May discontinue diuretic 2-3 days before initiating benazepril, then dose as noted above. Diuretic can be reinitiated if needed. If unable to discontinue diuretic, begin benazepril at reduced dose of 5 mg/day.

#### Dosage in renal impairment

For adult patients with creatinine clearance < 30 mL/min, initially, 5 mg/day titrated up to maximum of 40 mg/day. Not recommended in children with creatinine clearance < 30 mL/min.

## **OFF-LABEL USES**

Treatment of congestive heart failure, diabetic nephropathy.

## CONTRAINDICATIONS

History of angioedema or allergy from previous treatment with ACE inhibitors. Also contraindicated in those experiencing angioedema in past from other causes (e.g., hereditary angioedema).

## INTERACTIONS

#### Drug

#### Alcohol, antihypertensives,

**diuretics:** May increase the effects of benazepril.

**Lithium:** May increase the lithium blood concentration and risk of lithium toxicity.

**NSAIDs:** May decrease the effects of benazepril.

**Potassium-sparing diuretics, potassium supplements:** May cause hyperkalemia. Avoid when possible.

**Drospirenone-ethinyl estradiol:** May cause hyperkalemia; monitor potassium carefully for the first month in which OC is instituted. **Herbal** 

None known.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer.

## SIDE EFFECTS

Frequent (3%-6%)

Cough, headache, dizziness. Occasional (1-2%)

Fatigue, somnolence or drowsiness, nausea, hyperkalemia.

Rare (<1%)

Rash, fever, myalgia, diarrhea, loss of taste.

## SERIOUS REACTIONS

• Excessive hypotension ("first-dose syncope") may occur in patients with CHF and in those who are severely salt or volume depleted.

• Angioedema (swelling of the face and lips) and hyperkalemia occur rarely.

• Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function. • Nephrotic syndrome may be noted in patients with history of renal disease.

Hyperkalemia.

## PRECAUTIONS & CONSIDERATIONS

Patients with renal artery stenosis should not receive ACE inhibitors because renal insufficiency can result. Caution is warranted with cerebrovascular and coronary insufficiency, diabetes mellitus, hypovolemia, renal impairment, and sodium depletion as well as persons on dialysis and in those receiving diuretics. Benazepril crosses the placenta, and it is unknown whether it is distributed in breast milk. Benazepril may cause fetal or neonatal morbidity or mortality with exposure during the second or third trimesters. Discontinue use as soon as possible once pregnancy is detected. Safety and efficacy of benazepril have not been established in children < 6 yr of age. Elderly patients may be more sensitive to the hypotensive effects of benazepril.

Dizziness and orthostatic hypotension may occur. Rise slowly from lying to sitting position, and permit legs to dangle from the bed momentarily before standing to reduce the hypotensive effect of benazepril. Full therapeutic effect of benazepril may take 2-4 wks. BP should be obtained immediately before giving each benazepril dose, in addition to regular monitoring. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the person in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning benazepril therapy, then every 2 wks for the next 3 mo, and

periodically thereafter in patients with autoimmune disease or renal impairment and in those who are taking drugs that affect immune response or leukocyte count. **Storage** 

May store tablets at room temperature. Compounded oral suspension is stable for up to 30 days under refrigeration.

#### Administration

May take without regard to food. Do not skip doses. For those with swallowing diffculty, an oral suspension may be prepared by a pharmacist, in accordance with manufacturer recommendations. Shake well before each use and measure dose with a calibrated oral syringe or spoon.

#### **Bentoquatam**

ben'toe-kwa-tam

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: NR

**Classification:** Rhus dermatitis protectant

#### MECHANISM OF ACTION

An organoclay substance that absorbs and binds to urushiol, the active principle in poison oak, ivy, and sumac. *Therapeutic Effect:* Blocks urushiol skin contact and absorption.

#### PHARMACOKINETICS

None reported.

#### AVAILABILITY

Lotion: 5% (IvyBlock).

## **Bendamustine**

ben-da-muss'teen ★ ♥ Treanda

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastic, alkylating agent, nitrogen mustard derivative

## **MECHANISM OF ACTION**

An alkylating and antimetabolite agent that causes DNA strand breaks, resulting in apoptosis. Also inhibits several mitotic checkpoints, causing a necrotic form of cell death morphologically distinct from the alkylating actions. Cell cycle–phase nonspecific. *Therapeutic Effect:* Results in cancer cell death.

## PHARMACOKINETICS

Drug is 95% protein-bound. Metabolism occurs primarily by hydrolysis via CYP1A2 isoenzyme to slightly active metabolites,  $\gamma$ -hydroxy bendamustine (M3) and N-desmethyl-bendamustine (M4). The parent compound is primarily responsible for cytotoxicity. Approximately 90% of any given dose is excreted in the feces. *Half-life:* 40 min after single dose (active metabolites: M3 half-life 3 h, M4 half-life 30 min).

## AVAILABILITY

Powder for Injection: 25 mg, 100 mg.

## INDICATIONS AND DOSAGES

NOTE: Dosages and regimens may depend on type of cancer and use in combination with other agents. See prescribing information.

 Chronic lymphocytic leukemia (CLL)

## IV INFUSION

*Adults, Elderly.* 100 mg/m<sup>2</sup> IV over 30 min on days 1 and 2 of a 28-day cycle, up to 6 cycles. Hematologic or nonhematologic toxicities may require a reduction of dose to 25-50 mg/m<sup>2</sup>, or a delay in treatment.

## Indolent B-cell non-Hodgkin lymphoma

## IV INFUSION

Adults, Elderly. 120 mg/m<sup>2</sup> IV over 60 min on days 1 and 2 of a 21-day cycle, up to 8 cycles. Hematologic or nonhematologic toxicities may require a reduction of dose to 60-90 mg/m<sup>2</sup> or a delay in treatment.

#### Moderate to severe hepatic impairment or renal impairment (CrCl < 40 mL/min)</li>

Use not recommended due to lack of clinical data.

## IV INCOMPATIBILITIES

Do not mix with or infuse with other medications.

## CONTRAINDICATIONS

Hypersensitivity to the drug or to mannitol.

## INTERACTIONS

#### Drug

Allopurinol: May increase risk of serious skin reactions; monitor closely. CYP1A2 inhibitors (e.g.,

fluvoxamine, ciprofloxacin): May increase concentrations and toxic effects of bendamustine.

CYP1A2 inducers (e.g.,

omeprazole, cigarette smoking): May alter therapeutic response to bendamustine by reducing bendamustine concentrations. Digoxin: May reduce digoxin concentrations.

#### Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Increases in bilirubin, AST, ALT, uric acid; decreases in leukocyte, platelet, and RBC counts.

## SIDE EFFECTS

#### **Frequent (> 30%)**

Nausea and vomiting, myelosuppression, pyrexia, diarrhea, fatigue or asthenia.

#### Occasional

Esophagitis, stomatitis, anorexia, dysphagia, weight loss, male infertility and azospermia, pneumonia, hypokalemia, dehydration, infusionrelated reactions.

#### Rare

Thrombophlebitis.

#### SERIOUS REACTIONS

• Hematologic toxicity due to myelosuppression occurs frequently and includes thrombocytopenia and neutropenia. Neutropenia may lead to infection.

• Hyperbilirubinemia occurs frequently.

 Infusion-related reactions are common and may include anaphylactoid events; premedication with antihistamines, antipyretics, and corticosteroids may help attenuate.

• Hyperuricemia and tumor lysis syndrome.

• Skin reactions may be serious, and extravasation may lead to hospitalization for management.

#### **PRECAUTIONS & CONSIDERATIONS**

Administer with caution to patients with depressed platelet, leukocyte, or erythrocyte counts or with renal or hepatic impairment. Women of childbearing potential should be advised to avoid pregnancy, as the drug may cause fetal harm. Not recommended for use in breastfeeding. Safety and efficacy in children have not been established.

Nausea and vomiting occur frequently; prophylactic antiemetics are advised. Observe patient closely for signs of infusion-related reactions, skin reactions, immunosuppression, or infection. Advise patients to report shortness of breath, significant fatigue, bleeding, fever, or other signs of infection. Because patients may experience significant fatigue, they should use care in driving or other potentially hazardous tasks. Premedication may be necessary in subsequent cycles if infusion reactions occur. Follow good oral hygiene and be alert for mouth ulceration. Doses will be reduced, withheld, or delayed if significant hematologic or nonhematologic toxicities occur. Storage

Store powder for injection at room temperature protected from light. Once reconstituted, the vial contents should be further diluted within 30 min. Infusion solutions may be stored at room temperature for up to 3 h. If refrigerated, the infusion solution must be used within 24 h. Administration

#### Administration

CAUTION: Observe and exercise usual precautions for handling, preparing, and administering cytotoxic drugs.

To prepare injectable: dilute 25-mg vial with 5 mL of sterile water for injection (SWI) or 100-mg vial with 20 mL of SWI. Shake well; vial concentration will be 5 mg/ mL. Draw up the required dose and transfer to 500 mL of either 0.9% NaCl infusion or 500 mL of 2.5% dextrose/0.45% NaCl infusion. The final concentration should be within 0.2 mg/mL and 0.6 mg/mL. Thoroughly mix bag contents. Infuse IV over 30 or 60 min, dependent on protocol recommendations (see dosage). Precautions should be taken to avoid extravasation.

#### INDICATIONS AND DOSAGES > Prophylaxis of contact dermatitis caused by poison oak, ivy, or sumac

#### TOPICAL

*Adults, Elderly, Children 6 yr and older.* Apply thin film over skin at least 15 min before potential exposure. Reapply q4hr or sooner if needed.

## CONTRAINDICATIONS

Hypersensitivity to bentoquatam or any of its components such as methylparabens.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Occasional Erythema.

## SERIOUS REACTIONS

· None reported.

## PRECAUTIONS & CONSIDERATIONS

Caution is necessary in patients with a history of allergic-type responses to medications, especially topical formulations, open wounds, psoriatic lesions, or other cutaneous conditions. The use of bentoquatam has not been studied in pregnancy. There are no age-related precautions noted in children or in elderly patients.

#### Storage

Store at room temperature.

#### Administration

Bentoquatam is for external use only. Bentoquatam is a protectant, not a treatment, for poison oak, ivy, or sumac. Shake well before use. Apply 15 min before exposure. Do not apply after exposure. Reapply every 4 h or sooner if needed to maintain protection.

## Benzocaine

ben'zoe-kane Americaine Anesthetic Lubricant, Americaine Otic, Anbesol, Anbesol Baby Gel, Anbesol Maximum Strength, Babee Teething, Benzodent, Cepacol, Cetacaine, Chiggerex, Chiggertox, Cylex, Dermoplast, Detaine, Foille, Foille Medicated First Aid, Foille Plus, HDA Toothache, Hurricane, Lanacane, Mycinettes, Omedia, Orabase-B, Orajel, Orajel Baby, Orajel Baby Nighttime, Oraiel Maximum Strength, Orasol, Oticaine, Otocain, Retre-Gel, Solarcaine, Trocaine, Zilactin, Zilactin-B, Zilactin Baby

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Topical ester local anesthetic

## **MECHANISM OF ACTION**

A local anesthetic that blocks nerve conduction in the autonomic, sensory, and motor nerve fibers. Competes with calcium ions for membrane binding. Reduces permeability of resting nerves to potassium and sodium ions. *Therapeutic Effect:* Produces local analgesic effect.

## PHARMACOKINETICS

Poorly absorbed by topical administration. Well absorbed from mucous membranes and
traumatized skin. Metabolized in liver and by hydrolysis with cholinesterase. Minimal excretion in urine.

# AVAILABILITY

Cream: 5%, 20% (Lanacane). Lozenge: 10 mg (Cepacol, Trocaine), 15 mg (Cyclex, Mycinettes). Oral Aerosol: 14% (Cetacaine), 20% (Hurricane). Oral Gel: 6.3% (Anbesol), 6.5% (HDA Toothache), 7.5% (Anbesol Baby, Detaine, Orajel Baby), 10% (Orajel, Orajel Baby Nighttime, Zilactin-B, Zilactin Baby), 20% (Anbesol Maximum Strength, Hurricane). Oral Liquid: 6.3% (Anbesol), 7.5% (Orajel Baby), 10% (Orajel), 20% (Anbesol Maximum Strength, Hurricane). Oral Lotion: 2.5% (Babee Teething). Oral Ointment: 20% (Benzodent). Otic Solution: 20% (Americaine Otic, Omedia, Oticaine, Otocain). Paste: 20% (Orabase-B). Topical Aerosol: 5% (Foille, Foille Plus), 20% (Dermoplast,

Solarcaine).

*Topical Gel:* 5% (Retre-Gel), 20% (Americaine Anesthetic Lubricant). *Topical Liquid:* 2% (Chiggertox). *Topical Ointment:* 2% (Chiggerex), 5% (Foille Medicated First Aid).

# INDICATIONS AND DOSAGES

# Canker sores

TOPICAL

*Adults, Elderly, Children older than 2 yr.* Apply gel, liquid, or ointment to affected area. Maximum: 4 times/day.

#### Denture irritation TOPICAL

*Adults, Elderly.* Apply a thin layer of gel to affected area up to 4 times/day or until pain is relieved.

• General lubrication TOPICAL *Adults, Elderly, Children older than* 2 yr. Apply gel to exterior of tube or instrument before use.

### • Otitis externa, otitis media OTIC

Adults, Elderly, Children older than 1 yr: Instill 4-5 drops into external ear canal of affected ears. Repeat q1-2h as needed.

 Pain and itching associated with sunburn, insect bites, minor cuts, scrapes, minor burns, minor skin irritations

TOPICAL

Adults, Elderly, Children older than 2 yr: Apply to affected area 3-4 times/day. > Pharyngitis

#### Pharyi PO

*Adults, Elderly.* 1 lozenge q2hr. Maximum: 8 lozenges/day.

#### Toothache/teething pain TOPICAL

Adults, Elderly, Children older than 2 yr. Apply gel, liquid, or ointment to affected areas. Maximum: 4 times/ day. Do not use for more than 7 days.

# Anesthesia

TOPICAL *Adults, Elderly.* Apply aerosol, gel, ointment, liquid q4-12h as needed.

# CONTRAINDICATIONS

Hypersensitivity to benzocaine or ester-type local anesthetics, perforated tympanic membrane or ear discharge (otic preparations).

# INTERACTIONS

# Drug

**Hyaluronidase:** May increase the incidence of systemic reaction to benzocaine, when used at same sites.

# Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Occasional

Burning, stinging, angioedema, contact dermatitis, urticaria, taste disorders.

# SERIOUS REACTIONS

· Methemoglobinemia occurs rarely, most cases are in infants and young children.

# **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with children younger than 2 yr and patients with inflamed skin or open wounds. It is unknown whether benzocaine crosses the placenta or is distributed in breast milk. Safety and efficacy of this drug have not been established in children younger than 2 yr for topical preparations and younger than 1 yr for otic solutions. There are no age-related precautions for elderly patients. Avoid contact with eyes.

An allergic reaction with blue color around mouth, fingers, or toes; fast breathing; redness; pain or swelling; or unusual tiredness or weakness should be reported immediately (may signal methemoglobinemia).

#### Storage

Store at room temperature. Topical sprays are flammable and contents are under pressure. Do not use near fire or flame or expose to high heat. Administration

Oral or dental use: Do not eat 1 h before topical oral administration. Rinse mouth well before reinserting dentures. Do not use for more than 1 wk.

Topical dermal use: Follow manufacturer's product-specific directions for use. Clean area before applying topical benzocaine. For external use only. If using aerosol, hold can 6-12 inches away from affected area. If applying to face,

spray in palm of hand and then apply to affected area. Do not spray for longer than 2 seconds.

# Benzonatate

ben-zoe'na-tate Tessalon Perles, Zonatuss

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antitussive, nonnarcotic, ester, local anesthetic

## MECHANISM OF ACTION

A nonnarcotic antitussive that anesthetizes stretch receptors in respiratory passages, lungs, and pleura. Therapeutic Effect: Reduces cough.

#### PHARMACOKINETICS

PO onset 15-20 min: duration 3-8 h: metabolized by liver, excreted in urine.

#### **AVAILABILITY**

Capsules: 100 mg, 200 mg.

#### INDICATIONS AND DOSAGES Antitussive PO

Adults, Elderly, Children older than 10 yr. 100 mg 3 times/day only if needed, may give up to q4h (maximum 600 mg/day).

#### **OFF-LABEL USES**

Intractable hiccups.

# CONTRAINDICATIONS

Hypersensitivity to benzonatate or other ester local anesthetics

# INTERACTIONS

#### Drug

CNS depressants: May increase the effects of benzonatate.

Benzonatate (Generic Name)

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Occasional

Mild somnolence, mild dizziness, constipation, GI upset, skin eruptions, nasal congestion.

## SERIOUS REACTIONS

• A paradoxical reaction, including restlessness, insomnia, euphoria, nervousness, and tremor, has been noted, especially in overdose.

• Severe hypersensitivity (rare).

• Bizarre behavior, confusion, visual hallucinations (rare) more likely when given with other CNS medications.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with a productive cough. Dizziness and drowsiness are common side effects. Safety and efficacy not established in children under 10 yr. Serious overdose may occur in children from accidental ingection; death may occur in 1 hour. Unknown if the drug may cause fetal harm or if excreted in breast milk; caution advised. Avoid tasks that require mental alertness or motor skills until response to the drug has been established. Fluid intake and environmental humidity should be increased to lower the viscosity of secretions.

#### Storage

Store at room temperature. Protect from moisture and light; keep tightly closed.

### Administration

Take benzonatate without regard to food. Swallow the capsules whole; chewing them or dissolving them in the mouth may produce temporary local anesthesia or choking, which may compromise the airway.

# **Benzoyl Peroxide**

ben'zoe-ill per-ox'ide Benzac, Benzac, Benzac, Benzac AC, Benzac W, Benzagel, BenzeFoam, Benziq, Brevoxyl, Clearasil, Clearplex, Clinac BPO, Del-Aqua, Desquam-E, Desquam-X, Inova, Lavoclen, NeoBenz, PanOxyl, Peroderm, Triaz, Zaclir, Zoderm

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

**Classification:** Antiacne agent, topical; keratolytic, topical

# **MECHANISM OF ACTION**

A keratolytic agent that releases free-radical oxygen, which oxidizes bacterial proteins in the sebaceous follicles, decreasing the number of anaerobic bacteria and decreasing irritating-type free fatty acids. *Therapeutic Effect*: Bactericidal action against *Propionibacterium acnes* and *Staphylococcus epidermidis*.

#### PHARMACOKINETICS

Minimal absorption through skin. Gel is more penetrating than cream. Metabolized to benzoic acid in skin. Excreted in urine as benzoate.

#### AVAILABILITY

Cream, Topical: 2.5%, 3.5%, 5%, 5.5%, 8.5%, 10%. Gel, Topical: 2.5%, 4%, 4.5%, 5%, 6%, 6.5%, 7%, 8%, 8.5%, 9%, 10%. Liquid, Topical: 2.5%, 3%, 4%, 5%, 6%, 8%, 9%, 10%. Lotion, Topical: 3%, 4%, 5%, 5.5%, 6%, 8%, 10%.

# INDICATIONS AND DOSAGES Acne

#### TOPICAL

*Adults*. Apply 2.5%-10% concentration 1-2 times/day; cleansers used 1-2 times/day. If applied just once a day, then bedtime application after gentle cleansing is recommended. Some products can be used up to 3 times/day if needed; follow label directions.

## **OFF-LABEL USES**

Dermal ulcers, seborrheic dermatitis, surgical wounds, tinea pedis, tinea versicolor.

# CONTRAINDICATIONS

Hypersensitivity to benzoyl peroxide or any component of the formulation.

# INTERACTIONS

#### Drug

Sunscreens containing PABA: May cause skin to change color when both agents are used concomitantly. Retinoids: May increase skin

irritation.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Irritation, dryness, burning, peeling, stinging, contact dermatitis, bleaching of hair.

# SERIOUS REACTIONS

• Hypersensitivity reactions have been reported with benzoyl peroxide use.

# **PRECAUTIONS & CONSIDERATIONS**

Caution should be used on skin because benzoyl peroxide may cause contact dermatitis, hair bleaching, and seborrhea. Caution should also be used around the eyes, lips, mucous membranes, and highly inflamed skin. Sun exposure may increase skin irritation. Be aware that cross-sensitization may occur with benzoic acid derivatives such as cinnamon and other topical anesthetics. It is unknown whether benzoyl peroxide crosses the placenta or is distributed in breast milk. Safety and efficacy of benzovl peroxide have not been established in children younger than 12 yr. There are no age-related precautions noted for elderly patients.

Mild stinging and redness may occur. Be aware that benzoyl peroxide may bleach hair and fabric. Storage

Store at room temperature. Administration

For topical use only. If excessive dryness or peeling occurs, decrease concentration of product used or frequency of application. Avoid eyes and mucous membranes. Follow directions for specific product type.

# Benztropine

benz'troe-peen ★ Cogentin ▲ Apo-Benztropine Do not confuse benztropine with bromocriptine.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Anticholinergic, antidyskinetic

Benztropine (Generic Name)

# **MECHANISM OF ACTION**

An antiparkinsonian agent that selectively blocks central cholinergic receptors, helping to balance cholinergic and dopaminergic activity. *Therapeutic Effect:* Reduces the incidence and severity of akinesia, rigidity, and tremor.

# PHARMACOKINETICS

IM/IV: Onset 15 min, duration 6-10 h. PO: onset 1 h, duration 6-10 h.

# AVAILABILITY

*Tablets:* 0.5 mg, 1 mg, 2 mg. *Injection:* 1 mg/mL.

# INDICATIONS AND DOSAGES

Parkinsonism

#### PO

*Adults.* 0.5-6 mg/day as a single dose or in 2 divided doses. Titrate by 0.5 mg at 5- to 6-day intervals. *Elderly.* Initially, 0.5 mg once or twice a day. Titrate by 0.5 mg at 5- to 6-day intervals. Maximum: 4 mg/day.

#### Drug-induced extrapyramidal symptoms

### PO, IM

*Adults.* 1-4 mg once or twice a day. *Children older than 3 yr.* 0.02-0.05 mg/kg/dose once or twice a day.

#### Acute dystonic reactions IM, IV (IM PREFERRED)

*Adults.* Initially, 1-2 mg; then 1-2 mg PO twice a day to prevent recurrence.

# IV INCOMPATIBILITIES

Diazepam, furosemide, phenytoin.

# CONTRAINDICATIONS

Angle-closure glaucoma, benign prostatic hyperplasia, children younger than 3 yr, GI obstruction, intestinal atony, megacolon, myasthenia gravis, paralytic ileus, severe ulcerative colitis.

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase sedation. Amantadine, anticholinergics, MAOIs: May increase the effects of benztropine. Antacids, antidiarrheals: May

decrease the absorption and effects of benztropine.

**Phenothiazines, tricyclic antidepressants:** May increase the risk of heat intolerance, hyperthermia, and heatstroke.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Somnolence, dry mouth, blurred vision, constipation, decreased sweating or urination, GI upset, photosensitivity.

#### Occasional

Headache, memory loss, muscle cramps, anxiety, peripheral paresthesia, orthostatic hypotension, abdominal cramps, tachycardia. **Rare** 

Rash, confusion, eye pain.

# SERIOUS REACTIONS

• Overdose may produce severe anticholinergic effects, such as unsteadiness, somnolence, tachycardia, dyspnea, skin flushing, and severe dryness of the mouth, nose, or throat.

 Severe paradoxical reactions, marked by hallucinations, tremor, seizures, and toxic psychosis, may occur.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted with arrhythmias, heart disease, hypertension, hepatic or renal impairment, obstructive diseases of the GI or genitourinary tracts, urine retention, benign prostatic hyperplasia, tachycardia, and treated open-angle glaucoma. Caution is advised in hot weather; benztropine may increase risk of hyperthermia and heatstroke. Elderly (older than 60 yr) patients are more likely to develop agitation, disorientation, confusion, and psychotic-like symptoms.

Dizziness, drowsiness, and dry mouth are expected responses to the drug. Alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician of agitation, headache, somnolence, or confusion.

#### Storage

Store at room temperature. Administration

*Oral:* May give without regard to meals. Initial doses usually given at bedtime or dose may be divided throughout the day to treat tremors. Improvement usually occurs in 1-2 days.

# **Benzyl Alcohol**

ben′zil al′co-hol ★ ₩ Ulesfia

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

# Classification:

Anti-infectives, topical, pediculicides

#### MECHANISM OF ACTION

Inhibits lice from closing their respiratory spiracles, obstructing the spiracles and causing the lice to asphyxiate. *Therapeutic Effect:* Pediculocidal; product is NOT ovocidal.

#### PHARMACOKINETICS

Minimal absorption after topical application. Slight amounts detected in plasma in infants and children after 3 times the normal exposure period.

#### AVAILABILITY

Lotion: 5% (Ulesfia).

# INDICATIONS AND DOSAGES Head lice

#### TOPICAL

Adults, Children 6 mo and older. Apply sufficient lotion to dry hair and leave on for 10 min before rinsing off. The amount of lotion needed for each application is dependent on the length of the hair; the manufacturer provides guidelines based on hair length. Repeat application in 7 days after initial treatment.

# CONTRAINDICATIONS

None specifically noted by manufacturer. Recommended not to use in infants younger than 6 months; benzyl alcohol may cause a "gasping syndrome" in neonates. Hypersensitivity to any component of the formulation.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS Occasional

Skin irritation, eye stinging or irritation, contact sensitization (itching, redness), hypoesthesia at application site, pruritus, erythema.

# B

## Rare (< 1%)

Application site dryness, paresthesia, dermatitis, dandruff, skin exfoliation, rash.

# SERIOUS REACTIONS

· None reported.

# PRECAUTIONS & CONSIDERATIONS

No age-related precautions have been noted for suspension or topical use in children over 6 mo of age. Not recommended for use in children under 6 mo, especially in neonates, who are susceptible to benzyl alcohol toxicity. The drug has not been studied in elderly patients older than 60 yr.

Keep out of reach of children; children receiving treatment should be in direct supervision of an adult during each treatment application period. Use care to avoid eye exposure during use. If the eyes come in contact with the lotion, flush the eyes immediately for several minutes with water. If irritation persists, contact physician. Watch for signs of contact/allergy during applications. Because lice are contagious, use caution to avoid infecting others. To help prevent the spread of lice from one patient to another: Avoid head-to-head contact at school (e.g., playground, in physical education or sports activities, and any play with other children). Avoid sleepovers. Do not share combs, brushes, hats, towels, pillows, bedding, helmets, or other hair-related personal items with anyone else, whether they have lice or not. After finishing treatment, check everyone in the family for lice after 1 wk. Machine wash any bedding and clothing used by anyone having lice or thought to have been exposed to lice. Machine wash at high temperatures  $(150^{\circ} \text{ F})$ and tumble in a hot dryer for 20 min.

#### Storage

Store in a dry place at room temperature; do not freeze. Administration

For external use only. Shake well before use. Caregivers may wish to wear gloves for application. Patient should cover face and eyes with a towel and keep eyes tightly closed during application. Apply to dry hair using enough lotion to completely saturate the scalp and hair and leave on for 10 min. Use care to avoid contact with eyes and mucous membranes. After 10 min, rinse with water. Patient may shampoo hair immediately after use if desired. Wash hands after application. Remove nits with nit comb. Repeat application in 7 days after initial treatment. The lotion will not kill the nits, so the repeat application in 7 days is essential for curing infestation.

# Bepotastine bep'oh-tas'teen

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Ophthalmic, antihistamine

# MECHANISM OF ACTION

An ophthalmic  $H_1$  receptor antagonist that inhibits histaminestimulated vascular permeability in the conjunctiva and stabilizes mast cells. *Therapeutic Effect:* Relieves ocular itching associated with allergic conjunctivitis.

# PHARMACOKINETICS

Minimal absorption after ophthalmic administration; concentration peaks at 1-2 h after instillation. Any drug absorbed is metabolized by liver. Metabolites are excreted in urine.

# AVAILABILITY

Ophthalmic Solution: 1.5%.

# INDICATIONS AND DOSAGES Allergic conjunctivitis

OPHTHALMIC

*Adults, Elderly, Children 2 yr and older.* 1 drop in affected eye(s) twice daily.

# CONTRAINDICATIONS

Hypersensitivity to bepotastine or any other component of the formulation.

# INTERACTIONS

Drug None reported. Herbal and Food None known.

# SIDE EFFECTS

Frequent (> 5%)

Mild taste disturbance immediately after instillation, temporary eye stinging right after use. Occasional (2%-5%) Headache, nasopharyngitis.

# SERIOUS REACTIONS

• None known. Allergic reactions occur rarely.

# PRECAUTIONS & CONSIDERATIONS

This product should not be used to treat eye irritation associated with contact lenses. Do not wear contact lenses while instilling the solution. The preservative in the solution can be absorbed by soft contact lenses. Safety and efficacy have not been established in children < 2 yr of age. Not known to what extent bepotastine is distributed in breast milk; use with caution during lactation and pregnancy due to lack of data. There are no specific precautions in the elderly.

# Storage

Store at room temperature. Do not use if solution becomes discolored. Tightly close after each use.

# Administration

For topical ophthalmic use only. Remove any contact lenses prior to use. Wash hands prior to administration. Be careful not to touch dropper tip to any surface to avoid contamination. Tilt the head back and place the solution in the conjunctival sac of the affected eye(s). Close the eye and then press gently on the lacrimal sac for 1 min. Wait at least 10 min after use before inserting contact lenses.

# **Besifloxacin**

be'si-flox'a-sin Besivance Do not confuse Besivance with Glucovance.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Ophthalmic anti-infectives, quinolones

# **MECHANISM OF ACTION**

A fluoroquinolone that inhibits the enzyme DNA gyrase and topoisomerase IV in susceptible bacteria, interfering with bacterial cell replication. *Therapeutic Effect:* Bactericidal.

# **Beractant**

ber-akt'ant Survanta Do not confuse Survanta with Sufenta.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: This drug is not indicated for use in pregnant women.

Classification: Surfactants, lung

# **MECHANISM OF ACTION**

A natural bovine lung extract that reduces alveolar surface tension, stabilizing alveoli. *Therapeutic Effect*: Improves lung compliance and respiratory gas exchange.

# PHARMACOKINETICS

Not absorbed systemically.

# AVAILABILITY

Intratracheal Suspension for Inhalation: 25 mg/mL vials.

# INDICATIONS AND DOSAGES

 Prevention and rescue treatment of respiratory distress syndrome (RDS) or hyaline membrane disease in premature infants

ENDOTRACHEAL

*Infants.* 100 mg of phospholipids/kg birth weight (4 mL/kg).

Give within 15 min of birth if infant weighs < 1250 g and has evidence of surfactant deficiency; give within 8 h when RDS is confirmed by x-ray and requires mechanical ventilation. May repeat 6 h or longer after preceding dose. Maximum: 4 doses in the first 48 h of life.

# CONTRAINDICATIONS

None known.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Transient bradycardia, oxygen  $(O_2)$  desaturation, increased carbon dioxide  $(CO_2)$  retention.

# Occasional

Endotracheal tube reflux. Rare

Apnea, endotracheal tube blockage, hypotension or hypertension, pallor, vasoconstriction.

# SERIOUS REACTIONS

• Life-threatening nosocomial sepsis may occur but is a risk factor for the population in general.

# **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in persons at risk for circulatory overload. This drug is for use only in neonates. No age-related precautions have been noted.

The infant should be monitored with arterial or transcutaneous measurement of systemic  $O_2$  and  $CO_2$ . Visitors should be limited during treatment. Handwashing and other infection control measures should be monitored to minimize the risk of nosocomial infections.

#### Storage

Refrigerate vials. Unopened, unused vials may be returned to the refrigerator only once and within 8 h after having been warmed to room temperature.

#### Administration

Administer beractant in a highly supervised setting. Clinicians caring for the neonate must be experienced with intubation and ventilator management. Do not inject! For endotracheal (ET) tube administration only.

Warm the vial by letting it stand at room temperature for 20 min or warming in your hand for 8 min. Gently swirl the vial, if needed, to redisperse contents. Do not shake it. The solution normally appears off-white to light brown. Enter each single-use vial only once; discard unused suspension. Use a 20-gauge or larger needle to withdraw the proper dose from the vial. Do not filter.

Instill the drug through a catheter inserted into the infant's ET tube in 4 quarter doses, with the infant in a different position for each quarter dose. Do not instill it into the mainstem bronchus. Monitor the infant for bradycardia and decreased arterial  $O_2$  saturation during administration. Stop the procedure, as prescribed, if the infant experiences these effects, and take appropriate measures before reinstituting therapy.

#### PHARMACOKINETICS

Minimally absorbed systemically during ophthalmic administration. *Half-life:* 7 h.

# AVAILABILITY

*Ophthalmic Suspension (Besivance):* 0.6%.

#### INDICATIONS AND DOSAGES • Bacterial conjunctivitis

OPHTHALMIC Adults, Elderly, and Children 1 yr or older. Instill 1 drop in the affected eye(s) 3 times a day, 4-12 h apart, for 7 days.

#### CONTRAINDICATIONS

Hypersensitivity to besifloxacin or other quinolones.

#### INTERACTIONS

Drug None reported. Herbal and Food None known.

# SIDE EFFECTS

Frequent ( $\geq 2\%$ ) Conjunctival redness. Occasional (1%-2%) Blurred vision, eye pain or sensation of something in eye, itching,

headache. Rare (< 1%)

Hypersensitivity reaction.

#### SERIOUS REACTIONS

None known.

#### PRECAUTIONS & CONSIDERATIONS

For topical ophthalmic use only. Patients should not wear contact lenses if they have bacterial conjunctivitis and should not wear them during the course of treatment with besifloxacin. This drug will not treat vaccinia, varicella, herpes simplex, mycobacterial infection, or fungal disease of an ocular structure. Safety and effectiveness have not been established in children < 1 yr of age. The extent the drug is distributed in breast milk is not known; use with caution during lactation and during pregnancy due to lack of data. There are no specific precautions in the elderly. As with other anti-infectives, prolonged use may result in overgrowth of nonsusceptible organisms, including fungi. If superinfection occurs, discontinue use and institute alternative therapy after appropriate evaluation and ophthalmic examination.

#### Storage

Store at controlled room temperature. Protect from light.

#### Administration

Shake bottle well before each use. Wash hands prior to administration. Remove any contact lenses prior to use. Be careful not to touch dropper tip to any surface to avoid contamination. Tilt the head back and place the solution in the conjunctival sac of the affected eye(s). Close the eye and then press gently on the lacrimal sac for 1 min. Wait at least 10 min after use before instilling other eyedrops.

# Betamethasone

bay-ta-meth'a-sone Betaderm, Betanate, Celestone, Celestone Soluspan, Del-Beta, Diprolene, Diprolene AF, Luxiq

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Classification: Corticosteroid

В

# **MECHANISM OF ACTION**

An adrenocortical steroid that controls the rate of protein synthesis, depresses the migration of polymorphonuclear leukocytes and fibroblasts, reduces capillary permeability, and prevents or controls inflammation. *Therapeutic Effect*: Decreases tissue response to inflammatory process.

#### PHARMACOKINETICS

PO: Onset 1-2 h, peak 1 h, duration 3 days. IM/IV: Onset 10 min, peak 4-8 h, duration 1-1.5 days. Metabolized in liver, excreted in urine as steroids, crosses the placenta.

### AVAILABILITY

Cream (Betamethasone dipropionate, Betanate, Del-Beta): 0.05%. Cream (Betamethasone dipropionate [augmented], Diprolene AF): 0.05%. Gel (Betamethasone dipropionate [augmented]: 0.05%. Lotion: (Betamethasone dipropionate, Del-Beta): 0.05%. Cream (Betamethasone dipropionate [augmented], Diprolene): 0.05%. Lotion (Betamethasone dipropionate, Del-Beta): 0.05%. Ointment: 0.05%. Cream (Betamethasone valerate, Betaderm, Beta-Val): 0.1%. Foam (Betamethasone valerate, Luxiq): 0.12%. Lotion (Betamethasone valerate, Beta-Val): 0.1% Ointment (Betamethasone valerate): 0.1% Syrup (Celestone): 0.6 mg/5 mL. Injection Suspension (Celestone, Soluspan): 6 mg/mL.

# INDICATIONS AND DOSAGES

 Anti-inflammation, immunosuppression, corticosteroid replacement therapy
 PO
 Adults, Elderly. 0.6-7.2 mg/day. *Children*. 0.063-0.25 mg/kg/day in 3-4 divided doses.

IM

Adults. 0.6-9 mg/day (generally,  $\frac{1}{3}$  to  $\frac{1}{2}$  of oral dose) divided every 12-24 h. *Children*. 0.0175-0.125 mg/kg/day divided every 6-12 h or 0.5-7.5 mg base/m<sup>2</sup>/day divided every 6-12 h.

# Relief of inflamed and pruritic dermatoses

TOPICAL Adults, Elderly. 1-2 times a day. Foam: Apply twice a day. INTRADERMAL Adults. 0.2 mL/cm<sup>2</sup>/dose. Maximum dose 1 mL/wk.

Rheumatoid arthritis/osteoarthritis INTRA-ARTICULAR

Adults. 0.5-2 mL; 1-2 mL in very large joints (hip), 1 mL in large joints (knee, ankle, or shoulder), 0.5-1 mL in medium joints (wrist, elbow), and 0.25-0.5 mL in small joints (hand, chest).

#### • Bursitis INTRABURSAL Adult. 0.5-1 mL depending on affected area.

# **OFF-LABEL USES**

Fetal lung maturation to prophylax against anticipated neonatal respiratory immaturity (IM dosage).

#### CONTRAINDICATIONS

Hypersensitivity to betamethasone, systemic fungal infections.

# INTERACTIONS

#### Drug

Amphotericin; diuretics: May increase hypokalemia. Digoxin: May increase digoxin toxicity secondary to hypokalemia. Insulin, oral hypoglycemics: May decrease the effects of these drugs (example: rifampin).

Hepatic enzyme inducers: May decrease the systemic effect of betamethasone.

Live-virus vaccines: May decrease the patient's antibody response to vaccine, and potentiate virus replication.

#### DIAGNOSTIC TEST EFFECTS

May increase blood glucose levels and serum lipids, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

#### SIDE EFFECTS

#### Frequent

Systemic: Increased appetite, abdominal distention, nervousness, insomnia, false sense of well-being. Topical: Burning, stinging, pruritus. Occasional

Systemic: Dizziness, facial flushing, diaphoresis, decreased or blurred vision, mood swings.

Topical: Allergic contact dermatitis, purpura or blood-containing blisters, thinning of skin with easy bruising, telangiectases or raised dark red spots on skin.

## SERIOUS REACTIONS

Systemic hypercorticism and adrenal suppression.
An acute hypersensitivity reaction, as evidenced by urticaria, angioedema, and severe bronchospasm, occurs rarely.
A tranfer from systemic to local/ topical steroid therapy may unmask previously suppressed asthma or other corticosteroid responsive condition.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with persons at increased risk for peptic ulcer disease and in those with cirrhosis, diabetes, heart failure, hypothyroidism, myasthenia gravis, osteoporosis, renal impairment, or nonspecific ulcerative colitis. Monitor the growth and development of children receiving long-term steroid therapy.

Mood swings, ranging from euphoria to depression, may occur. Initially, tuberculosis skin test, x-rays, and ECG should be evaluated. Blood glucose level, BP, serum electrolyte levels, height, and weight should be monitored before and during therapy. Injectable form should not be given intravenously.

#### Storage

Store all forms at room temperature. Protect injection from light.

#### Administration

Give oral betamethasone with milk or food to decrease GI upset. Give single doses in the morning before 9 AM; give multiple doses at evenly spaced intervals. Do not abruptly discontinue the drug.

For topical use, gently cleanse area before applying drug. Apply sparingly and rub into area thoroughly. Use occlusive dressings only as ordered. Do not use topical form on broken skin or in areas of infection, and do not apply to the face or inguinal areas or to wet skin.

Celestone Soluspan is NOT for intravenous use. The injection is given intradermally, intrabursal, intra-articular, or intramusculary. Each route requries specific techniques and needle/syringe types for injection. Shake well before using. If coadministration of a local anesthetic is desired, betamethasone sodium phosphate/betamethasone acetate injectable suspension may be mixed with 1% or 2% lidocaine hydrochloride or similar local anesthetics, using the formulations that do not contain parabens. The drug dose is first withdrawn into a syringe, and then the anesthetic is drawn into the syringe. Briefly shake to mix.

# Betaxolol

bay-tax'oh-lol Betoptic, Betoptic-S, Kerlone Do not confuse betaxolol with bethanechol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensive, selective  $\beta_1$ -blocker

#### **MECHANISM OF ACTION**

An antihypertensive and antiglaucoma agent that blocks  $\beta_1$ -adrenergic receptors in cardiac tissue. Reduces aqueous humor production. *Therapeutic Effect:* Slows sinus heart rate, decreases BP, and reduces intraocular pressure (IOP).

#### PHARMACOKINETICS

PO: Peak 3-4 h. *Half-life*: 14-22 h. Protein binding: 50%; some hepatic metabolism; excreted in urine mostly unchanged.

# AVAILABILITY

Tablets (Kerlone): 10 mg, 20 mg. Ophthalmic Solution (Betoptic): 0.5%. Ophthalmic Suspension (Betoptic-S): 0.25%.

# INDICATIONS AND DOSAGES Hypertension

PO

*Adults*. Initially, 5-10 mg/day. May increase to 20 mg/day after 7-14 days. Maximum: 40 mg/day. *Elderly*. Initially, 5 mg/day, then titrate as per adult dose.

#### Chronic open-angle glaucoma and ocular hypertension

SOLUTION-EYEDROPS *Adults, Elderly:* 1-2 drop(s) twice a day in affected eye(s).

#### SUSPENSION EYEDROPS (BETOPTIC-S)

1 drop twice a day in affected eyes.

Oral dosage in renal impairment

Adult and elderly patients on dialysis. Initially give 5 mg/ day; increase by 5 mg/day q2wk. Maximum: 20 mg/day.

#### **OFF-LABEL USES**

Treatment of angle-closure glaucoma during or after iridectomy, malignant glaucoma, secondary glaucoma; with miotics, to decrease IOP in acute and chronic angle-closure glaucoma.

#### CONTRAINDICATIONS

Cardiogenic shock, overt cardiac failure, second- or third-degree heart block, sinus bradycardia, hypersensitivity.

#### INTERACTIONS Drug

71 ug

**Cimetidine:** May increase betaxolol blood concentration.

**Diuretics, other antihypertensives:** May increase hypotensive effect of betaxolol.

Insulin, oral hypoglycemics: May mask signs and symptoms of hypoglycemia from these drugs. NSAIDs: May decrease antihypertensive effect.

Sympathomimetics, xanthines: May mutually inhibit hypotensive effects and may mask symptoms of hypoglycemia.

# DIAGNOSTIC TEST EFFECTS

May increase serum antinuclear antibody titer and BUN, serum lipoprotein, creatinine, potassium, uric acid, and triglyceride levels.

#### SIDE EFFECTS

Betaxolol is generally well tolerated, with mild and transient side effects. **Frequent** 

Systemic: Hypotension manifested as dizziness, nausea, diaphoresis,

Betaxolol (Generic Name)

headache, fatigue, constipation or diarrhea, dyspnea. Ophthalmic: Eye irritation, visual

disturbances.

#### Occasional

Systemic: Insomnia, flatulence, urinary frequency, impotence or decreased libido, bradycardia, bronchospasm. Ophthalmic: Increased light sensitivity, watering of eye.

#### Rare

Systemic: Rash, arrhythmias, arthralgia, myalgia, confusion, altered taste, increased urination, alopecia. Ophthalmic: Dry eye, conjunctivitis, eye pain.

#### SERIOUS REACTIONS

• Overdose may produce profound bradycardia, hypotension, and bronchospasm.

 Abrupt withdrawal may result in diaphoresis, palpitations, headache, and tremors.

 Betaxolol administration may precipitate CHF or MI in patients with cardiac disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.
 Hypoglycemia may occur in patients

with previously controlled diabetes.

• Ophthalmic overdose may produce bradycardia, hypotension, bronchospasm, and acute cardiac failure.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with diabetes, hyperthyroidism, impaired hepatic or renal function, inadequate cardiac function, and peripheral vascular disease. Betaxolol is excreted in breast milk; use with caution in nursing mothers.

Orthostatic hypotension may occur, so rise slowly from a lying to sitting position and dangle the legs from the bed momentarily before standing. Notify the physician of fatigue, headache, prolonged dizziness, and shortness of breath. BP for hypotension, respiratory status for shortness of breath, pattern of daily bowel activity and stool consistency, and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 60 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed.

#### Storage

Store at room temperature (all forms).

#### Administration

To assess tolerance for betaxolol, obtain a standing systolic BP 1 h after giving the drug. Do not abruptly discontinue betaxolol. Compliance is essential to control glaucoma and hypertension.

Shake ophthalmic suspension well before using. After administration, perform nasolacrimal occlusion to reduce systemic absorption. Remove contact lens before administration and wait 15 min before reinserting. If other ophthalmic solutions are being used concurrently, administer at least 10 min before instilling the suspension. *Oral:* May give without regard to food.

# **Bethanechol**

be-than'e-kole Urecholine Duvoid, Myotonachol Do not confuse bethanechol with betaxolol.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Cholinergic stimulant

# MECHANISM OF ACTION

A cholinergic that acts directly at cholinergic receptors in the smooth muscle of the urinary bladder and GI tract. Increases detrusor muscle tone. *Therapeutic Effect:* May initiate micturition and bladder emptying. Improves gastric and intestinal motility.

# PHARMACOKINETICS

PO onset 30-90 min, duration 1-6 h. SC onset 5-15 min, duration 2 h; excreted by kidneys.

# AVAILABILITY

Tablets: 5 mg, 10 mg, 25 mg, 50 mg.

# INDICATIONS AND DOSAGES

# Postoperative and postpartum urine retention, neurogenic atony of bladder with retention

PO

Adults, Elderly. 10-50 mg 3-4 times a day. Minimum effective dose determined by giving 5-10 mg initially, then repeating same amount at 1-h intervals until desired response is achieved, or maximum of 50 mg is reached.

# **OFF-LABEL USES**

Treatment of congenital megacolon, gastroesophageal reflux, postoperative gastric atony.

### CONTRAINDICATIONS

Active or latent bronchial asthma, acute inflammatory GI tract conditions, anastomosis, bladder wall instability, cardiac or coronary artery disease, epilepsy, hypertension, hyperthyroidism, hypotension, GI or urinary tract obstruction, parkinsonism, peptic ulcer, pronounced bradycardia, recent GI resection, vasomotor instability.

#### INTERACTIONS Drug

Cholinesterase inhibitors: May increase the effects and risk of toxicity of bethanechol. **Procainamide, quinidine:** May decrease the effects of bethanechol. **Herbal** None known. **Food** None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum amylase, lipase, and AST (SGOT) levels.

# SIDE EFFECTS

#### Occasional

Belching, blurred or changed vision, diarrhea, urinary urgency, GI reflux.

# SERIOUS REACTIONS

 Overdosage produces CNS stimulation (including insomnia, anxiety, and orthostatic hypotension) and cholinergic stimulation (such as headache, increased salivation, diaphoresis, nausea, vomiting, flushed skin, abdominal pain, and seizures).

#### PRECAUTIONS & CONSIDERATIONS

Notify the physician of difficulty breathing, irregular heartbeat, muscle weakness, nausea and vomiting, diarrhea, severe abdominal pain, and increased salivation or sweating. Intake and output and vital signs should be monitored. Not recommended in nursing mothers. Use with caution in patients with hypertension, urinary retention. Safety and effectiveness not established in children.

#### Administration

Take 1 h before meals or 2 h after meals to reduce nausea.

# B

# **Bevacizumab**

beh-vah-siz'oo-mab Avastin Do not confuse Avastin with Astelin.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antineoplastics, monoclonal antibody; vascular endothelial growth factor (VEGF) inhibitor

# **MECHANISM OF ACTION**

An antineoplastic that binds to and inhibits vascular endothelial growth factor, a protein that plays a major role in the formation of new blood vessels to tumors. *Therapeutic Effect:* Inhibits metastatic disease progression.

# PHARMACOKINETICS

Clearance varies by body weight, gender, and tumor burden. *Half-life:* 20 days (range, 11-50 days).

# AVAILABILITY

*Injection:* 100 mg/4 mL or 400 mg/16 mL vials.

#### INDICATIONS AND DOSAGES

 First-line treatment of metastatic carcinoma of the colon or rectum in combination with 5-fluorouracil (5-FU) IV INFUSION

Adults, Elderly. 5 mg/kg once every 14 days when used with bolus irinotecan/5-FU/leucovorin; 10 mg/ kg once every 14 days when used with 5-FU/leucovorin/oxaliplatin.

#### Nonsquamous non-small cell lung cancer

IV INFUSION Adults, Elderly. 15 mg/kg once every 3 wks in combination with carboplatin and paclitaxel.

#### Renal cell cancer

IV INFUSION

*Adults, Elderly.* 10 mg/kg once every 2 wks in combination with interferon alfa.

# Gliobiastoma

IV INFUSION

Adults, Elderly. 10 mg/kg once every 2 wks.

# **OFF-LABEL USES**

Age-related macular degeneration, ovarian cancer, breast cancer.

# CONTRAINDICATIONS

Bevacizumab therapy should be permanently discontinued in patients developing GI perforation, hypertensive crisis, nephrotic syndrome, fistula, serious bleeding, wound dehiscence requiring medical intervention.

# INTERACTIONS

**Drug Sunitinib:** May cause hemolytic anemia; avoid combination.

#### Herbal None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease serum potassium, sodium, and hemoglobin levels; hematocrit; and WBC and platelet counts.

# IV INCOMPATIBILITIES

Do not mix bevacizumab with dextrose solutions.

# SIDE EFFECTS

#### Frequent (25%-73%)

Asthenia, vomiting, anorexia, hypertension, epistaxis, stomatitis, constipation, headache, dyspnea, urinary tract infections manifested as urinary frequency or urgency and proteinuria.

#### **Occasional (15%-21%)**

Altered taste, dry skin, exfoliative dermatitis, dizziness, flatulence, excessive lacrimation, skin discoloration, weight loss, myalgia. **Rare (6%-8%)** 

Nail disorder, skin ulcer, alopecia, confusion, abnormal gait, dry mouth.

#### SERIOUS REACTIONS

• Congestive heart failure, deep vein thrombosis, GI perforation, hypertensive crisis, nephrotic syndrome, and severe hemorrhage are the most serious reactions that occur.

• Anemia, neutropenia, and thrombocytopenia occur occasionally.

Hypersensitivity reactions occur rarely.

 Wound dehiscence and wound healing complications.

· Osteonecrosis of the jaw.

Ovarian failure.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with congestive heart failure, epistaxis, hypertension, proteinuria, and renal insufficiency. Bevacizumab should be permanently discontinued in patients developing GI perforation, fistula formation, wound dehiscence, serious bleeding, a severe arterial thromboembolic event, nephrotic syndrome, hypertensive crisis, or hypertensive encephalopathy. Therapy should be temporarily suspended in patients with moderate to severe proteinuria, with severe hypertension, or undergoing surgery. Do not initiate until at least 28 days following major surgery, and only after the surgical incision has fully healed. Bevacizumab is teratogenic and has the potential to

impair fertility. Its use by pregnant women may decrease maternal and fetal body weight and increase the risk of fetal skeletal abnormalities. Breastfeeding women should not take bevacizumab. The safety and efficacy of bevacizumab have not been established in children. Patients older than 65 yr have a higher incidence of serious adverse reactions. Avoid receiving immunizations without the physician's approval and avoid contact with crowds, people with known infections, and anyone who has recently received a live-virus vaccine.

Notify the physician if asthenia (loss of energy), abdominal pain, chills, fever, or nausea and vomiting occur. BP, CBC, serum potassium, and sodium levels should be monitored before and regularly during bevacizumab treatment. Urine should be assessed for proteinuria. Persons with a urine dipstick reading of 2+ or more should have a 24-h urine collection. Pattern of daily bowel activity and stool consistency should be monitored.

#### Storage

Refrigerate vials. Do not freeze. The diluted infusion solution may be refrigerated for up to 8 h.

#### Administration

Do not give bevacizumab by IV push or IV bolus. Withdraw the amount of bevacizumab needed for a dose and dilute it in 100 mL 0.9% NaCl. Do not administer or mix with dextrose solutions. Discard any unused portion. Infuse the initial dose of bevacizumab over 90 min after chemotherapy. If the person tolerates the first infusion well, the second infusion may be administered over 60 min. If 60-min infusion is tolerated, subsequent infusions may be given over 30 min.

# **Bexarotene**

beks-air'oh-teen

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Antineoplastic, retinoids

# **MECHANISM OF ACTION**

This retinoid antineoplastic agent binds to and activates retinoid X receptor subtypes, which regulate the genes that control cellular differentiation and proliferation. *Therapeutic Effect:* Inhibits growth of tumor cell lines of hematopoietic and squamous cell origin and induces tumor regression.

# PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: > 99%. Metabolized in the liver. Primarily eliminated through the hepatobiliary system. *Half-life:* 7 h.

# AVAILABILITY

Capsules, Soft Gelatin: 75 mg. Gel, Topical: 1%.

# INDICATIONS AND DOSAGES

#### Cutaneous T-cell lymphoma refractory to at least one prior systemic therapy PO

*Adults.* 300 mg/m<sup>2</sup>/day. If no response and initial dose is well tolerated, may be increased to 400 mg/m<sup>2</sup>/day. If not tolerated, may decrease to 200 mg/m<sup>2</sup>/day, then to 100 mg/m<sup>2</sup>/day. Round doses to nearest 75 mg.

#### TOPICAL

*Adults*. Initially apply once every other day. May increase at weekly intervals up to 4 times/day. Most patients tolerate and maintain 2-4 times/day application.

# **OFF-LABEL USES**

Treatment of non-small cell lung cancer; breast cancer; Kaposi sarcoma.

## CONTRAINDICATIONS

Retinoid hypersensitivity, pregnancy.

# INTERACTIONS

#### Drug

Antidiabetics: May enhance the effects of these drugs.

Erythromycin, itraconazole, ketoconazole: May increase bexarotene blood concentrations. Phenytoin, rifampin: May decrease bexarotene blood concentrations. Oral contraceptives: May reduce efficacy of hormonal contraceptives. Vitamin A supplements and other retinoids: Increased toxicity; avoid concurrent use.

**DEET-containing insect repellents:** Should not be used with bexarotene gel because of increased risk of DEET toxicity. Food

**Grapefruit juice:** May increase bexarotene blood concentration and risk of toxicity.

# DIAGNOSTIC TEST EFFECTS

May increase serum cholesterol, triglyceride, and LDL levels. May increase CA-125 assay value in patients with ovarian cancer. May decrease serum HDL cholesterol levels, total thyroxine, and thyroidstimulating hormone levels. May produce elevated liver function test results.

# SIDE EFFECTS

#### Frequent

Hyperlipidemia (79%), headache (30%), hypothyroidism (29%), asthenia (20%).

## Occasional

Rash (17%); nausea (15%); peripheral edema (13%); dry skin, abdominal pain (11%); chills, exfoliative dermatitis (10%); diarrhea (7%); changes in mood or behaviour (< 10%).

# SERIOUS REACTIONS

• Pancreatitis, hepatic failure, and pneumonia occur rarely.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with diabetes mellitus, lipid abnormalities, and hepatic impairment. Bexarotene use should be avoided during pregnancy because the drug may cause fetal harm. Pregnancy should be determined before beginning oral or topical treatment. Two reliable contraceptive methods (one nonhormonal) should be used during therapy and for 1 mo afterward. Women should notify their physician if they plan to become or become pregnant. It is unknown if bexarotene is distributed in breast milk; however, breastfeeding is not recommended. The safety and efficacy of bexarotene have not been established in children. No age-related precautions have been noted in the elderly. Abrasive, drying, or medicated soaps should be avoided during therapy.

Baseline lipid profile, liver function, thyroid function, and WBC count should be determined. Cholesterol and triglyceride levels, CBC, and liver and thyroid function test results should be monitored during therapy.

#### Storage

Store at room temperatures. Protect from light and moisture. Avoid high temperatures.

#### Administration

Take oral bexarotene with a fatcontaining meal. Avoid application of topical bexarotene to normal skin. Cover lesion with generous coating; avoid occlusive dressings. Allow to dry before applying clothing. Wait 20 min after bathing before applying gel. Avoid bathing or swimming for at least 3 h after applying.

#### **Bicalutamide**

bye-ka-loo'ta-mide

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: X

**Classification:** Nonsteroidal antiandrogen, antineoplastic

# **MECHANISM OF ACTION**

An antiandrogen antineoplastic agent that competitively inhibits androgen action by binding to androgen receptors in target tissue. *Therapeutic Effect:* Decreases growth of prostatic carcinoma.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 96%. Metabolized in the liver to inactive metabolite. Excreted in urine and feces. Not removed by hemodialysis. *Half-life:* 5.8 days (prolonged in severe liver disease).

#### AVAILABILITY

Tablets: 50 mg.

# INDICATIONS AND DOSAGES Prostatic carcinoma PO

*Adults, Elderly.* 50 mg once a day in morning or evening, given concurrently with a luteinizing

# B

Bicalutamide (Generic Name)

hormone-releasing hormone (LHRH) analog or after surgical castration.

#### CONTRAINDICATIONS

Pregnancy, use in women, hypersensitivity to any component of the formulation.

# INTERACTIONS

#### Drug

Potent CYP3A4 inhibitors: May increase bicalutamide exposure. Warfarin: May increase warfarin's

effects.

# Herbal

**St. John's wort:** May decrease bicalutamide concentrations.

# DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin level and WBC count.

#### SIDE EFFECTS

#### Frequent

Hot flashes (49%), breast pain (38%), muscle pain (27%), pelvic pain (21%), constipation (17%), diarrhea (10%), asthenia (15%), nausea (11%). Occasional (8%-9%)

Nocturia, abdominal pain, peripheral edema.

#### Rare (3%-7%)

Vomiting, weight loss, dizziness, insomnia, rash, impotence, gynecomastia.

#### SERIOUS REACTIONS

• Sepsis, CHF, hypertension, hepatotoxicity, and iron deficiency anemia may occur.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted with moderate to severe hepatic impairment. Liver function test results should be obtained before beginning therapy. Bicalutamide may inhibit spermatogenesis; this drug is not used in women, but is expected to cause fetal harm if a woman is exposed in pregnancy. The safety and efficacy of bicalutamide have not been established in children. No age-related precautions have been noted in elderly patients.

Notify the physician if nausea and vomiting persist.

#### Storage

Store at controlled room temperature. Administration

Give oral bicalutamide at the same time each day and without regard to food. Avoid abruptly discontinuing the drug. Both bicalutamide and the LHRH analog must be continued to achieve the desired therapeutic effect.

# **Bimatoprost**

bye-mat'oh-prost

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Ophthalmic agents, prostaglandin analogs

#### MECHANISM OF ACTION

A synthetic analog of prostaglandin with ocular hypotensive activity. *Therapeutic Effect:* Reduces intraocular pressure (IOP) by increasing the outflow of aqueous humor, increases eyelash growth.

#### PHARMACOKINETICS

Absorbed through the cornea and hydrolyzed to the active free acid form. Protein binding: 88%. Moderately distributed into body tissues. Metabolized in liver. Primarily excreted in urine; some elimination in feces. *Half-life:* 45 min.

# AVAILABILITY

*Ophthalmic solution (Lumigan):* 0.01% and 0.03%. *Eyelid solution (Latisse):* 0.03%.

# INDICATIONS AND DOSAGES

#### Glaucoma, ocular hypertension OPHTHALMIC

Adults, Elderly. 1 drop in affected eye(s) once daily, in the evening.

#### Hypotrichosis of eyelashes

TOPICAL (LATISSE ONLY) *Adults.* 1 drop at night, applied to the upper eyelid margin.

## CONTRAINDICATIONS

Hypersensitivity to bimatoprost or any other component of the formulation.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Conjunctival hyperemia, growth of eyelashes, increased iris pigmentation, and ocular pruritus.

# Occasional

Ocular dryness, visual disturbance, ocular burning, foreign body sensation, eye pain, pigmentation of the periocular skin, blepharitis, cataract, superficial punctate keratitis, eyelid erythema, ocular irritation, and eyelash darkening. **Rare** 

Intraocular inflammation (iritis).

#### SERIOUS REACTIONS

• Systemic adverse events, including infections (colds and upper respiratory tract infections), headaches, asthenia, and hirsutism, have been reported.

## **PRECAUTIONS & CONSIDERATIONS**

May permanently increase pigmentation in iris and eyelid and produce changes in eye color and changes in eyelashes (color, length, shape). Use with caution in patients with uveitis or risk factors for macular edema. Effects in pregnancy and lactation not known; use with caution and only if clearly needed in women who are pregnant or breastfeeding. Safety and effectiveness have not been established in children. Remove contact lenses to apply; wait 15 min after administration to reinsert.

#### Storage

Store at room temperature. Administration

*For Lumigan:* Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Instill drop(s) and gently close the eyes for 1-2 min. Do not blink. Do not touch the tip of the dropper to any surface to avoid contamination. If more than 1 topical ophthalmic agent is being used, wait at least 5 min between administration of each.

For Latisse: Patient's face should be clean; remove all makeup. Use only the disposable sterile applicator provided. Each applicator should be used for 1 eye only; dispose of after use. Apply 1 drop of solution to the applicator, then place along the skin of the upper eyelid margin at the base of the eyelashes. Blot excess runoff with a tissue. Do not apply to the lower eyelash line.

# **Bisacodyl**

bis-ah-koe'dill Alophen, Bisac-Evac, Biscolax, Correctol, Dacodyl, Dulcolax, Ex-Lax Ultra, Fematrol, Femilax, Fleets Bisacodyl, Verocolate Apo-Biscodyl, Carters **Do not confuse bisacodyl** with bisoprolol or Visicol, or Veracolate with Accolate.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC

**Classification:** Laxative, stimulant

# **MECHANISM OF ACTION**

A GI stimulant that has a direct effect on colonic smooth musculature by stimulating the intramural nerve plexi. *Therapeutic Effect:* Promotes fluid and ion accumulation in the colon, increasing peristalsis and producing a laxative effect.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	6-12 h	N/A	N/A
Rectal	15-60 min	N/A	N/A

Minimal absorption following oral and rectal administration. Absorbed drug is excreted in urine; remainder is eliminated in feces.

# AVAILABILITY

Tablets, Enteric Coated: 5 mg. Suppositories, Rectal: 10 mg. Enema: 10 mg.

# INDICATIONS AND DOSAGES

For use in bowel preparation regimens

#### PO

Adults, Children older than 12 yr. 10-mg single dose. Following the 1st bowel movement (or after a max of 6 h after bisacodyl dose), give the prepared bowel prep solution as directed until consumed.

# • Treatment of constipation PO

Adults, Children older than 12 yr. 5-15 mg as needed. Children 6-12 yr. 5-10 mg or 0.3 mg/kg at bedtime or after breakfast. RECTAL

*Adults, Children 12 yr and older.* 10 mg to induce bowel movement. *Children 6-11 yr.* 5-10 mg as a single dose.

# CONTRAINDICATIONS

Hypersensitivity, GI obstruction, bowel perforation, toxic colitis, toxic megacolon, undiagnosed rectal bleeding. Tablets should not be given if dysphagia is present.

# INTERACTIONS

#### Drug

Antacids, H<sub>2</sub>-blockers, protonpump inhibitors: May cause rapid dissolution of bisacodyl tablets, producing gastric irritation or dyspepsia, possible vomiting. Oral medications: May decrease transit time of concurrently administered oral medications.

#### Food

**Milk:** May cause rapid dissolution of bisacodyl tablets, increasing stomach irritation.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Frequent

Some degree of abdominal discomfort, nausea, mild cramps, and faintness.

Bisacodyl (Generic Name)

#### Occasional

В

Rectal administration: burning of rectal mucosa, mild proctitis.

#### SERIOUS REACTIONS

• Long-term use may result in laxative dependence, chronic constipation, and loss of normal bowel function.

 Prolonged use or overdose may result in electrolyte or metabolic disturbances (such as hypokalemia, hypocalcemia, and metabolic acidosis or alkalosis) as well as persistent diarrhea, vomiting, muscle weakness, malabsorption, and weight loss.

#### **PRECAUTIONS & CONSIDERATIONS**

Excessive use of bisacodyl may lead to fluid and electrolyte imbalance. It is unknown whether bisacodyl crosses the placenta or is distributed in breast milk. Avoid oral bisacodyl use in children younger than 6 yr of age. Rectal use ok in younger children with medical supervision. Repeated use of bisacodyl in elderly patients may cause orthostatic hypotension and weakness because of electrolyte loss.

In the treatment of constipation, increasing fluid intake, exercising, and eating a high-fiber diet should be instituted to promote defecation. Notify the physician if unrelieved constipation, dizziness, muscle cramps or pain, rectal bleeding, or weakness occurs. Electrolyte levels, hydration status, daily bowel activity, and stool consistency should be assessed.

When used for bowel preparation, carefully follow prescribed regimen to get best result for colon cleansing. Storage

Store at room temperature; suppositories may be stored in refrigerator.

#### Administration

Take oral bisacodyl on an empty stomach for faster action. Offer 6-8 glasses of water a day to aid in stool softening. Administer tablets whole; do not chew or crush them. Avoid taking within 1 h of antacids, milk, or other oral medications.

For rectal use, if suppository is too soft, chill for 30 min in refrigerator or run cold water over wrapper. Unwrap and moisten suppository with cold water before inserting deep into rectum.

#### Bismuth Subsalicylate

bis'muth sub-sal-ih'sah-late ★ Bismatrol, Kaopectate, Maalox Total Stomach Relief, Peptic Relief, Pepto-Bismol ◆ Stomak-Care, Pepto-Bismol

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC

**Classification:** Antidiarrheal, salicylates

# **MECHANISM OF ACTION**

An antinauseant and antiulcer agent that absorbs water and toxins in the large intestine and forms a protective coating in the intestinal mucosa. Also possesses antisecretory and antimicrobial effects. *Therapeutic Effect:* Prevents diarrhea. Helps treat *Helicobacter pylori*–associated peptic ulcer disease.

#### AVAILABILITY

Caplet: 262 mg.

*Liquid:* 262 mg/15 mL, 524 mg/ 15 mL, 525 mg/15 mL. *Tablet (Chewable):* 262 mg.

# INDICATIONS AND DOSAGES Diarrhea, gastric distress PO

(Doses based on 262 mg/15 mL liquid or 262 mg tablets) Adults, Children over 12 yrs of age. 2 tablets (30 mL) q30-60 min. Maximum: 8 doses in 24 h.

# H. pylori-associated duodenal ulcer, gastritis

PO

*Adults, Elderly.* 525 mg 4 times a day, for 14 days. Combined with metronidazole, tetracycline, and acid-suppressive therapy.

# **OFF-LABEL USES**

Prevention of traveler's diarrhea.

# CONTRAINDICATIONS

Salicylate hypersensitivity. Bleeding ulcers, gout, hemophilia, hemorrhagic states, renal impairment, pregnancy (third trimester); children and teenagers who have or are recovering from chickenpox, influenza symptoms, or influenza because of the risk of Reye's syndrome. Not a suitable treatment for dysentery.

# INTERACTIONS

#### Drug

Anticoagulants, heparin, thrombolytics: May increase the risk of bleeding.

Aspirin, other salicylates: May increase the risk of salicylate toxicity.

**Insulin, oral antidiabetics:** Large dose may increase the effects of insulin and oral antidiabetics. **Tetracyclines:** May decrease the absorption of tetracyclines.

# Herbal

Willow bark: May increase risk of salicylate toxicity. Food None known.

# DIAGNOSTIC TEST EFFECTS

May alter serum alkaline phosphatase, AST (SGOT), ALT (SGPT), and uric acid levels. May decrease serum potassium level. May prolong PT.

# SIDE EFFECTS

Frequent Grayish black stools. Rare Constipation.

# SERIOUS REACTIONS

• Debilitated patients may develop impaction.

 Symptoms of salicylate toxicity include abdominal pain, diaphoresis, dizziness, rapid respirations, drowsiness, headache, hearing loss or tinnitus, nausea/vomiting, metabolic acidosis. Encephalopathy including confusion, myasthenia, tremor or unusal body movements may be present.

• Hypersensitivity reactions may include anaphylaxis, angioedema, hives or other rashes, or acute asthma.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with diabetes and in elderly patients. Avoid bismuth if taking aspirin or other salicylates because of increased risk of toxicity. Also, inform the physician if taking anticoagulants because this drug combination can dangerously prolong bleeding time. Be aware that stool may appear black or gray; may cause darkening of the tongue. Pattern of daily bowel

#### 192 Bisoprolol

activity and stool consistency should be monitored. Due to risk of Reye's syndrome and lack of clinical data to support use, do not use in infants and children < 12 yr of age. In general, avoid use in pregnancy, especially in third trimester. Use with caution during breastfeeding.

#### Storage

Store in a dry place at room temperature.

#### Administration

Shake liquid/suspension well before administration. Measure suspension dosage with calibrated spoon or cup.

Caplets should be swallowed whole.

Chew the chewable tablet before swallowing. Alternatively, allow the chewable tablet to dissolve before swallowing.

# **Bisoprolol**

bis-ope'pro-lal ★ Zebeta ★ Apo-Bisoprolol, Monocor **Do not confuse Zebeta with DiaBeta.** 

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antihypertensive, β-adrenergic blockers

#### MECHANISM OF ACTION

An antihypertensive that blocks  $\beta_1$ -adrenergic receptors in cardiac tissue. *Therapeutic Effect:* Slows sinus heart rate and decreases BP.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: roughly 30%. Eliminated equally by renal and nonrenal pathways with about 50%. of the dose appearing unchanged in the urine and the remainder appearing in the form of inactive metabolites. Not removed by hemodialysis. *Half-life:* 9-12 h (increased in impaired renal function).

# AVAILABILITY

Tablets: 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Hypertension PO

*Adults*. Initially, 5 mg/day. May increase up to 20 mg/day. *Elderly*. Initially, 2.5-5 mg/day. May increase by 2.5-5 mg/day. Maximum: 20 mg/day.

#### Dosage in renal or hepatic impairment

For adults and elderly patients with cirrhosis or hepatitis or whose creatinine clearance is < 40 mL/min; initially give 2.5 mg/day, then titrate.

#### **OFF-LABEL USES**

Angina pectoris, heart failure, premature ventricular contractions, supraventricular arrhythmias.

#### CONTRAINDICATIONS

Cardiogenic shock, overt cardiac failure, second- or third-degree heart block (except in patients with functioning artificial pacemaker), marked sinus bradycardia.

# INTERACTIONS

#### Drug

**Cimetidine:** May increase bisoprolol blood concentration.

**Diuretics, other antihypertensives:** May increase the hypotensive effect of bisoprolol.

**Insulin, oral hypoglycemics:** May mask symptoms of hypoglycemia and prolong the hypoglycemic effect of these drugs.

Bisoprolol (Generic Name)

NSAIDs: May decrease antihypertensive effect. Sympathomimetics, xanthines: May mutually inhibit effects. Rifampin: May decrease bisoprolol blood concentration. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase antinuclear antibody titer and BUN, serum lipoprotein, creatinine, potassium, uric acid, and triglyceride levels.

#### SIDE EFFECTS

#### Frequent

Hypotension manifested as dizziness, nausea, diaphoresis, headache, cold extremities, fatigue, constipation, or diarrhea.

#### Occasional

Insomnia, flatulence, urinary frequency, impotence or decreased libido, asthenia, chest pain.

#### Rare

Rash, arthralgia, myalgia, confusion (especially in the elderly), altered taste.

#### SERIOUS REACTIONS

Overdose may produce profound bradycardia and hypotension.
Abrupt withdrawal may result in diaphoresis, palpitations, headache, and tremulousness.

 Bisoprolol administration may precipitate congestive heart failure and myocardial infarction in patients with heart disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.
 Hypoglycemia may occur in patients with previously controlled diabetes. • Thrombocytopenia, including unusual bruising and bleeding, occurs rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with bronchospastic disease, diabetes, hyperthyroidism, impaired hepatic or renal function, inadequate cardiac function, and peripheral vascular disease. Bisoprolol readily crosses the placenta and is distributed in breast milk. Bisoprolol use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, or hypothermia at birth. The safety and efficacy of bisoprolol have not been established in children. In elderly patients, age-related peripheral vascular disease may increase the risk of decreased peripheral circulation. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval.

Orthostatic hypotension may occur, so rise slowly from a lying to sitting position and dangle the legs from the bed momentarily before standing. Tasks that require mental alertness or motor skills should be avoided. BP for hypotension, respiratory status for shortness of breath, pattern of daily bowel activity and stool consistency, and pulse for quality, rate, and rhythm should be monitored. If pulse rate is 60 beats/ min or lower or systolic BP is < 90mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral

edema, and weight gain, should also be assessed.

#### Storage

Store at controlled room temperature and protect from moisture.

#### Administration

Bisoprolol may be taken without regard to food. Do not abruptly discontinue. Compliance is essential to control hypertension.

# **Bivalirudin**

bye-val'i-roo-din

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anticoagulants, thrombin inhibitors

# **MECHANISM OF ACTION**

An anticoagulant that specifically and reversibly inhibits thrombin by binding to its receptor sites. *Therapeutic Effect:* Decreases acute ischemic complications in patients with unstable angina pectoris.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	Immediate	N/A	1 h

Primarily eliminated by kidneys. A total of 25% removed by hemodialysis. *Half-life:* 25 min (increased in moderate to severe renal impairment).

#### AVAILABILITY

Injection, Lyophilized Powder: 250 mg.

#### INDICATIONS AND DOSAGES

Anticoagulant in patients with unstable angina who are undergoing percutaneous transluminal coronary angioplasty (PTCA) or percutaneous coronary intervention (PCI); patients undergoing PCI with (or at risk of) heparin-induced thrombocytopenia/thrombosis syndrome (HIT/HITTS) IV

Adults, Elderly. 0.75 mg/kg as IV bolus, followed by continuous infusion of 1.75 mg/kg/h for the duration of the procedure and up to 4 h postprocedure. NOTE: In patients without HIT/HITTS, 5 min after the initial bolus dose an activated clotting time (ACT) is performed and an additional bolus of 0.3 mg/kg is given if needed. Infusion may be continued beyond the initial 4 h at a lower rate of 0.2 mg/kg/h for up to 20 h.

#### Dosage in renal impairment

GFR	Infusion Dose Reduced to
10-29 mL/min	1 mg/kg/h
Dialysis	0.25 mg/kg/h

#### **OFF-LABEL USE**

Alternative to heparin during acute MI (STEMI).

#### CONTRAINDICATIONS

Active major bleeding, hypersensitivity.

#### INTERACTIONS Drug

Platelet aggregation inhibitors thrombolytics, warfarin: May increase the risk of bleeding complications.

#### Herbal

Ginkgo biloba: May increase the risk of bleeding. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Prolongs aPTT and PT.

## IV INCOMPATIBILITIES

Do not mix with other medications. Specific Y-site incompatibilities include alteplase (tPA, Activase), amiodarone, amphotericin B, caspofungin (Cancidas), chlorpromazine, diazepam, lansoprazole (Prevacid), phenytoin, prochlorperazine, quinidine gluconate, quinupristin-dalfopristin (Synercid), reteplase (Retavase), streptokinase, vancomycin.

#### SIDE EFFECTS

Frequent (42%) Back pain.

Occasional (12%-15%) Nausea, headache, hypotension, generalized pain.

# Rare (4%-8%)

Injection site pain, bleeding (e.g., epistaxis, hematoma), insomnia, hypertension, anxiety, vomiting, pelvic or abdominal pain, bradycardia, nervousness, dyspepsia, fever, urine retention.

# SERIOUS REACTIONS

• A serious hemorrhagic event occurs rarely and is characterized by a fall in BP or hematocrit.

• An increased risk of thrombus formation with use in coronary artery γ brachytherapy.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with conditions associated with increased risk of bleeding, including bacterial endocarditis, cerebrovascular accident, hemorrhagic diathesis, intracerebral surgery, recent major bleeding, recent major surgery, stroke, severe hypertension, and severe hepatic or renal impairment. An increased risk of thrombus formation is associated with use in  $\gamma$  brachytheraphy. If used during brachytheraphy procedures, maintain meticulous catheter technique, with frequent aspiration and flushing, with paying special attention to minimizing condition of stasis within the catheter or vessels.

It is unknown whether bivalirudin is distributed in breast milk or crosses the placenta. Safety and efficacy of bivalirudin have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment. Elderly patients experience more bleeding events than younger patients. Women should be aware that menstrual flow may be heavier than usual.

Notify the physician of bleeding from femoral vein site, blood in urine or stool, or discomfort or pain (especially chest pain) after treatment. Pulse rate, BP, aPTT, hematocrit, BUN and serum creatinine levels, and stool or urine cultures for occult blood should be monitored.

#### Storage

Store unreconstituted vials at room temperature.

#### Administration

Bivalirudin is intended for use with aspirin, 300-325 mg PO daily. Treatment should be initiated immediately before angioplasty.

To each 250-mg vial, add 5 mL sterile water for injection. Gently swirl until all material is dissolved. For the initial IV bolus and infusion, further dilute each vial in 50 mL D5W or 0.9% NaCl to yield final concentration of 5 mg/mL: 1 vial in 50 mL, 2 vials in 100 mL, 5 vials in 250 mL. If low-rate (e.g., the 0.2-mg/kg/h infusion) is used after the initial infusion, reconstitute a vial as directed and dilute in 500 mL D5W or 0.9% NaCl to yield a final concentration of 0.5 mg/mL. Diluting produces a clear, colorless solution; do not use solution if it is cloudy or contains a precipitate.

# Boceprevir

boe-se'pre-vir

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (drug itself); when used with ribavirin and peginterferon as indicated, Category X.

**Classification:** Antivirals, NS3/4A protease inhibitor

## **MECHANISM OF ACTION**

Inhibitor of HCV NS3/4A protease, thus inhibiting viral replication in hepatitis C virus (HCV) –infected host cells. *Therapeutic Effect:* Interrupts HCV replication, slowing the progression of or improving the clinical status of hepatitis C infection.

### PHARMACOKINETICS

Administer with food, as this increases oral absorption. Protein binding: 75%. Widely distributed. Primarily undergoes metabolism through the aldo-ketoreductase (AKR)-mediated path; the metabolites are inactive against HCV; lesser inactivation pathway via CYP3A4/5. Primarily (79% of the dose) was excreted in feces. Hemodialysis removes 1% or less of the dose. *Half-life:* 3.4 h.

#### AVAILABILITY

Capsules: 200 mg.

#### INDICATIONS AND DOSAGES • Hepatitis C genotype 1 infection (with peginterferon alfa and ribavirin), compensated PO

*Adults.* 800 mg 3 times per day (q7-9h) with food (a meal or light snack). Duration of treatment is determined by HCV-RNA levels and the degree of liver disease. See manufacturer's literature for current guidelines for hepatitis C treatment based on patient virologic response.

# CONTRAINDICATIONS

Hypersensitivity; use with certain CYP3A4/5 inducers and substrates (see drug interactions). Because the drug is coadministered with ribavirin, the following contraindications also apply: Pregnant women and men whose female partners are pregnant; see ribavirin and peginterferon alfa monographs for additional warnings.

# INTERACTIONS

Drug

Major CYP3A4/5 inducers (e.g., bosentan, carbamazepine, phenytoin, barbiturates, rifampin): May obliterate boceprevir effectiveness: contraindicated. Alfuzosin: Increased alfuzosin levels and hypotension. Contraindicated. Atazanavir, Darunavir: Reduced protease inhibitor and boceprevir concentrations and efficacy, compromising HIV and hepatitis C treatment. Co-use not recommended. Cisapride, Pimozide: Potential for cardiac arrhythmias. Contraindicated. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, itraconazole): Watch for evidence of boceprevir toxicity; use with caution.
# **Bleomycin Sulfate**

blee-oh-my'sin sull'fate

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Drug Class:** Antineoplastic, natural antineoplastics

## **MECHANISM OF ACTION**

A glycopeptide antibiotic whose mechanism of action is unknown. Is most effective in the G2 phase of cell division. *Therapeutic Effect:* Appears to inhibit DNA synthesis and, to a lesser extent, RNA and protein synthesis.

#### PHARMACOKINETICS

*Half-life:* 2 h; when creatinine clearance is > 35 mL/min, half-life is increased in lower clearance; metabolized in liver, 50% excreted in urine (unchanged).

# AVAILABILITY

*Powder for Injection:* 15 units, 30 units.

#### INDICATIONS AND DOSAGES

For monotherapy or in combination therapy for testicular carcinoma; lymphomas (including Hodgkin's disease, choriocarcinoma, reticulum cell sarcoma, and lymphosarcoma); and squamous cell carcinomas of the head and neck (including mouth, tongue, tonsil, nasopharynx, oropharynx, sinus, palate, lip, buccal mucosa, gingiva, epiglottis, and larynx)

IV, IM, SC Adults, Elderly. 10-20 units/m<sup>2</sup> (0.25-0.5 unit/kg) 1-2 times/wk. For Hodgkin's disease, after a 50% response is obtained, the maintenance dose is usually 1 unit/day or 5 units/week. NOTE: Other dosing regimens have been used for selected cancers, and bleomycin dosing in such regimens varies with the concurrent usage of other chemotherapy along with bleomycin.

#### As a sclerosing agent to treat malignant pleural effusions and prevent recurrent pleural effusions

INTRAPLEURAL Adults, Elderly. 60 units as a single injection.

General dose in renal impairment (Adults)

#### IV/IM/SC

*CrCl 40-50 mL/min*. 70% of normal dose.

*CrCl 30-40 mL/min.* 60% of normal dose.

*CrCl 20-30 mL/min*. 55% of normal dose.

*CrCl 10-20 mL/min.* 45% of normal dose.

*CrCl 5-10 mL/min.* 40% of normal dose.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

#### Drug

**Digoxin:** May reduce digoxin serum concentrations.

**Phenytoin:** May reduce phenytoin serum concentrations.

**Tobacco:** Smoking increases pulmonary toxicity risk.

#### Herbal

None known. Food None known.

**DIAGNOSTIC TEST EFFECTS** 

None known.

#### SIDE EFFECTS

#### Frequent

Anorexia, weight loss, erythematous skin swelling, urticaria, rash, striae, vesiculation, hyperpigmentation (particularly at areas of pressure, skinfolds, cuticles, IM injection sites, and scars), stomatitis (usually evident 1-3 wks after initial therapy); may also be accompanied by decreased skin sensitivity followed by skin hypersensitivity, nausea, vomiting, alopecia, and (with parenteral form) fever or chills (typically occurring a few hours after large single dose and lasting 4-12 h).

#### SERIOUS REACTIONS

 Interstitial pneumonitis occurs in 10% of patients and occasionally progresses to pulmonary fibrosis. This condition appears to be dose or age related, occurring more often in patients receiving a total dose > 400 units and those older than 70 yr.

• Nephrotoxicity and hepatotoxicity occur infrequently.

 Idiosyncratic reaction consisting of hypertension, mental confusion, fever, chills, and wheezing has been reported in 1% of lymphoma patients treated with bleomycin.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with renal impairment, compromised pulmonary function. Avoid use in pregnant or lactating women. Storage

Store unreconstituted powder for injection in the refrigerator. Diluted solution stable for 24 h at room temperature.

#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

Do not reconstitute or dilute with D5W or other dextrose-containing diluents.

When reconstituting for IM or subcutaneuous use, the 15-unit vial should be dissolved with 1-5 mL of sterile water for injection or 0.9% NaCl injection, or bacteriostatic water for injection. The 30-unit vial may be reconstituted with 2-10 mL of the listed diluents.

For IV use, 15 units or 30 units should be dissolved in 5 mL or 10 mL respectively, of 0.9% NaCl and given slowly over a period of 10 min.

For intrapleural use, 60 units is dissolved in 50-100 mL NaCl 0.9% and administered through a thoracostomy tube after drainage of excess pleural fluid and confirmation of complete lung expansion. Dihydroergotamine, ergonovine, ergotamine, methylergonovine: Risk of ergot toxicity; contraindicated. Drosperinone: Risk for hyperkalemia; contraindicated. Drugs metabolized by CYP3A4: Boceprevir may increase concentrations of these drugs. **HMG-CoA** reductase inhibitors ("statins"): Potential for myopathy and rhabdomyolysis. Lovastatin and simvastatin are contraindicated. Phosphodiesterase (PDE5) inhibitors for pulm HTN (e.g., REVATIO [sildenafil] or ADCIRCA [tadalafil]): Potential for visual abnormalities, hypotension, prolonged erection, and syncope. Contraindicated. Ritonavir: Ritonavir reduces boceprevir concentrations and efficacy, compromising hepatitis C treatment. Co-use not recommended. Triazolam and orally administered Midazolam: Increased sedation

or respiratory depression; contraindicated. Herbal

**St. John's wort:** May obliterate boceprevir effectiveness; contraindicated.

#### Food

Drug must be taken with food to ensure good absorption.

#### DIAGNOSTIC TEST EFFECTS

Decreases HCV-RNA levels (expected effect). Decreased hemoglobin, WBC, and platelets when used in combination with ribavirin and peginterferon alfa as directed.

#### SIDE EFFECTS

#### Frequent (> 35%)

Fatigue, anemia, nausea, headache, and dysgeusia.

#### Occasional (10%-34%)

Diarrhea, vomiting, neutropenia, dizziness, chills, insomnia, arthralgia, irritability, dry skin and mouth, alopecia, rash. **Rare** 

Thrombocytopenia.

#### SERIOUS REACTIONS

Hypersensitivity reactions occur rarely.

• Anemia or neutropenia may be severe enough for drug discontinuation; rare bleeding or infection risks.

• Teratogenic (ribavirin component of therapy).

#### **PRECAUTIONS & CONSIDERATIONS**

Boceprevir must be used in combination with peginterferon alfa and ribavirin. The treatments involve a risk of anemia and neutropenia. Safety and efficacy not established in patients with HIV infection, in patients co-infected with hepatitis B (HBV), in patients with organ transplant, or in those with decompensated liver disease. Therapy for HCV infection involves the use of drugs contraindicated during pregnancy. Patients (males and females) and their partners are required to use two forms of effective contraception during treatment and for 6 months after. Females must have a negative pregnancy test prior to initiation of therapy, monthly during therapy, and for 6 months post-therapy. It is not known if boceprevir is excreted in human milk; breastfeeding during treatment is not recommended. Efficacy and safety are not established in children.

Before starting drug therapy, check baseline lab values, including HCV-RNA levels. Expect to monitor HCV-RNA, serum liver function

tests, and other values at baseline and regularly during treatment. A complete blood count (CBC) with differential, as well as red blood cell indices, should be monitored prior to, at treatment weeks 4, 8, and 12, and as clinically appropriate. Assess for altered sleep patterns, dizziness, headache, nausea, and pattern of daily bowel activity and stool consistency and for signs of unusual bleeding or bruising. Avoid activities that require mental acuity if dizziness occurs until the effects of the drug are known. Patients should be advised not to stop taking the drug suddenly, as this can cause a worsening of hepatitis that may be sudden. Treatment does not reduce

the risk of transmission of HCV to others through sexual contact or blood contamination.

#### Storage

Preferably store capsules refrigerated; do not freeze (may also be stored at room temperature up to  $77^{\circ}$  F ( $25^{\circ}$ C) for up to 3 months). Keep tightly closed and away from heat.

#### Administration

Take each dose with food (meal or light snack) and space doses evenly throughout the day as directed. If the patient misses a dose and it is < 2 hours before the next dose, the missed dose should be skipped; do not double the next dose. If it is > 2 hours before the patient should take the missed dose with food.

#### **Bortezomib**

bor-teh'zoe-mib

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastics, proteasome inhibitors, signal transduction inhibitors

# **MECHANISM OF ACTION**

A proteasome inhibitor and antineoplastic agent that degrades conjugated proteins required for cell-cycle progression and mitosis, disrupting cell proliferation. *Therapeutic Effect:* Produces antitumor and chemosensitizing activity and cell death.

#### PHARMACOKINETICS

Distributed to tissues and organs, with highest level in the GI tract and liver. Protein binding: 83%. Primarily metabolized by CYP enzymes 3A4, 2C19, and 1A2. Deboronated metabolites are not active. The pathways of elimination are not characterized in humans. *Half-life:* The mean elimination half-life upon multiple dosing ranged from 40-193 h after the 1-mg/m<sup>2</sup> dose and 76-108 h after the 1.3-mg/m<sup>2</sup> dose.

#### AVAILABILITY

Powder for Injection: 3.5 mg.

# INDICATIONS AND DOSAGES Previously untreated multiple myeloma

IV

Adults, Elderly: Administered in combination with oral melphalan and prednisone for nine 6-wk treatment cycles. Treatment cycles 1-4 consist of 1.3 mg/m<sup>2</sup> twice weekly on days 1, 4, 8, 11, 22, 25, 29, and 32. Treatment cycles 5-9 consist of 1.3 mg/m<sup>2</sup> once weekly on days 1, 8, 22, and 29. Consecutive doses are separated by at least 72 h.

# Relapsed multiple myeloma or for mantle cell lymphoma IV

Adults, Elderly. Treatment cycle consists of 1.3 mg/m<sup>2</sup> twice weekly on days 1, 4, 8, and 11 followed by a 10-day rest priod (days 12-21). Therapy beyond 8 cycles may be given once weekly for 4 wks (days 1, 8, 15, and 22) followed by a 13-day rest (day 23-35). Consecutive doses are separated by at least 72h.

#### Moderate or severe hepatic impairment (all indications)

Reduce to  $0.7 \text{ mg/m}^2$  in first cycle. Consider escalation to  $1 \text{ mg/m}^2$  or further reduction to  $0.5 \text{ mg/m}^2$  in other cycles based on patient tolerance.

Dosage adjustment guidelines Therapy is withheld at onset of grade 3 nonhematologic or grade 4 hematologic toxicities, excluding neuropathy.

See manufacturer's recommendations for adjustments based on disease state, grade of toxicity, and toxicity type.

#### CONTRAINDICATIONS

Hypersensitivity to bortezomib, boron, or mannitol.

#### INTERACTIONS Drug

**Oral antidiabetics:** May alter the response of these drugs.

Potent CYP3A4 inhibitors (e.g., ketoconazole, ritonavir): May increase bortezomib exposure. Closely monitor.

#### В

#### Herbal

**St. John's wort:** May decrease bortezomib levels, may significantly decrease blood hemoglobin and hematocrit levels and neutrophil, platelet, and WBC counts.

#### SIDE EFFECTS

#### Expected (36%-65%)

Fatigue, malaise, asthenia, nausea, diarrhea, anorexia, constipation, fever, vomiting.

#### Frequent (21%-35%)

Headache, insomnia, arthralgia, limb pain, edema, paresthesia, dizziness, rash, emotional lability.

#### Occasional (11%-18%)

Dehydration, cough, anxiety, bone pain, muscle cramps, myalgia, back pain, abdominal pain, taste alteration, dyspepsia, pruritus, hypotension (including orthostatic hypotension), rigors, blurred vision.

#### SERIOUS REACTIONS

 Thrombocytopenia occurs in 40% of patients. Platelet count peaks at day 11 and returns to baseline by day 21. GI and intracerebral hemorrhage are associated with drug-induced thrombocytopenia.

Anemia occurs in 32% of patients.

 New-onset or worsening neuropathy occurs in 37% of patients. Symptoms may improve in some patients when bortezomib is discontinued.

• Reversible posterior leukoencephalopathy syndrome.

 Pneumonia occurs occasionally; rare reports of pneumonitis, interstitial pneumonia, lung infiltration, and acute respiratory distress syndrome.

• New onset or exacerbation of heart failure, new onset of decreased left ventricular ejection fraction.

• Tumor lysis syndrome, acute hepatic failure (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of syncope, risk factors for heart disease, diabetes, hepatic impairment. Caution should also be used with any medication that increases the risk of dehydration, hypotension, and hepatic or renal function impairment. Bortezomib may induce degenerative effects in the ovaries and testes and may affect male and female fertility. Breastfeeding is not recommended. The safety and efficacy of bortezomib have not been established in children. Elderly patients are at increased risk for grade 3 and 4 thrombocytopenia.

Notify the physician of orthostatic hypotension, fever, pregnancy, nausea, vomiting, or diarrhea. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established. Signs and symptoms of peripheral neuropathy, including a burning sensation, hyperesthesia, neuropathic pain, and paresthesia of the extremities, should be assessed. CBC, especially platelet count, should be monitored before and throughout bortezomib treatment. Intake and output and BP should also be monitored. Adequate hydration should be maintained to prevent dehydration. IM injections or rectal medications and performing other procedures that may induce trauma and bleeding should be avoided.

#### Storage

Store unopened vials at room temperature. Protect from light. The reconstituted solution is stable at room temperature for up to 8 h. Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs. Reconstitute the vial with 3.5 mL 0.9% NaCl. The solution will have a final concentration of 1 mg/mL and will be clear and colorless. Take care

to withdraw the correct dose. Give bortezomib as a 3- to 5-second bolus IV injection.

#### Bosentan

bo'sen-tan Tracleer **Do not confuse with Tricor.** 

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Antihypertensive; endothelin receptor antagonist

#### MECHANISM OF ACTION

An endothelin receptor antagonist that blocks endothelin-1, the neurohormone that constricts pulmonary arteries. *Therapeutic Effect*: Improves exercise ability and slows clinical worsening of pulmonary arterial hypertension (PAH).

#### PHARMACOKINETICS

Highly bound to plasma proteins, mainly albumin. Metabolized in the liver. Eliminated by biliary excretion. *Half-life:* Approximately 5 h.

#### AVAILABILITY

Tablets: 62.5 mg, 125 mg.

#### INDICATIONS AND DOSAGES > PAH in those with World Health Organization Class III or IV symptoms

PO

Adults, Elderly weighing more than 40 kg. 62.5 mg twice a day for 4 wks; then increase to maintenance dosage of 125 mg twice a day. Adults, Elderly, weighing < 40 kg. 62.5 mg twice a day.

#### MODERATE TO SEVERE HEPATIC IMPAIRMENT

Use not recommended. See manufacturers dose adjustment algorithm should elevated LFTs occur during treatment.

#### CONTRAINDICATIONS

Administration with cyclosporine or glyburide, pregnancy, hypersensitivity, moderate or severe liver impairment.

#### INTERACTIONS

NOTE: Bosentan may interact with many drugs, as it induces drug metabolism. Review prescribing information carefully with any new prescription.

#### Drug

Atorvastatin, hormonal contraceptives (including oral, injectable, and implantable), lovastatin, simvastatin, warfarin: May decrease the plasma concentrations of these drugs.

Cyclosporine, ketoconazole,

tacrolimus: Increases plasma concentration of bosentan.

Cyclosporine is contraindicated. **Glyburide:** Increased risk of liver injury. Bosentan also decreases glyburide concentrations. Glyburide is contraindicated.

Ritonavir: Increased bosentan levels and decreased ritonavir levels. Bosentan dose requires adjustments whenever initiated in patients receiving ritonavir-containing treatment for HIV. Herbal

St. John's wort: May decrease bosentan serum concentrations. Food

**Grapefruit juice:** May increase bosentan serum concentrations.

#### DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin and hematocrit levels.

#### SIDE EFFECTS

#### Occasional

Headache, nasopharyngitis, flushing.

#### Rare

В

Dyspepsia (heartburn, epigastric distress), fatigue, pruritus, hypotension, lower extremity edema, low sperm counts.

#### SERIOUS REACTIONS

 Abnormal hepatic function, with significant liver enzyme elevations; rare cases of unexplained hepatic cirrhosis.

Major birth defects.

#### PRECAUTIONS & CONSIDERATIONS

Bosentan can be prescribed and dispensed only through a restricted distribution program (Tracleer Access Program) due to hepatic and fetal risks.

Bosentan administration may induce atrophy of seminiferous tubules of the testes, cause male infertility, or reduced sperm count, Bosentan causes fetal harm and has teratogenic effects on the fetus. including malformations of the face, head, large vessels, and mouth. Breastfeeding is not recommended. The safety and efficacy of bosentan use in children have not been established. Use cautiously in elderly patients because the higher frequency of decreased cardiac, hepatic, and renal function is more common in this age group.

Because pregnancy must be avoided during bosentan therapy, it should be ruled out before the start of therapy. A negative result from a urine or serum pregnancy test should be obtained during the first 5 days of a normal menstrual period and at least 11 days after the last act of sexual intercourse before drug therapy begins. Monthly pregnancy tests should be performed during bosentan therapy. Female patients should not rely on hormonal contraceptives as sole birth control method.

Liver function tests (serum aminotransferase, serum alkaline phosphatase, bilirubin, AST [SGOT], and ALT [SGPT]) should be monitored before bosentan therapy begins and monthly thereafter. Changes in monitoring and treatment should be initiated if an elevation in liver enzymes occurs. Treatment should be stopped if clinical symptoms of hepatic injury, including abdominal pain, fatigue, jaundice, nausea, and vomiting, occur or if bilirubin level increases. Blood hemoglobin level at 1 and 3 mo should also be obtained after treatment begins and every 3 mo thereafter; a decrease in blood hematocrit and hemoglobin levels signifies anemia.

#### Storage

Store tablets at room temperature. Administration

Take bosentan in the morning and evening, with or without food. Do not break or crush film-coated tablets. Swallow the film-coated tablets whole, and avoid chewing them.

Botulism A/B Immune Globulin Intravenous (Human) bot'ue-lizm ih'mewn glob'voo-lin

BabyBIG

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: Not assigned.

**Classification:** Immune globulins

#### **MECHANISM OF ACTION**

Contains IgG antibodies from immunized donors who contributed to the plasma pool from which the product was derived. The titer of antibodies in the reconstituted product against type A botulinum toxin is at least 15 IU/mL and against type B toxin is at least 2 IU/mL. These antibodies bind and neutralize the target toxin. *Therapeutic Effect:* In the case of infants exposed to botulinum neurotoxin type A or B, this product is expected to provide antibodies at levels sufficient to neutralize the circulating neurotoxin, decreasing ICU time, related support, and overall hospitalization.

#### PHARMACOKINETICS

Traditional pharmacokinetic studies have not been done. The half-life is roughly 28 days in infants and is similar to other IVIG products. A single IV infusion is expected to provide a protective antibody level for up to 6 months.

#### AVAILABILITY

Lyophilized Powder for Injection: 100-mg single-dose vial, supplied with 2 mL sterile water for injection diluent.

# INDICATIONS AND DOSAGES Treatment of infant botulism

caused by types A or B

*Infants*. Recommended total dose is 1.5 mL/kg (roughly 75 mg/kg) given as a single IV infusion.

# Dosage in renal impairment

Administer at minimum concentration and rate of infusion.

#### CONTRAINDICATIONS

Allergies to human immune globulins or IgA deficiency with anti-IgA antibodies.

#### INTERACTIONS

#### Drug

Live-virus vaccines: Immune globulin administration may blunt immune response to live viral vaccines. Defer immunization with live vaccines until 3 mo after administration.

Nephrotoxic drugs: If receiving other nephrotoxic drugs, may be at increased risk of renal deterioration. Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Increases in serum creatinine and BUN have been observed as soon as 1-2 days following treatment with other IGIV products.

#### SIDE EFFECTS

#### Occasional (≥ 5%)

Mild, transient erythematous rash of the face or trunk.

#### Less frequent (< 5%)

Chills, muscle cramps, back pain, fever, nausea, vomiting, and wheezing.

#### SERIOUS REACTIONS

• Anaphylactic reactions are rare. Keep epinephrine readily available.

• Renal dysfunction/failure (especially with sucrose-containing products) as a result of osmotic nephrosis; BabyBIG contains sucrose.

• An aseptic meningitis syndrome has occurred with use of other IVIG products.

- · Hemolysis.
- Noncardiogenic pulmonary edema.

• Overdose may produce chills, diaphoresis, dizziness, facial flushing, nausea, vomiting, fever, and hypotension.

#### **PRECAUTIONS & CONSIDERATIONS**

Live vaccine administration should be deferred for 3 mo after this immune globulin. Caution is warranted with cardiovascular disease, a history of thrombosis, impaired renal function, sepsis, or volume depletion and concurrent use of nephrotoxic drugs. This drug has been used in pediatric patients under 1 yr of age only; data relating to use in any other population are not available.

Patients should be well hydrated prior to the initiation of the infusion. Assess renal function, including BUN or serum creatinine, prior to the initial infusion and periodically thereafter, especially for infants at risk of developing acute renal failure. Monitor the patient's vital signs continuously and observe for any associated symptoms. If a patient develops an infusion reaction, slow the rate of infusion immediately or temporarily interrupt the infusion. **Storage** 

Refrigerate unopened vials; do not freeze. Reconstituted vials should be used within 2 h. Do not use the injection if the solution is turbid.

#### Administration

Reconstitute the vial with 2 mL of sterile water for injection to obtain a 50-mg/mL concentration. When using a double-ended transfer needle for reconstitution, insert one end first into the vial of water. The lyophilized powder is supplied in an evacuated vial; therefore, the water should transfer by suction (the jet of water should be aimed to the side of the vial). After the diluent is transferred, the residual vacuum should be released to hasten the dissolution. Rotate gently to wet all the powder. It will take roughly 30 min to dissolve the powder. Do not shake, as this will cause foaming. Use the solution only if it is colorless, particulate-free, and not turbid. Begin infusion within 2 h after reconstitution. Conclude within 4 h of reconstitution, unless infusion is temporarily interrupted for adverse reaction.

Monitor vital signs continuously during IV infusion. Administer

using low-volume tubing and a constant infusion pump (i.e., an IVAC pump or equivalent) through a separate IV line. If a separate line is not possible, it may be "piggybacked" into a preexisting line if that line contains either 0.9% NaCl, or one of the following dextrose solutions (with or without NaCl added): D2.5W, D5W, D10W, or D20W. If a preexisting line must be used, do not dilute BabyBIG more than 1:2 with any of the above-named solutions. Use an in-line or syringe-tip sterile, disposable filter (18 µm). Begin infusion slowly. Administer IV at 0.5 mL/kg/h (25 mg/kg/h). If no untoward reactions occur after 15 min, may increase to 1 mL/kg/h (50 mg/kg/h). Do not exceed this rate. Monitor the patient closely during and after each rate change. At the recommended rates, infusion of the indicated dose should take 127.5 min total elapsed time.

If untoward reactions occur, slowing the infusion rate or temporarily interrupting infusion may resolve them. If anaphylaxis or a serious drop in blood pressure occurs, discontinue the infusion and administer epinephrine.

# Brimonidine

bry-mo'nih-deen Alphagan P Do not confuse with bromocriptine.

#### **CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Ophthalmic agents, antiglaucoma agents,  $\alpha_2$ -adrenergic receptor agonist

#### **MECHANISM OF ACTION**

An ophthalmic agent that is a selective  $\alpha_2$ -adrenergic agonist. *Therapeutic Effect:* Reduces intraocular pressure (IOP).

#### PHARMACOKINETICS

There is some systemic absorption following opthalmic use. Plasma concentrations peak within 0.5-2.5 h after ocular administration. Distributed into aqueous humor. Metabolized in liver. Primarily excreted in urine. *Half-life:* 3 h.

#### AVAILABILITY

*Ophthalmic Solution (Alphagan P):* 0.1%, 0.15%. *Ophthalmic Solution:* 0.2%.

#### INDICATIONS AND DOSAGES

Glaucoma, ocular hypertension
 OPHTHALMIC
 Adda Eldada Children 2 m and

*Adults, Elderly, Children 2 yr and older.* 1 drop in affected eye(s) 3 times a day.

#### CONTRAINDICATIONS

Concurrent use of MAOI therapy, hypersensitivity to brimonidine tartrate or any other component of the formulation.

#### INTERACTIONS

#### Drug

CNS depressants: Potential additive effects.

Antihypertensives,  $\beta$ -blockers, cardiac glycosides: Caution because brimonidine may also reduce heart rate and blood pressure.

**MAOIs:** Contraindicated due to potential risk of sympathomimetic interaction with MAOI and risk of hypertensive crisis.

#### SIDE EFFECTS

Occasional

Allergic conjunctivitis, conjunctival hyperemia, eye

pruritus, burning sensation, conjunctival folliculosis, oral dryness, visual disturbances. **Rare** 

Somnolance, vasodilation, erythema, rash.

#### SERIOUS REACTIONS

• Bradycardia, hypotension, iritis have been reported.

#### PRECAUTIONS & CONSIDERATIONS

Brimonidine should be used with caution in patients with severe cardiovascular disease, depression, cerebral or coronary insufficiency, Raynaud phenomenon, orthostatic hypotension, or thromboangiitis obliterans. Use not recommended in children younger than 2 yr. Somnolence occurs more frequently in children 2-6 yr of age than in older children.

#### Storage

Store at room temperature. Administration

Care should be taken to avoid contamination; do not touch the tip of the dropper to any other surface. Wash hands before and after use. Tilt the head back slightly and pull lower eyelid down with index finger to form a pouch. Squeeze drop into the pouch and gently close eyes for 1 to 2 min. Do not blink. Nasolacrimal occlusion is advised to reduce systemic exposure. If more than 1 topical ophthalmic product is to be used, administration should be separated by at least 5 min. Wait 15 min after using before inserting contact lenses.

#### **Brinzolamide**

brin-zol'ah-mide ★ ♥ Azopt

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Ophthalmic agents, antiglaucoma agents, carbonic anhydrase inhibitor

#### **MECHANISM OF ACTION**

An ophthalmic agent that inhibits carbonic anhydrase. Decreases aqueous humor secretion. *Therapeutic Effect:* Reduces intraocular pressure (IOP).

#### PHARMACOKINETICS

Systemically absorbed to some degree. Protein binding: 60%. Distributed extensively in red blood cells. Site of metabolism has not been established. Metabolized to active and inactive metabolites. Primarily excreted unchanged in urine.

#### AVAILABILITY

Ophthalmic Suspension: 1%.

#### INDICATIONS AND DOSAGES

Glaucoma, ocular hypertension
 OPHTHALMIC

*Adults, Elderly.* Instill 1 drop in affected eye(s) 3 times a day.

#### CONTRAINDICATIONS

Hypersensitivity to brinzolamide, sulfonamides, or any of the product ingredients.

#### INTERACTIONS

#### Drug

**Carbonic anhydrase inhibitors:** Concurrent use with oral carbonic anhydrase inhibitors may lead to additive toxicity. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (5%-10%)

Temporary blurred vision; bitter, sour, or unusual taste.

#### Occasional (1%-5%)

Blepharitis, dermatitis, dry eye, ocular discharge, ocular discomfort and pain, ocular pruritus, headache, rhinitis, hyperemia.

#### Rare (<1%)

Allergic reactions, alopecia, chest pain, conjunctivitis, diarrhea, diplopia, dizziness, dry mouth, dyspnea, dyspepsia, eye fatigue, hypertonia, keratoconjunctivitis, keratopathy, kidney pain, lid margin crusting or sticky sensation, nausea, pharyngitis, tearing, urticaria.

#### SERIOUS REACTIONS

Electrolyte imbalance, development of acidosis, and possible CNS effects may occur.
Systemic hypersensitivity effects including blood dyscrasias, Stevens-Johnson syndrome, toxic epidermal necrolysis, and fulminant hepatic necrosis possible.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with renal impairment, hepatic impairment. Safety and effectiveness have not been established in children or during pregnancy or lactation.

#### Storage

Store at room temperature.

#### Administration

Shake well before using. Care should be taken to avoid contamination; do not touch the tip of the dropper to any other surface. Wash hands before use. Tilt the head back slightly and pull lower eyelid down with index finger to form a pouch. Squeeze 1 drop into the pouch and gently close eyes. If more than one ophthalmic agent is being used, separate administration by at least 10 min. The preservative, benzalkonium chloride, may be absorbed by soft contact lenses. Remove contact lenses before instillation; may reinsert 15 min after instillation.

#### **Bromfenac**

brom'fen-ak ★ ▲ Xibrom, Bromday Do not confuse bromfenac with diclofenac.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Nonsteroidal anti-inflammatory drugs, oph-thalmic

#### **MECHANISM OF ACTION**

An NSAID that inhibits prostaglandin synthesis, reducing the intensity of pain and inflammation. In animal eyes, prostaglandins have been shown to produce disruption of the blood-aqueous humor barrier, vasodilatation, increased vascular permeability, leukocytosis, and increased intraocular pressure. *Therapeutic Effect:* Produces analgesic and anti-inflammatory effects in the eye.

#### PHARMACOKINETICS

Pharmacokinetics following ocular administration in humans are unknown. Based on the dose of 1 drop to each eye (0.09 mg)and information from other routes of administration, the systemic concentration is estimated to be negligible (< 50 ng/mL) at steady state in humans.

#### AVAILABILITY

Ophthalmic Solution (Xibrom): 0.09%. Ophthalmic Solution (Bromday): 0.09%.

#### INDICATIONS AND DOSAGES

 Relief of ocular pain and inflammation in patients who have had cataract extraction

OPHTHALMIC (XIBROM) *Adults, Elderly.* Apply 1 drop to affected eye(s) twice daily beginning 24 h after surgery and continuing for 2 wks.

OPHTHALMIC (BROMDAY) *Adults, Elderly.* Apply 1 drop to affected eye(s) once per day beginning 1 day prior to cataract surgery, continue the day of surgery, and give for 14 days post-op.

#### CONTRAINDICATIONS

Hypersensitivity to bromfenac or any formulation ingredient.

#### INTERACTIONS

Drug

#### **Ophthalmic corticosteroids:**

Co-use may increase risk of delay in healing.

#### Herbal

None known. Food None known.

**DIAGNOSTIC TEST EFFECTS** 

None known.

# SIDE EFFECTS

#### Frequent (2%-7%)

Abnormal sensation in eye; conjunctival hyperemia; eye irritation (including burning/stinging); ocular pain, pruritus, or redness; headache; and iritis.

#### SERIOUS REACTIONS

- · Rare hypersensitivity reactions.
- · Corneal adverse events such as

thinning, erosion, or perforation.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in those with sulfite sensitivity, or previous allergic reactions to other NSAIDs; cross-reactivity may occur. There have been reports that ocularly applied NSAIDs may cause increased bleeding of ocular tissues following ocular surgery. Topical NSAIDs may slow or delay healing, or may cause keratitis. Use with caution in patients with known bleeding tendencies or who are on medications affecting bleeding times. Patients with complicated ocular surgeries, corneal denervation, corneal epithelial defects, diabetes mellitus, dry eye syndrome, or repeat ocular surgeries may be at increased risk for corneal adverse events, which may become sight threatening. Use more than 24 h prior to surgery or use beyond 14 days post surgery may increase patient risk for the occurrence and severity of corneal adverse events. Patients should not wear contact lenses during treatment. The safety and efficacy of bromfenac have not been established in children. Use during pregnancy or lactation only if clearly needed due to lack of data. No particular precautions needed in elderly patients.

Therapeutic response, such as decreased pain, surgical healing, and inflammation, should be assessed. **Storage** 

Store at controlled room temperature. Administration

Take care to avoid contamination; do not allow dropper tip to touch any surface. Wash hands before use. Place index finger on the lower eyelid and pull gently until a pouch is formed. Place the prescribed number of drops in the pouch. Gently close the eye, and apply digital pressure to the lacrimal sac for 1-2 min to minimize the risk of systemic effects. Blot excess solution with a tissue.

#### **Bromocriptine**

broe-moe-krip'teen
Cycloset, Parlodel
Apo-Bromocriptine
Do not confuse bromocriptine
with benztropine, or Parlodel
with pindolol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antiparkinsonian agents, antidiabetic agents, dopamine receptor agonist

#### **MECHANISM OF ACTION**

A dopamine agonist that directly stimulates dopamine receptors in the corpus striatum and inhibits prolactin secretion. Also suppresses secretion of growth hormone. *Therapeutic Effect*: Improves symptoms of parkinsonism; suppresses galactorrhea and reduces serum growth hormone concentrations in acromegaly; lowers blood glucose and improves glucose tolerance in diabetes mellitus.

Bromocriptine (Generic Name)

Indication	Onset	Peak	Duration
Prolactin lowering	2 h	8 h	24 h
Antipar- kinsonian	0.5- 1.5 h	2 h	N/A
Growth hormone suppressant	1-2 h	4-8 wks	4-8 h

#### PHARMACOKINETICS

Minimally absorbed from the GI tract. Protein binding: 90%-96%. Metabolized in the liver. Excreted in feces by biliary secretion. *Half-life:* 15 h.

## AVAILABILITY

Capsules: 5 mg. Tablets: 2.5 mg. Tablets: 0.8 mg (Cycloset).

# INDICATIONS AND DOSAGES

# Hyperprolactinemia PO

*Adults, Elderly.* Initially, 1.25-2.5 mg/day. May increase by 2.5 mg/day at 3- to 7-day intervals. Range: 2.5 mg 2-3 times a day.

#### Parkinson disease PO

Adults, Elderly. Initially, 1.25 mg twice a day. May increase by 2.5 mg/ day every 14-28 days. Range: 30-90 mg/day.

#### Acromegaly

PO

Adults, Elderly. Initially, 1.25-2.5 mg. May increase at 3-7 day intervals. Usual dose 20-30 mg/day. Maximum: 100 mg/day.

# Diabetes mellitus type 2

PO (CYCLOSET ONLY) Adults, Elderly. Intially, 0.8 mg/ day. May increase weekly by 0.8 mg to an effective range of 1.6-4.8 mg/day.

#### **OFF-LABEL USES**

Treatment of cocaine addiction, hyperprolactinemia associated with pituitary adenomas, neuroleptic malignant syndrome.

#### CONTRAINDICATIONS

Hypersensitivity to ergot alkaloids, peripheral vascular disease, pregnancy, severe ischemic heart disease, uncontrolled hypertension.

# INTERACTIONS

#### Drug

**Alcohol:** May produce a disulfiram-like reaction (chest pain, confusion, flushed face, nausea, vomiting).

Erythromycin, clarithromycin, ritonavir, protease inhibitors, itraconazole, ketoconazole: May increase bromocriptine blood concentration and risk of toxicity.

**Ergot alkaloids:** Concurrent use is not recommended as it may increase ergot-related side effects.

**Estrogens, progestins:** May decrease the effects of bromocriptine.

#### Haloperidol, MAOIs,

**phenothiazines, risperidone:** May decrease bromocriptine's prolactin-lowering effect.

# Hypotension-producing

medications: May increase hypotension.

**Levodopa:** May increase the effects of bromocriptine.

**Sibutramine:** May increase the risk of serotonin syndrome.

Sympathomimetics: Do not use together for more than 10 days, as this may increase risk of hypertension and tachycardia. Herbal

# St. John's wort: May reduce bromocriptine levels.

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase plasma growth hormone concentration.

#### SIDE EFFECTS

#### Frequent

Nausea (49%), headache (19%), dizziness (17%), asthenia (>10%).

#### Occasional (3%-7%)

Fatigue, light-headedness, vomiting, abdominal cramps, diarrhea, constipation, nasal congestion, somnolence, dry mouth.

#### Rare

Muscle cramps, urinary hesitancy.

#### SERIOUS REACTIONS

• Visual or auditory hallucinations have been noted in patients with Parkinson disease.

Somnolence and sudden sleep
 onset.

• Long-term, high-dose therapy may produce continuing rhinorrhea, syncope, GI hemorrhage, peptic ulcer, and severe abdominal pain.

• Rare cases of pleural or retroperitoneal fibrosis.

 Some antiparkinsonian medications associated with melanoma development.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiac, renal, or hepatic function impairment, hypertension, and psychiatric disorders. Be aware the incidence of side effects is high, especially at the beginning of therapy and with high dosages. Bromocriptine use is not recommended during pregnancy or breastfeeding. Nonhormonal contraceptives are recommended to women during treatment. When used in the treatment of hyperprolactinemia, bromocriptine should be withdrawn when pregnancy is confirmed. The safety and efficacy of bromocriptine have not been established in children. Elderly patients are more prone to CNS adverse effects.

Dizziness, drowsiness, and dry mouth are expected responses to the drug. Alcohol and tasks that require mental alertness or motor skills should be avoided. Also, change positions slowly and dangle the legs momentarily before standing to avoid light-headedness. Notify the physician if watery nasal discharge occurs. Constipation should be assessed during treatment.

#### Storage

Store at room temperature. Protect from light.

#### Administration

Lie down after taking the first dose to avoid light-headedness. Take with food to decrease the incidence of nausea.

*For Cycloset:* Take with food within 2 h after waking in the morning.

#### **Brompheniramine**

brome-fen-ir'a-meen ★ Bidhist, BPM, J-Tan PD, Lodrane 24, LoHist-12, Respa-BR, TanaCof-XR, Vazol

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B Rx

*Classification:* Antihistamines, H<sub>1</sub>-receptor antagonist

#### MECHANISM OF ACTION

An alkylamine that competes with histamine at histaminic receptor

sites. Inhibits central acetylcholine. *Therapeutic Effect:* Results in anticholinergic, antipruritic, antitussive, antiemetic effects. Produces antidyskinetic, sedative effect.

# PHARMACOKINETICS

Rapidly absorbed after PO administration. Widely distributed. Metabolized in liver. Primarily excreted in urine. *Half-life:* 25 h.

# AVAILABILITY

Capsule, Extended Release: 12 mg (Lodrane 24). Tablets, Extended Release: 6 mg (Bidhist, LoHist). Elixir: 2 mg/5 mL (Vazol). Oral Suspension: 4 mg/5 mL (J-Tan), 8 mg/5 mL (TanaCof-XR).

# INDICATIONS AND DOSAGES

#### Allergic rhinitis, anaphylaxis, urticarial transfusion reactions, urticaria

PO

Adults, Elderly, Children 12 yr and older. Extended-release tablets: 6-12 mg every 12 h; extendedrelease capsules: 12-24 mg once daily; oral suspension: 12-24 mg every 12 h (up to 48 mg/24 h); oral liquid: 4 mg 4 times daily. *Children 6-12 yr*. Extended-release tablets: 6 mg every 12 h; extendedrelease capsules: 12 mg once daily; oral suspension: 12 mg every 12 h (up to 24 mg/24 h); oral liquid: 2 mg 4 times daily. *Children 2-6 yr*. Chewable tablets:

6 mg every 12 h (up to 12 mg/24 h); oral suspension: 6 mg every 12 h (up to 12 mg/24 h); to 12 mg/24 h); oral liquid: 1 mg 4 times daily.

Children 12 mo to 2 yr. Oral suspension 3 mg every 12 h

(up to 6 mg/24 h); oral liquid 0.5 mg/kg/day in divided doses 4 times daily.

## CONTRAINDICATIONS

Concurrent MAOI therapy, focal CNS lesions, newborn or premature infants, nursing mothers, hypersensitivity to brompheniramine or related drugs.

#### INTERACTIONS Drug

Alcohol and CNS depressants: May increase sedative effects. Anticholinergics: May increase anticholinergic effects. MAOIs: May increase anticholinergic and CNS depressant effects. Procarbazine: May increase CNS depressant effects. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing unless antihistamines are discontinued 4 days before testing.

#### SIDE EFFECTS

#### Frequent

Drowsiness; dizziness; dry mouth, nose, or throat; urinary retention; thickening of bronchial secretions.

*Elderly:* Sedation, dizziness, hypotension.

#### Occasional

Epigastric distress, flushing, blurred vision, tinnitus, paresthesia, sweating, chills.

#### Rare

Increased blood pressure, anxiety, chest pain.

#### SERIOUS REACTIONS

• Children may experience dominant paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremors.

• Overdosage in children may result in hallucinations, seizures, and death.

 Hypersensitivity reactions, such as eczema, pruritus, rash, cardiac disturbances, and photosensitivity, may occur.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with asthma, narrow-angle glaucoma, increased intraocular pressure, hyperthyroidism, cardiovascular disease, hypertension, pyloroduodenal or bladder neck obstruction, glucose-6-phosphate dehydrogenase (G6PD) deficiency, or prostatic hypertrophy. It is unknown whether brompheniramine crosses the placenta or is detected in breast milk. There is an increased risk of seizures in neonates and premature infants if the drug is used during the third trimester of pregnancy. Brompheniramine use is not recommended in newborns or premature infants because these groups are at an increased risk of experiencing paradoxical reaction. Elderly patients are at an increased risk of developing confusion, dizziness, hyperexcitability, hypotension, and sedation.

Dizziness, drowsiness, and dry mouth are expected side effects of brompheniramine. Avoid alcohol during therapy.

#### Storage

Store at room temperature. Protect from light to prevent discoloration.

#### Administration

Give oral brompheniramine with meals to minimize GI upset. Shake oral suspensions well before each use. Do not crush, cut, or chew extended-release dosage forms.

#### **Budesonide**

bu-dess'ah-nide ★ ► Entocort EC, Pulmicort Flexhaler, Pulmicort Respules, Rhinocort Aqua

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Corticosteroids, inhalation

#### **MECHANISM OF ACTION**

A glucocorticoid that inhibits the accumulation of inflammatory cells and decreases and prevents tissues from responding to the inflammatory process. *Therapeutic Effect:* Relieves symptoms of asthma, allergic rhinitis, or Crohn's disease.

#### PHARMACOKINETICS

Minimally absorbed from nasal tissue; moderately absorbed from inhalation. Protein binding: 88%. Primarily metabolized in the liver. *Half-life:* 2-3 h.

#### AVAILABILITY

Capsules (Entocort EC): 3 mg. Powder for Oral Inhalation (Pulmicort Flexhaler): 90 mcg/ inhalation, 180 mcg/inhalation. Suspension for Oral Inhalation (Pulmicort Resputes): 0.25 mg/2 mL, 0.5 mg/2 mL, 1 mg/2 mL. Nasal Spray (Rhinocort Aqua): 32 mcg/spray.

# INDICATIONS AND DOSAGES Allergic or vasomotor rhinitis

INTRANASAL (RHINOCORT AQUA)

*Adults, Elderly, Children 6 yr and older.* 1 spray in each nostril once a day. Maximum: 4 sprays/nostril for adults and children 12 yr and older; 2 sprays/nostril for children younger than 12 yr.

#### Bronchial asthma NEBULIZATION

*Children 12 mo to 8 yr.* 0.25-1 mg/ day titrated to lowest effective dosage.

INHALATION

*Adults, Elderly, Children 6 yr and older.* Flexhaler: Initially 180-360 mcg twice daily. Maximum: Adults: 720 mcg twice a day. Children: 360 mcg twice a day.

# Crohn's disease

PO

*Adults, Elderly.* 9 mg once a day for up to 8 wks.

#### CONTRAINDICATIONS

Hypersensitivity to any corticosteroid or its components, persistently positive sputum cultures for *Candida albicans*, primary treatment of status asthmaticus, systemic fungal infections, untreated localized infection involving nasal mucosa.

#### INTERACTIONS

#### Drug

**Cimetidine:** May increase the serum concentrations of budesonide. **CYP3A4 inhibitors:** May increase the serum level and toxicity of budesonide.

#### Herbal

**St. John's wort:** May decrease levels of budesonide.

#### Food

**Grapefruit juice:** May double systemic exposure to oral budesonide.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS

#### Frequent (≥ 3%)

Nasal: Mild nasopharyngeal irritation, burning, stinging, or dryness; headache; cough. Inhalation: Flu-like symptoms, headache, pharyngitis.

#### Occasional (1%-3%)

Nasal: Dry mouth, dyspepsia, rebound congestion, rhinorrhea, loss of taste.

Inhalation: Back pain, vomiting, altered taste, voice changes, abdominal pain, nausea, dyspepsia.

#### SERIOUS REACTIONS

 An acute hypersensitivity reaction, marked by urticaria, angioedema, and severe bronchospasm, occurs rarely.

• A transfer from local steroid therapy may unmask previously suppressed bronchial asthma condition.

• Potential adrenal insufficiency is used to replace systemic corticosteroid use.

• Signs and symptoms of hypercorticism, Cushing's syndrome, HPA suppression.

• Nasal septum perforation with chronic use or improper technique.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with adrenal insufficiency, cirrhosis, glaucoma, hypothyroidism, diabetes, osteoporosis, tuberculosis, and untreated infection. It is unknown

#### 212 Budesonide; Formoterol

whether budesonide crosses the placenta or is distributed in breast milk. In children, prolonged treatment and high doses may decrease cortisol secretion and short-term growth rate. No age-related precautions have been noted in elderly patients.

Symptoms should improve in 24 h, but the drug's full effect may take 3-7 days to appear. Those using budesonide intranasally should notify the physician if nasal irritation occurs or if symptoms, such as sneezing, fail to improve.

#### Storage

Store all budesonide dosage forms at room temperature. Once foil envelope for inhalation suspension has been opened, all ampules must be used within 2 wks. Discard Flexhaler when dose indicator displays zero. Discard nasal spray after 120 sprays.

#### Administration

Oral capsule should be swallowed whole. Do not crush or chew.

For inhalation, prime inhaler before first use. Exhale completely and place the mouthpiece between the lips. Inhale and hold breath for as long as possible before exhaling. Allow at least 1 min between inhalations. Rinse mouth after each use to decrease dry mouth and hoarseness and prevent fungal infection of the mouth.

Inhalation suspension for nebulization should be shaken well before using. Administer with jet nebulizer connected to an air compressor; do not use ultrasonic nebulizer. Do not mix with other medications in nebulizer. Rinse mouth after each use; wash face if using face mask.

For intranasal use, clear nasal passages as much as possible. Shake gently before use. Prime before first use by actuating 8 times. If not used for 2 consecutive days, reprime with 1 spray or until a fine spray appears. If not used for 14 days, rinse applicator and reprime with 2 sprays or until a fine spray appears. Tilt the head slightly forward. Insert the spray tip into the nostril, pointing toward the nasal passages, away from the nasal septum. Spray budesonide into the nostril while holding the other nostril closed, and at the same time inhale through the nose to deliver the medication as high into the nasal passages as possible.

#### Budesonide; Formoterol

bu-dess'ah-nide; for-moe'ter-ol Symbicort

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Respiratory agents; corticosteroids, long-acting  $\beta_2$ -agonists (LABA)

#### MECHANISM OF ACTION

A glucocorticoid that inhibits the tissue response to the inflammatory process. Used with a long-acting bronchodilator that stimulates  $\beta_2$ -adrenergic receptors in the lungs, resulting in relaxation of bronchial smooth muscle. *Therapeutic Effect*: Relieves symptoms of asthma and reduces airway resistance; helping to control asthma long term.

## PHARMACOKINETICS

Peak concentrations of both drugs occur usually within 15-20 min of dosing. Some systemic absorption does occur. Systemically absorbed drugs are primarily metabolized in the liver. Duration of effect is roughly 12 hours. Improvement in breathing control can occur within 15 min of use, although maximum benefit may not be achieved for 2 wks or longer. *Half-life:* 4.7 h (budesonide); 8-10 h (formoterol).

#### AVAILABILITY

Inhalation Aerosol (Symbicort): • Symbicort 80/4.5: budesonide 80 mcg and formoterol fumarate 4.5 mcg per inhalation.

• Symbicort 160/4.5: budesonide 160 mcg and formoterol fumarate 4.5 mcg per inhalation.

#### INDICATIONS AND DOSAGES • Bronchial asthma

INHALATION

*Adults, Elderly, Children 12 yr and older.* 2 inhalations twice daily of Symbicort 80/4.5 or 160/4.5. Starting dose is based on asthma severity.

#### COPD

INHALATION *Adults, Elderly.* 2 inhalations twice daily of Symbicort 160/4.5.

#### CONTRAINDICATIONS

Status asthmaticus or other acute asthma attack or bronchospasm. Hypersensitivity to any components.

#### INTERACTIONS

#### Drug

β-Blockers: May antagonize formoterol's bronchodilating effects. CYP3A4 inhibitors (e.g., ritonavir, atazanavir, clarithromycin, indinavir, itraconazole, nefazodone, nelfinavir, saquinavir, telithromycin): May increase the serum level and toxicity of budesonide. **Diuretics, xanthine derivatives:** May increase the risk of hypokalemia.

Drugs that can prolong QT interval (including erythromycin, quinidine, and thioridazine): May potentiate cardiovascular effects.

**MAOIs, tricyclic antidepressants:** May potentiate cardiovascular effects.

#### Herbal

St. John's wort: May decrease levels of budesonide. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level. May increase blood glucose level.

#### SIDE EFFECTS

#### Frequent (≥ 3%)

Nasopharyngitis, headache, upper respiratory tract infection, sore throat, sinusitis, nasal congestion, nausea or vomiting, and oral candidiasis.

#### Occasional (1%-3%)

Tremor, altered taste, voice changes, muscle cramps, tachycardia, insomnia, irritability, influenza, back pain.

#### Rare

Increased intraocular pressure and cataracts with long-term steroid use.

#### SERIOUS REACTIONS

 An acute hypersensitivity reaction marked by urticaria, angioedema, and severe bronchospasm; occurs rarely.

• Excessive sympathomimetic stimulation may produce palpitations, QT prolongation, extrasystole, and chest pain.

• A transfer from oral steroid therapy may unmask previously suppressed bronchial asthma condition. • Potential adrenal insufficiency if used to replace systemic corticosteriod use.

• Signs and symptoms of hypercorticism, Cushing's syndrome, HPA suppression.

Infection such as candidiasis or pneumonia.

#### PRECAUTIONS & CONSIDERATIONS

Formoterol use may increase risk of asthma-related events, such as hospitalization or mortality. Caution is warranted in patients with cardiovascular disease, hypertension, a seizure disorder, and thyrotoxicosis. Caution is also warranted with adrenal insufficiency, cirrhosis, pheochromocytoma, glaucoma, hyperthyroidism, diabetes, osteoporosis, tuberculosis, and untreated infection. It is unknown whether either drug crosses the placenta or is distributed in breast milk. In children, prolonged treatment and high doses may decrease cortisol secretion and short-term growth rate. Do not use in children < 12 years of age. Elderly patients may be more prone to tachycardia and tremor because of increased sensitivity to sympathomimetics.

Drink plenty of fluids to decrease the thickness of lung secretions. Monitor patients for signs and symptoms of pneumonia and other potential lung infections. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Pulse rate and quality, ECG, respiratory rate, depth, rhythm, and type, ABG, and serum potassium levels should be monitored. Keep a log of measurements of peak flow readings.

#### Storage

Store at controlled room temperature. Store with the mouthpiece down. Discard when the labeled number of inhalations on the package are used or within 3 months after removal from the foil pouch. Never immerse into water. Contents are under pressure; do not expose to heat, flame or temperatures above 120° F (may cause bursting).

#### Administration

For oral inhalation only. Shake well for 5 seconds before each use. Prime inhaler before first use, when more than 7 days have elapsed since the last use, or if it has been dropped. A spacer can be used with the inhaler if needed. To avoid the spread of infection, do not use the inhaler for more than one person.

Exhale completely and place the mouthpiece between the lips. Inhale and hold breath for as long as possible before exhaling. Allowing a brief period (at least 1 min) between inhalations often helps drug delivery with inhalers. Rinse mouth after each use (swish and spit) to decrease dry mouth and hoarseness and prevent fungal infection of the mouth.

#### **Bumetanide**

byoo-met'a-nide Bumex 🌄 Burinex

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in pregnancy-induced hypertension)

Classification: Diuretics, loop

Bumetanide (Generic Name)

#### **MECHANISM OF ACTION**

A loop diuretic that enhances excretion of sodium, chloride, and, to lesser degree, potassium, by direct action at the ascending limb of the loop of Henle and in the proximal tubule. *Therapeutic Effect:* Produces diuresis.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	30-60	60-120 min	4-6 h
IV	Rapid	15-30 min	2-3 h
IM	40	60-120 min	4-6 h

Completely absorbed from the GI tract (absorption decreased in CHF and nephrotic syndrome). Protein binding: 94%-96%. Partially metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 1-1.5 h in adults; prolonged in neonates and infants.

#### AVAILABILITY

*Tablets:* 0.5 mg, 1 mg, 2 mg. *Injection:* 0.25 mg/mL.

# INDICATIONS AND DOSAGES Edema

#### PO

*Adults.* 0.5-2 mg as a single dose in the morning. May repeat q4-5h. *Elderly.* 0.5 mg/day, increased as needed.

IV, IM

Adults, Elderly. 0.5-2 mg/dose; may repeat in 2-3 hr. Or 0.5-1 mg/h by continuous IV infusion. Maximum: 10 mg/day.

# Hypertension

#### PO

*Adults, Elderly.* Initially, 0.5 mg/day. Range: 1-4 mg/day. Maximum: 5 mg/day. Larger doses may be given 2-3 doses/day.

#### Usual pediatric dosage

PO, IV, IM Children. 0.015-0.1 mg/kg/dose q6-24h. Maximum: 10 mg/day.

#### **OFF-LABEL USES**

Treatment of hypercalcemia.

#### CONTRAINDICATIONS

Anuria, hepatic coma, severe electrolyte depletion, hypersensitivity to bumetanide.

#### INTERACTIONS

#### Drug

Amphotericin B, nephrotoxic and ototoxic medications: May increase the risk of nephrotoxicity and ototoxicity.

Anticoagulants, heparin: May decrease the effects of these drugs. Lithium: May increase the risk of lithium toxicity.

# Other hypokalemia-causing medications: May increase the risk of hypokalemia.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase blood glucose, BUN, serum uric acid, and urinary phosphate levels. May decrease serum calcium, chloride, magnesium, potassium, and sodium levels.

# IV INCOMPATIBILITIES

Amphotericin B, chlorpromazine, diazepam, haloperidol, inamrinone, midazolam (Versed), nesiritide (Natrecor), ofloxacin (Floxin), phenytoin, quinupristin-dalfopristin (Synercid).

# **IV COMPATIBILITIES**

Aztreonam (Azactam), cefepime (Maxipime), diltiazem (Cardizem), dobutamine (Dobutrex), furosemide

#### SIDE EFFECTS

#### Expected

Increased urinary frequency and urine volume.

#### Frequent

Orthostatic hypotension, dizziness. Occasional

Blurred vision, diarrhea, headache, anorexia, premature ejaculation, impotence, dyspepsia.

#### Rare

Rash, urticaria, pruritus, asthenia, muscle cramps, nipple tenderness.

#### SERIOUS REACTIONS

 Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, dehydration, coma, and circulatory collapse.

• Ototoxicity, manifested as deafness, vertigo, or tinnitus, may occur, especially in patients with severe renal impairment and those taking other ototoxic drugs.

• Blood dyscrasias and acute hypotensive episodes have been reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with diabetes mellitus, hypersensitivity to sulfonamides, hepatic or renal impairment, and in elderly and debilitated patients. It is unknown whether bumetanide is distributed in breast milk. The safety and efficacy of bumetanide have not been established in children. Bumetanide is a potent displacer of bilirubin; avoid use in neonates at risk for kernicterus. Elderly patients are at increased risk for circulatory collapse or thromboembolic episodes and may be more sensitive to the drug's hypotensive and electrolyte effects.

Age-related renal impairment may require reduced dosage or an extended dosage interval in older patients. Consuming foods high in potassium, such as apricots, bananas, legumes, meat, orange juice, raisins, whole grains, including cereals, and white and sweet potatoes, is encouraged.

An increase in the frequency and volume of urination and hearing abnormalities, such as a sense of fullness or ringing in the ears, may occur. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Hyponatremia may result in cold and clammy skin, confusion, and thirst. Storage

Store vials at room temperature. Protect from light.

#### Administration

Take bumetanide with food to avoid GI upset, preferably with breakfast to help prevent nocturia.

Bumetanide is compatible with D5W, 0.9% NaCl, and lactated Ringer's solution, but it may also be given undiluted. The solution remains stable for 24 h if diluted. Administer the drug by IV push over 1-2 min. Bumetanide may also be given as a continuous infusion.

#### Bupivacaine

byoo-piv'a-caine ★ Marcaine, Marcaine Spinal, Sensorcaine, Sensorcaine-MPF

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anesthetics, local

# **MECHANISM OF ACTION**

An amide-type anesthetic that stabilizes neuronal membranes and prevents initiation and transmission of nerve impulses, thereby effecting local anesthetic actions. *Therapeutic Effect:* Produces local analgesia.

## PHARMACOKINETICS

Onset of action occurs within 4-10 min, depending on route of administration. Duration is 1.5-8.5 h. Well absorbed. Protein binding: 95%. Metabolized in liver. Excreted in urine. *Half-life*: 1.5-5.5 h (adults), 8.1 h (neonates).

#### AVAILABILITY

*Injection:* 0.25% (Marcaine, Sensorcaine-MPF), 0.5% (Marcaine, Sensorcaine-MPF), 0.75% (Marcaine, Marcaine Spinal, Sensorcaine-MPF).

#### INDICATIONS AND DOSAGES

Dose varies with procedure, depth of anesthesia, vascularity of tissues, duration of anesthesia, and condition of patient.

#### Ânalgesic, epidural (partial to moderate motor blockade)

Adults, Elderly. 10-20 mL (25-50 mg) of a 0.25% solution. Repeat once q3hr as needed. *Children* > 10 kg. 1-2.5 mg/kg single dose as a 0.125% or 0.25% solution or 0.2-0.4 mg/ kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.4 mg/kg/h. *Children* < 10 kg. 1-1.25 mg/ kg single dose as a 0.125% or 0.25% solution or 0.1-0.2 mg/ kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.2 mg/kg/h.

 Analgesic, epidural (moderate to complete motor blockade) *Adults, Elderly.* 10-20 mL (50-100 mg) as a 0.5% solution. Repeat once q3h as needed.

*Children* > 10 kg. 1-2.5 mg/kg single dose as a 0.125% or 0.25% solution or 0.2-0.4 mg/kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.4 mg/kg/h. *Children* < 10 kg.1-1.25 mg/kg single dose as a 0.125% or 0.25% solution or 0.1-0.2 mg/kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.2 mg/kg/h.

#### Analgesic, epidural (complete motor blockade)

*Adults.* 10-20 mL (75-150 mg) as a 0.75% solution. Repeat once q3h as needed.

- Children weighing >10 kg. 1-2.5 mg/kg single dose as a 0.125% or 0.25% solution or 0.2-0.4 mg/kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.4 mg/kg/h.
- Children weighing < 10 kg. 1-1.25 mg/kg single dose as a 0.125% or 0.25% solution or 0.1-0.2 mg/ kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.2 mg/kg/h.

#### Analgesic, intrapleural

*Adults, Elderly.* 10-30 mL bolus of 0.25%, 0.375%, or 0.5% q4-8h or 0.375% solution with epinephrine continuous infusion at 6 mL/h after 20 mL loading dose.

#### Analgesic, caudal (moderate to complete blockade)

Adults, Elderly. 15-30 mL of 0.5% solution (75-150 mg) or 0.25% solution (37.5-75 mg), repeated once every 3 h as needed. Children weighing > 10 kg. 1-2.5 mg/kg single dose as a 0.125% or 0.25% solution or 0.2-0.4 mg/kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.4 mg/kg/h.

Children weighing < 10 kg. 1-1.25 mg/kg single dose as a 0.125% or 0.25% solution or 0.1-0.2 mg/ kg/h continuous infusion as a 0.1%, 0.125%, or 0.25% solution. Maximum: 0.2 mg/kg/h.

#### Analgesic, dental

*Adults, Elderly.* 1.8-3.6 mL of 0.5% solution (9-18 mg) with epinephrine. A second dose of 9 mg may be administered. Maximum: 90 mg total dose.

#### Analgesic, peripheral nerve block (moderate to complete motor blockade)

*Adults, Elderly.* 5-37.5 mL (25-175 mg) of 0.5% solution or 5-70 mL (12.5-175 mg) of 0.25% solution. Repeat q3h as needed. Maximum: up to 400 mg/day. *Children 12 yr and older.* 0.3-2.5 mg/kg as a 0.25% or 0.5% solution. Maximum: 1 mL/kg of 0.25% solution or 0.5 mL/kg of 0.5% solution.

# Analgesic, retrobulbar (complete motor blockade)

Adults, Elderly. 2-4 mL (15-30 mg) of 0.75% solution.

 Analgesic, sympathetic blockade Adults, Elderly. 20-50 mL (50-125 mg) of 0.25% (no epinephrine) solution. Repeat once q3h as needed.

• Analgesic, hyperbaric spinal (obstetric, normal vaginal delivery) Adults, Elderly. 0.8 mL (6 mg)

bupivacaine in dextrose as 0.75% solution.

# Analgesic, hyperbaric spinal (obstetrical, cesarean section) Adulta, Eldanta, 1, 1, 4, mJ, (7, 5, 1)

*Adults, Elderly.* 1-1.4 mL (7.5-10.5 mg) bupivacaine in dextrose as 0.75% solution.

#### Anesthesia, hyperbaric spinal (surgical, lower extremity, and perineal procedures)

*Adults, Elderly.* 1 mL (7.5 mg) bupivacaine in dextrose as 0.75% solution.

*Children 12 yr and older.* 0.3-0.6 mg/kg bupivacaine in dextrose as a 0.75% solution.

#### Anesthesia, spinal (surgical, lower abdominal procedures)

*Adults, Elderly.* 1.6 mL (12 mg) bupivacaine in dextrose as 0.75% solution.

*Children 12 yr and older.* 0.3-0.6 mg/kg bupivacaine in dextrose as a 0.75% solution.

#### Anesthesia, spinal (surgical, hyperbaric, upper abdominal procedures)

*Adults, Elderly.* 2 mL (15 mg) bupivacaine in dextrose administered in horizontal position.

*Children 12 yr and older.* 0.3-0.6 mg/kg bupivacaine in dextrose as a 0.75% solution.

#### Analgesic, local infiltration

*Adults, Elderly.* 0.25% solution. Maximum: 225 mg with epinephrine or 175 mg without epinephrine. *Children 12 yr and older.* 0.5-2.5 mg/kg as a 0.25% or 0.5% solution. Maximum: 1 mL/kg of 0.25% solution or 0.5 mL/kg of 0.5% solution.

# CONTRAINDICATIONS

Local infection at the site of proposed lumbar puncture (spinal anesthesia), obstetric paracervical block anesthesia, septicemia (spinal anesthesia), severe hemorrhage, severe hypotension or shock, arrhythmias such as complete heart block, which severely restrict cardiac output (spinal anesthesia), sulfite allergy (epinephrine-containing solutions only), hypersensitivity to bupivacaine products or to other amide-type anesthetics.

#### INTERACTIONS Drug

Angiotensin-converting enzyme inhibitors: May increase risk of bradycardia and hypotension as well as loss of consciousness. **β-Blockers, ergot-type drugs, MAOIs, TCAs, phenothiazines, vasopressors:** May increase the risk of bupivacaine toxicity.

**Cisatracurium, rapacuronium:** May increase neuromuscular blocking action.

**Hyaluronidase:** May increase incidence of systemic reaction to bupivacaine.

**Propofol:** May increase hypnotic effect of propofol.

**Ropivacaine:** May prolong effect of intrathecal bupivacaine.

**Verapamil:** May increase risk of heart block.

#### Herbal

St. John's wort: May increase risk of cardiovascular collapse and/or delay emergence from anesthesia. Food

None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Occasional

Hypotension, bradycardia, palpitations, respiratory depression, dizziness, headache, vomiting, nausea, restlessness, weakness, blurred vision, tinnitus, apnea.

#### SERIOUS REACTIONS

 Arterial hypotension, bradycardia, ventricular arrhythmias, CNS depression and excitation, convulsions, respiratory arrest, tinnitus have been reported.
 Solutions with epinephrine contain metabisulfite, a sulfite that may cause allergic-type reactions, including anaphylaxis.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with pregnancy as well as obstetrical epidural anesthesia. Only concentrations lower than 0.75% should be used for obstetrical anesthesia. Caution should be used with regional anesthesia (Bier block), hyperthyroidism, hepatic disease, impaired cardiovascular function, hypertension, and heart block because there is a higher risk for developing bupivacaine toxicity. Solutions containing vasoconstrictors should be used cautiously in areas with limited blood supply, in the presence of disease that may adversely affect the cardiovascular system, or with peripheral vascular disease. Caution should also be used with retrobulbar blocks because bupivacaine has caused respiratory arrest.

Solutions containing epinephrine or other vasopressors should not be used concomitantly with ergot-type oxytocic drugs. Use in extreme caution in persons receiving MAOIs or tricyclic antidepressants because severe hypertension can occur. Spinal anesthetics should not be injected during uterine contractions. Local anesthetic solutions containing antimicrobial preservatives should not be used for caudal or epidural anesthesia. Reduced doses should be given to debilitated, elderly, acutely ill, and young people. It is unknown if bupivacaine is a triggering agent for malignant hyperthermia. Bupivacaine may cause severe disturbances of cardiac rhythm, shock, or heart block after spinal anesthesia. Severe doserelated cardiac arrhythmias may occur if preparations containing a vasoconstrictor such as epinephrine are used during or following the administration of chloroform, cyclopropane, halothane, trichloroethylene, or other related agents.

Bupivacaine is distributed in breast milk. Fetal bradycardia frequently follows obstetrical paracervical block with some amide-type local anesthetics and may be associated with fetal acidosis. Bupivacaine spinal with dextrose is not recommended in children younger than 18 yr. Some elderly may require dosage adjustment. **Storage** 

Store at room temperature. Protect from light. Bupivacaine 1.25 mg/mL in 0.9% NaCl injection is stable for up to 32 days when refrigerated.

#### Administration

Only preservative-free injection should be used for epidural or caudal blocks. Dosage varies with anesthetic procedure, area to be anesthetized, vascularity of the tissues, number of neuronal segments to be blocked, depth of anesthesia and degree and muscle relaxation required, duration of anesthesia desired, individual tolerance, and physical condition of the person. The 0.75% solutions should not used for obstetric epidural anesthesia due to reports of cardiac arrest and death occurring with this concentration. Repeated doses of bupivacaine may cause significant increases in blood levels with each repeated dose due to accumulation of the drug or its metabolites or to slow metabolic degradation. Concentrated solutions (0.5%-0.75%) should be given in incremental doses of 3-5 mL with sufficient time between doses to detect toxic manifestations of unintentional intravascular or intrathecal injection during epidural administration. Bupivacaine should be used in dextrose only for spinal analgesia. The lowest bupivacaine dosage that gives effective anesthesia should be used to avoid high plasma levels and serious systemic side effects.

#### **Buprenorphine**

byoo-pre-nor'feen ★ Buprenex, Butrans, Subutex ◆ Butrans Do not confuse Buprenex with Bumex.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C Controlled Substance Schedule: III For opiate dependence, must comply with Narcotic Addict Treatment Act (NATA) [21USC823(g)]

Classification: Opioid agonist-antagonist

#### **MECHANISM OF ACTION**

An opioid agonist-antagonist that binds with opioid receptors in the CNS. *Therapeutic Effect:* Alters the perception of and emotional response to pain; produces minimal opioid withdrawal symptoms.

#### PHARMACOKINETICS

IM onset 15-30 min, duration 4-6 h; absorption 90%-100%; hepatic metabolism; excreted in feces (68%-71%); also renal excretion.

#### AVAILABILITY

Tablets, Sublingual: 2 mg, 8 mg. Injection: 0.3 mg/mL. Transdermal Patch: 5 mcg/hr, 10 mcg/hr, 20 mcg/hr.

# INDICATIONS AND DOSAGES Analgesia

IV, IM

Adults, Children older than 12 yr: 0.3 mg q6-8h as needed. May repeat once in 30-60 min. Range: 0.15-0.6 mg q4-8h as needed. Children 2-12 yr: 2-6 mcg/kg q4-6h as needed.

Elderly. 0.15 mg q6h as needed.

Buprenorphine (Generic Name)

# **CHRONIC ANALGESIA**

For moderate to severe pain. TRANSDERMAL PATCH *Adults*. For opioid-naïve patients, apply a 5 mcg/h patch q 7 days. After a minimum of 72 h for each dose, may titrate to analgesia. Use close supervision during titration every 3 days. Do not exceed 20 mcg/h patch every 7 days.

# Opioid dependence SUBLINGUAL

NOTE: Under the Drug Addiction Treatment Act of 2000 (DATA), only physicians who meet certain criteria may prescribe buprenorphine tablets for opioid dependence.

Adults, Elderly, Children older than 16 yr. Initially, 12-16 mg/day, beginning at least 4 h after last use of heroin or short-acting opioid. Maintenance: 16 mg/day. Range: 4-24 mg/day. Patients should be switched to buprenorphine and naloxone combination, which is preferred for maintenance treatment to defer abuse.

# CONTRAINDICATIONS

Hypersensitivity to buprenorphine; hypersensitivity to naloxone for those receiving the fixed combination product containing naloxone (Suboxone).

The transdermal path is contraindicated for use of acute pain or in opioid-naïve patients. Do not use buprenorphine in patients with severe respiratory depression or in patients with paralytic ileus.

# INTERACTIONS

#### Drug

Class IA or III Antiarrhythmics: May increase risk for QT prolongation with buprenorphine transdermal patch use; avoid co-use. CNS depressants, MAOIs:

May increase CNS or respiratory depression and hypotension.

# Other opioid analgesics: May

decrease the effects of other opioid analgesics.

# Herbal

Kava kava, St. John's wort, valerian: May increase CNS depression. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase levels.

# SIDE EFFECTS

#### Frequent

Tablet: Headache, pain, insomnia, anxiety, depression, nausea, abdominal pain, constipation, back pain, weakness, rhinitis, withdrawal syndrome, infection, diaphoresis. Injection (more than 10%): Sedation.

Occasional

Injection: Hypotension, respiratory depression, dizziness, headache, vomiting, nausea, vertigo.

# SERIOUS REACTIONS

• Overdose results in cold and clammy skin, weakness, confusion, severe respiratory depression, cyanosis, pinpoint pupils, and extreme somnolence progressing to seizures, stupor, and coma.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic impairment and possible neurologic injury, as well as those at risk for respiratory compromise. Do not exceed recommended doses. Use transdermal patch with caution in patients with unstable atrial fibrillation, bradycardia, heart failure, or active myocardial ischemia and avoid use if long QT syndrome is present or if patient is receiving other QT prolonging cardiac drugs, as the patch use has been associated with QT prolongation. Dizziness may occur, so change positions slowly and avoid tasks that require mental alertness or motor skills. BP, pulse rate, respiratory status, and clinical improvement should be monitored. For patients on chronic therapy, do not drive or operate machinery until the effects of the drug are known.

#### Storage

Store all dosage forms at controlled room temperature. Avoid excessive heat.

#### Administration

Place the sublingual tablet under the tongue until dissolved. If two or more tablets are needed, all may be placed under the tongue at the same time. Do not chew or swallow whole.

For IV use, administer buprenorphine slowly, over at least 2 min. No dilution is necessary for either IV or IM.

Apply transdermal patch to the left or right upper outer arm, upper chest, upper back, or the side of the chest, on a clean, dry, and nearly hairless area. Do not apply to broken or irritated skin; rotate sites. Wear for 7 days. After removal, wait a minimum of 21 days before reapplying to the same skin site again. If a patch falls off, apply new patch to a different site.

#### Bupropion

byoo-proe'pee-on Aplenzin, Budeprion, Buproban, Wellbutrin, Wellbutrin SR, Wellbutrin XL, Zyban Do not confuse bupropion with buspirone, Wellbutrin with Wellcovorin or Wellferon, or Zyban with Zagam.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antidepressant

#### MECHANISM OF ACTION

An aminoketone that blocks the reuptake of neurotransmitters, including serotonin and norepinephrine at CNS presynaptic membranes, increasing their availability at postsynaptic receptor sites. Also reduces the firing rate of noradrenergic neurons. *Therapeutic Effect:* Relieves depression and nicotine withdrawal symptoms.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 84%. Crosses the blood-brain barrier. Undergoes extensive first-pass metabolism in the liver to active metabolite. Primarily excreted in urine. *Half-life*: 14 h.

#### AVAILABILITY

Tablets (Wellbutrin): 75 mg, 100 mg. Tablets, Sustained Release (Wellbutrin SR, Zyban): 100 mg, 150 mg. Tablets, Extended Release (Wellbutrin XL): 150 mg, 300 mg. Tablets, Extended Release (Aplenzin): 174 mg, 348 mg, 522 mg.

# INDICATIONS AND DOSAGES Depression

PO (IMMEDIATE RELEASE) Adults. Initially, 100 mg twice a day. May increase to 100 mg 3 times a day no sooner than 3 days after beginning therapy. Maximum: 450 mg/day. *Elderly*. 37.5 mg twice a day. May increase by 37.5 mg q3-4 days. Maintenance: Lowest effective dosage.

PO (SUSTAINED RELEASE) Adults, Elderly. Initially, 150 mg/ day as a single dose in the morning. May increase to 150 mg twice a day as early as day 4 after beginning therapy. Maximum: 400 mg/day. PO (EXTENDED RELEASE WELLBUTRIN XL ONLY)

Bupropion (Generic Name)

Adults. 150 mg once a day. May increase to 300 mg once a day. Maximum: 450 mg once a day. PO (EXTENDED RELEASE, APLENZIN ONLY)

*Adults*, 174 mg once a day in the morning. May increase to 348 mg once a day on day 4 of treatment. Maximum: 522 mg once a day.

#### Smoking cessation PO (ZYBAN)

Adults. Initially, 150 mg a day for 3 days; then 150 mg twice a day for 7-12 wks. Longer duration of maintenance therapy may be considered. Do not exceed 300 mg/ day.

#### CONTRAINDICATIONS

Hypersensitivity. Current or prior diagnosis of anorexia nervosa or bulimia, seizure disorder, use within 14 days of MAOIs.

#### INTERACTIONS

! NOTE: It is important for a patient taking one product of bupropion to avoid other products containing the drug.

#### Drug

Carbamazepine, nevirapine, phenobarbital, phenytoin, rifampin: Decreased bupropion levels. Desipramine, paroxetine, sertraline: May increase bupropion levels MAOIs: Concurrent use or use within 14 days contraindicated. Tamoxifen: Bupropion decreases tamoxifen efficacy. Tricyclic antidepressants, phenothiazines, benzodiazepines, alcohol, haloperidol, and trazodone: Increased seizure risk. Herbal None known. Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS Frequent

Constipation, weight gain or loss, nausea, vomiting, anorexia, dry mouth, headache, diaphoresis, tremors, sedation, insomnia, dizziness, agitation. Occasional

#### Jecasional

Diarrhea, akinesia, blurred vision, tachycardia, confusion, hostility, fatigue.

#### SERIOUS REACTIONS

• The risk of seizures increases in patients taking more than 150 mg/dose of bupropion, in patients with a history of bulimia or seizure disorders, and in patients discontinuing drugs that may lower the seizure threshold.

#### PRECAUTIONS & CONSIDERATIONS

Bupropion should be used with caution in patients with renal and hepatic disease, bipolar disorder, recent myocardial infarction, cranial trauma, undergoing electroconvulsive therapy, and in elderly patients. Initial and maximum doses are reduced in patients with severe hepatic cirrhosis. Use in pregnancy only if the potential benefit outweighs the possible risks. Is excreted in breast milk; use is not recommended in nursing mothers. Bupropion is not FDA approved for use in children. A thorough cardiovascular assessment is recommended before initiation of therapy in pediatric patients; assessment should include medical history, family history, and physical examination with consideration of ECG testing. In addition, antidepressants have been associated with an increased risk of suicidal thinking and behavior
in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders. Elderly patients may be at greater risk of accumulation with chronic dosing.

#### Storage

Store at controlled room temperature. Administration

May take without regard to food. Swallow sustained-release and extended-release tablets whole; do not crush or chew.

### **Buspirone**

byoo-spir'own ★ BuSpar ₩ Bustab Do not confuse buspirone with bupropion.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Anxiolytics

#### MECHANISM OF ACTION

Although its exact mechanism of action is unknown, this nonbarbiturate is thought to bind to serotonin and dopamine receptors in the CNS. The drug may also increase norepinephrine metabolism in the locus ceruleus. *Therapeutic Effect:* Produces anxiolytic effect.

### PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Protein binding: 95%. Undergoes extensive first-pass metabolism. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 2-3 h.

#### AVAILABILITY

*Tablets:* 5 mg, 7.5 mg, 10 mg, 15 mg, 30 mg.

# INDICATIONS AND DOSAGES Generalized anxiety disorders PO

*Adults.* 5 mg 2-3 times a day or 7.5 mg twice a day. May increase by 5 mg/day every 2-4 days. Maintenance: 15-30 mg/day in 2-3 divided doses. Maximum: 60 mg/day. *Elderly.* Initially, 5 mg twice a day. May increase by 5 mg/day every 2-3 days. Maximum: 60 mg/day. *Children 6 yr and older.* Initially, 2.5-5 mg/day. May increase by 5 mg/day at weekly intervals. Usual maintenance dose: 15-30 mg/day in divided doses.

#### **OFF-LABEL USES**

Management of panic attack.

## CONTRAINDICATIONS

Concurrent use of MAOIs, severe hepatic or renal impairment, hypersensitivity.

#### INTERACTIONS

#### Drug

Erythromycin, itraconazole:

May increase buspirone blood concentration and risk of toxicity. **MAOIs:** May increase BP. Contraindicated. **Other CNS depressants:** Potentiates

effects of buspirone and may increase sedation.

#### Herbal

Kava kava: May increase sedation. St. John's wort: May decrease buspirone levels. Food

Alcohol: Potentiates effects of buspirone and may increase sedation. Grapefruit, grapefruit juice: May increase buspirone blood concentration and risk of toxicity. Avoid concurrent use.

### DIAGNOSTIC TEST EFFECTS

None known.

Buspirone (Generic Name)

### SIDE EFFECTS

#### Frequent (6%-12%)

Dizziness, somnolence, nausea, headache.

#### Occasional (2%-5%)

Nervousness, fatigue, insomnia, dry mouth, light-headedness, mood swings, blurred vision, poor concentration, diarrhea, paresthesia.

## Rare

Muscle pain and stiffness, nightmares, chest pain, involuntary movements.

### SERIOUS REACTIONS

• Overdose may produce severe nausea, vomiting, dizziness, drowsiness, abdominal distention, and excessive pupil contraction.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with impaired renal or hepatic function. It is unknown whether buspirone crosses the placenta or is distributed in breast milk. The safety and efficacy of buspirone have not been established in children under 6 yr of age. No age-related precautions have been noted in children. No age-related precautions have been noted in elderly patients.

Drowsiness may occur but usually disappears with continued therapy. Change positions slowly from recumbent, to sitting, before standing to prevent dizziness. Alcohol and tasks that require mental alertness or motor skills should also be avoided. Autonomic responses, such as cold, clammy hands and diaphoresis, and motor responses, such as agitation, trembling, and tension, should be assessed. Hepatic and renal function should be monitored in long-term therapy.

#### Administration

Take buspirone consistently either with or without food. Crush tablets if needed. Improvement may be noticed within 7-10 days of starting therapy, but optimum therapeutic effect generally takes 3-4 wks to appear.

## Butenafine

byoo-ten'a-feen Lotrimin Ultra, Mentax

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC/Rx

**Classification:** Antifungals, topical, dermatologics

## **MECHANISM OF ACTION**

An antifungal agent that locks biosynthesis of ergosterol, essential for fungal cell membrane. Fungicidal. *Therapeutic Effect:* Relieves dermatophytic infections.

#### PHARMACOKINETICS

Total amount absorbed into systemic circulation has not been determined. Metabolized in liver. Excreted in urine. *Half-life:* Biphasic decline with half-lives of 35 h and > 150 h.

#### AVAILABILITY

*Cream:* 1% (Lotrimin Ultra, Mentax).

#### INDICATIONS AND DOSAGES Tinea corporis, tinea cruris, tinea

## Tinea corporis, tinea cruris, tinea versicolor

TOPICAL

*Adults, Elderly, Children 12 yr and older.* Apply to affected area and immediate surrounding skin once daily for 2 wks.

## B

## **Busulfan**

byoo-sull'fan ★ ➡ Busulfex, Myleran Do not confuse Myleran with Alkeran, Leukeran, or Mylicon.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastic, alkylating agent

### **MECHANISM OF ACTION**

An alkylating agent that interferes with DNA replication and RNA synthesis. Cell cycle-phase nonspecific. *Therapeutic Effect:* Disrupts nucleic acid function and causes myelosuppression.

### PHARMACOKINETICS

Completely absorbed from the GI tract. Protein binding: 33%. Metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 2.5 h.

## AVAILABILITY

Tablets: 2 mg. Injection Solution: 6 mg/mL.

## INDICATIONS AND DOSAGES

#### Remission induction in chronic myelogenous leukemia (CML) PO

*Adults, Elderly.* 4-8 mg/day; up to 12 mg/day. Maintenance: 1-4 mg/day to 2 mg/wks. Continue until WBC count is 10,000-20,000/mm<sup>3</sup>, and resume when WBC count reaches 50,000/mm<sup>3</sup>.

*Children.* 0.06-0.12 mg/kg/day. Maintenance: Titrate to maintain leukocyte count above 40,000/mm<sup>3</sup>, reduce dose by 50% if count is 30,000-40,000/mm<sup>3</sup>, and discontinue if the count is 20,000/mm<sup>3</sup> or less.

#### Marrow ablative conditioning for bone marrow transplantation IV

Adults, Elderly, Children weighing more than 12 kg. 0.8 mg/kg/dose q6h for total of 16 doses. (Use IBW or ABW, whichever is lower.)

*Children weighing 12 kg or less.* 1.1 mg/kg/dose (ABW) q6h for 16 doses. PO

Adults, Elderly. 1 mg/kg/dose (IBW) q6h for 16 doses.

## IV INCOMPATIBILITIES

Do *not* dilute in dextrose 5% because it is incompatible.

## CONTRAINDICATIONS

Disease resistance to previous therapy with this drug; hypersensitivity to any component of the formulation.

## INTERACTIONS

#### Drug

Acetaminophen: Reduced busulfan clearance if used within 72 h before or concurrently with busulfan.

Itraconazole, ketoconazole: Increased busulfan levels.

**Metronidazole:** Increased busulfan trough concentrations and increased toxicity.

#### Herbal

St. John's wort: May decrease busulfan levels.

Alcohol: May increase GI irritation.

## DIAGNOSTIC TEST EFFECTS

Therapy associated with severe myelosuppression; AST elevation; increased creatinine, bilirubin, glucose; reduced calcium, potassium, magnesium.

## SIDE EFFECTS

#### Expected

Nausea, stomatitis, vomiting, anorexia, insomnia, diarrhea, fever, abdominal pain, anxiety.

#### Frequent

Headache, rash, asthenia, infection, chills, tachycardia, dyspepsia.

#### Occasional

Constipation, dizziness, edema, pruritus, cough, dry mouth, depression, abdominal enlargement, pharyngitis, hiccups, back pain, alopecia, myalgia.

#### Rare

Injection site pain, arthralgia, confusion, hypotension, lethargy.

#### SERIOUS REACTIONS

• Busulfan's major adverse effect is myelosuppression, resulting in hematologic toxicity, as evidenced by anemia, severe leukopenia, and severe thrombocytopenia.

 Very high busulfan dosages may produce blurred vision, muscle twitching, and tonic-clonic seizures.
 High concentrations are also associated with increased risk of hepatic veno-occlusive disease.

• Long-term therapy (more than 4 yr) may produce pulmonary syndrome ("busulfan lung"), characterized by persistent cough, congestion, crackles, and dyspnea.

• Hyperuricemia may produce uric acid nephropathy, renal calculi, and acute renal failure.

#### **PRECAUTIONS & CONSIDERATIONS**

Severe bone marrow suppression is common; may result in prolonged pancytopenia and severe neutropenia, thrombocytopenia, and/ or anemia. Secondary malignancies have been observed following busulfan therapy. Seizures have been associated with use; initiate prophylactic anticonvulsant therapy before high-dose treatment. Solvent in the IV formulation has been associated with impaired fertility, hepatotoxicity, hallucinations, somnolence, lethargy, and confusion. Busulfan may cause fetal harm if administered during pregnancy. Women of childbearing potential should avoid pregnancy while receiving busulfan. Breastfeeding is not recommended during busulfan therapy.

#### Storage

Store unopened injectable in refrigerator. Final solution stable 8 h at room temperature; complete infusion within the 8 h. Dilution in NS is stable for 12 h in refrigerator; infusion must be completed within the 12 h. Store tablet at room temperature.

#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

Dilute injectable with NS or D5W. Final concentration usually 0.5 mg/ mL. IV dose should be administered as a 2-h infusion via a central line.

Administer oral tablets 1 h before or 2 h after meals.

## B

## **Butabarbital Sodium**

byoo-tah-bar'bi-tal so'dee-uhm 🛃 Butisol

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: III

*Classification:* Sedativehypnotic, barbiturates

## **MECHANISM OF ACTION**

A barbiturate and nonselective CNS depressant that binds at GABA receptor complex, enhancing GABA activity. *Therapeutic Effect:* Produces hypnotic effect due to CNS depression.

## PHARMACOKINETICS

Widely distributed. Metabolized in liver. Minimally excreted unchanged in urine. *Half-life:* 34-100 h.

## AVAILABILITY

*Tablets:* 30 mg, 50 mg. *Elixir:* 30 mg/5 mL.

## INDICATIONS AND DOSAGES

Insomnia, short-term
 PO
 Adults. 50-100 mg at bedtime.
 Preoperative sedation
 PO
 Adults. 50-100 mg, 60-90 min before surgery.
 Children. 2-6 mg/kg. Maximum: 100 mg.
 Sedation, daytime
 PO
 Adults. 15-30 mg 3-4 times a day.

## CONTRAINDICATIONS

Porphyria, barbiturate sensitivity.

## INTERACTIONS

#### Drug

Alcohol, CNS depressants: May be increased sedative and respiratory depressant effects.

Corticosteroids, cyclosporine, doxycyline, lamotrigine, methadone, oral contraceptives, quinidine, theophylline, tricyclic antidepressants, warfarin:

Increased metabolism of these agents may reduce their therapeutic effects.

## Herbal

Valerian, kava kava: May increase sedative effects.

#### Food

Alcoholic beverages: Increased sedative and respiratory depressant effects.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Occasional (1%-3%) Somnolence.

## Rare (<1%)

Confusion, dizziness, agitation, nausea, vomiting, constipation, headache, hypotension, acne.

## SERIOUS REACTIONS

• Skin eruptions appear as hypersensitivity reaction.

• Blood dyscrasias, liver disease, and hypocalcemia occur rarely.

• Complex behaviors such as "sleep driving" (i.e., driving while not fully awake, with amnesia for the event) have been reported. Discontinue if these occur due to safety risk.

• Tolerance, psychological and physical dependence may occur with continued use.

## **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with depression, a history of drug

#### 225.e4 Butabarbital Sodium

abuse, hepatic or renal impairment, respiratory disease, and in elderly patients and children. Avoid use in pregnancy; may cause fetal harm. Acute withdrawal symptoms may occur in neonates following in utero exposure near term. Excreted in breast milk; use with caution in nursing mothers. Paradoxical reactions, including agitation and hyperactivity, have been observed in pediatric patients. Elderly patients may exhibit confusion, excitement, and mental depression. Alcohol consumption should be avoided while taking butabarbital. Tasks that require mental alertness or motor skills should be avoided because the drug may cause dizziness and drowsiness. Monitor blood pressure, respirations during treatment.

#### Administration

May take orally without regard to food.

## Tinea pedis

#### TOPICAL

В

Adults, Elderly, Children 12 yr and older. Apply to affected area and immediate surrounding skin twice daily for 7 days or once daily for 4 wks.

## CONTRAINDICATIONS

Hypersensitivity to butenafine or any component of the formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Occasional (2%) Contact dermatitis, burning/stinging, worsening of the condition. Rare (≤ 2%)

Erythema, irritation, pruritus.

## SERIOUS REACTIONS

None known.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with sensitivity to naftifine or other allylamine antifungals. It is unknown whether butenafine is excreted in breast milk. Safety and efficacy of butenafine have not been established in children younger than 12 yr. There are no age-related precautions noted for elderly patients. Avoid contact with eyes, nose, mouth, or other mucous membranes.

#### Storage

Store products at room temperature.

#### Administration

For external use only. Gently cleanse and dry area prior to application. Use occlusive dressings only as ordered. Apply sparingly and rub into area thoroughly. Use for full course of treatment.

#### **Butoconazole**

byoo-toe-ko'na-zole

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antifungals, azole antifungals

## **MECHANISM OF ACTION**

An antifungal imidazole derivative that inhibits the steroid synthesis, a vital component of fungal cell formation, thereby damaging the fungal cell membrane. *Therapeutic Effect:* Fungistatic.

## PHARMACOKINETICS

Following vaginal use, roughly 1.7% of the dose was absorbed. Peak plasma levels of the drug and its metabolites occur between 12 and 24 h after vaginal administration.

## AVAILABILITY

Cream: 2% (Gynazole-1, Rx).

## INDICATIONS AND DOSAGES

Treatment of vaginal candidiasis
 VAGINAL

*Adults, Elderly.* Insert one applicatorful (5 g cream, or 100 mg of butoconazole) intravaginally as a single dose.

## CONTRAINDICATIONS

Hypersensitivity to butoconazole or any of its components.

## B

INTERACTIONS

#### Drug

Spermicides (e.g., nonoxynol-9):

May inactivate spermicide; use other form of contraception.

#### Herbal

Not known. Food Not known.

## SIDE EFFECTS

Occasional Vaginal itching, burning, irritation.

### SERIOUS REACTIONS

• Soreness, swelling, pelvic pain, or cramping rarely occurs.

## **PRECAUTIONS & CONSIDERATIONS**

Be aware that butoconazole contains mineral oil, which may weaken latex or rubber products such as condoms. Tampons should not be used while using butoconazole because tampons can absorb and decrease the efficacy of the medication. It is unknown whether butoconazole crosses the placenta or is distributed in breast milk. Limit use during pregnancy to the second and third trimesters. Safety and efficacy not established in females under 12 yr of age.

#### Storage

Store at room temperature and avoid temperatures above 86° F. Do not use product if applicator tip is missing or broken.

#### Administration

Peel back the protective foil and remove the prefilled applicator. Applicator is designed to be used with the tip in place. Insert one applicatorful intravaginally as a single dose.

### **Butorphanol**

byoo-tor'fa-nole ★ Stadol, Stadol NS ★ Apo-Butorphanol **Do not confuse butorphanol** with butabarbital or Stadol with Haldol or sotalol.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used for prolonged time, high dose at term) Controlled Substance Schedule: IV

**Classification:** Analgesics, narcotic agonist-antagonist

## **MECHANISM OF ACTION**

An opioid that binds to opiate receptor sites in the central nervous system (CNS). Reduces the intensity of pain stimuli incoming from sensory nerve endings. *Therapeutic Effect:* Alters pain perception and emotional response to pain.

## PHARMACOKINETICS

Route	Onset (min)	Peak	Duration (h)
IM	10-30	30-60 min	3-4
IV	<1	30 min	2-4
Nasal	15	1-2 h	4-5

Rapidly absorbed after IM injection. Protein binding: 80%. Extensively metabolized in the liver. Primarily excreted in urine. *Half-life:* 2.5-4 h.

## AVAILABILITY

*Injection:* 1 mg/mL, 2 mg/mL. *Nasal Spray:* 1 mg/spray.

#### INDICATIONS AND DOSAGES > Analgesia

IM Adults. 1-4 mg q3-4h as needed. *Elderly.* 1 mg q4-6h as needed. IV

*Adults.* 0.5-2 mg q3-4h as needed. *Elderly.* 1 mg q4-6h as needed.

## Migraine

#### NASAL

*Adults.* 1 mg or 1 spray in one nostril. May repeat in 60-90 min. May repeat 2-dose sequence q3-4h as needed. Alternatively, 2 mg (one spray each nostril) if patient remains recumbent; may repeat in 3-4 h.

## Patients with hepatic or renal impairment

#### NASAL

Limit intial dose to 1 mg, followed by 1 mg in 90-120 min if needed. Follow patient response rather than repeat at fixed times, at no less than q6h. IM/IV

Initial dose should generally be half the normal dose, that is, 0.5 mg IV or 1 mg IM. Repeat no less than q6h, as indicated by patient response.

## CONTRAINDICATIONS

Hypersensitivity to butorphanol tartrate or the preservation benzethonium chloride, which is found in some products (nasal spray and multidose injection vials).

## INTERACTIONS

## Drug

#### Alcohol, CNS depressants:

May increase CNS or respiratory depression and hypotension.

**Buprenorphine:** Effects may be decreased with buprenorphine. **MAOIs:** May produce severe, fatal reaction unless dose is reduced by one fourth.

Sumatriptan nasal spray: May reduce butorphanol levels; may increase risk of transient high BP. Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## **IV COMPATIBILITIES**

Atropine, diphenhydramine (Benadryl), droperidol, hydroxyzine (Vistaril), morphine, promethazine (Phenergan), propofol (Diprivan).

## SIDE EFFECTS

#### Frequent

Parenteral: Somnolence (43%), dizziness (19%). Nasal: Nasal congestion (13%),

insomnia (11%).

#### Occasional

Parenteral (3%-9%): Confusion, diaphoresis, clammy skin, lethargy, headache, nausea, vomiting, dry mouth.

Nasal (3%-9%): Vasodilation, constipation, unpleasant taste, dyspnea, epistaxis, nasal irritation, upper respiratory tract infection, tinnitus. **Rare** 

Parenteral: Hypotension, pruritus, blurred vision, sensation of heat, CNS depression or paradoxic stimulation, insomnia. Nasal: Hypertension, tremor, ear pain, paresthesia, depression, sinusitis.

## SERIOUS REACTIONS

 Abrupt withdrawal after prolonged use may produce symptoms of narcotic withdrawal, such as abdominal cramping, rhinorrhea, lacrimation, anxiety, increased temperature, and piloerection or goose bumps.

• Overdose results in severe respiratory depression, skeletal

muscle flaccidity, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

• Tolerance to analgesic effect and physical dependence may occur with chronic use.

#### **PRECAUTIONS & CONSIDERATIONS**

Because of its opioid antagonist properties, butorphanol is not recommended for use in opioiddependent patients. The use of butorphanol in patients with head injury may be associated with CO<sub>2</sub> retention and secondary elevation of CSF pressure, and alterations in mental state. The drug may produce respiratory depression, especially in patients suffering from CNS diseases or respiratory impairment.

Caution is warranted with hypertension, impaired liver or renal function, or myocardial infarction, before biliary tract surgery (because the drug produces spasm of sphincter of Oddi), and in elderly or debilitated patients. During labor, assess fetal heart tones and uterine contractions. Be aware that the safety and efficacy of butorphanol have not been established in children younger than 18 yr of age. Be aware that elderly patients may be more sensitive to effects. Adjust drug dose and interval for elderly patients.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. BP, pulse rate and quality, respirations, and clinical improvement of pain should be monitored.

#### Storage

Store at room temperature.

#### Administration

Injection may be given by IM or IV push. For IV use, butorphanol may be given undiluted. Administer over 3-5 min.

For intranasal use, blow nose to clear nasal passages as much as possible. Before first use, prime pump 7-8 times. If unit not used for > 48 h, then reprime by pumping 1-2 times. Spray into nostril while holding other nostril closed and concurrently inspire through nose to permit medication as high into nasal passages as possible. Alternate nostrils when repeat doses are given. Cabergoline

ca-ber′goe-leen ★ ♥ Dostinex

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Dopamine agonist; antihyperprolactinemic

## **MECHANISM OF ACTION**

Agonist at dopamine D<sub>2</sub> receptors, suppressing prolactin secretion. *Therapeutic Effects:* Shrinks prolactinomas, restores gonadal function.

## PHARMACOKINETICS

Cabergoline is administered orally and undergoes significant first-pass metabolism following systemic absorption. Extensively metabolized in the liver. Elimination is primarily in the feces. *Half-life*: 80 h.

## AVAILABILITY

Tablet: 0.5 mg.

#### INDICATIONS AND DOSAGES • Hyperprolactemia (idiopathic or due to primary pituitary adenomas) PO

Adults, Elderly. 0.25 mg 2 times per wk, titrate by 0.25 mg/dose no more than every 4 wks up to 1 mg 2 times/ wk. Serum prolactin level guides dose adjustment.

## **OFF-LABEL USES**

Parkinson's disease, restless leg syndrome (RLS).

## CONTRAINDICATIONS

Hypersensitivity to cabergoline, ergot alkaloids. Uncontrolled hypertension, valvular heart disease.

#### INTERACTIONS Drug

Antihypertensives: May increase hypotensive effect. Antipsychotics, phenothiazinetype antiemetics: Cabergoline may diminish the effects of these dopamine agonists. Antiretroviral drugs: May lead to ergot toxicity. Cimetidine, haloperidol, loxapine, MAOIs, methyldopa, metoclopramide, molindone, olanzapine, phenothiazines, pimozide, reserpine, risperidone, thiothixene, tricyclic antidepressants: Antagonizes the prolactin-lowering effect of cabergoline. Ergot alkaloids: May lead to ergot toxicity. Imatinib: May increase the risk of ergot-related side effects. Levodopa: Additive neurologic effects are possible. Phentermine and other medications associated with cardiac valvulopathy: Avoid co-use, since may increase risk of valve problems. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Lowers serum prolactin.

## SIDE EFFECTS

#### Frequent

Nausea, orthostatic hypotension, confusion, dyskinesia, hallucinations, peripheral edema.

#### Occasional

Headache, vertigo, dizziness, dyspepsia, postural hypotension, constipation, asthenia, fatigue, abdominal pain, drowsiness. **Rare** 

# Vomiting, dry mouth, diarrhea, flatulence, anxiety, depression,

Cabergoline (Generic Name)

dysmenorrhea, dyspepsia, mastalgia, paresthesias, vertigo, visual impairment, peptic ulcer.

#### SERIOUS REACTIONS

Overdosage may produce nasal congestion, syncope, or hallucinations.
Cardiac valvulopathy or pleuropulmonary or pulmonary fibrotic changes occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is advised in patients with hepatic impairment. Orthostatic hypotension frequently reported; risk increased with initial doses > 1 mgand concurrent use of other blood pressure-lowering medications. It is unknown whether cabergoline crosses the placenta or is distributed into breast milk. In general, dopamine agonists like cabergoline are not used in pregnant women. Dopamine agonist use is not recommended for postpartum lactation inhibition or suppression. Safety and efficacy have not been established in children or in elderly patients.

Prior to initiation of therapy, consider echocardiography to assess presence of valvular heart disease. Patients receiving long-term treatment need periodic assessment of cardiac status.

## Storage

Store at room temperature. Administration Take without regard to meals.

#### **Caffeine Citrate**

kaf'een sit'rate

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** CNS stimulants, xanthine derivatives

## **MECHANISM OF ACTION**

A methylxanthine and competitive inhibitor of phosphodiesterase that blocks antagonism of adenosine receptors. *Therapeutic Effect:* Stimulates respiratory center, increases minute ventilation, decreases threshold of or increases response to hypercapnia, increases skeletal muscle tone, decreases diaphragmatic fatigue, increases metabolic rate, and increases oxygen consumption.

#### PHARMACOKINETICS

Protein binding: 36%. Widely distributed through the tissues and CSF. Metabolized in liver; limited metabolism in preterm neonates. Excreted in urine. *Half-life:* 4-5 h in adults, children, and older infants; 3-4 days in neonates.

#### AVAILABILITY

Intravenous Solution: 20 mg/mL (Cafcit). Oral Solution: 20 mg/mL (Cafcit).

## INDICATIONS AND DOSAGES

#### Neonatal apnea IV/PO

Dosage listed as caffeine citrate. Infants between 28 and 33 wks gestational age. Loading dose: 20 mg/kg IV over 30 min. Maintenance: 5 mg/kg/day IV over 10 min or orally beginning 24 h after loading dose.

#### CONTRAINDICATIONS

Hypersensitivity to caffeine, xanthines, or any other component of the formulation.

#### INTERACTIONS

#### Drug

**Cimetidine:** May increase effects of caffeine citrate.

**Ketoconazole:** May increase effects of caffeine citrate.

#### 232 Calcipotriene

**MAOIs:** Increased risk for cardiac arrhythmia or hypertension.

**Phenobarbital:** May decrease effects of caffeine citrate.

**Phenytoin:** May decrease effects of caffeine citrate.

**Theophylline:** May increase caffeine concentrations and toxicity.

#### Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May alter blood glucose concentration. Therapeutic caffeine level: 8-40 mg/L. Serious toxicity may occur at 50 mg/L.

### IV INCOMPATIBILITIES

Furosemide, lorazepam, nitroglycerin, pantoprazole.

#### 🗏 IV COMPATIBILITIES

Amino acid solutions, D5W, IV fat emulsion, antipyrine, calcium, dopamine, fentanyl, heparin, D50W.

#### SIDE EFFECTS

#### Occasional

Feeding intolerance, irritability, restlessness, nausea, tremor.

#### Rare

Necrotizing enterocolitis, rash, tachycardia, increased ventricular output, increased stroke volume, hypo/ hyperglycemia, arrhythmia, vomiting.

#### SERIOUS REACTIONS

 Accidental injury, sepsis, hemorrhage, gastritis, GI hemorrhage, disseminated intravascular coagulation, acidosis, abnormal healing, cerebral hemorrhage, dyspnea, lung edema, dry skin, retinopathy, and kidney failure have been reported.

• Overdosage includes symptoms of fever, tachypnea, jitteriness, insomnia,

fine tremor of the extremities, hypertonia, opisthotonos, tonicclonic movements, nonpurposeful jaw and lip movements, vomiting, hyperglycemia, elevated blood urea nitrogen, and elevated total leukocyte concentration.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in infants with cardiovascular disorders, hepatic or renal impairment, and seizure disorders. Use with caution in adult patients with tremor, anxiety, agitation, or heart arrhythmias. Caffeine readily crosses the placenta and is excreted in breast milk. Safety and efficacy in long-term treatment of infants have not been established. Be aware that necrotizing enterocolitis may occur in infants. There are no age-related precautions noted in elderly patients. **Storage** 

Store at room temperature.

#### Administration

! Be aware that 20 mg of caffeine citrate = 10 mg caffeine base. Take care in calculating dosage. Do not administer if particulate matter or discoloration is visible; discard vial. Discard unused portion. Administer IV using a syringe pump over 30 min for loading dose and over 10 min for maintenance doses. Oral administration: May give with formula feedings.

## **Calcipotriene**

kal-sip'oh-tri-een

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Dermatologics, topical vitamin D analogs

## **MECHANISM OF ACTION**

A synthetic vitamin  $D_3$  analog that regulates skin cell (keratinocyte) production and development. *Therapeutic Effect:* Preventing abnormal growth and production of psoriasis (abnormal keratinocyte growth).

### PHARMACOKINETICS

Minimal absorption through intact skin. Metabolized in liver.

## AVAILABILITY

Cream: 0.005% (Dovonex). Ointment: 0.005% (Dovonex). Topical Foam: 0.0005% (Sorilux). Topical Solution: 0.005% (Dovonex).

# INDICATIONS AND DOSAGES Psoriasis

TOPICAL

Adults, Elderly, Children 12 yr and older. Apply thin layer to affected skin twice daily (morning and evening); rub in gently and completely.

#### Scalp psoriasis

TOPICAL SOLUTION Adults, Elderly, Children 12 yr and older. Apply to lesions twice daily after combing hair.

#### CONTRAINDICATIONS

Hypercalcemia or evidence of vitamin D toxicity, use on face, hypersensitivity to calcipotriene or any component of the formulation. Scalp solution also contraindicated in patients with acute psoriatic eruptions.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Excessive use may increase serum calcium level.

## SIDE EFFECTS

#### Frequent

Burning, itching, skin irritation. Occasional

Erythema, dry skin, peeling, rash, worsening of psoriasis, dermatititis.

### Rare

Skin atrophy, hyperpigmentation, folliculitis.

## SERIOUS REACTIONS

• Potential for hypercalcemia may occur.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with history of nephrolithiasis. It is unknown whether calcipotriene crosses the placenta or is distributed in breast milk. Be aware that children and elderly patients are at greater risk for skin reactions. Improvement is usually noted after 2 wks of therapy and marked improvement after 8 wks of therapy.

Instruct patients to limit exposure of treated areas to sunlight or artificial UV sources.

#### Storage

Store at room temperature. Do not freeze. Foam is flammable; avoid exposure of the foam to fire, flame, and smoking.

#### Administration

Apply cream, foam, or ointment by rubbing gently into the affected and surrounding area twice daily (in morning and in the evening). Wash hands after application.

Apply scalp solution after combing hair to remove scaly debris and part the hair. Apply solution only to lesions and rub in gently and completely. Avoid spread of solution to the forehead.

## Calcitonin

kal-si-toe'nin

Calcimar, Fortical, Miacalcin Caltine, Calcimar, Miacalcin Do not confuse calcitonin with calcitriol.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Hormones/ hormone modifiers, calcium modifiers, bone resorption

## **MECHANISM OF ACTION**

A synthetic hormone that decreases osteoclast activity in bones, decreases tubular reabsorption of sodium and calcium in the kidneys, and increases absorption of calcium in the GI tract. *Therapeutic Effect:* Regulates serum calcium concentrations and inhibits bone resorption, lowering fracture risk.

## PHARMACOKINETICS

Injection rapidly metabolized (primarily in kidneys); primarily excreted in urine. Nasal form rapidly absorbed. *Half-life:* 70-90 min (injection); 43 min (nasal).

## AVAILABILITY

Injection: 200 international units/mL (calcitonin-salmon). Nasal Spray: 200 international units/spray (calcitonin-salmon).

#### INDICATIONS AND DOSAGES

#### Skin testing before treatment in patients with suspected sensitivity to calcitonin-salmon

Adults, Elderly. Prepare a 10-international units/mL dilution; withdraw 0.05 mL from a 200-international units/mL vial in a tuberculin syringe; fill up to 1 mL with 0.9% NaCl. Take 0.1 mL and inject intracutaneously on inner aspect of forearm. Observe after 15 min; a positive response is the appearance of more than mild erythema or wheal.

#### Paget disease

IM, SUBCUTANEOUS Adults, Elderly. Initially, 100 international units/day. Maintenance: 50 international units/day or 50-100 international units every 1-3 days. INTRANASAL Adults, Elderly. 200-400 international units/day.

#### Postmenopausal osteoporosis IM, SUBCUTANEOUS

Adults, Elderly. 100 international units every other day with adequate calcium and vitamin D intake. INTRANASAL Adults, Elderly. 200 international

*Adults, Elderly.* 200 international units/day as a single spray, alternating nostrils daily.

Hypercalcemia

IM, SUBCUTANEOUS Adults, Elderly. Initially, 4 international units/kg q12h; may increase to 8 international units/kg q12h if no response in 2 days; may further increase to 8 international units/kg q6h if no response in another 2 days.

### **OFF-LABEL USES**

Treatment of secondary osteoporosis due to drug therapy or hormone disturbance, phantom limb pain.

## CONTRAINDICATIONS

Hypersensitivity to calcitominsalmon or salmon protein.

## INTERACTIONS

Drug Lithium: May decrease lithium levels by increasing renal clearance. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known

### SIDE EFFECTS

#### Frequent

IM, Subcutaneous (10%): Nausea (may occur 30 min after injection. usually diminishes with continued therapy), inflammation at injection site

Nasal (10%-12%): Rhinitis, nasal irritation, redness, sores,

#### Occasional

IM, Subcutaneous (2%-5%): Flushing of face or hands. Nasal (3%-5%): Back pain, arthralgia, epistaxis, headache. Rare

IM, Subcutaneous: Epigastric discomfort, dry mouth, diarrhea, flatulence

Nasal: Itching of earlobes, edema of feet, rash, diaphoresis.

#### SERIOUS REACTIONS

· Patients with a protein allergy may develop a hypersensitivity reaction.

 Severe nasal ulceration is rare with nasal form

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with history of allergy. Calcitonin does not cross the placenta, and it is unknown whether the drug is distributed in breast milk: its safety in breastfeeding women has not been established. The safety and efficacy of this drug have not been established in children. Elderly patients may experience a higher incidence of nasal adverse events with the nasal spray.

Nausea may occur but usually decreases with continued therapy. Notify the physician if itching, rash, shortness of breath, or significant nasal irritation occurs. Electrolyte levels should be checked. Improvement in biochemical abnormalities and bone pain usually

occurs in the first few months of treatment; with neurologic lesions, improvement may take more than a year.

#### Storage

Refrigerate the unopened nasal spray and injection; do not freeze. Nasal spray may be stored at room temperature 30-35 days once the pump has been activated.

#### Administration

Patients should have adequate intake of calcium and vitamin D during treatment. Calcitonin may be administered as IM or subcutaneous injection. No more than 2 mL should be given IM at any one site. Bedtime administration may reduce flushing and nausea. Rotate injection sites.

Given as single spray to one nostril only per day; alternate nostrils used daily. For intranasal use, clear nasal passages as much as possible. Tilt head slightly forward and insert the spray tip into the nostril, pointing toward the nasal passages and away from the septum. Spray into the nostril while holding the other nostril closed, and at the same time inhale through the nose to deliver the drug as high into the nasal passage as possible. Bring to room temperature and prime pump before first use.

#### Calcitriol

kal-si-trye'ole 🖈 🏜 Calcijex, Rocaltrol, Vectical

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

Classification: Vitamin D analogs, bone resorption inhibitors, dermatologic antipsoriatic agents

Calcitriol (Generic Name)

#### **MECHANISM OF ACTION**

A fat-soluble vitamin that is essential for absorption, utilization of calcium phosphate, and normal calcification of bone. Therapeutic Effect: Stimulates calcium and phosphate absorption from small intestine, promotes secretion of calcium from bone to blood, promotes renal tubule phosphate resorption, and acts on bone cells to stimulate skeletal growth and on parathyroid gland to suppress hormone synthesis and secretion. In the skin, calcitriol reduces T-helper function, and thymocyte and lymphocyte proliferation. The exact role of these immunologic mechanisms in the reduction of psoriatic lesions is unknown.

### PHARMACOKINETICS

Rapidly absorbed from small intestine. Extensive metabolism in kidneys. Primarily excreted in feces; minimal excretion in urine. *Halflife:* 5-8 h (prolonged in children and patients on hemodialysis). Approximately 6% of a topical dose is absorbed when applied to psoriatic skin.

#### AVAILABILITY

Capsule: 0.25 mcg, 0.5 mcg (Rocaltrol). Injection: 1 mcg/mL, 2 mcg/mL (Calcijex). Oral Solution: 1 mcg/mL (Rocaltrol). Ointment (Vectical): 3 mcg/g.

## INDICATIONS AND DOSAGES

## Hypocalcemia with renal failure on dialysis

Adults, Elderly. 0.25 mcg/day or every other day; increase dose at 4to 8-wk intervals. Usual range 0.5-1 mcg/day. Children. 0.25-2 mcg/day with hemodialysis. IV

Adults, Elderly. 0.5 mcg/day (0.01 mcg/kg) 3 times/wk. Dose range: 0.5-3 mcg (0.01-0.05 mcg/kg) 3 times/wk. Adjust dose at 2- to 4-wk intervals. *Children.* 0.01-0.05 mcg/kg 3 times/ wk with hemodialysis.

## • Renal failure predialysis PO

*Adults, Children 3 yr and older.* Initially 0.25 mcg daily, may increase to 0.5 mcg daily.

*Children < 3 yr of age*. Initially 0.01-0.015 mcg/kg once daily.

## Hypoparathyroidism/ pseudohypoparathyroidism PO

Adults, Elderly, Children 6 yr and older: Initial dose 0.25 mcg/day, range 0.5-2 mcg once daily. Children 1-5 yr: 0.25-0.75 mcg once daily.

*Children* < 1 yr. 0.04-0.08 mcg/kg once daily.

#### Vitamin D-dependent rickets PO

Adults, Elderly, Children. 1 mcg once daily.

#### Vitamin D-resistant rickets PO

Adults, Elderly, Children. 0.015-0.02 mcg/kg once daily. Maintenance: 0.03-0.06 mcg/kg once daily. Maximum: 2 mcg once daily.

### Psoriasis

TOPICAL Adults: Apply ointment twice daily to affected areas. Maximum: 200 g/wk.

## CONTRAINDICATIONS

Hypercalcemia, vitamin D toxicity, hypersensitivity to other vitamin D products or analogs.

#### INTERACTIONS

#### Drug Aluminum-containing antacid (long-term use): May increase

aluminum concentration and aluminum bone toxicity.

**Calcium-containing preparations, thiazide diuretics:** May increase the risk of hypercalcemia.

#### Magnesium-containing antacids:

May increase magnesium concentration.

#### Herbal

None known. Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase serum cholesterol, calcium, magnesium, and phosphate levels. May decrease serum alkaline phosphatase.

#### SIDE EFFECTS

#### Occasional

Hypercalcemia, headache, irritability, constipation, metallic taste, nausea, polyuria. With topical use, pruritus (3%), erythema, skin discomfort, and contact dermatitis have been reported.

## SERIOUS REACTIONS

· Early signs of overdosage are manifested as weakness, headache, somnolence, nausea, vomiting, dry mouth, constipation, muscle and bone pain, and metallic taste sensation. · Later signs of overdosage are evidenced by polyuria, polydipsia, anorexia, weight loss, nocturia, photophobia, rhinorrhea, pruritus, disorientation, hallucinations, hyperthermia, hypertension, and cardiac arrhythmias. Excessive dose also leads to hypercalcemia, hyperphosphatemia, adynamic bone disease. · Hypersensitivity may include serious skin rashes, such as erythema

## multiforme.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with coronary artery disease, kidney stones,

malabsorption syndrome, and renal impairment.

It is unknown whether calcitriol crosses the placenta. It is distributed in breast milk; breastfeeding is not recommended. Children may be more sensitive to the effects of calcitriol. Unique age-related precautions have not been observed in elderly patients. Serum alkaline phosphatase, BUN, serum calcium, serum creatinine, serum magnesium, serum phosphate, and urinary calcium levels should be monitored. Therapeutic serum calcium level is 9-10 mg/dL. Daily dietary calcium intake should be estimated; minimum intake should be 600 mg daily. Maintain adequate fluid intake. Storage

Store at room temperature. Protect from light.

#### Administration

IV may be administered undiluted as bolus through catheter at the end of hemodialysis.

Give oral calcitriol without regard to food. Swallow the drug whole and avoid crushing, chewing, or opening the capsules.

For topical use, apply thin film to affected area(s) and rub in gently and completely.

## **Calcium Acetate**

kal'see-um as'e-tate ★ Calphron, Eliphos, PhosLo, Phoslyra

Do not confuse PhosLo with PhosChol.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Minerals and electrolytes, phosphate-binding agents

Calcium Acetate (Generic Name)

#### **MECHANISM OF ACTION**

Calcium is a mineral that is essential for the function and integrity of the nervous, muscular, and skeletal systems. Calcium acetate combines with dietary phosphate to form insoluble calcium phosphate. Does not promote aluminum absorption. *Therapeutic Effect:* Controls hyperphosphatemia in end-stage renal disease.

## PHARMACOKINETICS

Moderately absorbed from the small intestine (absorption depends on product solubility, the presence of vitamin D, and patient's pH). When taken orally at meals, much of the calcium in calcium acetate is readily soluble and combines with phosphate from the diet in the proximal small intestine. The calcium phosphate product is primarily eliminated in feces.

## AVAILABILITY

Gelcap (PhosLo): 667 mg. Tablet (Calphron, Eliphos): 667 mg. Oral Solution (Phoslyra): 667 mg calcium acetate per 5 mL.

## INDICATIONS AND DOSAGES

## To control hyperphosphatemia in end-stage renal disease

Adults, Elderly. 2 tablets or gelcaps 3 times a day with meals. May increase gradually to bring serum phosphate below 6 mg/dL, as long as hypercalcemia does not develop. Most patients require 3-4 gelcaps or tablets with each meal.

#### CONTRAINDICATIONS

Patients with hypercalcemia.

#### INTERACTIONS

#### Drug

**Digoxin:** May increase the risk of arrhythmias if hypercalcemia occurs.

## Fluoroquinolones, bisphosphonates, thyroid hormones, phenytoin,

**tetracyclines:** May decrease the oral absorption of these drugs; separate times of administration.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood pH and serum calcium levels. May decrease serum phosphate levels.

## SIDE EFFECTS

#### Occasional

Nausea, mild constipation. Oral solution may cause diarrhea.

## Rare

Skin rash, pruritus, or allergic reaction, fecal impaction, metabolic alkalosis.

## SERIOUS REACTIONS

Mild hypercalcemia (Ca<sup>2+</sup> > 10.5 mg/dL) may be asymptomatic, or may cause constipation, nausea and vomiting, headache, increased thirst, irritability, decreased appetite, metallic taste, fatigue, or weakness and may respond to a reduction in dosage or a temporary discontinuation of medicine. Severe hypercalcemia may cause confusion, somnolence, arrhythmias, increased painful urination, and coma.

• Chronic hypercalcemia may lead to vascular or soft-tissue calcification.

#### PRECAUTIONS & CONSIDERATIONS

The serum calcium level should be monitored twice weekly during the early dose adjustment period to avoid overdosage acutely or chronically. The serum calcium times phosphate (Ca x P) product should not be allowed to exceed 66. A reduction in dose will often resolve mild hypercalcemia.

Caution is warranted with patients on digitalis glycosides; avoidance of calcium acetate in these patients is recommended. Calcium is normally distributed in breast milk. Use in pregnancy only when clearly needed. Safety and effectiveness have not been established in children. Patients should be counseled regarding dietary restrictions and adherence and the need to avoid over-thecounter antacids. Adequate hydration should be maintained. BP, ECG, serum magnesium, phosphate and potassium levels, urine calcium concentrations, and renal function test results should be monitored. Storage

Store at room temperature. Administration

Take with meals. Measure oral solution with calibrated device to ensure accurate dose.

## **Calcium Salts**

★ Calciject, Calcionate, Calcitrate, Caltrate, Citracal, Dicarbosil, Oscal, PhosLo, Titralac, Tums ♪ PhosLo, Calcijet Do not confuse OsCal with Asacol, Citracal with Citrucel, or PhosLo with PhosChol.

## CATEGORY

Pregnancy Risk Category: C OTC (carbonate, citrate, glubionate, gluconate [oral forms only])

Classification: Minerals

#### MECHANISM OF ACTION

An electrolyte that is essential for the function and integrity

of the nervous, muscular, and skeletal systems. Calcium plays an important role in normal cardiac and renal function, respiration, blood coagulation, and cell membrane and capillary permeability. It helps to regulate the release and storage of neurotransmitters and hormones, and it neutralizes or reduces gastric acid (increased pH). Calcium combines with dietary phosphate to form insoluble calcium phosphate. Therapeutic Effect: Replaces calcium in deficiency states; controls hyperphosphatemia in endstage renal disease.

## PHARMACOKINETICS

Moderately absorbed from the small intestine (absorption depends on presence of vitamin D metabolites and patient's pH). Primarily eliminated in feces. Urinary excretion plays a minor role. Roughly 99% of filtered calcium is reabsorbed by the kidney with less than 1% excreted. Parathyroid hormone, calcitonin, and 1,25 dihydroxycholecalciferol help control calcium equilibrium.

#### AVAILABILITY

NOTE: There are a variety of calcium supplements available in the U.S. market; the following represent familiar dosage forms and brands.

#### **Calcium Carbonate**

Tablets (Caltrate 600): Equivalent to 600 mg elemental calcium. Tablets (OsCal 500): Equivalent to 500 mg elemental calcium. Tablets (Chewable [OsCal 500]): Equivalent to 500 mg elemental calcium. Tablets (Chewable [Tums]):

Equivalent to 200 mg elemental calcium.

#### **Calcium Chloride**

Injection: 10% (100 mg/mL) equivalent to 27.2 mg (1.36 mEq) elemental calcium per mL. **Calcium Citrate** 

Tablets (Calcitrate): 250 mg (equivalent to 53 mg elemental calcium).

Tablets (Citracal): 950 mg (equivalent to 200 mg elemental calcium).

#### **Calcium Glubionate**

Syrup: 1.8 g/5 mL (equivalent to 115 mg of elemental calcium per 5 mL). **Calcium Gluconate** 

Injection: 10% (equivalent to 9 mg [0.45-0.48 mEq] elemental calcium per mL).

#### INDICATIONS AND DOSAGES Hyperphosphatemia

PO (CALCIUM CARBONATE) Adults, Elderly. 2 tablets 3 times a day with meals. May increase gradually to bring serum phosphate below 6 mg/dL, as longs as hypercalcemia does not develop. Most patients require 3-4 Tums tablets with each meal.

#### Hypocalcemia

PO (CALCIUM CARBONATE) Adults, Elderly. 1-2 g/day in 3-4 divided doses.

Children. 45-65 mg/kg/day in 3-4 divided doses.

PO (CALCIUM GLUBIONATE) Adults, Elderly. 16-18 g/day in 4-6 divided doses.

Children, Infants. 0.6-2 g/kg/day in 4 divided doses.

Neonates. 1.2 g/kg/day in 4-6 divided doses.

IV (CALCIUM CHLORIDE) Adults, Elderly. 0.5-1 g repeated q4-6h as needed.

Children. 2.5-5 mg/kg/dose q4-6h. IV (CALCIUM GLUCONATE) Adults, Elderly. 2-15 g/24 h. Children. 200-500 mg/kg/day.

#### Antacid

PO (CALCIUM CARBONATE) Adults, Elderly. 1-2 tablets (5-10 mL) q2h as needed.

#### Osteoporosis

PO (CALCIUM CARBONATE) Adults, Elderly. 1200 mg/day.

#### Cardiac arrest

IV (CALCIUM CHLORIDE) Adults, Elderly. 2-4 mg/kg. May repeat q10min. Children. 20 mg/kg. May repeat in 10 min.

## Hypocalcemia tetany

IV (CALCIUM CHLORIDE) Adults, Elderly. 1 g. May repeat in 6 h.

Children. 10 mg/kg over 5-10 min. May repeat in 6-8 h.

IV (CALCIUM GLUCONATE) Adults, Elderly. 1-3 g until therapeutic response achieved. Children. 100-200 mg/kg/dose q6-8h.

## CONTRAINDICATIONS

Hypercalcemia. Contraindicated for cardiac resuscitation in the presence of ventricular fibrillation or in patients with the risk of existing digitalis toxicity. Not recommended in the treatment of asystole and electromechanical dissociation.

#### INTERACTIONS

#### Drug

Digoxin: May increase the risk of arrhythmias if hypercalcemia occurs.

Fluoroquinolones, bisphosphonates, thyroid hormones, phenytoin,

tetracyclines: May decrease the oral absorption of these drugs; separate times of administration.

#### Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood pH and serum gastrin and calcium levels. May decrease serum phosphate and potassium levels.

## IV INCOMPATIBILITIES

Calcium chloride: Amphotericin B complex (Abelcet, AmBisome, Amphotec), some cephalosporins, dexamethasone, diazepam, haloperidol, lansoprazole, magnesium sulfate, pantoprazole, phenytoin, propofol (Diprivan), quinupristin-dalfopristin (Synercid), sodium or potassium phosphate (concentration dependent).

Calcium gluconate: Amphotericin B complex (Abelcet, AmBisome, Amphotec), some cephalosporins, dexamethasone, diazepam, fluconazole (Diflucan), haloperidol, lansoprazole, magnesium sulfate, pantoprazole, phenytoin, quinupristin-dalfopristin (Synercid), sodium or potassium phosphate (concentration dependent).

## 🗏 IV COMPATIBILITIES

Calcium chloride: Amikacin (Amikin), dobutamine (Dobutrex), lidocaine, milrinone (Primacor), morphine, norepinephrine (Levophed). Calcium gluconate: Ampicillin, aztreonam (Azactam), cefazolin (Ancef), cefepime (Maxipime), ciprofloxacin (Cipro), dobutamine (Dobutrex), enalapril (Vasotec), famotidine (Pepcid), furosemide (Lasix), heparin, lidocaine, magnesium sulfate, meropenem (Merrem IV), midazolam (Versed), milrinone (Primacor), norepinephrine (Levophed), piperacillin and tazobactam (Zosyn), potassium chloride, propofol (Diprivan).

#### SIDE EFFECTS

#### Frequent

PO: Chalky taste.

Parenteral: Hypotension; flushing; feeling of warmth; nausea; vomiting; pain, rash, redness, or burning at injection site; diaphoresis.

## Occasional

PO: Mild constipation, fecal impaction, peripheral edema, metabolic alkalosis (muscle pain, restlessness, slow breathing). Rare

Difficult or painful urination.

### SERIOUS REACTIONS

 Hypercalcemia. Early signs include constipation, headache, dry mouth, increased thirst, irritability, decreased appetite, metallic taste, fatigue, weakness, and depression. Later signs include confusion, somnolence, hypertension, photosensitivity, arrhythmias, nausea, vomiting, and increased painful urination.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with chronic renal impairment, decreased cardiac function, dehydration, history of renal calculi, and patients with sarcoidosis. Calcium distributed in breast milk. Injectable products contain aluminum that may be toxic if kidney function is impaired; premature neonates are particularly at risk. Restrict IV use in children because their small vasculature increases the risk of developing extreme irritation and possible tissue necrosis or sloughing. Oral absorption may be decreased in the elderly. Avoid consuming excessive amounts of alcohol, caffeine, and tobacco.

Adequate hydration should be maintained. BP, ECG, serum magnesium, phosphate and potassium levels, urine calcium concentrations, and renal function test results should be monitored. Storage

Store vials and oral products at room temperature. If crystallization of calcium gluconate injection occurs during storage, warming vial in a 140° F water bath for 15-30 min with occasional shaking may dissolve the precipitate. Cool to body temperature before use. All injections must be clear at the time of use. Discard any unused portions once opened.

#### Storage

Store at room temperature; do not freeze.

#### Administration

Take tablets with a full glass of water 30 min to 1 h after meals. Dilute the syrup in juice or water and administer it before meals to increase absorption. Chew the chewable tablets well before swallowing them. Do not take calcium within 2 h of consuming other oral drugs or fiber-containing foods.

Injections of calcium should be made slowly through a small needle into a large vein to minimize venous irritation and avoid undesirable reactions.

Calcium chloride may be given undiluted or may be diluted with an equal amount 0.9% NaCl or sterile water for injection. Give calcium chloride 10% by slow IV push (0.5-1 mL/min). Rapid administration may produce bradycardia, hypotension, peripheral vasodilation, a chalky or metallic taste, and a feeling of warmth.

Calcium gluconate may be given undiluted or may be diluted in up to 1000 mL 0.9% NaCl. When administering calcium gluconate by intermittent IV infusion, the maximum rate is 200 mg/min. Rapid administration may produce arrhythmias, hypotension, and vasodilation.

#### Candesartan

kan-de-sar'tan 🛨 👾 Atacand

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

Classification: Antihypertensive agents, angiotensin II receptor antagonists

## MECHANISM OF ACTION

An angiotensin II receptor, type AT1, antagonist that blocks the vasoconstrictor and aldosteronesecreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT1 receptors. Therapeutic Effect: Causes vasodilation, decreases peripheral resistance, and decreases BP.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2-3 h	6-8 h	24 h

Rapidly, completely absorbed. Protein binding: > 99%. Undergoes minor hepatic metabolism to inactive metabolite. Excreted unchanged in urine and in the feces through the biliary system. Not removed by hemodialysis. Half-life: 9 h.

#### AVAILABILITY

Tablets: 4 mg, 8 mg, 16 mg, 32 mg.

#### INDICATIONS AND DOSAGES Hypertension as monotherapy or in combination with other antihypertensives PO

Adults, Elderly. Initially, 16 mg once a day in those who are not volume depleted. Can be given once or twice a day with total daily doses of

Candesartan (Generic Name), Atacand (Brand Name)

## Calfactant

cal-fac′tant ★ Infasurf

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: This drug is not indicated for use in pregnant women.

Classification: Surfactants, lung

## **MECHANISM OF ACTION**

A natural lung extract that reduces alveolar surface tension, stabilizing the alveoli. *Therapeutic Effect:* Restores surface activity to infant lungs, improves lung compliance and respiratory gas exchange.

#### PHARMACOKINETICS

No studies have been performed.

## AVAILABILITY

Intratracheal Suspension: 35-mg/ mL vials.

## INDICATIONS AND DOSAGES

## Respiratory distress syndrome (RDS)

INTRATRACHEAL

*Neonates.* 3 mL/kg of birth weight administered as soon as possible after birth in 2 doses of 1.5 mL/kg. Repeat 3-mL/kg doses, up to a total of 4 doses each given 12 h apart.

#### CONTRAINDICATIONS

None known.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS

#### Frequent

Cyanosis (65%), airway obstruction (39%), bradycardia (34%), reflux of surfactant into endotracheal tube (21%), need for manual ventilation (16%).

#### Occasional

Need for reintubation (3%).

### SERIOUS REACTIONS

• Cyanosis, airway obstruction, bradycardia, and reflux of surfactant into endotracheal tube may occur.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with a hypersensitivity to calfactant. This drug is for use only in neonates. No age-related precautions have been noted.

The neonate's oxygenation and ventilation should be monitored using arterial or transcutaneous measurement of systemic oxygen  $(O_2)$  and carbon dioxide  $(CO_2)$ . Visitors should be limited during treatment. Handwashing and other infection control measures should be monitored to minimize the risk of nosocomial infections.

#### Storage

Refrigerate vials. Unopened, unused vials may be returned to refrigerator within 24 h after having been warmed to room temperature. Repeated warming to room temperature should be avoided. Warming before administration is not necessary.

#### Administration

Gently swirl the vial, if needed, to redisperse contents. Do not shake it. Enter each single-use vial only once; discard unused suspension. Instill the drug intratracheally through a side port adapter into the infant's endotracheal tube. Give each aliquot over 20-30 ventilatory breaths. Administer only during the inspiratory cycle. Between aliquot dosages, turn the infant so that the opposite lung is in the dependent position. 8-32 mg. Give lower initial dosage in those treated with diuretics or with impaired renal function or moderate hepatic disease.

*Children 6-17 yr.* If < 50 kg, the dose range is 2-16 mg per day. The recommended starting dose is 4-8 mg. For those  $\geq$  50 kg, the dose range is 4-32 mg per day. The starting dose is 8-16 mg. *Children 1 to* < 6 yr. The starting

dose is 0.20 mg/kg (oral suspension). The dose range is 0.05-0.4 mg/kg per day.

NOTE: Children with glomerular filtration rate  $< 30 \text{ mL/min}/1.73 \text{ m}^2$  should not receive the drug.

#### Heart failure PO

Adults, Elderly. Initially 4 mg once daily. Target dose of 32 mg once daily can be reached by doubling dose approximately every 2 wks as tolerated.

#### CONTRAINDICATIONS

Hypersensitivity to candesartan.

#### INTERACTIONS

Drug

Lithium: May increase serum lithium levels; monitor lithium levels.

Potassium-sparing diuretics, eplerenone, drospirenone: May increase serum potassium; monitor potassium levels.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, potassium, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin and hematocrit levels.

## SIDE EFFECTS

#### Occasional (3%-6%)

Upper respiratory tract infection, dizziness, back and leg pain. Rare (1%-2%)

Pharyngitis, rhinitis, headache, fatigue, diarrhea, nausea, dry cough, peripheral edema, mild hyperkalemia.

### SERIOUS REACTIONS

• Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often. Institute supportive measures.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic and renal impairment, renal artery stenosis, severe congestive heart failure, and dehydration. It is unknown whether candesartan is distributed in breast milk. Candesartan may cause fetal or neonatal morbidity or mortality. If pregnancy is detected, discontinue use. Safety and efficacy of candesartan have not been established in children < 1 yr of age. No age-related precautions have been noted in elderly patients.

Apical pulse and BP should be assessed immediately before each candesartan dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the patient in the supine position with feet slightly elevated and notify the physician. Tasks that require mental alertness or motor skills should be avoided. Blood hemoglobin and hematocrit and BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, AST (SGOT), and ALT (SGPT) levels should be obtained before and during therapy. Also monitor potassium in heart failure patients.

#### 244 Capecitabine

Maintain adequate hydration; exercising outside during hot weather should be avoided to decrease the risk of dehydration and hypotension. **Storage** 

Store at room temperature. The compounded suspension will expire 30 days after first opened; do not freeze.

#### Administration

Take candesartan without regard to food.

The manufacturer has provided instructions for a pharmacist to compound an oral suspension if needed. Shake well before each use.

## Capecitabine

ka-pe-site'a-been ★ ▲ Xeloda Do not confuse Xeloda with Xenical.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, antimetabolites

#### MECHANISM OF ACTION

An antimetabolite that is enzymatically converted to 5-fluorouracil. Inhibits enzymes necessary for synthesis of essential cellular components. *Therapeutic Effect*: Interferes with DNA synthesis, RNA processing, and protein synthesis.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: < 60%. Metabolized in the liver. Primarily excreted in urine. *Half-life:* 45 min.

#### AVAILABILITY

Tablets: 150 mg, 500 mg.

## INDICATIONS AND DOSAGES Metastatic breast cancer, colon

#### Metastatic breast cancer, colon cancer

PO

Adults, Elderly. Initially, 2500 mg/ m<sup>2</sup>/day in 2 equally divided doses approximately q12h for 2 wks. Follow with a 1-wk rest period; given in 3-wk cycles. Expect dosages to be modified during the treatment course depending on the grade and type of any toxicities that appear.

#### Dosage in moderate renal impairment (CrCl 30-50 mL/min) PO

Adults, Elderly. Initally 950 mg/m<sup>2</sup> twice daily.

Severe renal

**impairment** (CrCl < 30 mL/min) Contraindicated.

## CONTRAINDICATIONS

Severe renal impairment, hypersensitivity to capecitabine, fluorouracil, or any component of the formulation; known deficiency of dihydropyrimidine dehydrogenase.

#### INTERACTIONS

Drug

**Phenytoin:** May increase phenytoin levels.

**Warfarin:** May increase the effects of warfarin. Monitor INR frequently and watch for bleeding.

## Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels. May decrease blood hematocrit, hemoglobin level, and WBC count.

Capecitabine (Generic Name), Xeloda (Brand Name)

### SIDE EFFECTS

#### Frequent (> 5%)

Diarrhea (sometimes severe), nausea, vomiting, stomatitis, hand and foot syndrome (painful palmar-plantar swelling with paresthesia, erythema, and blistering), fatigue, anorexia, dermatitis.

#### Occasional (< 5%)

Constipation, dyspepsia, nail disorder, headache, dizziness, insomnia, edema, myalgia.

### SERIOUS REACTIONS

 Serious reactions may include myelosuppression (evidenced by neutropenia, thrombocytopenia, and anemia), cardiovascular toxicity (marked by angina, cardiomyopathy, and deep vein thrombosis), respiratory toxicity (marked by dyspnea, epistaxis, and pneumonia), and lymphedema.

## PRECAUTIONS & CONSIDERATIONS

Use cautiously in patients with a history of coronary artery disease, concomitant coumarinderived anticoagulant therapy, concomitant phenytoin therapy, renal impairment, or liver dysfunction due to liver metastases. Caution is also warranted in elderly patients. Avoid use in pregnant women. It is unknown whether capecitabine is distributed in breast milk. Safety and efficacy of capecitabine have not been established in children. Monitor for signs of infection. Monitor for symptoms of hand-andfoot syndrome, diarrhea, nausea, vomiting, and stomatitis. Also watch for fever, and monitor CBC for hematologic changes.

#### Storage

Store at room temperature; keep tightly closed.

#### Administration

Take capecitabine within 30 min after a meal; take with water. Be aware

that the prescription may require the patient to take tablets of different strengths to get the correct dose.

## Capreomycin

kap-ree-oh-mye'sin ★ Capastat Do not confuse with Captopril, Capsaicin, or Kanamycin.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antimycobacterials

### **MECHANISM OF ACTION**

A cyclic polypeptide antimicrobial but the mechanism of action is not well understood. *Therapeutic Effect:* Suppresses mycobacterial multiplication.

#### PHARMACOKINETICS

Not well absorbed from the gastrointestinal (GI) tract. Undergoes little metabolism. Primarily excreted unchanged in urine. *Half-life:* 4-6 h (half-life is increased with impaired renal function).

#### AVAILABILITY

Injection: 100 mg/mL (Capastat).

## INDICATIONS AND DOSAGES Tuberculosis

IM/IV

Adults, Elderly> 59 yrs. The ATS, CDC, and IDSA recommend 10 mg/kg/day (max 750 mg/day) 5-7 days a week, reduced to 2-3 times/ week after the first 2-4 months or after culture conversion, depending on regimen efficacy. Dosing is based on ideal body weight. Adults  $\leq$  59yrs. The ATS, CDC, and IDSA recommend 15 mg/kg/day (max 1000 mg/day) 5-7 days a week, reduced to 2-3 times/week after the

#### Dosage in renal impairment

The ATS, CDC, and the IDSA recommend: CrCI> 30 mL/min: No adjustment needed. CrCl < 30 mL/min: 12-15 mg/kg IV/IM 2-3 times/week.

### **OFF-LABEL USES**

Treatment of atypical mycobacterial infections.

## CONTRAINDICATIONS

Hypersensitivity to capreomycin.

## INTERACTIONS

#### Drug

Aminoglycosides: May increase the risk of aminoglycoside toxicity. Nondepolarizing neuromuscular blocking agents: May increase neuromuscular blockade.

Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS

Frequent Ototoxicity, nephrotoxicity. Occasional Eosinophilia. Rare

Rash, fever, urticaria, hypokalemia, thrombocytopenia, vertigo.

## SERIOUS REACTIONS

• Renal failure, ototoxicity, and thrombocytopenia can occur.

#### PRECAUTIONS & CONSIDERATIONS

Cautiously use with preexisting hearing impairment, renal dysfunction, or concurrent use of other ototoxic or nephrotoxic drugs. It is unknown whether capreomycin crosses the placenta and is excreted in breast milk. Safety and efficacy are not established in children. Age-related renal impairment may require dosage adjustment in elderly patients. Complete blood count (CBC) and renal and liver function test results should be obtained before the initiation of therapy. Hearing changes must be reported immediately. Renal function, electrolytes, and acid-base balance should be monitored during therapy.

#### Storage

Unopened vials are stored at room temperature. After reconstitution, solutions may be stored for up to 24 h under refrigeration. The solution for injection may acquire a pale straw color and darken with time. This is not associated with a loss of potency or development of toxicity.

## Administration

Reconstitute by dissolving the vial contents (1 g) in 2 mL of 0.9% NaCl injection or sterile water for injection. Allow 2-3 min for complete dissolution. Further dilute in NS 100 mL for IV administration. Administer IV over 60 min. Administer deep IM into large muscle mass.

## Capsaicin

cap-say'sin Qutenza, Trixaicin, Zostrix, Zostrix HP, Zostrix Neuropathy Do not confuse Zostrix with Zovirax.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC (topical creams), Rx (dermal patch)

**Classification:** Analgesics, topical

## **MECHANISM OF ACTION**

A topical analgesic that depletes and prevents reaccumulation of the chemomediator of pain impulses (substance P) from peripheral sensory neurons to CNS. *Therapeutic Effect:* Relieves pain.

#### PHARMACOKINETICS

Transient, low systemic exposure following topical use. Highest plasma level detected during patch use was 4.6 ng/mL immediately upon removal. Levels below the limit of detection 3-6 h after removal.

## AVAILABILITY

Cream: 0.025%, 0.035%, 0.075%, 0.1%, 0.25%. Gel: 0.025%, 0.05%. Lotion: 0.025%, 0.075%. Patch: 8% (Qutenza). Roll-on: 0.075%.

## INDICATIONS AND DOSAGES

 Treatment of neuralgia, osteoarthritis, rheumatoid arthritis TOPICAL

*Adults, Elderly, Children older than* 2 yr. Apply directly to affected area 3-4 times/day. Continue for optimal clinical response.

## Post-herpetic neuralgia PATCH (OUTENZA)

Adults, Elderly. Up to 4 patches per treatment applied for 60 min and repeated no more frequently than q3mo.

#### CONTRAINDICATIONS

Hypersensitivity to capsaic or any component of the formulation.

#### INTERACTIONS

#### Drug

Anticoagulants, antiplatelet agents, low-molecular-weight heparins, thrombolytic agents: May increase risk of bleeding.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Burning, stinging, erythema at site of application.

#### SERIOUS REACTIONS

 Pain during topical patch application may require analgesics.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with concurrent use of nephrotoxic agents, dehydration, fluid and electrolyte imbalance, neurologic abnormalities, and renal or hepatic impairment. It is unknown whether capsaicin crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children < 2 yr of age. There are no age-related precautions noted for elderly patients.

Transient burning may occur on application and usually disappears after 72 h with continued use. If Qutenza patch is used, the patient may require pain relievers during the procedure to minimize discomfort. Inform the patient that the treated area may be sensitive to heat for a few days, including bathing and exercise.

#### Storage

Store at room temperature. Administration

Capsaicin is for external use only. Avoid eye or mucous membrane contact. Wash hands immediately after application, unless used on arthritic hands,
then wait 30 min, then wash. If there is no improvement or condition deteriorates after 28 days, discontinue use and consult physician.

For Qutenza patch, administered only by health care personnel; do not apply at home. Pretreat with local anesthetic to treatment area plus 1-2 cm of surrounding area (e.g., lidocaine 4% cream used 60 min prior to patch application). Use only nitrile gloves when handling and when cleaning capsaicin residue. Latex gloves do not provide adequate protection. Have provider mark area to be treated. Do not apply to the face. The patch can be cut to match the size and the shape of the treatment area. Use only on dry, intact (unbroken) skin. Apply the patch to dry, intact skin within 2 h of opening the pouch. Dispose of used and unused patches, cleansing gel, and other treatment materials in accordance with the local biomedical waste procedures.

Captopril

cap'toe-pril Capoten Do not confuse captopril with Capitrol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensive agents, angiotensin-converting enzyme (ACE) inhibitors

#### MECHANISM OF ACTION

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system and prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. Decreases plasma angiotensin II, increases plasma renin activity, and decreases aldosterone secretion. *Therapeutic Effect:* Reduces peripheral arterial resistance, pulmonary capillary wedge pressure; improves cardiac output and exercise tolerance.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.25 h	0.5-1.5 h	Dose
			related

Rapidly, well absorbed from the GI tract (absorption is decreased in the presence of food). Protein binding: 25%-30%. Metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* < 3 h (increased in those with impaired renal function).

### AVAILABILITY

*Tablets:* 12.5 mg, 25 mg, 50 mg, 100 mg.

# INDICATIONS AND DOSAGES Hypertension

#### PO

Adults, Elderly. Initially, 12.5-25 mg 2-3 times a day. After 1-2 wks, may increase to 50 mg 2-3 times a day. Diuretic may be added if no response in additional 1-2 wks. If taken in combination with diuretic, may increase to 100-150 mg 2-3 times a day after 1-2 wks. Maintenance: 25-150 mg 2-3 times a day. Maximum: 450 mg/day.

 Congestive heart failure PO

Captopril (Generic Name)

Adults, Elderly. Initially, 6.25-25 mg 3 times a day. Increase to 50 mg 3 times a day. After at least 2 wks, may increase to 50-100 mg 3 times a day. Maximum: 450 mg/day.

# Post-myocardial infarction, left ventricular dysfunction

*Adults, Elderly.* 6.25 mg a day, then 12.5 mg 3 times a day. Increase to 25 mg 3 times a day over several days up to 50 mg 3 times a day over several weeks.

# • Diabetic nephropathy PO

Adults, Elderly. 25 mg 3 times a day.

#### Usual pediatric dose

*Children.* Initially 0.3-0.5 mg/kg/ dose titrated up to a maximum of 6 mg/kg/day in 2-4 divided doses. *Neonates.* Initially, 0.05-0.1 mg/kg/ dose q8-24h titrated up to 0.5 mg/ kg/dose given q6-24h. Maximum: 2 mg/kg/day.

#### Dosage in renal impairment (adults)

Creatinine clearance 10-50 mL/min: 75% of normal dosage. Creatinine clearance < 10 mL/min: 50% of normal dosage.

# **OFF-LABEL USES**

Diagnosis of anatomic renal artery stenosis, hypertensive urgency.

# CONTRAINDICATIONS

History of angioedema from previous treatment with ACE inhibitors. Also contraindicated in those experiencing angioedema in past from other causes (e.g., hereditary angioedema).

# INTERACTIONS

#### Drug

Alcohol, antihypertensives,

**diuretics:** May increase the effects of captopril.

Lithium: May increase lithium blood concentration and risk of lithium toxicity. NSAIDs: May decrease the effects

of captopril.

**Potassium-sparing diuretics, drospirenone, eplerenone, potassium supplements**: May cause hyperkalemia.

#### Herbal

None known.

Food

**All food:** Food significantly reduces drug absorption by 30%-40%.

# **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer.

# SIDE EFFECTS

Frequent (4%-7%) Rash.

#### Occasional (2%-4%)

Pruritus, dysgeusia (change in sense of taste), hyperkalemia.

#### Rare (0.5% to < 2%)

Headache, cough, insomnia, dizziness, fatigue, paresthesia, malaise, nausea, diarrhea or constipation, dry mouth, tachycardia.

# SERIOUS REACTIONS

• Excessive hypotension (first-dose syncope) may occur in patients with CHF and in those who are severely salt and volume depleted.

• Angioedema (swelling of face and lips) occurs rarely.

• Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in those with history of renal disease.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cerebrovascular or coronary insufficiency, hypovolemia, renal impairment, sodium depletion, those on dialysis and/or receiving diuretics, and in elderly patients. Captopril crosses the placenta, is distributed in breast milk, and may cause fetal or neonatal morbidity or mortality. Discontinue therapy as soon as possible once pregnancy is detected. Safety and efficacy of captopril have not been established in children. Elderly patients may be more sensitive to the hypotensive effects of captopril.

Dizziness may occur. BP should be obtained immediately before giving each captopril dose, in addition to regular monitoring. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the person in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning captopril therapy, then every 2 wks for the next 3 mo, and periodically thereafter in patients with autoimmune disease or renal impairment and in those who are taking drugs that affect immune response or leukocyte count. Skin for rash and urinalysis for proteinuria should also be assessed. CBC, BUN, serum creatinine, and serum potassium should be monitored in those who are receiving a diuretic. Full therapeutic effect of captopril may take several weeks.

#### Storage

Store at room temperature. Keep tightly closed to protect from moisture.

#### Administration

Give captopril 1 h before meals for maximum absorption because food significantly decreases drug absorption.

Crush tablets if necessary. Do not skip doses.

### Carbachol

kar'ba-kole Kar'ba-kole Carbachol, Miostat

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antiglaucoma agent, ophthalmic; miotic

#### MECHANISM OF ACTION

A direct-acting

parasympathomimetic agent that stimulates cholinergic receptors resulting in muscarinic and nicotinic effects. Indirectly promotes release of acetylcholine. *Therapeutic Effect:* Produces contraction of the iris sphincter muscle, resulting in miosis and reduction in intraocular pressure associated with decreased resistance to aqueous humor outflow.

#### PHARMACOKINETICS

None reported.

#### AVAILABILITY

*Ophthalmic Solution:* 1.5%, 3%. *Solution for Intraocular Administration:* 0.01%.

# INDICATIONS AND DOSAGES Glaucoma

OPHTHALMIC Adults, Elderly. Instill 1–2 drops of 0.75%–3% solution in affected eye(s) up to 3 times a day.

# Miosis, ophthalmic surgery

OPHTHALMIC Adults, Elderly. Instill 0.5 mL of 0.01% solution into anterior chamber before or after securing sutures.

#### CONTRAINDICATIONS

Acute iritis, hypersensitivity to carbachol or any component of the formulation.

#### INTERACTIONS

Drugs None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Occasional

Blurred vision, burning/irritation of eye, decreased night vision, headache. **Rare** Diaphoresis, abdominal cramps.

#### SERIOUS REACTIONS

Retinal detachment.

#### PRECAUTIONS & CONSIDERATIONS

Intraocular carbachol 0.01% should be used with caution in patients with acute cardiac failure, bronchial asthma, peptic ulcer, hyperthyroidism, GI spasm, urinary tract obstruction, and Parkinson disease. Safety and effectiveness have not been established in children.

#### Storage

Store at room temperature.

#### Administration

Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Instill drop(s) and gently close the eyes for 1-2 min. Do not blink. Use nasolacrimal occlusion to reduce systemic absorption. Do not touch the tip of the dropper to any surface to avoid contamination.

Sterile technique must be used for intraocular administration. Instill no more than 0.5 mL into the anterior chamber. Discard unused portion.

# Carbamazepine

kar-ba-maz'e-peen Carbatrol, Epitol, Equetro, Tegretol, Tegretol XR Apo-Carbamazepine, Mazepine Do not confuse Tegretol with Cartrol, Toradol, or Trental. Do not confuse carbamazepine with oxcarbazepine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Anticonvulsants, antipsychotics

# **MECHANISM OF ACTION**

An iminostilbene derivative that decreases sodium and calcium ion influx into neuronal membranes, reducing post-tetanic potentiation at synapses. *Therapeutic Effect:* Reduces seizure activity.

# PHARMACOKINETICS

Slowly and completely absorbed from the GI tract. Protein binding: 75%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 25-65 h (decreased with chronic use).

Carbamazepine (Generic Name)

### AVAILABILITY

Capsules (Extended Release [Carbatrol, Equetro]): 100 mg, 200 mg, 300 mg. Suspension (Tegretol): 100 mg/5 mL. Tablets (Epitol, Tegretol): 200 mg. Tablets (Chewable [Tegretol]): 100 mg. Tablets (Extended Release [Tegretol XR]): 100 mg, 200 mg, 400 mg.

# INDICATIONS AND DOSAGES

NOTE: Extended-release dosage forms are given twice daily, while immediate-release dosage forms may be given twice, 3 times, or 4 times per day.

#### Seizure control PO

Adults, Children older than 12 yr. Initially, 200 mg twice a day. May increase dosage by 200 mg/day at weekly intervals. Range: 400-1200 mg/ day in 2-4 divided doses. Usual dose: 800-1200 mg per day. Maximum: 1.6-2.4 g/day.

*Children 6-12 yr.* Initially, 100 mg twice a day. May increase by 100 mg/day at weekly intervals. Range: 20-30 mg/kg/day. Maxiumum: 1000 mg/day.

*Children younger than 6 yr.* Initially 5 mg/kg/day. May increase at weekly intervals to 10 mg/kg/day up to 20 mg/kg/day. Do not use extended-release forms. *Elderly.* Initially 100 mg 1-2 times a

day. May increase by 100 mg/day at weekly intervals. Usual dose 400-1000 mg/day.

# Trigeminal neuralgia, diabetic neuropathy PO

#### *Adults.* Initially, 100 mg twice a day. May increase by 100 mg twice a day up to 400-800 mg/day. Maxiumum: 1200 mg/day.

*Elderly*. Initially 100 mg 1-2 times a day. May increase by 100 mg/day

at weekly intervals. Usual dose 400-1000 mg/day.

# Bipolar disorder PO

*Adults*. Initially 200 mg twice a day. May increase by 200 mg/day. Maximum: 1600 mg/day.

# **OFF-LABEL USES**

Diabetes insipidus, agitation associated with dementia.

# CONTRAINDICATIONS

Concomitant use of MAOIs, history of myelosuppression, hypersensitivity to carbamazepine or tricyclic antidepressants. Carbamazepine renders nefazodone ineffective; do not give with nefazodone.

# INTERACTIONS

#### Drug

NOTE: Carbamazepine induces the metabolism of many drugs, which can lessen their efficacy.

Anticoagulants, clarithromycin, diltiazem, erythromycin, estrogens, propoxyphene, quinidine, steroids: May decrease the effects of these drugs.

Antipsychotics, haloperidol, tricyclic antidepressants: May increase CNS depressant effects. Cimetidine: May increase carbamazepine blood concentration and risk of toxicity. Isoniazid: May increase metabolism of isoniazid; may increase carbamazepine blood concentration and risk of toxicity. MAOIs: May cause seizures and hypertensive crisis. Contraindicated. Etravirine, nefazodone, delavirdine: Decreases concentrations of these to negligible; do not give. Other anticonvulsants, barbiturates, benzodiazepines,

valproic acid: May increase the metabolism of these drugs. Verapamil: May increase the toxicity of carbamazepine.

#### Herbal

None known.

# Food

**Grapefruit:** May increase the absorption and blood concentration of carbamazepine.

#### DIAGNOSTIC TEST EFFECTS

May increase BUN and blood glucose levels and serum alkaline phosphatase, bilirubin, AST (SGOT), ALT (SGPT), protein, cholesterol, HDL, and triglyceride levels. May decrease serum calcium and thyroid hormone (T3, T4, T4 index) levels. Therapeutic serum level is 4-12 mcg/mL; toxic serum level is > 12 mcg/mL.

#### SIDE EFFECTS

#### Frequent

Drowsiness, dizziness, nausea, vomiting. Also common are ataxia, pruritus, dry mouth, amblyopia, speech disorder.

#### Occasional

Visual abnormalities (spots before eyes, difficulty focusing, blurred vision), tongue irritation, headache, fluid retention, diaphoresis, constipation or diarrhea, behavioral changes in children.

#### SERIOUS REACTIONS

 Toxic and serious multiorgan hypersensitivity reactions may include blood dyscrasias (such as aplastic anemia, agranulocytosis, thrombocytopenia, leukopenia, leukocytosis, and eosinophilia), cardiovascular disturbances (such as CHF, hypotension, or hypertension, thrombophlebitis and arrhythmias), and dermatologic effects (such as rash, urticaria, pruritus, photosensitivity, Stevens-Johnson syndrome, and toxic epidermal necrolysis).

• Abrupt withdrawal may precipitate status epilepticus.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with impaired cardiac, hepatic, and renal function. AEDs increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, or unusual behavior or moods. Be aware that carbamazepine crosses the placenta and accumulates in fetal tissue and is associated with fetal defects. It is also distributed in breast milk. Children are more likely than adults to develop behavioral changes. Elderly patients are more susceptible to agitation, AV block, bradycardia, confusion, and syndrome of inappropriate antidiuretic hormone secretion. Individuals who possess a genetic susceptibility marker known as the HLA- $B^*1502$  allele have an increased risk of developing Stevens-Johnson syndrome and/ or toxic epidermal necrolysis compared with persons without this genotype. The presence of this genetic variant exists in up to 15% of people of Asian descent, varying from < 1% in Japanese and Koreans, to 2%-4% of South Asians and Indians, to 10%-15% of populations from China, Taiwan, Malaysia, and the Philippines. This variant is virtually absent in those of white, African-American, Hispanic, or European ancestry. Genetic testing is recommended before initiation of therapy in most patients of Asian ancestry for the presence of this genetic marker. A positive result should preclude

#### 254 Carbamide Peroxide

use of carbamazepine unless the benefit exceeds risk. An increased risk of suicidal behavior and suicidal ideation has been observed in patients receiving antiepileptic therapies. Monitor for anxiety, depression, or changes in behavior.

Drowsiness may occur but disappears with continued therapy, so tasks that require mental alertness or motor skills should be avoided. Notify the physician if visual disturbances, fever, joint pain, mouth ulcerations, sore throat, or unusual bleeding occur. Seizure disorder, including the duration, frequency, and intensity of seizures, should be assessed before and during therapy. BUN level, CBC, serum iron determination, and urinalysis should be obtained before and periodically during carbamazepine therapy.

#### Storage

Store the tablets, capsules, and oral suspension at room temperature.

# Administration

! If the patient must change to another anticonvulsant, plan to decrease the carbamazepine dose gradually as therapy begins with a low dose of the replacement drug. When transferring from tablets to suspension, expect to divide the total daily tablet dose into smaller, more frequent doses of suspension. Also plan to administer extended-release tablets in 2 divided doses.

Take carbamazepine with meals to reduce the risk of GI distress. Shake the oral suspension well. Do not administer it simultaneously with any other liquid medicine. Do not crush extended-release tablets. May open extended-release capsules and administer beads sprinkled on applesauce; however, do not crush or chew.

# **Carbamide Peroxide**

car'bah-mide per-ox-ide ★ Auro Ear Drops, Debrox, Gly-Oxide, Murine Ear Drops, Orajel Perioseptic

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Cerumenolytic; topical oral anti-inflammatory

#### MECHANISM OF ACTION

A cerumenolytic that releases oxygen on contact with moist mouth tissues to provide cleansing effects, reduce inflammation, relieve pain, and inhibit odor-forming bacteria. In the ear, oxygen is released and hydrogen peroxide is reduced to water, which enables the chemical reaction. *Therapeutic Effect:* Relieves inflammation of gums and lips. Emulsifies and disperses earwax.

#### PHARMACOKINETICS

Not known.

#### AVAILABILITY

Solution, Oral: 10% (Gly-Oxide), 15% (Orajel Perioseptic). Solution, Otic: 6.5% (Auro Ear Drops, Debrox, Murine Ear Drops).

#### INDICATIONS AND DOSAGES Earwax removal

Earwax removal

OTIC SOLUTION Adults, Elderly, Children 12 yr or older. Tilt head and administer 5-10 drops twice a day for up to 4 days.

*Children 12 yr or younger.* Tilt head and administer 1-5 drops twice a day for up to 4 days.

Oral lesions

TOPICAL, SOLUTION

*Adults, Elderly, Children.* Apply several drops undiluted on affected area 4 times a day after meals and at bedtime. Expectorate after 1-3 min. Do not use for more than 7 days.

# CONTRAINDICATIONS

Dizziness; ear discharge or drainage; recent ear surgery or tympanic membrane perforation; ear pain, irritation, or rash; hypersensitivity to carbamide peroxide or any one of its components.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

DIAGNOSTIC TEST EFFECTS

Not known.

# SIDE EFFECTS

Occasional Oral: Gingival sensitivity.

# SERIOUS REACTIONS

• Opportunistic infections caused by organisms like *Candida albicans* are possible with prolonged use.

#### **PRECAUTIONS & CONSIDERATIONS**

With prolonged use of oral carbamide peroxide, there is a potential for overgrowth of opportunistic organisms, damage to periodontal tissues, and delayed wound healing; should not be used for longer than 7 days. Otic solution should not be used for longer than 4 days. It is unknown whether carbamide peroxide crosses the placenta or is distributed in breast milk. There are no age-related precautions noted in elderly patients.

#### Administration

*Oral topical use:* Use several drops after a meal or at bedtime. Mix with saliva, swish for several minutes, and expectorate. Do not rinse mouth after use.

Otic product use: For use in the ear only. Tilt the patient's head sideways to instill in ear. Keep drops in ear for several minutes by keeping head tilted and placing cotton in ear. Tip of the applicator should not enter the ear canal. Any wax remaining after treatment may be removed by gently flushing the ear with warm water, using a soft rubber bulb ear syringe.

# Carbidopa and Levodopa

kar-bi-doe'pa; lee-voe-doe'pa
A Parcopa, Sinemet, Sinemet CR
▲ DuoDopa, Levocarb SR, Sinemet, Sinemet CR
Do not confuse Sinemet with Serevent.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, dopaminergics

# **MECHANISM OF ACTION**

Levodopa is converted to dopamine in the basal ganglia, thus increasing dopamine concentration in the brain and inhibiting hyperactive cholinergic activity. Carbidopa prevents peripheral breakdown of levodopa, allowing more levodopa to be available for transport into the brain. *Therapeutic Effect:* Reduces tremor.

# PHARMACOKINETICS

Carbidopa is rapidly and completely absorbed from the GI tract. Widely

Carbidopa and Levodopa (Generic Name)

distributed. Excreted primarily in urine. Levodopa is converted to dopamine. Excreted primarily in urine. *Half-life:* 1-2 h (carbidopa); 1-3 h (levodopa).

# AVAILABILITY

*Tablets:* 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa.

*Tablets (Extended Release):* 25 mg carbidopa/100 mg levodopa, 50 mg carbidopa/200 mg levodopa.

*Tablets (Orally Disintegrating Parcopa):* 10 mg carbidopa/100 mg levodopa, 25 mg carbidopa/100 mg levodopa, 25 mg carbidopa/250 mg levodopa.

#### INDICATIONS AND DOSAGES Parkinsonism

#### Parkinson

PO

*Adults*. Initially, 25/100 mg 2-4 times a day. May increase up to 200/2000 mg daily in divided doses. *Elderly*. Initially, 25/100 mg twice a day. May increase as necessary.

 When converting a patient from Sinemet to Sinemet CR (50 mg/200 mg), dosage is based on the total daily dose of levodopa:

Sinemet (mg)	Sinemet CR	
300-400	1 tablet twice a day	
500-600	1.5 tablets twice a day or 1 tablet 3 times a day	
700-800	4 tablets in 3 or more divided doses	
900-1000	5 tablets in 3 or more divided doses	

Intervals between doses of Sinemet CR should be 4-8 h while awake.

# CONTRAINDICATIONS

Angle-closure glaucoma, use within 14 days of MAOIs, history of melanoma.

# INTERACTIONS

# Anticonvulsants, benzodiazepines, haloperidol, phenothiazines: May

decrease the effects of carbidopa and levodopa.

**MAOIs:** May increase the risk of hypertensive crisis.

Contraindicated.

Selegiline: May increase levodopainduced dyskinesias, nausea, orthostatic hypotension, confusion, and hallucinations.

**Iron salts:** May reduce levodopa absorption.

Herbal

None known.

**Protein:** Avoid high-protein diet. Distribute dietary protein throughout the day to avoid fluctuations in levodopa absorption.

**Pyridoxine/vitamin B<sub>6</sub>:** May reduce levodopa's effect at high doses.

# DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum LDH, alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

#### Frequent (10%-90%)

Uncontrolled movements of the face, tongue, arms, or upper body; nausea and vomiting (80%); anorexia (50%).

### Occasional

Depression, anxiety, confusion, nervousness, urine retention, palpitations, dizziness, lightheadedness, decreased appetite, blurred vision, constipation, dry mouth, flushed skin, headache, insomnia, diarrhea, unusual fatigue, darkening of urine and sweat.

# Rare

Hypertension, ulcer, hemolytic anemia (marked by fatigue).

#### SERIOUS REACTIONS

• Patients on long-term therapy have a high incidence of involuntary choreiform, dystonic, and dyskinetic movements.

 Numerous mild to severe CNS and psychiatric disturbances may occur, including reduced attention span, anxiety, nightmares, daytime somnolence, euphoria, fatigue, paranoia, psychotic episodes, depression, impulse control problems (e.g., gambling, sexual), and hallucinations.

• Increased risk of melanoma noted in Parkinson's patients.

Orthostasis, syncope.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with active peptic ulcer, severe cardiac, endocrine, hepatic, pulmonary, or renal impairment, treated openangle glaucoma, a history of myocardial infarction, bronchial asthma (because of tartrazine sensitivity), and emphysema. It is unknown whether carbidopa and levodopa cross the placenta or are distributed in breast milk. However, this drug may inhibit lactation. Women should not breastfeed while taking this drug. The safety and efficacy of carbidopa and levodopa have not been established in children younger than 18 yr. Elderly patients are more sensitive to levodopa's effects. Elderly patients receiving anticholinergics are at increased risk for adverse CNS effects, such as anxiety, confusion, and nervousness.

Dizziness, drowsiness, dry mouth, and darkened urine may occur. Alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician if agitation, headache, lethargy, or confusion occurs. Relief of symptoms, such as improvement of masklike facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should be assessed.

#### Storage

Store at room temperature. Administration

! Plan to discontinue levodopa at least 12 h before giving carbidopa and levodopa. Expect the initial dose to provide at least 25% of the previous levodopa dose. Void before giving carbidopa and levodopa to reduce the risk of urine retention.

Take carbidopa and levodopa without regard to food. If GI upset occurs, take with food. Scored tablets may be crushed as needed. Extendedrelease tablets may be cut in half but not crushed. Orally disintegrating tablets should be allowed to dissolve on the tongue and then swallowed with saliva.

#### Carboprost kar'boe-prost

🗙 🍟 Hemabate

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Abortifacients; oxytocics; prostaglandins; stimulants, uterine

# **MECHANISM OF ACTION**

A prostaglandin similar to prostaglandin F2 $\alpha$  (dinoprost) that directly acts on myometrium and stimulates contraction in gravid uterus. *Therapeutic Effect:* Produces cervical dilation and softening.

#### PHARMACOKINETICS

None reported.

# Carboplatin

car-bow'play-tin **Do not confuse carboplatin with Cisplatin or Platinol.** 

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastics, platinum agents

# **MECHANISM OF ACTION**

A platinum coordination complex that inhibits DNA synthesis by cross-linking with DNA strands, preventing cell division. Cell cycle-phase nonspecific. *Therapeutic Effect:* Interferes with DNA function.

#### PHARMACOKINETICS

Protein binding: Low. Hydrolyzed in solution to active form. Primarily excreted in urine. *Half-life:* 2.6-5.9 h.

# AVAILABILITY

Powder for Injection: 50 mg, 150 mg, 450 mg. Injection Solution: 10 mg/mL.

#### INDICATIONS AND DOSAGES

 Ovarian cancer (monotherapy) IV INFUSION

Adults. 360 mg/m<sup>2</sup> on day 1, every 4 wks. Do not repeat dose until neutrophil and platelet counts are within acceptable levels. Adjust drug dosage in previously treated patients based on lowest post-treatment platelet or neutrophil count. Increase dosage only once to no more than 125% of starting dose.

# Ovarian cancer (combination therapy)

IV INFUSION *Adults.* 300 mg/m<sup>2</sup> (with cyclophosphamide) on day 1, every 4 wks. Do not repeat dose until neutrophil and platelet counts are within acceptable levels.

 Calvert formula for AUC-based dosing in adults as an alternative method of dosing for ovarian cancer: Total dose (mg) = Target AUC × (GFR + 25)

• Adult dosage in renal impairment Initial dosage is based on creatinine clearance; subsequent dosages are based on the patient's tolerance and degree of myelosuppression.

#### Creatinine

Clearance (mL/ min)	Dosage Day 1 (mg/m²)	
≥ 60	No adjustment	
41-59	250	
16-40	200	

#### **OFF-LABEL USES**

Treatment of bony and soft tissue sarcoma; germ cell tumor; neuroblastoma pediatric brain tumor; small cell lung cancer; solid tumors of the bladder, cervix, and testes; squamous cell carcinoma of the esophagus.

#### CONTRAINDICATIONS

History of severe allergic reaction to cisplatin, platinum compounds, or mannitol; severe bleeding; severe myelosuppression.

# INTERACTIONS

#### Drug

**Bone marrow depressants:** May increase myelosuppression.

Live-virus vaccines: May potentiate virus replication and decrease the patient's antibody response to the vaccine.

**Nephrotoxic, ototoxic medications:** May increase the risk of nephrotoxicity/ototoxicity. **Phenytoin:** Phenytoin levels may be reduced.

Warfarin: The effects of warfarin may be increased. Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease serum electrolyte levels, including calcium, magnesium, potassium, and sodium. High dosages (more than 4 times the recommended dosage) may elevate BUN and serum alkaline phosphatase, bilirrubin, creatinine, and AST SGOT levels.

# IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), diazepam, lansoprazole, leucovorin calcium, phenytoin.

# **IV COMPATIBILITIES**

Etoposide (VePesid), granisetron (Kytril), ondansetron (Zofran), paclitaxel (Taxol).

# SIDE EFFECTS

#### Frequent

Nausea (75%-80%), vomiting (65%). Occasional

Generalized pain (17%), diarrhea or constipation (6%), peripheral neuropathy (4%).

### Rare (2%-3%)

Alopecia, asthenia, hypersensitivity reaction (erythema, pruritus, rash, urticaria, and rarely bronchospasm and hypotension).

# SERIOUS REACTIONS

• Vomiting is severe in 30%.

• Myelosuppression may be severe, resulting in anemia, infection (sepsis, pneumonia), and bleeding.

• Prolonged treatment may result in peripheral neurotoxicity.

• High doses may be associated with reversible vision loss.

• Serious hypersensitivity reactions such as anaphylaxis (rare).

# **PRECAUTIONS & CONSIDERATIONS**

Carboplatin therapy is highly emetogentic; all patients must receive prophylactic antiemetic therapy. Caution is warranted in renal impairment. Be aware that prior aminoglycoside therapy may potentiate carboplatin-induced renal toxicity. Use cautiously in elderly patients who were previously treated with cisplatin; they are at an increased risk of developing carboplatin-induced peripheral neuropathy. Avoid using carboplatin in pregnant women. The use of a contraceptive is recommended during therapy. It is unknown whether carboplatin is distributed in breast milk. Safety and efficacy have not been established in children. Tell the patient of the possibility of hair loss and that normal hair growth should resume after treatment has ended.

#### Storage

Store at room temperature. Protect from light. Diluted solutions are stable for 8 h at room temperature. Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

Expect to premedicate with antiemetics like a corticosteroid (e.g., dexamethasone) and a serotonin antagonist prior to infusion.

Be aware that aluminum reacts with carboplatin to form an inactive precipitate; intravenous sets and needles containing aluminum that may come in contact with carboplatin should not be used.

Given as an IV infusion, carboplatin injection can be diluted to concentrations as low as 0.5 mg/mL with D5W or 0.9% NaCl injection. Infusion may be given over 15 min or longer.

### AVAILABILITY

*Injection:* 250 mcg carboprost and 83 mcg tromethamine/mL (Hemabate).

#### INDICATIONS AND DOSAGES > Pregnancy termination between 13 and 20 wks, gestation under select circumstances IM

*Adults.* Initially, 100-250 mcg, may repeat at 1.5- to 3.5-h intervals. May increase up to 500 mcg if uterine contractility inadequate. Maximum: 12-mg total dose or continuous administration for more than 2 days.

#### Postpartum uterine hemorrhage IM

*Adults*. Initially, 250 mcg, may repeat at 15- to 90-min intervals. Maximum: 2 mg total dose.

# **OFF-LABEL USES**

Treatment of incomplete abortion.

# CONTRAINDICATIONS

Acute pelvic inflammatory disease, active cardiac disease, pulmonary disease, renal disease, hepatic disease, hypersensitivity to carboprost or other prostaglandins.

# INTERACTIONS

#### Drug

**Oxytocin, oxytocics:** May cause uterine hypertonus leading to uterine rupture or cervical lacerations.

### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Nausea, transient pyrexia, vomiting, diarrhea.

### Occasional

Facial flushing. **Rare** Endometritis.

# SERIOUS REACTIONS

• Excessive dosing may cause uterine hypertonicity with spasm and tetanic contraction, leading to cervical laceration/perforation and uterine rupture and hemorrhage.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of hypotension or hypertension, anemia, jaundice, diabetes mellitus, epilepsy, compromised (scarred) uterus, cardiovascular disease, adrenal disease, or hepatic disease. NOTE: Use is not indicated if the fetus has reached a stage of viability in utero. Be aware that carboprost tromethamine use is contraindicated during later pregnancy and that small amounts of the drug are found in breast milk. There is no information available on carboprost tromethamine use in children or in elderly patients. Avoid smoking because of added effects of vasoconstriction.

Strength, duration, and frequency of contractions as well as vital signs should be monitored every 15 min until stable, then hourly until abortion is complete. Fever, chills, foul-smelling/increased vaginal discharge, and uterine cramps/pain should be reported immediately. Storage

# Refrigerate ampules. Do not freeze. Administration

Administer by deep IM injection. Be aware that carboprost tromethamine should not be injected IV because it may result in bronchospasm, hypertension, vomiting, and anaphylaxis.

# Carisoprodol

kar'i-so-pro'dol ★ Soma

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Skeletal muscle relaxant, central acting

# **MECHANISM OF ACTION**

A centrally acting skeletal muscle relaxant whose exact mechanism is unknown. Effects may be due to its CNS depressant actions. *Therapeutic Effect:* Relieves muscle spasms and pain.

# PHARMACOKINETICS

Onset 2 h; duration 4-6 h. *Half-life:* 2.5 h. *Meprobamate half-life:* 10 h. Metabolized in liver to meprobamate by the CYP2C19 isoenzyme; excreted by kidneys.

### AVAILABILITY

Tablets: 250 mg, 350 mg.

### INDICATIONS AND DOSAGES

 Adjunct to rest, physical therapy, analgesics, and other measures for relief of discomfort from acute, painful musculoskeletal conditions PO

*Adults, Elderly, Adolescents over 16 yr of age.* 250-350 mg 4 times a day. Duration of therapy should be limited to 2-3 wks.

#### CONTRAINDICATIONS

Acute intermittent porphyria, sensitivity to meprobamate or other carbanates.

#### INTERACTIONS

Drug Alcohol, other CNS depressants: May increase CNS depression.

#### Herbal

None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent (> 10%) Somnolence.

Occasional (1%-10%)

Tachycardia, facial flushing, dizziness, headache, lightheadedness, dermatitis, nausea, vomiting, abdominal cramps, dyspnea.

#### SERIOUS REACTIONS

 Overdose may cause CNS and respiratory depression, shock, and coma.

 Rarely idiosyncratic reaction appears within minutes or hours of the first dose. Symptoms reported include extreme weakness, transient quadriplegia, dizziness, ataxia, temporary loss of vision, diplopia, mydriasis, dysarthria, agitation, euphoria, confusion, and disorientation.

· Seizures (rare).

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic and renal impairment and addictive personalities and in elderly patients. Drowsiness or dizziness may occur. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills. Liver and renal function tests should be obtained at baseline and periodically for those on long-term therapy. Therapeutic response, such as relief of muscle spasm and pain, should be assessed.

#### Storage

Store at room temperaure.

Carisoprodol (Generic Name)

#### Administration

Take carisoprodol without regard to food. Take the last dose of the day at bedtime.

# Carteolol

kar-tee'oh-lole **Do not confuse with carvedilol.** 

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Ophthalmic agents, antiglaucoma agents, β-adrenergic blocker

#### MECHANISM OF ACTION

An antihypertensive that blocks  $\beta_1$ -adrenergic receptors at normal doses and  $\beta_2$ -adrenergic receptors at large doses. Predominantly blocks  $\beta_1$ -adrenergic receptors in cardiac tissue if given orally. Reduces aqueous humor production. *Therapeutic Effect:* Decreases intraocular pressure (IOP).

#### PHARMACOKINETICS

Carteolol has not been detected in plasma following ocular use; however, systemic absorption has been reported with use of other ocular  $\beta$ -blockers. Minimally metabolized in liver. Primarily excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* 6 h (increased in decreased renal function).

#### AVAILABILITY

Ophthalmic Solution: 1%.

#### INDICATIONS AND DOSAGES • Open-angle glaucoma, ocular hypertension

OPHTHALMIC *Adults, Elderly.* 1 drop 2 times a day to affected eye(s).

### **OFF-LABEL USES**

Combination with miotics decreases IOP in acute/chronic angle-closure glaucoma, treatment of secondary glaucoma, malignant glaucoma, angle-closure glaucoma during or after iridectomy.

#### CONTRAINDICATIONS

Bronchial asthma, COPD, bronchospasm, overt cardiac failure, cardiogenic shock, heart block greater than first degree, persistently severe bradycardia.

### INTERACTIONS

**Drug Other hypotensives:** May increase hypotensive effect.

# DIAGNOSTIC TEST EFFECTS

May increase serum ANA titer, BUN, serum LDH, lipoprotein, alkaline phosphatase, bilirubin, creatinine, potassium, triglyceride, uric acid, SGOT (AST), and SGPT (ALT) levels.

# SIDE EFFECTS

#### Frequent

Transient eye irritation, burning, tearing, conjunctival hypermia, and edema of eyelids.

#### Occasional

Blurred or cloudy vision, photophobia, decreased night vision, ptosis, blepharoconjunctivitis, and corneal sensitivity.

#### Rare

Bradycardia, decreased BP, cardiac arrhythmia, heart palpitation, dyspnea, asthenia, headache, dizziness, insomnia, sinusitis, and taste perversion.

#### SERIOUS REACTIONS

 Abrupt withdrawal (particularly in those with coronary artery disease) may produce angina or precipitate myocardial infarction.

# Carmustine

kar-muss'teen ★ 🏜 BiCNU, Gliadel

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastic, nitrosureas, alkylating agent

# **MECHANISM OF ACTION**

An alkylating agent and nitrosourea that inhibits DNA and RNA synthesis by cross-linking with DNA and RNA strands, preventing cell division. Cell cycle-phase nonspecific. *Therapeutic Effect*: Interferes with DNA and RNA function.

#### PHARMACOKINETICS

Degraded within 15 min; crosses blood-brain barrier; 70% excreted in urine within 96 h; 10% excreted as CO<sub>2</sub>; fate of 20% is unknown. *Half-life*: 20 min (active metabolites half-life 67 h).

# AVAILABILITY

*Powder for Injection:* 100 mg. *Wafer:* 7.7 mg.

#### INDICATIONS AND DOSAGES

 Disseminated Hodgkin's disease, non-Hodgkin's lymphoma, multiple myeloma, and primary and metastatic brain tumors in previously untreated patients (monotherapy)

IV (BiCNU) INFUSION NOTE: Dosages and regimens depend on type of cancer and use in combination with other agents. See prescribing information. *Adults, Elderly.* 150-200 mg/m<sup>2</sup> as

a single dose or 75-100 mg/m<sup>2</sup> on 2 successive days.

*Children with brain tumors.* 200-250 mg/m<sup>2</sup> every 4-6 wks as a single dose. IMPLANTATION (GLIADEL) FOR BRAIN TUMOR INDICATIONS *Adults, Elderly, Children.* Up to 8 wafers may be placed in resection cavity.

# Dosage adjustments

IV: Expect dosage adjustments to occur based on toxicity and blood cell counts.

### CONTRAINDICATIONS

Hypersenstivity to carmustine.

# INTERACTIONS

# Drug

**Cimetidine:** May increase concentrations and toxic effects of carmustine.

**Digoxin:** May reduce digoxin concentrations.

**Phenytoin:** May reduce phenytoin concentrations.

# DIAGNOSTIC TEST EFFECTS

Increases in bilirubin, alkaline phosphatase, AST; decreases in leukocytes, platelets.

#### SIDE EFFECTS

#### Frequent

Nausea and vomiting within min to 2 h after administration (may last up to 6 h); myelosuppression.

# Occasional

Diarrhea, esophagitis, anorexia, dysphagia.

# Rare

Thrombophlebitis.

#### SERIOUS REACTIONS

 Hematologic toxicity due to myelosuppression occurs frequently. Thrombocytopenia occurs about
 4 wks after carmustine treatment begins and lasts 1-2 wks.

• Leukopenia is evident 5-6 wks after treatment begins and lasts

1-2 wks. Anemia occurs less frequently and is less severe. · Mild, reversible hepatotoxicity also occurs frequently.

· Prolonged high-dose carmustine therapy may produce impaired renal function and pulmonary toxicity (pulmonary infiltrate or fibrosis).

#### **PRECAUTIONS & CONSIDERATIONS**

Administer with caution to patients with depressed platelet, leukocyte, or erythrocyte counts or with renal or hepatic impairment. Pretreatment pulmonary function testing is advised. Nausea and vomiting occur frequently with carmustine therapy; prophylactic antiemetics are advised. Women of childbearing potential should be advised to avoid pregnancy. Not recommended for use in breastfeeding. Storage

Store powder for injection in refrigerator. Reconstituted and diluted solutions may be stored at room temperature for up to 8 h. Store wafers in freezer. Unopened foil pouches may be held at room temperature for up to 6 h. Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

Antiemetics including serotonin antagonists and corticosteroids (e.g., dexamethasone) are recommended prior to infusion.

To prepare injectable, dilute powder with 3 mL of absolute alcohol. Further dilute with 27 mL of sterile water for injection to a concentration of 3.3 mg/mL. May further dilute with D5W. Displays significant absorption to PVC containers; administer in glass or polyolefin containers. Infuse over 1-2 h using polyethylene tubing. Protect from light.

For wafers: Wear surgical gloves to handle. See specialized instructions to avoid loss of sterility or unintended exposure, which may cause burns and depigmentation of skin.

• May precipitate thyroid crisis in those with thyrotoxicosis.

 β-blockers may mask signs and symptoms of acute hypoglycemia (tachycardia, BP changes) in diabetic patients.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with impaired renal, cardiac, or liver function; thyrotoxicosis, diminished pulmonary function, myasthenia. Be aware that carteolol crosses the placenta and is distributed in small amounts in breast milk. Safety and efficacy of carteolol have not been established in children. In patients with angle-closure glaucoma, carteolol should be used with a miotic and not alone.

#### Storage

Store ophthalmic solution at room temperature.

#### Administration

Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Instill drop(s) and gently close the eyes for 1-2 min. Do not blink. Use nasolacrimal occlusion to reduce systemic absorption. Do not touch the tip of the dropper to any surface to avoid contamination. Wait several minutes before use of other eyedrops.

# Carvedilol

kar-ve'dil-ol Coreg Do not confuse carvedilol with carteolol or with captopril.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antihypertensives, β-adrenergic blocker

### **MECHANISM OF ACTION**

An antihypertensive that possesses nonselective  $\beta$ -blocking and  $\alpha$ -adrenergic blocking activity. Causes vasodilation. *Therapeutic Effect*: Reduces cardiac output, exercise-induced tachycardia, and reflex orthostatic tachycardia; reduces peripheral vascular resistance.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	30 min	1-2 h	24 h

Rapidly and extensively absorbed from the GI tract. Protein binding: 98%. Metabolized in the liver. Excreted primarily via bile into feces. Minimally removed by hemodialysis. *Half-life*: 7-10 h. Food delays rate of absorption.

#### AVAILABILITY

*Capsules (Extended Release):* 10 mg, 20 mg, 40 mg, 80 mg. *Tablets:* 3.125 mg, 6.25 mg, 12.5 mg, 25 mg.

# INDICATIONS AND DOSAGES Hypertension

PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 6.25 mg twice a day. May double at 7- to 14-day intervals to highest tolerated dosage. Maximum: 50 mg/day. PO (EXTENDED RELEASE) Adults, Elderly. Initially 20 mg once daily. May double at 7- to 14-day intervals to highest tolerated dosage. Maximum 80 mg/day.

Congestive heart failure

PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 3.125 mg twice a day. May double at 2-wk intervals to highest tolerated dosage. Maximum: For patients weighing more than 85 kg, give

Carvedilol (Generic Name)

50 mg twice a day; for those weighing 85 kg or less, give 25 mg twice a day.

PO (EXTENDED RELEASE) Adults, Elderly. Initially 10 mg once daily for 2 wks. May double at 2-wk intervals to highest tolerated dosage. Maximum 80 mg/day.

Left ventricular dysfunction PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 3.125-6.25 mg twice a day. May increase at intervals of 3-10 days up to 25 mg twice a day. PO (EXTENDED RELEASE) Adults, Elderly. Initially 10-20 mg once daily. May increase at intervals of 3-10 days up to 80 mg once daily.

 Patients can be converted from immediate release to extendedrelease carvedilol at the following doses:

Twice-Daily Dose (mg)	Once-Daily Dose (mg) (Coreg-CR)	
3.125	10	
6.25	20	
12.5	40	
25	80	

# **OFF-LABEL USES**

Treatment of angina pectoris, idiopathic cardiomyopathy.

# CONTRAINDICATIONS

Hypersensitivity. Bronchial asthma or related bronchospastic conditions, cardiogenic shock, pulmonary edema, second- or third-degree AV block, severe bradycardia, clinical hepatic impairment.

# INTERACTIONS

#### Drug

Alcohol: Alcohol may affect the extended-release properties, resulting in fasting absorption and a higher peak. Avoid alcohol, including alcohol in prescription and nonprescription medications, for at least 2 h after carvedilol extendedrelease administration.

**Calcium blockers:** Increase risk of conduction disturbances.

**Clonidine:** May potentiate BP effects. **Cimetidine:** May increase carvedilol blood concentration.

**Digoxin:** Increases concentrations of this drug.

**Diuretics, other antihypertensives:** May increase hypotensive effect.

**Insulin, oral hypoglycemics:** May mask symptoms of hypoglycemia and prolong hypoglycemic effect of these drugs.

**Rifampin:** Decreases carvedilol blood concentration.

Herbal None known. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

Increases in AST and ALT.

# SIDE EFFECTS

Carvedilol is generally well tolerated, with mild and transient side effects.

Frequent (4%-6%)

Fatigue, dizziness. Occasional (2%)

Diarrhea, bradycardia, rhinitis, back pain.

Rare (< 2%)

Orthostatic hypotension, somnolence, urinary tract infection, viral infection.

# SERIOUS REACTIONS

 Overdose may produce profound bradycardia, hypotension, bronchospasm, cardiac insufficiency, cardiogenic shock, and cardiac arrest.

• Abrupt withdrawal may result in diaphoresis, palpitations, headache, and tremors.

 Carvedilol administration may precipitate congestive heart failure (CHF) and myocardial infarction (MI) in patients with heart disease, thyroid storm in those with thyrotoxicosis, and peripheral ischemia in those with existing peripheral vascular disease.
 Hypoglycemia may occur in patients with previously controlled diabetes.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in those undergoing anesthesia and in those with CHF controlled with ACE inhibitor, digoxin, or diuretics; diabetes mellitus; hypoglycemia; impaired hepatic function; peripheral vascular disease; and thyrotoxicosis. Manufacturer recommends against withholding the medication prior to major surgery. It is unknown whether carvedilol crosses the placenta or is distributed in breast milk. Carvedilol use should be avoided in pregnant women after the first trimester because it may result in low-birthweight infants. The drug may also produce apnea, bradycardia, hypoglycemia, or hypothermia during childbirth. The safety and efficacy of carvedilol have not been established in children. In elderly patients, the incidence of dizziness may be increased.

Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval.

Orthostatic hypotension may occur, so rise slowly from a lying to sitting position and dangle the legs from the bed momentarily before standing. Tasks that require mental alertness or motor skills should be avoided. Apical pulse and BP should be assessed immediately before giving carvedilol. BP for hypotension; respiratory status for shortness of breath; pattern of daily bowel activity and stool consistency; ECG for arrhythmias; and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 55 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain, should also be assessed.

#### Storage

Store at room temperature. Protect from light and moisture.

# Administration

Take carvedilol tablets with food to slow the rate of absorption and reduce the risk of orthostatic hypotension. Carvedilol extendedrelease capsules should be taken once daily in the morning with food. Swallow extended-release capsules whole, without crushing or chewing. Capsules may be opened and the contents sprinkled on applesauce.

Caspofungin Acetate kas-poe-fun'jin as'e-tate

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antifungal, systemic; echinocandins

#### MECHANISM OF ACTION

An antifungal that inhibits the synthesis of glucan, a vital component of fungal cell formation, thereby damaging the fungal cell membrane. *Therapeutic Effect:* Fungicidal.

# PHARMACOKINETICS

Distributed in tissue. Extensively bound to albumin. Protein binding: 97%. Slowly metabolized in liver to active metabolite. Excreted primarily in urine and to a lesser extent in feces. Not removed by hemodialysis. *Half-life:* 40-50 h.

#### AVAILABILITY

Powder for Injection: 50-mg, 70-mg vials.

# INDICATIONS AND DOSAGES Aspergillosis

IV INFUSION

Adults, Elderly, Children older than 12 yr. Give single 70-mg loading dose on day 1, followed by 50 mg/day thereafter.

#### Invasive candidiasis

IV INFUSION *Adults, Elderly.* Initially, 70 mg followed by 50 mg daily.

# Esophageal candidiasis IV INFUSION

Adult, Elderly. 50 mg a day. • Empirical therapy, neutropenic

#### patients

IV INFUSION

Adults, Elderly. Give single 70-mg loading dose on day 1, followed by 50 mg/day thereafter. If 50-mg dose is tolerated, but does not provide adequate clinical response, dose can be increased to 70 mg/day.

#### Dosage in hepatic impairment IV INFUSION

Adults, Elderly with moderate hepatic impairment. Reduce daily dose to 35 mg. Loading dose, when indicated, remains 70 mg.

# CONTRAINDICATIONS

Hypersensitivity to any of the product ingredients.

#### INTERACTIONS Drug

Carbamazepine, dexamethasone, efavirenz, nelfinavir, nevirapine, phenytoin, rifampin: May decrease blood concentration of caspofungin. Cyclosporine: May increase caspofungin concentrations and increase incidence of hepatic transaminase elevations. Tacrolimus: May decrease the effect of tacrolimus. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase PT as well as serum alkaline phosphatase, serum bilirubin, serum creatinine, LDH, SGOT (AST), SGPT (ALT), serum uric acid, urine pH, urine protein, urine RBC, and urine WBC levels. May decrease hemoglobin, hematocrit, platelet count, and serum albumin, serum bicarbonate, serum protein, and serum potassium levels.

# IV INCOMPATIBILITIES

Do not mix caspofungin with any other medication or use dextrose as a diluent.

# SIDE EFFECTS

Frequent (26%) Fever. Occasional (4%-11%) Headache, nausea, phlebitis. Rare (3% or less)

Paresthesia, vomiting, diarrhea, abdominal pain, myalgia, chills, tremor, insomnia.

# SERIOUS REACTIONS

• Hypersensitivity reactions (characterized by rash, facial swelling, pruritus, and a sensation of warmth, hypotension, tachycardia) may occur.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted for patients with liver function impairment. Be aware that caspofungin crosses the placental barrier, may be embryotoxic, and is distributed in breast milk. Be aware that the safety and efficacy of caspofungin have not been established in children. In elderly patients, agerelated moderate renal impairment may require dosage adjustment.

Baseline temperature, liver function test results, and history of allergies should be obtained before giving the drug. Signs and symptoms of liver function should be assessed. If increased shortness of breath, itching, facial swelling, or a rash occurs, notify the physician. Report pain, burning, or swelling at the IV infusion site. **Storage** 

Refrigerate but warm it to room temperature before preparing it with the diluent. The reconstituted solution, before it is prepared as the patient infusion solution, may be stored at room temperature for 1 h. The final infusion solution can be stored at room temperature for 24 h or up to 48 h under refrigeration. Discard the solution if it contains particulate or is discolored.

# Administration

For IV infusion only. For a 50- to 70-mg loading dose, add 10.5 mL 0.9% NaCl to the 50- or 70-mg vial. Transfer 10 mL of the reconstituted solution to 250 mL 0.9% NaCl or other compatible solution (see manufacturer's recommendations). Do not use dextrose solutions to prepare or infuse the drug. For 35-mg dose in persons with moderate liver insufficiency, add 10.5 mL 0.9% NaCl to the 50-mg vial. Transfer 7 mL to 100 or 250 mL 0.9% NaCl. Infuse over 60 min. Castor Oil cass'ter-oil

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X OTC

**Classification:** Laxative, stimulant

# **MECHANISM OF ACTION**

A laxative prepared from the bean of the castor plant; the exact mechanism of action is unknown. Acts primarily in the small intestine. May be hydrolyzed to ricinoleic acid, which reduces net absorption of fluid and electrolytes and stimulates peristalsis. *Therapeutic Effect:* Increases peristalsis, promotes laxative effect.

# PHARMACOKINETICS

Minimal absorption by the GI tract. May be metabolized like other fatty acids within the gut.

#### AVAILABILITY

Oral liquid: 95%, 100%.

# INDICATIONS AND DOSAGES Constipation

Adults, Elderly, Children 12 yr and older. 15-60 mL as a single dose. Children 2-12 yr. 5-15 mL as a single dose.

*Children* < 2 yr. 1-2 mL as a single dose. Maximum: 5 mL as a single dose.

#### CONTRAINDICATIONS

Abdominal pain, appendicitis, intestinal obstruction, nausea, vomiting, pregnancy.

#### INTERACTIONS

Drug

None known

#### Herbal

Licorice: May increase risk of hypokalemia. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Occasional

Some degree of abdominal discomfort, nausea, mild cramps, griping, faintness.

# SERIOUS REACTIONS

• Long-term use may result in laxative dependence, chronic constipation, and loss of normal bowel function.

 Chronic use or overdosage may result in electrolyte disturbances, such as hypokalemia, hypocalcemia, metabolic acidosis or alkalosis, persistent diarrhea, malabsorption, and weight loss. Electrolyte disturbance may produce vomiting and muscle weakness.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used for extended periods (> 1 wk) of castor oil use. Be aware that castor oil is contraindicated in pregnancy. It is unknown whether castor oil is distributed in breast milk. Safety and efficacy of castor oil have not been established in children younger than 2 yr of age. No age-related precautions have been noted in elderly patients, but monitor for signs of dehydration and electrolyte loss. Avoid taking within 1 h of other oral medication because it decreases drug absorption.

#### Storage

Store at room temperature. Administration

Take castor oil on an empty stomach for faster results. Drink at least 6-8

glasses of water a day to aid in stool softening.

# Cefaclor

sef'a-klor Apo-Cefaclor, Ceclor

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (second generation)

# **MECHANISM OF ACTION**

A second-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

# PHARMACOKINETICS

Well-absorbed from the GI tract. Protein binding: 25%. Widely distributed. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. *Half-life:* 0.6-0.9 h (increased in impaired renal function).

# AVAILABILITY

*Capsules:* 250 mg, 500 mg. *Oral Suspension:* 125 mg/ 5 mL, 187 mg/5 mL, 250 mg/5 mL, 375 mg/5 mL. *Tablets, Extended Release:* 500 mg.

# INDICATIONS AND DOSAGES Bronchitis

PO Adults, Elderly (extended release). 500 mg q12h for 7 days.

# Lower respiratory tract infections PO

Adults, Elderly. 250-500 mg q8h.

# Otitis media

PO Children. 20-40 mg/kg/day in 2-3 divided doses. Maximum: 1 g/day.

Cefaclor (Generic Name)

# Pharyngitis, skin or skin-structure infections, tonsillitis

PO

Adults, Elderly (extended release). 375 mg q12h. Adults, Elderly (regular release). 250-500 mg q8h. Children. 20-40 mg/kg/day in 2-3

divided doses. Maximum: 1 g/day.

# • Urinary tract infections PO

Adults, Elderly. 250-500 mg q8h. Children. 20-40 mg/kg/day in 2-3 divided doses q8h. Maximum: 1 g/day. PO (EXTENDED-RELEASE

TABLETS)

Adults, Children older than 16 yr. 375-500 mg q12h.

#### Otitis media

#### PO

*Children older than 1 mo.* 40 mg/kg/ day in divided doses q8h. Maximum: 1 g/day.

# CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

# INTERACTIONS

#### Drug

**Probenecid:** May increase cefaclor blood concentration. **Herbal** 

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May cause a positive direct or indirect Coombs' test.

# SIDE EFFECTS

#### Frequent

Oral candidiasis, rash, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

# Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

#### Rare

Allergic reaction (pruritus, urticaria).

### SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with a history of GI disease (especially antibioticassociated colitis or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic medications. Be aware that cefaclor readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children older than 1 mo. In elderly patients, age-related renal impairment may require dosage adjustment.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the mouth for white patches on the mucous membranes and tongue, the pattern of daily bowel activity and stool consistency, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed.

#### Storage

Store capsules, extended-release tablets, and powder for suspension at room temperature. After reconstitution, oral suspension is stable for 14 days if refrigerated. Administration

#### Administration

Take without regard to meals; if GI upset occurs, give with food or milk. Do not cut, crush, or chew extended-release tablets.

Shake oral suspension well before using.

# Cefadroxil

sef-a-drox'ill

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (first generation)

# **MECHANISM OF ACTION**

A first-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 15%-20%. Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life*: 1.2-1.5 h (increased in impaired renal function).

# AVAILABILITY

Capsules: 500 mg. Oral Suspension: 250 mg/5 mL, 500 mg/5 mL. Tablets: 1000 mg.

# INDICATIONS AND DOSAGES

• Urinary tract infection PO

*Adults, Elderly.* 1-2 g/day as a single dose or in 2 divided doses.

*Children*. 30 mg/kg/day in 2 divided doses. Maximum: 2 g/day.

# Skin and skin-structure infections, group A β-hemolytic streptococcal pharyngitis, tonsillitis

#### PO

*Adults, Elderly.* 1-2 g in 2 divided doses. *Children.* 30 mg/kg/day in 2 divided doses. Maximum: 2 g/day.

# Impetigo

### PO

*Children.* 30 mg/kg/day as a single dose or in 2 divided doses. Maximum: 2 g/day.

#### Dosage in renal impairment (adults)

After an initial 1-g dose, dosage and frequency are modified based on creatinine clearance and the severity of the infection.

# Creatinine

Clearance (mL/min)	Dosage Interval
25-50	500 mg q12h
10-25	500 mg q24h
0-10	500 mg q36h

# CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

# INTERACTIONS

#### Drug

**Probenecid:** Increases cefadroxil blood concentration.

# Herbal

None known. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May cause a

Cefadroxil (Generic Name)

positive direct or indirect Coombs' test.

# SIDE EFFECTS

#### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

#### Occasional

Nausea, unusual bruising or bleeding, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

#### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

#### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

• Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with a history of GI disease (especially antibiotic-associated colitis or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic medications. Be aware that cefadroxil readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted for children. In elderly patients, age-related renal impairment may require dosage adjustment. Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibiotic-associated colitis. Assess the mouth for white patches on the mucous membranes and tongue, pattern of daily bowel activity and stool consistency, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed.

Store capsules, extended-release tablets, and powder for suspension at room temperature. After reconstitution, oral suspension is stable for 14 days if refrigerated. Administration

# Take without regard to meals; if GI upset occurs, give with food or mill

upset occurs, give with food or milk. Shake oral suspension well before using.

# Cefazolin

sef-a'zoe-lin Ancef Do not confuse cefazolin with cefprozil or Cefzil.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (first generation)

#### **MECHANISM OF ACTION**

A first-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

#### PHARMACOKINETICS

Widely distributed. Protein binding: 85%. Primarily excreted unchanged

in urine. Moderately removed by hemodialysis. *Half-life*: 1.4-1.8 h (increased in impaired renal function).

### AVAILABILITY

*Powder for Injection:* 500 mg, 1 g, 5 g, 10 g, 20 g.

# INDICATIONS AND DOSAGES

Uncomplicated UTIs
 IV, IM
 Adults, Elderly. 1 g q12h.
 Mild to moderate infections
 IV, IM
 Adults, Elderly. 250-500 mg q8-12h.

# Severe infections

IV, IM Adults, Elderly. 0.5-1 g q6-8h. Life-threatening infections

# IV, IM

*Adults, Elderly.* 1-1.5 g q6h. Maximum: 12 g/day.

#### Perioperative prophylaxis IV, IM

*Adults, Elderly.* 1 g 30-60 min before surgery, 0.5-1 g during surgery, and q6-8h for up to 24 h postoperatively.

#### Usual pediatric dosage

*Children.* 50-100 mg/kg/day in divided doses q8h. Maximum: 6 g/day. *Neonates older than 7 days.* 40-60 mg/kg/day in divided doses q8-12h. *Neonates 7 days and younger.* 40 mg/kg/day in divided doses q12h.

#### Dosage in renal impairment (adults)

Dosing frequency is modified based on creatinine clearance.

CrCl > 54 mL/min: No adjustment needed.

CrCl 35-54 ml/min: Reduce frequency to every 8 h.

CrCl 11-34 mL/min: After a loading dose, reduce maintenance dose by 5% and administer q12h.

CrCl < 10 mL/min: After a loading dose, reduce maintenance dose by 50% and administer every 18-24 h.

#### CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

#### INTERACTIONS

#### Drug

Probenecid: Increases cefazolin blood concentration. Warfarin: May increase response to warfarin. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase INR, BUN level, and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May cause a positive direct or indirect Coombs' test.

# IV INCOMPATIBILITIES

Amikacin (Amikin), amiodarone (Cordarone), calcium chloride, caspofungin (Cancidas), diazepam, diphenhydramine, dobutamine, dopamine, erythromycin, haloperidol, hydromorphone (Dilaudid), inamrinone, lansoprazole (Prevacid), levofloxacin (Levaquin), pantoprazole (Protonix), phenytoin, tobramycin.

# 🗏 IV COMPATIBILITIES

Calcium gluconate, diltiazem (Cardizem), famotidine (Pepcid), heparin, insulin (regular), lidocaine, midazolam (Versed), morphine, multivitamins, potassium chloride, propofol (Diprivan), vecuronium (Norcuron).

# SIDE EFFECTS

#### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea,

mild abdominal cramping, vaginal candidiasis.

#### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

#### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

#### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with a history of GI disease (especially antibioticassociated colitis or ulcerative colitis), seizure disorder, renal impairment, and concurrent use of nephrotoxic medications. May be associated with increased INR, especially in nutritionally deficient patients, prolonged treatment, hepatic or renal disease. Be aware that cefazolin readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children. In elderly patients, age-related renal impairment may require dosage adjustment.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the mouth for white patches on the mucous membranes and tongue, pattern of daily bowel activity and stool consistency, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed.

#### Storage

Store unreconstituted vials at room temperature protected from light. Solution normally appears light yellow to yellow. IV infusion (piggyback) is stable for 24 h at room temperature and 10 days if refrigerated. Discard solution if precipitate forms.

# Administration

To minimize discomfort, give IM injection deep and slowly. To minimize injection site discomfort, give the IM injection in the gluteus maximus rather than lateral aspect of thigh. Administer cefazolin for the full length of treatment and evenly space doses around the clock.

For IV use, reconstitute each 1 g with at least 10 mL sterile water for injection. May further dilute in 50-100 mL D5W or 0.9% NaCl to decrease the incidence of thrombophlebitis. For IV push, maximum concentration should be 100 mg/mL and administered over 3-5 min. For intermittent IV infusion (piggyback), infuse over 20-30 min.

# Cefdinir

sef′di-neer ★ Omnicef

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

Cefdinir (Generic Name)
## **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: 60%-70%. Widely distributed. Not appreciably metabolized. Primarily excreted unchanged in urine. Minimally removed by hemodialysis. *Half-life:* 1-2 h (increased in impaired renal function).

## AVAILABILITY

Capsules: 300 mg. Oral Suspension: 125 mg/5 mL, 250 mg/5 mL.

### INDICATIONS AND DOSAGES

## Community-acquired pneumonia PO

*Adults, Elderly, Children 13 yr and older.* 300 mg q12h for 10 days.

## Acute exacerbation of chronic bronchitis

PO

Adults, Elderly. 300 mg q12h for 5-10 days.

## Acute maxillary sinusitis PO

Adults, Elderly, Children 13 yr and older. 300 mg q12h or 600 mg q24h for 10 days.

*Children 6 mo to 12 yr.* 7 mg/kg q12h or 14 mg/kg q24h for 10 days.

#### Pharyngitis or tonsillitis PO

Adults, Elderly, Children 13 yr and older. 300 mg q12h for 5-10 days or 600 mg q24h for 10 days.

*Children 6 mo to 12 yr:* 7 mg/kg q12h for 5-10 days or 14 mg/kg q24h for 10 days.

## Uncomplicated skin or skinstructure infections

Adults, Elderly, Children 13 yr and older. 300 mg q12h for 10 days. Children 6 mo to 12 yr. 7 mg/kg q12h for 10 days.

### Acute bacterial otitis media PO (CAPSULES)

Children 6 mo to 12 yr. 7 mg/kg q12h or 14 mg/kg q24h for 10 days. • Usual pediatric dosage for oral

## suspension

Children weighing 81-95 lb (37-43 kg). 12.5 mL (2.5 tsp) q12h or 25 mL (5 tsp) q24h. Children weighing 61-80 lb (28-36 kg). 10 mL (1.5 tsp) q12h or 20 mL (4 tsp) q24h. Children weighing 41-60 lb (19-27 kg). 7.5 mL (1 tsp) q12h or 15 mL (3 tsp) q24h. Children weighing 20-40 lb (9-18 kg). 5 mL (1 tsp) q12h or 10 mL (2 tsp) q24h. Infants weighing < 20 lb (9 kg). 2.5 mL (1/2 tsp) q12h or 5 mL (1 tsp) q24h.

### Dosage in renal impairment (adults)

For patients with creatinine clearance < 30 mL/min, dosage is 300 mg/ day as single daily dose. For hemodialysis patients, dosage is 300 mg every other day.

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

### Drug

Antacids: Decrease cefdinir blood concentration.

## Magnesium or iron supplements: Decrease cefdinir blood

concentration.

**Probenecid:** Increases cefdinir blood concentration.

## Herbal

None known.

### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, LDH, AST (SGPT), and ALT (SGOT) levels. May produce a false-positive reaction for ketones in urine.

### SIDE EFFECTS

### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria).

### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with hypersensitivity to penicillins or other drugs, a history of GI disease (especially antibiotic-associated colitis or ulcerative colitis), and liver or renal impairment. Be aware that cefdinir readily crosses the placenta and is not detected in breast milk. Be aware that infants and newborns may have lower renal clearance of cefdinir. In elderly patients, agerelated decreases in renal function may require decreased cefdinir dosage or increased dosing interval.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the mouth for white patches on the mucous membranes and tongue, pattern of daily bowel activity and stool consistency, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed.

## Storage

Capsules and unreconstituted powder for oral suspension are stored at room temperature. Store mixed suspension at room temperature. Discard unused portion after 10 days. Administration

### Administration

Take without regard to meals; if GI upset occurs, give with food or milk. Reconstitute oral suspension according to package label. Shake oral suspension well before administering. Continue therapy for the full length of treatment and evenly space doses around the clock.

### Cefditoren

seff-di-tore'en

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

### MECHANISM OF ACTION

A third-generation cephalosporin that binds to bacterial cell membranes

Cefditoren (Generic Name)

and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: 88%. Not metabolized. Excreted in the urine. Minimally removed by hemodialysis. *Half-life:* 1.6 h (half-life increased with impaired renal function).

## AVAILABILITY

Tablets: 200 mg, 400 mg.

## INDICATIONS AND DOSAGES

## Pharyngitis, tonsillitis, skin infections

PO

Adults, Elderly, Children older than 12 yr. 200 mg twice a day for 10 days.

## Acute exacerbation of chronic bronchitis

PO

*Adults, Elderly, Children older than 12 yr.* 400 mg twice a day for 10 days.

## Community-acquired pneumonia PO

*Adults, Elderly, Children older than 12 yr.* 400 mg twice a day for 14 days.

### Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance.

## Creatinine

Clearance (mL/min)	Dosage
50-80	No adjustment necessary
30-49	200 mg twice a day
< 30	200 mg once a day

## CONTRAINDICATIONS

Carnitine deficiency or inborn errors of metabolism that may result in carnitine deficiency, known allergy to cephalosporins, or anaphylactic reactions to penicillins, hypersensitivity to milk protein.

## INTERACTIONS

### Drug

Antacids containing magnesium or aluminum, H<sub>2</sub> receptor antagonists: May decrease the absorption of cefditoren. Probenecid: May increase the absorption of cefditoren. Warfarin: May increase response to warfarin. Herbal None known. Food High-fat meals: Increase the cefditoren plasma concentration.

## **DIAGNOSTIC TEST EFFECTS**

May cause a positive direct or indirect Coombs' test and a falsepositive urine glucose testing. May increase INR, alkaline phosphatase, bilirubin, LDH, creatinine. May cause pancytopenia, neutropenia, and agranulocytosis.

## SIDE EFFECTS

### Occasional (11%)

Diarrhea. Rare (1%-4%)

Nausea, headache, abdominal pain, vaginal candidiasis, dyspepsia, vomiting. Carnitine deficiency might occur if the drug is used for long periods of time (months).

## SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may occur.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with allergies, renal impairment, seizure disorder, a history of GI disease, and hypersensitivity to penicillins or other drugs. May be associated with increased INR, especially in nutritionally deficient patients, prolonged treatment, hepatic or renal disease. It is unknown whether cefditoren is distributed in breast milk. The safety and efficacy of cefditoren have not been established in children younger than 12 yr. Agerelated renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the mouth for white patches on the mucous membranes and tongue; also check the pattern of daily bowel activity and stool consistency, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed. **Storage** 

Store at room temperature. Protect from light and moisture.

### Administration

Take with meals to enhance drug absorption. Take for the full length of treatment. Do not skip doses.

### Cefepime

sef<sup>2</sup>e-peem Maxipime Do not confuse with ceftidine.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (fourth generation)

## **MECHANISM OF ACTION**

A fourth-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Well absorbed after IM administration. Protein binding: 20%. Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life*: 2-2.3 h (increased in impaired renal function and in elderly patients).

## AVAILABILITY

Powder for Injection: 1 g, 2 g.

## INDICATIONS AND DOSAGES Pneumonia

IV

*Adults, Elderly.* 1-2 g q12h for 7-10 days.

*Children 2 mo and older.* 50 mg/kg q12h. Maximum: 2 g/dose.

### Intra-abdominal infections IV

Adults, Elderly. 2 g q12h for 10 days. Skin and skin-structure infections IV

Adults, Elderly. 2 g q12h for 10 days. Children 2 mo and older. 50 mg/kg q12h. Maximum: 2 g/dose.

### Urinary tract infections

IV/IM

*Adults, Elderly.* 0.5-2 g q12h for 7-10 days.

*Children 2 mo and older.* 50 mg/kg q12h. Maximum: 2 g/dose.

### Febrile neutropenia

IV

*Adults, Elderly.* 2 g q8h. *Children 2 mo and older.* 50 mg/kg q8h. Maximum: 2 g/dose.

Dosage in renal impairment Dosage and frequency are modified based on creatinine clearance and the severity of the infection, and the initial dosage given. History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

### Drug

Aminoglycosides, loop diuretics: Increased risk of nephrotoxicity. **Probenecid:** May increase cefepime blood concentration.

**Warfarin:** May increase response to warfarin.

Herbal

None known.

Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, INR, LDH, AST (SGOT), and ALT (SGPT) levels. May cause a positive direct or indirect Coombs' test.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin (Fungizone), cimetidine (Tagamet), ciprofloxacin (Cipro), cisplatin (Platinol), dacarbazine (DTIC), daunorubicin (Cerubidine), diazepam (Valium), diphenhydramine (Benadryl), dobutamine (Dobutrex), dopamine (Intropin), doxorubicin (Adriamycin), droperidol (Inapsine), famotidine (Pepcid), ganciclovir (Cytovene), haloperidol (Haldol), magnesium, magnesium sulfate, mannitol, meperidine (Demerol), metoclopramide (Reglan), morphine, ofloxacin (Floxin), ondansetron (Zofran), vancomycin (Vancocin).

## **IV COMPATIBILITIES**

Bumetanide (Bumex), calcium gluconate, furosemide (Lasix), hydromorphone (Dilaudid), lorazepam (Ativan), propofol (Diprivan).

## SIDE EFFECTS

### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## SERIOUS REACTIONS

 Antibiotic-associated colitis manifested and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

• Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with renal impairment, seizure disorder. May be associated with increased INR, especially in nutritionally efficient patients, prolonged treatment, hepatic or renal disease. It is unknown whether cefepime is distributed in breast milk. No age-related precautions have been noted in children older than 2 mo. Age-related renal impairment may require dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibiotic-associated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed.

### Storage

Store unreconstituted vials at room temperature and protect from light. Solution is stable for 24 h at room temperature or 7 days if refrigerated.

### Administration

For IM use, add 1.3 mL sterile water for injection, 0.9% NaCl, or D5W to 500-mg vial (2.4 mL for 1-g and 2-g vials). To minimize the pain experienced by the patient, give IM injection slowly and deeply into a large muscle mass (e.g., upper gluteus maximus) instead of the lateral aspect of the thigh.

For IV use, add 5 mL to 500-mg vial (10 mL for 1-g and 2-g vials). Further dilute with 50-100 mL 0.9% NaCl, or D5W. For IV push, administer over 3-5 min. For intermittent IV infusion (piggyback), infuse over 30 min.

## Cefixime

sef-ix'ime Suprax Do not confuse Suprax with Sporanox, Surbex, or Surfak.

### **CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

## **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: 65%-70%. Widely distributed. Primarily excreted unchanged in urine. Minimally removed by hemodialysis. *Half-life*: 3-4 h (increased in renal impairment).

### AVAILABILITY

Oral Suspension: 100 mg/5 mL, 200 mg/5 mL. Tablets: 400 mg.

## INDICATIONS AND DOSAGES

 Otitis media, acute bronchitis, acute exacerbations of chronic bronchitis, pharyngitis, tonsillitis, and uncomplicated urinary tract infections PO

Adults, Elderly, Children weighing more than 50 kg. 400 mg/day as a single dose or in 2 divided doses. Children 6 mo to 12 yr weighing < 50 kg. 8 mg/kg/day as a single dose or in 2 divided doses. Maximum: 400 mg/day.

## Uncomplicated gonorrhea PO

Adults. 400 mg as a single dose.

Dosage in renal impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	% of Usual Dose
20-60	75
< 20	50

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins, hypersensitivity to cephalosporins.

Cefixime (Generic Name)

### INTERACTIONS

### Drug

Aminoglycosides, loop diuretics:

May increase risk of nephrotoxicity. **Carbamazepine:** May increase carbamazepine concentrations. **Probenecid:** Increases serum concentration of cefixime. **Warfarin:** Increases prothrombin time.

### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May increase LDH level. May cause a positive direct or indirect Coombs' test.

### SIDE EFFECTS

### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by arthralgia and fever; usually occurs after second course of therapy and resolves after drug is discontinued). Rare

Allergic reaction (rash, pruritus, urticaria).

### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

• Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypersensitivity to penicillin, history of gastrointestinal disease (particularly colitis), and renal impairment. Cefixime crosses the placenta. It is not known whether it is distributed in breast milk. No age-related precautions have been noted in children. Agerelated renal impairment in elderly may require dose adjustment.

Stool changes, abdominal cramps, diarrhea, nausea, vomiting, headache, sore mouth or tongue may occur. If fever, skin itching, rash, or swelling occurs, notify the physician immediately.

### Storage

Suspension is stable at room temperature or under refrigeration for 14 days. Flavor improves with refrigeration.

Store tablets at room temperature.

### Administration

NOTE: When treating otitis media, the suspension is preferred due to higher serum concentrations achieved compared to the tablets. Shake well before using. Take tablets or suspension with food if GI irritation occurs. Continue for the full length of treatment.

## Cefotaxime

sef-oh-taks'eem Claforan Do not confuse cefotaxime with cefoxitin, ceftizoxime, cefuroxime, or Claritin.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

## **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Widely distributed, including to CSF. Protein binding: 30%-50%. Partially metabolized in the liver to active metabolite. Primarily excreted in urine. Moderately removed by hemodialysis. *Half-life*: 1 h (increased in impaired renal function).

## AVAILABILITY

*Powder for Injection:* 500 mg, 1 g, 2 g, 10 g. *Injection:* 1 g, 2 g.

## INDICATIONS AND DOSAGES

 Uncomplicated infections IV, IM
 Adults, Elderly. 1 g q12h.
 Mild to moderate infections IV, IM
 Adults, Elderly. 1-2 g q8h.

## Severe infections

IV, IM Adults, Elderly. 2 g q6-8h.

#### Life-threatening infections IV

Adults, Elderly. 2 g q4h.

## Gonorrhea

IM Adults. (Male): 1 g as a single dose. (Female): 0.5 g as a single dose.

## Perioperative prophylaxis

IV, IM Adults, Elderly. 1 g 30-90 min before surgery.

#### Cesarean section IV

*Adults.* 1 g as soon as umbilical cord is clamped, then 1 g 6 and 12 h after first dose.

## Usual pediatric dosage

*Children weighing 50 kg or more.* 1-2 g q6-8h; may give q4h for life-threatening infection. *Children 1 mo to 12 yr weighing* < 50 kg. 100-200 mg/kg/day in divided doses q6-8h.

## Dosage in renal impairment

For patients with creatinine clearance < 20 mL/min, give half of dose at usual dosing intervals.

### **OFF-LABEL USES**

Treatment of Lyme disease.

### CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

Drug Aminoglycosides, loop diuretics: May increase risk of nephrotoxicity. Probenecid: May increase cefotaxime blood concentration. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase liver function test results and produce a positive direct or indirect Coombs' test.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), filgrastim (Neupogen), fluconazole (Diflucan), hetastarch (Hespan), pentamidine (Pentam IV), vancomycin (Vancocin).

## **IV COMPATIBILITIES**

Diltiazem (Cardizem), famotidine (Pepcid), hydromorphone (Dilaudid), lorazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, propofol (Diprivan).

## SIDE EFFECTS

#### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea,

mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

 Granulocytopenia and rarely granulocytosis have occurred with prolonged therapy (i.e., longer than 10 days).

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of GI disease (especially antibioticassociated or ulcerative colitis) and renal impairment. Cefotaxime readily crosses the placenta and is distributed in breast milk. No agerelated precautions have been noted for use in children. Age-related renal impairment may require dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. The pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness should be assessed. Renal function should be assessed. Storage

### Store powder for injection at room temperature and premixed solutions in the freezer. The solution for IV use normally appears light yellow to amber. The IV infusion (piggyback) may become darker, but this does not affect potency. The IV infusion (piggyback) prepared from the powder for injection is stable for 24 h at room temperature, 5 days if refrigerated, and 13 wks if frozen. Thawed previously frozen premixed bags are stable for 24 h at room temperature or 10 days if refrigerated. Discard the solution if a precipitate forms.

### Administration

For IV use, add 10 mL of sterile water for injection to each 500-mg, 1-g, or 2-g vial to provide a concentration of 50, 95, or 180 mg/mL, respectively. The resulting solution may be further diluted with 50-100 mL of 0.9% NaCl or D5W. Administer the IV push over 3-5 min. More rapid IV administration through a central line has been associated with a high incidence of cardiac arrhythmias. Administer the intermittent IV infusion (piggyback) over 20-30 min.

For IM use, reconstitute the drug with sterile water for injection or bacteriostatic water for injection. Add 2, 3, or 5 mL to each 500mg, 1-g, or 2-g vial, respectively, to yield a concentration of 230, 300, or 330 mg/mL, respectively. To minimize patient discomfort, slowly inject the drug deep into the gluteus maximus rather than the lateral aspect of the thigh. Administer a 2-g IM dose at two separate sites.

## Cefotetan

sef'oh-tee-tan ★ Cefotan Do not confuse cefotetan with cefoxitin or Ceftin.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (second generation)

## **MECHANISM OF ACTION**

A second-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Protein binding: 78%-91%. Primarily excreted unchanged in urine. Minimally removed by hemodialysis. *Half-life:* 3-4.6 h (increased in impaired renal function).

### AVAILABILITY

*Powder for Injection:* 1 g, 2 g, 10 g. *Premixed IVPB, Frozen:* 1 g, 2 g.

## INDICATIONS AND DOSAGES

Urinary tract infections

IV, IM Adults, Elderly. 1-2 g in divided doses q12-24h.

#### Mild to moderate infections IV. IM

Adults, Elderly. 1-2 g q12h. Severe infections

### IV

Adults, Elderly. 2 g q12h. Life-threatening infections

IV Adults, Elderly. 3 g q12h.

## Perioperative prophylaxis

Adults, Elderly. 1-2 g 30-60 min before surgery.

### Cesarean section

### IV

*Adults.* 1-2 g as soon as umbilical cord is clamped.

Usual pediatric dosage

*Children*. 40-80 mg/kg/day in divided doses q12h. Maximum: 6 g/day.

## Dosage in renal impairment

Dosing frequency is modified based on creatinine clearance and the severity of the infection.

Creatinine Clearance (mL/min)	Dosage Interval
10-30	Usual dose q24h
< 10	Usual dose q48h

For intermittent hemodialysis, give <sup>1</sup>/<sub>4</sub> of the usual dose q24h on days between dialysis and <sup>1</sup>/<sub>2</sub> the usual dose on the day of dialysis.

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

### Drug

**Alcohol:** May produce a disulfiramlike reaction (facial flushing, headache, nausea, pruritus, tachycardia).

Heparin, warfarin, other

**anticoagulants:** May increase the risk of bleeding.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels. May prolong PT and produce a positive direct or indirect Coombs' test.

## **IV INCOMPATIBILITIES**

Amphotericin B, caspofungin (Cancidas), diazepam, dobutamine, doxycycline, erythromycin, haloperidol, lansoprazole (Prevacid), pantoprazole, phenobarbital, phenytoin, sodium bicarbonate, tobramycin, vancomycin (Vancocin).

## 🗏 IV COMPATIBILITIES

Diltiazem (Cardizem), famotidine (Pepcid), heparin, insulin (regular), morphine, propofol (Diprivan).

### SIDE EFFECTS

### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, unusual bleeding or bruising, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

### SERIOUS REACTIONS

· Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

· Nephrotoxicity may occur, especially in patients with preexisting renal disease.

· Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

Hemolytic anemia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of GI disease (especially antibioticassociated or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic drugs. May be associated with increased INR, especially in nutritionally deficient patients, prolonged treatment, hepatic or renal disease. Cefotetan readily crosses the placenta and is distributed in breast milk. The safety and efficacy have not been established in children. Agerelated renal impairment may require dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed. Storage

The solution normally appears colorless to light yellow. A deeper yellow does not indicate loss of potency. The IV infusion (piggyback) is stable for 24 h at room temperature, 96 h if refrigerated, and 12 wks if frozen. Discard the solution if a precipitate forms.

### Administration

For IV use, reconstitute each 1-g vial with 10 mL of sterile water for injection to provide a concentration of 95 mg/mL. The resulting solution may be further diluted with 50-100 mL of 0.9% NaCl or D5W. Administer IV push over 3-5 min. Administer intermittent IV infusion (piggyback) over 20-30 min.

For IM use, add 2 mL of sterile water for injection or other appropriate diluent to each 1-g vial, or 3 mL to each 2-g vial, to provide a concentration of 400 mg/mL or 500 mg/mL, respectively. To minimize discomfort, slowly inject the drug deep into the gluteus maximus rather than the lateral aspect of the thigh.

## Cefoxitin

se-fox'i-tin Mefoxin Do not confuse cefoxitin with cefotaxime, cefotetan, or Cytoxan.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (second generation)

### **MECHANISM OF ACTION**

A second-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## AVAILABILITY

*Powder for Injection:* 1 g, 2 g, 10 g. *Premixed IVPB, Frozen:* 1 g, 2 g.

## INDICATIONS AND DOSAGES

Mild to moderate infections IV

Adults, Elderly. 1-2 g q6-8h.

## Severe infections

IV *Adults, Elderly.* 1 g q4h or 2 g q6-8h up to 2 g q4h.

### Perioperative prophylaxis IV

*Adults, Elderly.* 2 g 30-60 min before surgery, then q6h for up to 24 h after surgery.

Children older than 3 mo.

30-40 mg/kg 30-60 min before surgery, then q6h for up to 24 h after surgery.

## Cesarean section

## IV

*Adults.* 2 g as soon as umbilical cord is clamped, then 2 g 4 and 8 h after first dose, then q6h for up to 24 h.

## Usual pediatric dosage

*Children older than 3 mo.* 80-160 mg/kg/day in 4-6 divided doses. Maximum: 12 g/day. *Neonates.* 90-100 mg/kg/day in

divided doses q8h.

Dosage in renal impairment (adults) After a loading dose of 1-2 g, dosage and frequency are modified based on creatinine clearance and the severity of the infection.

## Creatinine

Clearance (mL/min)	Dosage
30-50	1-2 g q8-12h
10-29	1-2 g q12-24h
5-9	500 mg-1 g q12-24h
< 5	500 mg-1 g q24-48h

For hemodialysis, give a dose of 1 to 2 g after each hemodialysis; the maintenance dose should be given as indicated in the table.

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

### INTERACTIONS

### Drug

### Aminoglycosides, loop diuretics:

May increase risk of nephrotoxicity. **Probenecid:** Increases serum concentration of cefoxitin.

### Herbal

None known.

None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN level and serum alkaline phosphatase, creatinine,

AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test.

### IV INCOMPATIBILITIES

Filgrastim (Neupogen), pentamidine (Pentam IV), vancomycin (Vancocin).

## 🗏 IV COMPATIBILITIES

Diltiazem (Cardizem), famotidine (Pepcid), heparin, hydromorphone (Dilaudid), magnesium sulfate, morphine, multivitamins, propofol (Diprivan).

### SIDE EFFECTS

### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

## Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (pruritus, rash, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

### SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of GI disease (especially

antibiotic-associated or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic drugs.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibiotic-associated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed. **Storage** 

The solution normally appears colorless to light amber; a darker color does not indicate loss of potency. Reconstituted solution is stable for 6 h at room temperature and 7 days if refrigerated. The IV infusion (piggyback) is stable for 24 h at room temperature and 48 h if refrigerated. Thawed, previously frozen premixed solution is stable for 24 h at room temperature or 21 days if refrigerated. Discard the solution if a precipitate forms. Administration

! Give by intermittent IV infusion (piggyback) or IV push. Space doses evenly around the clock.

For IV use, reconstitute each 1-g vial with 10 mL of sterile water for injection to provide a concentration of 95 mg/mL. The resulting solution may be further diluted with 50-100 mL of sterile water for injection, 0.9% NaCl, or D5W. Administer IV push over 3-5 min. Administer intermittent IV infusion (piggyback) over 10-60 min.

## Cefpodoxime

sef-pod'ox-ime ★ Vantin **Do not confuse Vantin with Ventolin.** 

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

## **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Well absorbed from the GI tract (food increases absorption). Protein binding: 21%-40%. Widely distributed. Primarily excreted unchanged in urine. Partially removed by hemodialysis. *Half-life:* 2.3 h (increased in impaired renal function and elderly patients).

## AVAILABILITY

Oral Suspension: 50 mg/5 mL, 100 mg/5 mL. Tablets: 100 mg, 200 mg.

## INDICATIONS AND DOSAGES

Chronic bronchitis, pneumonia
 PO

Adults, Elderly, Children older than 13 yr: 200 mg q12h for 10-14 days.

## Gonorrhea (men and women), rectal gonococcal infection (female patients only) PO

Adults, Children older than 13 yr. 200 mg as a single dose.

Skin and skin-structure infections PO *Adults, Elderly, Children older than* 13 yr. 400 mg q12h for 7-14 days.

Pharyngitis, tonsillitis PO

Adults, Elderly, Children older than 13 yr. 100 mg q12h for 5-10 days.

*Children 6 mo to 13 yr.* 5 mg/kg q12h for 5-10 days. Maximum: 100 mg/dose.

## Acute maxillary sinusitis PO

Adults, Children older than 13 yr: 200 mg twice a day for 10 days. Children 2 mo to 13 yr: 5 mg/kg q12h for 10 days. Maximum: 400 mg/day.

### Urinary tract infection PO

Adults, Elderly, Children older than 13 yr. 100 mg q12h for 7 days.

### Acute otitis media PO

Children 6 mo to 13 yr. 5 mg/kg q12h for 5 days. Maximum: 400 mg/ dose.

## Dosage in renal impairment

For patients with creatinine clearance < 30 mL/min, usual dose is given q24h. For patients on hemodialysis, usual dose is given 3 times/wk after dialysis.

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## **INTERACTIONS**

### Drug

Antacids, H<sub>2</sub> antagonists: May decrease cefpodoxime absorption. **Probenecid:** May increase cefpodoxime blood concentration. **Herbal** None known. **Food** 

Food None known.

Cefpodoxime (Generic Name)

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test.

### SIDE EFFECTS

### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (pruritus, rash, urticaria).

### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with history of GI disease (especially antibioticassociated or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic drugs. Cefpodoxime readily crosses the placenta and is distributed in breast milk. The safety and efficacy of cefpodoxime have not been established in children younger than 6 mo. Age-related renal impairment may require a dosage adjustment in elderly patients. Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed.

### Storage

Store tablets and unreconstituted suspension powder at room temperature. After reconstitution, the oral suspension is stable for 14 days if refrigerated. Administration

#### Administration

Administer cefpodoxime tablets with food to enhance drug absorption; suspension may be taken without regard to food. Shake suspension well before each use.

### Cefprozil

sef-pro'zil Cefzil Do not confuse cefprozil with Cefazolin, Cefol, Ceftin, or Kefzol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (second generation)

### MECHANISM OF ACTION

A second-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 36%-45%. Widely

Cefprozil (Generic Name)

distributed. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. *Half-life*: 1.3 h (increased in impaired renal function).

## AVAILABILITY

Oral Suspension: 125 mg/5 mL, 250 mg/5 mL. Tablets: 250 mg, 500 mg.

## INDICATIONS AND DOSAGES Pharyngitis, tonsillitis

#### PO

*Adults, Elderly.* 500 mg q24h for 10 days.

*Children 2-12 yr*: 7.5 mg/kg q12h for 10 days.

### Acute bacterial exacerbation of chronic bronchitis, secondary bacterial infection of acute bronchitis PO

Adults, Elderly. 500 mg q12h for 10 days.

### Skin and skin-structure infections PO

Adults, Elderly. 250-500 mg q12h for 10 days.

*Children.* 20 mg/kg q24h for 10 days. • Acute sinusitis

### PO

Adults, Elderly. 250-500 mg q12h for 10 days.

Children 6 mo to 12 yr. 7.5-15 mg/kg q12h for 10 days.

## Otitis media

### PO

*Children 6 mo to 12 yr.* 15 mg/kg q12h for 10 days. Maximum: 1 g/day.

## Dosage in renal impairment

Patients with creatinine clearance < 30 mL/min receive 50% of usual dose at usual interval.

### CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

### INTERACTIONS

### Drug

Probenecid: Increases serum concentration of cefprozil. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase liver function test results. May produce a positive direct or indirect Coombs' test.

### SIDE EFFECTS

### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

## Rare

Allergic reaction (pruritus, rash, urticaria).

## SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of GI disease (especially antibioticassociated or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic drugs. Cefprozil readily crosses the placenta and is distributed in breast milk. The safety and efficacy of cefprozil have not been established in children younger than 6 mo. Avoid use of suspension in patients with phenylketonuria. Age-related renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed.

### Storage

After reconstitution, the oral suspension is stable for 14 days if refrigerated.

## Administration

Shake the oral suspension well before using. Take cefprozil without regard to meals; however, if GI upset occurs, give it with food or milk.

## **Ceftaroline Fosamil**

sef-tar'oh-leen Teflaro Do not confuse with ceftidine or ceftazidime.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (fifth generation), extended spectrum

### MECHANISM OF ACTION

An extended-spectrum cephalosporin that binds to

bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal; uniquely active against resistant gram-positive pathogens including methicillin-resistant and vancomycin-resistant *Staphylococcus aureus* (MRSA and VRSA), and vancomycininsensitive *S. aureus* (VISA).

### PHARMACOKINETICS

Protein binding: 20%. Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis. Half-life: 1.6-2.6 h (increased in impaired renal function).

## AVAILABILITY

Powder for Injection: 400 mg, 600 mg.

## INDICATIONS AND DOSAGES

 Pneumonia, community acquired: IV

*Adults, Elderly.* 600 mg IV q12h for 5-7 days.

Skin and skin-structure infections: IV

*Adults, Elderly.* 600 mg IV q12h for 5-14 days.

## Dosage in renal impairment: Dosage and frequency are modified based on creatinine clearance.

CrCl 31-50 mL/min: 400 mg IV q12h. CrCl 15-30 mL/min: 300 mg IV q12h. CrCl < 15 mL/min: 200 mg IV q12h. If on hemodialysis, give the scheduled dose after dialysis.

### CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

### INTERACTIONS

### Drug

Aminoglycosides, loop diuretics: May increase risk of nephrotoxicity. **Probenecid:** May increase cephalosporin blood concentration. **Warfarin:** May increase response to warfarin.

**Herbal and Food** 

None known.

## DIAGNOSTIC TEST EFFECTS

Reduced serum potassium or increased AST (SGOT) and ALT (SGPT) levels. Rare reductions in platelets or WBC. May cause a positive direct or indirect Coombs' test without hemolysis in > 10% of patients.

## IV INCOMPATIBILITIES

Do not mix with or add ceftaroline to solutions containing other drugs.

### SIDE EFFECTS

### Occasional (2-5%)

Diarrhea, nausea, rash, phlebitis, constipation, vomiting, headache, insomnia, pruritus, hypokalemia. **Rare** (< 2%)

Dizziness, convulsions, hepatitis or renal failure, abdominal pain, hypersensitivity (urticaria), serum sickness (fever with joint pain). Less commonly reported: anemia, eosinophilia, neutropenia, thrombocytopenia. Hemolytic anemia not reported in trials.

### SERIOUS REACTIONS

 Antibiotic-associated colitis manifested and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with renal impairment, seizure disorder. It is unknown whether the drug is distributed in breast milk. Age-related renal impairment may require dosage adjustment in elderly patients. Safety and efficacy not yet established in children or infants. Observe for infection improvement. Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed.

### Storage

Store unreconstituted vials in the refrigerator; they may be kept at room temperature under 77° for no more than 7 days. Do not freeze. The diluted infusion solution is stable for 6 h at room temperature or 24 h if refrigerated.

#### Administration

For intravenous (IV) infusion only over 1 hour. To prepare, add 20 mL of sterile water for injection to the ceftaroline 400-mg or 600-mg vial. This will yield approximate concentration of 20 mg/mL for the 400-mg vials and 30 mg/mL for the 600-mg vials. Mix gently and let dissolve completely. Color will be clear and ranges from light to dark yellow. Must further dilute with 250 mL of a compatible infusion solution such as 0.9% NaCl, or D5W.

## Ceftazidime

sef-taz'i-deem Ceptaz, Fortaz, Tazicef, Tazidime Fortaz Do not confuse ceftazidime with ceftizoxime.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antibiotic, cephalosporin (third generation)

### **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Widely distributed (including to CSF). Protein binding: 5%-17%. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life*: 2 h (increased in impaired renal function).

## AVAILABILITY

*Powder for Injection (Fortaz, Tazicef, Tazidime):* 500 mg, 1 g, 2 g, 6 g. *Premixed IVPB, Frozen:* 1 g, 2 g.

### INDICATIONS AND DOSAGES

Urinary tract infection IV, IM Adults. 250-500 mg q8-12h.
Mild to moderate infections IV, IM Adults. 1 g q8-12h.
Uncomplicated pneumonia, skin and skin-structure infections IV, IM Adults. 0.5-1 g q8h.
Bone and joint infections IV Adults. 2 g q12h.

### Meningitis, serious gynecologic and intra-abdominal infections IV

Adults. 2 g q8h.

 Pseudomonal pulmonary infections in patients with cystic fibrosis

IV

*Adults*. 30-50 mg/kg q8h. Maximum: 6 g/day.

### Usual elderly dosage

*Elderly (with normal renal function).* 500 mg-1 g q12h.

### Usual pediatric dosage

Children 1 mo to 12 yr. 100-150 mg/kg/day in divided doses q8h. Maximum: 6 g/day. Neonates 0-4 wks. 100-150 mg/kg/

day in divided doses q8-12h.

## Dosage in renal impairment

After an initial 1-g dose, dosage and frequency are modified based on creatinine clearance and the severity of the infection.

## Creatinine Clearance (ml/min) Adult Dosage 30-50 1 g q12h 16-30 1 g q24h 6-15 500 mg q24h < 5</td> 500 mg q48h

### CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

### INTERACTIONS

Drug Probenecid: May increase ceftazidime blood concentration. Warfarin: May increase warfarin effect. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, creatinine, INR, LDH, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test. Interferes with crossmatching procedures and hematologic tests.

## IV INCOMPATIBILITIES

Acetylcysteine (Acetadote), amphotericin B complex (Abelcet, AmBisome, Amphotec), acetylcysteine (Acetadote), caspofungin (Cancidas), diazepam, diphenhydramine, dobutamine, doxorubicin liposomal (Doxil), fluconazole (Diflucan), haloperidol, idarubicin (Idamycin), lansoprazole (Prevacid), midazolam (Versed), nitroprusside, pentamidine (Pentam IV), phenytoin, thiamine, vancomycin (Vancocin), verapamil, warfarin (Coumadin).

## 🗏 IV COMPATIBILITIES

Diltiazem (Cardizem), famotidine (Pepcid), heparin, hydromorphone (Dilaudid), morphine, propofol (Diprivan).

### SIDE EFFECTS

### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (pruritus, rash, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of GI disease (especially antibioticassociated or ulcerative colitis), seizure disorder, renal impairment, and concurrent use of nephrotoxic drugs. May be associated with increased INR, especially in nutritionally deficient patients, prolonged treatment, and hepatic or renal disease. Ceftazidime readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children. Age-related renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed.

### Storage

The solution normally appears light yellow to amber, but it tends to darken; color change does not indicate loss of potency. Reconstituted solution is stable for 24 h at room temperature, 7 days if refrigerated, or 12 wks if frozen. The IV infusion (piggyback) is stable for 24 h at room temperature and 7 days if refrigerated. Thawed premixed frozen solutions are stable for 24 h at room temperature and 7 days if refrigerated. Discard the solution if a precipitate forms. Administration

For IV use, add 10 mL of sterile water for injection to each 1-g vial to provide a concentration of 90 mg/mL. The resulting solution may be further diluted with 50-100 mL of 0.9% NaCl, D5W, or another compatible diluent. Administer IV push over 3-5 min. Administer intermittent IV infusion (piggyback) over 15-30 min.

For IM use, to reconstitute, add 1.5 mL of sterile water for injection or lidocaine 1% to 500-mg vial, if prescribed, or 3 mL to 1-g vial to provide a concentration of 280 mg/ mL. To minimize patient discomfort, slowly inject the drug deep into the gluteus maximus rather than into the lateral aspect of the thigh.

### Ceftibuten

cef'te-bute-in ★ Cedax

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotic, cephalosporin (third generation)

## **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Rapidly absorbed from the gastrointestinal tract. Excreted primarily in urine. *Half-life:* 2-3 h.

### AVAILABILITY

Capsules: 400 mg. Oral Suspension: 90 mg/5 mL.

# INDICATIONS AND DOSAGES Chronic bronchitis PO

*Adults, Elderly.* 400 mg/day once a day for 10 days.

### Pharyngitis, tonsillitis PO

Adults, Elderly. 400 mg once a day for 10 days.

Children 6 mo of age and older. 9 mg/kg once a day for 10 days. Maximum: 400 mg/day.

### Otitis media PO

Children 6 mo of age and older. 9 mg/kg once a day for 10 days. Maximum: 400 mg/day.

• **Dosage in renal impairment** Dosage is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage
50 (and higher)	400 mg or 9 mg/kg q24h
30-49	200 mg or 4.5 mg/kg q24h
< 30	100 mg or 2.25 mg/kg q24h

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

### Drug

Aminoglycosides: Increased risk of nephrotoxicity.

Ceftibuten (Generic Name)

Probenecid: Increases serum ceftibuten level. Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test.

### SIDE EFFECTS

### Frequent

Oral candidiasis, mild diarrhea (discharge, itching).

## Occasional

Nausea, headache, dizziness, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

#### Rare

Allergic reaction (rash, pruritus, urticaria).

## SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with history of GI disease (especially antibioticassociated or ulcerative colitis), renal impairment, and allergies to penicillins or other drugs. Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed. **Storage** 

Reconstituted suspension is stable for 14 days if refrigerated.

### Administration

Take capsule without regard to food; may take with food or milk if GI upset occurs. Take suspension 1 h before or 2 h after a meal. Take a full course of treatment, and space drug doses evenly around the clock. Shake suspension well before each use.

## Ceftizoxime

sef-ti-zox'eem Cefizox Do not confuse ceftizoxime with cefotaxime or ceftazidime.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

### **MECHANISM OF ACTION**

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Widely distributed (including to CSF). Protein binding: 30%. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. *Half-life:* 1.7 h (increased in impaired renal function).

## AVAILABILITY

Premixed IVPB, Frozen: 1 g, 2 g.

## INDICATIONS AND DOSAGES

 Uncomplicated urinary tract infection

IV

Adults, Elderly. 500 mg q12h.

 Mild, moderate, or severe infections of the biliary, respiratory, and genitourinary tracts; skin, bone, and intra-abdominal infections; meningitis; and septicemia IV

Adults, Elderly. 1-2 g q8-12h.

 Life-threatening infections of the biliary, respiratory, and genitourinary tracts; skin, bone, and intra-abdominal infections; meningitis; and septicemia IV

*Adults, Elderly.* 3-4 g q8h, up to 2 g q4h.

 Pelvic inflammatory disease (PID) IV

Adults. 2 g q4-8h.

Usual pediatric dosage

*Children older than 6 mo.* 50 mg/kg q6-8h. Maximum: 12 g/day.

### Dosage in renal impairment

After a loading dose of 0.5-1 g, dosage and frequency are modified based on creatinine clearance and the severity of the infection.

Creatinine Clearance (mL/min)	Adult Dosage
50-79	0.5 g-1.5 g q8h
5-49	0.25 g-1 g q12h
< 5	0.25-0.5 g q24h or 0.5 g-1 g q48h

### CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

### Drug

Aminoglycosides: May increase risk of nephrotoxicity. Probenecid: Increases serum concentration of ceftizoxime. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline serum phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test.

## IV INCOMPATIBILITIES

Diazepam, dobutamine, erythromycin, filgastrim (Neupogen), haloperidol, lansoprazole (Prevacid), phenytoin, thiamine.

## **IV COMPATIBILITIES**

Hydromorphone (Dilaudid), morphine, propofol (Diprivan).

## SIDE EFFECTS

### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (fever, joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## SERIOUS REACTIONS

 Antibiotic-associated colitis manifested and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with history of GI disease (especially antibiotic-associated or ulcerative colitis) and hepatic or renal impairment. Ceftizoxime readily crosses the placenta and is distributed in breast milk. Ceftizoxime use in children is associated with transient elevations of blood eosinophil count and serum CK, AST (SGOT), and ALT (SGPT) levels. Age-related renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed. **Storage** 

The solution normally appears clear to pale yellow. A change from yellow to amber does not indicate loss of potency. Thawed premixed frozen solution is stable for 24 h at room temperature and 10 days if refrigerated. Discard the solution if a precipitate forms.

### Administration

For IV use, infuse intermittent IV infusion (piggyback) over 15-30 min.

## Ceftriaxone

sef-try-ax'one

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (third generation)

### MECHANISM OF ACTION

A third-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Widely distributed (including to CSF). Protein binding: 83%-96%. Primarily excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* 4.3-4.6 h IV; 5.8-8.7 h IM (increased in impaired renal function).

### AVAILABILITY

Powder for Injection: 250 mg, 500 mg, 1 g, 2 g, 10 g. Premixed IVPB, Frozen: 1 g, 2 g.

## INDICATIONS AND DOSAGES Mild to moderate infections

Wind to indefate infections
IV, IM
Adults, Elderly. 1-2 g as a single dose or in 2 divided doses.
Serious infections
IV, IM
Adults, Elderly. Up to 4 g/day in 2 divided doses.

*Children.* 50-75 mg/kg/day in divided doses q12h. Maximum: 2 g/day.

## Skin and skin-structure infections

## IV, IM

*Children*. 50-75 mg/kg/day as a single dose or in 2 divided doses. Maximum: 2 g/day.

### Meningitis

### IV

C

*Children.* Initially 100 mg/kg, then 100 mg/kg/day as a single dose or in divided doses q12h. Maximum: 4 g/day.

## Lyme disease

IV

*Adults, Elderly.* 2-4 g a day for 10-14 days.

### Acute bacterial otitis media IM

*Children.* 50 mg/kg as a single dose. **Perioperative prophylaxis** 

### IV, IM Adults, Elderly. 1 g 0.5-2 h before surgery.

 Uncomplicated gonorrhea IM

*Adults.* 250 mg plus azithromycin or doxycycline one time.

### Dosage in renal impairment

Dosage modification is usually unnecessary, but liver and renal function test results should be monitored in persons with both renal and liver impairment or severe renal impairment.

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins; hyperbilirubinemic neonates; concomitant use with calcium-containing solutions or products.

### INTERACTIONS Drug

## Calcium-containing solutions:

Ceftriaxone may precipitate with calcium when mixed. Avoid coadministration, even via separate infusion lines or at different times. Do not administer calciumcontaining solutions or products within 48 h after the last dose of ceftriaxone.

**Warfarin:** May increase the effects of warfarin.

### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level, INR, and serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test. Interferes with crossmatching procedures and hematologic tests.

## IV INCOMPATIBILITIES

NOTE: Do not use diluents containing calcium (e.g., Ringer's solution) to reconstitute or for further dilution for IV use. Precipitation can also occur when mixed with calciumcontaining solutions in the same IV line, including continuous calciumcontaining infusions (i.e., parenteral nutrition), via a Y-site.

Aminophylline, amphotericin B complex (Abelcet, AmBisome, Amphotec), calcium, filgrastim (Neupogen), fluconazole (Diflucan), labetalol (Normodyne), pentamidine (Pentam IV), vancomycin (Vancocin).

## **IV COMPATIBILITIES**

Diltiazem (Cardizem), heparin, lidocaine, morphine, propofol (Diprivan).

### SIDE EFFECTS Frequent

Discomfort with IM administration, induration, oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria), thombophlebitis (pain, redness, swelling at injection site).

### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

 Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

 Renal and pulmonary ceftriaxonecalcium precipitations, including some fatalities in neonates.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with a history of GI disease (especially antibiotic-associated or ulcerative colitis), hepatic or renal impairment, and concurrent use of nephrotoxic drugs. May be associated with increased INR, especially in nutritionally deficient patients or those who have undergone prolonged treatment or have hepatic or renal disease. Ceftriaxone readily crosses the placenta and is distributed in breast milk. Ceftriaxone use in children may displace serum bilirubin from serum albumin. Use ceftriaxone cautiously in neonates, who may become hyperbilirubinemic; use is contraindicated in neonates with hyperbilirubinemia. Age-related renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed.

### Storage

Store unreconstituted vials at room temperature. The solution normally appears light yellow to amber. The IV infusion (piggyback) is stable for 3 days at room temperature and 10 days if refrigerated. Thawed premixed frozen solutions are stable for 3 days at room temperature or 21 days if refrigerated. Discard the solution if a precipitate forms.

### Administration

For IV use, add 2.4 mL of sterile water for injection to each 250-mg vial, 4.8 mL to each 500-mg vial, 9.6 mL to each 1-g vial, and 19.2 mL to each 2-g vial to provide a concentration of 100 mg/mL. The resulting solution may be further diluted with 50-100 mL of 0.9% NaCl or D5W. Infuse the intermittent IV infusion (piggyback) over 15-30 min for adults and over 10-30 min for children or neonates. Alternate IV sites and use large veins to reduce the risk of phlebitis.

For IM use, add 0.9 mL of sterile water for injection, 0.9% NaCl, D5W, bacteriostatic water and 0.9% benzyl alcohol, or 1% lidocaine to each 250-mg vial; 1.8 mL to each 500-mg vial; 3.6 mL to each 1-g vial; and 7.2 mL to each 2-g vial to provide a concentration of 250 mg/mL. To minimize patient discomfort, slowly inject the drug deep into the gluteus maximus rather than the lateral aspect of the thigh.

## Cefuroxime

sef-yoor-ox'eem Ceftin, Zinacef Do not confuse cefuroxime with cefotaxime, Cefzil, or deferoxamine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, cephalosporin (second generation)

### **MECHANISM OF ACTION**

A second-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 33%-50%. Widely distributed (including to CSF). Primarily excreted unchanged in urine. Moderately removed by hemodialysis. *Half-life:* 1.3 h (increased in impaired renal function).

### AVAILABILITY

*Oral Suspension:* 125 mg/5 mL, 250 mg/5 mL. *Tablets:* 125 mg, 250 mg, 500 mg. *Powder for Injection:* 750 mg, 1.5 g, 7.5 g. *Premixed IVPB, Frozen:* 750 mg, 1.5 g.

### INDICATIONS AND DOSAGES

 Ampicillin-resistant influenza; bacterial meningitis; early Lyme disease; genitourinary tract,

### gynecologic, skin, and bone infections; septicemia; gonorrhea; and other gonococcal infections IV. IM

*Adults, Elderly.* 750 mg-1.5 g q8h. *Children.* 75-100 mg/kg/day divided q8h. Maximum: 8 g/day.

Neonates. 50-100 mg/kg/day divided q12h.

PO

*Adults, Elderly.* 125-500 mg twice a day, depending on the infection. For uncomplicated gonorrhea, give a 1-g single dose.

### Pharyngitis, tonsillitis PO

*Children 3 mo to 12 yr.* 125 mg (tablets) q12h or 20 mg/kg/day (suspension) in 2 divided doses.

## Acute otitis media, acute bacterial maxillary sinusitis, impetigo

*Children 3 mo to 12 yr.* 250 mg (tablets) q12h or 30 mg/kg/day (suspension) in 2 divided doses.

### Bacterial meningitis IV

Children 3 mo to 12 yr. 200-240 mg/kg/day in divided doses q6-8h.

### Perioperative prophylaxis IV

*Adults, Elderly.* 1.5 g 30-60 min before surgery and 750 mg q8h after surgery.

### Dosage in renal impairment

Adult dosage and frequency are modified based on creatinine clearance and the severity of the infection. The usual initial (loading dose) is given, followed by maintenance as follows:

#### Creatinine Clearance

(mL/min)	Adult Dosage
> 20	Use usual dose
10-20	750 mg q12h
< 10	750 mg q24h

Cefuroxime (Generic Name)

## CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

## INTERACTIONS

### Drug

Antacids, H<sub>2</sub> antagonists: May reduce cefuroxime absorption. Probenecid: Increases serum concentration of cefuroxime. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, LDH, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test.

## IV INCOMPATIBILITIES

Azithromycin (Zithromax IV), calcium chloride, caspofungin (Cancidas), diazepam, diphenhydramine, dobutamine, doxycycline, filgrastim (Neupogen), fluconazole (Diflucan), haloperidol, magnesium sulfate, midazolam (Versed), phenobarbital, phenytoin, promethazine, sodium bicarbonate, vancomycin (Vancocin).

## **IV COMPATIBILITIES**

Diltiazem (Cardizem), hydromorphone (Dilaudid), morphine, propofol (Diprivan).

## SIDE EFFECTS

### Frequent

Discomfort with IM administration, oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

### Occasional

Nausea, serum-sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

### Rare

Allergic reaction (rash, pruritus, urticaria), thrombophlebitis (pain, redness, swelling at injection site).

## SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

• Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with a history of GI disease (especially antibiotic-associated or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic drugs. May be associated with increased INR, especially in nutritionally deficient patients, prolonged treatment, hepatic or renal disease. Cefuroxime readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children. Age-related renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibiotic-associated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should also be assessed.

### Storage

Reconstituted oral suspension is stable for 10 days refrigerated. The injection solution normally appears light yellow to amber; a darker color does not indicate loss of potency. Reconstituted solution is stable for 24 h at room temperature and 48 h if refrigerated. The IV infusion (piggyback) is stable for 24 h at room temperature, 7 days if refrigerated, and 26 wks if frozen. Thawed previously frozen premixed solution is stable for 24 h at room temperature or 21 days if refrigerated. Discard the solution if a precipitate forms.

### Administration

Cefuroxime axetil tablets and powder for oral suspension are not bioequivalent and are therefore not substitutable on a mg/mg basis; bioavailability is greater with the tablets. Take cefuroxime tablets without regard to food. However, if GI upset occurs, give with food or milk. Avoid crushing tablets because they have a bitter taste. Give the oral suspension with food. Shake suspension well prior to each use.

For IV use, to reconstitute, add 8 mL of sterile water for injection to each 750-mg vial, or 14 mL to each 1.5-g vial to provide a concentration of 100 mg/mL. For intermittent IV infusion (piggyback), further dilute with 50-100 mL of 0.9% NaCl or D5W. Administer the IV push over 3-5 min. Infuse the intermittent IV infusion (piggyback) over 15-60 min.

For IM use, to minimize patient discomfort, slowly inject the drug deep into the gluteus maximus rather than the lateral aspect of the thigh.

### Celecoxib

sel-eh-cox'ib Celebrex Do not confuse Celebrex with Cerebyx or Celexa.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Nonsteroidal anti-inflammatory, analgesic, COX-2 inhibitor

### **MECHANISM OF ACTION**

An NSAID that inhibits cyclooxygenase-2, the enzyme responsible for prostaglandin synthesis. *Therapeutic Effect:* Reduces inflammation and relieves pain.

### PHARMACOKINETICS

Widely distributed. Protein binding: 97%. Metabolized in the liver. Primarily eliminated in feces. *Half-life:* 11.2 h.

### AVAILABILITY

*Capsules:* 50 mg, 100 mg, 200 mg, 400 mg.

## INDICATIONS AND DOSAGES • Osteoarthritis

PO

Adults, Elderly. 200 mg/day as a single dose or 100 mg twice a day.

Celecoxib (Generic Name), Celebrex (Brand Name)
# Rheumatoid arthritis

PO

Adults, Elderly. 100-200 mg twice a day.

# • Acute pain, primary dysmenorrhea PO

*Adults, Elderly.* Initially, 400 mg with additional 200 mg on day 1, if needed. Maintenance: 200 mg twice a day as needed.

# Juvenile rheumatoid arthritis PO

*Children 2 yr and older and weighing 10-25 kg.* 50 mg twice daily. *Children 2 yr and older and weighing more than 25 kg.* 100 mg twice daily.

#### Ankylosing spondylitis PO

*Adults.* 200 mg once daily or 100 mg twice daily. May increase to 400 mg/day.

# Dose in moderate hepatic impairment

Reduce dose 50%.

#### Dose in renal impairment

Not recommended for patients with advanced renal disease.

# CONTRAINDICATIONS

Hypersensitivity to aspirin, NSAIDs, or sulfonamides; use within 14 days of coronary artery bypass graft surgery (CABG).

# INTERACTIONS

#### Drug

Fluconazole: May increase celecoxib blood level. Lithium: May increase lithium blood levels. SSRIs, SNRIs: Increased risk of GI bleeding. Warfarin: May increase the risk of bleeding. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase AST (SGOT) and ALT (SGPT) levels.

# SIDE EFFECTS

#### Frequent (> 5%)

Diarrhea, dyspepsia, headache, hypertension, upper respiratory tract infection.

#### Occasional (1%-5%)

Abdominal pain, flatulence, nausea, back pain, peripheral edema, dizziness, rash.

#### SERIOUS REACTIONS

None known.

# **PRECAUTIONS & CONSIDERATIONS**

Be aware of the potential for increased risk of cardiovascular events and GI bleeding associated with celecoxib use. Celecoxib, like all NSAIDs, may exacerbate hypertension and congestive heart failure and may cause an increased risk of serious cardiovascular thrombotic events, myocardial infarction, and stroke, which can be fatal. Caution is recommended with cardiac disease, peripheral vascular disease, cerebrovascular disease (e.g., stroke, transient ischemic attack), fluid retention, hypertension, edema, or preexisting renal disease. Do not use in patients with acute MI or CABG surgery. Caution is warranted with smokers and patients with active alcoholism, who have a history of peptic ulcer disease, who are receiving anticoagulant or steroid therapy, and who are elderly. It is unknown whether celecoxib crosses the placenta or is distributed in breast milk. Celecoxib should not be used during the third trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. The safety and efficacy of celecoxib have not been established in

children younger than 18 yr. No agerelated precautions have been noted in elderly patients. Alcohol and aspirin should be avoided during celecoxib therapy because these substances increase the risk of GI bleeding.

Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness, improved grip strength, and increased joint mobility, should be evaluated. Storage

Store at room temperature.

#### Administration

Celecoxib at dosages up to 200 mg twice daily can be administered without regard to timing of meals. Administer higher dosages (400 mg twice daily) with food to improve absorption. For patients with difficulty swallowing, the capsules may be opened and the contents sprinkled on applesauce.

#### Cephalexin

sef-a-lex'in 🛧 Keflex, Panixine Disperdose Apo-Cephalex, Keflex, Novo-Lexin, Nu-Cephalex

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Antibiotics. cephalosporin (first generation)

#### **MECHANISM OF ACTION**

A first-generation cephalosporin that binds to bacterial cell membranes and inhibits cell wall synthesis. Therapeutic Effect: Bactericidal.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 10%-15%. Widely distributed. Primarily excreted

unchanged in urine. Moderately removed by hemodialysis. Half-life: 0.9-1.2 h (increased in impaired renal function).

#### AVAILABILITY

Powder for Oral Suspension: 125 mg/5 mL, 250 mg/5 mL. Capsules or Tablets: 250 mg, 500 mg. Tablets for Oral Suspension: 125 mg, 250 mg.

# INDICATIONS AND DOSAGES

Bone infections, prophylaxis of rheumatic fever, follow-up to parenteral therapy PO

Adults, Elderly. 250-500 mg q6h up to 4 g/day.

Streptococcal pharyngitis, skin and skin-structure infections, uncomplicated cystitis PO

Adults, Elderly. 500 mg q12h.

# Usual pediatric dosage

Children. 25-100 mg/kg/day in 2-4 divided doses.

Otitis media

PO

Children. 75-100 mg/kg/day in 4 divided doses.

Dosage in renal impairment

After usual initial dose, dosing frequency is modified based on creatinine clearance and the severity of the infection.

Creatinine

Clearance (mL/min)	Dosage Interval
10-40	Usual dose q8-12h
< 10	Usual dose q12-24h

# CONTRAINDICATIONS

History of anaphylactic reaction to penicillins or hypersensitivity to cephalosporins.

Cephalexin (Generic Name)

#### INTERACTIONS

#### Drug

**Probenecid:** Increases serum concentration of cephalexin.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase INR, serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. May produce a positive direct or indirect Coombs' test.

#### SIDE EFFECTS

#### Frequent

Oral candidiasis, mild diarrhea, mild abdominal cramping, vaginal candidiasis.

#### Occasional

Nausea, serum sickness-like reaction (marked by fever and joint pain; usually occurs after the second course of therapy and resolves after the drug is discontinued).

#### Rare

Allergic reaction (rash, pruritus, urticaria).

# SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Nephrotoxicity may occur, especially in patients with preexisting renal disease.

• Patients with a history of allergies, especially to penicillin, are at increased risk for developing a severe hypersensitivity reaction, marked by severe pruritus, angioedema, bronchospasm, and anaphylaxis.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with history of GI disease (especially

antibiotic-associated or ulcerative colitis), renal impairment, and concurrent use of nephrotoxic drugs. May be associated with increased INR, especially in nutritionally deficient patients, those undergoing prolonged treatment, and patients with hepatic or renal disease. Cephalexin readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children. Age-related renal impairment may require a dosage adjustment in elderly patients.

Although mild GI effects may be tolerable, an increase in their severity may indicate the onset of antibioticassociated colitis. Assess the pattern of daily bowel activity and stool consistency, the mouth for white patches on the mucous membranes and tongue, signs and symptoms of superinfection including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Renal function should be assessed.

#### Storage

Keep tablets, capsules, unreconstituted powder for oral suspension, and tablets for dispersion at room temperature in tightly closed containers. After reconstitution, the oral suspension is stable for 14 days if refrigerated.

#### Administration

Space drug doses evenly around the clock.

Shake the oral suspension well before using. Take oral cephalexin without regard to meals. However, if GI upset occurs, give with food or milk.

For dispersible tablets for suspension: Do not chew or swallow the tablets. Mix tablet in about 10 mL of water. Drink entire mixture. Rinse container with additional water and drink the contents to ensure the whole dose is taken.

## **Certolizumab Pegol**

sir-toe-liz'oo-mab peg'ol Cimzia Do not confuse Cimzia with Cymbalta.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Diseasemodifying antirheumatic drugs, gastrointestinal anti-inflammatory agents, biologic response modifiers, monoclonal antibodies, tumor necrosis factor (TNF) modulators

# **MECHANISM OF ACTION**

A monoclonal antibody that binds to tumor necrosis factor (TNF), inhibiting functional activity of TNF- $\alpha$ . Reduces infiltration of inflammatory cells. *Therapeutic Effect*: Decreases intestinal inflammation, decreases synovitis and joint erosion.

# PHARMACOKINETICS

Peak plasma concentrations are attained 54-171 h after subcutaneous injection. The bioavailability is approximately 80%. There is a linear relationship between the dose and the maximum serum concentration and the area under the certolizumab pegol plasma concentration versus time curve (AUC). *Terminal Halflife:* Roughly 14 days.

# AVAILABILITY

Powder for Injection: 200 mg. Prefilled Injection Syringes: 200 mg/mL.

# INDICATIONS AND DOSAGES

 Moderate to severe Crohn's disease
 SUBCUTANEOUS *Adults, Elderly.* 400 mg initially and at wks 2 and 4. If response occurs, follow with 400 mg every 4 wks.

# Rheumatoid arthritis (RA), moderate to severe

SUBCUTANEOUS

*Adults, Elderly.* 400 mg initially and at wks 2 and 4. Follow with 200 mg every other week; consider a dose of 400 mg every 4 wks for maintenance regimens.

# CONTRAINDICATIONS

Hypersensitivity to certolizumab.

# INTERACTIONS

#### Drug

Abatacept, rilonacept, anakinra, natalizumab, and other TNFmodulating drugs: May increase the risk of adverse effects such as infection risk. Concurrent use not recommended.

**Immunosuppressants:** May increase risk of serious infection.

Live vaccines: May decrease immune response to vaccine. Deferral of live vaccination may be necessary; consult CDC guidelines.

#### Herbal

Echinacea: In theory, may alter effect of certolizumab. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May cause erroneously elevated activated partial thromboplastin time (aPTT) results even though the drug does not affect coagulation.

# SIDE EFFECTS

Frequent ( $\geq 5\%$ )

Upper respiratory infections (e.g., nasopharyngitis, laryngitis), urinary tract infections, rash, arthralgia.

#### Occasional (3%-5%)

Injection site reactions, headache, fatigue, fever, increased blood pressure, myalgia, back pain. **Rare** (< 3%)

Urticaria, psoriasis, optic neuritis or vision change, stomatitis, mood changes, vasculitis, changes in blood counts, alopecia, menstrual changes, anxiety. Autoantibody production may produce a lupus-like syndrome.

#### SERIOUS REACTIONS

 Hypersensitivity reactions may occur, including angioedema or serum-sickness-like syndromes.

- Severe hepatic reactions or reactivation of hepatitis B.
- Anemia, leukopenia, pancytopenia, or aplastic anemia (rare).
- Potential for lymphoma or other malignancy in young adults or children.
- New or worsening heart failure or other heart changes.
- Reactivation of latent tuberculosis has occurred.
- Serious infections, such as bacteremia or pneumonia.
- Demyelinating disorders,
- exacerbation or new onset.

#### **PRECAUTIONS & CONSIDERATIONS**

Certolizumab should not be initiated in patients with an active infection, including clinically important localized infections. Weigh risks and benefits in patients (1) with chronic or recurrent infection; (2) who have been exposed to tuberculosis; (3) who have resided or traveled in areas of endemic TB or endemic mycoses, such as histoplasmosis, coccidioidomycosis, or blastomycosis with underlying conditions that may predispose them to infection. A PPD and/or chest x-ray should be obtained prior to use. Caution is warranted in patients with a history of recurrent infections and in patients on concomitant immunosuppresant agents, especially those receiving corticosteroids. Use with caution in patients with hypertension, existing history of heart failure, or other significant heart disease or in those with hepatic disease or a history of hepatitis. Use with caution in patients with central and peripheral nervous system demyelinating disease, including multiple sclerosis. There are no data regarding use in pregnant women. It is unknown whether certolizumab is distributed in breast milk; discontinuation of breastfeeding is recommended. Safety and efficacy of the drug have not been established in children. Use cautiously in elderly patients.

Notify the physician of signs of infection, such as fever or sore throat, or if there are signs of allergic reaction. Monitor BP. Persons with rheumatoid arthritis should report increase in pain, stiffness, or swelling of joints. Persons with Crohn's disease should report changes in stool color, consistency, abdominal complaints, or elimination pattern.

#### Storage

Refrigerate powder for injection and prefilled syringes in the original carton. Do not freeze. Protect from light. Once powder is reconstituted, can store in the vial in the refrigerator for up to 24 h prior to injection. Do not freeze. The syringes are glass and may break if dropped or mishandled. Inspect product before use once in solution. The solution will be clear to opalescent, colorless to pale yellow liquid and free from particulates; if cloudy or discolored or if has large particles, do not use.

#### Administration

For subcutaneous use only.

Reconstitute each lyophilized vial with 1 mL of sterile water for injection and a syringe with a 20-gauge needle. Gently swirl without shaking. Leave vials undisturbed; full dissolution may take as long as 30 min. Concentration will be 200 mg/mL. Let come to room temperature before injecting, but for no more than 2 h. Using a new 20-gauge needle for each vial, withdraw the reconstituted solution into a separate syringe for each vial, so that each syringe contains 1 mL. Switch to a 23-gauge (dosing) needle before administration and inject the full contents of each syringe subcutaneously into the thigh or abdomen. Where a 400-mg dose is required, separate sites should be used for each 200-mg (1-mL) injection. A patient may be taught to use the prefilled syringes.

# Cetirizine

si-tear'a-zeen Zyrtec Reactine Do not confuse Zyrtec with Zantac or Zyprexa.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC

*Classification:* Antihistamines, H<sub>1</sub>, low sedating

# **MECHANISM OF ACTION**

A second-generation piperazine that competes with histamine for  $H_1$ -receptor sites on effector cells in the GI tract, blood vessels, and respiratory tract. *Therapeutic Effect:* Prevents allergic response, produces mild bronchodilation, and blocks histamine-induced bronchitis.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	< 4-8 h	<1h	24 h

Rapidly and almost completely absorbed from the GI tract (absorption not affected by food). Protein binding: 93%. Undergoes low first-pass metabolism; not extensively metabolized. Primarily excreted in urine (more than 80% as unchanged drug). *Half-life:* 6.5-10 h.

#### AVAILABILITY

Oral Solution: 5 mg/5 mL. Tablets: 5 mg, 10 mg. Tablets (Chewable): 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Allergic rhinitis, urticaria

Adults, Elderly, Children older than 5 yr. Initially, 5-10 mg/day as a single dose or in 2 divided doses. Children 2-5 yr. 2.5 mg/day. May increase up to 5 mg/day as a single dose or in 2 divided doses. Children 12-23 mo. Initially, 2.5 mg/day. May increase up to 5 mg/day in 2 divided doses. Children 6-11 mo. 2.5 mg once a day.

#### Dosage in renal or hepatic impairment (adults)

For creatinine clearance of 11-31 mL/min, receiving hemodialysis (creatinine clearance of < 7 mL/min), and those with hepatic impairment, dosage is decreased to 5 mg once a day.

#### CONTRAINDICATIONS

Hypersensitivity to cetirizine or hydroxyzine.

Cetirizine (Generic Name)

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression.

#### Herbal

None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing, unless drug is discontinued 4 days before testing.

# SIDE EFFECTS

#### Occasional (2%-10%)

Pharyngitis; dry mucous membranes, nose, or throat; nausea and vomiting; abdominal pain; headache; dizziness; fatigue; thickening of mucus; somnolence; photosensitivity; urine retention.

#### SERIOUS REACTIONS

• Children may experience paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremor.

 Dizziness, sedation, and confusion are more likely to occur in elderly patients.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with renal or hepatic impairment. Cetirizine use is not recommended during the early months of pregnancy. It is unknown whether cetirizine is excreted in breast milk. Breastfeeding is not recommended. Cetirizine is less likely to cause anticholinergic effects in children. Elderly patients are more likely to experience anticholinergic effects, such as dry mouth and urine retention, as well as dizziness, sedation, and confusion. Avoid drinking alcoholic beverages, prolonged exposure to sunlight, and tasks that require alertness or motor skills until response to the drug is established.

Drowsiness may occur at dosages > 10 mg/day. Therapeutic response should be monitored.

## Storage

All dosage forms can be stored at room temperature.

#### Administration

Take cetirizine without regard to food. Chewable tablets should be throughly chewed. May take chewable tablets with or without water.

# Cevimeline

sev-im'el-ine ★ Evoxac Do not confuse Evoxac with Eurax or cevimeline with Savella.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Cholinergic (muscarinic) agonist

# **MECHANISM OF ACTION**

A cholinergic agonist that binds to muscarinic receptors of effector cells, thereby increasing secretion of exocrine glands, such as salivary glands. *Therapeutic Effect:* Relieves dry mouth.

#### PHARMACOKINETICS

Rapid absorption after oral administration, peak levels 1.5-2 h. Protein binding: 20%. Metabolized in liver by CYP2D6 and CYP3A4 isoenzymes. *Half-life:* 5 h. 84% excreted in urine within 24 h.

Cevimeline (Generic Name), Evoxac (Brand Name)

# Cetuximab

ceh-tux'ih-mab

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antineoplastics, monoclonal antibodies

# **MECHANISM OF ACTION**

A monoclonal antibody that binds to the epidermal growth factor receptor (EGFR), a glycoprotein on normal and tumor cells, thus inhibiting cell growth and inducing apoptosis. *Therapeutic Effect:* Inhibits the growth and survival of tumor cells that overexpress EGFR.

# PHARMACOKINETICS

Reaches steady-state levels by the third weekly infusion. Clearance decreases as dose increases. *Half-life*: 112 h (range, 63-230 h).

# AVAILABILITY

Injection: 2 mg/mL.

# INDICATIONS AND DOSAGES

 Metastatic colorectal carcinoma, squamous cell carcinoma of the head and neck

IV INFUSION

*Adults, Elderly.* Initially, 400 mg/m<sup>2</sup> over 2 h as a loading dose. Maintenance: 250 mg/m<sup>2</sup> infused over 60 min once weekly.

Expect to reduce the infusion rate by 50% for infusion-related reactions and to adjust dose based on the degree (grade) of dermatologic toxicity during treatment. Serious infusion reactions may require discontinuation of treatment. **OFF-LABEL USES** 

Non-small cell lung cancer (NSCLC).

# CONTRAINDICATIONS

None known.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May decrease WBC count, magnesium, calcium, potassium, hematocrit, and hemoglobin level.

# IV INCOMPATIBILITIES

Do not mix cetuximab with any other medications.

# SIDE EFFECTS

#### Frequent (25%-90%)

Acneiform rash, malaise, fever, nausea, diarrhea, constipation, headache, abdominal pain, anorexia, vomiting, fatigue, insomnia.

#### Occasional (10%-16%)

Nail disorder, back pain, stomatitis, peripheral edema, pruritus, cough, chills.

#### Rare (5%-9%)

Weight loss, depression, dyspepsia, conjunctivitis, alopecia, confusion.

# SERIOUS REACTIONS

- Anemia occurs in 10% of patients.
- A severe infusion reaction, characterized by rapid onset of airway obstruction, a precipitous drop in blood pressure, and severe urticaria, occurs rarely.

 Dermatologic toxicity, pulmonary embolus, interstitial lung disease, leukopenia, and renal failure occur rarely.  Cardiopulmonary arrest has been reported in patients receiving cetuximab in conjunction with radiation therapy.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypersensitivity to murine proteins and in patients with a history of coronary artery disease, heart failure, arrhythmias, or lung disease. Cetuximab crosses the placental barrier and may cause fetal harm or spontaneous abortion. Use adequate contraception in both males and females during and for 6 mo following the last dose. Women should not breastfeed while taking cetuximab or for 2 mo after completion of treatment. The safety and efficacy of cetuximab have not been established in children. No age-related precautions have been noted in elderly patients. Vaccinations and contact with crowds, persons with a known infection, and anyone who has recently received a live-virus vaccine should be avoided. Sun exposure should be limited and sunscreen should be worn outdoors during and for 2 mo after treatment completion because sunlight can exacerbate skin reactions.

Signs and symptoms of an infusion reaction, such as rapid onset of bronchospasm, hoarseness, hypotension, stridor, and urticaria, should be monitored for at least 1 h after each infusion. The severe infusion reaction may occur during subsequent infusions. Skin should be assessed for evidence of dermatologic toxicity, such as dry skin, exfoliative dermatitis or rash, and inflammatory sequelae. Electrolytes, hemoglobin levels, and hematocrit levels should be monitored.

#### Storage

Refrigerate vials. Do not freeze. Preparations in infusion containers are stable for up to 8 h at room temperature or 12 h if refrigerated. Discard any unused portion. The solution should appear clear and colorless; it may contain a small amount of visible white particulates.

#### Administration

CAUTION: Expect to prepare in a biological safety cabinet. Use the same cautions for preparing and administering as are used for chemotherapy.

! Premedicate the patient with 50 mg diphenhydramine IV. Cetuximab may be used as monotherapy or in combination with irinotecan. Do not give cetuximab by IV push or bolus. For IV infusion only, use a controlled rate IV pump or an IV syringe pump.

Do not shake or dilute the vials. The undiluted injection is placed either in appropriate empty IV containers or syringes prior to infusion. Affix the line and prime it with solution before starting the infusion. Administer through a low-protein-binding 0.22-µm in-line filter. Repeat until total dose is given. Use 0.9% NaCl solution to flush line at the end of infusion. Give the first dose as a 120-min IV infusion. Administer maintenance infusions over 60 min. The maximum infusion rate is 5 mL/min. When administered in conjunction with radiation therapy in head and neck carcinoma, first dose is given 1 wk before initiation of radiation therapy and maintenance therapy is administered for the duration of radiation therapy with each infusion completed 1 h before radiation. Patient should be monitored closely for 1 h after each infusion.

# AVAILABILITY

Capsules: 30 mg.

# INDICATIONS AND DOSAGES

Dry mouth associated with
 Sjögren's syndrome
 PO

Adults. 30 mg 3 times a day.

#### CONTRAINDICATIONS

Acute iritis, angle-closure glaucoma, uncontrolled asthma.

# INTERACTIONS

#### Drug

Amiodarone, diltiazem, erythromycin, fluoxetine, itraconazole, ketoconazole, paroxetine, quinidine, ritonavir, verapamil: May increase the effects of cevimeline.

Atropine, phenothiazines, tricyclic antidepressants: May decrease the effects of cevimeline.

 $\beta$ -Blockers: May increase the risk of conduction disturbances.

# Herbal

None known.

#### Food

All foods: Decreases the absorption rate of cevimeline.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (11%-19%)

Diaphoresis, headache, nausea, sinusitis, rhinitis, upper respiratory tract infection, diarrhea.

Occasional (3%-10%)

Dyspepsia, abdominal pain, cough, urinary tract infection, vomiting, back pain, rash, dizziness, fatigue.

#### Rare (1%-2%)

Skeletal pain, insomnia, hot flashes, excessive salivation, rigors, anxiety.

# SERIOUS REACTIONS

• Cevimeline use may result in decreased visual acuity, especially at night, and impaired depth perception.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiovascular disease, congestive heart failure, asthma, chronic bronchitis, COPD, cholecystitis, biliary obstruction, cholelithiasis, GI ulcers, seizure disorders, Parkinson's disease, urinary tract or bladder obstruction, and a history of nephrolithiasis. Avoid driving at night or performing hazardous duties in reduced lighting because cevimeline use may decrease visual acuity or impair depth perception. Adequate hydration should be maintained to prevent dehydration. Vital signs should be monitored.

#### Storage

Store at room temperature.

#### Administration

Take cevimeline without regard to food. Administration with food may decrease GI upset.

# **Charcoal, Activated**

★ Actidose-Aqua, Actidose with Sorbitol, Aqueous Charcodote, Charcoal Plus DS, Charcocaps, EZ-Char, Liqui-Char ▲ Aqueous Charcodote

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antidote

# **MECHANISM OF ACTION**

An antidote that adsorbs (detoxifies) ingested toxic substances, irritants, intestinal gas. *Therapeutic* 

*Effect:* Inhibits GI absorption and absorbs intestinal gas.

# PHARMACOKINETICS

Not orally absorbed from the GI tract. Not metabolized. Excreted in feces as charcoal. *Half-life:* Unknown.

#### AVAILABILITY

*Capsules, Activated:* 260 mg (Charcocaps). *Liquid, Activated:* 15 g, 25 g, 50 g (Actidose-Aqua). *Liquid, Activated:* 25 g, 50 g (Actidose with Sorbitol). *Pellets, Activated:* 25 g (EZ-Char).

# INDICATIONS AND DOSAGES Acute poisoning

PO ACTIDOSE SUSPENSION, EZ-CHAR

Adults, Elderly, Children 12 yr and older. Give 30-100 g as slurry (30 g in at least 8 oz  $H_2O$ ) or 12.5-50 g in aqueous or sorbitol suspension. Usually given as single dose. Children more than 1 yr and < 12 yr. 25-50 g as a single dose. Smaller doses (10-25 g) may be used in children aged 1-5 yr because of smaller gut lumen capacity.

#### **OFF-LABEL USES**

Antiflatulent, antidiarrheal (dietary supplements marketed in capsules/ tablets).

#### CONTRAINDICATIONS

Intestinal obstruction, GI tract that is not anatomically intact, patients at risk of hemorrhage or GI perforation. If use would increase risk and severity of aspiration; not effective for cyanide, mineral acids, caustic alkalis, organic solvents, iron, ethanol, methanol poisoning, lithium. Do not use charcoal with sorbitol in patients with fructose intolerance; charcoal with sorbitol not recommended in children younger than 1 yr of age or in persons with hypersensitivity to charcoal or any component of the formation.

# INTERACTIONS

# Drug

#### Orally administered medications:

May decrease absorption of orally administered medications. **Ipecac:** May decrease the effect of

ipecac. Herbal

#### nerbai

None known.

Food

Ice cream, chocolate syrup, sherbet, marmalade, milk: May reduce the absorptive properties of charcoal.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Occasional

Diarrhea, GI discomfort, intestinal gas.

#### SERIOUS REACTIONS

 Hypernatremia, hypokalemia, and hypermagnesemia may occur with coadministration of cathartics.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used with decreased peristalsis. It is unknown whether charcoal crosses the placenta or is distributed in breast milk. Safety and efficacy of charcoal have not been established in children < 1 yr old. There are no age-related precautions noted for elderly patients. Be aware that charcoal causes the stools to turn black.

Be aware that charcoal may cause vomiting, which is hazardous in petroleum distillate and caustic ingestions. Be aware that if charcoal and sorbitol are administered, doses should be limited to prevent excessive fluid and electrolyte loss.

#### Storage

Store at controlled room temperature. Do not freeze. Keep tightly closed.

#### Administration

Charcoal is most effective when administered within 1 h of ingestion for most ingestions. It is common to administer via an NG or gastric tube.

Be aware that about 10 g of activated charcoal for each 1 g of toxin is considered adequate but may require multiple doses. If sorbitol is also used, sorbitol dose should not exceed 1.5 g/kg. When using multiple doses of charcoal, sorbitol should be given with every other dose (not to exceed 2 doses/day).

Be aware that if treatment includes ipecac syrup, vomiting should be induced before administration of charcoal.

#### Chenodiol

kee'noe-dye'ol
Chenodal
Do not confuse with ursodiol.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification**: Gallstone dissolution agent

#### **MECHANISM OF ACTION**

A naturally occurring bile acid and gallstone-solubilizing agent. *Therapeutic Effect:* Changes the bile of patients with gallstones from precipitating (capable of forming crystals) to cholesterol solubilizing (capable of being dissolved).

# PHARMACOKINETICS

Well absorbed from the small intestine and taken up by the liver; converted to its taurine and glycine conjugates and secreted in bile. First-pass clearance 60%-80%, and drug stays mainly in enterohepatic circulation. Some chenodiol is converted by bacterial action to lithocholic acid and excreted in the feces or reenters the liver as it is sulfated to be eliminated in the feces; lithocholic acid is an established hepatotoxin, and sulfation allows for its safe elimination. Some patients are poor sulfaters.

# AVAILABILITY

Tablets: 250 mg.

#### INDICATIONS AND DOSAGES

# Dissolution of radiolucent, noncalcified gallstones when cholecystectomy is not recommended:

Adults, Elderly. 13 to 16 mg/kg/day in two divided doses, morning and night, starting with 250 mg twice daily for 2 weeks, then increase by 250 mg/day each week thereafter until the recommended or maximum tolerated dose is reached. Dosage reduction (temporary) may be needed for diarrhea, but dosage less than 10 mg/kg usually is ineffective and is not recommended. Treatment may require months. Obtain ultrasound image of gallbladder at 6- to 9-mo intervals. If gallstones have dissolved, continue therapy and repeat ultrasound within 1-3 mo. There is no established maintenance dosage.

#### CONTRAINDICATIONS

Hypersensitivity to the drug or any other bile acid agents. Pregnancy. Do not use in those with hepatocyte dysfunction or bile duct abnormalities such as intrahepatic cholestasis, primary biliary cirrhosis, or sclerosing cholangitis; a gallbladder confirmed as nonvisualizing after two consecutive single doses of dye; radiopaque stones; or gallstone complications or compelling reasons for gallbladder surgery including unremitting acute cholecystitis, cholangitis, biliary obstruction, gallstone pancreatitis, or biliary gastrointestinal fistula. The drug will not dissolve calcified cholesterol stones, radiopaque stones, or radiolucent bile pigment stones.

#### INTERACTIONS

#### Drug

Aluminum-based antacids, cholestyramine: May decrease the absorption and effects of chenodiol. Estrogens, oral contraceptives: May decrease the effects of chenodiol. Warfarin: May prolong INR and increase risk of bleeding. Monitor INR. Herbal None known.

Food None known.

# DIAGNOSTIC TEST EFFECTS

Aminotransferases, AST (SGOT), and ALT (SGPT) may increase in 2%-3% of patients; increased total cholesterol and LDL fraction. Rare decreased WBC.

#### SIDE EFFECTS

#### Frequent

Diarrhea (up to 40%), fecal urgency, cramps, heartburn, constipation, nausea and vomiting, anorexia, epigastric distress, dyspepsia, flatulence, and nonspecific abdominal pain.

#### Infrequent

Cholecystitis biliary colic.

#### SERIOUS REACTIONS

• Jaundice, hepatitis, or other hepatotoxicity.

# **PRECAUTIONS & CONSIDERATIONS**

This drug may increase the rate of patients needing gallbladder removal. If dissolution of stones does not occur within 18 mos, then therapy should be discontinued. Total treatment has been limited to 2 years. Chenodiol may cause harm to the fetus. It is not known if the drug is excreted in breast milk; use caution during lactation. Safety and effectiveness of chenodiol have not been established in children. Blood serum chemistry values, including BUN, cholesterol, serum bilirubin, AST (SGOT), and ALT (SGPT) levels, should be obtained before the start of chenodiol therapy and frequently thereafter. If LFT elevations 2-3 times normal occur, the drug may need to be discontinued, then restarted. Some elevations recur on rechallenge and may require permanent discontinuation of the drug to avoid hepatic injury. Diarrhea is common and if severe usually responds to dose reduction, and sometimes antidiarrheal agents. Monitor stool consistency and frequency. Up to 3% of patients have diarrhea that is not controlled with dose reduction or other measures. Low cholesterol diets and weight reduction may be helpful adjunct measures. Patients should report any steady epigastric pain that may be indicative of gallstone complications.

#### Storage

Store at room temperature. Keep tightly closed.

# Administration

Most bile acids are recommended to be taken with a meal or snack. Avoid taking antacids 1 h before or 2 h after taking chenodiol. Therapy with chenodiol is usually for several months.

# **Chloral Hydrate**

klor-al hye'drate ★ Somnote ★ Chloral Hydrate Odan

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: IV

#### Classification: Sedatives/ hypnotics

nyphones

# **MECHANISM OF ACTION**

A nonbarbiturate chloral derivative that produces CNS depression. *Therapeutic Effect:* Induces quiet, deep sleep, with only a slight decrease in respiratory rate and BP.

# PHARMACOKINETICS

Rapid absorption after oral administration, peak levels 30-45 min. Duration: 2-5 h. Metabolized to trichloroethanol in liver and other tissues and, to a lesser extent, trichloroacetic acid, in liver. Glucuronide conjugate excreted in urine. *Half-life:* 7-9.5 h.

# AVAILABILITY

*Capsules (Somnote):* 500 mg. *Syrup:* 500 mg/5 mL. *Suppositories:* 500 mg.

# INDICATIONS AND DOSAGES

# Premedication for anesthesia, medical procedures, or diagnostics, such as EEG or CT scan PO, RECTAL

Adults. 0.5-1.5 g. Maximum: 2 g. Children. 25-50 mg/kg/dose 30-60 min prior to event. Use PO form only. May repeat in 30 min. The total dose should not exceed 100 mg/kg or 2 g, whichever is less. Normally, do not need to exceed 1.5 g in children.

# CONTRAINDICATIONS

Marked hepatic or renal impairment, hypersensitivity, or an idiosyncratic reaction to the drug.

# INTERACTIONS

# Drug

Alcohol, other CNS depressants: May increase the effects of chloral hydrate. Furosemide (IV): May alter BP and cause diaphoresis if given within 24 h after chloral hydrate. Warfarin: May increase the effect of warfarin. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Gastric irritation (nausea, vomiting, flatulence, diarrhea), rash, sleepwalking.

# Rare

Headache, paradoxical CNS hyperactivity or nervousness in children, excitement or restlessness in elderly patients, particularly in patients with pain.

# SERIOUS REACTIONS

• Overdose may produce somnolence, confusion, slurred speech, severe incoordination, respiratory depression, and coma.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with clinical depression, patients

with a history of drug abuse, patients with porphyria, gastritis, cardiac disease, and in neonates. Do not drive if taking chloral hydrate before a procedure. BP, pulse rate, and respiratory rate, rhythm, and depth should be assessed immediately before and during chloral hydrate use. Elderly patients should be monitored for paradoxical reactions, such as excitability.

#### Storage

Store suppositories at room temperature; do not refrigerate them. Store capsules and syrup at room temperature.

#### Administration

! Only trained health care workers (not parents or care providers) should administer this drug to children in preparation for a procedure and only *after* the child has arrived at the facility to ensure proper monitoring of neurologic and respiratory status, and availability of resuscitation equipment in the event of respiratory depression.

! Always verify a child's mg/kg dosage to avoid serious overdose. Take chloral hydrate capsules with a full glass of water or fruit juice. Swallow the capsules whole and do not chew them. Dilute the dose of syrup in water to minimize gastric irritation. May dilute in juice to mask unpleasant taste.

For rectal use, if the suppository is too soft to insert, chill in the refrigerator for 30 min or run cold water over it before removing the foil wrapper. First remove the foil wrapper and moisten the suppository with cold water. Lie down on side and use finger to push the suppository well up into the rectum.

#### Chloramphenicol

klor-am-fen'i-kole Chloromycetin Do not confuse chloramphenicol with chlorambucil.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anti-infectives, ophthalmics, otics, antibiotics, chloramphenicol and derivatives

# **MECHANISM OF ACTION**

A dichloroacetic acid derivative that inhibits bacterial protein synthesis by binding to bacterial ribosomal receptor sites. *Therapeutic Effect:* Bacteriostatic (may be bactericidal in high concentrations).

#### PHARMACOKINETICS

Widely distributed, crosses blood-brain barrier. Extensively metabolized to inactive metabolites, primarily via glucuronidation. *Half-life:* 1.6-3.3 h (prolonged in renal and hepatic impairment).

#### AVAILABILITY

Powder for Injection: 1-g vial.

#### INDICATIONS AND DOSAGES

 Mild to moderate infections caused by organisms resistant to other less toxic antibiotics IV

Adults, Elderly. 50-100 mg/kg/day in divided doses q6h. Maximum: 4 g/day. Children older than 1 mo. 50-75 mg/kg/day in divided doses q6h. Maximum: 4 g/day.

#### Meningitis IV

Adults, Children older than 1 mo. 75-100 mg/kg/day in divided doses q6h.

# CONTRAINDICATIONS

Hypersensitivity to chloramphenicol. Due to toxicity risk, do not use in treatment of trivial infections or where it is not indicated, or as a prophylactic agent to prevent bacterial infections.

# INTERACTIONS

#### Drug

Anticonvulsants, bone marrow depressants: May increase myelosuppression.

**Clindamycin, erythromycin:** May antagonize the effects of these drugs.

Iron supplements: May antagonize hematopoietic response to iron therapy. Oral antidiabetics: May increase the effects of these drugs.

# Phenobarbital, phenytoin,

warfarin: May increase blood concentrations of these drugs.

**Vitamin**  $B_{12}$ : May decrease the effects of vitamin  $B_{12}$  in patients with pernicious anemia.

# Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

Therapeutic blood level: 10-20 mcg/mL; toxic blood level: > 25 mcg/mL.

# IV INCOMPATIBILITIES

In general, do not mix chloramphenicol with other medications.

# SIDE EFFECTS

#### Occasional

Systemic: Nausea, vomiting, diarrhea. Rare

"Gray baby" syndrome in neonates (abdominal distention, blue-gray skin color, cardiovascular collapse, unresponsiveness), rash, shortness of breath, confusion, headache, optic neuritis (blurred vision, eye pain), peripheral neuritis (numbness and weakness in feet and hands).

# SERIOUS REACTIONS

• Superinfection from bacterial or fungal overgrowth may occur.

• There is a narrow margin between effective therapy and toxic levels producing blood dyscrasias.

 Myelosuppression, with resulting aplastic anemia, hypoplastic anemia, and pancytopenia, may occur weeks or months later.

· Optic neuritis may cause blindness.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with myelosuppression, glucose-6-phosphate dehydrogenase deficiency, or renal or hepatic impairment and in those who have previously undergone cytotoxic drug therapy or radiation therapy. Caution should be used in children younger than 2 yr and in children of any age with impaired or immature metabolic processes, especially neonates and premature neonates.

Concurrent use of other drugs that cause myelosuppression should be determined before therapy because chloramphenicol should not be given concurrently with these drugs, if possible. Baseline blood studies should also be determined before beginning chloramphenicol therapy.

Nausea, vomiting, and visual disturbances should be reported. Pattern of daily bowel activity and stool consistency, mental status, and skin for rash should be assessed. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, a change in the oral mucosa, diarrhea, and increased fever. Know and monitor the drug's therapeutic blood level, which is 10-20 mcg/mL; toxic blood level is > 25 mcg/mL. Monitor complete blood counts at baseline and a minimum of every 2 days during treatment.

#### Storage

Store vials at room temperature. Administration

Space drug doses evenly around the clock and continue for the full course of treatment.

Expect to change therapy to an antibiotic of less risk as soon as possible. Prepare IV injection by adding 10 mL of sterile water for injection on dextrose 5% into the 1-g vial (concentration: 100 mg/mL). Withdraw correct dose. Inject dose over at least a 1 min interval.

# Chlordiazepoxide

klor-dye-az-e-pox'ide

📩 Librium

Apo-Chlordiazepoxide **Do not confuse Librium with** Librax or Chlordiazepoxide with Chlorpromazine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D Controlled Substance Schedule: IV

**Classification:** Anxiolytics, benzodiazepines

#### **MECHANISM OF ACTION**

A benzodiazepine that enhances the action of the inhibitory neurotransmitter γ-aminobutyric acid in the CNS. *Therapeutic Effect:* Produces anxiolytic effect.

# PHARMACOKINETICS

Slow onset after oral administration, peak levels 2 h. Metabolized in liver (active metabolites). *Half-life:* 24-48 h. Metabolites excreted in urine.

#### AVAILABILITY

Capsules: 5 mg, 10 mg, 25 mg.

# INDICATIONS AND DOSAGES Alcohol withdrawal symptoms

PO Adults, Elderly. 50-100 mg. May

repeat q2-4h. Maximum: 300 mg/24 h.

Anxiety

PO

Adults. 15-100 mg/day in 3-4 divided doses.

Elderly. 5 mg 2-4 times a day.

 Preoperative apprehension and anxiety

PO

*Adults.* 5-10 mg 3-4 times/day on days preceding surgery.

Usual pediatric dose (anxiety)
 Children 6 yr of age and older. 5 mg
 2-4 times/daily, may increase to
 10 mg 2-3 times/daily.

• Adjustment for renal impairment If creatinine clearance is less than 10 mL/min, reduce usual dose by 50%.

• Adjustment for hepatic impairment Use with caution; drug may accumulate with repeat dosing.

# CONTRAINDICATIONS

Hypersensitivity to the drug.

#### INTERACTIONS Drug

Other CNS depressants: May increase CNS depression.

## Herbal

Kava kava, valerian: May increase CNS depression. Food Alcohol: May increase CNS depression.

# DIAGNOSTIC TEST EFFECTS

None known. Therapeutic serum drug level is 1-3 mcg/mL; toxic serum drug level is > 5 mcg/mL.

Chlordiazepoxide (Generic Name), Librium (Brand Name)

C

#### SIDE EFFECTS

#### Frequent

C

Somnolence, ataxia, dizziness, confusion (particularly in elderly or debilitated patients).

#### Occasional

Rash, peripheral edema, GI disturbances, anterograde amnesia. **Rare** 

Paradoxical CNS reactions, such as hyperactivity or nervousness in children and excitement or restlessness in elderly patients (generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain).

#### SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal or muscle cramps, diaphoresis, vomiting, and seizures.
 Overdosage results in somnolence, confusion, diminished reflexes, and coma.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with impaired renal or hepatic function. Caution is also warranted in patients with CNS depression or in those with severe pulmonary disease or respiratory depression. Avoid chlordiazepoxide use in first trimester of pregnancy. Use during pregnancy may cause fetal harm. Use during lactation is not recommended as the drug is distributed to breast milk. Safety and effectiveness in children under the age of 6 yr have not been established. Drowsiness may occur. Change positions slowly from recumbent to sitting before standing to prevent dizziness. Alcohol and tasks that require mental alertness or motor skills should also be avoided. Autonomic responses, such as cold, clammy hands and diaphoresis, and motor responses,

such as agitation, trembling, and tension, should be assessed. BP, pulse rate, and respiratory rate, rhythm, and depth should be monitored immediately before giving the drug.

# Storage

Store capsules at room temperature. Administration

Take chlordiazepoxide orally without regard to meals. Do not abruptly discontinue after long-term therapy.

# Chlorhexidine Gluconate

klor-hex'ih-deen gloo'ko-nate Betasept Surgical Scrub, Oro-Clense, Peridex, PerioChip, PerioGard, PerioRx, Perisol

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anti-infective

# **MECHANISM OF ACTION**

An antiseptic and antimicrobial agent that is active against a broad spectrum of microbes. The chlorhexidine molecule, due to its positive charge, reacts with the microbial cell surface, destroys the integrity of the cell membrane, penetrates the cell, and precipitates the cytoplasm, and the cell dies. *Therapeutic Effect:* Causes cell death.

#### PHARMACOKINETICS

Initially, the chlorhexidine gluconate dental chip releases approximately 40% of the drug within the first 24 h, then releases the remainder in an almost linear fashion for 7-10 days.

Approximately 30% of the active ingredient, chlorhexidine gluconate, is retained in the oral cavity following oral rinsing. This

retained drug is slowly released into the oral fluids. Poorly absorbed from the GI tract. Primarily excreted in feces. *Half-life*: Unknown.

# AVAILABILITY

Chip: 2.5 mg. Oral Rinse: 0.12%. Topical Solution: 2%, 4%. Topical Rinse: 0.5%. Topical Wipes: 0.5%. Topical Sponge: 4%.

#### 

#### Gingivitis

ORAL RINSE *Adults, Elderly.* Swish and spit for 30 seconds twice daily.

#### Periodontitis

DENTAL IMPLANT (PERIOCHIP) *Adults, Elderly.* One chip is inserted into a periodontal pocket; insert a new chip q3mo; maximum of 8 chips per dental visit.

# Topical cleansing of skin

CLEANSER Rinse with water, apply chlorhexidine and wash, rinse with water. PREOPERATIVE SKIN PREPARATION Apply to site and swab for 2 min.

Dry with sterile towel. Repeat.

# OFF-LABEL USES

Acute aphthous ulcers and denture stomatitis (dental rinse).

# CONTRAINDICATIONS

Hypersensitivity to chlorhexidine gluconate or any component of the formulation.

# INTERACTIONS

Drug None known. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS Occasional

Oral rinse: Altered taste, staining of teeth, toothache, increased tartar on teeth. Topical: Skin erythema and roughness, dryness, sensitization, allergic reactions.

#### SERIOUS REACTIONS

· Anaphylaxis has been reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Oral rinse not intended for periodontitis. Avoid use of topical solution in children < 2 yr of age. Storage

Store oral rinse, dental implant, and topical solutions at room temperature. Protect from light and freezing.

# Administration

Dental implant: Avoid flossing for 10 days after chip insertion.

Dental rinse: Swish dose in mouth for 30 seconds, then expectorate. Do not rinse with water, use other mouthwashes, brush teeth, or eat immediately after using. Do not swallow the rinse.

Use topical solutions and scrubs as advised for each individual product; keep topical products out of the ears, mouth, and eyes.

# Chloroquine/ Chloroquine Phosphate

klor'oh-kwin Aralen Novo-Chloroquine

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antimalarial, antiprotozoal

Chloroquine/Chloroquine Phosphate (Generic Name)

# **MECHANISM OF ACTION**

An amebecide that concentrates in parasite acid vesicles and may interfere with parasite protein synthesis. *Therapeutic Effect:* Inhibits parasite growth.

# PHARMACOKINETICS

Rate of absorption is variable. Chloroquine is almost completely absorbed from the GI tract. Protein binding: 50%-65%. Widely distributed into body tissues such as eyes, heart, kidneys, liver, and lungs. Partially metabolized to active de-ethylated metabolites (principal metabolite is desethylchloroquine). Excreted in urine. Removed by hemodialysis. *Half-life:* 1-2 mo.

#### AVAILABILITY

Tablets: 250 mg, 500 mg (Aralen).

# INDICATIONS AND DOSAGES

Chloroquine phosphate
 Treatment of malaria (acute attack): Dose (mg base)
 PO

Dose	Time	Adults (mg)	Children (mg/kg)
Initial	Day 1	600	10
Second	6 h later	300	5
Third	Day 2	300	5
Fourth	Day 3	300	5

#### Malaria prophylaxis PO

*Adults.* 300 mg (base)/wk on same day each week beginning 2 wks before exposure; continue for 6-8 wks after leaving endemic area. *Children.* 5 mg (base)/kg/wk with start duration as for adults.

#### Amebiasis

#### PO

Adults. 1 g (600 mg base) daily for 2 days; then 500 mg (300 mg base)/ day for at least 2-3 wks.

# **OFF-LABEL USES**

Treatment of rheumatoid arthritis, discoid lupus erythematosus, solar urticaria.

# CONTRAINDICATIONS

Hypersensitivity to 4-aminoquinoline compounds, retinal or visual field changes.

# INTERACTIONS

#### Drug

Alcohol: May increase GI irritation. Ampicillin: May reduce the absorption of ampicillin. Separate administration by 2 h.

Antacids and kaolin: May be decreased due to GI binding with kaolin or magnesium trisilicate. Cimetidine: May increase levels of chloroquine.

**Cyclosporine:** May increase cyclosporine concentrations.

CYP2D6 inhibitors

(chlorpromazine, delavirdine, fluoxetine, miconazole, paroxetine, pergolide, quinidine, quinine, ritonavir, ropinirole): May increase the levels and effects of chloroquine.

# CYP2D6 substrates

(amphetamines, selected β-blockers, dextromethorphan,

fluoxetine, lidocaine, mirtazapine, nefazodone, paroxetine, risperidone, ritonavir, thioridazine, tricyclic antidepressants,

venlafaxine): May increase the levels and effects of CYP2D6 substrates.

#### CYP2D6 prodrug substrates:

Chloroquine may decrease the levels and effects of CYP2D6 prodrug substrates.

CYP3A4 inducers (aminoglutethimide,

carbamazepine, nafcillin,

nevirapine, phenobarbital,

phenytoin, and rifamycins):

CYP3A4 inducers may decrease the levels and effects of chloroquine.

CYP3A4 inhibitors (azole antifungals, ciprofloxacin, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, guinidine, and verapamil): May increase the levels and effects of chloroquine. Mefloquine: May increase risk of convulsions. Penicillamine: May increase concentration of penicillamine and increase risk of hematologic, renal, or severe skin reaction. Praziguantel: May decrease

praziquantel concentrations. Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

Acute decrease in hematocrit, hemoglobin, and RBC count may occur.

# SIDE EFFECTS

#### Frequent

Mild transient headache, anorexia, nausea, vomiting.

#### Occasional

Visual disturbances (blurring, difficulty focusing); nervousness; fatigue; pruritus, especially of palms, soles, scalp; bleaching of hair; irritability; personality changes; diarrhea; skin eruptions.

#### Rare

Abdominal cramps, headache, hypotension.

# SERIOUS REACTIONS

• Ocular toxicity and ototoxicity have been reported.

 Prolonged therapy: Peripheral neuritis and neuromyopathy, hypotension, ECG changes, agranulocytosis, aplastic anemia, thrombocytopenia, convulsions, psychosis.  Overdosage includes symptoms of headache, vomiting, visual disturbance, drowsiness, convulsions, hypokalemia followed by cardiovascular collapse, and death.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with alcoholism, severe blood disorders, liver disease, neurologic disorders, auditory damage, porphyria, psoriasis, and G6PD deficiency. It is unknown whether chloroquine crosses the placenta or is distributed in breast milk. Be aware that children are especially susceptible to chloroquine effects. There are no age-related precautions noted in elderly patients.

History of allergies, especially to antibiotics, should be determined before giving chloroquine.

Visual disturbances should be reported immediately.

#### Storage

Store tablets at room temperature. Administration

Chloroquine  $PO_4$  500 mg = 300 mg base.

Give oral chloroquine with food or milk to minimize GI irritation. May mix with chocolate syrup or enclose in gelatin capsules to mask the bitter taste.

# Chlorothiazide

klor-oh-thye'a-zide

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Diuretics, thiazide

# **MECHANISM OF ACTION**

A sulfonamide derivative that acts as a thiazide diuretic and antihypertensive. As a diuretic, it

Chlorothiazide (Generic Name)

#### 320 Chlorothiazide

blocks the reabsorption of water and the electrolytes sodium and potassium at the cortical diluting segment of the distal tubule. As an antihypertensive, it reduces plasma; extracellular fluid volume decreases peripheral vascular resistance (PVR) by direct effect on blood vessels. *Therapeutic Effect:* Promotes diuresis, reduces BP.

# PHARMACOKINETICS

Poorly absorbed from the GI tract. Not metabolized. Primarily excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* 45-120 min.

#### AVAILABILITY

Powder for Injection, Lyophilized: 0.5 g. Oral Suspension: 250 mg/5 mL (Diuril). Tablets: 250 mg, 500 mg.

#### INDICATIONS AND DOSAGES • Edema, hypertension

PO

*Adults.* 0.5-1 g 1-2 times/day for hypertension. For edema, may give every other day or 3-5 days/wk. *Children 12 yr and older.* 10-20 mg/kg/dose in divided doses q8-12h. Maximum: 2 g/day. *Children 2-12 yr.* 10-20 mg/kg/day in divided doses q12-24 h; not to exceed 1 g/day. *Children 6 mo to 2 yr.* 10-20 mg/kg/day in divided doses q12-24h. Maximum: 375 mg/day. *Children younger than 6 mo.* 20-30 mg/kg/day in divided doses q12h. Maximum: 375 mg/day.

# Hypertension/edema

*Adults.* 0.5-1 g in divided doses q12-24h. For edema, may give every other day or 3-5 days/wk.

#### **OFF-LABEL USES**

Treatment of diabetes insipidus, prevention of calcium-containing renal stones.

# CONTRAINDICATIONS

Anuria, history of hypersensitivity to sulfonamides or thiazide diuretics, renal decompensation.

#### INTERACTIONS Drug

Cholestyramine, colestipol: May decrease the absorption and effects of chlorothiazide. Digoxin: May increase the risk of toxicity of digoxin caused by hypokalemia. Lithium: May increase the risk of toxicity of lithium. NSAIDs: May decrease the absorption and effects of chlorothiazide. Probenecid: May increase concentrations of chlorothiazide. Herbal Ginkgo biloba: May increase BP. Licorice: May increase risk of hypokalemia and decrease effectiveness of chlorothiazide. Ma huang: May decrease hypotensive effect of chlorothiazide. Yohimbe: May decrease effects of chlorothiazide. Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Expected.

Increase in urine frequency and volume.

#### Frequent

Potassium depletion.

#### Occasional

Postural hypotension, headache, GI disturbances, photosensitivity reaction, muscle spasms, alopecia, rash, urticaria.

# SERIOUS REACTIONS

• Vigorous diuresis may lead to profound water loss and electrolyte depletion, resulting in hypokalemia, hyponatremia, and dehydration.

• Acute hypotensive episodes may occur.

• Hyperglycemia may be noted during prolonged therapy.

 GI upset, pancreatitis, dizziness, paresthesias, headache, blood dyscrasias, pulmonary edema, allergic pneumonitis, and dermatologic reactions occur rarely.

 Overdosage can lead to lethargy and coma without changes in electrolytes or hydration.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with diabetes mellitus, electrolyte imbalance, hyperuricemia or gout, hypotension, systemic lupus erythematosus, hypercholesterolemia, impaired liver function, and severe renal disease. Chlorothiazide crosses the placenta, and a small amount is distributed in breast milk. Breastfeeding is not recommended in this patient population. Safety and efficacy of IV chlorothiazide have not been established in children and infants. Be aware that elderly patients may be more sensitive to the drug's electrolyte and hypotensive effects. Age-related renal impairment may require caution in elderly patients.

Frequency and volume of urination are expected to increase. Be aware that chlorothiazide may aggravate digitalis toxicity. Be aware that sensitivity reactions may occur with or without history of allergy or asthma. Skin should be protected from sunlight. Hypokalemia may result in change in mental status, muscle cramps, nausea, tachycardia, tremor, vomiting, and weakness.

Hyponatremia may result in clammy and cold skin, confusion, and thirst. Be especially alert for potassium depletion in persons taking digoxin, such as cardiac arrhythmias. Foods high in potassium, such as apricots, bananas, legumes, meat, orange juice, white and sweet potatoes, and raisins, and whole grains, such as cereals, should be eaten during treatment.

#### Storage

Store at room temperature. Administration

May take with food or milk if GI upset occurs, preferably with breakfast to help prevent nocturia. Shake oral suspension well before use.

Prepare injection just before each administration because chlorothiazide does not contain preservatives. Discard unused portion. Do not administer subcutaneously or intramuscularly. May be given slowly by direct IV injection or infusion. Reconstitute with 18 mL sterile water for injection for a final concentration of 28 mg/ mL. For IV infusion, may add to dextrose 5% or 0.9% NaCl injection solutions.

#### Chlorpheniramine

klor-fen-ir'a-meen Aller-Chlor, Chlor-Trimeton, Chlor-Trimeton Allergy, Chlor-Trimeton Allergy 12 Hour, Diabetic Tussin Allergy Relief, TanaHist-PD Chlor-Tripolon, Novo-Pheniran Do not confuse with chlorpromazine or chlorpropamide.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC (tablets, syrup)

*Classification:* Antihistamines, H<sub>1</sub>, sedating

# **MECHANISM OF ACTION**

A propylamine derivative antihistamine that competes with histamine for histamine receptor sites on cells in the blood vessels, GI tract, and respiratory tract. *Therapeutic Effect*: Inhibits symptoms associated with seasonal allergic rhinitis such as increased mucus production and sneezing.

#### PHARMACOKINETICS

Well absorbed after PO administration. Food delays absorption. Widely distributed. Metabolized in liver. Primarily excreted in urine. Not removed by dialysis. *Half-life*: 20 h.

#### AVAILABILITY

Syrup: 2 mg/5 mL (Aller-Chlor, Diabetic Tussin Allergy Relief [sugar free]). Tablets: 4 mg (Aller-Chlor, Chlor-Trimeton). Tablets (Sustained Release): 12 mg (Chlor-Trimeton Allergy 12 Hour). Capsules (Extended Release): 8 mg. Suspension: 8 mg/5 mL. Oral Drops Suspension: 2 mg/mL.

#### INDICATIONS AND DOSAGES Allergic rhinitis, common cold

PO Adults, Elderly. 4 mg q6-8h, or 8-12 mg (sustained release) q8-12h, or 16 mg (sustained release) q24h. Maximum: 24 mg/day. Children 12 yr and older: 4 mg q6-8h or 8 mg (sustained release) q12h. Maximum: 24 mg/day. Children 6-11 yr. 2 mg q4-6h. Maximum: 12 mg/day.

# CONTRAINDICATIONS

Hypersensitivity to chlorpheniramine or its components; MAOI therapy; breastfeeding; newborn or premature infants.

#### INTERACTIONS

Drug

Alcohol, central nervous system (CNS) depressants: May increase CNS depressant effects. Anticholinergics: May increase anticholinergic effects. MAOIs: May increase anticholinergic and CNS depressant effects.

**Phenytoin, fosphenytoin:** May increase the risk of phenytoin toxicity.

**Procarbazine:** May increase CNS depressant effects.

# Herbal and Food

None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS Frequent

Drowsiness; dizziness; muscular weakness; hypotension; dry mouth, nose, throat, and lips; urinary

Chlorpheniramine (Generic Name)

retention; thickening of bronchial secretions.

Elderly: Sedation, dizziness, hypotension.

#### Occasional

Epigastric distress, flushing, visual or hearing disturbances, paresthesia, diaphoresis, chills.

# SERIOUS REACTIONS

 Children may experience dominant paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremors.

• Overdosage in children may result in hallucinations, seizures, and death.

• Hypersensitivity reactions, such as eczema, pruritus, rash, cardiac disturbances, and photosensitivity, may occur.

 Overdosage may vary from CNS depression, including sedation, apnea, hypotension, cardiovascular collapse, and death, to severe paradoxical reaction, such as hallucinations, tremor, and seizures.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with asthma, cardiovascular disease, chronic obstructive pulmonary disease (COPD), hypertension, hyperthyroidism, narrow-angle glaucoma, increased intraocular pressure (IOP), peptic ulcer disease, prostatic hypertrophy, pyloroduodenal or bladder neck obstruction, and seizure disorders. It is unknown whether chlorpheniramine crosses the placenta or is detected in breast milk. Be aware that chlorpheniramine use is not recommended in newborns or premature infants since these groups are at an increased risk of experiencing paradoxical reaction. Be aware that elderly patients are at an increased risk of developing confusion, dizziness, hyperexcitability, hypotension, and sedation.

Dizziness, drowsiness, and dry mouth are expected side effects. Tasks that require mental alertness or motor skills should be avoided. Tolerance to the drug's sedative effects can occur.

#### Storage

Store at room temperature. Administration

Give oral chlorpheniramine without regard to meals. Do not crush, break, or chew sustained-release tablets. Shake suspensions well before use.

#### Chlorpromazine

klor-proe'ma-zeen Do not confuse chlorpromazine with chlorpropamide, clomipramine, or prochlorperazine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Phenothiazine, antiemetic, antipsychotic

# **MECHANISM OF ACTION**

A phenothiazine that blocks dopamine neurotransmission at postsynaptic dopamine receptor sites. Possesses strong anticholinergic, sedative, and antiemetic effects; moderate extrapyramidal effects; and slight antihistamine action. *Therapeutic Effect:* Relieves nausea and vomiting; improves psychotic conditions; controls intractable hiccups and porphyria.

#### PHARMACOKINETICS

Rapidly absorbed after oral or IM administration. Protein binding: 92%-97%. Metabolized in the liver. Excreted in urine. *Half-life:* 6 h.

Chlorpromazine (Generic Name)

# AVAILABILITY

*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg, 200 mg. *Injection:* 25 mg/mL.

# INDICATIONS AND DOSAGES Severe nausea or vomiting

PO

Adults, Elderly. 10-25 mg q4-6h. Children. 0.55 mg/kg q4-6h. IM

*Adults, Elderly.* 25 mg; may repeat 25-50 mg q3-4h as needed until vomiting stops. Then switch to oral dosage.

Children. 0.55 mg/kg q6-8h.

# Psychotic disorders

PO

Adults, Elderly. 75-800 mg/day 3-4 divided doses.

Children older than 6 mo.

0.55 mg/kg q4-6h.

IM, IV

Adults, Elderly. Initially, 25 mg; may repeat in 1-4 h. May gradually increase to 400 mg q4-6h. Maximum: 300-800 mg/day. Children older than 6 mo. 0.5-1 mg/kg q6-8h. Maximum: 75 mg/day for children 5-12 yr; 40 mg/day for children younger than 5 yr.

# Intractable hiccups

PO, IM, or IV Adults. 25-50 mg PO 3 times a day. If symptoms persist after 2-3 days, try a single 25-50 mg IM or IV dose.

#### • Acute intermittent porphyria PO

Adults. 25-50 mg 3-4 times a day. IM

#### Adults, Elderly. 25 mg 3-4 times a day. • Preoperative apprehension and anxiety

# PO

*Adults.* 25-50 mg, single dose 2-3 h before surgery.

*Children*. 0.5 mg/kg, single dose 2-3 h before surgery.

# Tetanus

#### IM or IV

Adults: 25-50 mg 3-4 times/day; in conjunction with barbiturates. *Children:* 0.55 mg/kg q6-8h. If < 23 kg, do not exceed 40 mg/day. If 23-45 kg, do not exceed 75 mg/day.

# **OFF-LABEL USES**

Symptomatic treatment of Huntington disease.

# CONTRAINDICATIONS

Comatose states and hypersensitivity to phenothiazine. Do not use in the presence of large amounts of CNS depressants (alcohol, barbiturates, narcotics, etc.).

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase respiratory depression and the hypotensive effects of chlorpromazine.

Extrapyramidal symptomproducing medications (e.g., metoclopramide): Increased risk of extrapyramidal symptoms. Hypotensives: May increase

hypotension. May counteract guanethidine and related drugs. Levodopa: May decrease the effects of levodopa.

**Lithium:** May decrease the absorption of chlorpromazine and produce adverse neurologic effects.

**MAOIs, tricyclic antidepressants:** May increase the anticholinergic and sedative effects of chlorpromazine.

Metrizamide: Discontinue phenothiazine 48 h before myelography and do not start until 24 h after, due to seizure risk. **QT-prolonging drugs:** May have additive effect on QT interval.

Warfarin: Effectiveness of warfarin may be decreased; monitor INR.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May produce false-positive pregnancy and phenylketonuria (PKU) test results. May cause ECG changes, including Q- and T-wave disturbances. Therapeutic serum drug level is 50-300 mcg/ mL; toxic serum drug level is > 750 mcg/mL.

#### SIDE EFFECTS

#### Frequent

Somnolence, blurred vision, hypotension, color vision or night vision disturbances, dizziness, decreased sweating, constipation, dry mouth, nasal congestion. Occasional

Urinary retention, photosensitivity, rash, decreased sexual function, swelling or pain in breasts, weight gain, nausea, vomiting, abdominal pain, tremors.

#### SERIOUS REACTIONS

 Extrapyramidal symptoms appear to be dose related and are divided into three categories: akathisia (including inability to sit still, tapping of feet), parkinsonian symptoms (such as mask-like face, tremors, shuffling gait, hypersalivation), and acute dystonias (including torticollis, opisthotonos, and oculogyric crisis). A dystonic reaction may also produce diaphoresis and pallor.

• Tardive dyskinesia, including tongue protrusion, puffing of the cheeks, and puckering of the mouth, is a rare reaction that may be irreversible.

• Abrupt discontinuation after longterm therapy may precipitate nausea, vomiting, gastritis, dizziness, and tremors.

 Blood dyscrasias, particularly agranulocytosis and mild leukopenia, may occur.

• Chlorpromazine may lower the seizure threshold.

#### PRECAUTIONS & CONSIDERATIONS

Possible risk factors for leukopenia/ neutropenia include preexisting low WBC or history of druginduced neutropenia. Monitor CBC frequently during the first few months of therapy. The injection contains sodium metabisulfite and sodium sulfite, sulfites that may cause allergic-type reactions in those with sulfite sensitivity. Safety in pregnancy has not been established, and there is evidence for excretion into breast milk. Use with caution in children less than 12 yr of age.

Caution is warranted with alcoholism; glaucoma; history of seizures; hypocalcemia (increases susceptibility to dystonias); impaired cardiac, hepatic, renal, or respiratory function; benign prostatic hyperplasia; and urine retention. Increased mortality has been observed in elderly patients with dementia-related psychosis treated with antipsychotics. Alcohol, tasks that require mental alertness or motor skills, and excessive exposure to sunlight and heat should be avoided. Skin should not come in contact with the injection solution because it can cause contact dermatitis.

Drowsiness may occur, and urine may darken. Notify the physician of visual disturbances. CBC, calcium, hydration status, and skin should be assessed. Be alert for signs of neutropenia (fever), movement disorders, or hypotension.

#### Storage

All products should be stored at room temperature. Do not freeze. A slight yellow color to injection is acceptable.

#### Administration

! Do not give chlorpromazine by the subcutaneous route because severe tissue necrosis may occur.

For IM use, to prevent irritation at the injection site, dilute the injection solution with sodium chloride for injection or add 2% procaine, as prescribed. Inject IM slowly deep into upper outer quadrant of buttock; keep point recumbent for at least 30 min after injection.

! The IV route is reserved for severe hiccups, tetanus, and surgery. Never administer IV undiluted; the drug is given as an IV infusion diluted in 0.9% NaCl injection to a final concentration of at least 1 mg/mL and infused no faster than 1 mg/min (adults) or 0.5 mg/min (children). The patient should be supine and carefully monitored for hypotension before and after the infusion.

Give oral tablets with food, milk, or a full glass of water to minimize GI irritation.

# Chlorpropamide

klor-pro'pa-mide **Do not confuse with chlorpromazine.** 

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, sulfonylureas, first generation

# **MECHANISM OF ACTION**

A first-generation sulfonylurea that promotes release of insulin from  $\beta$  cells of pancreas. *Therapeutic Effect:* Lowers blood glucose concentration.

# PHARMACOKINETICS

Rapidly absorbed from the gastrointestinal (GI) tract. Protein binding: 60%-90%. Extensively metabolized in liver. Drugs and metabolites excreted primarily in urine. Removed by hemodialysis. *Half-life:* 30-62 h.

#### AVAILABILITY

Tablets: 100 mg, 250 mg.

# INDICATIONS AND DOSAGES Diabetes mellitus, type 2 PO

Adults. Initially, 250 mg once a day. Maintenance: 250-500 mg once a day. Maximum: 750 mg/day. Elderly. Initially, 100-125 mg once a day. Maintenance: 100-250 mg once a day. Increase or decrease by 50-125 mg/day at 3- to 5-day intervals.

# Renal function impairment Creatinine clearance 50-80 mL/min: Reduce dosage by 50%. Creatinine clearance less than 50 mL/min: Do not use.

#### **OFF-LABEL USES**

Neurogenic diabetes insipidus.

#### CONTRAINDICATIONS

Diabetic complications, such as ketosis, acidosis, and diabetic coma, severe liver or renal impairment, therapy for type 1 diabetes mellitus, or hypersensitivity to sulfonylureas.

#### INTERACTIONS Drug

Alcohol: Disulfiram-like reactions may occur. Symptoms of low blood sugar, including sweating, shaking,

Chlorpropamide (Generic Name)

weakness, drowsiness, and trouble concentrating, will occur.

β-Blockers, MAOIs, NSAIDs, salicylates: May increase hypoglycemic effect.

Fluoroquinolone antibiotics: May increase the risk of hypoglycemia. Glucocorticoids, thiazide diuretics:

May increase blood glucose. **Oral contraceptives:** May increase blood glucose.

#### Herbal

**Bitter melon:** May increase the risk of hypoglycemia.

**St. John's wort:** May increase the risk of hypoglycemia.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Headache, upper respiratory tract infection.

## Occasional

Sinusitis, myalgia (muscle aches), pharyngitis, aggravated diabetes mellitus.

## SERIOUS REACTIONS

• Possible increased risk of cardiovascular mortality with this class of drugs.

 Overdosage can cause severe hypoglycemia prolonged by extended half-life.

#### PRECAUTIONS & CONSIDERATIONS

Caution is necessary with elderly patients and those with liver function impairment. Chlorpropamide should be avoided in elderly patients because of the high risk of hypoglycemia. Blood glucose should be checked before giving chlorpropamide. Chlorpropamide crosses the placenta and is distributed in breast milk and is not recommended in pregnant or breastfeeding women. Abdominal or chest pain, dark urine or light stool, hypoglycemic reactions, fever, nausea, palpitations, rash, vomiting, or yellowing of the eyes or skin should be reported immediately.

Be alert to conditions that alter blood glucose requirements, such as fever, increased activity, stress, or a surgical procedure. Hypoglycemia, such as anxiety, cool, wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, and tremors, and hyperglycemia, including deep, rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, and vomiting, can occur. Blood glucose levels, hemoglobin levels, and liver function tests should be monitored during therapy. Because of the long half-life of chlorpropamide, hypoglycemia may be prolonged. Careful monitoring and frequent feedings may be required for several days. Candy or a source of glucose for immediate response to hypoglycemia should be carried.

## Storage

Store at room temperature in a wellclosed container.

#### Administration

Give chlorpropamide with or without regard to meals. Usually given in the morning with breakfast.

## Chlorthalidone

klor-thal'i-doan ★ Thalitone ◆ Apo-Chlorthalidone

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

*Classification:* Antihypertensive agents, diuretics, thiazide, and derivatives

Chlorthalidone (Generic Name)

## **MECHANISM OF ACTION**

A thiazide diuretic that blocks reabsorption of sodium, potassium, and water at the distal convoluted tubule; also decreases plasma and extracellular fluid volume and peripheral vascular resistance. *Therapeutic Effect*: Produces diuresis; lowers BP.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (diuretic)	2 h	2-6 h	Up to 36 h

Rapidly absorbed from the GI tract. Excreted unchanged in urine. *Half-life*: 35-50 h. Onset of antihypertensive effect: 3-4 days. *Optimal Therapeutic Effect*: 3-4 wks.

## AVAILABILITY

Tablets: 15 mg, 25 mg, 50 mg, 100 mg.

# INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults*. Initially 15-25 mg once daily; may increase to 45-50 mg once daily. Titrate as needed. Maximum: 100 mg/day.

## Edema

## PO

*Adults.* Initially 50-100 mg once daily or 100 mg on alternate days. Some patients may require increase to 150 mg/day or every other day. Maximum: 200 mg/day.

## CONTRAINDICATIONS

Anuria, history of hypersensitivity to sulfonamides or thiazide diuretics, renal decompensation.

## INTERACTIONS

#### Drug

**Cholestyramine, colestipol:** May decrease the absorption and effects of chlorthalidone.

**Digoxin:** May increase the risk of digoxin toxicity associated with chlorthalidone-induced hyperkalemia. **Lithium:** May increase the risk of lithium toxicity. **Herbal** 

Licorice: May increase the risk of hypokalemia. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose and serum cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, and triglyceride levels. May decrease urinary calcium and serum magnesium, potassium, and sodium levels.

## SIDE EFFECTS

#### Expected

Increase in urinary frequency and urine volume.

## Frequent

Potassium depletion (rarely produces symptoms).

## Occasional

Anorexia, impotence, diarrhea, orthostatic hypotension, GI disturbances, photosensitivity. **Rare** 

Rash.

## SERIOUS REACTIONS

• Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, and dehydration.

Acute hypotensive episodes may occur.

• Hyperglycemia may occur during prolonged therapy.

• Overdose can lead to lethargy and coma without changes in electrolytes or hydration.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with diabetes mellitus, gout,

hypercholesterolemia, hepatic impairment, and severe renal disease and in elderly and debilitated patients. Chlorthalidone crosses the placenta, and a small amount is distributed in breast milk. Breastfeeding is not recommended for patients taking this drug. Safety and efficacy have not been established in children. Elderly patients may be more sensitive to the drug's hypotensive and electrolyte effects. Consuming foods high in potassium, such as apricots, bananas, legumes, white and sweet potatoes, meat, orange juice, and raisins, and whole grains, including cereals, is encouraged. Avoid prolonged exposure to sunlight.

Dizziness or light-headedness may occur, so change positions slowly to reduce the drug's hypotensive effect. An increase in the frequency and volume of urination may also occur. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Blood glucose levels should be checked after prolonged therapy, because hyperglycemia may occur. Be aware of the signs of electrolyte disturbances, such as hypokalemia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor.

#### Storage

Store at room temperature in a well-closed container. Protect from light.

#### Administration

Take chlorthalidone with food or milk, preferably with breakfast to help prevent nocturia. Crush tablets if needed.

## Chlorzoxazone

klor-zox'a-zone Lorzone, Parafon Forte DSC, Relax-DS Do not confuse with chlorthalidone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Skeletal muscle relaxant, centrally acting

## **MECHANISM OF ACTION**

A skeletal muscle relaxant that inhibits transmission of reflexes at the spinal cord level. *Therapeutic Effect:* Relieves muscle spasticity.

## PHARMACOKINETICS

Readily absorbed from the GI tract. Metabolized in liver. Primarily excreted in urine. *Half-life*: 1.1 h.

#### AVAILABILITY

Tablets: 375 mg, 500 mg, 750 mg.

# INDICATIONS AND DOSAGES Musculoskeletal pain

PO Adults, Elderly. 250-500 mg 3-4 times/day. Maximum: 750 mg 3-4 times/day.

## CONTRAINDICATIONS

Hypersensitivity to chlorzoxazone or any one of its components.

## INTERACTIONS

## Drug

Alcohol CNS depressants: May increase CNS depression.

## Herbal

**Garlic:** May inhibit metabolism of chlorzoxazone.

Kava kava: May increase CNS depression.

Chlorzoxazone (Generic Name)

**St. John's wort:** May decrease the effectiveness of chlorzoxazone.

#### C

None known.

Food

## DIAGNOSTIC TEST EFFECTS

False-positive for serum aprobarbital when using Toxi-Lab Screen. May cause elevated LFTs.

## SIDE EFFECTS

Frequent

Drowsiness, fever, headache.

## Occasional

Nausea, vomiting, stomach cramps, rash.

## SERIOUS REACTIONS

 Overdosage results in nausea, vomiting, diarrhea, and hypotension.

 Serious hepatocellular toxicity has been reported rarely; it is idiosyncratic and unpredictable. Report early signs/ symptoms such as anorexia, nausea, vomiting, right upper quadrant pain, dark urine, or jaundice; discontinue drug immediately.

#### PRECAUTIONS & CONSIDERATIONS

Caution is necessary with liver impairment. Blood counts and liver and renal function tests should be performed periodically for those on long-term therapy. There is an increased risk of CNS toxicity, manifested as confusion, hallucinations, mental depression, and sedation in elderly patients. Effect of chlorzoxazone in pregnancy is unknown and use best avoided; avoid use during lactation. Not approved for use in children.

Drowsiness may occur during treatment but usually diminishes with continued therapy. Tasks that require mental alertness or motor skills should be avoided until response to drug is established. Alcohol and CNS depressants should be avoided.

#### Storage

Store at room temperature.

## Administration

Take without regard to meals. Scored tablets may be divided.

#### Cholestyramine Resin

koe-less-tir'a-meen ★ Prevalite, Questran, Questran Lite ✔ Olestyr

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antihyperlipidemics, bile acid sequestrants

#### **MECHANISM OF ACTION**

An antihyperlipoproteinemic that binds with bile acids in the intestine, forming an insoluble complex. Binding results in partial removal of bile acid from enterohepatic circulation. *Therapeutic Effect:* Removes LDL cholesterol from plasma.

## PHARMACOKINETICS

Not absorbed from the GI tract. Decreases in serum LDL apparent in 5-7 days and in serum cholesterol in 1 mo. Serum cholesterol returns to baseline levels about 1 mo after drug is discontinued.

## AVAILABILITY

Powder for Oral Suspension: 4 g.

#### INDICATIONS AND DOSAGES • Primary hypercholesterolemia PO

*Adults, Elderly.* 3-4 g 3-4 times a day. Maximum: 24 g/day in 2-4 divided doses.

*Children older than 10 yr.* 2 g/day. Maximum: 8 g/day in 2 or more divided doses.

# Pruritis associated with biliary stasis

## PO

*Adults, Elderly.* 4 g 1-2 times a day. Maintenance: Up to 16 g/day in divided doses.

## **OFF-LABEL USES**

Treatment of diarrhea (due to bile acids), hyperoxaluria.

## CONTRAINDICATIONS

Complete biliary obstruction, hypersensitivity to cholestyramine or tartrazine.

## INTERACTIONS

#### Drug

NOTE: To minimize drug interactions, give other drugs at least 1 h before or at least 4-6 h after cholestyramine.

Anticoagulants: May increase effects of these drugs by decreasing level of vitamin K.

Digoxin, folic acid, penicillins, propranolol, tetracyclines, thiazides, thyroid hormones, other medications: May bind and decrease absorption of these drugs.

**Oral vancomycin:** Binds and decreases the effects of oral vancomycin.

**Warfarin:** May decrease warfarin absorption.

## Herbal

None known.

#### Food

Vitamins A, D, E, K: Cholestyramine may interfere with absorption.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, serum magnesium, AST (SGOT), and ALT (SGPT) levels. May decrease serum calcium, potassium, and sodium levels. May prolong prothrombin time.

## SIDE EFFECTS

Frequent

Constipation (may lead to fecal impaction), nausea, vomiting, abdominal pain, indigestion. Occasional

Diarrhea, belching, bloating, headache, dizziness.

## Rare

Gallstones, peptic ulcer disease, malabsorption syndrome. Sipping or holding the resin suspension in the mouth for prolonged periods may cause tooth discoloration, erosion of enamel or decay; maintain good oral hygiene.

## SERIOUS REACTIONS

GI tract obstruction,

hyperchloremic acidosis, and osteoporosis secondary to calcium excretion may occur.

• High dosage may interfere with fat absorption, resulting in steatorrhea.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with bleeding disorders, GI dysfunction (especially constipation), hemorrhoids, and osteoporosis. Cholestyramine is not systemically absorbed and may interfere with maternal absorption of fat-soluble vitamins. Phenylketonurics should not use light formulations, which contain phenylalanine. No age-related precautions have been noted in children. Cholestyramine use is limited in children younger than 10 yr of age. Elderly patients are at increased risk for experiencing adverse nutritional effects and GI side effects.

Notify the physician of abdominal discomfort, flatulence, and food intolerance. Pattern of daily bowel activity and stool consistency should be assessed. High-fiber foods, such as fruits, whole grain cereals, and vegetables, will reduce the risk of constipation. History of hypersensitivity to aspirin, cholestyramine, and tartrazine should be determined before beginning cholestyramine therapy. Serum cholesterol and triglyceride levels should be checked at baseline and periodically thereafter.

#### Storage

Store powder at room temperature in a well-closed container.

## Administration

Do not take cholestyramine in its dry form because it is highly irritating and may cause choking. Place the dose in a glass or cup. Mix with 2-6 oz noncarbonated fruit juice, milk, or water. Mix thoroughly. May also mix with highly fluid soups or pulpy fruits with a high moisture content such as applesauce or crushed pineapple. Usually take at mealtimes, but may adjust time to avoid drug interactions.

## Choline Magnesium Trisalicylate

koe'leen mag-nees'ee-um tri-sal'eh-cye'late

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if full dose used in third trimester of pregnancy)

**Classification:** Analgesics, nonnarcotic, salicylates

## MECHANISM OF ACTION

A nonsteroidal salicylate that inhibits prostaglandin synthesis and acts on the hypothalamus heat-regulating center. *Therapeutic Effect:* Reduces inflammatory response and intensity of pain stimulus reaching sensory nerve endings.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Oral route onset 1 h, peak 2 h, and duration 9-17 h. Protein binding: High. Widely distributed. Excreted in the urine. *Half-life:* 2-3 h.

## AVAILABILITY

*Tablets:* 500 mg, 750 mg, 1000 mg. *Liquid:* 500 mg/5 mL.

## INDICATIONS AND DOSAGES

## Osteoarthritis, rheumatoid arthritis, analgesia, antipyretic, anti-inflammatory

Adults, Elderly. Initially, 500-1500 mg q8-12h or 3g at bedtime. Children weighing < 37 kg. 50 mg/ kg/day in divided doses.

## CONTRAINDICATIONS

History of hypersensitivity to choline magnesium trisalicylate, aspirin, or other salicylates.

## INTERACTIONS

Drug

Alcohol, NSAIDs: May increase the risk of adverse GI effects, including ulceration and GI bleeding. Concurrent use with other salicylates may cause salicylate toxicity.

Antacids, urinary alkalinizers: Increase the excretion of choline magnesium trisalicylate.

Anticoagulants, heparin, thrombolytics: Increase the risk of bleeding.

Methotrexate: Salicylates inhibit renal methotrexate excretion. Sulfonylureas: Enhanced hypoglycemic effect.

Platelet aggregation inhibitors, valproic acid: May increase the risk of bleeding.

**Probenecid:** May decrease the effect of these drugs.

Choline Magnesium Trisalicylate (Generic Name)

## Herbal

Cat's claw, dong quai, evening primrose, feverfew, garlic, ginger, ginkgo, red clover, horse chestnut, green tea, ginseng: May increase the risk of bleeding.

#### Food

Curry powder, paprika, licorice, Benedictine liqueur, prunes, raisins, tea, gherkins: May increase the risk of salicylate accumulation.

## DIAGNOSTIC TEST EFFECTS

Free T4 values may be increased due to competitive plasma protein binding; may see a concurrent decrease in total plasma T4. Thyroid function is not affected. *Plasma salicylate therapeutic level*: 150-300 mcg/mL. Toxic level > 300 mcg/mL.

## SIDE EFFECTS

#### Occasional

Tinnitus and nausea, vomiting, dyspepsia (indigestion, heartburn), diarrhea, constipation, and epigastric pain.

## Rare

Anorexia, headache, flatulence, dizziness, somnolence, insomnia, fatigue, hearing impairment.

## SERIOUS REACTIONS

• High doses may produce GI bleeding.

• Overdosage may be characterized by ringing in ears, generalized pruritus (may be severe), headache, dizziness, flushing, tachycardia, hyperventilation, sweating, and thirst.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used with dehydration, erosive gastritis, peptic ulcer disease, and chronic renal insufficiency. Caution is also warranted in children with acute viral febrile illness because choline magnesium trisalicylate increases the risk of developing Reye's syndrome. Choline magnesium trisalicylate crosses the placenta and is distributed in breast milk. It should be avoided during the last trimester of pregnancy because the drug may adversely affect the fetal cardiovascular system, causing premature closure of ductus arteriosus. Lower choline magnesium trisalicylate dosages are recommended in elderly patients because this age group may be more susceptible to toxicity.

#### Storage

Store all products at room temperature.

## Administration

Take choline magnesium trisalicylate with meals to avoid GI upset. Liquid may be mixed with fruit juice or water just before drinking.

## Ciclesonide

sye-kles'oh-nide 📩 🏰 Alvesco, Omnaris

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

## Classification: Respiratory

agent, anti-inflammatory, corticosteroid

## **MECHANISM OF ACTION**

Corticosteroid prodrug, activated by esterases in the respiratory tract, to active des-ciclesonide. Desciclesonide is a glucocorticoid that inhibits the accumulation of inflammatory cells and decreases and prevents tissues from responding to the inflammatory process. *Therapeutic Effect:* Inhalation: Inhibits bronchoconstriction, produces smooth muscle relaxation, decreases mucus secretion. Intranasal: Decreases response to seasonal and perennial allergies.

## PHARMACOKINETICS

Oral bioavailability < 1%; extensive first-pass metabolism. Primarily excreted in the feces. *Half-life*: 0.71 h ciclesonide; 6-7 h des-ciclesonide.

## AVAILABILITY

Nasal Spray: 50 mcg per spray. Inhalation Aerosol: 80 mcg per actuation, 160 mcg per actuation.

# INDICATIONS AND DOSAGES Maintenance treatment of asthma

ORAL INHALATION Adults, Elderly, Children 12 yr and older. Starting dose 80 mcg twice daily in patients previously treated with bronchodilators alone or previously treated with another inhaled corticosteroid, with titration as needed. Lowest effective dose should be used. Maximum recommended dose is 160 mcg twice daily in patients previously treated with bronchodilators alone and 320 mcg twice daily in patients previouly treated with inhaled corticosteroids. In patients receiving oral corticosteroids, ciclesonide dose is 320 mcg twice daily.

## Perennial allergic rhinitis

INTRANASAL

Adults, Elderly, Children 12 yr and older. 200 mcg per day administered as two 50-mcg sprays per nostril once daily.

## Seasonal allergic rhinitis

INTRANASAL

Adults, Elderly, Children 6 yr and older. 200 mcg per day administered as two 50-mcg sprays per nostril once daily.

## CONTRAINDICATIONS

Hypersensitivity to ciclesonide or any of the product ingredients, status asthmaticus (inhaled).

## INTERACTIONS

Drug

Ketoconazole: May increase concentrations of des-ciclesonide. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent (> 3%)

Oral inhalation: Headache, nasopharyngitis, sinusitis, pharyngolaryngeal pain, upper respiratory infection, arthralgia, nasal congestion, pain in extremity, back pain. Nasal: Headache, epistaxis, nasopharyngitis, pharyngolaryngeal pain. Occasional

Nasal: ear pain.

## SERIOUS REACTIONS

 An acute hypersensitivity reaction, as evidenced by urticaria, angioedema, and severe bronchospasm, occurs rarely.

• A transfer from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.

• Potential adrenal insufficiency if used to replace systemic corticosteroid.

• Signs and symptoms of hypercorticism.

• Nasal septal perforation has been reported in association with nasal corticosteroid use.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted for patients with glaucoma, hypothyroidism, osteoporosis, tuberculosis, and untreated systemic infections. Avoid nasal corticosteroid use in patients with recent nasal septal ulcers, nasal surgery, or nasal trauma until healing has occurred. It is unknown whether ciclesonide or des-ciclesonide crosses the placenta or is distributed in breast milk. In children, prolonged treatment and high doses may decrease cortisol secretion and the short-term growth rate. Safety and effectiveness have not been established in children under the age of 12 yr for the inhalation or under the age of 6 yr for the nasal spray. No age-related precautions have been noted in elderly patients.

Those receiving ciclesonide by inhalation should maintain fastidious oral hygiene; notify the physician or nurse if sore throat or mouth develops. Those using intranasally should notify the physician if nasal irritation occurs or if symptoms, such as sneezing, fail to improve. Persons who are using drugs that suppress the immune system are more susceptible to infections than healthy individuals.

#### Storage

Store at room temperature. Discard inhaler when dose indicator displays zero. Discard nasal spray after 120 sprays after initial priming or 4 mo after removal from the foil pouch. Administration

For inhalation, prime before first use and when not used for more than 10 days by actuating 3 times. If also using a bronchodilator inhaler, use the bronchodilator several minutes before using ciclesonide to help the steroid penetrate into the bronchial tree. Exhale completely and place the mouthpiece between the lips. Inhale and hold breath for as long as possible before exhaling. If more than one inhalation is necessary, allow at least 1 min between inhalations. Rinse mouth after each use to decrease dry mouth and hoarseness and prevent fungal infection of the mouth.

For intranasal use, clear nasal passages as much as possible. Prime before first use by actuating 8 times. Prime if not used for more than 4 consecutive days by actuating once or until a fine spray appears. Shake gently before use. Insert the spray tip into the nostril, pointing toward the nasal passages, away from the nasal septum. Spray into the nostril while holding the other nostril closed, and at the same time, inhale through the nose to deliver the medication as high into the nasal passages as possible.

## **Ciclopirox**

sye-kloe-peer'ox Loprox, Penlac Do not confuse ciclopirox with ciprofloxacin or Loprox with Lonox.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antifungals, topical

## MECHANISM OF ACTION

An antifungal that inhibits the transport of essential elements in the fungal cell, thereby interfering with biosynthesis in fungi. *Therapeutic Effect:* Results in fungal cell death.

## PHARMACOKINETICS

Absorbed through intact skin but only about 1% is absorbed systemically. Distributed to epidermis and dermis, including hair, hair follicles, and sebaceous glands. Protein binding: 98%. Primarily excreted in urine and to a lesser extent in feces. *Half-life*: 1.7 h.

## AVAILABILITY

Cream: 0.77% (Loprox). Gel: 0.77% (Loprox). Lotion: 0.77% (Loprox TS). Shampoo: 1% (Loprox). Topical Solution, Nail Lacquer: 8% (Penlac).

## INDICATIONS AND DOSAGES Tinea pedis

## TOPICAL

Adults, Elderly, Children 10 yr and older. Apply 2 times a day until signs and symptoms significantly improve. Usually for 4 wks.

#### • Tinea cruris, tinea corporis TOPICAL

Adults, Elderly, Children 10 yr and older. Apply 2 times a day until signs and symptoms significantly improve. Usually 2-4 wks.

#### Onychomycosis

TOPICAL (NAIL LACQUER SOLUTION)

*Adults, Elderly, Children 10 yr and older.* Apply to the affected area (nails) daily. Remove with alcohol every 7 days. May require months of treatment.

## Seborrheic dermatitis

GEL

Adults, Elderly, Children 10 yr and older. Apply to affected scalp areas 2 times a day, in the morning and evening for 4 wks.

#### SHAMPOO

Adults, Elderly, Children 10 yr and older. Apply 5 mL (1 tsp) to wet hair; lather, and leave in place about 3 min; rinse. May use up to 10 mL for longer hair. Repeat twice weekly for 4 wks; allow a minimum of 3 days between applications.

## CONTRAINDICATIONS

Hypersensitivity to ciclopirox or any one of its components.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Rare

Topical: Irritation, burning, redness, pain at the site of application. Dry skin, acne, rash, alopecia, eye pain, headache, facial edema. Nail Lacquer: Nail disorders such as nail discoloration, shape change, or ingrown nail.

## SERIOUS REACTIONS

None known.

## **PRECAUTIONS & CONSIDERATIONS**

Avoid use of occlusive wrappings or dressings. Avoid contact with eyes. If local irritation occurs, ciclopirox should be discontinued. It is unknown whether ciclopirox crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children younger than 10 yr old. No age-related precautions have been noted for elderly patients.

## Storage

Store products at room temperature. Nail lacquer solution should be protected from light. Nail solution is flammable and should be stored away from heat and flame.

#### Administration

Apply topical formulation by rubbing gently into the affected and surrounding area twice daily until signs and symptoms improve.

Apply nail lacquer once daily, preferably at bedtime or 8 h before washing, to the affected nails with the applicator brush provided. Cover evenly over the entire nail plate. Ciclopirox should not be removed on a daily basis. Daily applications should be made over the previous coat. Remove with alcohol every 7 days. Repeat cycle throughout the duration of therapy. File away with emery board loose nail material, and trim nails every 7 days after ciclopirox is removed with alcohol.

Apply gel to affected scalp areas twice daily, in the morning and evening for 4 wks, or use the shampoo twice weekly for 4 wks. Clinical improvement usually occurs within the first week, with continuing resolution of signs and symptoms through the fourth week of treatment.

## Cilostazol

sil-os'tah-zol ★ Pletal Do not confuse Pletal with Plendil.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Platelet inhibitors

#### MECHANISM OF ACTION

A phosphodiesterase III inhibitor that inhibits platelet aggregation. Dilates vascular beds with greatest dilation in femoral beds. *Therapeutic Effect:* Improves walking distance in patients with intermittent claudication.

## PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: 95%-98%. Extensively metabolized in the liver. Excreted primarily in the urine and, to a lesser extent, in the feces. Not removed by hemodialysis. *Half-life:* 11-13 h. Therapeutic effect is usually noted in 2-4 wks but may take as long as 12 wks.

#### AVAILABILITY

Tablets: 50 mg, 100 mg.

# INDICATIONS AND DOSAGES Intermittent claudication PO

*Adults, Elderly.* 100 mg twice a day at least 30 min before or 2 h after meals. Reduce dose to 50 mg twice a day with concurrent CYP3A4 or CYP2C19 inhibitors.

#### **OFF-LABEL USES**

For thromboembolism prophylaxis in stent recipients following percutaneous coronary intervention (PCI).

#### CONTRAINDICATIONS

Congestive heart failure of any severity, hemostatic disorders or active bleeding, (e.g., such as intracranial bleeding or bleeding peptic ulcer), hypersensitivity to cilostazol or any of the product ingredients.

## INTERACTIONS

#### Drug

CYP3A4 inhibitors (azole antifungals, clarithromycin, diltiazem, erythromycin, fluoxetine, nefazodone, protease inhibitors, quinidine, sertraline, telithromycin, and verapamil): May increase cilostazol concentration. Reduce cilostazol dose.

Cilostazol (Generic Name)

## Cidofovir

ci-dah'fo-veer ★ Vistide

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Classification: Antivirals

## **MECHANISM OF ACTION**

An anti-infective that inhibits viral DNA synthesis by incorporating itself into the growing viral DNA chain. *Therapeutic Effect:* Suppresses replication of cytomegalovirus (CMV).

## PHARMACOKINETICS

Protein binding: < 6%. Excreted primarily unchanged in urine. Effect of hemodialysis unknown. *Elimination half-life:* 1.4-3.8 h.

AVAILABILITY Injection: 75 mg/mL (5-mL vial).

#### INDICATIONS AND DOSAGES CMV retinitis in patients with AIDS (in combination with probenecid) IV INFUSION

Adults. Induction: 5 mg/kg at constant rate over 1 h once weekly for 2 consecutive weeks. Give 2 g of PO probenecid 3 h before cidofovir dose, and then give 1 g 2 h and 8 h after completion of the 1-h cidofovir infusion (total of 4 g). In addition, give 1 L of 0.9% NaCl over 1-2 h immediately before the cidofovir infusion. If tolerated, a second liter may be infused over 1-3 h at the start of the infusion or *immediately* afterward. *Maintenance:* 5 mg/kg cidofovir at constant rate over 1 h once every 2 wks.

▶ Dosage in renal impairment Patients with CrCl ≤ 55 mL/min before treatment must not receive cidofovir. Once treatment starts in other patients, decrease dose to 3 mg/kg if serum creatinine increases 0.3-0.4 mg/dL above baseline. Discontinue if a rise in serum creatinine is 0.5 mg/dL or more.

## **OFF-LABEL USES**

Treatment of ganciclovir-resistant cytomegalovirus (CMV), foscarnetresistant CMV, adenovirus, and acyclovir-resistant herpes simplex virus or progressive vaccinia infection.

## CONTRAINDICATIONS

Direct intraocular injection, history of clinically severe hypersensitivity to probenecid or other sulfacontaining drugs, hypersensitivity to cidofovir, renal impairment (serum creatinine level > 1.5 mg/dL, creatinine clearance of 55 mL/min or less, or urine protein level > 100 mg/dL), use with or within 7 days of other nephrotoxic medications.

## INTERACTIONS

#### Drug

Nephrotoxic medications (such as aminoglycosides, amphotericin B, foscarnet, tacrolimus IV pentamidine): Increase the risk of nephrotoxicity. Discontinue these at least 7 days before cidofovir treatment.

**Tenofovir:** Cidofovir may increase tenofovir serum concentrations.

Zidovudine: For persons also taking zidovudine (AZT), expect to discontinue zidovudine administration temporarily or to decrease AZT dose by 50% on days of cidofovir infusion. Be aware that concurrent probenecid use reduces the metabolic clearance of zidovudine.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May decrease neutrophil count and serum bicarbonate, phosphate, and uric acid levels. May elevate serum creatinine levels.

## IV INCOMPATIBILITIES

No information available for Y-site administration. Do not mix or infuse with other medications.

#### SIDE EFFECTS

#### Frequent

Nausea, vomiting (65%), fever (57%), asthenia (46%), rash (30%), diarrhea (27%), headache (27%), alopecia (25%), chills (24%), anorexia (22%), dyspnea (22%), abdominal pain (17%).

## SERIOUS REACTIONS

Serious adverse reactions may include proteinuria (80%), nephrotoxicity (53%), neutropenia (31%), elevated serum creatinine levels (29%), infection (24%), anemia (20%), ocular hypotony (a decrease in intraocular pressure, 12%), and pneumonia (9%).

 Concurrent use of probenecid may produce a hypersensitivity reaction characterized by a rash, fever, chills, and anaphylaxis.

- Acute renal failure occurs rarely.
- Metabolic acidosis.
- Hypospermia in males.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with preexisting diabetes. Animal studies indicate cidofovir is possibly carcinogenic. Be aware that cidofovir is embryotoxic and results in reduced fetal body weight in animals. Females of childbearing age should use effective contraception during and for 1 mo after cidofovir treatment; male patients should practice barrier contraceptive methods during and for 3 mo after treatment. Be aware that it is unknown whether cidofovir is excreted in breast milk. Do not administer to breastfeeding women. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Be aware that the safety and efficacy of cidofovir have not been established in children. In elderly patients, agerelated renal impairment may require dosage adjustment.

Renal function should be closely monitored through serum creatinine levels and urinalysis during therapy. Urine protein and WBC count should also be monitored. Visual acuity and ocular symptoms should be evaluated.

#### Storage

Store cidofovir at room temperature. Refrigerate admixtures for no longer than 24 h. Allow refrigerated admixtures to warm to room temperature before use. Discard any unused solution.

## Administration

CAUTION: Expect to prepare in a biological safety cabinet. Use the same cautions for preparing and administering as are used for chemotherapy.

! Do not exceed the recommended dosage, frequency, or infusion rate. Dilute in 100 mL 0.9% NaCl and infuse over 1 h. Prepare to administer IV hydration with 0.9% NaCl and give oral probenecid with each cidofovir infusion to minimize the risk of nephrotoxicity. Eat food before each dose of probenecid to help reduce nausea and vomiting. As prescribed, administer an antiemetic to reduce the risk of nausea. Give cidofovir IV infusion over 60 min. omeprazole, and ticlopidine): May increase cilostazol concentration. Reduce cilostazol dose. Aspirin: May potentiate inhibition of platelet aggregation.

## **Clopidogrel**, ticlopidine:

Ticlopidine may decrease cilostazol metabolism. Effects of clopidogrel with cilostazol unknown; may potentiate platelet effects.

## Herbal

None known.

#### Food

Grapefruit juice: May increase blood concentration and risk of toxicity of cilostazol. Do not give with grapefruit juice.

High-fat meal: May increase cilostazol peak concentration up to 90%.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum creatinine levels. May decrease hemoglobin and hematocrit.

## SIDE EFFECTS

#### Frequent (10%-34%)

Headache, abnormal stools, diarrhea, palpitations, dizziness, pharyngitis.

## Occasional (3%-7%)

Nausea, rhinitis, back pain, peripheral edema, dyspepsia, abdominal pain, tachycardia, cough, flatulence, myalgia.

## Rare (1%-2%)

Leg cramps, paresthesia, rash, vomiting.

## SERIOUS REACTIONS

· Signs and symptoms of overdose are noted by severe headache, diarrhea, hypotension, and cardiac arrhythmias.

 Leukopenia and thrombocytopenia, with progression to agranulocytosis when cilostazol was not immediately discontinued.

## **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with heart disease and renal or hepatic impairment. There are no adequate studies of use in pregnant women. The drug may be distributed to breast milk and use during lactation not recommended. Safety and efficacy of cilostazol have not been established in children. No agerelated precautions have been noted in elderly patients. Hemoglobin, hematocrit, and platelet counts should be obtained before and periodically during treatment.

Effect of treatment on symptoms during walking or other activities should be assessed periodically. Storage

Store at room temperature. Administration

Take cilostazol at least 30 min before or 2 h after meals. Do not give with grapefruit juice. Doses are usually given before breakfast and dinner.

## Cimetidine

sve-met'i-deen 🛧 Tagamet, Tagamet HB Nu-Cimet Do not confuse cimetidine with simethicone.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B OTC 200 mg tablets; other forms Rx only

Classification: Gastrointestinal agents, antiulcer agents, H2 histamine receptor antagonist

## MECHANISM OF ACTION

An antiulcer agent and gastric acid reducer that inhibits histamine action at H<sub>2</sub> receptor sites of parietal cells.

Cimetidine (Generic Name)

*Therapeutic Effect:* Inhibits gastric acid secretion during fasting, at night, or when stimulated by food, caffeine, or insulin.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 15%-20%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2 h; increased with impaired renal function.

## AVAILABILITY

Tablets (Tagamet HB): 200 mg. Tablets (Tagamet): 300 mg, 400 mg, 800 mg. Liquid: 300 mg/5 mL. Injection: 150 mg/mL.

## INDICATIONS AND DOSAGES

#### Active gastric or duodenal ulcer PO

*Adults, Elderly.* 300 mg 4 times a day or 400 mg twice a day or 800 mg at bedtime.

IM, IV

*Adults, Elderly.* 300 mg q6h or 150 mg IV as single dose followed by 37.5 mg/h continuous infusion.

# Prevention of duodenal ulcer PO

Adults, Elderly. 400-800 mg at bedtime.

#### Gastric hypersecretory secretions PO, IV, IM

*Adults, Elderly*. 300-600 mg q6h. Maximum: 2400 mg/day.

*Children.* 20-40 mg/kg/day in divided doses q6h.

*Infants*. 10-20 mg/kg/day in divided doses q6-12h.

*Neonates*. 5-10 mg/kg/day in divided doses q8-12h.

#### Gastrointestinal reflux disease PO

Adults, Elderly. 800 mg twice a day or 400 mg 4 times a day for 12 wks.

## OTC use

## PO

Adults, Elderly. 200 mg up to 30 min before meals. Maximum: 2 doses/ day.

#### Prevention of upper GI bleeding IV INFUSION

*Adults, Elderly.* 50 mg/h. If CrCl < 30 mL/min, give 25 mg/h.

Dosage in renal impairment

Dosage is based on a 300-mg dose in adults. Dosage interval is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage Interval
> 40	q6h
20-40	q8h or decrease dose by 25%
< 20	q12h or decrease dose by 50%

Give after hemodialysis and q12h between dialysis sessions.

## **OFF-LABEL USES**

Prevention of aspiration pneumonia; treatment of acute urticaria, common warts.

## CONTRAINDICATIONS

Hypersensitivity to cimetidine or other  $H_2$  antagonists.

## INTERACTIONS

#### Drug

Antacids: May decrease the absorption of cimetidine if administered at the same time. Calcium channel blockers,

cyclosporine, lidocaine, metoprolol, metronidazole, oral anticoagulants, oral antidiabetics, phenytoin, propranolol, theophylline, tricyclic antidepressants: May decrease the metabolism and increase the blood concentrations of these drugs.

## CYP 1A2, 2C19, 2D6, 3A4, 2C9,

and 2E1 substrates: Cimetidine inhibits these isoenzymes and may decrease the metabolism and increase the blood concentrations of substrates of these isoenzymes. **Ketoconazole:** May decrease the absorption of ketoconazole.

#### Herbal

St. John's wort: May decrease cimetidine levels. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Interferes with skin tests using allergen extracts. May increase prolactin, serum creatinine, and transaminase levels. May decrease parathyroid hormone concentration.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin, cefepime (Maxipime), diazepam, furosemide, phenobarbital, phenytoin, warfarin.

## 🗏 IV COMPATIBILITIES

Aminophylline, diltiazem (Cardizem), heparin, hydromorphone (Dilaudid), insulin (regular), lidocaine, lorazepam (Ativan), midazolam (Versed), morphine, potassium chloride, propofol (Diprivan).

## SIDE EFFECTS

#### Occasional (2%-4%)

Headache. Elderly and severely ill patients, patients with impaired renal function: Confusion, agitation, psychosis, depression, anxiety, disorientation, hallucinations. Effects reverse 3-4 days after discontinuance. **Rare (< 2%)** 

Diarrhea, dizziness, somnolence, nausea, vomiting, gynecomastia, rash, impotence.

## SERIOUS REACTIONS

 Rapid IV administration may produce cardiac arrhythmias and hypotension.

- Rare cases of neutropenia, agranulocytosis, or thrombocytopenia.
- Rare severe hypersensitivity reactions.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with impaired hepatic or renal function and in elderly patients. Cimetidine crosses the placenta and is distributed in breast milk. Cimetidine use in infants may suppress gastric acidity, inhibit drug metabolism, and produce CNS stimulation. Long-term use in children may induce cerebral toxicity and affect the hormonal system. Elderly patients are more likely to experience confusion, especially those with impaired renal function. Tasks that require mental alertness or motor skills should also be avoided until response to the drug has been established.

Notify the physician if blood in emesis or stool or dark, tarry stool occurs. Pattern of daily bowel activity and stool consistency, electrolytes, and hydration status should be monitored. Patients should avoid or reduce lifestyle factors contributing to GI distress, such as smoking.

## Storage

Store at room temperature. Reconstituted IV solution is stable for 48 h at room temperature.

## Administration

For IV push, do not administer larger than a 300-mg dose. Dilute each 300 mg (2 mL) with 18 mL 0.9% NaCl, (NS) to a total volume of 20 mL. Administer over not < 5 min to prevent arrhythmias and hypotension.

For intermittent IV (piggyback) administration, dilute 300 mg in

at least 50 mL of D5W or NS and infuse over 15-20 min.

For continuous IV infusion, dilute the 24-h dose with 100-1000 mL 0.9% NaCl, D5W, or other compatible solution and infuse over 24 h. Use a volumetric pump if volume is less than 250 mL.

For IM use, administer undiluted. Inject deep into large muscle mass, such as the gluteus maximus. IM administration may produce transient discomfort at the injection site.

Take oral cimetidine without regard to food. Antacid therapy may be used along with oral cimetidine, but administration times should be separate to avoid interference with cimetidine absorption.

#### Cinacalcet

sin-a-cal'set

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Calcimimetic agent

#### MECHANISM OF ACTION

A calcium receptor agonist that increases the sensitivity of the calcium-sensing receptor on the parathyroid gland to extracellular calcium, thus lowering the parathyroid hormone (PTH) level. *Therapeutic Effect:* Decreases serum calcium and PTH levels.

#### PHARMACOKINETICS

Extensively distributed after PO administration. Protein binding: 93%-97%. Rapidly and extensively metabolized by hepatic enzymes. Metabolites primarily eliminated in urine with a lesser amount excreted in feces. *Half-life:* 30-40 h.

#### AVAILABILITY

Tablets: 30 mg, 60 mg, 90 mg.

#### INDICATIONS AND DOSAGES Hypercalcemia in parathyroid carcinoma or for primary hyperparathyroidism PO

*Adults, Elderly.* Initially, 30 mg twice a day. Titrate dosage sequentially (60 mg twice a day, 90 mg twice a day, and 90 mg 3-4 times a day) every 2-4 wks as needed to normalize serum calcium levels.

## Secondary hyperparathyroidism in patients on dialysis

*Adults, Elderly.* Initially, 30 mg once a day. Titrate dosage sequentially (60, 90, 120, and 180 mg once a day) every 2-4 wks to target intact PTH levels of 150-300 pg/mL.

#### CONTRAINDICATIONS

Hypersensitivity, hypocalcemia.

#### INTERACTIONS

#### Drug

CYP2D6 substrates (e.g., dextromethorphan, flecainide, fluoxetine, lidocaine, mirtazapine, nefazodone, paroxetine, propafenone risperidone, ritonavir, thioridazine, tricyclic antidepressants, venlafaxine): Increased concentrations of CYP2D6 substrates. Cinacalcet is a strong CYP2D6 inhibitor; thioridazine may be contraindicated. CYP3A4 inhibitors (e.g., azole antifungals, clarithromycin, erythromycin, nefazodone, protease inhibitors, telithromycin, and verapamil): Increase cinacalcet plasma concentration. Herbal None known.

Cinacalcet (Generic Name)

#### Food

**High-fat meals:** Increase cinacalcet plasma concentration.

## DIAGNOSTIC TEST EFFECTS

Reduces serum calcium level and reduces intact PTH levels.

## SIDE EFFECTS

Frequent (21%-31%) Nausea, vomiting, diarrhea. Occasional (10%-15%) Myalgia, dizziness. Rare (5%-7%)

Asthenia, hypertension, anorexia, noncardiac chest pain.

## SERIOUS REACTIONS

• Overdose may lead to hypocalcemia.

• Hypotension and heart failure have been reported in patients with cardiovascular disease.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiovascular disease, seizure disorder, chronic kidney disease not on hemodialysis, or hepatic impairment. Cinacalcet may cross the placental barrier. Cinacalcet's safe use during breastfeeding has not been established. The safety and efficacy of cinacalcet have not been established in children. No agerelated precautions have been noted in elderly patients.

Notify the physician if diarrhea or vomiting occurs. Serum electrolyte levels and pattern of daily bowel activity and stool consistency should be monitored.

#### Storage

Store tablets at room temperature. Administration

Do not break or crush film-coated tablets. Take the drug with food or shortly after a meal.

## Ciprofloxacin

sip-ro-floks'a-sin ★ Cetraxal, Ciloxan, Cipro, Cipro XR, Proquin XR ★ Ciloxan, Cipro, Cipro XR Do not confuse ciprofloxacin with Cytoxan, or Cetraxal with Celexa or Trexall.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Anti-infectives, fluoroquinolones

## **MECHANISM OF ACTION**

A fluoroquinolone that inhibits the enzyme DNA gyrase in susceptible bacteria, interfering with bacterial cell replication. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Well absorbed from the GI tract (food delays absorption). Protein binding: 20%-40%. Widely distributed (including to CSF). Metabolized in the liver to active metabolite. Primarily excreted in urine. Minimal removal by hemodialysis. *Half-life:* 4-6 h (increased in patients with impaired renal function and in elderly patients).

## AVAILABILITY

Tablets (Cipro): 100 mg, 250 mg, 500 mg, 750 mg. Tablets, Extended Release (Cipro XR, Proquin XR): 500 mg, 1000 mg. Infusion: 200 mg/100 mL, 400 mg/200 mL. Injection Solution: 10 mg/mL. Ophthalmic Ointment (Ciloxan): 0.3%. Ophthalmic Suspension (Ciloxan): 0.3%. Oral Suspension: 250 mg/5 mL, 500 mg/5 mL. Otic Suspension (Cetraxal): 0.2%.

Ciprofloxacin (Generic Name)

# INDICATIONS AND DOSAGES Mild to moderate urinary tract infection (UTI)

PO

Adults, Elderly. 250 mg q12h. IV

Adults, Elderly. 200 mg q12h. Complicated UTIs, mild to

moderate respiratory tract, bone, joint, skin, and skin-structure infections; infectious diarrhea PO

Adults, Elderly. 500 mg q12h. IV

Adults, Elderly. 400 mg q12h.

 Severe, complicated infections PO

Adults, Elderly. 750 mg q12h. IV

Adults, Elderly. 400 mg q12h.

## Prostatitis

PO Adults, Elderly. 500 mg q12h for 28 days.

Uncomplicated bladder infection

Adults. 100 mg twice a day for 3 days. • Acute sinusitis

PO

Adults. 500 mg q12h.

#### Uncomplicated gonorrhea PO

*Adults.* 250 mg as a single dose. NOTE: CDC does not recommend due to resistant *N. gonorrhoeae*.

## Cystic fibrosis

IV

*Children.* 30 mg/kg/day in 2-3 divided doses. Maximum: 1.2 g/day. PO

## Corneal ulcer

OPHTHALMIC

*Adults, Elderly.* 2 drops q15min for 6 h, then 2 drops q30min for the remainder of first day, 2 drops q1h on second day, and 2 drops q4h on days 3-14.

Bacterial conjunctivitis
 OPHTHALMIC DROPS

Adults, Elderly, and Children  $\geq 1$  yr. 1-2 drops q2h for 2 days, then 2 drops q4h for next 5 days. OPHTHALMIC OINTMENT Adults, Elderly, and Children  $\geq 1$  yr.  $\frac{1}{2}$ -inch ribbon 3 times daily for 2 days, then twice daily for next 5 days.

## Otitis externa

## OTIC

Adults, Elderly, and Children > 1 yr: Instill 0.5 mg (0.25 mL single-use drops) into affected ear(s) q12h for 7 days.

## Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance and the severity of the infection.

CrCl 30-50 mL/min: No adjustment for IV. For PO, give 250-500 mg PO q12h.

CrCl 5-29 mL/min: 250-500 mg PO q18h or 200-400 mg IV q18-24h.

Hemodialysis
 200-500 mg q24h (after dialysis).
 Peritoneal dialysis
 200-500 mg q24h (after dialysis).

## **OFF-LABEL USES**

Treatment of chancroid.

## CONTRAINDICATIONS

Hypersensitivity to ciprofloxacin or other quinolones, concurrent tizanidine; for ophthalmic administration: vaccinia, varicella, epithelial herpes simplex, keratitis, mycobacterial infection, fungal disease of ocular structure, use after uncomplicated removal of a foreign body.

#### INTERACTIONS Drug

Antacids, iron preparations, calcium or magnesium supplement, sucralfate: May decrease ciprofloxacin absorption. Separate times of administration. Caffeine, oral anticoagulants: May increase the effects of these drugs. Theophylline: Decreases clearance and may increase blood concentration and risk of toxicity of theophylline. **Tizanidine:** Decreases clearance and increases toxicity of tizanidine substantially. Contraindicated. **Herbal** 

#### Herbai Nono lun

None known.

## Food

Enteral feedings: Reduce ciprofloxacin absorption.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels.

## IV INCOMPATIBILITIES

Acyclovir, aminophylline, ampicillin and sulbactam (Unasyn), azithromycin (Zithromax), cefepime (Maxipime), dexamethasone (Decadron), dotrecogin alfa (Xigris), furosemide (Lasix), heparin, hydrocortisone (Solu-Cortef), lansoprazole (Prevacid IV), magnesium sulfate, methylprednisolone (Solu-Medrol), pantoprazole (Protonix), phenytoin (Dilantin), piperacillin-tazobactam (Zosyn), potassium or sodium phosphates, propofol (Diprivan), rituximab (Rituxan), sodium bicarbonate, warfarin (Coumadin).

## 🗏 IV COMPATIBILITIES

Calcium gluconate, diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), lidocaine, lorazepam (Ativan), midazolam (Versed), potassium chloride.

## SIDE EFFECTS

#### Frequent (2%-5%)

Nausea, diarrhea, dyspepsia, vomiting, constipation, flatulence, confusion, crystalluria. Ophthalmic: Burning, crusting in corner of eye.

## Occasional (< 2%)

Abdominal pain or discomfort, headache, rash.

Ophthalmic: Bad taste, sensation of something in eye, eyelid redness or itching.

## Rare (<1%)

Dizziness, confusion, tremors, hallucinations, hypersensitivity reaction, insomnia, dry mouth, paresthesia.

Ophthalmic: Crystal precipitates that generally resolve in 1-7 days.

## SERIOUS REACTIONS

 Superinfection (especially enterococcal or fungal), nephropathy, cardiopulmonary arrest, chest pain, tendon inflammation/rupture, and cerebral thrombosis may occur.

• Hypersensitivity reactions, including photosensitivity (as evidenced by rash, pruritus, blisters, edema, and burning skin), have occurred in patients receiving fluoroquinolones.

Arthropathy may occur if the drug is given to children younger than 18 yr.
Sensitization to the ophthalmic form of the drug may contraindicate later systemic use of ciprofloxacin.

· Tendonitis or tendon rupture.

• Benign intracranial hypertension (headache, visual changes).

• Exacerbation of myasthenia, may be severe and lead to life-threatening weakness of respiratory muscles.

## PRECAUTIONS & CONSIDERATIONS

History of hypersensitivity to ciprofloxacin and other quinolones should be determined before therapy.

Quinolones may exacerbate myasthenia gravis; avoid use in these patients when possible. Caution is warranted in patients with CNS disorders, renal impairment, seizures, risk factors for QT prolongation, and those taking caffeine or theophylline. It is unknown whether ciprofloxacin is distributed in breast milk. If possible, pregnant or breastfeeding women should avoid taking the drug because of the risk of arthropathy in the fetus or infant. The safety and efficacy of ciprofloxacin have not been established in children younger than 18 yr except for select indications. Age-related renal impairment may require a dosage adjustment in elderly patients.

Dizziness, headache, tremors, visual problems, and chest and joint pain should be reported. Food tolerance and pattern of daily bowel activity and stool consistency should be assessed. If tendon pain is reported, evaluate; tendon rupture may require surgical repair and extended disability.

#### Storage

Store all products at room temperature. Once reconstituted, the oral suspension and diluted IVPB are stable for up to 14 days at room temperature. The solution normally appears clear and colorless or slightly yellow.

## Administration

Oral ciprofloxacin may be taken without regard to food, but the preferred administration time is 2 h after a meal. Shake the oral suspension well before taking it, and do not chew the microcapsules in the suspension. Do not administer antacids containing aluminum or magnesium within 2 h of ciprofloxacin. Take full course of therapy, and do not skip doses.

For IV use, after withdrawing the drug from a 200- or 400-mg vial, further dilute it with D5W or 0.9% NaCl for injection to a final concentration of 1-2 mg/mL. Infuse the drug over 60 min. Also available prediluted in ready-to-use infusion containers. For ophthalmic use, tilt the head back and place the solution in the conjunctival sac of the affected eye. Close the eye and then press gently on the lacrimal sac for 1 min.

For otic use, warm container in hands for approximately. 1 min. Patient should lie with the affected ear upward and maintain position least 1 min after instillation. Instill 1 single-use container (0.25 mL) into affected ear canal.

#### Citalopram

sye-tal'oh-pram Celexa Do not confuse Celexa with Celebrex, Zyprexa, or Cerebyx.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, selective serotonin reuptake inhibitors (SSRIs)

#### MECHANISM OF ACTION

A selective serotonin reuptake inhibitor that blocks the uptake of the neurotransmitter serotonin at CNS presynaptic neuronal membranes, increasing its availability at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression.

## PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 80%. Primarily metabolized in the liver. Primarily excreted in feces with a lesser amount eliminated in urine. *Half-life:* 35 h.

#### AVAILABILITY

Oral Solution: 10 mg/5 mL. Tablets: 10 mg, 20 mg, 40 mg.

Citalopram (Generic Name)

## Cisplatin

sis-plah'tin Do not confuse cisplatin with carboplatin or oxaliplatin.

CATEGORY AND SCHEDULE Pregnancy Risk Category: D

**Classification:** Antineoplastic, platinum compounds

## **MECHANISM OF ACTION**

A platinum coordination complex that inhibits DNA and, to a lesser extent, RNA, protein synthesis by cross-linking with DNA strands, preventing cell division. Cell cycle– phase nonspecific. *Therapeutic Effect:* Causes cell-cycle arrest in G2 phase and induces programmed cancer cell death (apoptosis).

## PHARMACOKINETICS

Widely distributed. Protein binding: > 90%. Undergoes rapid nonenzymatic conversion to inactive metabolite. Excreted in urine. Removed by hemodialysis. *Half-life:* 58-73 h (increased with impaired renal function).

#### AVAILABILITY

Injection Solution: 1 mg/mL.

## INDICATIONS AND DOSAGES

NOTE: Regimens vary widely with indication for use, other medications employed. Consult specialized references to confirm protocols.

#### Advanced bladder carcinoma, metastatic ovarian tumors, lung cancer, metastatic testicular tumors IV INFUSION

*Adults, Elderly.* For intermittent dosage schedule, 37-75 mg/m<sup>2</sup> once every 2-3 wks or 50-100 mg/m<sup>2</sup> over 4-8 h once every 21-28 days. For daily dosage schedule, 15-20 mg/m<sup>2</sup>/ day for 5 days every 3-4 wks.

## **OFF-LABEL USES**

Use in children for various cancers, use in adults for many different solid tumor protocols.

## CONTRAINDICATIONS

Hearing impairment; myelosuppression; hypersensitivity to cisplatin or other platinum compounds, creatinine clearance less than 50 mL/min, preexisting renal impairment.

#### INTERACTIONS Drug

Nephrotoxic, ototoxic medications: May increase the risk of nephrotoxicity/ototoxicity. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

Increased hepatic transaminases, BUN, serum creatinine; decreased serum sodium, calcium, magnesium, uric acid.

## IV INCOMPATIBILITIES

Amphotericin B, cefepime, dantrolene, diazepam, gallium, insulin, lansoprazole, mesna, pantoprazole, piperacillintazobactam, thiotepa, TPN. Refer to specialized references to check compatibility with other medications and solutions.

## SIDE EFFECTS

## Frequent

Nausea, vomiting (generally beginning 1-4 h after administration and lasting up to 24 h); myelosuppression (25%-30% of patients, with recovery generally in 18-23 days); mild alopecia; ototoxicity; nephrotoxicity.

#### Occasional

Peripheral neuropathy (with prolonged therapy [4-7 mo]). Pain or redness at injection site, loss of taste or appetite.

#### Rare

Hemolytic anemia, blurred vision, stomatitis.

## SERIOUS REACTIONS

• An anaphylactic reaction manifested as angioedema, wheezing, tachycardia, and hypotension may occur in the first few minutes of IV administration in patients previously exposed to cisplatin.

• Nephrotoxicity occurs in 28%-36% of patients. Related to cumulative exposure and may be severe.

• Ototoxicity, including tinnitus and hearing loss, occurs in 31% of patients of cisplatin. It may be more severe in children or more frequent or severe with repeated doses.

## PRECAUTIONS & CONSIDERATIONS

Cisplatin therapy is highly emetogenic; all patients must receive prophylactic antiemetic therapy. Caution with renal impairment and in elderly patients, who may be more susceptible to peripheral neuropathy and nephrotoxicity. Avoid use in pregnant women. Do not breastfeed during treatment.

#### Storage

Store at room temperature. Do not refrigerate. Protect from light. The amber vial, following initial entry, is stable for 28 days protected from light or 7 days under fluorescent room light. If IV infusion is not used within 6 h, protect solution from light. Diluted infusion is stable for up to 24 h at room temperature. Do not refrigerate (precipitates).

#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs. Verify any cisplatin doses  $> 100 \text{ mg/m}^2 \text{ per course}$ ; such high doses are rarely used.

Hydration with 0.9% NaCl is usually begun before the infusion and continued after. Expect to premedicate with antiemetics like a corticosteroid (e.g., dexamethasone) and a serotonin antagonist prior to infusion.

Give by slow IV infusion only. Cisplatin may be diluted in 0.9% NaCl to a final concentration of 50-500 mg/L. Needles or IV sets containing aluminum parts should not be used for preparation or administration. Aluminum reacts with cisplatin, causing a precipitate and a loss of potency. Infuse IV no faster than 1 mg/min.

# INDICATIONS AND DOSAGES Depression

#### PO

C

Adults. Initially, 20 mg once a day in the morning or evening. May increase in 20-mg increments at intervals of no less than 1 wk. Maximum: 40 mg/day. Elderly, Patients with hepatic impairment, and CYP2C19 poor metabolizers. 20 mg/day.

## **OFF-LABEL USES**

Treatment of anxiety, obsessivecompulsive disorder, hot flashes, premenstrual dysphoric disorder, panic disorder, post-traumatic stress.

## CONTRAINDICATIONS

Sensitivity to citalopram, use within 14 days of MAOIs. Use with pimozide contraindicated. Do not use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

## INTERACTIONS

#### Drug

Antifungals, cimetidine, macrolide antibiotics: May increase the citalopram plasma level. Carbamazepine: May decrease the citalopram plasma level. Cimetidine or other CYP2C19 inhibitors: Increases citalopram concentrations; max dose citalopram 20 mg/day. MAOIs: May cause serotonin syndrome. Contraindicated. Metoprolol: Increases the metoprolol plasma level. Anticoagulants, antiplatelet agents, NSAIDs, aspirin: May increase bleeding risk. Nefazodone, triptans, sibutramine, trazodone, venlafaxine: May increase risk of serotonin syndrome. QT prolonging drugs (e.g., class IA and class III antiarrhythmics, cisapride, pimozide, others): Use caution; some combinations (e.g., pimozide) are contraindicated.

## Herbal

Valerian, St. John's wort, SAM-e, kava kava: May alter psychotropic response. St. John's wort may increase serotonin activity. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May reduce serum sodium level.

## SIDE EFFECTS

Frequent (11%-21%) Nausea, dry mouth, somnolence,

insomnia, diaphoresis.

## Occasional (4%-8%)

Tremor, diarrhea, abnormal ejaculation, dyspepsia, fatigue, anxiety, vomiting, anorexia. Rare (2%-3%)

Sinusitis, sexual dysfunction, menstrual disorder, abdominal pain, agitation, decreased libido, platelet dysfunction with or without bleeding.

## SERIOUS REACTIONS

 Overdose is manifested as serotonin syndrome and symptoms may include nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental status changes, myoclonia, restlessness, shivering, and hypertension.

• QT prolongation and risk for serious arrhythmias.

• SIADH and hyponatremia have been reported rarely, most commonly in elderly patients.

## PRECAUTIONS & CONSIDERATIONS

Citalopram should not be used in patients with congenital long QT syndrome, bradycardia, hypokalemia or hypomagnesmia, recent acute MI, or uncompensated heart failure. Do not use in patients taking other drugs that prolong the QTc interval. Caution is warranted in patients with hepatic and renal impairment and in those with a history of hypomania, mania, and seizures. Citalopram is distributed in breast milk. Citalopram use in children may increase anticholinergic effects and hyperexcitability. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments. Elderly patients are more sensitive to the drug's anticholinergic effects, such as dry mouth, and are more likely to experience confusion, dizziness, hyperexcitability, and sedation.

Alcohol and tasks that require mental alertness or motor skills should be avoided. CBC and blood chemistry tests should be performed before and periodically during therapy, especially with long-term use. Administration

Take citalopram without regard to food. Crush scored tablets, if necessary. Do not abruptly

## Clarithromycin

discontinue citalopram.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antibiotics, macrolides

#### **MECHANISM OF ACTION**

A macrolide that binds to ribosomal receptor sites of susceptible organisms, inhibiting protein

synthesis of the bacterial cell wall. *Therapeutic Effect:* Bacteriostatic; may be bactericidal with high dosages or very susceptible microorganisms.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 65%-75%. Widely distributed. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 3-7 h; metabolite 5-7 h (increased in impaired renal function).

## AVAILABILITY

*Oral Suspension:* 125 mg/5 mL, 250 mg/5 mL. *Tablets:* 250 mg, 500 mg. *Tablets (Extended Release):* 500 mg.

# INDICATIONS AND DOSAGES Bronchitis PO

*Adults, Elderly.* 500 mg q12h for 7-14 days or extended-release tablets 1g q24h for 7 days.

#### Skin, soft-tissue infections PO

Adults, Elderly. 250 mg q12h for 7-14 days. Children.

7.5 mg/kg q12h for 10 days.

## Mycobacterium avium complex (MAC) prophylaxis

PO

Adults, Elderly. 500 mg 2 times/day. Children.

7.5 mg/kg q12h. Maximum: 500 mg 2 times/day.

## Mycobacterium avium complex (MAC) treatment

*Adults, Elderly.* 500 mg 2 times/day in combination with other effective drugs.

*Children*. 7.5 mg/kg q12h in combination. Maximum: 500 mg 2 times/day.

Clarithromycin (Generic Name)

## Pharyngitis, tonsillitis

## PO

*Adults, Elderly.* 250 mg q12h for 10 days.

*Children*. 7.5 mg/kg q12h for 10 days.

## Pneumonia

## PO

*Adults, Elderly.* 250 mg q12h for 7-14 days or extended-release tablets 1g q24h for 7 days. *Children.* 7.5 mg/kg q12h.

#### Maxillary sinusitis PO

Adults, Elderly. 500 mg q12h for 14 days or extended-release tablets 1g q24h for 14 days.

*Children*. 7.5 mg/kg q12h. Maximum: 500 mg 2 times/day.

# Helicobacter pylori PO

*Adults, Elderly.* 500 mg q12h for 10-14 days in combination with amoxicillin or metronidazole, and a PPI.

## • Acute otitis media

*Children.* 7.5 mg/kg q12h for 10 days.

## Dosage in renal impairment

CrCl 30-60 mL/min: In patients receiving ritonavir, reduce recommended clarithromycin dose by 50%.

CrCl < 30 mL/min: Reduce recommended dose by 50%. In patients receiving ritonavir, decrease recommended clarithromycin dose by 75%.

## CONTRAINDICATIONS

Hypersensitivity to clarithromycin or other macrolide antibiotics; history of cholestatic jaundice or hepatic dysfunction with prior use; history of QT prolongation or cardiac ventricular arrhythmia; concurrent use of any of the following drugs: cisapride, pimozide, astemizole, terfenadine, and ergotamine or dihydroergotamine.

#### INTERACTIONS Drug

# Cisapride, pimozide, astemizole, terfenadine, and ergot alkaloids:

Clarithromycin increases blood levels and toxicity. Contraindicated. **Colchicine:** Co-use contraindicated if renal or hepatic impairment is present due to risk of colchcine toxicity.

Lovastatin, other HMG-CoA reductase inhibitors: May increase risk for rhabdomyolysis. Temporary halt of statin recommended.

## **Carbamazepine, digoxin, theophylline:** May increase blood concentration and toxicity of these drugs.

QT prolonging drugs (e.g., class IA and class III antiarrhythmics, cisapride, pimozide, others): Use caution; some combinations are contraindicated.

Rifampin: May decrease

clarithromycin blood concentration. **Ritonavir:** Increases clarithromycin concentrations; reduce

clarithromycin dose.

Warfarin: May increase warfarin effects.

Zidovudine: May decrease blood concentration of zidovudine. Herbal

St. John's wort: May decrease clarithromycin blood concentration. Red yeast rice: May cause rhabdomyolysis. Avoid.

## Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May (rarely) increase BUN, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

Occasional (3%-6%)

Diarrhea, nausea, altered (metallic) taste, abdominal pain. Rare (1%-2%)

Headache, dyspepsia.
### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Hepatotoxicity, QT prolongation, and thrombocytopenia occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic or renal dysfunction and in elderly patients with severe renal impairment. Determine whether there is a history of hepatitis or allergies to clarithromycin or other macrolides before beginning therapy. Macrolides have been associated with QTc prolongation; use with caution in patients with risk factors for OT prolongation. Only used in pregnancy if no other treatment is appropriate; animal studies indicate some possibility for fetal harm. It is unknown whether clarithromycin is distributed in breast milk. The safety and efficacy of clarithromycin have not been established in children younger than 6 mo. Age-related renal impairment may require a dosage adjustment in older patients.

Daily bowel activity and stool consistency should be assessed. Mild GI effects may be tolerable, but severe symptoms may indicate the onset of antibiotic-associated colitis. Be alert for signs and symptoms of superinfection, including abdominal pain, anal or genital pruritus, moderate to severe diarrhea, and mouth soreness. Liver function test (LFT) monitoring is recommended. **Storage** 

Store at room temperature.

Reconstitued oral suspension is stable for 14 days at room temperature. Do not refrigerate; suspension may gel.

### Administration

Shake suspension well before use, Take tablets and oral suspension with or without food; take extended- release tablets with food. Take clarithromycin tablets with 8 oz of water. Do not crush or break extended-release tablets. Space doses evenly around the clock, and continue taking clarithromycin for the full course of therapy.

### Clemastine

klem'as-teen ★ Dayhist Allergy, Tavist Allergy ★ Tavist

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC (1.34-mg tablet)

*Classification:* Antihistamines, H<sub>1</sub> receptor antagonist, sedating

### **MECHANISM OF ACTION**

An ethanolamine that competes with histamine on effector cells in the GI tract, blood vessels, and respiratory tract. *Therapeutic Effect:* Relieves allergy symptoms, including urticaria, rhinitis, and pruritus.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15-60 min	5-7 h	10-12 h

Well absorbed from the GI tract. Metabolized in the liver. Excreted primarily in urine.

### AVAILABILITY

Syrup: 0.5 mg/5 mL. Tablets (Dayhist Allergy, Tavist Allergy): 1.34 mg (OTC), 2.68 mg.

#### INDICATIONS AND DOSAGES > Allergic rhinitis, urticaria

PO

Clemastine (Generic Name)

Adults, Children 12 years and older. 1.34 mg twice a day up to 2.68 mg 3 times a day. Maximum: 8.04 mg/day. Children 6-11 yr: 0.5-1 mg twice a day (use syrup). Maximum: 3 mg/day. Elderly. 1.34 mg 1-2 times a day.

### CONTRAINDICATIONS

Angle-closure glaucoma, hypersensitivity to clemastine, use within 14 days of MAOIs.

### INTERACTIONS

#### Drug

Alcohol, other CNS depressants:

May increase CNS depression. **MAOIs:** May increase the anticholinergic and CNS depressant effects of clemastine. **Herbal and Food** 

#### nerbai and rood

None known.

### DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing unless drug is discontinued 4 days before testing.

### SIDE EFFECTS

#### Frequent

Somnolence; dizziness; urine retention; thickening of bronchial secretions; dry mouth, nose, or throat; in elderly, sedation, dizziness, hypotension.

### Occasional

Epigastric distress, flushing, blurred vision, tinnitus, paresthesia, diaphoresis, chills.

### SERIOUS REACTIONS

A hypersensitivity reaction, marked by eczema, pruritus, rash, cardiac disturbances, angioedema, and photosensitivity, may occur.
Overdose symptoms may vary from CNS depression, including sedation, apnea, cardiovascular collapse, and death, to severe paradoxical reaction, such as hallucinations, tremor, and seizures.
Children may experience
paradoxical reactions, such as restlessness, insomnia, euphoria, nervousness, and tremors.
Overdose in children may result in

hallucinations, seizures, and death.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with increased intraocular pressure, renal disease, cardiac disease, hypertension, seizure disorder, hyperthyroidism, asthma, GI or genitourinary obstruction, peptic ulcer disease, and benign prostatic hyperplasia. Clemastine is excreted in breast milk and should not be used in breastfeeding women. The safety and efficacy of clemastine have not been established in children younger than 6 yr. Age-related renal impairment may require a dosage adjustment in elderly patients. Avoid drinking alcoholic beverages and tasks that require alertness or motor skills until response to the drug is established.

Drowsiness, dizziness, and dry mouth may occur; tolerance may develop to the sedative effects. BP and therapeutic response should be monitored.

#### Administration

Take clemastine without regard to food. Crush scored tablets as needed.

### Clevidipine

kle-vid'a-peen Cleviprex Do not confuse clevidipine with clonidine or cladribine.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Antihypertensives, calcium channel blockers (dihydropyridine group)

### **MECHANISM OF ACTION**

A dihydropyridine antihypertensive agent that inhibits calcium ion movement across cell membranes during depolarization, and is primarily selective for vascular smooth muscle. *Therapeutic Effect:* Decreases systemic vascular resistance and BP.

### PHARMACOKINETICS

Rapidly distributed and metabolized. Blood concentration declines in a multiphasic pattern following end of the infusion. > 99.5% bound to plasma proteins. Rapidly metabolized via hydrolysis by blood and extravascular esterases; elimination unlikely to be affected by hepatic or renal dysfunction. The primary metabolites are carboxylic acid metabolite (inactive) and formaldehyde. Of parent drug and metabolite, 63%-74% is excreted in the urine, 7%-22% excreted in the feces. Half-life: The initial phase half-life is ultrashort, approx 1 min; the terminal half-life is 15 min.

### AVAILABILITY

*Injection (Cleviprex):* 0.5 mg/mL, in either 50-mL or 100-mL vials.

## INDICATIONS AND DOSAGES Short-term treatment of

#### Short-term treatment of hypertension when oral therapy is not feasible or desirable W DUFUSION

IV INFUSION

Adults, Elderly. Initiate IV infusion at 1-2 mg/h. Double the dose at short (90-sec) intervals. As BP reaches goal, increase the dose by less than doubling and lengthen the time between adjustments to q 5-10 min. A 1-2 mg/h increase will generally produce an additional 2-4 mm Hg decrease in SBP. Maintenance dose usually 4-6 mg/h. Severe hypertension may require higher doses. Maximum: 16 mg/h; limited use of short-term doses of 32 mg/h. Give no more than 1000 mL or an average of 21 mg/h per 24 h, due to lipid in emulsion formulation. Usually, infusions do not exceed 72 h total.

### Dosage in hepatic or severe renal impairment

IV INFUSION Initiate IV infusion at 1-2 mg/h, titrate as above.

#### CONTRAINDICATIONS

Hypersensitivity to clevidipine; allergies to soybeans, soy products, eggs, or egg products; defective lipid metabolism (e.g., pathologic hyperlipemia, lipoid nephrosis, or acute pancreatitis if it is accompanied by hyperlipidemia); and severe aortic stenosis.

#### INTERACTIONS

Drug Antihypertensives: Would be expected to have additive effects on BP. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Do not mix or dilute with any other medications, as these will interfere with stability of the emulsion. Do not administer in the same line as other medications.

### **IV COMPATIBILITIES**

Cleviprex should not be diluted, but it can be administered with the following: Water for injection, 0.9% NaCl, D5W, D5NS, D5LR, LR, and 10% amino acid.

#### SIDE EFFECTS

Frequent (> 2%) Headache, nausea, vomiting.

#### Rare (<1%)

Palpitations, angina, syncope, dyspnea.

### SERIOUS REACTIONS

 Hypotension and reflex tachycardia are potential consequences of rapid upward titration. If overdose occurs, discontinuation of the infusion leads to a reduction in antihypertensive effects within 5-15 min.

• Unstable angina, MI, cardiac arrest (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiomyopathy, heart failure, severe left ventricular dysfunction, and in those concurrently receiving β-blockers; the drug will not protect against β-blocker withdrawal symptoms. Cleviprex contains approximately 0.2 g of lipid per milliliter (2 kcal). Lipid intake restrictions may be necessary for some patients. It is unclear whether the drug crosses the placenta. It should be administered only when the benefit to the mother exceeds the risk to the fetus. It is unknown whether it is distributed in breast milk. The safety and efficacy of clevidipine have not been established in children. There are no particular cautions in the elderly or in those with hepatic or renal impairment.

Notify the physician if anginal pain, dizziness, irregular heartbeat, nausea, shortness of breath, swelling, or symptoms of hypotension occur. Assess BP for hypotension and monitor heart rate and pulse continuously during infusion and until vital signs are stable. Also watch skin for dermatitis, facial flushing, and monitor ECG. Use caution with postural changes. **Storage** 

Store unopened vials refrigerated in the original carton protected from

light. Do not freeze. Vials in cartons may be transferred to controlled room temperature for a period not to exceed 2 mo. Drug vials contain phospholipids and can support microbial growth. Do not use if contamination is suspected. The injection is a milky-white emulsion. Administration

For IV use, no premixing is required, and the drug may be given by peripheral or central line. Commercially available standard plastic cannulae may be used to administer the infusion. Use strict aseptic technique. Once the infusion is spiked, use and discard within 4 h. Invert vial gently several times before use to ensure uniformity of the emulsion prior to administration. If contamination is suspected, discard. Titrate drug to achieve the desired blood pressure reduction. Monitor for the possibility of rebound hypertension for at least 8 h after the infusion is stopped if not on other antihypertensives.

#### Clindamycin

klin-da-mye'sin Cleocin, Cleocin-T, Clindamax, Clindesse Dalacin Do not confuse Clindesse with Clindets.

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

**Classification:** Lincomycin derivative anti-infective

#### MECHANISM OF ACTION

A lincosamide antibiotic that inhibits protein synthesis of the bacterial cell wall by binding to bacterial ribosomal receptor sites. Topically, it decreases

Clindamycin (Generic Name)

fatty acid concentration on the skin. *Therapeutic Effect:* Bacteriostatic. Prevents outbreaks of acne vulgaris.

### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 92%-94%. Widely distributed. Metabolized in the liver to some active metabolites. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2.4-3 h (increased in impaired renal function and premature infants).

### AVAILABILITY

Capsules: 75 mg, 150 mg, 300 mg. Oral Solution: 75 mg/5 mL. Injection: 150 mg/mL. Injection Solution Premixed: 300 mg, 600 mg, 900 mg. Topical Gel: 1%. Topical Foam: 1%. Topical Solution: 1%. Vaginal Cream: 2%. Vaginal Suppository: 100 mg.

### INDICATIONS AND DOSAGES

 Chronic bone and joint, respiratory tract, skin and soft-tissue, intraabdominal, and female genitourinary infections; endocarditis; septicemia PO

Adults, Elderly. 150-450 mg/dose q6-8h.

*Children.* 10-30 mg/kg/day in 3-4 divided doses. Maximum: 1.8 g/day. IV, IM

*Adults, Elderly.* 1.2-1.8 g/day in 2-4 divided doses. Maximum: 4.8 g/day. *Children.* 25-40 mg/kg/day in 3-4 divided doses.

# Bacterial vaginosis PO

*Adults, Elderly.* 300 mg twice a day for 7 days. INTRAVAGINAL

*Adults*. One applicatorful at bedtime for 3-7 days or 1

suppository at bedtime for 3 days. A 1-dose regimen is also available (Clindesse).

Acne vulgaris

### TOPICAL

*Adults*. Apply thin layer to affected area twice a day; foam once daily.

### **OFF-LABEL USES**

Treatment of malaria, otitis media, *Pneumocystis carinii* pneumonia, toxoplasmosis, dental abscess.

### CONTRAINDICATIONS

History of antibiotic-associated colitis, regional enteritis, or ulcerative colitis; hypersensitivity to clindamycin or lincomycin; known allergy to tartrazine dye.

### INTERACTIONS

#### Drug

Adsorbent antidiarrheals: May delay absorption of clindamycin. Chloramphenicol, erythromycin: May antagonize the effects of clindamycin. Cyclosporine: May alter cyclosporine levels with systemic use; monitor closely. Neuromuscular blockers: May increase the effects of these drugs. Herbal and Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

### IV INCOMPATIBILITIES

Allopurinol (Aloprim), caspofungin (Cancidas), diazepam, filgrastim (Neupogen), fluconazole (Diflucan), haloperidol, idarubicin (Idamycin), lansoprazole (Prevacid IV), phenytoin, promethazine, quinupristindalfopristin (Synercid), traztuzumab (Herceptin).

### IV COMPATIBILITIES

Amiodarone (Cordarone), diltiazem (Cardizem), heparin, hydromorphone (Dilaudid), magnesium sulfate, midazolam (Versed), morphine, multivitamins, propofol (Diprivan).

#### SIDE EFFECTS

#### Frequent

Systemic: Abdominal pain, nausea, vomiting, diarrhea. Topical: Dry, scaly skin. Vaginal: Vaginitis, pruritus.

#### Occasional

Systemic: Phlebitis or thrombophlebitis with IV administration, pain and induration at IM injection site, allergic reaction, urticaria, pruritus.

Topical: Contact dermatitis, abdominal pain, mild diarrhea, burning or stinging. Vaginal: Headache, dizziness,

nausea, vomiting, abdominal pain. Rare

Vaginal: Hypersensitivity reaction.

### SERIOUS REACTIONS

· Antibiotic-associated colitis and other superinfections may occur during and several weeks after clindamycin therapy (including the topical form). Colitis may be severe or fatal. · Blood dyscrasias (leukopenia, thrombocytopenia) and nephrotoxicity (proteinuria, azotemia, oliguria) occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with severe renal or hepatic dysfunction and in patients using neuromuscular blockers concurrently. Do not apply topical preparations to abraded areas or near the eyes. Systemic clindamycin readily crosses the placenta and is distributed in breast milk. It is unknown whether the topical and vaginal forms of

clindamycin are distributed in breast milk. Use clindamycin cautiously in children < 1 mo old. No age-related precautions have been noted in elderly patients. Use caution when applying topical clindamycin concurrently with abrasive, peeling acne agents, soaps, or alcohol-containing cosmetics to avoid a cumulative effect. Sexual intercourse during treatment with the vaginal form of clindamycin should be avoided.

Diarrhea should be reported promptly to the physician because of the potential for developing serious colitis (even with topical or vaginal clindamycin). Pattern of daily bowel activity and stool consistency should be assessed. Skin should be assessed for dryness, irritation, and rash. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, a change in oral mucosa, increased fever, and severe diarrhea. History of allergies, particularly to clindamycin or lincomycin, should be determined before beginning drug therapy. Storage

Store capsules and topical formulations at room temperature. After reconstitution, the oral solution is stable for 2 wks at room temperature. Do not refrigerate the oral solution to avoid thickening it. The premixed IV infusion is stable at room temperature for up to 16 days or up to 32 days under refrigeration. Administration

Take capsules and solution with water and without regard to food.

For IV infusion, dilute 300-600 mg with 50 mL D5W or 0.9% NaCl (900-1200 mg with 100 mL). Never exceed a concentration of 18 mg/mL. Infuse 50-mL (300- to 600-mg) piggyback solution over 10-20 min; infuse 100-mL (900-mg to 1.2-g) piggyback solution over 30-40 min. Be aware

that severe hypotension or cardiac arrest can occur with too-rapid administration. Do not administer more than 1.2 g in a single infusion.

For IM use, do not exceed 600 mg/ dose. Give by deep IM injection.

Do not apply topical or intravaginal preparations near the eyes or on abraded areas. Rinse eyes with copious amounts of cool tap water if these forms of clindamycin accidentally come in contact with eyes. For intravaginal use, use provided applicators to insert dosage.

### Clioquinol, Hydrocortisone

klee-oh-kwee'nole, hye-dro-kor'ti-sone Ala-Quin, Dofscort

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Anti-infectives, topical; antifungals, topical; corticosteroids, topical; dermatologics

#### MECHANISM OF ACTION

Clioquinol is a broad-spectrum antibacterial agent, but the mechanism of action is unknown. Hydrocortisone is a corticosteroid that diffuses across cell membranes, forms complexes with specific receptors, and further binds to DNA and stimulates transcription of mRNA (messenger RNA) and subsequent protein synthesis of various enzymes thought to be ultimately responsible for the anti-inflammatory effects of corticosteroids applied topically to the skin. Therapeutic Effect: Alters membrane function and produces antibacterial activity.

### PHARMACOKINETICS

Clioquinol is absorbed through the skin; absorption may be increased with use of an occlusive dressing.

### AVAILABILITY

Cream: 3% clioquinol and 0.5% hydrocortisone (Ala-Quin), 3% clioquinol and 1% hydrocortisone (Dofscort).

#### INDICATIONS AND DOSAGES • Antibacterial, antifungal skin conditions TOPICAL

Adults, Elderly, Children 12 yr and older. Apply to skin 3-4 times/day. Typical duration is 2-4 wks.

### CONTRAINDICATIONS

Lesions of the eye, tuberculosis of skin, diaper rash, children < 2 yr of age; hypersensitivity to clioquinol or hydrocortisone or any other component of the formulation.

### INTERACTIONS

Drug None known. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

May alter thyroid function tests. Clioquinol may produce falsepositive ferric chloride test results for phenylketonuria (PKU).

### SIDE EFFECTS

#### Occasional

Blistering, burning, itching, peeling, skin rash, redness, swelling.

#### SERIOUS REACTIONS

• Thinning of skin with easy bruising may occur with prolonged use.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with herpes simplex, eczema vaccinatum, varicella, or other viral infections of the skin as well as intolerance to chloroxine, iodine, or iodinecontaining preparations. It is unknown whether clioquinol and hydrocortisone cross placenta or are distributed in breast milk. No agerelated precautions have been noted in children or elderly patients.

This medication may stain fabrics, skin, hair, and nails yellow. The affected area should be kept clean and dry. Light clothing should be worn to promote ventilation.

#### Storage

Store at room temperature. Administration

Before applying, wash affected area with soap and water and dry thoroughly. Apply a thin layer to affected area. Wash hands after application.

### Clobazam

kloe'ba-zam Confi Do not confuse clobazam with clonazepam.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: IV

*Classification*: Anticonvulsant, benzodiazepines

### **MECHANISM OF ACTION**

A benzodiazepine that depresses all levels of the CNS, inhibits nerve impulse transmission in the motor cortex, and suppresses abnormal discharge in petit mal seizures. *Therapeutic Effect:* Produces anxiolytic and anticonvulsant effects.

### PHARMACOKINETICS

Well absorbed from the GI tract. Administration with food or applesauce does not affect absorption. Protein binding: 80%-90%. Metabolized in the liver by CYP3A4 and CYP2C19; active metabolite further metabolized by CYP2C19. Metabolites excreted in urine, and smaller amounts in feces. Unknown if removed by hemodialysis. *Half-life:* 36-42 h (clobazam); 71-82 h (active metabolite).

### AVAILABILITY

Tablets: 5 mg, 10 mg, 20 mg.

### INDICATIONS AND DOSAGES Adjunctive treatment of Lennox-Gastaut syndrome (petit mal variant) seizures:

PO

NOTE: Doses above 5 mg/day should be administered in two divided doses. Adults, Children 2 yr and older. Dosing is weight based. ≤ 30 kg: Initiate therapy at 5 mg daily and after 7 days may titrate to 10 mg/day, then by the second week, as tolerated, up to 20 mg/day. > 30 kg body weight: Initiate therapy at 10 mg daily, and may titrate after 7 days up to 20 mg/day, and then by the second week, as tolerated, up to 40 mg/day. *Elderly or CYP2C19 poor* 

metabolizers, or those with mild to moderate hepatic impairment. Start at 5 mg/day. Titrate according to weight, increasing daily dosage by roughly 5 mg every 7 days. Generally, titrate to a dose that is 50% of the usual maximum dosage. If necessary and based upon clinical response and tolerance, an additional titration to the absolute maximum dose (20 mg/day or 40 mg/day, depending on weight) may occur on day 21.

#### CONTRAINDICATIONS

None, except hypersensitivity.

#### INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depressant effect. Alcohol increases clobazam exposure up to 50%. Avoid alcoholic drinks.

#### **Dextromethorphan and other CYP2D6 substrates:** Clobazam reduces metabolism and increases exposure; monitor for need for dose reduction.

Hormonal contraceptives: Clobazam induces metabolism that may reduce efficacy. Use nonhormonal forms of birth control. Strong inhibitors of CYP2C19 (e.g., fluconazole, fluvoxamine, ticlopidine): May increase clobazam levels; consider dose reduction. Moderate inhibitors of CYP2C19

(e.g., omeprazole): May increase clobazam levels; monitor for need for dose reduction.

### Herbal

Kava kava, valerian: May increase sedation.

#### Food

See alcohol, above.

### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Somnolence or sedation, drooling, constipation, cough, urinary tract infection, irritability, insomnia, dysarthria, fatigue, upper respiratory infection.

### Occasional

Change in appetite, dry mouth, nausea, blurred vision, dysphagia, dizziness, shortness of breath, cough, pneumonia, bronchitis. **Rare** 

Paradoxical CNS reactions, including hyperactivity or nervousness in children and excitement or restlessness in elderly patients.

#### SERIOUS REACTIONS

• Abrupt withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal or muscle cramps, diaphoresis, vomiting, and status epilepticus.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with chronic respiratory disease, glaucoma, and impaired hepatic function. Clobazam crosses the placenta and is distributed in breast milk. Chronic clobazam use during pregnancy may produce withdrawal symptoms and CNS depression in neonates. Safety of use in young children and infants less than 2 years of age is not established. Elderly patients, those with liver disease, and those who are poor metabolizers are usually more sensitive to clobazam's CNS effects, such as ataxia, dizziness, and oversedation. Expect to give a lower dosage initially and increase it gradually.

Alcohol, smoking, driving, and tasks that require mental alertness or motor skills should be avoided. Drowsiness and dizziness may occur. History of the seizure disorder, including the duration, frequency, and intensity of seizures, should be assessed. Patients, their caregivers, and families should be informed that AEDs increase the risk of suicidal thoughts and behavior and should be advised to report any unusual changes in mood or behavior, or the emergence of suicidal thoughts or behavior. CBC and blood chemistry tests and hepatic and renal function should be periodically monitored. **Storage** 

Store at room temperature.

#### Administration

If the patient must switch to another anticonvulsant, expect to decrease the clobazam dose gradually as treatment begins with the replacement drug. Do not abruptly discontinue clobazam after long-term therapy. Strict maintenance of drug therapy is essential for seizure control. Clobazam tablets can be administered whole, or crushed and mixed in applesauce. Can be taken without regard to meals.

### Clobetasol

klo-bet'a-sol Clobex, Cormax, Olux, Olux-E, Temovate, Temovate E, Temovate Scalp Clobex, Cormax, Dermovate, Olux, Olux-E, Temovate, Temovate E, Temovate Scalp

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Topical corticosteroid, very high potency

### **MECHANISM OF ACTION**

A corticosteroid that inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release, and synthesis or release of mediators of inflammation. *Therapeutic Effect:* Decreases or prevents tissue response to inflammatory process.

#### PHARMACOKINETICS

May be absorbed from intact skin. Metabolized in liver. Excreted in the urine.

### AVAILABILITY

Cream: 0.05% (Temovate). Cream, in Emollient Base: 0.05% (Temovate E). Foam: 0.05% (Olux, Olux-E). Gel: 0.05% (Temovate). Lotion: 0.05% (Clobex). Ointment: 0.05% (Cormax, Temovate). Shampoo: 0.05% (Clobex). Topical Solution: 0.05% (Cormax, Temovate). Topical Spray: 0.05% (Clobex).

#### INDICATIONS AND DOSAGES

#### Corticosteroid-responsive dermatoses, such as eczema, psoriasis

TOPICAL

*Adults, Elderly, Children 12 yr and older.* Apply 2 times/day for 2 wks. FOAM

*Adults, Elderly, Children 12 yr and older.* Apply 2 times/day for 2 wks. SHAMPOO

*Adults, Elderly.* Apply thin film to dry scalp once daily; leave in place for 15 min, and then add water, lather; rinse thoroughly.

**Maximum dose:** For any use, do not exceed 50 g or mL per week. Treatment often cycles for 2 wks, off for 2 wks, then begins again if needed.

#### CONTRAINDICATIONS

Hypersensitivity to clobetasol or other corticosteroids.

### INTERACTIONS

Drug None known. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

Frequent

Local irritation, dry skin, itching, redness.

### Occasional

Skin atrophy.

#### Rare

Allergic contact dermatitis, Cushing's syndrome, numbness of fingers.

### SERIOUS REACTIONS

 Overdosage can occur from topically applied clobetasol propionate absorbed in sufficient amounts to produce systemic effects producing reversible adrenal suppression, manifestations of Cushing's syndrome, hyperglycemia, and glucosuria in some patients.

### **PRECAUTIONS & CONSIDERATIONS**

Avoid use of occlusive dressings on affected area. Skin irritation should be reported. HPA axis suppression should be evaluated by ACTH stimulation test, AM plasma cortisol test, or urinary free cortisol test. It is unknown whether clobetasol propionate crosses the placenta or is distributed in breast milk. Safety and efficacy of clobetasol have not been established in children less than 12 yr of age. No age-related precautions have been noted in elderly patients. **Storage** 

Store all products at room temperature. Do not refrigerate or freeze. Topical spray and foam must be kept away from heat; spray is flammable.

#### Administration

Apply sparingly to skin or scalp and rub into area thoroughly. Use for 2 wks. If using for the scalp, part the hair and apply to the area.

### Clocortolone

klo-kort'o-lone Cloderm Do not confuse clocortolone or Cloderm with Clocort.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Corticosteroids, topical low potency

### **MECHANISM OF ACTION**

A topical corticosteroid that inhibits accumulation of inflammatory cells at inflammation sites, suppresses mitotic activity, and causes vasoconstriction. *Therapeutic Effect:* Decreases or prevents tissue response to inflammatory process.

### PHARMACOKINETICS

Absorption is variable and dependent upon many factors, including the integrity of skin, dose, vehicle used, and use of occlusive dressings. Small amounts may be absorbed from the skin. Metabolized in liver. Excreted in the urine and feces.

### AVAILABILITY

Cream: 0.1%.

# INDICATIONS AND DOSAGES Corticosteroid-responsive dermatoses

TOPICAL Adults, Elderly, Children 12 yr and older. Apply 1-4 times/day.

### CONTRAINDICATIONS

Hypersensitivity to clocortolone pivalate or other corticosteroids; viral, fungal, or tubercular skin lesions.

### INTERACTIONS

Drug, Herbal, and Food None known.

### **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

#### Occasional

Local irritation, burning, itching, redness, allergic contact dermatitis.

#### Hypertrichosis, hypopigmentation, maceration of skin, miliaria, perioral dermatitis, skin atrophy, striae.

### SERIOUS REACTIONS

• Overdosage can occur from topically applied clocortolone pivalate absorbed in sufficient amounts to produce systemic effects in some patients.

### **PRECAUTIONS & CONSIDERATIONS**

Avoid use of occlusive dressings on affected area. Skin irritation should be reported. HPA axis suppression should be evaluated by ACTH stimulation test, AM plasma cortisol test, or urinary free cortisol test. It is unknown whether clocortolone crosses the placenta or is distributed in breast milk. Safety and efficacy of clocortolone have not been established in children under 12 yr. No age-related precautions have been noted in elderly patients.

#### Storage

Store at room temperature; do not freeze.

### Administration

Apply topical preparation sparingly. Do not use on broken skin. Avoid use of occlusive dressings.

### **Clomiphene**

kloe'mi-feen Serophene Do not confuse clomiphene with clomipramine or clonidine.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Nonsteroidal ovulatory stimulant, antiestrogen

### **MECHANISM OF ACTION**

An ovulation stimulator that promotes release of pituitary gonadotropins. *Therapeutic Effect:* Stimulates ovulation.

### PHARMACOKINETICS

Readily absorbed. Time to peak occurs within 6.5 h. Undergoes enterohepatic recirculation. Primarily excreted in feces. *Half-life:* 5-7 days.

### AVAILABILITY

*Tablets:* 50 mg (Clomid, Milophene, Serophene).

#### INDICATIONS AND DOSAGES Infertility in females due to anovulation or irregular ovulation PO

Adults. 50 mg/day for 5 days (first course); start the regimen on the fifth day of cycle. Increase dose only if unresponsive to cyclic 50 mg. Maximum: 100 mg/day for 5 days. Do not exceed 6 courses of treatment.

### **OFF-LABEL USES**

Infertility in men.

### CONTRAINDICATIONS

Liver dysfunction, abnormal uterine bleeding, enlargement or development of ovarian cyst, uncontrolled thyroid or adrenal dysfunction in the presence

Clomiphene (Generic Name)

### Clofarabine

kloe-far'ah-been Clolar Do not confuse clofarabine with cladribine or clevidipine.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic, antimetabolites, purine analogs

### **MECHANISM OF ACTION**

An antineoplastic agent that inhibits DNA synthesis by decreasing deoxynucleotide triphosphate pools. It inhibits ribonucleoside reductase, terminates elongation of the DNA chain, and inhibits repair through incorporation into the DNA chain by competitive inhibition of DNA polymerases. *Therapeutic Effect:* Inhibits synthesis of DNA.

### PHARMACOKINETICS

Protein binding: 47%. Negligible liver metabolism. Primarily excreted in urine. *Half-life:* 5.2 h.

### AVAILABILITY

Injection Solution: 1 mg/mL.

### INDICATIONS AND DOSAGES

 Acute lymphocytic leukemia (ALL) IV

Young Adults and Children 1-21 yr. 52 mg/m<sup>2</sup> over 2 h daily for 5 consecutive days. Repeat every 2-6 wks following recovery or return to baseline organ function.

### CONTRAINDICATIONS

Hypersensitivity to clofarabine or its components.

### INTERACTIONS

Drug, Herbal, and Food None known. Live-virus vaccines: Defer vaccination due to potential virus replication, adverse reactions to the virus, immunosuppression.

### DIAGNOSTIC TEST EFFECTS

Increased AST, ALT, potassium, uric acid, creatinine.

### IV INCOMPATIBILITIES

Do not administer with any other medications through the same IV line.

### **IV COMPATIBILITIES**

Dextrose 5%, 0.9% NaCl. No other information available.

### SIDE EFFECTS

### Frequent

Infection, vomiting, nausea, febrile neutropenia, diarrhea, pruritus, headache, ALT increased, dermatitis, pyrexia, AST increased, rigors, abdominal pain, fatigue, pericardial effusion, tachycardia, epistaxis, anorexia, petechiae, hypotension, pain in limb, left ventricular systolic dysfunction, anxiety, constipation, edema, pain, cough, erythema, flushing, mucosal inflammation, hematuria, dizziness, bilirubin increased, jaundice, gingival bleeding, hepatomegaly, injection site pain, myalgia, respiratory distress, palmar-plantar sore throat, back pain, dyspnea, erythrodysesthesia syndrome, staphylococcal infection, oral candidiasis, appetite decreased, cellulitis, depression, irritability, arthralgia, herpes simplex, hypertension, lethargy.

#### Occasional

Somnolence, weight gain, tremor, pleural effusion, pneumonia, systemic inflammatory response syndrome (SIRS)/capillary leak syndrome, transfusion reaction, bacteremia, creatinine increased.

### SERIOUS REACTIONS

Tumor lysis syndrome may occur.
Severe bone marrow suppression, including neutropenia, anemia, and thrombocytopenia, has been observed.
Risk of serious infections due to bone marrow suppression.

### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in renal or hepatic impairment. Safety and effectiveness have not been established in patients over 21 yr of age. High emetic potential; all patients should receive prophylactic antiemetics. Prophylactic corticosteroids should be considered to SIRS/capillary leak syndrome; prophylactic allopurinol may be considered if tumor lysis is anticipated. Avoid clofarabine use in pregnancy and breastfeeding. Women of childbearing potential should be advised to use adequate contraception.

### Storage

Store vials at room temperature. Reconstituted solution must be used within 24 h at room temperature.

### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

Injection should be filtered through a  $0.2 \ \mu m$  syringe filter and then diluted with D5W or 0.9% NaCl (final concentration: 0.15- $0.4 \ mg/mL$ .)

Infused IV over 2 h; expect continuous intravenous fluid therapy and supportive measures to prophylax potential side effects. of an organic intracranial lesion such as pituitary tumor, pregnancy, hypersensitivity to clomiphene.

#### INTERACTIONS

#### Drug

**Danazol:** May decrease the response of clomiphene. **Estradiol:** May decrease estradiol.

#### Herbal

Black cohosh, chasteberry, DHEA: Possible interference with fertility treatment. Food

None known.

### DIAGNOSTIC TEST EFFECTS

Altered levels of thyroid function tests.

#### SIDE EFFECTS

#### Frequent (10%-13%)

Hot flashes, ovarian enlargement. Occasional (2%-5%)

Abdominal/pelvic discomfort, bloating, nausea, vomiting, breast discomfort (females).

### Rare (<1%)

Vision disturbances, abnormal menstrual flow, breast enlargement (males), headache, mental depression, ovarian cyst formation, thromboembolism, uterine fibroid enlargement.

#### SERIOUS REACTIONS

- Thrombophlebitis, alopecia, and polyuria occur rarely.
- Ectopic pregnancy is possible; bilateral tubal pregnancy is rare.
- While not necessarily an adverse event, multiparity rates are 3%-5%, most commonly twins.
- Ovarian hyperstimulation syndrome/enlargement.
- · Vision changes.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used with liver dysfunction, polycystic ovary

disease, and multiple pregnancies. Clomiphene use should be avoided during pregnancy, and it is distributed in breast milk. Safety and efficacy have not been established in children or in elderly patients. Pregnancy should be immediately reported. Visual disturbances, dizziness, lightheadedness may occur.

#### Administration

Take clomiphene without regard to meals. Encourage coitus to coincide with ovulation.

### **Clomipramine**

klom-ip'ra-meen Anafranil Anafranil, Apo-Clomipramine, Novo-Clopamine Do not confuse clomipramine with chlorpromazine or clomiphene, or Anafranil with alfentanil, enalapril, or nafarelin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidepressants, tricyclic

### MECHANISM OF ACTION

A tricyclic antidepressant that blocks the reuptake of neurotransmitters, such as norepinephrine and serotonin, at CNS presynaptic membranes, increasing their availability at postsynaptic receptor sites. *Therapeutic Effect:* Reduces obsessive-compulsive behavior.

### PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 97%. Principally bound to albumin. Distributed into cerebrospinal fluid. Metabolized in the liver. Undergoes extensive

Clomipramine (Generic Name)

first-pass effect. Excreted in urine and feces. *Half-life:* 19-37 h.

### AVAILABILITY

Capsules: 25 mg, 50 mg, 75 mg.

### INDICATIONS AND DOSAGES

#### Obsessive-compulsive disorder PO

*Adults, Elderly*. Initially, 25 mg/day. May gradually increase to 100 mg/day in the first 2 wks. Maximum: 250 mg/day. *Children 10 yr and older*. Initially, 25 mg/day. May gradually increase up to maximum of 200 mg/day.

### **OFF-LABEL USES**

Treatment of bulimia nervosa, cataplexy associated with narcolepsy, mental depression.

### CONTRAINDICATIONS

Acute recovery period after MI, use within 14 days of MAOIs, hypersensitivity to TCAs. Do not use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

### INTERACTIONS

#### Drug

Antithyroid agents: May increase the risk of agranulocytosis. Cimetidine: May increase clomipramine concentration and risk of toxicity. Clonidine, guanadrel: May decrease the effects of these drugs. MAOIs: May increase the risk of neuroleptic malignant syndrome, seizures, hyperpyresis, and hypertensive crisis. Contraindicated. Other CNS depressants: May increase CNS and respiratory depression and the hypotensive effects of clomipramine. SSRIs: Fluoxetine, sertraline, paroxetine, fluvoxamine inhibit

CYP2D6 and may decrease TCA metabolism.

**QT-prolonging drugs:** Effects on QT interval may be additive.

**Phenothiazines:** May increase the anticholinergic and sedative effects of clomipramine.

**Sympathomimetics:** May increase the risk of cardiac effects.

Herbal

None known.

Food

Alcohol: May increase CNS and respiratory depression and the hypotensive effects of clomipramine. Grapefruit juice: May increase clomipramine concentrations.

### DIAGNOSTIC TEST EFFECTS

May alter the blood glucose level and ECG readings.

### SIDE EFFECTS

#### Frequent

Somnolence, fatigue, dry mouth, blurred vision, constipation, sexual dysfunction (42%), ejaculatory failure (20%), impotence, weight gain (18%), delayed micturition, orthostatic hypotension, diaphoresis, impaired concentration, increased appetite, urine retention.

#### Occasional

GI disturbances (such as nausea, GI distress, and metallic taste), asthenia, aggressiveness, muscle weakness. **Rare** 

Rare

Paradoxical reactions (agitation, restlessness, nightmares, insomnia), extrapyramidal symptoms, (particularly fine hand tremor), laryngitis, seizures.

### SERIOUS REACTIONS

 Overdose may produce seizures; cardiovascular effects, such as severe orthostatic hypotension, dizziness, tachycardia, palpitations, and arrhythmias; and altered temperature regulation, including hyperpyrexia or hypothermia.  Abrupt discontinuation after prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

• Anemia and agranulocytosis have been noted.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac disease, diabetes mellitus, glaucoma, hiatal hernia, history of seizures, history of urinary obstruction or urine retention, hyperthyroidism, increased intraocular pressure, benign prostatic hyperplasia, renal or hepatic disease, and schizophrenia. Clomipramine is minimally distributed in breast milk. Clomipramine use is not recommended for children younger than 10 yr. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments. A lower dosage should be given to elderly patients, who are at increased risk for drug toxicity.

Dizziness may occur, so change positions slowly and avoid alcohol and tasks that require mental alertness or motor skills. CBC to detect signs of anemia and agranulocytosis and ECG to detect arrhythmias should be performed before and periodically during therapy.

#### Storage

Store at room temperature and protect from moisture.

#### Administration

Take clomipramine with food or milk if GI distress occurs. Administer in divided doses with food during dose titration; final dose may be administered once daily at bedtime to minimize daytime sedation. Full therapeutic effect may be noted in 2-4 wks. Do not abruptly discontinue clomipramine.

### Clonazepam

kloe-na'zi-pam Klonopin Mapo-Clonazepam, Clonapam, Rivotril Do not confuse clonazepam with clonidine or lorazepam.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

*Classification:* Anxiolytic, anticonvulsant, benzodiazepines

### MECHANISM OF ACTION

A benzodiazepine that depresses all levels of the CNS, inhibits nerve impulse transmission in the motor cortex, and suppresses abnormal discharge in petit mal seizures. *Therapeutic Effect*: Produces anxiolytic and anticonvulsant effects.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 85%. Metabolized in the liver. Excreted in urine. Not removed by hemodialysis. *Half-life:* 18-50 h.

### AVAILABILITY

*Tablets:* 0.5 mg, 1 mg, 2 mg. *Tablets (Disintegrating):* 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 2 mg.

#### INDICATIONS AND DOSAGES

 Adjunctive treatment of Lennox-Gastaut syndrome (petit mal variant) and akinetic, myoclonic, and absence (petit mal) seizures PO

Clonazepam (Generic Name)

Adults, Elderly, Children 10 yr and older. 1.5 mg/day; may be increased in 0.5- to 1-mg increments every 3 days until seizures are controlled. Do not exceed maintenance dosage of 20 mg/day.

Infants, Children < 10 yr or weighing < 30 kg. 0.01-0.03 mg/ kg/day in 2-3 divided doses; may be increased by up to 0.5 mg every 3 days until seizures are controlled. Do not exceed maintenance dosage of 0.2 mg/kg/day.

## • Panic disorder

*Adults, Elderly.* Initially, 0.25 mg twice a day; increased in increments of 0.125-0.25 mg twice a day every 3 days. Maximum: 4 mg/day.

### **OFF-LABEL USES**

Adjunctive treatment of simple, complex partial, and tonic-clonic seizures. Also used for nystagmus, restless leg syndrome.

### CONTRAINDICATIONS

Narrow-angle glaucoma, significant hepatic disease.

### INTERACTIONS

### Drug

Alcohol, other CNS depressants: May increase CNS depressant effect. Ketoconazole, itraconazole, fluconazole, protease inhibitors, nefazodone: May increase clonazepam serum levels. Herbal Kava kava: May increase sedation. St. John's wort: May decrease

clonazepam concentrations.

Food

None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

### Frequent

Mild, transient drowsiness; ataxia; behavioral disturbances (aggression, irritability, agitation), especially in children.

### Occasional

Rash, ankle, or facial edema, nocturia, dysuria, change in appetite or weight, dry mouth, sore gums, nausea, blurred vision. **Rare** 

Paradoxical CNS reactions, including hyperactivity or nervousness in children and excitement or restlessness in elderly patients (particularly in the presence of uncontrolled pain).

### SERIOUS REACTIONS

 Abrupt withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal or muscle cramps, diaphoresis, vomiting, and status epilepticus.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with chronic respiratory disease and impaired renal and hepatic function. Clonazepam crosses the placenta and may be distributed in breast milk. Chronic clonazepam use during pregnancy may produce withdrawal symptoms and CNS depression in neonates. Long-term clonazepam use may adversely affect the mental and physical development of children. Elderly patients are usually more sensitive to clonazepam's CNS effects, such as ataxia, dizziness, and oversedation. Expect to give them a lower dosage and increase it gradually. Alcohol, smoking, and tasks that require mental alertness or motor skills should be avoided.

Drowsiness and dizziness may occur. History of the seizure disorder, including the duration, frequency, and intensity of seizures, should be assessed. Autonomic responses, such as cold or clammy hands and diaphoresis, and motor responses, such as agitation, trembling, and tension, in those with panic disorder should also be assessed. CBC and blood chemistry tests and hepatic and renal function should be periodically monitored. **Storage** 

#### Store at room temperature; keep disintegrating tablet in package until time of use.

#### Administration

If the patient must switch to another anticonvulsant, expect to decrease the clonazepam dose gradually as therapy begins with a low dose of the replacement drug.

Do not abruptly discontinue the drug after long-term therapy. Strict maintenance of drug therapy is essential for seizure control.

Swallow the tablet whole with water. For the orally disintegrating tablet (ODT): After opening, peel back the foil on the blister. Do not push ODT through foil. Immediately, using dry hands, place ODT in the mouth. ODT will dissolve quickly and can be easily swallowed with or without water.

### Clonidine

klon'ih-deen Catapres, Catapres TTS, Duraclon, Kapvay Dixarit Do not confuse clonidine with clomiphene, Klonopin, or quinidine, or Catapres with Cetapred.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antihypertensive, central  $\alpha$ -adrenergic agonist

### **MECHANISM OF ACTION**

An antiadrenergic, sympatholytic agent that prevents pain signal transmission to the brain and produces analgesia at pre- and post- $\alpha$ -adrenergic receptors in the spinal cord. *Therapeutic Effect:* Reduces peripheral resistance; decreases BP and heart rate.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	0.5-1 h	2-4 h	Up to 8 h

Well absorbed from the GI tract. Transdermal best absorbed from the chest and upper arm; least absorbed from the thigh. Protein binding: 20%-40%. Metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life*: 12-16 h (increased with impaired renal function).

### AVAILABILITY

Tablets (Catapres): 0.1 mg, 0.2 mg, 0.3 mg. Tablets, Extended Release (Kapvay): 0.1 mg. Transdermal Patch (Catapres TTS): 2.5 mg (release at 0.1 mg/24 h), 5 mg (release at 0.2 mg/24 h), 7.5 mg (release at 0.3 mg/24 h). Injection (Duraclon): 100 mcg/mL, 500 mcg/mL.

# INDICATIONS AND DOSAGES Hypertension PO

*Adults.* Initially, 0.1 mg twice a day. Increase by 0.1-0.2 mg q2-4 days. Maintenance: 0.2-1.2 mg/day in 2-4 divided doses up to maximum of 2.4 mg/day.

*Elderly.* Initially, 0.1 mg at bedtime. May increase gradually.

*Children.* 5-25 mcg/kg/day in divided doses q6h. Increase at 5- to 7-day intervals. Maximum: 0.9 mg/day.

Clonidine (Generic Name)

TRANSDERMAL

*Adults, Elderly.* System delivering 0.1 mg/24 h up to 0.6 mg/24 h q7 days.

### Severe pain

EPIDURAL Adults, Elderly. 30-40 mcg/h. Children. Initially, 0.5 mcg/kg/h, not to exceed adult dose.

#### ADHD

PO (KAPVAY EXTENDED RELEASE TABLETS) *Children 6-18 yr.* Initially 0.1 mg/day PO at bedtime. Increase weekly by 0.1 mg/day increments, up to 0.4 mg/day PO as needed to attain the desired response. Divide dose > 0.1 mg/day into 2 doses, morning and at bedtime. If the divided doses are not equal, give the larger dose at bedtime. May use as monotherapy or with stimulants for ADHD

### **OFF-LABEL USES**

Diagnosis of pheochromocytoma, alcohol or opioid withdrawal, treatment of menopausal flushing.

### CONTRAINDICATIONS

Hypersensitivity to clonidine or any product component, epidural contraindicated with bleeding diathesis or infection at the injection site, or anticoagulation therapy.

### INTERACTIONS

#### Drug

**β-Blockers:** Potential for additive effects on BP or heart rate.

**Tricyclic antidepressants:** May decrease effect of clonidine.

#### Herbal

None known.

#### Food

Alcohol: Potentiate CNS effects.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent

Dry mouth (40%), somnolence (33%), dizziness (16%), sedation, constipation (10%).

### Occasional (1%-5%)

Depression, swelling of feet, loss of appetite, decreased sexual ability, dry or itching eyes, dizziness, nausea, vomiting, nervousness. Decreases in blood pressure or heart rate. Transdermal: Itching, reddening, or darkening of skin.

### Rare (<1%)

Nightmares, vivid dreams, cold feeling in fingers and toes.

### SERIOUS REACTIONS

• Overdose produces profound hypotension, irritability, bradycardia, respiratory depression, hypothermia, miosis (pupillary constriction), arrhythmias, and apnea.

 Abrupt withdrawal may result in rebound hypertension, nervousness, agitation, anxiety, insomnia, hand tingling, tremor, flushing, and diaphoresis.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cerebrovascular disease, chronic renal failure, Raynaud's disease, recent myocardial infarction, severe coronary insufficiency, and thromboangiitis obliterans. Clonidine crosses the placenta and is distributed in breast milk. Children are more sensitive to clonidine's effects. A thorough cardiovascular assessment is recommended before initiation in pediatric patients; include medical history, family history, and physical examination, and consider ECG testing. Elderly patients may be more sensitive.

Epidural clonidine not recommended for perioperative, obstetrical, or postpartum pain.

Dizziness and light-headedness may occur. Rise slowly from a lying to a sitting position and permit legs to dangle momentarily. BP should be obtained immediately before giving each dose. Be alert for BP fluctuations. Daily bowel activity and stool consistency should also be assessed. Expect concurrent  $\beta$ -blocker therapy to be discontinued several days before discontinuing clonidine therapy to prevent clonidine withdrawal hypertensive crisis; and clonidine dosage should be reduced over 2-4 days.

#### Administration

Take oral clonidine without regard to food. Do not chew, crush, or break extended release tablets. Take last dose of the day just before bedtime. Avoid skipping doses or voluntarily discontinuing clonidine because it can produce severe, rebound hypertension.

For transdermal use, apply the system to dry, hairless area of intact skin on upper arm or chest. Rotate sites to prevent skin irritation. Do not trim patch to adjust dose.

Epidural injection must be diluted in 0.9% NaCl injection to a concentration of 100 mcg/mL before use. Administered using a continuous epidural device.

### Clopidogrel

clo-pid'o-grill Plavix Do not confuse Plavix with Paxil.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Platelet aggregation inhibitor

### **MECHANISM OF ACTION**

A thienopyridine derivative that inhibits binding of the enzyme adenosine phosphate (ADP) to its platelet receptor and subsequent ADP-mediated activation of a glycoprotein complex. *Therapeutic Effect:* Inhibits platelet aggregation.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	1 h	2 h	N/A

Rapidly absorbed. Protein binding: 98%. Extensively metabolized by the liver. Eliminated equally in the urine and feces. *Half-life*: 8 h.

### AVAILABILITY

Tablets: 75 mg, 300 mg.

#### INDICATIONS AND DOSAGES • Recent MI, recent stroke, or

established peripheral arterial disease PO

Adults, Elderly. 75 mg once a day. Acute coronary syndrome (unstable angina or non-Q-wave acute MI), including those who have PCI or CABG: PO

*Adults, Elderly.* Initially, 300 mg loading dose, then 75 mg once a day (in combination with aspirin).

### CONTRAINDICATIONS

Hypersensitivity to clopidogrel, active pathological bleeding such as peptic ulcer or intracranial hemorrhage.

#### INTERACTIONS

#### Drug

Anticoagulants: May increase the risk of bleeding.

Clarithromycin, erythromycin: May reduce the effects of clopidogrel. Fluvastatin, NSAIDs, phenytoin, tamoxifen, tolbutamide, torsemide, Omeprazole, possibly other PPIs with CYP2C19 inhibiting activity: Reduce conversion of clopidogrel to active metabolite; may result in cardiovascular events due to decreased efficacy. Avoid when possible.

#### Herbal

Ginger, ginkgo biloba, white willow: May increase the risk of bleeding. Food None known.

### DIAGNOSTIC TEST EFFECTS

Prolongs bleeding time.

### SIDE EFFECTS

Frequent (15%) Skin disorders.

### Occasional (6%-8%)

Upper respiratory tract infection, chest pain, flu-like symptoms, headache, dizziness, arthralgia.

### Rare (3%-5%)

Fatigue, edema, hypertension, abdominal pain, dyspepsia, diarrhea, nausea, epistaxis, dyspnea, rhinitis.

#### SERIOUS REACTIONS

 Thrombotic thrombocytopenic purpura.

· GI hemorrhage.

### **PRECAUTIONS & CONSIDERATIONS**

Patients who are poor metabolizers of CYP2C19 may have reduced efficacy of clopidogrel. Caution is warranted with hematologic disorders, history of bleeding, hypertension, hepatic or renal impairment, and in preoperative persons. Be aware that it may take longer to stop bleeding during drug therapy.

Notify the physician of unusual bleeding. Also, notify dentists and other physicians before surgery is scheduled or when new drugs are prescribed. Platelet count for thrombocytopenia, hemoglobin level, WBC count, and BUN, serum bilirubin, creatinine, AST (SGOT) and ALT (SGPT) levels should be monitored. Platelet count should be obtained before clopidogrel therapy, every 2 days during the first week of treatment, and weekly thereafter until therapeutic maintenance dose is reached. Be aware that abrupt discontinuation of clopidogrel produces an elevated platelet count within 5 days.

#### Storage

Store at room temperature.

### Administration

Take clopidogrel without regard to food. Do not crush coated tablets.

### Clorazepate

klor-az'e-pate ★ Tranxene Do not confuse clorazepate with clofibrate or clonazepam.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

*Classification:* Anticonvulsants, anxiolytic, benzodiazepine

### **MECHANISM OF ACTION**

A benzodiazepine that depresses all levels of the CNS, including limbic and reticular formation, by binding to benzodiazepine receptor sites on the  $\gamma$ -aminobutyric acid (GABA) receptor complex. Modulates GABA, a major inhibitory neurotransmitter in the brain. *Therapeutic Effect:* Produces anxiolytic effect, suppresses seizure activity.

### PHARMACOKINETICS

Well absorbed after oral administration. Rapidly metabolized by liver to nordiazepam, which is

Clorazepate (Generic Name)

slowly eliminated. *Half-life:* 40-50 h. Protein binding of nordiazepam: 97%-98%. Metabolites (nordiazepam, oxazepam, and glucuronide conjugates) excreted in urine.

### AVAILABILITY

Tablets: 3.75 mg, 7.5 mg, 15 mg.

# INDICATIONS AND DOSAGES Anxiety

PO

*Adults, Elderly.* (Regular release): 7.5-15 mg 2-4 times a day. (Sustained release): 11.25 mg or 22.5 mg once a day at bedtime.

### Anticonvulsant (adjunct) PO

Adults, Elderly, Children older than 12 yr: Initially, 7.5 mg 2-3 times a day. May increase by 7.5 mg at weekly intervals. Maximum: 90 mg/day.

*Children 9-12 yr.* Initially, 3.75-7.5 mg twice a day. May increase by 2.75 mg at weekly intervals. Maximum: 60 mg/day.

#### Alcohol withdrawal PO

*Adults, Elderly.* Initially, 30 mg, then 15 mg 2-4 times a day on first day. Gradually decrease dosage over subsequent days. Maximum: 90 mg/day.

### CONTRAINDICATIONS

Hypersensitivity, acute narrow-angle glaucoma.

#### INTERACTIONS

Drug

Other CNS depressants: May increase CNS depressant effects. Herbal

Kava kava, St. John's wort, valerian: May increase CNS depression. Food Alcohol: May increase CNS

depressant effects.

Grapefruit juice: Clorazepate concentrations may be increased.

### DIAGNOSTIC TEST EFFECTS

Decreased hematocrit; abnormal liver and renal function tests. Therapeutic serum drug level is 0.12-1.5 mcg/mL; toxic serum drug level is > 5 mcg/mL.

#### SIDE EFFECTS

Frequent

Somnolence.

#### Occasional

Dizziness, GI disturbances, nervousness, blurred vision, dry mouth, headache, confusion, ataxia, rash, irritability, slurred speech. **Rare** 

Paradoxical CNS reactions, such as hyperactivity or nervousness in children and excitement or restlessness in elderly or debilitated patients (generally noted during first 2 wks of therapy, particularly in the presence of uncontrolled pain).

### SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal or muscle cramps, diaphoresis, vomiting, and seizures.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute alcohol intoxication and renal and hepatic impairment. Women should use effective contraception during therapy and notify their physician immediately if they become or may be pregnant.

Drowsiness and dizziness may occur. Change positions slowly from recumbent to sitting, before standing, to prevent dizziness. Alcohol, smoking, and tasks that require mental alertness or motor skills should also be avoided. Autonomic responses, such as cold, clammy hands and diaphoresis, and

motor responses, such as agitation, trembling, and tension, should be assessed. Seizure frequency and intensity should be assessed.

#### Storage

Store at controlled room temperature, protect from heat and moisture.

#### Administration

If the person must change to another anticonvulsant, plan to decrease clorazepate dosage gradually as low-dose therapy begins with the replacement drug.

Do not abruptly discontinue the medication after long-term use, because this may precipitate seizures. Strict compliance with the drug regimen is essential for seizure control.

May take without regard to food.

### Clotrimazole

kloe-try'mah-zole ★ Cruex, Gyne-Lotrimin-3, Gyne-Lotrimin-7, Lotrimin, Lotrimin AF Canesten, Clotrimaderm

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (topical), C (troches) OTC/Rx

**Classification:** Antifungals, azole antifungals

### **MECHANISM OF ACTION**

An antifungal that binds with phospholipids in fungal cell membrane. Alters cell membrane permeability. *Therapeutic Effect:* Inhibits yeast growth.

### PHARMACOKINETICS

Poorly, erratically absorbed from GI tract. Bound to oral mucosa. Absorbed portion metabolized in liver. Eliminated in feces. Topical: Minimal systemic absorption (highest concentration in stratum corneum). Intravaginal: Small amount systemically absorbed. *Half-life*: 3.5-5 h.

### AVAILABILITY

Combination Pack: Vaginal tablet 100 mg and vaginal cream 1%. Lotion: 1% (Lotrimin). Topical Cream: 1% (Cruex, Lotrimin, Lotrimin AF). Topical Solution: 1% (Lotrimin, Lotrimin AF). Troches: 10 mg. Vaginal Cream: 1% (Gyne-Lotrimin-7), 2% (Gyne-Lotrimin-3). Vaginal Tablets: 100 mg, 500 mg (Gyne-Lotrimin).

#### INDICATIONS AND DOSAGES • Oropharyngeal candidiasis

#### Uropharyngeal candidiasis treatment

TROCHE *Adults, Elderly.* 10 mg 5 times/day for 14 days.

 Oropharyngeal candidiasis prophylaxis TROCHE

Adults, Elderly. 10 mg 3 times/day.

 Cutaneous candidiasis or tinea corporis; tinea cruris; tinea pedis TOPICAL

*Adults, Elderly.* Apply to affected area 2 times/day. Therapeutic effect may take up to 8 wks.

Vulvovaginal candidiasis

VAGINAL (CREAM, 7-day regimen) *Adults, Elderly.* 1 applicatorful at bedtime for 7-14 days.

VAGINAL (CREAM, 3-day regimen) *Adults, Elderly.* 1 applicatorful at bedtime for 3 days.

### **OFF-LABEL USES**

Topical: Treatment of paronychia, tinea barbae, tinea capitis.

### CONTRAINDICATIONS

Hypersensitivity to clotrimazole or any component of the formulation.

#### INTERACTIONS

#### Drug

Vaginal spermicides: Clotrimazole vaginal may inactivate contraceptive effect.

**Tacrolimus:** Troche use may increase risk of tacrolimus toxicity.

### Herbal

None known. Food None known.

None known.

### DIAGNOSTIC TEST EFFECTS

May increase SGOT (AST).

### SIDE EFFECTS

#### Frequent

Oral: Nausea, vomiting, diarrhea, abdominal pain.

#### Occasional

Topical: Itching, burning, stinging, erythema, urticaria. Vaginal: Mild burning, irritation, cystitis.

#### Rare

Vaginal: Itching, rash, lower abdominal cramping, headache.

#### SERIOUS REACTIONS

None reported.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic disorder with oral therapy. It is unknown whether clotrimazole crosses the placenta or is distributed in breast milk. Troche use is not recommended in children < 3 yr of age; use of intravaginal and topical products not established in those < 12 yr. There are no special precautions for the elderly. During vaginal treatment, patients should refrain from sexual intercouse and not use tampons; do not use condoms or diaphragms or cervical cap, as product may damage them and make them unreliable. For any OTC use, the patient should seek advice for any condition not responding after 1 wk, or if condition is associated with fever, rash, or complicated by potential immunosuppression. Separate personal items and linens. **Storage** 

Store at room temperature. Do not freeze.

#### Administration

Lozenges must be dissolved in mouth more than 15-30 min for oropharyngeal therapy. Do not chew. Swallow saliva.

When using topical preparation, rub well into affected, surrounding areas. Do not apply occlusive covering or other preparations. Keep area clean and dry. Wear light clothing to promote ventilation.

To use vaginally, use vaginal applicator and insert high in vagina. Continue to use during menses.

### Clozapine

klo'za-peen Clozaril, FazaClo Do not confuse clozapine with Cloxapen or clofazimine, or Clozaril with Clinoril or Colazal.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antipsychotic, atypical

### MECHANISM OF ACTION

A dibenzodiazepine derivative that mainly blocks dopamine  $D_1$  and  $D_4$  receptors and also

Clozapine (Generic Name)

blocks serotonin type 2 receptors. Increases turnover of GABA in the nucleus accumbens. Some side effects occur due to  $\alpha_1$ -adrenergic blockage and anticholinergic effects. One exception is M4 muscarinic receptor agonism, which causes hypersalivation. Drug lowers seizure threshold. *Therapeutic Effect:* Diminishes schizophrenic behavior.

### PHARMACOKINETICS

Absorbed rapidly and almost completely. Distributed rapidly and extensively. Crosses the bloodbrain barrier. Protein binding: 95%. Metabolized in the liver. Excreted in urine and feces. *Half-life*: 8 h.

### AVAILABILITY

Tablets (Clozaril): 25 mg, 50 mg, 100 mg, 200 mg. Oral disintegrating tablets (FazaClo): 12.5 mg, 25 mg, 100 mg.

### INDICATIONS AND DOSAGES

### Schizophrenic disorders, reduce suicidal behavior

*Adults.* Initially, 25 mg once or twice a day. May increase by 25-50 mg/day over 2 wks until dosage of 300-450 mg/day is achieved. May further increase by 50-100 mg/day no more than once or twice a week. Range: 200-600 mg/day. Maximum:

900 mg/day. *Elderly*. Initially, 25 mg/day. May increase by 25 mg/day. Maximum: 450 mg/day.

### CONTRAINDICATIONS

Coma, concurrent use of other drugs that may suppress bone marrow function, history of clozapineinduced agranulocytosis or severe granulocytopenia, myeloproliferative disorders, severe CNS depression, uncontrolled epilepsy, paralytic ileus.

### INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depressant effects.

Bone marrow depressants: May increase myelosuppression. Lithium: May increase the risk of confusion, dyskinesia, and seizures. Phenobarbital: Decreases clozapine blood concentration.

#### Herbal

St. John's wort: May decrease clozapine levels.

Kava kava, gotu kola, valerian, St. John's wort: May increase CNS depression.

Food None known.

### **DIAGNOSTIC TEST EFFECTS**

May increase serum glucose levels.

### SIDE EFFECTS

#### Frequent

Somnolence (39%), salivation (31%), tachycardia (25%), dizziness (19%), constipation (14%).

#### Occasional

Hypotension (9%); headache (7%); tremor, syncope, diaphoresis, dry mouth (6%); nausea, visual disturbances (5%); nightmares, restlessness, akinesia, agitation, hypertension, abdominal discomfort or heartburn, weight gain (4%). **Rare** 

Rigidity, confusion, fatigue, insomnia, rash, fecal impaction.

### SERIOUS REACTIONS

• Seizures occur in about 3% of patients.

· Overdose produces CNS

depression (including sedation,

coma, and delirium), respiratory depression, and hypersalivation.
Blood dyscrasias, particularly agranulocytosis and mild leukopenia, may occur. If WBC < 2000/mm<sup>3</sup> or ANC < 1000/mm<sup>3</sup>, do not rechallenge.

- Myocarditis.
- · Paralytic ileus.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with alcohol withdrawal and in those with cardiovascular disease, glaucoma, diabetes, history of seizures, benign prostatic hyperplasia, myocarditis, myasthenia gravis, urine retention, and impaired hepatic, renal, or respiratory function.

Drowsiness may occur but generally subsides with continued therapy. Increased mortality has been observed in elderly patients with dementia-related psychosis treated with antipsychotics. Alcohol and tasks that require mental alertness or motor skills should be avoided. BP for hypertension or hypotension, heart rate for tachycardia, and CBC for blood dyscrasias (particularly agranulocytosis and mild leukopenia) should be assessed.

Clozapine is available only through a distribution system that ensures monitoring of WBC count and ANC. WBC count should be monitored every week for the first 6 mo of continuous therapy, then biweekly when WBC counts are acceptable.

### Storage

Store tablets at room temperature. Orally disintegrating tablet (ODT) should be left in the unopened blister until time of use. Protect from moisture.

#### Administration

Take clozapine without regard to food. Do not abruptly discontinue.

Expect to monitor blood work before prescription can be filled.

For ODT: Just prior to use, peel the foil from the blister and gently remove. Do not push through the blister foil. Immediately place the tablet in the mouth and allow to disintegrate and swallow with saliva, or chew as desired. No water is needed. If a partial tablet is needed for the dose, discard the unused portion.

#### Co-Trimoxazole (Sulfamethoxazole and Trimethoprim)

koe-trye-mox'a-zole Bacter-Aid DS, Bactrim, Bactrim DS, Sulfatrim Pediatric, Septra, Septra DS, Sultrex Pediatric Novo-Trimel, Nu-Cotrimox, Trisulfa, Trisulfa DS Do not confuse Bactrim with bacitracin, co-trimoxazole with clotrimazole, or Septra with Sectral or Septa.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antibiotics, folate antagonists, sulfonamides

#### MECHANISM OF ACTION

A sulfonamide and folate antagonist that blocks bacterial synthesis of essential nucleic acids. *Therapeutic Effect:* Bactericidal in susceptible microorganisms.

#### PHARMACOKINETICS

Rapidly and well absorbed from the GI tract. Protein binding: 45%-60%. Widely distributed.

Co-Trimoxazole (Sulfamethoxazole and Trimethoprim) (Generic Name)
Metabolized in the liver. Excreted in urine. Minimally removed by hemodialysis. *Half-life:* Sulfamethoxazole 6-12 h, trimethoprim 8-10 h (increased in impaired renal function).

## AVAILABILITY

! All dosage forms have same 5:1 ratio of sulfamethoxazole (SMX) to trimethoprim (TMP).

Oral Suspension (Sultrex Pediatric, Sulfatrim Pediatric): SMX 200 mg/ 5 mL and TMP 40 mg/5 mL. Tablets (Bactrim, Septra): SMX 400

mg and TMP 80 mg. Tablets, double strength (Bacter-Aid DS, Bactrim DS, Septra DS): SMX

800 mg and TMP 160 mg.

Injection: SMX 80 mg/mL and TMP 16 mg/mL.

# INDICATIONS AND DOSAGES Mild to moderate infections PO

Adults, Elderly. 160 mg TMP/800 mg SMX q12hr.

*Children older than 2 mo.* 8-12 mg/ kg/day based on the TMP component in divided doses q12hr.

IV

*Adults, Elderly, Children older than* 2 mo. 8-12 mg/kg/day based on the TMP component in divided doses q6-12h.

## Serious infections, *Pneumocystis* carinii pneumonia (PCP) PO, IV

Adults, Elderly, Children older than 2 mo. 15-20 mg/kg/day based on the TMP component in divided doses q6-8h.

## Prevention of PCP PO

Adults. 160 mg TMP/800 mg SMX each day.

*Children.* 150 mg/m<sup>2</sup>/day based on the TMP component in 2 divided doses on 3 consecutive days/wk.

#### Traveler's diarrhea PO

Adults, Elderly. 160 mg TMP/800 mg SMX q12h for 5 days.

## Acute exacerbation of chronic bronchitis

PO

*Adults, Elderly.* 160 mg TMP/800 mg SMX q12h for 14 days.

## Prevention of urinary tract infection

PO

Adults, Elderly, Children older than 2 mo. 2 mg/kg/dose once a day.

## Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance, the severity of the infection, and the serum concentration of the drug. For those with creatinine clearance of 15-30 mL/min, a 50% dosage reduction is recommended.

## **OFF-LABEL USES**

Treatment of bacterial endocarditis; gonorrhea; meningitis; septicemia; sinusitis; and biliary tract, bone, joint, chancroid, chlamydial, intra-abdominal, skin, and soft-tissue infections.

## CONTRAINDICATIONS

Known hypersensitivity to trimethoprim or sulfonamides, a history of drug-induced immune thrombocytopenia with these drugs; megaloblastic anemia due to folate deficiency, marked hepatic damage, or several renal insufficiency if patient cannot be closely monitored. Do not use in pregnancy or breastfeeding because sulfonamides may cause kernicterus. Do not use in infants < 2 mo of age.

## INTERACTIONS Drug

**Cyclosporine:** May decrease cyclosporine levels and increase risk of nephrotoxicity.

**Hemolytics:** May increase the risk of toxicity.

Hepatotoxic medications: May increase the risk of hepatotoxicity.

Hydantoin anticonvulsants, oral antidiabetics, warfarin: May increase or prolong the effects of these drugs and increase their risk of toxicity.

Methenamine: May form a precipitate.

Methotrexate: May increase the effects of methotrexate.

**Warfarin:** Potentiates anticoagulant effect of warfarin.

#### **Herbal and Food**

None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, creatinine, potassium, AST (SGOT), and ALT (SGPT) levels; decreases glucose.

## IV INCOMPATIBILITIES

NOTE: SMZ-TMP incompatible with many drugs at Y-site. Consult specialized resources prior to infusing. Incompatibilities include alfentanil, amikacin, aminophylline, ampicillin, ampicillin-sulbactam (Unasyn), aztreonam, bumetanide, butorphanol, calcium glucnonate, caspofungin (Cancidas), most cephalosporins, cimetidine, clindamycin (Cleocin), codeine, dexamethasone, diazepam, digoxin (Lanoxin), dobutamine, dopamine, famotidine (Pepcid), fluconazole (Diflucan), foscarnet (Foscavir), furosemide, gentamicin, haloperidol, hydrocortisone, imipenem-cilastatin (Primaxin), regular insulin, lactaged Ringer's, mannitol, methylprednisolone, metoclopramide, midazolam (Versed), nitroglycerin, nitroprusside, ondansetron

(Zofran), promethazine, quinupristin-dalfopristin (Synercid), sodium bicarbonate.

## SIDE EFFECTS

## Frequent

Anorexia, nausea, vomiting, rash (generally 7-14 days after therapy begins), urticaria.

## Occasional

Diarrhea, abdominal pain, pain or irritation at the IV infusion site. **Rare** 

Headache, vertigo, insomnia, seizures, hallucinations, depression.

## SERIOUS REACTIONS

• Rash, fever, sore throat, pallor, purpura, cough, and shortness of breath may be early signs of serious adverse reactions.

 Fatalities have occasionally occurred after Stevens-Johnson syndrome, toxic epidermal necrolysis, fulminant hepatic necrosis, agranulocytosis, aplastic anemia, and other blood dyscrasias in patients taking sulfonamides.

 Myelosuppression, decreased platelet count, and severe dermatologic reactions may occur, especially in elderly patients.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with impaired renal or hepatic function or glucose-6-phosphate dehydrogenase deficiency. Co-trimoxazole use is contraindicated during pregnancy at term and during breastfeeding. Co-trimoxazole readily crosses the placenta and is distributed in breast milk. Co-trimoxazole use is contraindicated in children younger than 2 mo old; if given to newborns, it may produce kernicterus. Elderly patients have an increased risk of developing myelosuppression, decreased platelet count, and severe skin reactions.

History of bronchial asthma, hypersensitivity to trimethoprim or any sulfonamide, or sulfite sensitivity should be determined before beginning drug therapy. Report any new symptoms, especially bleeding, bruising, fever, sore throat, and a rash or other skin changes. Intake and output, pattern of daily bowel activity and stool consistency, skin for rash, renal and liver function, CNS symptoms such as hallucinations, headache, insomnia, and vertigo should be assessed. Vital signs should be monitored at least twice a day. Storage

Store tablets and oral suspension at room temperature. Store unopened vials at room temperature; do not refrigerate or freeze. Be aware that the IV infusion solution is stable for 2-6 h. Discard the solution if it is cloudy or contains a precipitate.

#### Administration

! Be aware that drug dosing is expressed in terms of trimethoprim content.

Take the oral form with 8 oz water on an empty stomach. Have the patient drink several additional glasses of water each day. Shake oral suspension well before each use.

For piggyback IV infusion, dilute each 5-mL vial with 75-125 mL D5W. Do not mix co-trimoxazole with other drugs or solutions. Infuse the solution over 60-90 min. Avoid bolus or rapid infusion and IM injection. Ensure that the patient is adequately hydrated.

## Codeine

koe'deen Codeine, Contin Do not confuse codeine with Cardene or Lodine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II (analgesic), III (fixed-combination form)

**Classification:** Analgesics, narcotic, antitussives

## MECHANISM OF ACTION

An opioid agonist that binds to opioid receptors at many sites in the CNS, particularly in the medulla. This action inhibits the ascending pain pathways. *Therapeutic Effect:* Alters the perception of and emotional response to pain, suppresses cough reflex.

#### PHARMACOKINETICS

Well absorbed after oral administration. Rapidly metabolized by liver/10% methylated to the active analgesic morphine; the conversion is mediated by CYP2D6. *Half-life:* 2.5-3 h. Metabolites excreted in urine.

## AVAILABILITY

Tablets: 15 mg, 30 mg, 60 mg.

## INDICATIONS AND DOSAGES > Analgesia

#### PO

Adults, Elderly. 30 mg q4-6h. Range: 15-60 mg. Children. 0.5-1 mg/kg q4-6h. Maximum: 60 mg/dose. Cough

PO

*Adults, Elderly, Children 12 yr and older.* 10-20 mg q4-6h. *Children 6-11 yr.* 5-10 mg q4-6h. *Children 2-5 yr.* 2.5-5 mg q4-6h.

Dosage in renal impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	
(mL/min)	Dosage
10-50	75% of usual dose
< 10	50% of usual dose

## **OFF-LABEL USES**

Treatment of noninfectious diarrhea.

## CONTRAINDICATIONS

Hypersensitivity to codeine. Some products list paralytic ileus, presence of respiratory depression in absence of resuscitative equipment, and severe bronchial asthma or hypercarbia as additional contraindications.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase hypotension and CNS or respiratory depression.

**MAOIs:** May produce a severe, sometimes fatal reaction; plan to administer a test dose, which is onequarter of usual codeine dose.

#### CYP2D6 inhibitors

(chlorpromazine, delavirdine, fluoxetine, miconazole, paroxetine, pergolide, quinidine, quinine, ritonavir, and ropinirole): May decrease the effects of codeine. Herbal

St. John's wort, valerian, kava kava, gotu kola: Increase CNS depression.

**St. John's wort:** May reduce codeine concentrations; speed conversion to the metabolite.

## Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase levels.

## SIDE EFFECTS

#### Frequent

Constipation, somnolence, nausea, vomiting.

## Occasional

Paradoxical excitement, confusion, palpitations, facial flushing, decreased urination, blurred vision, dizziness, dry mouth, headache, hypotension (including orthostatic hypotension), decreased appetite.

## Rare

Hallucinations, depression, abdominal pain, insomnia.

## SERIOUS REACTIONS

 Too-frequent use may result in paralytic ileus.

 Overdose may produce cold and clammy skin, confusion, seizures, decreased BP, restlessness, pinpoint pupils, bradycardia, respiratory depression, decreased level of conciousness, and severe weakness.

• The patient who uses codeine repeatedly may develop a tolerance to the drug's analgesic effect as well as physical dependence.

## PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used in patients with acute alcoholism, anoxia, CNS depression, hypercapnia, respiratory depression or dysfunction, seizures, shock, and untreated myxedema. Caution is also warranted in patients with acute abdominal conditions, Addison's disease, COPD, hypothyroidism, hepatic impairment, increased C

intracranial pressure, benign prostatic hyperplasia, and urethral stricture. Codeine crosses the placenta and is distributed in breast milk. Regular use of opioids during pregnancy may produce withdrawal symptoms in the neonate. Codeine may prolong labor if it is administered in the latent phase of the first stage of labor or before the cervix is dilated 4-5 cm. The neonate may develop respiratory depression if the mother receives codeine during labor. Nursing infants may be exposed to high levels of the codeine metabolite, morphine, in breast milk. Caution is advised with use in breastfeeding. Infant should be closely monitored for signs of toxicity. Children and elderly patients are more prone to paradoxical excitement and respiratory depression. In elderly patients, age-related renal impairment may increase the risk of codeine-induced urine retention.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. Vital signs, pattern of daily bowel activity and stool consistency, and clinical improvement of pain should be monitored.

## Administration

Be aware that ambulatory patients and patients not in severe pain may be more prone to dizziness, hypotension, nausea, and vomiting than patients in the supine position and those in severe pain.

For oral use, take codeine with food or milk to minimize adverse GI effects.

## Colchicine

kol'chi-seen Colcrys Do not confuse colchicine with Cortrosyn.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

Classification: Antigout agents

## MECHANISM OF ACTION

An alkaloid that decreases leukocyte motility, phagocytosis, and lactic acid production. *Therapeutic Effect:* Decreases urate crystal deposits and reduces inflammatory process.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Highest concentration is in the liver, spleen, and kidney. Protein binding: 30%-50%. Reenters the intestinal tract by biliary secretion and is reabsorbed from the intestines. Partially metabolized in the liver. Eliminated primarily in feces.

#### AVAILABILITY

Tablets: 0.6 mg.

# INDICATIONS AND DOSAGES Acute gout flare PO

Adults, Elderly. 1.2 mg (2 tablets) at the first sign of the flare then 0.6 mg (1 tablet) 1 h later. Higher doses are not more effective. Maximum: 1.8 mg over a 1-h period. May also give in patients already receiving colchicine prophylaxis, with first dose not to exceed 1.2 mg, then 0.6 mg at 1 h later. Wait 12 h and then resume the prophylactic dose.

## Prophylaxis of gout flares PO

*Adults, Elderly, and Children* > 16 yr: 0.6 mg once or twice daily. Maximum: 1.2 mg/day.

## Familial Mediterranean fever (FMF)

PO

Adults, Elderly on no interacting drugs. 1.2-2.4 mg PO daily in 1 to 2 divided doses; start at lower dose and titrate by increments of 0.3 mg/day. *Children > 12 yr*. 1.2-2.4 mg PO daily in 1 to 2 divided doses; titrate within this range by increments of 0.3 mg/day.

*Children 6-12 yr.* 0.9-1.8 mg PO daily in 1 to 2 divided doses. *Children 4-6 yr.* 0.3-1.8 mg PO daily in 1 to 2 divided doses.

## For any Indication: Patients on a strong CYP3A4 inhibitor, moderate CYP3A4 inhibitor, or a P-gp inhibitor in past 14 days or patients with renal or hepatic impairment

Recommendations for dosage adjustment are dependent on indication for use, age of patient, and the concomitant use of interacting drugs. See specific prescribing information; dosages *must* be adjusted downward. Patients with renal or hepatic impairment on interacting drugs must *not* receive colchicine.

## **OFF-LABEL USES**

Amyloidosis, biliary cirrhosis, recurrent pericarditis, sarcoid arthritis.

## CONTRAINDICATIONS

Hypersensitivity. Do not use in patients with renal or hepatic impairment in conjunction with P-gp or strong CYP3A4 inhibitors. In these patients, life-threatening and fatal colchicine toxicity has been reported with colchicine taken in therapeutic doses.

## INTERACTIONS Drug

**Bone marrow depressants:** May increase the risk of blood dyscrasias.

P-gp (e.g., cyclosporine, ranolazine) or strong CYP3A4 inhibitors (this includes all protease inhibitors [except when fosamprenavir is used without ritonavir], clarithromycin, ketoconazole, itraconazole, nefazodone; moderate inhibitors include aprepitant, fluconazole, erythromycin, diltiazem,

verapamil): May decrease colchicine metabolism, resulting in increased colchicine toxicity.

**NSAIDs:** May increase the risk of bone marrow depression, neutropenia, and thrombocytopenia.

## Herbal

None known.

Food

**Vitamin B**<sub>12</sub>: Vitamin B<sub>12</sub> absorption may be reduced.

**Grapefruit juice:** May decrease colchicine metabolism and increase risk of toxicity; avoid use or adjust dosage downward.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum alkaline phosphatase and AST (SGOT) levels. May decrease platelet count.

## SIDE EFFECTS

#### Frequent

Nausea, vomiting, abdominal discomfort.

Occasional

Anorexia.

#### Rare

Hypersensitivity reaction, including angioedema.

## SERIOUS REACTIONS

• Bone marrow depression, including aplastic anemia, agranulocytosis, and

thrombocytopenia, may occur with long-term therapy.

• Overdose initially causes a burning feeling in the skin or throat, severe diarrhea, and abdominal pain. The patient then experiences fever, seizures, delirium, and renal impairment, marked by hematuria and oliguria. The third stage of overdose causes hair loss, leukocytosis, and stomatitis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with impaired hepatic function and in elderly or debilitated patients. It is unknown whether colchicine crosses the placenta. The drug appears to be excreted in breast milk, and due to potential adverse events, particularly in premature infants, breastfeeding is not advised. Safety and efficacy of colchicine have not been established in children less than 4 yr old for FMF, and the drug has not been fully tested to treat acute gout flares in children. Elderly patients may be more susceptible to cumulative toxicity, and age-related renal impairment may increase the risk.

The drug should be discontinued immediately if GI symptoms occur. If taken for gout, limit intake of highpurine foods, such as fish and organ meats, and drink 8-10 eight-oz glasses of fluid daily while taking colchicine.

Notify the physician if fever, numbness, skin rash, sore throat, fatigue, unusual bleeding or bruising, or weakness occurs. The drug should be discontinued as soon as gout pain is relieved or at the first appearance of diarrhea, nausea, or vomiting. High fluid intake (3000 mL/day) should be encouraged; intake and output should be monitored; output should be at least 2000 mL/day. Signs and symptoms of a therapeutic response, including improved joint range of motion and reduced joint tenderness, redness, and swelling, should be evaluated.

## Storage

Store at room temperature. Administration

Take colchicine without regard to meals. Do not administer with grapefruit juice unless prescriber has reduced daily dosage.

## Colesevelam

koh-le-sev'e-lam

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antihyperlipidemics, bile acid sequestrants

## **MECHANISM OF ACTION**

A bile acid sequestrant and nonsystemic polymer that binds with bile acids in the intestines, preventing their reabsorption and removing them from the body. *Therapeutic Effect:* Decreases LDL cholesterol.

## PHARMACOKINETICS

Insignificant absorption. 0.05% of dose excreted in urine after 1 mo of chronic use.

## AVAILABILITY

*Tablets:* 625 mg. *Powder for Suspension:* 1.875 g per packet; 3.75 g per packet.

#### INDICATIONS AND DOSAGES

 To decrease LDL cholesterol level in primary hypercholesterolemia (Fredrickson type IIa); adjunctive therapy for type 2 diabetes mellitus PO (TABLETS)

Colesevelam (Generic Name), Welchol (Brand Name)

*Adults, Elderly.* 3 tablets with meals twice a day or 6 tablets once a day with a meal.

#### PO (POWDER FOR

SUSPENSION) *Adults, Elderly.* 1.875-g packet with meals twice a day or 3.75-g packet once a day with a meal.

## CONTRAINDICATIONS

Complete biliary obstruction, hypersensitivity to colesevelam, serum triglycerides > 500 mg/dL.

#### INTERACTIONS

#### Drug

NOTE: Oral drugs, especially those with a narrow therapeutic index, should be administered at least 4 h prior to colesevelam to help avoid interactions whenever possible. Monitor response to and/or blood levels of other drugs.

Aspirin, clindamycin, digoxin, furosemide, glipizide, hydrocortisone, imipramine, NSAIDs, phenytoin, propranolol, tetracyclines, thiazide diuretics, vitamin A, vitamin D, vitamin E, vitamin K: May decrease the absorption of these drugs.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Can increase serum triglycerides.

## SIDE EFFECTS

#### Frequent (8%-12%)

Flatulence, constipation, infection, dyspepsia (heartburn, epigastric distress).

#### SERIOUS REACTIONS

· GI tract obstruction may occur.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with dysphagia, patients with severe GI motility disorders, patients who have had major GI tract surgery, and those susceptible to fat-soluble vitamin deficiency. Colesevelam is not absorbed systemically. It may decrease proper maternal vitamin absorption and may affect breastfeeding infants. Safety and efficacy of colesevelam have not been established in children. No agerelated precautions have been noted in elderly patients.

Pattern of daily bowel activity and stool consistency should be assessed. Serum cholesterol and triglyceride levels should be checked at baseline and periodically thereafter.

#### Storage

Store at room temperature and protect from moisture. Mix powder for suspension just prior to administration.

## Administration

Take tablets with a meal and a full glass of liquid.

Do not take powder for suspension in dry form; this will cause esophageal distress and choking. To prepare, empty 1 packet into a glass or cup. Add 4-8 oz of water. Stir well and drink. Take with meals.

Colestipol koe-les'ti-pole

## **CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antihyperlipidemics, bile acid sequestrants

Colestipol (Generic Name)

## **MECHANISM OF ACTION**

An antihyperlipoproteinemic that binds with bile acids in the intestine, forming an insoluble complex. Binding results in partial removal of bile acid from enterohepatic circulation. *Therapeutic Effect:* Removes low-density lipoproteins (LDLs) and cholesterol from plasma.

## PHARMACOKINETICS

Not absorbed from the GI tract. Excreted in the feces.

## AVAILABILITY

*Granules:* 5-g packet (Colestid). *Tablet:* 1 g (Colestid).

## INDICATIONS AND DOSAGES

## Primary hypercholesterolemia

PO, GRANULES *Adults, Elderly.* Initially, 5 g 1-2 times/day. Range: 5-30 g/day once or in divided doses. PO, TABLETS *Adults, Elderly.* Initially, 2 g 1-2 times/day. Range: 2-16 g/day.

## **OFF-LABEL USES**

Treatment of diarrhea (due to bile acids); hyperoxaluria.

## CONTRAINDICATIONS

Complete biliary obstruction, hypersensitivity to bile acid sequestering resins, pancreatitis due to high triglycerides.

## INTERACTIONS

#### Drug

Anticoagulants: May increase effects of these drugs by decreasing vitamin K.

Digoxin, folic acid, penicillins, propranolol, tetracyclines, thiazides, thyroid hormones, and other medications: May bind and decrease absorption of these drugs. **Oral vancomycin:** Binds and decreases the effects of oral vancomycin. **Warfarin:** May decrease warfarin

absorption.

## Herbal

Vitamin A, vitamin E: May decrease vitamin A and vitamin E absorption. Food

#### roou

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum calcium, potassium, and sodium levels. May prolong prothrombin time or INR.

## SIDE EFFECTS

#### Frequent

Constipation (may lead to fecal impaction), nausea, vomiting, stomach pain, indigestion.

## Occasional

Diarrhea, belching, bloating, headache, dizziness.

## Rare

Gallstones, peptic ulcer, malabsorption syndrome.

## SERIOUS REACTIONS

• GI tract obstruction, hyperchloremic acidosis, and osteoporosis secondary to calcium excretion may occur.

• High dosage may interfere with fat absorption, resulting in steatorrhea.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with bleeding disorders, GI dysfunction (especially constipation), hemorrhoids, and osteoporosis. Abdominal discomfort, flatulence, and food tolerance may occur during therapy. Colestipol may interfere with maternal absorption of fat-soluble vitamins. No age-related precautions have been noted in children. Elderly patients are at an increased risk of experiencing adverse nutritional effects and GI side effects. Electrolytes and serum cholesterol and triglyceride levels should be monitored during therapy.

## Storage

Store at room temperature and protect from moisture. Mix just prior to administration.

## Administration

Take other drugs at least 1 h before or 4-6 h after colestipol because this drug is capable of binding drugs in the GI tract. Do not take granules dry because they are highly irritating. Mix with 3-6 oz fruit juice, milk, soup, or water. May add to pulpy fruits such as crushed pineapple, pears, peaches, or fruit cocktail. Place powder on the surface of the liquid for 1-2 min to prevent lumping, and then mix thoroughly. When mixing the powder with carbonated beverages, use an extra large glass and stir the liquid slowly to avoid excessive foaming. Take before meals to reduce the risk of constipation.

#### Conivaptan

con-ih-vap′tan ★ Vaprisol

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

regnancy Kisk Category. C

Classification: Vasopressin antagonist

## MECHANISM OF ACTION

An arginine vasopressin (AVP) V1A and V2 selective antagonist that inhibits vasopressin binding V1A in the liver and V1 and V2 sites in renal collecting ducts. Results in excretion of free water. *Therapeutic Effect:* Restores normal fluid and electrolyte status.

## PHARMACOKINETICS

Protein binding: 99%. Metabolized in liver; CYP450 3A4 is responsible for primary metabolism. Primarily eliminated in feces (approximately 83%); minimal excretion in urine (about 12%). *Half-life*: 3.6–8.6 h.

#### AVAILABILITY

Premixed IV Infusion: 20 mg/100 mL D5W.

## INDICATIONS AND DOSAGES Hyponatremia

IV

Adults. Initially, a loading dose of 20 mg given over 30 min. Maintenance: 20 mg/day as continuous infusion over 24 h for an additional 1-3 days. May titrate to maximum dose of 40 mg/day; total duration should not exceed 4 days after loading dose. *Children*. Safety and efficacy have not been established in children.

### Renal impairment

Dose adjustments not necessary in those with CrCl > 60 mL/min. If CrCl < 30 mL/min, use is not recommended. Contraindicated in anuria.

## CONTRAINDICATIONS

Known allergy to conivaptan, corn, or corn products; anuria (no benefit can be expected), use with strong CYP3A4 inhibitors (see interactions), hypovolemic hyponatremia.

## INTERACTIONS

## Drug

**CYP3A4 inducers:** May decrease the levels and effects of conivaptan.

#### CYP3A4 inhibitors (e.g.,

erythromycin): May increase the levels and effects of conivaptan. Use with strong CYP3A4 inhibitors is contraindicated, including ketoconazole, itraconazole, clarithromycin, ritonavir, and indinavir. CYP3A4 substrates: Conivaptan may increase the levels and effects of CYP3A4 substrates, including midazolam and amlodipine, simvastatin, and other "statins." Avoid use of these agents during and for 1 wk after conclusion of treatment.

**Digoxin:** May increase the levels of digoxin.

#### Herbal

**St. John's wort:** May reduce conivaptan levels.

## IV INCOMPATIBILITIES

Lactated Ringer's. Do not mix or infuse with other medications, since no other information available.

## **IV COMPATIBILITIES**

Dextrose 5%, per manufacturer compatible with 0.9% NaCl (NS) for up to 22 h when coadministered via Y-site at a rate of 4.2 mL/h for conivaptan and 2.1 mL/h or 6.3 mL/h for NS.

## DIAGNOSTIC TEST EFFECTS

Increased sodium.

## SIDE EFFECTS

#### Frequent

Injection site reaction, headache. Occasional

Hypokalemia, thirst, vomiting, diarrhea, hypertension, orthostatic hypotension, polyuria, phlebitis, constipation, dry mouth, anemia, fever, nausea, confusion, erythema, insomnia, hyperglycemia or hypoglycemia, hyponatremia, pneumonia, urinary tract infection, hypomagnesemia, pain, dehydration, oral candidiasis, hematuria.

## SERIOUS REACTIONS

• Atrial fibrillation has been reported.

## PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with hyponatremia with underlying congestive heart failure or renal or hepatic impairment. The drug does not improve heart failure. Monitor neurologic status and sodium concentrations closely to avoid overly rapid correction of serum Na+ concentration (> 12 mEq/L over 24 h) during treatment. Monitor for signs of heart decompensation, orthostatic hypotension, and infusion site reactions, which may be frequent and uncomfortable.

Animal data indicate possible fetal harm; not recommended for use in pregnancy or lactation. There are no studies in children. For patients who develop hypovolemia or hypotension, conivaptan should be discontinued, and volume status and vital signs frequently monitored. May be resumed at a reduced dose if the patient remains hyponatremic as long as euvolemic and hypotension resolved.

#### Storage

Store premixed infusion at controlled room temperature. Protect from light. Do not remove overwrap until time of use. Do not freeze. Discard any unused portion.

#### Administration

! Only give in settings where serum Na concentrations, volume status, and blood pressure can be monitored closely.

Loading dose: Administer 20 mg/100 mL premixed flexible infusion over 30 min. Maintenance: For patients receiving 20 mg/day, administer one 20 mg/100 mL premixed flexible container over 24 h. For patients requiring a maintenance dose of 40 mg/day, administer 2 consecutive 20 mg/100 mL premixed flexible containers over 24 h.

Do not use premixed flexible containers in series connections as they may result in the formation of air embolism.

## Cortisone

kor'ti-sone **Cortone** Do not confuse cortisone with Cort-Dome.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

Classification: Glucocorticoid, short-acting

## MECHANISM OF ACTION

An adrenocortical steroid that inhibits the accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release and synthesis, and release of mediators of inflammation. Therapeutic Effect: Prevents or suppresses cell-mediated immune reactions. Decreases or prevents tissue response to inflammatory process.

## PHARMACOKINETICS

Slowly absorbed. Hepatic metabolism to inactive metabolites. Half-life: 0.5-2 h.

#### AVAILABILITY

Tablets: 25 mg.

## INDICATIONS AND DOSAGES

Dosage is dependent on the condition being treated and patient response.

#### Anti-inflammation, immunosuppression PO

Adults, Elderly. 25-300 mg/day in divided doses q12-24h. Children. 2.5-10 mg/kg/day in divided doses q6-8h.

## Physiologic replacement PO

Adults, Elderly. 25-35 mg/day. Children. 0.5-0.75 mg/kg/day in divided doses a8h.

## CONTRAINDICATIONS

Hypersensitivity to corticosteroids, administration of live-virus vaccine, peptic ulcers (except in life-threatening situations), systemic fungal infection.

#### INTERACTIONS

Drug Amphotericin: May increase hypokalemia. Digoxin: May increase digoxin toxicity caused by hypokalemia. Diuretics, insulin, oral hypoglycemics, potassium supplements: May decrease the effects of these drugs. Hepatic enzyme inducers: May decrease the effects of cortisone. Live-virus vaccines: May decrease the patient's antibody response to vaccine, increase vaccine side effects, and potentiate virus replication. Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose and serum lipid, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

Cortisone (Generic Name)

### SIDE EFFECTS

## Frequent

Insomnia, heartburn, anxiety, abdominal distention, increased diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea or constipation.

## Occasional

Headache, edema, change in skin color, frequent urination.

## Rare

Tachycardia, allergic reaction (such as rash and hives), psychologic changes, hallucinations, depression.

## SERIOUS REACTIONS

Long-term therapy may cause hypocalcemia, hypokalemia, muscle wasting in arms and legs, osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, and congestive heart failure.
Abrupt withdrawal following longterm therapy may cause anorexia, nausea, fever, headache, joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with diabetes, cirrhosis, congestive heart failure, glaucoma, history of tuberculosis (cortisone may reactivate tuberculosis disease), hypertension, hypothyroidism, nonspecific ulcerative colitis, osteoporosis, psychosis, seizure disorders, and thromboembolic disorders. Monitor growth and development of children receiving long-term corticosteroid therapy. Dentist or other physicians should be informed of cortisone therapy if taken within the past 12 mo.

Not recommended for use during pregnancy or breastfeeding; other corticosteroids normally employed if needed.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. Blood glucose level, BP, serum electrolyte levels, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms. In long-term therapy, signs and symptoms of hypocalcemia should be assessed.

#### Storage

Store at room temperature. Protect from light and moisture.

### Administration

Do not abruptly discontinue the drug; the drug must be withdrawn gradually under medical supervision. May be taken with food to reduce GI irritation.

#### Cosyntropin

kos-syn-troe'pin Cortrosyn Do not confuse Cortrosyn with colchicine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Hormones/ hormone modifiers

## MECHANISM OF ACTION

A glucocorticoid that stimulates initial reaction in synthesis of adrenal steroids from cholesterol. *Therapeutic Effect:* Increases endogenous corticoid synthesis.

## PHARMACOKINETICS

Time to peak for IM and IV push dose about 1 h. Plasma cortisol levels rise within 5 min; peak plasma cortisol levels are reached within 45-60 min.

## AVAILABILITY

Powder for Reconstitution: 0.25 mg (Cortrosyn). Injection Solution (IV use only): 0.25 mg/ml (Cortrosin).

## INDICATIONS AND DOSAGES

 Screening test for adrenal function IM or DIRECT IV

Adults, Elderly, Children 2 yr and older: 0.25-0.75 mg one time. Children < 2 yr. 0.125 mg one time. Neonates. 0.015 mg/kg/dose. IV, INFUSION Adults. 0.25 mg in D5W or 0.9% NaCl infused at rate of 0.04 mg/h.

## CONTRAINDICATIONS

Hypersensitivity to cosyntropin or corticotrophin.

## INTERACTIONS

#### Drug

**Bupropion:** May lower seizure threshold.

Fluoroquinolones: May increase risk for tendon rupture.

**Itraconazole:** May increase cosyntropin plasma concentrations and side effects.

Rotavirus vaccine: May increase risk of infection by live vaccine. Herbal

Echinacea, ma huang: May decrease effectiveness of cosyntropin.

Licorice: May increase risk of corticosteroid side effects.

**Saiboku-to:** May increase and prolong effect of cosyntropin.

## Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATABILITIES

Do not add to blood or plasma as it is apt to be inactivated by enzymes.

## SIDE EFFECTS

Occasional

Nausea, vomiting.

## Rare

Hypersensitivity reaction (fever, pruritus). Bradycardia, tachycardia, increased blood pressure, peripheral edema, rash.

## SERIOUS REACTIONS

None reported.

## **PRECAUTIONS & CONSIDERATIONS**

Be aware that short duration for diagnostic use does not produce effects of long-term cosyntropin therapy. It is unknown whether cosyntropin crosses the placenta or is distributed in breast milk. No agerelated precautions have been noted in children or in elderly patients.

If an allergic reaction with itching, hives, swelling in face or hands, swelling or tingling in mouth or throat, tightness in chest, and trouble breathing occurs, notify the physician.

The following criteria may be used as guidelines to determine whether there has been a normal response to cosyntropin:

• Morning control plasma cortisol concentration exceeds 5 mcg (0.005 mg) per 100 mL.

• 30-min cortisol concentration shows an increase of at least 7 mcg (0.007 mg) per 100 mL above the control level.

• 30-min cortisol concentration exceeds 18 mcg (0.018 mg) per 100 mL.

• If a 60-min test interval is used, a normal response to cosyntropin

is shown by a plasma cortisol concentration that is approximately 2 times the baseline concentration.

## Storage

Store unreconstituted product at room temperature.

When constituted with 0.9% NaCl, cosyntropin is stable for 24 h at room temperature.

#### Administration

Each 0.25 mg of cosyntropin is equivalent to 25 units of corticotrophin. Peak plasma cortisol concentrations usually occur 45-60 min after cosyntropin administration.

NOTE: The manufacture-supplied injection solution is *not* for IM use; only use IV.

For IM injection, 1 mL of diluent provided (0.9% NaCl injection) should be added to the vial containing 0.25 mg of cosyntropin. The resultant solution contains 0.25 mg of cosyntropin per mL.

Two alternative methods of administration are IV injection or IV infusion. The solution can be injected in 2-5 mL of 0.9% NaCl injection over a 2-minute period.

For IV infusion, cosyntropin may be further diluted with D5W or 0.9% NaCl injection. Administer 0.25 mg in D5W or 0.9% NaCl infused at rate of 0.04 mg/h over a 6-h period.

## Cromolyn

kroe'moe-lin ★ Crolom, Gastrocrom, Intal, Nasalcrom ▲ Apo-Cromolyn, Nalcrom, Opticrom, Rhinaris-CS

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiasthmatic, mast cell stabilizer, ophthalmic anti-inflammatory, respiratory anti-inflammatory

## **MECHANISM OF ACTION**

An antiasthmatic and antiallergic agent that prevents mast cell release of histamine, leukotrienes, and slow-reacting substances of anaphylaxis by inhibiting degranulation after contact with antigens. *Therapeutic Effect:* Helps prevent symptoms of asthma, allergic rhinitis, mastocytosis, and exercise-induced bronchospasm.

## PHARMACOKINETICS

Minimal absorption after PO, inhalation, or nasal administration. Absorbed portion excreted in urine or by biliary system. *Half-life:* 80-90 min.

## AVAILABILITY

Oral Concentrate (Gastrocrom): 100 mg/5 mL. Nasal Spray (Nasalcrom): 5.2 mg/actuation. Solution for Nebulization: 10 mg/mL. Ophthalmic Solution (Crolom): 4%.

## INDICATIONS AND DOSAGES Asthma

INHALATION (NEBULIZATION) Adults, Elderly, Children older than 2 yr. 20 mg 3-4 times a day.

Prevention of bronchospasm INHALATION (NEBULIZATION) Adults, Elderly, Children older than 2 yr. 20 mg within 1 h before

exercise or exposure to allergens.

## Food allergy, inflammatory bowel disease

#### PO

Adults, Elderly, Children older than 12 yr. 200-400 mg 4 times a day. Children 2-12 yr. 100-200 mg 4 times a day. Maximum: 40 mg/ kg/day.

If patient has renal or hepatic impairment, consider dose reduction.

Allergic rhinitis

INTRANASAL

Adults, Elderly, Children older than 6 yr: 1 spray each nostril 3-4 times a day. May increase up to 6 times a day. > Systemic mastocytosis

#### Systemic mastocytosis PO

Adults, Elderly, Children older than 12 yr. 200 mg 4 times a day. Children 2-12 yr. 100 mg 4 times a day. Maximum: 40 mg/kg/day. Children younger than 2 yr. 20 mg/kg/day in 4 divided doses. Maximum: 30 mg/kg/day (children 6 mo to 2 yr).

#### • Allergic-type conjunctivitis OPHTHALMIC

*Adults, Elderly, Children older than 4 yr.* 1-2 drops in both eyes 4-6 times a day.

## CONTRAINDICATIONS

Hypersensitivity; drug has no role in treatment of status asthmaticus.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

PO: Headache, diarrhea. Inhalation: Cough, dry mouth and throat, stuffy nose, throat irritation, unpleasant taste. Nasal: Nasal burning, stinging, or irritation; increased sneezing. Ophthalmic: Eye burning or stinging.

## Occasional

PO: Rash, abdominal pain, arthralgia, nausea, insomnia. Inhalation: Bronchospasm, hoarseness, lacrimation. Nasal: Cough, headache, unpleasant taste, postnasal drip.

Ophthalmic: Lacrimation and itching of eye.

## Rare

Inhalation: Dizziness, painful urination, arthralgia, myalgia, rash. Nasal: Epistaxis, rash.

Ophthalmic: Chemosis or edema of conjunctiva, eye irritation.

## SERIOUS REACTIONS

• Anaphylaxis occurs rarely when cromolyn is given by the inhalation, nasal, or oral route.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with arrhythmias and coronary artery disease. When discontinuing the drug, taper the dosage cautiously because symptoms may recur. It is unknown whether cromolyn crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children. Agerelated hepatic and renal impairment may require a dosage adjustment in elderly patients. Drink plenty of fluids to decrease the thickness of lung secretions.

Baseline exercise and activity tolerance should be established. Pulse rate and quality and respiratory rate, depth, rhythm, and type should be monitored. Observe for cyanosis manifested as lips and fingernails with a blue or dusky color in lightskinned patients, a gray color in dark-skinned patients.

## Storage

Oral concentrate ampules should be kept in foil packet and protected from light at room temperature until time of use. Do not use if it contains a precipitate (particles or cloudiness) or becomes discolored. All other dosage forms are kept at room temperature.

#### Administration

Take oral cromolyn at least 30 min before meals. Pour contents of capsule into water and stir until completely dissolved. Do not mix the drug with food, fruit juice, or milk.

For inhalation, do not mix with other drugs in the nebulizer.

For intranasal use, clear nasal passages as much as possible; a nasal decongestant may be required. Tilt the head slightly forward. Insert the spray tip into the nostril, pointing toward the nasal passages, away from the nasal septum. Spray into the nostril while holding the other nostril closed, and at the same time, inhale through the nose to deliver the medication as high into the nasal passages as possible.

For ophthalmic use, place a finger on the lower eyelid and pull it down until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket and instill the prescribed number of drops into the pocket. Close the eyes gently. Apply gentle finger pressure to the lacrimal sac after instillation to lessen systemic absorption.

### Crotamiton

kroe-tam'i-ton Eurax Do not confuse Eurax with Euflex, Eulexin, or Evoxac.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Anti-infectives, topical, scabicides/pediculicides

## MECHANISM OF ACTION

A scabicidal agent whose exact mechanism is unknown. *Therapeutic Effect:* Scabicidal activity against *Sarcoptes scabiei*.

## PHARMACOKINETICS

Not known.

## AVAILABILITY

Cream: 10% (Eurax). Lotion: 10% (Eurax).

## INDICATIONS AND DOSAGES Treatment of scabies

TOPICAL

Adults, Elderly, Children. Wash and scrub away loose scales and towel dry. Apply a thin layer and massage into the skin over the entire body with special attention to skinfolds, creases, and interdigital spaces. Repeat application in 24 h. Take a cleansing bath 48 h after the final application. Treatment may be repeated after 7-10 days if live mites are still present.

## Pruritus due to a variety of skin conditions

TOPICAL

Adults, Elderly, Children. Massage into affected areas until medication is completely absorbed. Repeat as needed. Most find relief with 2-3 applications per day. The need to use may resolve by about 5 days unless prescriber prolongs course.

#### **OFF-LABEL USES**

Pediculosis capitis.

#### CONTRAINDICATIONS

Hypersensitivity to crotamiton or any one of its components.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional

Itching, burning, irritation, warm sensation, contact dermatitis.

## SERIOUS REACTIONS

None known.

## PRECAUTIONS & CONSIDERATIONS

It is unknown whether crotamiton crosses the placenta or is distributed in breast milk. Safety and efficacy of crotamiton have not been established in children. No age-related precautions have been noted in elderly patients.

## Storage

Store at room temperature.

#### Administration

Avoid contact with eyes and mucous membranes; do not apply to inflamed skin. Shake lotion well before use.

For scabies: After bathing, massage gently and well into the skin from the chin to the toes, including folds and creases and under fingernails after trimming fingernails short. Apply again 24 h later. A 60-g tube/bottle is sufficient for the 2 applications. Clothing and bed linen should be changed the next day and may be dry-cleaned, or washed in the hot cycle of the washing machine. A cleansing bath should be taken 48 h after the last application.

## Cyanocobalamin (Vitamin B<sub>12</sub>)

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: A (C if used in doses above recommended daily allowance)

**Classification:** Vitamin B<sub>12</sub>, water-soluble vitamin

## MECHANISM OF ACTION

Acts as a coenzyme for various metabolic functions, including fat and carbohydrate metabolism and protein synthesis. *Therapeutic Effect:* Necessary for cell growth and replication, hematopoiesis, and myelin synthesis.

## PHARMACOKINETICS

In the presence of calcium, absorbed systemically in lower half of ileum. Initially, bound to intrinsic factor; this complex passes down intestine, binding to receptor sites on ileal mucosa. Protein binding: High. Metabolized in the liver. Primarily eliminated unchanged in urine. *Half-life:* 6 days.

## AVAILABILITY

*Lozenge:* 50 mcg, 100 mcg, 250 mcg, 500 mcg. *Tablets:* 50 mcg, 100 mcg, 250 mcg, 500 mcg, 1000 mcg, 5000 mcg. *Tablet (Extended Release):* 1000 mcg, 1500 mcg. *Tablet (Sublingual):* 1000 mcg, 2500 mcg, 5000 mcg. *Injection:* 1000 mcg/mL. *Nasal Solution:* 500 mcg/0.1 mL actuation.

## INDICATIONS AND DOSAGES Pernicious anemia

IM, SUBCUTANEOUS Adults, Elderly. 100 mcg/day for 7 days, then every other day for 7 days, then every 3-4 days for 2-3 wks. Maintenance: 100 mcg/mo. Children. 30-50 mcg/day for 2 or more weeks. Maintenance: 100 mcg/mo. Neonates. 1000 mcg/day for 2 or more weeks. Maintenance: 50 mcg/mo.

#### Uncomplicated vitamin B<sub>12</sub> deficiency PO

Adults, Elderly. 1000-2000 mcg/day. IM, SUBCUTANEOUS Adults, Elderly. 100 mcg/day for 5-10 days, followed by 100-200 mcg/mo.

Cyanocobalamin (Vitamin B<sub>12</sub>) (Generic Name)

#### NASAL (NASCOBAL)

*Adults*. 500 mcg in one nostril once weekly.

Complicated vitamin B<sub>12</sub> deficiency IM, SUBCUTANEOUS Adults, Elderly. 1000 mcg (with IM or IV folic acid 15 mg) as a single dose, then 1000 mcg/day plus oral folic acid 5 mg/day for 7 days.

## CONTRAINDICATIONS

Folic acid deficiency anemia, hereditary optic nerve atrophy, history of allergy to cobalamins.

## INTERACTIONS

#### Drug

Alcohol, colchicines, metformin, proton-pump inhibitors: May decrease the absorption of cyanocobalamin. Octreotide: May decrease cyanocobalamin blood concentration. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Occasional Diarrhea, pruritus.

#### SERIOUS REACTIONS

• Impurities in preparation may cause a rare allergic reaction.

 Peripheral vascular thrombosis, pulmonary edema, hypokalemia, and congestive heart failure may occur.

## PRECAUTIONS & CONSIDERATIONS

Cyanocobalamin crosses the placenta and is excreted in breast milk. No age-related precautions have been noted in children or in elderly patients. Eating foods rich in vitamin B<sub>12</sub>, including clams, dairy products, egg yolks, fermented cheese, herring, muscle and organ meats, oysters, and red snapper, is encouraged.

Notify the physician of symptoms of infection. Serum potassium level, which normally ranges from 3.5 to 5 mEq/L, and serum cyanocobalamin level, which normally ranges from 200 to 800 mcg/mL, should be monitored. Also, watch for a rise in the blood reticulocyte count, which peaks in 5-8 days. Reversal of deficiency symptoms (anorexia, ataxia, fatigue, hyporeflexia, insomnia, irritability, loss of positional sense, pallor, and palpitations on exertion) should also be assessed. A therapeutic response to treatment usually occurs within 48 h.

## Administration

Take oral cyanocobalamin with meals to increase absorption.

Before the initial dose, activate Nascobal spray nozzle by pumping until first appearance of spray, and then prime twice more. The unit must be reprimed once immediately before each subsequent use. Administer 1 h before or after ingestion of hot foods or liquids.

Injection is administrered IM or by deep subcutaneous injection; intravenous (IV) injection is not usually recommended as it is excreted more readily by that route. However, cyanocobalamin may be mixed with TPN solutions.

## Cyclobenzaprine

sye-kloe-ben'za-preen Amrix, Fexmid, Flexeril Do not confuse cyclobenzaprine with cycloserine or cyproheptadine, or Flexeril with Floxin, or Amrix with Arixtra.

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

**Classification:** Skeletal muscle relaxant, centrally acting tricyclic

Cyclobenzaprine (Generic Name)

## **MECHANISM OF ACTION**

A centrally acting skeletal muscle relaxant that reduces tonic somatic muscle activity at the level of the brainstem. *Therapeutic Effect:* Relieves local skeletal muscle spasm.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	3-4 h	12-24 h

Well but slowly absorbed from the GI tract. Protein binding: 93%. Metabolized in the GI tract and the liver. Primarily excreted in urine. *Half-life:* 1-3 days.

## AVAILABILITY

Capsule (Extended Release, Amrix): 15 mg, 30 mg. Tablets: 5 mg, 7.5 mg, 10 mg.

## INDICATIONS AND DOSAGES Acute, painful musculoskeletal conditions

PO

*Adults.* Initially, 5 mg 3 times a day. May increase to 10 mg 3 times a day OR 15 mg extended-release capsule once daily. May increase to 30 mg once daily.

*Elderly.* 5 mg 3 times a day; extended-release capsules not recommended in elderly patients.

## Dosage in hepatic impairment

*Mild:* 5 mg 3 times a day; extendedrelease capsules not recommended in hepatic impairment. *Moderate and severe:* Not recommended.

## **OFF-LABEL USES**

Treatment of fibromyalgia.

## CONTRAINDICATIONS

Hypersensitivity, acute recovery phase of MI, arrhythmias, congestive heart failure, heart block, conduction disturbances, hyperthyroidism, use within 14 days of MAOIs.

#### INTERACTIONS Drug

Alcohol, other CNS depression– producing medications (such as tricyclic antidepressants): May increase CNS depression.

**MAOIs:** May increase the risk of hypertensive crisis and severe seizures. Contraindicated.

## Herbal

Valerian, kava kava, gotu kola: May increase CNS depression.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS Frequent

Somnolence (39%), dry mouth (27%), dizziness (11%).

## Rare (1%-3%)

Fatigue, asthenia, blurred vision, headache, nervousness, confusion, nausea, constipation, dyspepsia, unpleasant taste.

## SERIOUS REACTIONS

 Overdose may result in visual hallucinations, hyperactive reflexes, muscle rigidity, vomiting, and hyperpyrexia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with angleclosure glaucoma, impaired hepatic or renal function, increased intraocular pressure, and history of urine retention. It is unknown whether cyclobenzaprine crosses the placenta or is distributed in breast milk. The safety and efficacy of cyclobenzaprine have not been established in children. Elderly patients have an increased sensitivity to the drug's anticholinergic effects, such as confusion and urine retention. Drowsiness may occur but usually diminishes with continued therapy. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills. Change positions slowly to help avoid the drug's hypotensive effects. Therapeutic response, such as decreased skeletal muscle pain, stiffness, and tenderness and improved mobility, should be assessed.

## Storage

Store all products at room temperature. Keep tightly closed.

## Administration

Do not administer cyclobenzaprine for longer than 2-3 wks without reevaluation. Take cyclobenzaprine without regard to food. Take extendedrelease capsules at roughly the same time daily; do not crush or chew.

## Cycloserine

sye-kloe-ser'een ★ Seromycin Do not confuse cycloserine with cyclosporine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification:

Antimycobacterials

#### **MECHANISM OF ACTION**

An antitubercular that inhibits cell wall synthesis by competing with the amino acid D-alanine for incorporation into the bacterial cell wall. *Therapeutic Effect:* Causes disruption of bacterial cell wall. Bactericidal or bacteriostatic.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. No protein binding. Widely distributed (including cerebrospinal fluid [CSF]). Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 10 h.

## AVAILABILITY

Capsules: 250 mg (Seromycin).

## INDICATIONS AND DOSAGES Tuberculosis

Adults, Elderly. 250 mg q12h for 14 days, then 500 mg to 1g/day in 2 divided doses for 18-24 mo. Maximum: 1 g as a single daily dose. Adjust dose to keep levels < 30 mcg/mL. *Children*. 10-20 mg/kg/day in 2 divided doses. Maximum: 1000 mg/day for 18-24 mo.

Dosage in renal impairment Data are limited; adjust dosing to keep levels < 30 mcg/ml. Estimated adjustments based on CrCl:

Creatinine Clearance (mL/min)	Dosage Interval
10-50	q24h
< 10	q36-48h

## **OFF-LABEL USES**

Gaucher's disease, acute urinary tract infections.

## CONTRAINDICATIONS

Epilepsy, depression, severe anxiety, psychosis, severe renal insufficiency, excessive concurrent use of alcohol, history of hypersensitivity reactions with previous cycloserine therapy.

## INTERACTIONS

#### Drug

Alcohol: May increase CNS effects. Isoniazid, ethionamide: May

increase cycloserine toxicity.

**Phenytoin:** May increase the risk of epileptic seizures.

## Herbal

**Vitamin B**<sub>12</sub>: May decrease vitamin  $B_{12}$ .

Folic acid: May decrease folic acid.

## Cyclophosphamide sye-kloe-foss'fa-mide

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: D

**Classification:** Antineoplastic alkylating agent

Cyclophosphamide (Generic Name)

## **MECHANISM OF ACTION**

An alkylating agent that inhibits DNA and RNA protein synthesis by cross-linking with DNA and RNA strands, preventing cell growth. Cell cycle–phase nonspecific. *Therapeutic Effect:* Potent immunosuppressant.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: Low. Crosses the blood-brain barrier. Metabolized in the liver to active metabolites. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 3-12 h.

## AVAILABILITY

*Injection, Powder for Solution:* 500 mg, 1 g, 2 g. *Tablets:* 25 mg, 50 mg.

## INDICATIONS AND DOSAGES

NOTE: Regimens vary widely with indication for use, other medications

employed. Consult specialized references to confirm protocols.

Ovarian adenocarcinoma, breast carcinoma, Hodgkin's disease, non-Hodgkin's lymphoma, multiple myeloma, leukemia (acute lymphoblastic, acute myelogenous, acute monocytic, chronic granulocytic, chronic lymphocytic), mycosis fungoides, disseminated neuroblastoma, retinoblastoma PO

Adults. 1-5 mg/kg/day. Children. Initially, 2-8 mg/kg/day. Maintenance: 2-5 mg/kg twice a week. IV

*Adults.* 40-50 mg/kg in divided doses over 2-5 days, 10-15 mg/kg every 7-10 days, or 3-5 mg/kg twice a week.

*Children.* 2-8 mg/kg/day for 6 days or total dose for 7 days once a week.

## Biopsy-proven minimal-change nephrotic syndrome PO

Adults, Children. 2.5-3 mg/kg/day for 60-90 days.

## CONTRAINDICATIONS

Severely depressed bone marrow function; hypersensitivity to cyclophosphamide.

## INTERACTIONS

## Drug

Allopurinol: Increased cyclophosphamide levels. Cyclosporine: Decreased cyclosporine levels. Succinylcholine: Prolonged succinylcholine effects. Vaccines, Live: Increased risk of infection by live vaccine. Warfarin: Increased risk elevated INR and bleeding. Herbal St. John's wort: Reduced

cyclophosphamide effectiveness.

## DIAGNOSTIC TEST EFFECTS

Myelosuppression risk, monitor CBC with differential and platelets; nephrotoxicity risk, monitor BUN, urinalysis, and serum creatinine.

## IV INCOMPATIBILITIES

Amphotericin B cholesteryl sulfate complex, diazepam, lansoprazole (Prevacid IV), phenytoin.

## SIDE EFFECTS

#### Expected

Marked leukopenia 8-15 days after initial therapy.

## Frequent

Nausea, vomiting (beginning about 6 h after administration and lasting about 4 h), alopecia.

#### Occasional

Diarrhea, darkening of skin and fingernails, stomatitis, headache, diaphoresis.

#### Rare

Pain or redness at injection site.

## SERIOUS REACTIONS

• Cyclophosphamide's major toxic effect is myelosuppression resulting in blood dyscrasias, such as leukopenia, anemia, thrombocytopenia, and hypoprothrombinemia.

• Expect leukopenia to resolve in 17-28 days. Anemia generally occurs after large doses or prolonged therapy. Thrombocytopenia may occur 10-15 days after drug initiation.

• Hemorrhagic cystitis occurs commonly in long-term therapy, especially in pediatric patients.

 Pulmonary fibrosis and cardiotoxicity have been noted with high doses.

• Amenorrhea, azoospermia, and hyperkalemia may also occur.

Permanent or long-standing sterility is a possibility.

Anaphylactoid reactions may rarely occur.

## **PRECAUTIONS & CONSIDERATIONS**

Ensure adequate fluid intake and frequent voiding to reduce occurrence of hemorrhagic cystitis. Use with caution in patients with leukopenia, thrombocytopenia, tumor cell infiltration of bone marrow, previous radiation therapy, previous therapy with other cytotoxic agents, impaired hepatic function, or impaired renal function. Emetic potential ranges from very high with high doses to moderate with oral therapy. Women of childbearing potential should be advised to avoid becoming pregnant. Avoid use during breastfeeding. No unique precautions in pediatric patients or in elderly patients.

#### Storage

Store unopened vials and tablets at room temperature, but protect against temperatures  $> 86^\circ$  F, which cause melting. The injection (when prepared for either direct injection or infusion) is stable for 24 h at room temperature or for 6 days in the refrigerator. Extemporaneous oral liquids are prepared by dissolving the oral drug in Aromatic Elixir, N.F. and may be stored under refrigeration in glass containers and used within 14 days.

#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing cytotoxic drugs.

Administer orally during or after meals. Do not crush or cut tablets. To reduce risk of bladder irritation, do not administer tablets at bedtime.

Parenteral product is most commonly given by either direct IV injection or by IV infusion. When given by direct IV injection, *only* dilute with 0.9% NaCl; dilution with water creates a hypotonic solution that cannot be directly injected.

For IV infusion, may reconstitute with sterile water for injection,

OR 0.9% NaCl, and then *further* dilute in one of the following: D5W, D5NS, D5LR, LR, 0.45% NaCl, or  $\frac{1}{6}$  M sodium lactate injection. Infusions are typically given over 1 hr.

## DIAGNOSTIC TEST EFFECTS

Toxic cycloserine concentrations: > 30 mcg/mL.

## SIDE EFFECTS

#### Occasional

Drowsiness, headache, dizziness, vertigo, seizures, confusion, psychosis, paresis, tremor, vitamin B<sub>12</sub> deficiency, folate deficiency, cardiac arrhythmias, increased liver enzymes.

## SERIOUS REACTIONS

 Neurotoxicity, as evidenced by confusion, agitation, CNS depression, psychosis, coma, and seizures, occurs rarely. Neurotoxic effects of cycloserine may be treated and prevented with the administration of 200-300 mg of pyridoxine daily.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with epilepsy, depression, severe anxiety, psychosis, severe renal disease, and chronic alcoholism. Hypersensitivity reactions to cycloserine should be determined before starting treatment. Cycloserine crosses the placenta and is excreted in breast milk. No age-related precautions have been noted in children or in elderly patients. Cycloserine concentrations should be monitored. Toxicity is greatly increased at levels more than 30 mcg/mL.

Drowsiness, mental confusion, dizziness, or tremors may occur during treatment. Excessive amounts of alcoholic beverages should be avoided.

#### Storage

Store at room temperature. Administration May be taken with food.

Pyridoxine (vitamin  $B_6$ ) may be

coadministered to help prevent neurotoxicity.

## Cyclosporine

sye-kloe-spor'in Gengraf, Neoral, Restasis, Sandimmune Do not confuse cyclosporine with cycloserine, cyclophosphamide, or Cyklokapron.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

## Classification:

Immunosuppressant

## **MECHANISM OF ACTION**

A cyclic polypeptide that inhibits both cellular and humoral immune responses by inhibiting interleukin-2, a proliferative factor needed for T-cell activity. *Therapeutic Effect:* Prevents organ rejection and relieves symptoms of psoriasis and arthritis.

## PHARMACOKINETICS

Variably absorbed from the GI tract. Protein binding: 90%. Widely distributed. Metabolized in the liver. Eliminated primarily by biliary or fecal excretion. Not removed by hemodialysis. *Half-life*: Adults, 10-27 h; children, 7-19 h.

#### AVAILABILITY

Capsules, Softgel (Sandimmune): 25 mg, 100 mg. Capsules, Softgel [modified] (Gengraf, Neoral): 25 mg, 100 mg. Oral Solution (Sandimmune): 100 mg/mL in 50-mL bottle with calibrated liquid measuring device.

Cyclosporine (Generic Name)

Oral Solution [modified] (Gengraf, Neoral): 100 mg/mL. Injection (Sandimmune): 50 mg/mL. Ophthalmic Emulsion (Restasis): 0.05%.

## INDICATIONS AND DOSAGES

! Sandimmune capsules and oral solution have decreased bioavailability compared with the Gengraf and Neoral modified capsules and oral solution. Gengraf, Neoral, and generic modified cyclosporine formulations are not bioequivalent to Sandimmune. Blood concentration monitoring should be used to guide dosing changes and conversion between formulations.

## Transplantation, prevention of organ rejection

PO

Adults, Elderly, Children. 10-18 mg/ kg/dose given 4-12h before organ transplantation. Maintenance: 5-15 mg/kg/day in divided doses, then tapered to 3-10 mg/kg/day. IV

Adults, Elderly, Children. Initially, 5-6 mg/kg/dose given 4-12h before organ transplantation. Maintenance: 2-10 mg/kg/day in divided doses.

## Rheumatoid arthritis PO

*Adults, Elderly.* Initially, 2.5 mg/kg/ day in 2 divided doses. May increase by 0.5-0.75 mg/kg/day. Maximum: 4 mg/kg/day.

## Psoriasis

#### РО

Adults, Elderly. Initially, 2.5 mg/kg/ day in 2 divided doses. May increase by 0.5 mg/kg/day. Maximum: 4 mg/ kg/day.

## Dry eye

## OPHTHALMIC

Adults, Elderly. Instill 1 drop in each affected eye q12h.

## **OFF-LABEL USES**

Treatment of alopecia areata, aplastic anemia, atopic dermatitis, Behçet's syndrome, biliary cirrhosis, prevention of corneal transplant rejection.

## CONTRAINDICATIONS

History of hypersensitivity to cyclosporine or polyoxyethylated castor oil; contraindicated in psoriasis and rheumatoid arthritis patients with abnormal renal function, uncontrolled hypertension, or malignancies; contraindicated with concurrent PUVA or UVB therapy, methotrexate or other immunosuppressives, coal tar, or radiation therapy in psoriasis patients; ophthalmic contraindicated in patients with active ocular infection.

Check for contraindicated drugs due to serious interactions.

## INTERACTIONS

NOTE: Many drugs may cause serious drug interactions with cyclosporine; check carefully. Notable interactions are listed here.

## Drug

ACE inhibitors, potassium-sparing diuretics, potassium supplements: May cause hyperkalemia. Bosentan: Cyclosporine greatly increases bosentan concentrations. Contraindicated.

Cimetidine, danazol, diltiazem, erythromycin, ketoconazole, itraconazole, methotrexate, protease inhibitors, voriconazole:

May increase cyclosporine concentration and risk of hepatotoxicity and nephrotoxicity. **Immunosuppressants:** May

increase risk of infection and lymphoproliferative disorders.

Live-virus vaccines: May increase vaccine side effects, potentiate virus replication, and decrease the patient's antibody response to the vaccine.

## HMG-CoA reductase inhibitors:

Cyclosporine may increase statin levels and increase the risk of acute renal failure and rhabdomyolysis. Pitavastatin is contraindicated; many other statin agents require dose reduction.

## Carbamazepine, oxcarbazepine, phenobarbital, phenytoin, rifampin, sulfasalazine, ticlopidine: May decrease cyclosporine levels. Herbal

**St. John's wort:** May decrease cyclosporine plasma levels. Contraindicated.

#### Food

## Grapefruit, grapefruit juice:

May increase the absorption and risk of toxicity of cyclosporine. Avoid.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, amylase, bilirubin, creatinine, potassium, uric acid, AST (SGOT), and ALT (SGPT) levels. May decrease serum magnesium level. Therapy is usually guided by trough concentrations, with desired whole blood trough 150-400 ng/mL; plasma trough 50-125 ng/mL.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), diazepam, drotecogin alfa (Xigris), magnesium, phenobarbital, phenytoin, voriconazole (VFend).

### SIDE EFFECTS

#### Frequent

Mild to moderate hypertension (26%), hirsutism (21%), tremor (12%). Occasional (2%-4%)

Acne, leg cramps, gingival hyperplasia (marked by red, bleeding, and tender gums), paresthesia, diarrhea, nausea, vomiting, headache.

#### Rare (<1%)

Hypersensitivity reaction, abdominal discomfort, gynecomastia, sinusitis.

## SERIOUS REACTIONS

Mild nephrotoxicity occurs in 25% of renal transplant patients, 38% of cardiac transplant patients, and 37% of liver transplant patients, generally 2-3 mo after transplantation (more severe toxicity generally occurs soon after transplantation). Hepatotoxicity occurs in 4% of renal transplant patients, 7% of cardiac transplant patients, and 4% of liver transplant patients, generally within the first month after transplantation. Both toxicities usually respond to dosage reduction.

 Severe hyperkalemia and hyperuricemia occur occasionally.

• Increased infection risk due to immunosuppression.

• Use may increase risk of nonmelanoma skin cancers.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac impairment, chickenpox, herpes zoster infection, hypokalemia, malabsorption syndrome, renal or hepatic impairment, and pregnant women. Cyclosporine readily crosses the placenta and is distributed in breast milk. Women taking this drug should not breastfeed. No agerelated precautions have been noted in children. Elderly patients are at increased risk for hypertension and an increased serum creatinine level.

Headache, excessive hair growth, gum disease, and tremor may occur. Good oral hygiene should be maintained to prevent gingivitis. Renal function studies, liver function tests, and drug levels should be monitored before beginning cyclosporine therapy and regularly during treatment. Mild toxicity is characterized by a slow rise in serum levels; more overt toxicity, by a rapid rise in serum levels. Hematuria is also noted in nephrotoxicity. Serum potassium level for hyperkalemia and BP for hypertension should also be assessed.

#### Storage

The capsules should be kept in original foil wrapping and stored in a dry, cool environment, away from direct light. Do not refrigerate the oral solution because it may separate. The liquid form should be kept in the amber-colored glass container. Discard the oral solution 2 mo after the bottle has been opened. Store the parenteral form at room temperature and protect it from light. After diluted, solution is stable for 24 h. Store ophthalmic emulsion at room temperature.

#### Administration

! Always confirm the formulation prescribed, as the different cyclosporine formulas are not interchangeable.

For the oral solutions, always measure dose with calibrated device that comes with the bottle. In a glass container, mix Sandimmune oral solution with room-temperature milk, chocolate milk, or orange juice or mix Neoral or Gengraf oral solution with room temperature orange or apple juice. Stir the mixture well, and have the patient drink it immediately. Avoid using Styrofoam containers because the liquid form of the drug may adhere to the wall of the container. Add more diluent to the glass container and mix it with the remaining solution to ensure that the total amount of cyclosporine is swallowed. Dry the outside of the measuring device before replacing it in its cover. Do not rinse it with water. Take the drug at the same time each day.

All oral cyclosporine dosage forms should be taken consistently with regard to time of day and relation to meals. Do not give with grapefruit juice.

For IV use, dilute each milliliter of injection with 20-100 mL 0.9% NaCl or D5W. Infuse the solution over 2-6 h. Monitor continuously for the first 30 min of the infusion and frequently thereafter for a hypersensitivity reaction, marked by facial flushing and dyspnea.

For ophthalmic use, invert vial several times to obtain a uniform suspension. Remove any contact lenses before administration. May reinsert lenses 15 min after drug administration. May use with artificial tears. Single-use vial; discard after use.

### Cyproheptadine

si-proe-hep'ta-deen **Do not confuse with cyclobenzaprine.** 

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Antihistamines, H<sub>1</sub> receptor antagonist, sedating

#### MECHANISM OF ACTION

An antihistamine that competes with histamine at histaminic receptor sites. Anticholinergic effects cause drying of nasal mucosa. Competes with serotonin at receptor sites in intestinal smooth muscle and other locations. Antagonism of serotonin on the appetite center of the

Cyproheptadine (Generic Name)

hypothalamus may account for cyproheptadine's ability to stimulate appetite and counteract some effects of SSRI antidepressants. *Therapeutic Effect*: Relieves allergic conditions (urticaria, pruritus).

## PHARMACOKINETICS

Well absorbed from GI tract. Metabolized in liver. Primarily eliminated in feces. *Half-life*: 16 h.

## AVAILABILITY

Syrup: 2 mg/5 mL. Tablets: 4 mg.

# INDICATIONS AND DOSAGES Allergic condition PO

Adults, Children older than 15 yr. 4 mg 3 times/day. May increase dose but do not exceed 0.5 mg/kg/day. Dose range 4-20 mg/day.

*Children 7-14 yr.* 4 mg 2-3 times/day, or 0.25 mg/kg daily in divided doses.

*Children 2-6 yr.* 2 mg 2-3 times/ day, or 0.25 mg/kg daily in divided doses.

Elderly. Initially, 4 mg 2 times/day.

## **OFF-LABEL USES**

Stimulation of appetite; treatment of anorgasmy secondary to SSRI use; treatment of serotonin-syndrome.

## CONTRAINDICATIONS

Acute asthmatic attack, patients receiving MAOIs, history of hypersensitivity to antihistamines.

## INTERACTIONS

#### Drug

Alcohol, central nervous system (CNS) depressants: May increase CNS depression.

**SSRI antidepressants:** May antagonize SSRI effects if used chronically.

MAOIs: May increase anticholinergic and CNS depressant effects. Protirelin: May decrease TSH response. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May suppress flare and wheal reaction to antigen skin testing unless drug is discontinued 4 days before testing. May increase SGPT (AST) levels.

## SIDE EFFECTS Frequent

Drowsiness, dizziness, muscular weakness, dry mouth/nose/throat/ lips, urinary retention, thickening of bronchial secretions. Sedation, dizziness, hypotension may be seen more commonly in elderly

## Occasional

Epigastric distress, flushing, visual disturbances, hearing disturbances, paresthesia, sweating, chills.

#### SERIOUS REACTIONS

 Children may experience dominant paradoxical reaction (restlessness, insomnia, euphoria, nervousness, tremors).

• Overdosage in children may result in hallucinations, convulsions, death.

• Hypersensitivity reaction (eczema, pruritus, rash, cardiac disturbances, angioedema, photosensitivity) may occur.

• Overdosage may vary from CNS depression (sedation, apnea, cardiovascular collapse, death) to severe paradoxical reaction (hallucinations, tremor, seizures).

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with narrowangle glaucoma, peptic ulcer,
prostatic hypertrophy, pyloroduodenal or bladder neck obstruction, asthma, COPD, increased intraocular pressure, cardiovascular disease, hyperthyroidism, hypertension, and seizure disorders. It is unknown whether cyproheptadine crosses the placenta or is distributed in breast milk. Safety and efficacy of cyproheptadine have not been established in newborns. Be aware that elderly patients are more likely to experience dizziness, sedation, confusion, and hypotension.

Dry mouth, drowsiness, and dizziness are expected side effects. Tolerance to sedative effects may occur. Avoid alcohol and tasks that require alertness and motor skills. **Storage** 

Store at room temperature. Administration

Give without regard to meals. Scored tablets may be crushed.

## **Cytarabine**

sye-tare'a-been Ara-C Cytosar Do not confuse cytarabine with Cytadren, Cytovene, or vidarabine. Do not confuse conventional Ara-C with DepoCyt, a liposomal form of cytarabine not discussed in this monograph.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastics, antimetabolites

## **MECHANISM OF ACTION**

An antimetabolite that is converted intracellularly to a nucleotide. Cell cycle-specific for S phase of cell division. *Therapeutic Effect:* May inhibit DNA synthesis. Potent immunosuppressive activity.

#### PHARMACOKINETICS

Widely distributed; moderate amount crosses the blood-brain barrier. Protein binding: 15%. Primarily excreted in urine. *Half-life:* 1-3 h.

#### AVAILABILITY

Injection Powder: 100 mg, 500 mg, 1 g, 2 g. Injection Solution: 20 mg/mL, 100 mg/mL.

#### INDICATIONS AND DOSAGES

 To induce remission in acute lymphocytic leukemia, acute and chronic myelocytic leukemia, or meningeal leukemia

IV

Adults, Elderly, Children. For acute non-lymphocytic leukemia, the usual dose in combination with other anticancer drugs is 100 mg/m<sup>2</sup> per day by continuous IV infusion (days 1-7) OR 100 mg/m<sup>2</sup> IV q12h (days 1-7). For acute lymphocytic leukemia, consult specialized resources for current protocols. INTRATHECAL *Adults, Elderly, Children.* The usual dose range is 5-75 mg/m<sup>2</sup>. The frequency of administration varies from once a day for 4 days, to once every 4 days. The most frequently used dose is 30 mg/m<sup>2</sup> every 4 days.

## **OFF-LABEL USES**

Treatment of Hodgkin's disease, myelodysplastic syndrome, non-Hodgkin's lymphoma.

### CONTRAINDICATIONS

None known.

## INTERACTIONS

#### Drug

Antigout medications: May decrease the effects of these drugs.

Bone marrow depressants: May increase myelosuppression. Cyclophosphamide: May increase the risk of cardiomyopathy. Digoxin: May decrease levels of digoxin.

Flucytosine: May decrease therapeutic effect of flucytosine. Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, uric acid, and AST (SGOT) levels.

#### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ganciclovir (Cytovene), insulin (regular).

## 🗏 IV COMPATIBILITIES

Dexamethasone (Decadron), diphenhydramine (Benadryl), filgrastim (Neupogen), granisetron (Kytril), hydromorphone (Dilaudid), lorazepam (Ativan), morphine, ondansetron (Zofran), potassium chloride, propofol (Diprivan).

#### SIDE EFFECTS

#### Frequent

IV, Subcutaneous (16%-33%): Asthenia, fever, pain, altered taste and smell, nausea, vomiting (risk greater with IV push than with continuous IV infusion).

Intrathecal (11%-28%): Headache, asthenia, altered taste and smell, confusion, somnolence, nausea, vomiting.

#### Occasional

IV, subcutaneous (7%-11%): Abnormal gait, somnolence, constipation, back pain, urinary incontinence, peripheral edema, headache, confusion.

Intrathecal (3%-7%): Peripheral edema, back pain, constipation, abnormal gait, urinary incontinence.

#### SERIOUS REACTIONS

 Myelosuppression may result in blood dyscrasias, such as leukopenia, anemia, thrombocytopenia, megaloblastosis, and reticulocytopenia, after a single IV dose.

 Leukopenia, anemia, and thrombocytopenia should be expected with daily or continuous IV therapy.

• Cytarabine syndrome (as evidenced by fever, myalgia, rash,

conjunctivitis, malaise, and chest pain) and hyperuricemia/tumor lysis syndrome may occur.

• Acute pancreatitis has been reported in patients receiving continuous infusions.

 High-dose cytarabine therapy may produce severe CNS, GI, and pulmonary toxicity.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in cardiomyopathy, hepatic impairment, and preexisting drug-induced bone marrow suppression. Caution should also be used in women of childbearing age. The use of contraception should be advised. It is unknown whether cytarabine is distributed in breast milk. Monitor leukocyte and platelet counts daily during the induction phase. Perform bone marrow examinations and liver and kidney function tests periodically. Monitor uric acid serum concentrations.

#### Storage

Unopened vials may be stored at room temperature. Reconstituted solutions are stable at room temperature for 48 h. However, it is recommended to use the prepared injections or infusions as soon as possible after they are prepared.

#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

The drug can be administered by IV injection or infusion, as a continuous IV infusion, subcutaneously (rarely used), or intrathecally. The correct dose and route and time of administration of cytarabine will vary from protocol to protocol. Clinicians should consult the appropriate references to verify ordered dilutions and rates of infusion. Intrathecal use of cytarabine requires the use of single-dose, *unpreserved* solutions only. Do not use bulk injection to prepare intrathecal doses. Avoid using diluents containing benzyl alcohol; preservative-free 0.9% NaCL is usually used. Note that DepoCyt, a liposomal, intrathecal cytarabine, is not discussed in this monograph; consult specialized references for information.

For IV infusion, the dose is commonly diluted in 100-250 mL of D5W or 0.9% NaCl and infused over 0.5-2 hrs. Continuous infusions have also been employed for select indications.

## Dabigatran

da'bi-gat'ran Pradaxa Do not confuse dabigatran with argatroban or rivaroxaban.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Oral anticoagulant (direct thrombin inhibitor type)

## **MECHANISM OF ACTION**

Dabigatran and its active metabolites are competitive, direct thrombin inhibitors that inhibit both free and clot-bound thrombin. Prevents thrombin-induced platelet aggregation and the development of a thrombus. Prevents thrombinmediated conversion of fibrinogen into fibrin during the coagulation cascade. *Therapeutic Effect:* Prevents new clot formation.

## PHARMACOKINETICS

Absorption is 1%-3% orally in the capsule. Do not remove capsule shell as drug absorption increases to 75% and would result in overanticoagulation. Metabolized by esterases. Metabolites are active and the drug is a P-glycoprotein substrate. Primarily eliminated in the urine. Removed by hemodialysis. *Half-life*: 12-17 h (increased in renal impairment).

## AVAILABILITY

Capsules: 75 mg, 150 mg.

#### INDICATIONS AND DOSAGES Stroke and systemic embolism prophylaxis in nonvalvular AFib PO

Adults, Elderly. 150 mg twice daily.

## Dosage in renal impairment

CrCl > 30 mL/min: 150 mg PO twice daily. However, in patients with CrCl 30-50 mL/min and taking dronedarone or ketoconazole concurrently, consider dose reduction to 75 mg twice per day. CrCl 15-30 mL/min: 75 mg PO twice

CrCl 15-30 mL/min: 75 mg PO twice per day.

CrCl < 15 mL/min or dialysis: Dosage recommendations are not available.

Converting from or to warfarin

When converting patients from warfarin therapy to dabigatran: Discontinue warfarin and start dabigatran when the INR is < 2.0. When converting from dabigatran to warfarin: Adjust the starting time of warfarin based on CrCl as follows: CrCl ≥ 50 mL/min: Start warfarin 3 days before discontinuing dabigatran. CrCl 30-50 mL/min: Start warfarin 2 days before discontinuing dabigatran. CrCl 15-30 mL/min: Start warfarin 1 day before discontinuing dabigatran. CrCl < 15 mL/min or dialysis: No recommendations can be made. NOTE: Because dabigatran can increase the INR, the INR will better reflect warfarin's effect only after dabigatran has been stopped for at least 2 days.

## **OFF-LABEL USES**

Alternative to warfarin for DVT or pulmonary embolus prevention.

## CONTRAINDICATIONS

Known hypersensitivity; active pathological bleeding.

## INTERACTIONS

## Drug

**Dronedarone:** Use with caution; dronedarone increases dabigatran exposure and potential for over-anticoagulation.

NSAIDs, salicylates: Monitor patient due to increased risk for GI bleeding.

Parenteral anticoagulants (e.g., argatroban, heparins, lepirudan, platelet inhibitors): May increase risk for bleeding. When initiating a parenteral anticoagulant, discontinue dabigatran. See manufacturer labeling for recommendations. P-glycoprotein inhibitors (e.g., amiodarone, azithromycin, clarithromycin, cyclosporine,

diltiazem, itraconazole, ketoconazole, quinidine,

verapamil): Avoid use if at all possible in patients with renal impairment, as these drugs increase dabigatran exposure and may cause over-anticoagulation and bleeding in such patients. In any patient taking ketoconazole, consider dose reduction of dabigatran to 75 mg twice daily.

**Rifampin:** Decreases effectiveness of dabigatran. Avoid co-use.

Warfarin: Would increase risk for bleeding. Do not use concurrently. Follow instructions for switching from warfarin to dabigatran.

## Herbal

Cranberry, dong quai, evening primrose oil, feverfew, garlic, ginger, ginkgo, glucosamine, green tea, omega-3 acids, SAM-e: May increase the risk of bleeding. Food

Alcohol: Alcoholism may increase risk for GI bleeding. Limit alcohol use.

## DIAGNOSTIC TEST EFFECTS

May increase the PT and INR, so be aware of this if switching from dabigatran to warfarin until patient stabilized. However, the INR is *not* used for dabigatran monitoring.

#### SIDE EFFECTS

#### Common

GI distress, such as nausea, dyspepsia, gastroesophageal reflux, abdominal or epigastric discomfort.

#### Occasional

Gastritis, esophagitis, peptic ulcer. Rare

Hypersensitivity reactions such as rash, urticaria, edema, pruritus. May be an increased rate of MI versus patients anticoagulated with warfarin.

#### SERIOUS REACTIONS

 Bleeding complications ranging from local ecchymoses to major hemorrhage. Unlike Coumadin or heparin anticoagulants, there is no antidote and patient is managed clinically.

 Serious hypersensitivity, such as anaphylactoid reactions or angioedema, are rare.

## PRECAUTIONS & CONSIDERATIONS

Anticoagulation is contraindicated in any circumstance in which the risk of hemorrhage is greater than the potential benefit. Identification of risk factors for bleeding in a patient warrants frequent monitoring. Use caution in patients with renal impairment, history of GI bleeding, peptic ulcer disease, and those with risk factors for intracranial bleeding. Patients on dialysis have not been well studied for dosage recommendations. The effect of dabigatran on the fetus during pregnancy or during breastfeeding is unknown. Safety and efficacy in children have not been established. Nonessential medications, including OTC drugs, should be avoided. An electric razor and soft toothbrush may be advisable. Avoid dangerous recreational sports. Notify the physician before having dental work or surgery, as dabigatran should be discontinued several days prior to major surgery for most patients. However, minimize lapses in treatment to maintain

stroke prophylaxis. Monitor clinically for signs of bleeding, or for symptoms of clotting. Promptly evaluate for bleeding if drop in hemoglobin or hematocrit is sudden. Carefully assess for new medicines (prescription and OTC), as well as supplement use, at every appointment.

#### Storage

Store in the original container or blister package only. Keep tightly closed. Protect from moisture. Store between 59-86° F (15-30° C). After opening use within 4 months. Safely throw away any unused medicine after 4 months.

#### Administration

Give dabigatran capsules whole, without regard to food. Patients should not chew, break, or open the capsules. Patient should take exactly as prescribed. Adherence to the prescription is essential to minimize the risk of stroke.

If a dose is not taken at the scheduled time, have patient take as soon as possible on the same day; skip a missed dose if it cannot be taken at least 6 h before the next scheduled dose. Never double a dose to make up for a skipped dose.

#### Dalfampridine

dal-fam'pri-dine

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Neurologic agents, potassium channel blockers

#### MECHANISM OF ACTION

Broad-spectrum potassium channel blocker; mechanism not fully understood. In animals, inhibition of potassium channels increases the action potential conduction in demyelinated axons. *Therapeutic Effect:* Improves motor function for walking.

#### PHARMACOKINETICS

Well absorbed; largely unbound to plasma proteins. Clearance significantly correlated with renal function. Mostly excreted unchanged; 90.3% of the drug in the urine is parent drug. The CYP2E1 isoenzyme is the major enzyme responsible for the 3-hydroxylation of the drug to 2 inactive metabolites, also excreted in the urine. *Half-life:* 5.2-6.5 h.

## AVAILABILITY

Tablets, Extended Release: 10 mg.

#### INDICATIONS AND DOSAGES > To improve walking for patients with multiple sclerosis

PO

Adults. 10 mg twice daily.

▶ Dosage in renal impairment CrCl 51-80 mL/min: No dose adjustment is needed, but elimination is decreased, and may have increased seizure risk. CrCl ≤ 50 mL/min: Contraindicated.

## CONTRAINDICATIONS

Hypersensitivity, moderate to severe renal impairment, history of seizure.

#### INTERACTIONS

#### Drug

Other aminopyridine (e.g., 4-aminopyridine, fampridine): Do not take together. These represent duplicate medications and may increase seizure risk. Herbal

#### Herbal

None known.

## Dacarbazine

da-kar'ba-zeen ★ DTIC-Dome ▲ DTIC Do not confuse dacarbazine with Dicarbosil or procarbazine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antineoplastics, alkylating agents

## **MECHANISM OF ACTION**

An alkylating antineoplastic agent that forms methyldiazonium ions, which attack nucleophilic groups in DNA. Cross-links DNA strands. *Therapeutic Effect:* Inhibits DNA, RNA, and protein synthesis.

## PHARMACOKINETICS

Minimally crosses the blood-brain barrier. Protein binding: 5%. Metabolized in the liver. Excreted in urine. *Half-life:* 5 h (increased in impaired renal function).

## AVAILABILITY

*Powder for Injection:* 100-mg vials, 200-mg vials.

# INDICATIONS AND DOSAGES Malignant melanoma IV

Adults, Elderly. 2-4.5 mg/kg/day for 10 days, repeated q4wk; or 250 mg/ $m^2$ /day for 5 days, repeated q3wk.

#### Hodgkin's disease IV

Adults, Elderly. 150 mg/m<sup>2</sup>/day for 5 days, repeated q4wk; or 375 mg/ m<sup>2</sup> once, repeated every 15 days (as combination therapy).

## **OFF-LABEL USES**

Treatment of islet cell carcinoma, neuroblastoma, soft tissue sarcoma.

## CONTRAINDICATIONS

Demonstrated hypersensitivity to dacarbazine.

## INTERACTIONS

#### Drug

**Bone marrow depressants:** May enhance myelosuppression.

Live-virus vaccines: May potentiate virus replication, and decrease the patient's antibody response to the vaccine.

#### Herbal

None known.

Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

## **IV INCOMPATIBILITIES**

Allopurinol (Aloprim), amphotericin B (including liposomal forms), cefepime (Maxipime), heparin, pantoprazole (Protonix), pemetrexed (Alimta), piperacillin/tazobactam (Zosyn).

## **IV COMPATIBILITIES**

Etoposide (VePesid), granisetron (Kytril), ondansetron (Zofran), paclitaxel (Taxol).

## SIDE EFFECTS

#### Frequent (90%)

Nausea, vomiting, (occurs within 1 h of initial dose, may last up to 12 h), anorexia. Myelosuppression.

### Occasional

Facial flushing, paresthesia, alopecia, flu-like symptoms (fever, myalgia, malaise), dermatologic reactions, confusion, blurred vision, headache, lethargy.

#### Rare

Diarrhea, stomatitis, photosensitivity.

#### SERIOUS REACTIONS

• Myelosuppression is frequent and may result in blood dyscrasias, such as leukopenia and thrombocytopenia, generally 2-4 wks after the last dacarbazine dose.

- · Hepatotoxicity occurs rarely.
- Anaphylaxis.

• Extravasation may cause tissue damage and severe pain.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal impairment. Because dacarbazine is highly emetogenic, antiemetic therapy for the prevention of acute and delayed emesis is recommended. Because of the risk of fetal harm, pregnant women should not take dacarbazine, especially during the first trimester. Breastfeeding should be avoided while receiving treatment. The safety and efficacy of dacarbazine have not been established in children. In elderly patients, age-related renal impairment may require a dosage adjustment. Immunizations and coming in contact with those who have recently received a live-virus vaccine should be avoided during treatment.

Notify the physician if easy nausea and vomiting, bruising, fever, signs of local infection, sore throat, or unusual bleeding from any site occurs. Adequate hydration should be maintained to avoid dehydration from vomiting. Erythrocyte, leukocyte, and platelet counts for evidence of myelosuppression should be monitored. Restricting the patient's oral intake of food for 4-6 h prior to treatment may help reduce nausea. Expect toleration of GI symptoms after the first 1 or 2 days.

#### Storage

Refrigerate unopened vials and protect them from light. The reconstituted solution containing 10 mg/mL is stable for up to 8 h at room temperature or up to 72 h if refrigerated. Solutions further diluted with D5W or 0.9% NaCl are stable for up to 8 h at room temperature or up to 24 h if refrigerated.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

Dacarbazine dosage is individualized based on clinical response and tolerance of the drug's adverse effects. When administering this drug in combination therapy, consult specific protocols for optimum dosage and sequence of drug administration.

Give dacarbazine by IV push or IV infusion, as prescribed. For IV use, reconstitute the 100-mg vial with 9.9 mL (or the 200-mg vial with 19.7 mL) sterile water for injection to provide a concentration of 10 mg/ mL. Give by IV push over 2-3 min. Because IV push administration may cause severe pain along the injected vein, IV infusion may be preferred. For IV infusion, further dilute in 250 mL D5W or 0.9% NaCl. Infuse the drug over 15-30 min. Discard it if the color changes from ivory to pink, because this indicates decomposition. Apply hot packs if the patient develops a burning sensation, irritation, or local pain at the injection site. Monitor the injection site for signs and symptoms of extravasation, including coolness, stinging, swelling, and slight or no blood return.

#### Food

Alcohol: Manufacturer recommends avoidance, although specific drug interactions not known.

DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

## Common (≥ 2%)

Urinary tract infection, insomnia, dizziness, headache, nausea, asthenia, back pain, paresthesia, nasopharyngitis, constipation, dyspepsia, pharyngeal pain.

## Occasional

Balance disorders, relapse of multiple sclerosis, confusional state.

## SERIOUS REACTIONS

Seizures.

• Serious bladder or urinary tract infections.

#### **PRECAUTIONS & CONSIDERATIONS**

Those with renal impairment or physiologic changes due to aging may require decreased dosage. It is unknown whether the drug is excreted in breast milk; the manufacturer does not recommend use during breastfeeding. Use caution when giving the drug to pregnant women; use only when benefit outweighs risk to fetus. The safety and efficacy of this drug have not been established in children. Age-related renal impairment may require precautions for use in elderly patients. Use caution in driving or other hazardous tasks until the effects of the drug are known.

MS symptoms and gait should be assessed throughout therapy; monitor for neurologic excitability, such as tremor. If seizures occur, notify physician immediately and discontinue use.

#### Storage

Store at room temperature. Administration

Take without regard to food. Do not crush, cut, or chew the extendedrelease tablet. The twice daily doses should be evenly spaced, approximately 12 h apart.

#### Dalteparin

doll'teh-pare-in

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anticoagulants, low-molecular-weight heparins

## **MECHANISM OF ACTION**

A low-molecular-weight heparin that enhances inhibition of factor Xa and thrombin by antithrombin. Only slightly influences platelet aggregation, PT, and aPTT. *Therapeutic Effect:* Produces anticoagulation.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
Subcutaneous	1-2 h	4 h	12 h

Protein binding: < 10%. *Half-life:* 3-5 h.

## AVAILABILITY

Single-Dose Syringe: 2500 IU/0.2 mL, 5000 IU/0.2 mL, 7500 IU/0.3 mL, 10,000 IU/0.4 mL, 10,000 IU/1 mL, 12,500 IU/0.5 mL, 15,000 IU/0.6 mL, 18,000 IU/0.72 mL. *Multiple-Dose Vial*: 10,000 IU/1 mL, 25,000 IU/mL.

## INDICATIONS AND DOSAGES

 Prophylaxis of deep vein thrombosis (DVT), low- to moderate-risk abdominal surgery

SUBCUTANEOUS *Adults, Elderly.* 2500 international units 1-2 h before surgery, then daily for 5-10 days.

## Prophylaxis of DVT, high-risk abdominal surgery

SUBCUTANEOUS Adults, Elderly. 5000 international units the evening before surgery, then 5000 international units/day for 5-10 days. In patients with malignancy, 2500 international units 1-2 h before surgery, then 2500 international units 12 h later, then 5000 international units daily for 5-10 days.

#### Prophylaxis of DVT, total hip surgery

SUBCUTANEOUS Adults, Elderly. 2500 international units 1-2 h before surgery, then 2500 units 4-8 h after surgery, then 5000 units/day for 5-10 days; or 2500 international units 4-8 h after surgery, then 5000 international units/day for 5-10 days; or 5000 international units 10-12 h before surgery, then 5000 international units 4-8 h after surgery, then 5000 units/day for 5-10 days.

#### Unstable angina, non–Q-wave MI SUBCUTANEOUS

Adults, Elderly. 120 international units/kg q12h (maximum: 10,000 international units/dose) given with aspirin until clinically stable; usual duration 5-8 days.

#### Prophylaxis of DVT or pulmonary embolism in the acutely ill patient SUBCUTANEOUS

*Adults, Elderly.* 5000 international units once a day. Usual duration 12-14 days.

#### Extended treatment of symptomatic venous thromboembolism (VTE) in patients with cancer

SUBCUTANEOUS

Adults, Elderly. 200 international units/kg once daily (maximum 18,000 international units/day for first 30 days). 150 international units/kg once daily (maximum 18,000 international units/day for months 2-6). Doses for patients with cancer and symptomatic VTE with platelet counts 50,000-100,000/mm<sup>3</sup>: Reduce dose by 2500 international units daily until platelet count recovers to 100,000/mm<sup>3</sup>. Discontinue if platelet count < 50,000/mm<sup>3</sup>. Dose for renal insufficiency in patients with cancer and

*in patients with cancer and symptomatic VTE:* Target anti-Xa range 0.5-1.5 international units/mL (sample 4-6 h after dose after patient has received 3-4 doses).

## CONTRAINDICATIONS

Active major bleeding, history of heparin-induced thrombocytopenia (HIT or HITT), hypersensitivity to dalteparin, heparin, or pork products, *and* do not use in patients undergoing epidural/neuraxial anesthesia as (1) a treatment of unstable angina and non–Q-wave MI or (2) for prolonged VTE prophylaxis.

## INTERACTIONS

## Drug

Anticoagulants, platelet inhibitors, thrombolytics, NSAIDs: May increase risk of bleeding.

#### Herbal

Supplements with antiplatelet or anticoagulant effects (e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow, etc.).

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

Increases (reversible) LDH, serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. Anti-factor Xa level may be useful to monitor anticoagulant effect in patients with severe renal impairment or if abnormal coagulation parameters occur. Routinely monitor CBC (drug can reduce platelet counts).

#### SIDE EFFECTS

#### Occasional (3%-7%)

Hematoma at injection site. Pain at injection site.

## Rare (<1%)

Hypersensitivity reaction (chills, fever, pruritus, urticaria, asthma, rhinitis, lacrimation, headache); mild, local skin irritation; skin necrosis; alopecia, mild bleeding (e.g., ecchymosis).

#### SERIOUS REACTIONS

Major bleeding occurs rarely.

• Overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage.

- Thrombocytopenia occurs rarely.
- Epidural or spinal hematoma may cause paralysis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with neuraxial (spinal/epidural) anesthesia or spinal puncture, bacterial endocarditis, conditions with increased risk of hemorrhage, history of heparininduced thrombocytopenia, recent GI ulceration and hemorrhage, hypertensive or diabetic retinopathy, impaired hepatic or renal function, and uncontrolled arterial hypertension. Dalteparin should be used with caution in pregnant women, particularly during the last trimester and immediately postpartum because it increases the risk of maternal hemorrhage. It is unknown whether dalteparin is distributed in breast milk. Safety and efficacy of dalteparin have not been established in children. The drug contains benzyl alcohol and may cause a "gasping syndrome" in exposed neonates. No age-related precautions have been noted in elderly patients. Other medications, including OTC drugs, should be avoided.

Notify the physician of signs of bleeding, breathing difficulty, bruising, dizziness, fever, itching, light-headedness, rash, or swelling. Report any tingling, numbness in the lower limbs, or muscular weakness immediately, as this may indicate spinal/epidural hematoma. Serious bleeding is treated with protamine (see protamine). Baseline CBC and BP should be established. CBC and stool for occult blood should be monitored throughout therapy.

#### Storage

Store drug at room temperature. Administration

Administer subcutaneously. Do not inject intramuscularly. The patient should sit or lie down before deep subcutaneous injection. Inject into U-shaped area around the navel, upper outer side of thigh, or upper outer quadrangle of buttock. Use a fine needle (25- to 26-gauge) to minimize tissue trauma. Introduce the entire length of the needle  $(\frac{1}{2}-inch)$ into skinfold held between the thumb and forefinger, holding the needle during injection at a 45- to 90-degree angle. Do not rub the injection site after administration to avoid bruising. Alternate administration site with each injection. The usual length of dalteparin therapy is 5-10 days. Perform an ice massage at the injection site shortly before injection to prevent excessive bruising.

## Danazol

da'na-zole ★ Danocrine

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Hormones/ hormone modifiers, androgenic antiestrogenic

## **MECHANISM OF ACTION**

A weakly androgenic testosterone derivative that suppresses the pituitary-ovarian axis. Folliclestimulating hormone (FSH) and luteinizing hormone (LH) output are reduced, and there is lowered estrogen production and hypothalamic-pituitary response. Recent evidence suggests a direct inhibitory effect at target sites by the binding to gonadal steroid receptors at target organs. The drug also decreases IgG, IgM, and IgA levels, as well as phospholipid and IgG isotope autoantibodies. Also increases the levels of the deficient C1 esterase inhibitor (C1EI) in patients with hereditary angioedema. Therapeutic Effect: Produces anovulation and amenorrhea, reduces the production of estrogen, corrects biochemical deficiency as seen in hereditary angioedema.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Metabolized in liver, primarily to 2-hydroxymethylethisterone. Excreted in urine. *Half-life:* 4.5 h.

#### AVAILABILITY

Capsules: 50 mg, 100 mg, 200 mg.

#### INDICATIONS AND DOSAGES • Endometriosis

#### PO

*Adults*. Initially, 200-400 mg/day in 2 divided doses; usual maintenance 800 mg/day in 2 divided doses for 3-9 mo.

#### Fibrocystic breast disease PO

*Adults.* 100-400 mg/day in 2 divided doses. Usual duration is 4-6 mo.

#### Hereditary angioedema PO

*Adults*. Initially, 200 mg 2-3 times/ day. Decrease dose by 50% or less at 1- to 3-mo intervals. If attack occurs, increase dose by up to 200 mg/day.

## **OFF-LABEL USES**

Treatment of gynecomastia, menorrhagia, precocious puberty, premenstrual syndrome.

## CONTRAINDICATIONS

Cardiac impairment, pregnancy, breastfeeding, severe liver or renal disease, undiagnosed genital bleeding, porphyria.

## INTERACTIONS

Drug

Carbamazepine, cyclosporine, tacrolimus, and warfarin: May increase levels and increase risk of toxicity of these drugs.

HMG-CoA reductase inhibitors: May increase chance of developing myopathy or rhabdomyolysis.

Hormonal contraceptives: May decrease effectiveness of contraceptives.

**Hypoglycemic agents:** May increase the risk of hypoglycemia.

Herbal None known.

#### Food

All foods: May delay time to peak.

Danazol (Generic Name)

**High-fat meal:** Increases plasma concentration.

#### DIAGNOSTIC TEST EFFECTS

May increase blood hemoglobin and hematocrit levels, LDL concentrations, serum alkaline phosphatase, bilirubin, calcium, potassium, SGOT (AST) levels, and sodium levels. May decrease HDL concentrations. May alter levels of testosterone, androstenedione, and dehydroepiandrosterone.

### SIDE EFFECTS

#### Frequent

Females: Amenorrhea, breakthrough bleeding/spotting, decreased breast size, increased weight, irregular menstrual periods.

Males: Semen abnormalities, spermatogenesis reduction.

#### Occasional

Males/females: Edema, rhabdomyolysis (muscle cramps, unusual fatigue), virilism (acne, oily skin), flushed skin, altered moods, increased blood pressure, palpitations, sinus tachycardia. **Rare** 

Males/females: Hematuria, gingivitis, carpal tunnel syndrome, cataracts, severe headache, vomiting, rash, photosensitivity, anxiety, depression, sleep disorders.

Females: Enlarged clitoris, hoarseness, deepening voice, hair growth, monilial vaginitis. Males: Decreased testicle size.

## SERIOUS REACTIONS

• Jaundice may occur in those receiving 400 mg/day or more. Liver dysfunction, eosinophilia, thrombocytopenia, pancreatitis occur rarely. • Hepatic or splenic peliosis and benign hepatic adenoma have occurred with long-term use.

 Benign intracranial hypertension (pseudotumor cerebri) occurs rarely.
 Monitor for papilledema, headache, nausea and vomiting, and visual disturbances.

 Thromboembolism, thrombotic, and thrombophlebitic events have occurred, including fatal strokes.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used with seizure disorder, migraine, or conditions influenced by edema. Be aware that danazol use is contraindicated during pregnancy and lactation. Exclude pregnancy prior to initiating treatment in females. If pregnancy is suspected, notify the physician. Nonhormonal contraceptives should be used during therapy. Safety and efficacy of danazol have not been established in children. Be aware that danazol should be used with caution in elderly patients. Breast cancer should be ruled out before starting therapy for fibrocystic breast disease. Monitor liver function.

If masculinizing effects, weight gain, muscle cramps, or fatigue occurs, notify the physician. Spotting or bleeding may occur in the first months of therapy.

#### Storage

Store at room temperature. Administration

Take full course of treatment as prescribed by the physician. Administration with meals may lessen GI upset.

## Dantrolene

dan'troe-leen ★ Dantrium, Revonto ★ Dantrium Do not confuse Dantrium with Daraprim.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Skeletal muscle relaxant

#### **MECHANISM OF ACTION**

A skeletal muscle relaxant that reduces muscle contraction by interfering with release of calcium ion. Reduces calcium ion concentration. *Therapeutic Effect:* Dissociates excitation-contraction coupling. Interferes with catabolic process associated with malignant hyperthermic crisis.

## PHARMACOKINETICS

Poorly absorbed from the GI tract. Protein binding: High. Metabolized in the liver. Primarily excreted in urine. *Half-life*: IV 4-8 h; PO 8.7 h.

#### AVAILABILITY

Capsules: 25 mg, 50 mg, 100 mg. Powder for Injection: 20-mg vial.

## 

PO

*Adults, Elderly.* Initially, 25 mg/day. Increase to 25 mg 2-4 times a day, then by 25-mg increments every 4-7 days up to 100 mg 2-4 times a day. Maximum: 400 mg/day.

*Children 5 yr and older.* Initially, 0.5 mg/kg twice a day. Increase to 0.5 mg/kg 3-4 times a day, then in increments of 0.5 mg/kg/day up to

3 mg/kg 2-4 times a day. Maximum: 100 mg 4 times a day.

## Prevention of malignant hyperthermic crisis PO

*Adults, Elderly.* 4-8 mg/kg/day in 3-4 divided doses 1-2 days before surgery; give last dose 3-4 h before surgery.

IV

Adults, Elderly, Children. 2.5 mg/kg about 1.25 h before surgery.

## Management of malignant hyperthermic crisis

Adults, Elderly, Children. Initially a minimum of 1 mg/kg rapid IV; may repeat up to total cumulative dose of 10 mg/kg. May follow with 4-8 mg/kg/day PO in 4 divided doses up to 3 days after crisis.

#### **OFF-LABEL USES**

Relief of exercise-induced pain in patients with muscular dystrophy, treatment of flexor spasms and neuroleptic malignant syndrome, heatstroke.

## CONTRAINDICATIONS

Active hepatic disease, hypersensitivity; do not use where spasticity is utilized to sustain upright posture and balance or to maintain increased function.

## INTERACTIONS

#### Drug

**Calcium channel blockers:** Use together not recommended for hyperthermia due to rare risk for cardiovascular collapse.

**Vecuronium:** Dantrolene may potentiate neuromuscular blockade.

CNS depressants: May increase CNS depression with short-term use. Liver toxic medications, estrogens: May increase the risk of liver toxicity with chronic use.

Dantrolene (Generic Name)

CYP3A4 inducers/inhibitors: May

alter dantrolene plasma levels. **Herbal** 

St. John's wort: May decrease plasma level of dantrolene. Food None known.

## DIAGNOSTIC TEST EFFECTS

May alter liver function test results.

## IV INCOMPATIBILITIES

Dantrolene is incompatible with most medications. Do not infuse with other medications. Not compatible with D5W or 0.9% NaCl.

#### SIDE EFFECTS

#### Frequent (>10%)

Drowsiness, dizziness, weakness, general malaise, diarrhea (mild), rash, nausea.

#### Occasional

Confusion, diarrhea (may be severe), headache, insomnia, constipation, urinary frequency.

#### Rare

Paradoxical CNS excitement or restlessness, paresthesia, tinnitus, slurred speech, tremor, blurred vision, dry mouth, nocturia, impotence, rash, pruritus.

#### SERIOUS REACTIONS

• There is a risk of liver toxicity, most notably in women, those 35 yr of age and older, those taking other medications concurrently, or those taking  $\geq$  800 mg per day.

• Overt hepatitis noted most frequently between 3rd and 12th mo of therapy.

• Overdosage results in vomiting, muscular hypotonia, muscle twitching, respiratory depression, and seizures.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with a history of previous liver disease and impaired cardiac or pulmonary function. Be aware that dantrolene readily crosses the placenta and should not be used in breastfeeding mothers. The longterm safety in children < 5 yrs has not been established; consider risk vs. benefit before prolonged use.

Drowsiness may occur but usually diminishes with continued therapy. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills. Notify the physician if bloody or tarry stools, continued weakness, diarrhea, fatigue, itching, nausea, or skin rash occurs. Blood tests, such as liver and renal function tests, should be performed before and during therapy. Therapeutic response, such as decreased intensity of skeletal muscle pain or spasm, should be assessed.

#### Storage

Store at room temperature. Protect from light. Use infusion within 6 h after reconstitution. Discard if cloudy or a precipitate is present.

#### Administration

Take oral dantrolene without regard to meals.

For IV use, reconstitute 20-mg vial with 60 mL sterile water for injection to provide a concentration of 0.33 mg/mL. Transfer dose to an IV infusion bag, but do *not* use glass bottle (precipitates). For IV infusion, administer over 1 h. Diligently monitor for extravasation because of high pH of IV preparation and risk for severe complications.

## Dapsone

dap'sone ★ Aczone **Do not confuse with Diprosone.** 

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antiprotozoal

## **MECHANISM OF ACTION**

An antibiotic that is a competitive antagonist of para-aminobenzoic acid (PABA); it prevents normal bacterial utilization of PABA for synthesis of folic acid. *Therapeutic Effect:* Inhibits bacterial growth.

## AVAILABILITY

Tablets: 25 mg, 100 mg. Topical Gel: 5%.

## INDICATIONS AND DOSAGES

Leprosy PO

*Adults, Elderly.* 50-100 mg/day for 3-10 yr. *Children.* 1-2 mg/kg/24 h.

Maximum: 100 mg/day.

#### Dermatitis herpetiformis PO

Adults, Elderly. Initially, 50 mg/day. May increase up to 300 mg/day.

## Pneumocystis carinii pneumonia (PCP) (off-label)

PO

*Adults, Elderly.* 100 mg/day in combination with trimethoprim for 21 days.

#### Prevention of PCP (off-label) PO

Adults, Elderly. 100 mg/day. Children older than 1 mo. 2 mg/ kg/day. Maximum: 100 mg/day. Alternate dosing: 4 mg/kg/dose once weekly. Maximum: 200 mg/dose.

#### Acne

TOPICAL GEL

*Adults and children 12 yr and older.* Apply thin layer twice daily to affected areas.

## **OFF-LABEL USES**

Malaria prophylaxis, PCP prophylaxis and treatment, toxoplasmosis prophylaxis.

## CONTRAINDICATIONS

Hypersensitivity to the drug or product components.

## INTERACTIONS

Drug

**CYP2C9 and CYP3A4 inhibitors:** May increase levels and effects of dapsone.

**CYP2C9 and CYP3A4 inducers:** May decrease levels and effects of dapsone.

**Methotrexate:** May increase hematologic reactions.

**Probenecid:** May decrease the excretion of dapsone.

**Protease inhibitors (including ritonavir):** May increase dapsone blood concentration.

**Rifampin:** May decrease rifampin blood concentration.

**Trimethoprim:** May increase the risk of toxic effects of both drugs.

#### Herbal

St. John's wort: May decrease dapsone blood concentration. Food

None significant.

#### DIAGNOSTIC TEST EFFECTS

Decreases hemoglobin.

#### SIDE EFFECTS

Frequent (> 10%)

Hemolytic anemia, methemoglobinemia, rash.

## Occasional (1%-10%)

Hemolysis, photosensitivity reaction, tachycardia, headache,

Dapsone (Generic Name)

insomnia, dermatitis, abdominal pain, nausea.

#### SERIOUS REACTIONS

• Agranulocytosis, aplastic anemia, and blood dyscrasias may occur.

• Stevens-Johnson syndrome has occurred rarely.

· Drug-induced hepatitis.

• Peripheral neuropathy, with motor loss and weakness.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with agranulocytosis, severe anemia, aplastic anemia, glucose-6phosphate dehydrogenase deficiency, hemoglobin M deficiency, or a hypersensitivity to dapsone or its derivatives (such as sulfoxone sodium). Overexposure to sun or ultraviolet light should be avoided.

Baseline CBC should be obtained. Hypersensitivity to dapsone or its derivatives should be determined before therapy. Skin should be assessed for a dermatologic reaction. Signs and symptoms of hemolysis, such as jaundice, should be monitored. Persistent fatigue, fever, or sore throat should be reported. If muscle weakness appears, discontinue the drug.

#### Storage

Store at room temperature; protect from light; do not freeze.

#### Administration

Take dapsone without regard to food.

Topical gel: Apply thin layer to affected areas; rub in gently and completely. Gel is gritty. Wash hands after applying.

## **Daptomycin**

dap'toe-my-sin Cubicin Do not confuse Daptomycin with dactinomycin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anti-infectives, lipopeptides

## **MECHANISM OF ACTION**

A lipopeptide antibacterial agent that binds to bacterial membranes and causes a rapid depolarization of the membrane potential. The loss of membrane potential leads to inhibition of protein, DNA, and RNA synthesis. *Therapeutic Effect:* Bactericidal.

#### PHARMACOKINETICS

Widely distributed. Protein binding: 90%. Primarily excreted unchanged in urine. Moderately removed by hemodialysis. *Half-life:* 7-8 h (increased in impaired renal function).

#### AVAILABILITY

Powder for Injection: 500 mg/vial.

## INDICATIONS AND DOSAGES

 Complicated skin and skinstructure infections

IV

*Adults, Elderly.* 4 mg/kg every 24 h for 7-14 days.

#### Bacteremia from Staphylococcus aureus (MSSA or MRSA), including right-sided endocarditis IV

Adults, Elderly. 6 mg/kg every 24 h for 2-6 wks.

#### Dosage in renal impairment

For patients with creatinine clearance of < 30 mL/min, dosage is 4 mg/kg q48h for 7-14 days for skin infections. For patients with creatinine clearance of < 30 mL/min, dosage is 6 mg/kg q48h for 2-6 wks for bacteremia. For patients on hemodialysis, give dose after hemodialysis when possible.

## **OFF-LABEL USES**

Nonpulmonary infections caused by vancomycin-resistant enterococci (VRE).

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

#### Drug

HMG-CoA reductase inhibitors (e.g., "statins"): May cause myopathy. Tobramycin: Increases the serum concentration of daptomycin. Herbal None known. Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum CPK levels. May alter liver function test results. May alter serum potassium levels. False increased INR or prothrombin time (PT) with certain assays.

#### IV INCOMPATIBILITIES

Because only limited data are available on the compatibility of daptomycin injection with other intravenous substances, additives or other medications should not be added to daptomycin vials or infusions. Diluents containing dextrose should not be used. If the same IV line is used to administer different drugs, the line should be flushed with 0.9% NaCl. Acyclovir (Zovirax), allopurinol (Aloprim), amphotericin B cholesteryl sulfate complex (Amphotec), amphotericin B lipid complex (Abelcet), gemcitabine (Gemzar), impipenem/cilastatin (Primaxin), methotrexate, metronidazole (Flagyl), minocycline (Minocin), mitomycin (Mutamycin), nesiritide (Natrecor), nitroglycerin, pantoprazole (Protonix), pentobarbital, phenytoin, remifentanil (Ultiva), streptozocin, sufentanil (Sufenta), thiopental (Thioplex).

## 🗏 IV COMPATIBILITIES

0.9% NaCl or lactated Ringer's injection.

#### SIDE EFFECTS

#### Frequent (5%-13%)

Constipation, nausea, peripheral injection site reactions, headache, diarrhea, vomiting, anemia, peripheral edema, chest pain, hypertension, hypotension, insomnia.

## Occasional (3%-4%)

Insomnia, rash, vomiting, abdominal pain, injection site reaction.

## Rare (< 3%)

Pruritus, dizziness, peripheral neuropathy.

## SERIOUS REACTIONS

• Skeletal muscle myopathy, characterized by muscle pain and weakness, particularly of the distal extremities, occurs rarely.

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

- · Renal failure has occurred.
- Hypersensitivity.

• Eosinophilic pneumonia, characterized by dyspnea, hypoxia, and diffuse infiltrates, requires discontinuation and treatment with steroids.

#### **PRECAUTIONS & CONSIDERATIONS**

Daptomycin should not be used to treat pneumonia as the drug is inactivated by pulmonary surfactant. Not effective for left-sided endocarditis due to poor outcomes. Caution is warranted with pregnancy, musculoskeletal disorders, and renal impairment. Avoid concurrent use of HMG-CoA reductase inhibitors because they may cause myopathy. It is unknown whether daptomycin is distributed in breast milk. The safety and efficacy of this drug have not been established in children younger than 18 yr of age. No age-related precautions have been noted in elderly patients.

Report headache, dizziness, nausea, rash, severe diarrhea, new muscle weakness, or any other new symptoms. Be alert for dyspnea or hypoxia which may indicate eosinophilic pneumonia. Mild GI effects may be tolerable, but severe symptoms may indicate the onset of antibiotic-associated colitis. Pattern of daily bowel activity and stool consistency should be monitored. Culture and sensitivity tests should be obtained before giving the first dose of daptomycin; therapy may begin before the test results are known. Check for white patches on the mucous membranes and tongue. Be alert for signs and symptoms of superinfection, including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. Storage

Store the unopened vials in the refrigerator. The reconstituted and diluted solutions are stable for 12 h at room temperature and up to 48 h if refrigerated.

#### Administration

Do not mix with dextrose-containing solutions. Reconstitute the 250-mg vial with 5 mL 0.9% NaCl and the 500-mg vial with 10 mL 0.9% NaCl. Do not shake. The vial concentration will be 50 mg/mL. Prepared dose may be given by IV injection over a period of 2 min, or may dilute further for infusion. Further dilute in 50 mL 0.9% NaCl. Infuse the intermittent IV infusion over 30 min.

Daptomycin should not be used in conjunction with ReadyMED elastomeric infusion pumps (Cardinal Health, Inc.) due to the leaching of an impurity, 2-mercaptobenzothiazole (MBT), from this pump system into the daptomycin solution.

If the same IV line is used for sequential infusion of different drugs, flush the line with a compatible IV solution before and after datomycin administration.

## **Darbepoetin Alfa**

dar-beh-poe'ee-tin Aranesp Do not confuse Aranesp with Aricept.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Hematopoietic agents, erythropoiesis-stimulating agents (ESAs)

## **MECHANISM OF ACTION**

A glycoprotein that stimulates formation of red blood cells in bone marrow; increases the serum halflife of epoetin. *Therapeutic Effect:* Induces erythropoiesis and release of reticulocytes from bone marrow.

#### PHARMACOKINETICS

Well absorbed after subcutaneous (SC) administration. *Half-life (CRF)*: IV 21 h, SC 48.5 h. *Half-life (cancer)*: SC adults 74 h, children 49 h.

#### AVAILABILITY

Injection, Single-Dose Vials: 25 mcg/ mL, 40 mcg/mL, 60 mcg/mL, 100 mcg/mL, 150 mcg/mL, 200 mcg/mL, 300 mcg/mL.

*Injection, Prefilled Syringes:* 25 mcg/0.42 mL, 40 mcg/0.4 mL, 60 mcg/0.3 mL, 100 mcg/0.5 mL, 150 mcg/0.3 mL, 200 mcg/0.4 mL, 300 mcg/0.6 mL, 500 mcg/1 mL.

## INDICATIONS AND DOSAGES Anemia in chronic renal failure

IV BOLUS, SUBCUTANEOUS *Adults, Elderly.* Initially, 0.45 mcg/kg once weekly. Adjust dosage to achieve and maintain a target hemoglobin level not to exceed 12 g/dL (target 10-12 g/dL). Do not increase dosage more frequently than once monthly. Limit increases in hemoglobin level by < 1 g/dL over any 2-wk period. IV route preferred in hemodialysis patients. *Children >1 yr.* Convert from epoetin alfa based on manufacturer dosing table.

Dosage adjustment: If hemoglobin level approaches 12 g/dL or increases >1 g/dL in any 2-wk period, decrease dose by 25%. If it continues to rise, discontinue therapy temporarily, then resume with 25% reduction. If hemoglobin level does not increase by 1 g/dL after 4 wks, increase dose by 25%.

#### Anemia associated with chemotherapy

IV, SUBCUTANEOUS Adults, Elderly. 2.25 mcg/kg/dose once a week or 500 mcg every 3 wks. Adjust dosage to achieve and maintain a target hemoglobin level not to exceed 12 g/dL. Dosage adjustment. If hemoglobin

Dosage adjustment: If hemoglobin exceeds 12 g/dL, withhold dose and then restart at 40% dose reduction. If hemoglobin increases 1 g/dL in any 2-wk period, decrease dose by 40%. If hemoglobin does not increase by 1 g/dL after 6 wks, increase dose up to 4.5 mcg/kg once a week.

### CONTRAINDICATIONS

History of sensitivity to hamster cellderived products or human albumin, uncontrolled hypertension.

### INTERACTIONS

Drug, Herbal, Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum phosphorus, serum potassium, serum creatinine, serum uric acid, and serum sodium levels. May decrease bleeding time, serum iron concentration, and serum ferritin.

### IV INCOMPATIBILITIES

Do not mix with other medications.

## SIDE EFFECTS

#### Frequent (11%-33%)

Myalgia, fatigue, edema, fever, dizziness, constipation, vomiting, nausea, abdominal pain, arthralgia, infection, hypertension or hypotension, headache, diarrhea. Occasional (3%-10%)

Angina, rash, injection site pain, vascular access infection, flu-like syndrome, reaction at administration site, asthenia, dizziness.

#### SERIOUS REACTIONS

 Vascular access thrombosis, congestive heart failure (CHF), sepsis, arrhythmias, thrombosis, myocardial infarction (MI), stroke, transient ischemic attack (TIA), and anaphylactic reaction occur rarely.

• Pure red blood cell aplasia and severe anemia, with or without other cytopenias, associated

with neutralizing antibodies to erythropoietin have occurred, predominantly in patients with CRF receiving darbepoetin by subcutaneous administration. · Erythropoiesis-stimulating agents (ESAs) increase the risk for death and serious cardiovascular events in controlled clinical trials when administered to target a hemoglobin of more than 12 g/dL and in cancer patients receiving chemotherapy. There is an increased risk of serious arterial and venous thromboembolic reactions, including MI, stroke, CHF, and hemodialysis graft occlusion. To reduce cardiovascular risks, use the lowest dose of ESAs that will gradually increase the hemoglobin concentration to a level sufficient to avoid the need for red blood cell (RBC) transfusion. The hemoglobin concentration should not exceed 12 g/dL; the rate of hemoglobin increase should not exceed 1 g/dL in any 2-wk period.

• ESAs have shortened time to tumor progression and reduced survival time in solid tumor patients with target hemoglobin > 12 g/dL.

#### **PRECAUTIONS & CONSIDERATIONS**

Darbepoetin alfa is not indicated for patients receiving myelosuppressive chemotherapy when the anticipated outcome is cure, due to the risk. Caution is warranted with hemolytic anemia, a history of seizures, known porphyria (impairment of erythrocyte formation in bone marrow), sickle cell anemia, and thalassemia. It is unknown whether darbepoetin alfa crosses the placenta or is distributed in breast milk. Safety and efficacy of darbepoetin alfa have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment. Avoid

tasks that require mental alertness or motor skills until response to the drug is established. Prefilled syringe needle covers contain dry natural rubber, which may cause allergic reactions in individuals with latex hypersensitivity.

Notify the physician of severe headache. Hematocrit level should be monitored diligently. The dosage should be reduced if hematocrit level increases more than 4 points in 2 wks. CBC with differential, hemoglobin, reticulocyte count, BUN, phosphorus, potassium, serum creatinine, and serum ferritin levels should also be monitored before and during therapy. In addition, BP must be monitored aggressively for an increase because 25% of persons taking darbepoetin alfa require antihypertensive therapy and dietary restrictions. Keep in mind that most patients will eventually need supplemental iron therapy.

#### Storage

Refrigerate vials. Do not shake vials vigorously because doing so may denature medication, rendering it inactive. Do not freeze. Protect from light.

#### Administration

For IV use, further dilution is not necessary. May be given as an IV bolus. IV administration is preferred route for patients with renal failure.

For subcutaneous administration, use one dose per vial; do not reenter vial. Discard unused portion. Also available in prefilled syringes or autoinjectors. Do not inject into an area that is red, bruised, hard, or tender. Rotate sites of SC administration with each injection.

## Darifenacin Hydrobromide

dare-ih-fen'ah-sin

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antimuscarinics, urinary incontinence agents, bladder antispasmodics

## **MECHANISM OF ACTION**

A urinary antispasmodic agent that acts as a direct antagonist at muscarinic receptor sites in cholinergically innervated organs. Blockade of the receptors limits bladder contractions. *Therapeutic Effect*: Reduces symptoms of bladder irritability and overactivity; improves bladder capacity.

## AVAILABILITY

Tablets (Extended Release): 7.5 mg, 15 mg.

## INDICATIONS AND DOSAGES

#### • Overactive bladder PO

*Adults, Elderly.* Initially, 7.5 mg once daily. If response is not adequate after at least 2 wks, dosage may be increased to 15 mg once daily. Dose should not exceed 7.5 mg once daily with concomitant CYP3A4 inhibitors.

## Dosage in hepatic impairment For patients with moderate hepatic impairment, maximum dosage is 7.5 mg once daily.

## CONTRAINDICATIONS

Hypersensitivity; GI or gastrourinary obstruction, paralytic ileus, severe hepatic impairment, uncontrolled angle-closure glaucoma, urine retention.

## INTERACTIONS

#### Drug Aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, rifamycins, CYP3A4 inducers: May decrease the effects and blood level of darifenacin. Amphetamines, β-blockers (selected), dextromethorphan, fluoxetine, lidocaine, mirtazapine, nefazodone, paroxetine, risperidone, ritonavir, thioridazine, tricyclic antidepressants, venlafaxine, CYP2D6 substrates: May increase the effects and blood levels of these drugs. Anticholinergic agents: Anticholinergic side effects may be increased. Azole antifungals, ciprofloxacin, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine, verapamil, CYP3A4 inhibitors: May increase the effects and blood level of darifenacin. Maximum dose 7.5 mg daily with potent CYP3A4 inhibitors. Codeine, hydrocodone, oxycodone, tramadol, CYP2D6 prodrug substrates: May decrease the effects and blood levels of these drugs.

Digoxin: Increased digoxin levels. Herbal

**St. John's wort:** May decrease effects and blood level of darifenacin.

#### Food

None known.

Darifenacin Hydrobromide (Generic Name), Enablex (Brand Name)

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Frequent (21%-35%) Dry mouth, constipation. Occasional (4%-8%)

Dyspepsia, headache, hypertension, peripheral edema, nausea, abdominal pain.

#### Rare (2%-3%)

Asthenia, diarrhea, dizziness, dry eyes.

## SERIOUS REACTIONS

• Urinary tract infection occurs occasionally.

- · Heat prostration may occur.
- Acute urinary retention requiring treatment.

• Rare cases of hypersensitivity, such as angioedema.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with bladder outflow obstruction, constipation, controlled angle-closure glaucoma, decreased GI motility, GI obstructive disorders, hiatal hernia, myasthenia gravis, nonobstructive prostatic hyperplasia, reflux esophagitis, ulcerative colitis, moderate hepatic dysfunction, and urine retention. Safety and efficacy have not been established in pediatric patients. Effects in pregnancy and breastfeeding are unknown.

#### Storage

Store at room temperature; protect from light.

### Administration

Take darifenacin without regard to food. Swallow extended-release tablets whole; do not cut or crush them.

#### Darunavir

da-roon'ah-veer ★ ● Prezista **Do not confuse darunavir with Denavir.** 

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Antiretrovirals, protease inhibitors

#### **MECHANISM OF ACTION**

A protease inhibitor that suppresses HIV protease, an enzyme necessary for splitting viral polyprotein precursors into mature and infectious viral particles. *Therapeutic Effect:* Interrupts HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

A single 600-mg dose of darunavir exhibits an absolute bioavailability of 37%. Coadministration with ritonavir (100 mg twice daily) increases bioavailability to 82%. Coadministration with ritonavir increases darunavir concentrations approximately 14-fold. Roughly 95% bound to plasma proteins, specifically α-1-acid glycoprotein. Primarily metabolized in liver via CYP3A; 80% of a single dose is excreted in the feces and approximately 14% is recovered in the urine. Unchanged darunavir accounted for approximately 41% and 8% of the administered dose in feces and urine, respectively. Halflife: 15 h (increased in very impaired hepatic function).

## AVAILABILITY

*Tablets:* 75 mg, 150 mg, 300 mg, 400 mg, 600 mg. *Suspension:* 100 mg/mL.

Darunavir (Generic Name), Prezista (Brand Name)

#### INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals) PO

Adults. Treatment-naïve: 800 mg with ritonavir (100 mg) once daily with food.

Treatment-experienced with *no* darunavir resistance substitutions. 800 mg with ritonavir (100 mg) once daily with food.

Treatment-experienced with at least 1 documented darunavir resistance substitutions. 600 mg with ritonavir (100 mg) twice daily with food.

*Children.* 3 to < 18 yr. Do not use once-daily dosing; dose is weight based and should not exceed adult dosing:

## Body Weight

(kg)	Darunavir Dose	
10 to < 11 kg	200 mg with ritonavir (32 mg) BID	
11 to < 12 kg	220 mg with ritonavir (32 mg) BID	
12 to < 13 kg	240 mg with ritonavir (40 mg) BID	
13 to < 14 kg	260 mg with ritonavir (40 mg) BID	
14 to < 15 kg	280 mg with ritonavir (48 mg) BID	
20 to < 30 kg	375 mg with ritonavir (50 mg) BID	
30 to < 40 kg	450 mg with ritonavir (60 mg) BID	
≥ 40 kg	600 mg with ritonavir (100 mg) BID	

#### CONTRAINDICATIONS

Hypersensitivity to darunavir; coadministration with alfuzosin, ergot alkaloids, cisapride, pimozide, oral midazolam, triazolam, St. John's wort, lovastatin, simvastatin, rifampin, and sildenafil. Also, since darunavir is boosted with ritonavir, review ritonavir contraindications. The manufacturer recommends against use of darunavir in patients with severe hepatic impairment.

#### INTERACTIONS Drug

Alfuzosin: Increases alfuzosin levels and significantly increases hypotension risk. Contraindicated. Antifungal agents, delavirdine, NNRTIS: May increase levels of darunavir.

Calcium channel blockers: Darunavir may increase concentrations of calcium channel blockers. Monitor BP and heart rate. Clarithromycin: May increase levels of clarithromycin.

**Colchicine:** May increase levels of colchicine and resultant risk of toxicity. **CYP3A4 inducers:** May decrease effects of darunavir.

**CYP3A4 inhibitors:** May increase effects of darunavir.

**CYP3A4 substrates:** Levels of CYP3A4 substrates may be increased by darunavir. Contraindicated with cisapride and pimozide.

**Ergot alkaloids:** Effects of ergot alkaloids may be increased. Contraindicated.

**HMG CoA reductase inhibitors:** Darunavir may increase side effects. Use contraindicated with lovastatin, simvastatin.

Sildenafil (when given routinely for pulmonary HTN): Levels may be increased by darunavir. Contraindicated.

Alprazolam, oral midazolam: Increases the risk of prolonged sedation. Contraindicated.

**Rifamycins:** Decrease darunavir concentrations. Avoid.

Warfarin: Decreased anticoagulant effect. Monitor INR.

#### Herbal

**St. John's wort:** May decrease darunavir blood concentration and

effect. Contraindicated. **Food** 

All food: Enhances darunavir blood concentration; give with food.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum AST (SGOT) and ALT (SGPT), serum amylase, lipase, triglyceride or cholesterol levels, blood glucose.

### SIDE EFFECTS

#### Frequent (≥ 5%)

Diarrhea, abdominal pain, headache, rash.

#### Occasional (2%-5%)

Nausea, insomnia, vomiting, anorexia, accumulation of fat in waist, abdomen, or back of neck.

#### Rare (< 2%)

Fatigue, abnormal dreams, asthenia, heartburn, flatulence, hyperglycemia, myalgia, urticaria, and other hypersensitivity.

## SERIOUS REACTIONS

· Immune reconstitution syndrome.

Pancreatitis.

 Stevens-Johnson syndrome and other serious skin rashes. Discontinue immediately if signs or symptoms of *severe* skin reactions develop.

· Hepatitis/liver failure.

• Reports of bleeding in patients with hemophilia.

#### **PRECAUTIONS & CONSIDERATIONS**

Darunavir contains a sulfonamide moiety. Use with caution in patients with a known sulfonamide allergy. Use with caution in mild to moderate liver function impairment, hemophilia, or diabetes mellitus. Be aware that it is unknown whether darunavir is excreted in breast milk. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Use with caution during pregnancy due to lack of data. The safety and efficacy of this drug have not been established in children under the age of 3 yr.

Establish baseline lab values (chemistry, CBC, HIV status, etc.) and monitor hepatic function before and during therapy. Assess the pattern of GI side effects and stool consistency. Evaluate for abdominal discomfort or headache.

#### Storage

Store drug at room temperature. Administration

Take darunavir with food; administration with ritonavir is essential to therapeutic effectiveness. Shake the suspension well before each use and measure dosage with the calibrated device that comes with the product.

If a once-daily dose is missed and less than 12 h have elapsed since it was due, the patient may take the missed dose. A patient taking the drug twice a day may take a missed dose if less than 6 h have elapsed. Otherwise, have the patient skip the missed dose and take the next dose at the regularly scheduled time; do not double the dose.

## Dasatinib

da-sa′ti-nib ★ 👾 Sprycel

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Antineoplastic, signal transduction inhibitors (STIs)

Dasatinib (Generic Name), Sprycel (Brand Name)

## **MECHANISM OF ACTION**

Inhibits BCR-ABL tyrosine kinase, an enzyme created by the Philadelphia chromosome abnormality found in patients with chronic myeloid leukemia (CML). Also inhibits SRC family kinases. *Therapeutic Effect:* Suppresses tumor growth during the three stages of CML: blast crisis, accelerated phase, and chronic phase.

## PHARMACOKINETICS

Protein binding: 96%. Metabolized in liver, primarily by CYP450 3A4. Primarily eliminated in feces (85%, 19% as unchanged); minimal excretion in urine (4%, 0.1% unchanged). *Half-life:* 3-5 h.

## AVAILABILITY

*Tablets:* 20 mg, 50 mg, 70 mg, 100 mg.

#### INDICATIONS AND DOSAGES

 Acute lymphocytic leukemia (ALL), Philadelphia chromosome-positive, resistant or intolerant to prior therapy

#### PO

*Adults.* Initially, 140 mg once per day. In clinical studies, dose escalation to 180 mg once daily was allowed in patients who did not achieve a hematologic or cytogenetic response at the recommended starting dosage.

## CML, accelerated, or myeloid, or lymphoid blast phase

*Adults.* Initially, 140 mg once per day. In clinical studies, dose escalation to 180 mg once daily was allowed in patients who did not achieve a hematologic or cytogenetic response at the recommended starting dosage.

#### CML, chronic phase PO

Adults. 100 mg PO once daily. In clinical studies, dose escalation to

140 mg once daily was allowed in patients who did not achieve a hematologic or cytogenetic response at the recommended starting dosage.

## CONTRAINDICATIONS

Hypersensitivity to dasatinib or its components.

## INTERACTIONS

#### Drug

H<sub>2</sub> antagonists, proton-pump inhibitors: Decreased dasatinib absorption. Anticoagulants, NSAIDs: Increased risk of bleeding. CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, azole antifungals): May increase the levels and adverse effects of dasatinib. Consider dasatinib dose reduction. CYP3A4 substrates (midazolam, triazolam): Increased plasma concentrations of these drugs with increased CNS depression. QTc-prolonging medications (e.g., class Ia or III antiarrhythmics): Additive effects on OT interval. Herbal St. John's wort: Decrease dasatinib levels.

Food Grapefruit juice: May increase dasatinib levels and adverse effects.

dasatinib levels and adverse effects. Do not drink grapefruit juice while taking dasatinib.

## DIAGNOSTIC TEST EFFECTS

Myelosuppression, QTc prolongation.

#### SIDE EFFECTS Frequent

Neutropenia, thrombocytopenia, diarrhea, headache, musculoskeletal pain, fatigue, fever, superficial edema, rash, nausea, dyspnea, upper respiratory infection, abdominal pain, pleural effusion, vomiting, arthralgia, asthenia, loss of appetite, inflammatory disease of mucous membrane, GI hemorrhage, constipation, weight loss, dizziness, chest pain, neuropathy, myalgia, weight increase, cardiac dysrhythmia, pruritus, pneumonia, swollen abdomen, pneumonia, shivering. Occasional

Febrile neutropenia, CHF, pericardial effusion, pulmonary edema, prolonged QT interval, anemia. Rare

Pulmonary hypertension, CNS hemorrhage, ascites.

#### SERIOUS REACTIONS

Severe CNS hemorrhage, including fatalities, have been reported.
Dasatinib may cause severe bone marrow suppression (thrombo-

cytopenia, neutropenia, anemia).

 Fluid retention, including pleural and pericardial effusion, severe ascites, and generalized edema, has been reported.

• Pulmonary arterial hyertension; discontinue drug if confirmed.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with impaired hepatic function, cardiovascular disease, pulmonary disease, and patients with OTc prolongation or at risk for OT prolongation including those with hypokalemia, hypomagnesemia, congenital long QT syndrome, taking other medications known to prolong OTc, or receiving cumulative high-dose anthracycline therapy. Safety and effectiveness have not been established in children. Fluid retention may occur more often in the elderly. Men and women of childbearing potential should be advised to use adequate contraception as the drug may cause fetal harm. Breast milk excretion unknown; do not breastfeed.

#### Storage

Store at room temperature. Administration

Tablets should be swallowed whole, not crushed or cut. May be taken without regard to food. Dosage adjustments are recommended based on tolerability and potential drug interactions. Expect dosage adjustments if significant myelosuppression occurs.

### **Deferasirox**

de-fer'a-si-rox Exjade Do not confuse deferasirox with deferoxamine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antidotes, chelators

## **MECHANISM OF ACTION**

An orally active chelator that binds selectively with iron to form a complex. One oral dose of deferasirox appears to be 4-5 times more effective than parenteral deferoxamine in promoting the excretion of chelatable iron from hepatocellular iron stores. Deferasirox chelates excess iron that enters the reticuloendothelial system as insoluble ferritin rather than iron required for enzyme activity. At recommended doses, drug is able to prevent net iron accumulation in most patients receiving frequent transfusions. Therapeutic Effect: Promotes urine excretion of iron.

## PHARMACOKINETICS

Bioavailability roughly 70%. Food variably increases absorption. Protein binding: 99%, mostly to

## Daunorubicin

daw-noe-roo'bi-sin Cerubidine, DaunoXome Do not confuse daunorubicin with dactinomycin or doxorubicin. Do *not* confuse conventional daunorubicin with daunorubicine liposomal (DaunoXome) due to different indications and dosage regimens.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastics, anthracyclines

## **MECHANISM OF ACTION**

An anthracycline antibiotic that inhibits DNA and DNA-dependent RNA synthesis by binding with DNA strands. Liposomal encapsulation increases uptake by tumors, prolongs drug action, and may decrease toxicity. *Therapeutic Effect:* Prevents cell division.

## PHARMACOKINETICS

Widely distributed. Protein binding: High. Does not cross the blood-brain barrier. Metabolized in the liver to active metabolite. Excreted in urine; eliminated by biliary excretion. *Half-life*: 18.5 h; metabolite: 26.7 h.

## AVAILABILITY

## Cerubidine (daunorubicin hydrochloride)

Powder for Injection: 20 mg. Solution for Injection: 5 mg/mL. DaunoXome (liposomal daunorubicin) Injection: 2 mg/mL.

## INDICATIONS AND DOSAGES

 Acute lymphocytic leukemia (ALL) IV Adults. 45 mg/m<sup>2</sup> on days 1-3 of induction course. Children < 2 or BSA < 0.5. Give 2.1 mg/kg/dose per protocol. Children > 2 and BSA > 0.5. Give  $0.25 mg/m^2$  on day 1 each week for

# 4-6 cycles. Acute myeloid leukemia (AML) IV

Adults < 60 yr. 45 mg/m<sup>2</sup> on days 1-3 of first cycle and on days 1 and 2 of subsequent courses.

Adults > 60 yr: 30 mg/m<sup>2</sup> on days 1-3 of induction course and on days 1 and 2 of subsequent cycles.

Children < 2 or BSA < 0.5. Give 2.1 mg/kg/dose per protocol. Children > 2 and BSA > 0.5. Give

30-60 mg/m<sup>2</sup> on days 1-3 of cycle. Acute nonlymphocytic leukemia

(ANLL) IV

Adults < 60 yr: 45 mg/m<sup>2</sup> on days 1-3 of first cycle and on days 1 and 2 of subsequent courses.

Adults > 60 yr: 30 mg/m<sup>2</sup> on days 1-3 of induction course and on days 1 and 2 of subsequent cycles.

 Kaposi sarcoma (DaunoXome only) IV

Adults. 40 mg/m<sup>2</sup> (DaunoXome) over 1 h repeated q2wk.

Dosage in renal impairment

ALL, AML, ANLL Adults, Children. Serum creatinine > 3 mg/dL. 50% of normal dose. Kaposi sarcoma (DaunoXome) Serum creatinine > 3 mg/dL. 50% of normal dose.

#### Dosage in hepatic impairment ALL, AML, ANLL

*Bilirubin 1.2-3 mg/dL.* 75% of normal dose. *Bilirubin 3.1-5 mg/dL.* 50% of normal dose.

*Bilirubin* > 5 *mg/dL*. Daunorubicin is not recommended for use in this patient population.

KAPOSI SARCOMA

(DAUNOXOME) Bilirubin 1.2-3 mg/dL. 75% of normal dose. Bilirubin > 3 mg/dL. 50% of normal dose.

#### **OFF-LABEL USES**

Treatment of chronic myelocytic leukemia, Ewing's sarcoma, neuroblastoma, non-Hodgkin's lymphoma, Wilms's tumor.

#### CONTRAINDICATIONS

Hypersensitivity to daunorubicin.

#### INTERACTIONS

#### Drug

Antigout medications: May decrease the effects of these drugs. Bevacizumab, trastuzumab, cyclophosphamide: May increase cardiotoxic effects.

**Bone marrow depressants:** May enhance myelosuppression.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine. Killed vaccines: May decrease the patient's antibody response to the vaccine.

## Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, uric acid, and AST (SGOT) levels.

### IV INCOMPATIBILITIES Daunorubicin hydrochloride:

Allopurinol (Aloprim), amphotericin B liposomal (AmBisome), aztreonam (Azactam), cefepime (Maxipime), dexamethasone sodium phosphate, heparin, ertapenem (Invanz), fludarabine (Fludara), lanosprazole (Prevacid), levofloxacin (Levaquin), pantoprazole (Protonix), pemetrexed (Alimta), piperacillin/tazobactam (Zosyn).

**DaunoXome:** Do not mix with any other solution, especially NaCl or bacteriostatic agents (such as benzyl alcohol).

Rituximab (Rituxan), tigecycline (Tygacil).

## **IV COMPATIBILITIES** Daunorubicin hydrochloride:

Amifostine (Ethyol), anidulafungin (Eraxis), bivalirudin (Angiomax), carboplatin, caspofungin (Cancidas), cisplatin, cyclophosphamide (Cytoxan), cytarabine (Cytosar), dactinomycin (Cosmegen), daptomycin (Cubicin), dexmedetomidine (Precedex), etoposide (VePesid), etoposide phosphate (EtopoPhos), fenoldopam (Corlopam), filgrastim (Neupogen), gemcitabine (Gemzar), granisetron (Kytril), hydrocortisone sodium succinate, melphalan (Alkeran), meperidine (Demerol), methotrexate, ondansetron (Zofran), oxaliplatin (Eloxatin), paclitaxel (Taxol), palonosetron (Aloxi), quinupristin/ dalfopristin (Synercid), rituximab (Rituxan), sodium acetate, sodium bicarbonate, teniposide (Vumon), thiotepa (Thioplex), tigecycline (Tygacil), trastuzumab (Herceptin), vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend). DaunoXome: Bivalirudin (Angiostat), meperidine (Demerol), sodium acetate, tirofibran (Aggrastat), trastuzumab (Herceptin).

#### SIDE EFFECTS Frequent (> 15%)

Complete alopecia (scalp, axillary, pubic), nausea, vomiting (beginning a few hours after administration and lasting 24-48 h), discoloration of bodily fluids.
DaunoXome: Mild to moderate nausea, fatigue, diarrhea, fever, abdominal pain, anorexia, headache, rigors, back pain, cough, dyspnea, mild alopecia.

#### Occasional (5%-14%)

Diarrhea, abdominal pain, esophagitis, stomatitis, transverse pigmentation of fingernails and toenails.

#### Rare (< 5%)

Transient fever, chills, hypertension, palpitation, tachycardia, anxiety, confusion.

#### SERIOUS REACTIONS

 Myelosuppression may cause hematologic toxicity, manifested as severe leukopenia, anemia, and thrombocytopenia. Platelet and WBC counts typically nadir in 10-14 days and return to normal levels by the third week of daunorubicin treatment. Neutropenic fever commonly occurs.

 Allergic reactions (DanuoXome) in 25% of patients.

 The risk of cardiotoxicity (either acute, manifested as transient ECG abnormalities, or chronic, manifested as congestive heart failure [CHF]) increases when the total cumulative dose exceeds 550 mg/m<sup>2</sup> in adults, 400 mg/m<sup>2</sup> in adults receiving chest radiation, 300 mg/m<sup>2</sup> in children older than 2 yr, or 10 mg/kg in children younger than 2 yr. Monitor liver function at baseline and periodically.

• Severe, local tissue damage leading to ulceration and necrosis can occur with extravasation.

• Secondary malignancy may occur when used in combination with chemotherapy or radiation.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in elderly patients, preexisting cardiac disease, CHF, hepatic or renal function impairment, myelosuppression, hyperuricemia, and concomitant radiation. Avoid using daunorubicin in pregnant women. It is unknown whether daunorubicin is distributed in breast milk. Cardiac, hepatic, and renal function should be monitored prior to each cycle.

#### Storage

Daunorubicin hydrochloride: Store vials of powder at room temperature, vials of solution in refrigerator. Reconstituted solutions are stable for 4 days at room temperature. Protect from light. Daunorubicin liposomal (DaunoXome): Store vials in refrigerator. Protect from light. Diluted solution stable in refrigerator for 6 h. Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs. For IV use only. Do not administer IM or SC. Avoid extravasation, potent vesicant. Daunorubicin hydrochloride: Reconstitute by adding 4 mL of sterile water for injection to the vial and shaking gently to dissolve to produce 5 mg of daunorubicin per mL. The desired dose is withdrawn into a syringe containing 10-15 mL of 0.9% NaCl and then given IV over 3-5 min into the tubing or sidearm in a rapidly flowing IV infusion of D5W or 0.9% NaCl injection. **Daunorubicin liposomal** (DaunoXome): Only dilute with D5W to 1 mg/mL. Do not filter. Administered IV over 1-2 h.

# Decitabine

de-sye'ta-been ★ 🗳 Dacogen

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastic, pyrimidine analogs

# **MECHANISM OF ACTION**

A pyrimidine antimetabolite that is incorporated into DNA and inhibits DNA methyltransferase causing hypomethylation and subsequent cell death. *Therapeutic Effect:* Restores normal function to tumorsuppressor genes regulating cellular differentiation and proliferation.

# PHARMACOKINETICS

Few pharmacokinetic data available. *Half-life:* less than 1 h.

# AVAILABILITY

Powder for Injection: 50 mg.

#### INDICATIONS AND DOSAGES Myelodysplastic syndrome (MDS) IV

*Adults.* 15 mg/m<sup>2</sup> over 3 h; repeat every 8 h for 3 days; repeat cycle every 6 wks for a minimum of 4 cycles. Alternatively, 20 mg/m<sup>2</sup> over 1 h once daily for 5 days; repeat cycle every 4 wks. Dose may be adjusted or delayed based on tolerability.

# CONTRAINDICATIONS

Hypersensitivity to decitabine or its components.

# INTERACTIONS

#### Drug

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

#### **Herbal and Food**

None known.

# **DIAGNOSTIC TEST EFFECTS**

Myelosuppression, hyperglycemia, increased liver enzymes.

# 🗏 IV COMPATIBILITIES

Stable in NS, D5W, and lactated Ringer's.

# SIDE EFFECTS

#### Common (> 30%)

Neutropenia, thrombocytopenia, anemia, fatigue, fever, nausea, cough, petechiae, constipation or diarrhea, hyperglycemia.

#### **Occasional (10%-30%)**

Headache, insomnia, swelling, altered albumin, magnesium or potassium, bruising, chills, dizziness, rash, general myalgia, poor appetite, mouth sores/ stomatitis, pharyngitis, drowsiness, confusion, altered liver function tests, confusion, pruritus, heartburn.

#### Rare (<10%)

Mental status changes, serious bleeding, gingival disorders, serious infections of various sites, allergic reactions, injection site reactions, acute febrile neutrophilic dermatosis.

## SERIOUS REACTIONS

• Neutropenia and thrombocytopenia are expected to occur.

- · Anaphylactic reactions are rare.
- · Opportunistic infection risks.

# **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with bone marrow depression, or renal or hepatic impairment. Safety and effectiveness have not been established in children. No unique precautions were observed in the elderly. Advise women of childbearing potential to avoid becoming pregnant while receiving treatment. Advise men not to father a child while receiving decitabine or for 2 mo after discontinuation of therapy. Not known if excreted in breast milk; do not breastfeed.

# Storage

Store vials at room temperature. Use within 15 min of reconstitution. Solution prepared with cold infusion fluids may be stored in the refrigerator for up to 7 h.

# Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs. Reconstitute vial with 10 mL sterile water for injection and further dilute with NS, D5W, or Ringer's lactate injection to final concentration of 0.1-1 mg/mL. Administer by IV infusion for duration specified by dose protocol.

Moderately emetogenic; consider antiemetic pretreatment. Dosing may be delayed or reduced based on tolerability. albumin. Glucuronidation via uridine diphosphate glucoronosyltranferase (UGT) is the main metabolic pathway, with subsequent biliary excretion. CYP450 (oxidative) metabolism is minor (8%). Drug undergoes enterohepatic recycling. Parent drug and metabolites are primarily (84%) excreted in the feces. Renal excretion is minimal. *Half-life:* 8-16 h.

## AVAILABILITY

*Tablets for Oral Suspension:* 125 mg, 250 mg, 500 mg.

#### INDICATIONS

 Chronic iron toxicity secondary to transfusional iron overload

Adults, Children > 2 yr. Initially, give 20 mg/kg daily (round to the nearest whole tablet strength). Following initial dosing, adjust q 3-6 mo by 5 to 10 mg/kg (to the nearest whole tablet strength) based on serum ferritin. Maximum recommended: 40 mg/kg/day.

#### Adjustment if taking a potent UGT inducer or cholestyramine

Consider increase to 30 mg/kg daily initially; round to the nearest whole tablet strength.

 Dosage in hepatic imapirment: Avoid in severe (Child-Pugh class C) impairment. Reduce dose by 50% in those with moderate (Child-Pugh class B) impairment. Closely monitor for efficacy and needed adjustments.

#### CONTRAINDICATIONS

Hypersensitivity to drug or product components, severe renal disease (CrCl < 40 mL/min or serum creatinine > 2 times upper limit of normal); poor performance status and high-risk myelodysplastic syndromes or advanced malignancies; thrombocytopenia.

#### INTERACTIONS Drug

#### Aluminum-containing antacids:

May interfere with absorption of deferasirox and iron-chelating action; avoid.

Anticoagulants (e.g., warfarin): There may be increased risk of hemorrhage; monitor INR and patient status closely.

Cholestyramine and UGT inducers (rifampin, phenytoin, phenobarbital, ritonavir): Avoid if possible, as they significantly reduce deferasirox efficacy. If used together, increase deferasirox dose.

Nephrotoxic drugs (e.g., aminoglycosides, platinum compounds, vancomycin): May increase risk for renal dysfunction; monitor renal function closely. Substrates of CYP3A4 (e.g., cyclosporine, simvastatin, hormonal contraceptive agents): Potential for reduced efficacy of these drugs.

Substrates of CYP2C8 (e.g., repaglinide, paclitaxel): Potential for increased levels of these drugs.

Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase liver transaminases, serum creatinine. May lower blood cell counts.

# SIDE EFFECTS

# Frequent (≥ 8%)

Nausea, vomiting, skin rash, diarrhea, abdominal pain, increased serum creatinine.

#### Occasional

Edema, gastritis, glycosuria, increased blood glucose, proteinuria, purpura, dizziness, insomnia, restlessness or anxiety, drug fever, elevated liver enzymes.

#### SERIOUS REACTIONS

• Serious allergic reactions (which include angioedema) have been reported, usually within the first month of treatment.

- · Acute renal failure.
- Hepatitis and hepatic failure, possible pancreatitis.
- · GI bleeding in at-risk patients.

• Agranulocytosis, neutropenia, and thrombocytopenia.

• Ocular (optic neuritis) or hearing disturbances/loss occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Use caution in patients with multiple comorbidities and who have preexisting renal conditions, are elderly, or are receiving medicines that reduce renal function. Closely monitor the renal function of patients with creatinine clearances between 40 and less than 60 mL/min. Maintain adequate hydration. Monitor serum creatinine and other renal parameters at baseline and monthly after initiation of treatment. Consider dose reduction, interruption, or discontinuation for increases in serum creatinine. Monitor hepatic function before the initiation of treatment, every 2 wks during the first month and monthly thereafter. Consider dose modifications or interruption of treatment for severe or persistent LFT elevations. Remain alert for signs and symptoms of GI ulceration and hemorrhage during therapy. Monitor blood counts regularly. Be alert for signs of allergic reactions, such as severe skin rash. Auditory and ophthalmic testing (including slit lamp examinations and dilated fundoscopy) are recommended before starting treatment and at

regular intervals (every 12 mo). If disturbances are noted, consider dose reduction or interruption. Measure serum ferritin monthly to assess response to therapy and to evaluate for the possibility of overchelation of iron. It is unknown whether drug crosses the placenta or is distributed in breast milk. Use only when absolutely necessary. Safety and efficacy have not been evaluated in children < 2 yr. Monitor children for growth and development.

#### Storage

Store dispersible tablets at room temperature; keep tightly closed; and protect from moisture.

# Administration

Take on an empty stomach at least 30 min before food, at the same time each day. Do not chew tablets or swallow them whole. Do not take with aluminumcontaining antacid products. Disperse tablet by stirring in water, orange juice, or apple juice until a fine suspension is obtained. Disperse doses of < 1 g in 3.5 oz of liquid and doses of  $\geq$  1 g in 7 oz of liquid. After swallowing the suspension, resuspend any residue in a small volume of liquid and swallow.

# Deferoxamine

de-fer-ox′a-meen ★ 🖤 Desferal

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

Classification: Antidotes, chelators

# **MECHANISM OF ACTION**

An antidote that binds with iron to form complex. *Therapeutic Effect:* Promotes urine excretion of acute iron poisoning or chronic iron overload.

# PHARMACOKINETICS

Well absorbed after IM or SC administration. Widely distributed. Rapidly metabolized in tissues, plasma. Excreted in urine, eliminated in feces via biliary excretion. Removed by hemodialysis. *Half-life:* 6 h.

# AVAILABILITY

Injection: 500 mg, 2 g.

# INDICATIONS AND DOSAGES Acute iron intoxication

IM (PREFERRED)

Children > 3yr. 90 mg/kg/dose every 8 h. Maximum: 6 g/day. Adults. 1000 mg initially, then 500 mg q4h for up to 2 doses. Subsequent doses have been given every 4-12 h. Maximum: 6 g/day. IV (FOR PATIENTS WITH SHOCK/ SEVERE SYSTEMIC SYMPTOMS)

*Adults.* 1000 mg initially, then 500 mg q4h for up to 2 doses. Subsequent doses have been given. Every 4-12 h. Maximum: 6 g/day. *Children.* 15 mg/kg/h. Maximum: 6 g/day.

#### Chronic iron overload

SUBCUTANEOUS (VIA SC INFUSION PUMP)

*Adults*. 1-2 g/day (20-40 mg/kg) over 8-24 h.

*Children.* 20-40 mg/kg/day over 8-24 h. Maximum 1000-2000 mg/ 24 h. IM/IV

*Adults.* 0.5-1 g/day IM. In addition to IM, 2 g infused at rate not to exceed 15 mg/kg/h for each unit of blood transfused. Maximum: 1 g/day if not transfused; 6 g/day on transfusion days. *Children (IV).* 15 mg/kg/h.

# **OFF-LABEL USES**

Diagnosis and treatment of aluminum toxicity in chronic kidney disease.

# CONTRAINDICATIONS

Severe renal disease, anuria, primary hemochromatosis, hypersensitivity to deferoxamine mesylate or any component of the formulation.

# INTERACTIONS

#### Drug

Vitamin C: May increase effect of deferoxamine. Prochlorperazine: May cause

loss of consciousness, mechanism unclear.

# Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

May cause a falsely high total ironbinding capacity (TIBC).

# IV INCOMPATIBILITIES

Do not mix with any other intravenous medications.

# SIDE EFFECTS

#### Frequent

Pain, induration at injection site, urine color change (to orange-rose).

#### Occasional

Abdominal discomfort, diarrhea, leg cramps, impaired vision.

# SERIOUS REACTIONS

• Neurotoxicity, including highfrequency hearing loss, and seizures have been reported.

- Adult respiratory distress syndrome with high doses.
- Infusion reactions (flushing, hypotension, urticaria, shock) with rapid infusion.
- Ocular disturbances with prolonged or high doses.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used with aluminum overload or aluminumrelated encephalopathy.

It is unknown whether drug crosses the placenta or is distributed in breast milk. Use only when absolutely necessary in pregnancy or breastfeeding. Be aware that skeletal anomalies may present in neonate. Safety and efficacy have not been evaluated in children < 3 yr of age. Monitor children for growth retardation. Be aware that agerelated renal impairment may require caution. Reddish urine may occur. Storage

# Store unopened vials at room temperature. After reconstitution, use within 3 h. If prepared aseptically, the manufacturer states the product may be stored at room temperature for a maximum of 24 h. Do not refrigerate reconstituted solution.

# Administration

In general, IM route is preferred unless in shock. Reconstitute each 500-mg vial with 2 mL sterile water for injection to provide a concentration of 250 mg/mL or dilute each 2-g vial with 8 mL of sterile water for injection.

For IM administration, inject deeply into upper outer quadrant of buttock. May give undiluted.

For subcutaneous injection, administer very slowly. May give undiluted. An SC infusion pump is utilized.

For IV administration, further dilute with 0.9% NaCl, D5W, or lactated Ringer's and administer at maximum rate of 15 mg/kg/h for the first 1000 mg given. Use a slower rate for any subsequent doses, not to exceed 125 mg/h. A too-rapid IV administration may produce skin flushing, urticaria, hypotension, or shock.

# Delavirdine

deh-la'ver-deen ★ 🐏 Rescriptor Do not confuse Rescriptor with Retrovir or ritonavir.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antiretrovirals. nonnucleoside reverse transcriptase inhibitors

#### MECHANISM OF ACTION

A nonnucleoside reverse transcriptase inhibitor that binds directly to HIV-1 reverse transcriptase and blocks RNAand DNA-dependent DNA polymerase activities. Therapeutic Effect: Interrupts HIV replication, slowing the progression of HIV infection.

# PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 98%. Primarily distributed in plasma. Metabolized in the liver. Eliminated in feces and urine. Half-life: 2-11 h.

#### AVAILABILITY

Tablets: 100 mg, 200 mg.

#### INDICATIONS AND DOSAGES

HIV infection (in combination with other antiretrovirals) PO

Adults. 400 mg 3 times a day.

#### CONTRAINDICATIONS

Hypersensitivity. Concomitant use with alprazolam, cisapride, ergot alkaloids, midazolam, pimozide, rifampin, or triazolam.

Delavirdine (Generic Name), Rescriptor (Brand Name)

# INTERACTIONS

NOTE: Please see detailed manufacturer's information regarding the management of drug interactions. In some cases, dosage adjustment or an alternate agent is recommended.

#### Drug

Antacids, H<sub>2</sub> blockers, protonpump inhibitors: May reduce absorption. Separate antacids by at least 1 h. Concurrent use with H<sub>2</sub> blockers and proton-pump inhibitors is not recommended.

**Benzodiazepines:** May cause lifethreatening adverse reactions. See contraindications.

Carbamazepine, phenobarbital, phenytoin, CYP3A4: May decrease delavirdine blood concentration. Corticosteroids, inhaled: May increase systemic effects of corticosteroids.

CYP2C9, CYP2C19, CYP2D6, CYP3A4 substrates: Levels and effects of substrates may be increased by delavirdine. Didanosine: Decreased concentrations of both drugs.

Separate administration by 1 h. **Protease inhibitors:** Delavirdine has been reported to increase the serum concentrations of amprenavir, indinavir, nelfinavir, ritonavir, and saquinavir. Decreased delavirdine concentrations may occur when used with amprenavir and nelfinavir. Dose reduction of indinavir and saquinavir should be considered.

**Rifabutin, rifampin:** May decrease delavirdine blood concentrations. Contraindicated.

Antiarrhythmics, calcium channel blockers, clarithromycin, methadone, immunosuppressants, sildenafil, lovastatin, simvastatin:

Increased levels and side effects of these medications may occur.

#### Herbal

**St. John's wort:** May decrease delavirdine levels and efficacy. Avoid. **Food** None known.

### DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT), bilirubin, and amylase levels. Prothrombin time may increase. May decrease neutrophil count or hemoglobin.

# SIDE EFFECTS

Frequent (> 18%) Rash, pruritus, headache, nausea. Occasional (> 2%)

Vomiting, fever, depression, diarrhea, fatigue, anorexia, anxiety, accumulation of fat in waist, abdomen, or back of neck.

#### SERIOUS REACTIONS

• Severe skin rashes, including Stevens-Johnson syndrome, have been reported.

Immune reconstitution syndrome.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with impaired liver function. It is unknown whether delavirdine crosses the placenta or is distributed in breast milk. Breastfeeding is not recommended due to risk of HIV transmission. Be aware that safety and efficacy have not been established in children younger than 16 yr and elderly patients. Delavirdine is not a cure for HIV infection, nor does it reduce the risk of transmission to others. Must give in combination with other antiretrovirals to adequately treat HIV and reduce chance of resistance.

Expect to obtain baseline laboratory testing, especially liver function tests, before beginning therapy and at periodic intervals

#### 428 Demeclocycline

during therapy. Assess for any nausea or vomiting and for skin rash. Determine the pattern of bowel activity and stool consistency. Monitor eating pattern and weight loss. Consume small, frequent meals to help offset anorexia and nausea. Medications, including OTC drugs, should not be taken without consulting the physician.

#### Storage

Store at room temperature, tightly closed. Protect from high humidity.

# Administration

May take without regard to food. May disperse 100-mg tablets in water before consumption. Add 4 tablets to at least 3 oz of water and allow to stand for a few minutes, then stir well. Drink promptly. Refill glass with water, and swallow to ensure full dose. Do not dissolve 200-mg tablets. Persons with achlorhydria should take delavirdine with orange juice or cranberry juice. Do not administer within 1 h of antacids or didanosine.

# **Demeclocycline**

dem-e-kloe-sye'kleen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antibiotics, tetracyclines

#### **MECHANISM OF ACTION**

A broad-spectrum tetracycline antibiotic that inhibits bacterial protein synthesis by binding to ribosomal receptor sites; also inhibits antidiuretic hormone–induced water reabsorption. *Therapeutic Effect:* Bacteriostatic; also produces water diuresis.

#### AVAILABILITY

Tablets: 150 mg, 300 mg.

# INDICATIONS AND DOSAGES

 Mild to moderate infections, including acne, pertussis, chronic bronchitis, and urinary tract infection

#### PO

Adults, Elderly. 150 mg 4 times a day or 300 mg 2 times a day. Children older than 8 yr: 8-12 mg/kg/day in 2-4 divided doses. > Uncomplicated gonorrhea

# PO

*Adults*. Initially, 600 mg, then 300 mg q12hr for 4 days for total of 3 g.

# Syndrome of inappropriate ADH secretion (SIADH)

PO

Adults, Elderly. Initially, 900-1200 mg/day in 3-4 divided doses, then decrease dose to 600-900 mg/day in divided doses.

#### CONTRAINDICATIONS

Children 8 yr and younger, pregnancy, hypersensitivity to tetracyclines.

# INTERACTIONS

#### Drug

Acitretin: Contraindicated due to potential for increased intracranial pressure (ICP).

Antacids or supplements containing aluminum, calcium, or magnesium; laxatives containing magnesium; oral iron preparations; zinc: Impair the absorption of demeclocycline. Take demeclocycline 1 h before or 2 h after these cations.

Cholestyramine, colestipol: May decrease demeclocycline absorption. Methotrexate: May increase methotrexate levels.

Methoxyflurane: Combination may increase risk of nephrotoxicity.

Demeclocycline (Generic Name)

Oral contraceptives: May decrease the effects of oral contraceptives. Penicillins: Concomitant therapy may decrease efficacy. Avoid. Warfarin: Tetracyclines may depress plasma prothrombin activity, may

#### increase INR; monitor INR. Herbal

None known.

#### Food

**Dairy products:** May decrease demeclocycline absorption. Take demeclocycline 1 h before or 2 h after meals.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, amylase, bilirubin, AST (SGOT), and ALT (SGPT) levels. With prolonged use, brown-black microscopic discolaration of thyroid gland; very rare reports of abnormal thyroid function.

# SIDE EFFECTS

## Frequent

Anorexia, nausea, vomiting, diarrhea, dysphagia, possibly severe photosensitivity (with moderate to high demeclocycline dosage).

## Occasional

Urticaria; rash; diabetes insipidus syndrome, marked by polydipsia, polyuria, and weakness (with longterm therapy).

# SERIOUS REACTIONS

• Superinfection (especially fungal), anaphylaxis, and benign intracranial hypertension occur rarely.

• Bulging fontanelles occur rarely in infants.

- · Nephropathy can occur if expired.
- Pseudotumor cerebri has been reported rarely.
- May induce nephrogenic diabetes insipidus.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with renal and hepatic impairment, and in those who can't avoid sun or ultraviolet exposure, because such exposure may produce a severe photosensitivity reaction. Should be avoided in children < 8 yr because can cause permanent tooth discoloration, damage to tooth enamel. Do not use during pregnancy because of effects on fetal bone and tooth development. Tetracyclines are excreted in breast milk and are generally not recommended during breastfeeding.

History of allergies, especially to tetracyclines, should be determined before drug therapy. Pattern of daily bowel activity, stool consistency, food intake and tolerance, renal function, and skin for rash should be assessed. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, diarrhea, and ulceration or changes of the oral mucosa or tongue. BP and mental alertness should be monitored because of the potential for increased intracranial pressure. Storage

Store at room temperature. Administration

Take demeclocycline doses on an empty stomach with a full glass of water. Space drug doses evenly around the clock and continue taking for the full course of treatment. Take antacids containing aluminum, calcium, or magnesium; laxatives containing magnesium; or oral iron preparations 1-2 h before or after demeclocycline because they may impair the drug's absorption.

# Denosumab

den-oh'sue-mab Prolia, Xgeva Do not confuse Prolia with Xgeva; these two products have different indications and dosage regimens.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Bone resorption inhibitors, monoclonal antibodies, osteoporosis therapy adjunct

#### **MECHANISM OF ACTION**

Binds with nuclear factor  $\kappa$ -B ligand (RANKL) on precursor and mature osteoclasts, on activated T and B lymphocytes, and in lymph nodes. Results in a down-regulation of osteoclast activity and thus reduces bone turnover. *Therapeutic Effect:* Inhibits bone resorption; increases bone mass and strength in both cortical and trabecular bone.

#### PHARMACOKINETICS

Given subcutaneously, bioavailability is 62%. Displays nonlinear pharmacokinetics at doses below 60 mg, but dose-proportional increases in AUC occur at higher doses. Steady state was achieved by 6 months with multiple dosing regimens. Not affected by hemodialysis. *Half-life* (mean): 28 days.

#### AVAILABILITY

*Injection Solution:* 60 mg/mL in prefilled syringe (Prolia). 70 mg/mL in vials of 120 mg/1.7 mL (Xgeva).

# INDICATIONS AND DOSAGES

To prevent skeletal-related events due to bone metastases from solid tumors SC (XGEVA) Adults, Elderly. 120 mg SC once every 4 weeks.

#### •Osteoporosis prophylaxis SC (PROLIA)

Adults, Elderly. 60 mg SC once every 6 months. Used in men who have received androgen deprivation treatment for prostate cancer or women who have received aromatase inhibitors for breast cancer.

# CONTRAINDICATIONS

Hypersensitivity. For Prolia, also contraindicated with uncorrected hypocalcemia.

#### INTERACTIONS

#### Drug

**Bisphosphonates (e.g., alendronate, risedronate, zoledronic acid):** Not used in conjunction with these drugs due to additive effects.

Herbal and Food

None known.

# SIDE EFFECTS

**Frequent (≥ 25%)** 

Fatigue/asthenia, hypophosphatemia, and nausea.

#### Occasional (10%-24%)

Dyspnea, diarrhea, hypocalcemia (and related myalgia, muscle stiffness, and twitching or paresthesias), headache, cough.

Less common (< 10%) Fever, chills, bone pain.

#### SERIOUS REACTIONS

• Severe hypocalcemia and hypophosphatemia.

- · Osteonecrosis of the jaw.
- · May increase risk of pancreatitis.
- May increase risk of infection or have immune effects or secondary malignancy (impact unclear).

# **PRECAUTIONS & CONSIDERATIONS**

Correct hypocalcemia or other electrolyte imbalances before using denosumab. Use caution in patients with history of hypoparathyroidism, pancreatitis, renal impairment. The needle cover on the Prolia prefilled syringe contains dry, natural rubber; use with caution in those with a latex hypersensitivity. Data for use of this drug in children are not available. Do not use during lactation; may cause fetal harm, so do not use during pregnancy.

Monitor calcium, serum phosphorus, and related parameters; ensure good hydration and proper dietary intake, particularly of calcium and vitamin D and magnesium where appropriate. Avoid invasive dental procedures, such as dental implants. Report any persistent pain following dental procedures.

#### Storage

Store unopened vials or prefilled syringes of solution in the refrigerator; do not freeze.

#### Administration

Patients must receive adequate calcium and vitamin D supplementation; recommendations vary with indication for use. All doses should be administered by a health care professional. The date of the last dose determines when the next dose is due.

Prior to administration, remove the vial or prefilled syringe from the refrigerator and allow to slowly come to room temperature. This will take 15 to 30 min. Do not warm artificially. Visually inspect the solution for particulate matter or discoloration before administration; the solution is clear and colorless to light yellow. A small amount of tiny white or opalescent particles may be present and is acceptable. Do not use if discolored, cloudy, or if foreign particulate matter is present. Do not shake.

For Prolia prefilled syringes: Leave green needle safety guard in original position until after dosage administration; sliding guard prior to administration will prevent injection. Remove and discard needle cap immediately prior to use. Administer full contents of denosumab prefilled syringe subcutaneously in the upper arm, the upper thigh, or the abdomen. Immediately following injection, point needle away and gently slide green safety guard over needle. Discard all used supplies as appropriate. For Xgeva vial: Use a 27-gauge needle to withdraw the dose and inject; do not reinsert into the vial. Administer subcutaneously in the upper arm, upper thigh, or abdomen. Discard any unused medication and all used supplies as appropriate.

# **Desipramine**

dess-ip'ra-meen ★ Norpramin ▲ Apo-Desipramine **Do not confuse desipramine with disopyramide or imipramine.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, tricyclic

#### **MECHANISM OF ACTION**

A tricyclic antidepressant that blocks the reuptake of neurotransmitters, such as norepinephrine and serotonin, at presynaptic membranes, increasing their availability at postsynaptic receptor sites. Also has strong anticholinergic activity. *Therapeutic Effect:* Relieves depression.

Desipramine (Generic Name)

# PHARMACOKINETICS

Rapidly and well absorbed from the GI tract. Protein binding: 90%. Metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 12-27 h.

# AVAILABILITY

*Tablets:* 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg.

# INDICATIONS AND DOSAGES Depression PO

Adults. 75 mg/day. May gradually increase to 150-200 mg/day. Maximum: 300 mg/day. *Elderly*. Initially, 10-25 mg/day. May gradually increase to 75-100 mg/day. Maximum: 300 mg/day. *Children older than 12 yr*. Initially, 25-50 mg/day. May gradually increase to 100 mg/day. Maximum: 150 mg/day.

# **OFF-LABEL USES**

Treatment of bulimia nervosa, cataplexy associated with narcolepsy, neurogenic pain, panic disorder, social phobia.

# CONTRAINDICATIONS

Angle-closure glaucoma, use within 14 days of MAOIs, use in postmyocardial infarction period, hypersensitivity to desipramine.

# INTERACTIONS

#### Drug

# Alcohol, other CNS depressants:

May increase CNS and respiratory depression and the hypotensive effects of desipramine.

Anticholinergic agents: May increase toxicity.

Antithyroid agents: May increase the risk of agranulocytosis.

Carbamazepine: May decrease desipramine levels. Desipramine may increase carbamazepine levels. Cimetidine, ritonavir: May increase desipramine blood concentration and risk of toxicity. Clonidine, guanadrel: May decrease the effects of these drugs. CYP2D6 inhibitors: May increase effects of desipramine. Fluoxetine: May increase desipramine levels and toxicity. Reduce desipramine dose by 75%. MAOIs: May increase the risk of neuroleptic malignant syndrome, hyperpyrexia, hypertensive crisis, and seizures. Contraindicated. Phenothiazines: May increase the anticholinergic and sedative effects of desipramine. Phenytoin: May decrease the desipramine blood concentration. Sympathomimetics: May increase the risk of cardiac effects. Serotonergic agents, SSRIs, sibutramine: Concomitant use may increase serotonergic effects and risk for serotonin syndrome. Herbal St. John's wort: May increase

desipramine's pharmacologic effects and risk of toxicity, specifically serotonin syndrome.

# Food

None known.

# DIAGNOSTIC TEST EFFECTS

May alter blood glucose level and ECG readings. Therapeutic serum drug level is 50-300 ng/mL; toxic serum drug level is > 400 ng/mL.

## SIDE EFFECTS Frequent

Somnolence, fatigue, dry mouth, blurred vision, constipation, delayed micturition, orthostatic hypotension, diaphoresis, impaired concentration, increased appetite, urine retention.

### Occasional

GI disturbances (such as nausea, GI distress, metallic taste).

#### Rare

Paradoxical reactions (agitation, restlessness, nightmares, insomnia), extrapyramidal symptoms (particularly fine hand tremor).

# SERIOUS REACTIONS

· Overdose may produce confusion, seizures, somnolence, arrhythmias, fever, hallucinations, dyspnea, vomiting, and unusual fatigue or weakness.

- Abrupt discontinuation after prolonged therapy may produce severe headache, malaise, nausea, vomiting, and vivid dreams.
- · Tricyclics may cause bone marrow suppression (rare).

· Orthostatic hypotension may occur.

#### **PRECAUTIONS & CONSIDERATIONS**

Cross-sensitivity to other dibenzazepines. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr) with major depressive disorder (MDD) and other psychiatric disorders. Caution is warranted with cardiac conduction disturbances, cardiovascular disease, hyperthyroidism, diabetes, hepatic and renal dysfunction, seizure disorders, urine retention, and in those taking thyroid replacement therapy. Desipramine crosses the placenta and is minimally distributed in breast milk. Desipramine use is not recommended for children younger than 6 yr. Expect to administer lower dosages to elderly patients because they are at increased risk for drug toxicity.

Anticholinergic, sedative, and hypotensive effects may occur during

early therapy, but tolerance to these effects usually develops. Because dizziness may occur, change positions slowly and avoid alcohol and avoid tasks that require mental alertness or motor skills. CBC and blood chemistry tests to assess hepatic and renal function and ECG to detect arrhythmias should be performed before and periodically during therapy. Administration

Take desipramine with food or milk if GI distress occurs. Full therapeutic effect may be noted in 2-4 wks. Do not abruptly discontinue designamine. Once titrated, maintenance dose may be given once per day, at bedtime.

# Desloratadine

des-loer-at'ah-deen Clarinex, Clarinex Reditabs 🛀 Aerius Do not confuse with Claritin or loratadine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antihistamines, nonsedating

## MECHANISM OF ACTION

A nonsedating antihistamine that exhibits selective peripheral histamine H1 receptor blocking action. Competes with histamine at receptor sites. Therapeutic Effect: Prevents allergic responses mediated by histamine, such as rhinitis and urticaria.

## PHARMACOKINETICS

Rapidly and almost completely absorbed from the GI tract. Distributed mainly in liver, lungs, GI tract, and bile. Metabolized in the liver to active metabolite

Desloratadine (Generic Name), Clarinex (Brand Name)

#### 434 Desloratadine

and undergoes extensive firstpass metabolism. Eliminated in urine and feces. *Half-life:* 27 h (increased in elderly patients and in those with renal or hepatic impairment).

# AVAILABILITY

Syrup: 0.5 mg/mL. Tablets: 5 mg. Tablets (Orally Disintegrating [Reditabs]): 2.5 mg, 5 mg.

# INDICATIONS AND DOSAGES Virticaria

PO

Adults, Elderly, Children 12 yr and older. 5 mg once a day. Children 6-11 mo. 1 mg once a day. Children 12 mo to 5 yr. 1.25 mg once a day. Children 6-11 yr. 2.5 mg once a day. Seasonal or perennial allergic rhinitis PO Adults, Elderly, Children 12 yr and older. 5 mg once a day. Children 2-5 years. 1.25 mg once a day. Children 6-11 yr. 2.5 mg once a day. Dosage in hepatic or renal impairment Adult dosage is decreased to 5 mg every other day. CONTRAINDICATIONS None known.

#### INTERACTIONS

Drug

Erythromycin, ketoconazole:

May increase desloratadine blood concentration. But dosage adjustment not recommended. Herbal

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing unless the drug is discontinued 4 days before testing.

#### SIDE EFFECTS

Frequent (> 10%) Headache. Occasional (9%-39%) Dry mouth, fatigue, dizziness,

nausea.

#### Rare (< 3%)

Dysmenorrhea, myalgia, diarrhea, somnolence.

#### SERIOUS REACTIONS

None known.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and renal impairment. Desloratadine is excreted in breast milk and should not be used by breastfeeding women. The safety and efficacy of desloratadine have not been established in children younger than 6 mo. Children and elderly patients are more sensitive to the drug's anticholinergic effects, such as dry mouth, nose, and throat. Avoid drinking alcoholic beverages and performing tasks that require alertness or motor skills until response to the drug is established. Desloratadine orally disintegrating tablets contain phenylalanine 1.75 mg per tablet.

Drowsiness may occur. Increase fluid intake with upper respiratory allergies to decrease the viscosity of secretions, offset thirst, and replace fluids lost from diaphoresis. Therapeutic response should be monitored.

#### Storage

Store at room temperature. Keep disentegrating tablets in blister packaging until ready to use.

#### Administration

Do not crush or break film-coated tablets. Place rapidly disintegrating tablets on the tongue immediately after opening the blister; tablet disintegration occurs rapidly. Administer with or without water. Oral solution often used for children's doses.

# Desmopressin

des-moe-press'in ★ DDAVP, Stimate ♥ Minirin, Octostim

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antidiuretics, hormones/hormone modifiers

# **MECHANISM OF ACTION**

A synthetic pituitary hormone that increases reabsorption of water by increasing permeability of collecting ducts of the kidneys. Also serves as a plasminogen activator. *Therapeutic Effect:* Increases plasma factor VIII (antihemophilic factor). Decreases urinary output.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	1 h	2-7 h	6-8 h
IV	15-30 min	1.5-3 h	N/A
Intranasal	15 min to 1 h	1-5 h	5-21 h

Poorly absorbed after oral or nasal administration. Metabolism: Unknown. *Half-life:* Oral: 1.5-2.5 h. Intranasal: 3.3-3.5 h. IV: 0.4-4 h.

## AVAILABILITY

Tablets (DDAVP): 0.1 mg, 0.2 mg. Injection (DDAVP): 4 mcg/mL. Nasal Solution (DDAVP Rhinal tube): 100 mcg/mL. Nasal Spray (Stimate): 1.5 mg/mL (150 mcg/spray). Nasal Spray (DDAVP): 100 mcg/mL (10 mcg/spray).

#### INDICATIONS AND DOSAGES • Primary nocturnal enuresis PO

*Children 6 yr and older.* 0.2-0.6 mg once before bedtime.

#### Central cranial diabetes insipidus PO

Adults, Elderly, Children 12 yr and older. Initially, 0.05 mg twice a day. Range: 0.1-1.2 mg/day in 2-3 divided doses.

*Children at least 4 yr.* Initially, 0.05 mg; then twice a day. Range: 0.1-1.2 mg daily in 2-3 divided doses. INTRANASAL *Adults, Elderly, Children older than* 12 yr. 5-40 mcg (0.05-0.4 mL) in 1-3 doses/day. *Children 3 mo to 12 yr.* Initially, 5 mcg. (0.05 mL) /day in 1-2 divided

5 mcg (0.05 mL)/day in 1-2 divided doses. Range: 5-30 mcg (0.05-0.3 mL)/day.

IV, SUBCUTANEOUS

Adults, Elderly, Children older than 12 yr: 2-4 mcg/day in 2 divided doses or <sup>1</sup>/<sub>10</sub> of maintenance intranasal dose.

# Hemophilia A, von Willebrand disease (type I)

IV INFUSION Adults, Elderly, Children 3 mo and older weighing 10 kg or more. 0.3 mcg/kg diluted in 50 mL 0.9% NaCl. Children weighing < 10 kg. 0.3 mcg/kg diluted in 10 mL 0.9% NaCl. INTRANASAL (STIMATE) Adults, Elderly, Children 11 mo and older weighing 50 kg or more. 300 mcg, use 1 spray in each nostril.

Desmopressin (Generic Name)

Adults, Elderly, Children 11 mo and older weighing < 50 kg. 150 mcg as a single spray.

#### CONTRAINDICATIONS

Hypersensitivity. Hyponatremia, moderate to severe renal dysfunction (creatinine clearance less than 50 mL/min).

# INTERACTIONS

#### Drug

Carbamazepine, chlorpropamide, clofibrate: May increase the effects of desmopressin.

**Demeclocycline, lithium, norepinephrine:** May decrease effects of desmopressin.

Herbal None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase AST and ALT.

#### SIDE EFFECTS

#### Occasional

IV: Pain, redness, or swelling at injection site; headache; abdominal cramps; vulval pain; flushed skin; mild BP elevation or decrease; nausea with high dosages. Nasal: Rhinorrhea, nasal congestion, slight BP elevation, dizziness, rhinitis.

# SERIOUS REACTIONS

• Water intoxication or hyponatremia, marked by headache, somnolence, confusion, decreased urination, rapid weight gain, seizures, and coma, may occur in overhydration. Children, elderly patients, and infants are especially at risk. As a result of FDA review, intranasal desmopressin is no longer indicated for treatment of primary nocturnal enuresis. Tablets may be used, but treatment should be stopped during acute illness or conditions with increased water consumption.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with fluid or electrolyte imbalances, coronary artery disease, hypertensive cardiovascular disease, and predisposition to thrombus formation. Use cautiously in neonates younger than 3 mo because this age group is at increased risk for fluid balance problems. Hemophilia A with factor VIII levels < 5%; hemophilia B; severe type I, type IIB, or platelet-type von Willebrand disease are precautions for use. Careful fluid restrictions are recommended in infants. Fluid intake should be restricted for 1 h prior to dose and for 8 h after administration. Caution should be used in patients with polydipsia or SIADH. Elderly patients are at increased risk for hyponatremia and water intoxication. Avoid overhydration.

Notify the physician of abdominal cramps, headache, heartburn, nausea, or shortness of breath. Signs and symptoms of diabetes insipidus should be monitored. Also, serum electrolyte levels, fluid intake, serum osmolality, urine volume, urine specific gravity, and weight should be assessed. Factor VIII antigen level, aPTT, and factor VIII activity level should be assessed for hemophilia. **Storage** 

Store oral desmopressin away from light and excessive heat. Refrigerate desmopressin for injection. Refrigerate DDAVP nasal solution and Stimate nasal spray. DDAVP nasal solution and Stimate nasal spray are stable for 3 wks at room temperature if unopened; DDAVP nasal spray is stable at room temperature. Store in upright position.

#### Administration

For IV infusion, dilute in 10-50 mL 0.9% NaCl and prepare to infuse over 15-30 min. For preoperative use, administer 30 min before procedure, as prescribed. Monitor BP and pulse during infusion.

For subcutaneous use, estimate therapeutic response by adequacy of sleep duration. Expect to adjust morning and evening dosages separately.

! Stimate nasal spray and DDAVP nasal spray are not exchangeable because of significant differences in concentration. Follow patient package insert for correct administration techniques.

To administer nasal solution, draw up a measured quantity of desmopressin with a calibrated catheter (Rhinal tube). Insert one end in nose and blow on the other end to deposit the solution deep in the nasal cavity. For infants, young children, and obtunded patients, an air-filled syringe may be attached to the catheter to deposit the solution.

# Desonide

dess'oh-nide ★ Desonate, DesOwen, LoKara, Verdeso ₩ Desocort

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Corticosteroids, low potency, topical, dermatologics

#### **MECHANISM OF ACTION**

A topical corticosteroid that has anti-inflammatory, antipruritic, and vasoconstrictive properties. The exact mechanism of the antiinflammatory process is unclear. *Therapeutic Effect:* Reduces or prevents tissue response to the inflammatory process.

#### PHARMACOKINETICS

Large variation in absorption determined by many factors. Metabolized in the liver. Primarily excreted by the kidneys and small amounts in the bile.

# AVAILABILITY

Lotion: 0.05% (DesOwen, LoKara). Cream: 0.05% (DesOwen). Ointment: 0.05% (DesOwen). Foam: 0.05% (Verdeso). Gel: 0.05% (Desonate).

# INDICATIONS AND DOSAGES

# Corticosteroid-responsive dermatoses

TOPICAL *Adults, Elderly.* Apply sparingly 2-4 times/day.

Atopic dermatitis

TOPICAL (AEROSOL/GEL) Adults, Elderly, Children > 3 mo. Apply sparingly 2-4 times/day.

# CONTRAINDICATIONS

History of hypersensitivity to desonide.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Occasional

Burning and stinging at site of application, dryness, skin peeling, contact dermatitis.

# SERIOUS REACTIONS

• The serious reactions of long-term therapy and the addition of occlusive dressings are reversible hypothalamicpituitary-adrenal (HPA) axis suppression, manifestations of Cushing's syndrome, hyperglycemia, and glucosuria.

# PRECAUTIONS & CONSIDERATIONS

Caution should be used over large surface areas, with prolonged use, and in addition to occlusive dressings as well as uncontrolled or untreated infections. Avoid use of occlusive dressings on affected area. Skin irritation should be reported. It is unknown whether desonide crosses the placenta or is distributed in the breast milk. Children may absorb larger amounts of the topical form and may be more susceptible to toxicity. No age-related precautions have been noted in elderly patients. Treatment should not exceed 4 consecutive weeks. Storage

Store at room temperature; protect foam from excessive heat, fire, or smoking; foam aerosol is flammable.

# Administration

Gently cleanse area before topical application. Use occlusive dressings only as directed. Apply sparingly and rub into area gently and thoroughly. Do not apply foam directly to face; dispense into hands and apply. Shake lotion well before use.

# Desoximetasone

des-ox-i-met'a-sone ★ Topicort, Topicort-LP ◆ Desoxi, Topicort Do not confuse desoximetasone with dexamethasone.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Corticosteroids, medium-high potency, topical, dermatologics

# **MECHANISM OF ACTION**

A medium to high potency, fluorinated topical corticosteroid that has anti-inflammatory, antipruritic, and vasoconstrictive properties. The exact mechanism of the anti-inflammatory process is unclear. *Therapeutic Effect:* Reduces tissue response to the inflammatory process.

# PHARMACOKINETICS

Large variation in absorption among sites. Overall, roughly 5%-7% systemically absorbed. Metabolized in liver. Primarily excreted in urine.

# AVAILABILITY

Cream: 0.25% (Topicort), 0.05% (Topicort-LP). Gel: 0.05% (Topicort). Ointment: 0.25% (Topicort).

# INDICATIONS AND DOSAGES Corticosteroid-responsive dermatoses

Topical *Adults, Elderly.* Apply sparingly 2 times/day. *Children* >10 yr. Apply sparingly 1-2 times/day.

# CONTRAINDICATIONS

History of hypersensitivity to desoximetasone, topical fungal infections.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Itching, redness, irritation, burning at site of application.

#### Occasional

Dryness, folliculitis, hypertrichosis, acneiform eruptions, hypopigmentation, perioral dermatitis.

#### Rare

Allergic contact dermatitis, adrenal suppression, atrophy, striae, miliaria, photosensitivity.

# SERIOUS REACTIONS

 Serious reactions of longterm therapy and addition of occlusive dressings are reversible hypothalamic-pituitary-adrenal (HPA) axis suppression, manifestations of Cushing's syndrome, hyperglycemia, and glucosuria.

• Abruptly withdrawing the drug after long-term therapy may require supplemental systemic corticosteroids.

## **PRECAUTIONS & CONSIDERATIONS**

Urinary free cortisol test and ACTH stimulation test should be evaluated before therapy. It is unknown whether desoximetasone is excreted in breast milk. No age-related precautions have been established for elderly patients. Pediatric patients may absorb larger amounts and may be more susceptible to toxicity. Safety and efficacy have not been evaluated in children younger than 10 yr.

Caution should be used over large surface areas, with prolonged use, and with addition of occlusive dressings. If concomitant skin infections develop, an appropriate antimicrobial agent should be used. **Storage** 

Store at room temperature.

# Administration

Gently cleanse area before application. Use occlusive dressings only as directed. Apply sparingly. Rub into area gently and thoroughly.

#### Desvenlafaxine des-ven'la-fax'een

ristiq

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, serotonin and norepinephrine reuptake inhibitors

## MECHANISM OF ACTION

A phenethylamine derivative and major active metabolite of venlafaxine that potentiates central nervous system (CNS) neurotransmitter activity by inhibiting the reuptake of serotonin, and norepinephrine. *Therapeutic Effect:* Relieves depression.

Desvenlafaxine (Generic Name), Pristiq (Brand Name)

### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 30%. Primarily metabolized by conjugation (UGT) and, to a minor extent, oxidative metabolism via CYP3A4. Roughly 45% excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* range, 9-13 h (increased in hepatic or renal impairment).

## AVAILABILITY

*Tablets, extended-release:* 50 mg, 100 mg.

# INDICATIONS AND DOSAGES Depression

#### PO

*Adults, Elderly.* Initially, 50 mg/ day. May increase to 100 mg/day if needed. Up to 400 mg/day given in clinical trials, but additional benefit versus 100 mg/day is uncertain.

# Dosage in renal impairment

Moderate renal impairment: 50 mg/day.

Severe renal impairment and end-stage renal disease (ESRD): 50 mg every other day.

• **Dosage in hepatic impairment** Dose escalation above 100 mg/day is not recommended.

# CONTRAINDICATIONS

Hypersensitivity to desvenlafaxine or venlafaxine; use within 14 days of MAOIs. Do not use with linezolid or IV methylene blue due to increased risk of serotonin syndrome.

## INTERACTIONS

#### Drug

MAOIs: Contraindicated. May cause neuroleptic malignant syndrome, autonomic instability (including rapid fluctuations of vital signs), extreme agitation, hyperthermia, mental status changes, myoclonus, rigidity, and coma.

#### NSAIDs, aspirin, anticoagulants:

Desvenlafaxine may affect platelet function; effects may be additive to these drugs, with potential increase in bleeding risk.

Serotonergic agents (e.g., linezolid, SSRIs, triptans): May increase risk of serotonin syndrome.

## Herbal

St. John's wort: Increased risk of serotonin syndrome. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease serum sodium levels. May increase LDL, total cholesterol and triglyceride levels. May rarely increase BUN level and serum alkaline phosphatase, bilirubin, cholesterol, uric acid, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

Frequent (> 20%) Nausea, headache, dry mouth. Occasional (5%-20%)

# Occasional (5%-20%)

Dizziness, insomnia, constipation, diarrhea, vomiting, hyperhydrosis, somnolence, fatigue, tremor, mydriasis, nervousness, ejaculatory disturbance, anorexia.

#### Rare (< 5%)

Anxiety, asthenia, blurred vision, irritability, tremor, abnormal dreams, impotence, weight loss, increased blood pressure.

## SERIOUS REACTIONS

 A sustained increase in diastolic BP of 10-15 mm Hg occurs occasionally. May increase intraocular pressure.

 Serotonin syndrome and reactions similar to neuroleptic malignant syndrome (NMS).

- · Platelet dysfunction and bleeding.
- · Hyponatremia.

• Interstitial lung disease or eosinophilic pneumonia is very rare.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with suicidal tendencies and those with abnormal platelet function, preexisting hypertension, cardiac disease or recent myocardial infarction, cerebrovascular disease, hyperlipidemia, volume depletion, hyperthyroidism, mania, angleclosure glaucoma, hepatic and renal impairment, and seizure disorder. Notify the physician if pregnant or planning to become pregnant. Complications have been observed in neonates exposed to related drugs in the third trimester; consider tapering in the third trimester. Desvenlafaxine is excreted in breast milk; breastfeeding is not recommended during treatment. The safety and efficacy of desvenlafaxine have not been established in children. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Mania or hypomania may be activated. Age-related renal dysfunction may prompt need for dose reduction in elderly patients.

Drowsiness, dizziness, and light-headedness may occur, so avoid alcohol and tasks that require mental alertness or motor skills until the effects of the drug are known. Monitor for clinical worsening, suicidality, and unusual changes in behavior. BP, pulse rate, and weight should be assessed during therapy.

# Storage

Store at room temperature.

#### Administration

May take without regard to food. Tablets are taken whole; do not divide, crush, chew, or dissolve. When discontinuing, plan to taper the dosage slowly to avoid a discontinuation syndrome.

# **Dexamethasone**

dex-a-meth'a-sone Baycadron, Decadron, DexPak Taperpak, Maxidex, Ozurdex, Zema-Pak Dexasone, Diodex Do not confuse dexamethasone with desoximetasone or dextromethorphan, or Maxidex with Maxzide, or Zema-Pak with ZPak.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in the first trimester)

*Classification:* Corticosteroids, ophthalmic, dermatologics

# **MECHANISM OF ACTION**

A long-acting glucocorticoid that inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release and synthesis, and release of mediators of inflammation. *Therapeutic Effect:* Prevents and suppresses cell and tissue immune reactions and inflammatory process.

# PHARMACOKINETICS

Rapidly, completely absorbed from the GI tract after oral administration. Widely distributed. Protein binding: High. Metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 3-4.5 h.

Dexamethasone (Generic Name)

# AVAILABILITY

*Elixir:* 0.5 mg/5 mL. *Ophthalmic Suspension, Solution:* 0.1% drops. *Oral Solution:* 0.5 mg/5 mL, 1 mg/mL. *Tablets:* 0.5 mg, 0.75 mg, 1 mg, 1.5 mg, 2 mg, 4 mg, 6 mg. *Injection:* 4 mg/mL, 10 mg/mL. *Intravitreal Implant (Ozurdex):* 0.7 mg.

# INDICATIONS AND DOSAGES Anti-inflammatory

PO/IV/IM Adults, Elderly. 0.75-9 mg/day in divided doses q6-12h. Children. 0.08-0.3 mg/kg/day in divided doses q6-12h.

#### Cerebral edema IV

Adults, Elderly. Initially, 10 mg, then 4 mg (IM/IV) q6h. IV/IM *Children*. Loading dose of 1-2 mg/kg, then 1-1.5 mg/kg/day in divided doses q4-6h.

#### Nausea and vomiting in chemotherapy patients IV

Adults, Elderly. 8-20 mg once, then 4 mg (PO) q4-6hr or 8 mg q8h. Many dosage regimens available. *Children*.10 mg/m<sup>2</sup>/dose (maximum: 20 mg), then 5 mg/m<sup>2</sup>/dose q6h.

> Physiologic replacement PO/IV/IM

*Children, Adults.* 0.03-0.15 mg/kg/ day in divided doses q6-12h.

#### Usual ophthalmic dosage, ocular inflammatory conditions

SUSPENSION/SOLUTION Adults, Elderly, Children. Initially, 2 drops q1h while awake and q2h at night for 1 day, then reduce to 1 drop q4h, then 3-4 times/day.

# Ocular inflammation due to macular edema following retinal vein occlusion

INTRAVITREAL IMPLANT

*Adults.* 0.7 mg implant is injected surgically via a specialized application system. Monitor the patient for elevated IOP.

# CONTRAINDICATIONS

Active untreated systemic infections; fungal, tuberculosis, or viral diseases of the eye.

#### INTERACTIONS Drug

Amphotericin B: May increase hypokalemia. Aprepitant: May increase levels and effects of dexamethasone. CYP3A4 inhibitors/inducers: May increase/decrease effects of dexamethasone. CYP3A4 substrates, cyclosporine: Dexamethasone may decrease levels and effects of substrates. Digoxin: May increase digoxin toxicity caused by hypokalemia. Diuretics, insulin, oral hypoglycemics, potassium supplements: May decrease the effects of these drugs. Hepatic enzyme inducers: May decrease the effects of dexamethasone. Live-virus vaccines: May decrease the patient's antibody response to vaccine, increase vaccine side effects, and potentiate virus replication. Salicylates: Salicylates may

increase the GI adverse effects of corticosteroids.

**Thalidomide:** May increase risk of deep venous thrombosis (DVT) **Warfarin:** May alter effects of warfarin.

Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose and serum lipid, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

# IV INCOMPATIBILITIES

Calcium chloride, calcium gluconate, caspofungin (Cancidas), cefuroxime (Zinacef), chlorpromazine, ciprofloxacin (Cipro), dantrolene, daunorubicin (Cerubidine), diazepam (Valium), diphenhydramine (Benadryl), dobutamine, epirubicin (Ellence), erythromycin lactobionate, esmolol (Brevibloc), fenoldopam (Corlopam), gentamicin, haloperidol (Haldol), hydroxyzine, idarubicin (Idamycin), labetalol, magnesium sulfate, midazolam (Versed), minocycline (Minocin), mitoxantrone (Novantrone), pantoprazole (Protonix), phenytoin, prochlorperazine, promethazine, protamine, quinupristin/dalfopristin (Synercid), rocuronium (Zemuron), sulfamethoxazole-trimethoprim, tobramycin, topotecan (Hycamtin).

## SIDE EFFECTS

#### Frequent

Inhalation: Cough, dry mouth, hoarseness, throat irritation. Intranasal: Burning, mucosal dryness.

Ophthalmic: Blurred vision. Systemic: Insomnia, facial swelling or cushingoid appearance, moderate abdominal distention, indigestion, increased appetite, nervousness, facial flushing, diaphoresis.

#### Occasional

Inhalation: Localized fungal infection, such as thrush. Intranasal: Crusting inside nose, nosebleed, sore throat, ulceration of nasal mucosa. Ophthalmic: Decreased vision, watering of eyes, eye pain, burning, stinging, redness of eyes, nausea, vomiting.

Systemic: Dizziness, decreased or blurred vision.

Topical: Allergic contact dermatitis, purpura or blood-containing blisters, thinning of skin with easy bruising, telangiectasis or raised dark red spots on skin.

#### Rare

Inhalation: Increased bronchospasm, esophageal candidiasis. Intranasal: Nasal and pharyngeal candidiasis, eye pain. Systemic: General allergic reaction (such as rash and hives); pain, redness, or swelling at injection site; psychologic changes; false sense of well-being; hallucinations; depression.

# SERIOUS REACTIONS

 Long-term therapy may cause immunosuppression, Kaposi sarcoma, muscle wasting (especially in the arms and legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, and congestive heart failure (CHF).

• The ophthalmic form may cause glaucoma, ocular hypertension, and cataracts.

• May cause adrenal suppression with high doses or extended treatment periods. Taper therapy slowly to avoid adrenal crisis.

 Abrupt withdrawal following long-term therapy may cause severe joint pain, severe headache, anorexia, nausea, fever, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

• May cause psychiatric disturbances, depression, euphoria, insomnia.

Myocardial rupture following recent MI.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cirrhosis, hepatic impairment, renal impairment, CHF, diabetes mellitus, high thromboembolic risk, hypertension, hyperthyroidism, adrenal insufficiency, myasthenia gravis, ocular herpes simplex, osteoporosis, peptic ulcer disease, respiratory tuberculosis, seizure disorders, ulcerative colitis, and untreated systemic infections. The ophthalmic form should be used cautiously in long-term therapy because prolonged use may result in cataracts or glaucoma. Dexamethasone crosses the placenta and is distributed in breast milk. Prolonged treatment with high dosages may decrease the short-term growth rate and cortisol secretion in children. Elderly patients are at higher risk for developing hypertension or osteoporosis. Severe stress, including serious infection, surgery, or trauma, may require an increase in dexamethasone dosage. Dentists or other physicians should be informed of dexamethasone therapy if taken within the past 12 mo.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. Blood glucose level, intake and output, BP, serum electrolyte levels, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms. In long-term therapy, signs and symptoms of hypocalcemia (such as muscle twitching, cramps, and positive Chvostek's or Trousseau's sign) or hypokalemia (such as ECG changes, nausea and vomiting, irritability, weakness and

muscle cramps, and numbness or tingling, especially in the lower extremities) should be assessed. Administration

Take oral dexamethasone with milk or food. Do not abruptly discontinue the drug or change the dosage or schedule. Expect to taper the drug after chronic use.

Dexamethasone sodium phosphate may be given by IV push or IV infusion. For IV push, give over 1-4 min. For IV infusion, mix with 0.9% NaCl or D5W and infuse over 15-30 min. If administering to a neonate, solution must be preservative free. May give deep IM, preferably in the gluteus maximus.

Shake ophthalmic suspension well before use. For ophthalmic use, to administer the solution or suspension, place a gloved finger on the lower eyelid and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket and place the correct number of drops into the pocket. Close the eye gently. Apply digital pressure to the lacrimal sac for 1-2 min to minimize drainage to the nose and throat, thereby reducing the risk of systemic effects. Remove excess around the eye with a tissue.

The intravitreal insert is applied by a physician trained in intravitreal techniques.

Dexchlorpheniramine dex'klor-fen-eer'a-meen

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

*Classification:* Antihistamines, H<sub>1</sub> receptor antagonist, sedating

Dexchlorpheniramine (Generic Name)

# **MECHANISM OF ACTION**

A propylamine derivative that competes with histamine for  $H_1$ -receptor sites on effector cells in the GI tract, blood vessels, and respiratory tract. Dexchlorpheniramine is the dextroisomer of chlorpheniramine and is approximately 2 times more active. *Therapeutic Effect:* Prevents allergic response, produces mild bronchodilation, blocks histamineinduced allergic responses.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	0.5 h	1-2 h	3-6 h

Well absorbed from the GI tract. Protein binding: 70%. Widely distributed. Metabolized in liver to active metabolite; undergoes extensive first-pass metabolism. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 20 h.

# AVAILABILITY

Syrup: 2 mg/5 mL.

## INDICATIONS AND DOSAGES

#### Allergic rhinitis, common cold, angioedema, urticaria, vasomotor rhinitis

PO Adults, Elderly, Children 12 yr or older. 2 mg q4-6h. Children 6-11 yr. 1 mg (oral syrup) q4-6h. Children 2-5 yr. 0.5 mg q4-6h.

## CONTRAINDICATIONS

History of hypersensitivity to antihistamines, newborn or premature infants, third trimester of pregnancy, MAOIs.

# INTERACTIONS

#### Drug

Alcohol, central nervous system (CNS) depressants: May increase CNS depression. MAOIs: May cause severe hypotension. Methacholine: May interfere with interpretation of pulmonary function tests after a methacholine bronchial challenge. Procarbazine: May increase CNS depression. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May interfere with methacholine bronchial challenge test or allergy testing.

# SIDE EFFECTS

#### Frequent

Drowsiness; dizziness; headache; dry mouth, nose, or throat; urinary retention; thickening of bronchial secretions; sedation; hypotension. Occasional

Epigastric distress, flushing, blurred vision, tinnitus, paresthesia, sweating, chills.

## SERIOUS REACTIONS

 Children may experience dominant paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremors.

 Hypersensitivity reaction, such as eczema, pruritus, rash, cardiac disturbances, and photosensitivity, may occur.

 Overdosage may vary from CNS depression, including sedation, apnea, hypotension, cardiovascular collapse, or death, to severe paradoxical reaction, such as hallucinations, tremor, and seizures.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with asthma, cardiovascular disease, chronic obstructive pulmonary disease (COPD), narrow-angle glaucoma, peptic ulcer disease, prostatic hypertrophy, pyloroduodenal or bladder neck obstruction, thyroid disease, and severe CNS depression or coma. Be aware that timed-release tablets should be avoided in children 5 yr and younger. It is unknown whether dexchlorpheniramine crosses the placenta or is distributed in breast milk. Dexchlorpheniramine should not be used in patients during the third trimester of pregnancy or while breastfeeding. No age-related precautions have been noted in elderly patients, although they may be more sensitive to adverse effects.

Dizziness, drowsiness, and dry mouth are expected side effects of dexchlorpheniramine. Tasks that require mental alertness or motor skills should be avoided until the effects are established. Alcohol should be avoided during therapy.

# Storage

Store at room temperature. Administration Take without regard to meals.

# Dexlansoprazole

dex'lan-soe'pra-zole Dexilant Do not confuse Dexilant with Dexedrine.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Gastrointestinal agents, anticular agents, protonpump inhibitors (PPI)

#### **MECHANISM OF ACTION**

A proton-pump inhibitor that selectively inhibits the parietal cell membrane enzyme system (hydrogen, potassium adenosine triphosphatase) or proton-pump. *Therapeutic Effect*: Suppresses gastric acid secretion.

## PHARMACOKINETICS

Formulated as a dual delayed-release capsule that results in two distinct peaks; the first peak occurs in 1-2 h, followed by a second peak within 4-5 h. Protein binding: Roughly 97%. Extensively metabolized in the liver to inactive metabolites. Eliminated in feces and urine. Not removed by hemodialysis. *Half-life*: 1-2 h (plasma); > 24 h at gastric site of action (increased in those with hepatic impairment).

# AVAILABILITY

Capsules (Delayed Release): 30 mg, 60 mg.

#### INDICATIONS AND DOSAGES • Healing and maintenance of erosive esophagitis

#### РО

*Adults, Elderly.* 60 mg/day for up to 8 wks. If healing does not occur within 8 wks, may give for additional 8 wks. Maintenance: 30 mg/day for up to 6 mo.

#### Symptomatic nonerosive gastroesophageal reflux (GERD) PO

Adults, Elderly. 30 mg/day for up to 4 wks; repeat courses may be given.

#### Dosage adjustment in hepatic impairment

*Adults*. No adjustment needed if impairment mild. If Child-Pugh class B or C, maximum is 30 mg/day PO. (No studies in patients with class C cirrhosis are available.)

Dexlansoprazole (Generic Name)
## CONTRAINDICATIONS

Hypersensitivity to dexlansoprazole, lansoprazole, or any product components.

## INTERACTIONS

#### Drug

Ampicillin, digoxin, iron salts, ketoconazole: May interfere with the absorption of ampicillin, digoxin, iron salts, and ketoconazole.

**Sucralfate:** May delay the absorption of lansoprazole.

Atazanavir: Do not give PPI with atazanavir because levels of atazanavir will be decreased and effectiveness against HIV will be diminished.

**Methotrexate:** May increase risk of Methotrexate toxicity.

**Rifampin:** May decrease the levels and efficacy of dexlansoprazole.

Tacrolimus: May increase tacrolimus concentrations.

Warfarin: Monitor INR as anticoagulant effect may be increased.

#### Herbal

St. John's wort: May decrease the levels of dexlansoprazole. Food

None known

## **DIAGNOSTIC TEST EFFECTS**

May increase AST (SGOT), ALT (SGPT), serum alkaline phosphatase, bilirubin, creatinine, glucose and potassium levels. May reduce platelet, RBC, and WBC counts. May decrease serum magnesium in chronic use.

## SIDE EFFECTS

## Occasional (≥ 2%)

Diarrhea, abdominal pain, nausea, vomiting, flatulence, mild upper respiratory infection.

## Rare (< 2%)

Altered taste, headache, rash, dizziness, myalgia/arthralgia, bronchospasm.

## SERIOUS REACTIONS

· Hepatomegaly (rare).

• Serious hypersensitivity/ dermatologic reactions (rare), such as angioedema, anaphylaxis, Stevens-Johnson syndrome.

- Neutropenia or thrombocytopenia.
- In chronic use, may cause hypomagnesemia.

• In chronic use, may increase risk of bone fracture.

• Possible alteration of GI microflora, which increases risk of *C.dificile* associated diarrhea (CDAD).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in impaired hepatic function. It is unknown whether dexlansoprazole is distributed in human breast milk; caution is warranted in pregnancy and lactation. Safety and efficacy of dexlansoprazole have not been established in children. No agerelated precautions have been noted in the elderly.

Laboratory values, including CBC and blood chemistry, should be obtained before therapy. Monitor for gastric symptom improvement. **Storage** 

## Store at room temperature. Administration

May take without regard to meals. Do not chew or crush delayedrelease capsules; swallow whole. May open capsules and sprinkle granules on 1 tbsp of applesauce; swallow immediately.

## Dexmedetomidine Hydrochloride

decks-meh-deh-tome'ih-deen Dercedex Do not confuse Precedex with Peridex or Percocet.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Central-acting adrenergic agonists, sedatives

## **MECHANISM OF ACTION**

A selective centrally acting  $\alpha_2$ -adrenergic agonist. *Therapeutic Effect:* Produces analgesic, hypnotic, and sedative effects.

## PHARMACOKINETICS

Protein binding 94%. Metabolized in liver. Excreted primarily in urine. *Half-life:* 6 min, terminal 2 h. Onset of action is rapid.

#### AVAILABILITY

Injection: 100 mcg/mL.

#### INDICATIONS AND DOSAGES

 Sedation before, during, and after intubation and mechanical ventilation while in the intensive care unit (ICU)

IV

*Adults.* Loading dose of 1 mcg/kg over 10 min followed by maintenance infusion of 0.2-0.7 mcg/kg/h. *Elderly.* May require decreased dosage. No guidelines available.

#### Procedural sedation IV

*Adults*. Load 1 mcg/kg (or 0.5 mcg/kg if procedure less invasive) over 10 min followed by infusion of 0.6 mcg/kg/h. Titrate within range of 0.2-1 mcg/kg/h. If patient receiving awake fiberoptic intubation, give maintenance of 0.7 mcg/kg/h until endotracheal tube is secured.

*Elderly*. Load 0.5 mcg/kg over 10 min then titrate to desired level of sedation. Usual infusion rates lower than those of adults

• Patients with hepatic impairment For all indications, consider dosage reduction.

## CONTRAINDICATIONS

None known.

## INTERACTIONS

#### Drug

Anesthetics, opioids, other sedative-hypnotics: May enhance the effects of dexmedetomidine.

## CYP2D6 substrates:

Dexmedetomidine may increase levels/effects of substrates.

Herbal None known.

Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum potassium, alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

#### IV INCOMPATIBILITIES

Do not mix dexmedetomidine with amphotericin, blood, serum, or plasma.

Additional incompatibilities include diazepam (Valium), pantoprazole (Protonix), phenytoin.

## **IV COMPATIBILITIES**

0.9% NaCl, D5W, 20% mannitol, alfentanil, amikacin, aminophylline, amiodarone, ampicillin, ampicillinsulbactam (Unasyn), atracurium, atropine, azithromycin (Zithromax), aztreonam (Azactam), bretylium, bumetanide, butorphanol, calcium

#### 447.e2 **Dexmedetomidine Hydrochloride**

gluconate, cefazolin, cefepime (Maxipime), cefoperazone sodium, cefotaxime, cefotetan, cefoxitin,

ceftazidime (Fortaz), ceftizomine, ceftriaxone (Rocephin), cefuroxime, chlorpromazine, cimetidine, ciprofloxacin (Cipro), cisatracurium, clindamycin (Cleocin), dexamethasone sodium phosphate, digoxin, diltiazem, diphenhydramine, dobutamine, dolasetron, dopamine, doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, erythromycin, esmolol, etomidate, famotidine, fenoldopam, fentanyl, fluconazole (Diflucan), furosemide (Lasix), gatifloxacin, gentamicin, glycopyrrolate, granisetron (Kytril), haloperidol, heparin, hydrocortisone sodium succinate, hydromorphone (Dilaudid), hydroxyzine, inamrinone, isoproterenol, ketorolac, labetalol, lactated Ringer's, levofloxacin (Levaquin), lidocaine, linezolid (Zyvox), lorazepam, magnesium sulfate, meperidine, methylprednisolone sodium succinate, metoclopramide, metronidazole, midazolam, milrinone, mivacurium, morphine, nalbuphine (Nubain), nitroglycerin, norepinephrine, ofloxacin, ondansetron (Zofran), pancuronium, phenylephrine, piperacillin/tazobactam (Zosyn), potassium chloride, procainamide, prochloperazine, promethazine, propofol, ranitidine, rapacuronium, remifentanil, rocuronium, sodium bicarbonate, sodium nitroprusside, succinvlcholine, sufentanil, sulfamethoxazole-trimethoprim, theophylline, thiopental, ticarcillinclavulanate (Timentin), tobramycin, vancomycin, vecuronium, verapamil, and a plasma substitute.

## SIDE EFFECTS

#### Frequent

Hypotension (30%), hypertension (16%), nausea (11%). When infused for more than 6 h, nervousness, agitation, and headaches may occur for up to 48 h.

#### Occasional (2%-5%)

Pain, fever, vomiting, dry mouth, oliguria, thirst.

## SERIOUS REACTIONS

· Bradycardia, hypotension, and sinus arrest may occur with too-rapid IV infusion.

· Atrial fibrillation, tachycardia, arrhythmia, hypoxia, anemia, hemorrhage, and pleural effusion have occurred.

## **PRECAUTIONS & CONSIDERATIONS**

I Use only in intensive care setting. Caution is warranted with CHF, advanced heart block, hypovolemia, chronic hypertension, ventricular dysfunction, diabetes hepatic or renal impairment, and those on a continuous cardiac monitor and pulse oximeter. Be aware that dexmedetomidine will provide relaxation and sedation before, during, and after insertion of the endotracheal tube, and during mechanical ventilation. Comfort measures, such as mouth care and repositioning, should be provided. Transient hypertension may occur initially and may require reduction in infusion rate.

Before dexmedetomidine use, baseline vital signs, ECG, and liver function tests should be obtained. ECG for atrial fibrillation, BP for hypotension and level of sedation, pulse rate for bradycardia, and respiratory rate and rhythm should be monitored during therapy. Monitor for weakness, confusion, excessive sweating, abdominal pain, salt cravings, dizziness.

#### Storage

Store vials at room temperature. Infusions in NS are stable for up to 24 h at room temperature.

#### Administration

! Do not infuse the drug for longer than 24 h.

For IV use, dilute 2 mL of dexmedetomidine with 48 mL of 0.9% NaCl. (Final concentration: 4 mcg/mL.) Administer the drug as a maintenance infusion using a controlled infusion device, as prescribed. Titrate dose to desired clinical effect for individual patient. The rate of maintenance infusion should be adjusted to achieve desired level of sedation. Dexmedetomidine has been continuously infused in mechanically ventilated patients before, during, and after extubation. It is not necessary to discontinue dexmedetomidine before extubation provided the infusion does not exceed 24 h.

## **Dexmethylphenidate**

dex-meth-ill-fen'i-date ★ Focalin, Focalin XR Do not confuse dexmethylphenidate with methylphenidate or with methadone.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Stimulants, central nervous system (CNS)

## **MECHANISM OF ACTION**

A CNS stimulant that blocks the reuptake of norepinephrine and dopamine into presynaptic neurons, increasing the release of these neurotransmitters into the synaptic cleft. *Therapeutic Effect:* Decreases motor restlessness and fatigue; increases motor activity, mental alertness, and attention span; elevates mood.

## PHARMACOKINETICS

Readily absorbed from the GI tract. Plasma concentrations increase rapidly. Time to peak: 1-1.5 h (tablet); 1.5 h and 6.5 h (extended-release capsule). Metabolized in the liver. Excreted as metabolites in urine. *Half-life:* 2.2 h. Duration of action: 4-5 h (tablet), 12 h (extended-release capsule).

#### AVAILABILITY

*Tablets:* 2.5 mg, 5 mg, 10 mg. *Capsules (Extended Release):* 5 mg, 10 mg, 15 mg, 20 mg, 30 mg, 40 mg.

# INDICATIONS AND DOSAGES Attention deficit hyperactivity

disorder (ADHD) PO Adults. Patients new to dexmethylphenidate or methylphenidate. Tablets: 2.5 mg twice a day (5 mg/day). May adjust dosage in 2.5- to 5-mg increments. Maximum: 40 mg/day. Capsule: 10 mg daily. May adjust dose in 10-mg increments at weekly intervals. Maximum dose: 40 mg/day. Children 6 vr and older. Patients new to dexmethylphenidate or methylphenidate. Tablets: 2.5 mg twice a day (5 mg/day). May adjust dosage in 2.5- to 5-mg increments. Maximum dose: 30 mg/day. Capsule: 5 mg daily. May adjust dose in 5-mg increments at weekly intervals. Maximum dose: 30 mg/day. Patients currently taking methylphenidate. Half the methylphenidate dosage. Patients changing from dexmethylphenidate immediaterelease tablets to dexmethylphenidate extended release. Convert at same daily dose. Capsules are given once daily.

#### CONTRAINDICATIONS

Hypersensitivity to drug or methylphenidate. Diagnosis or family history of Tourette's syndrome; glaucoma; history of marked agitation, anxiety, or tension; motor tics; use within 14 days of MAOIs.

#### INTERACTIONS Drug

Amitriptyline, phenobarbital, phenytoin, primidone, anticonvulsants: Dosage of these drugs may need to be decreased. Antihypertensives: Decreased effect of antihypertensives may occur. Clonidine: Severe toxic reactions occur with methylphenidate. MAOIs, linezolid: May increase the effects of dexmethylphenidate such

Dexmethylphenidate (Generic Name)

as severe hypertensive episodes. MAOIs are contraindicated.

Other CNS stimulants: May have an additive effect.

**Warfarin:** May inhibit the metabolism of warfarin. Monitor INR.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (≥ 5%)

Appetite decreased, abdominal pain, headache, restlessness or insomnia, nausea.

#### Occasional

Tachycardia, arrhythmias, palpitations, twitching, irritability. **Rare** 

Blurred vision, anxiety, hostility or aggression, rash, arthralgia.

## SERIOUS REACTIONS

 Withdrawal after prolonged therapy may unmask symptoms of the underlying disorder.
 Dependency may occur with longterm use.

 CNS stimulant use associated with serious cardiovascular events and sudden death in patients with cardiac abnormalities or serious heart problems.

• Dexmethylphenidate may lower the seizure threshold in those with a history of seizures.

 Rarely, mood changes can be severe and may include aggressive behaviors or other serious mood problems.

 Rarely, cerebral vasculitis and hemorrhage reported.

 Overdose produces excessive sympathomimetic effects, including vomiting, tremor, hyperreflexia, seizures, confusion, hallucinations, and diaphoresis.

• Prolonged administration to children may delay growth.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiovascular disease, structural cardiac abnormalities, or other cardiac problems, psychosis, seizure disorders, hypertension, and history of substance abuse. It is unknown whether dexmethylphenidate is excreted in breast milk; avoid breastfeeding. Children are more prone to develop abdominal pain, insomnia, anorexia, and weight loss. Long-term dexmethylphenidate use may inhibit growth in children. In psychotic children, dexmethylphenidate use may exacerbate behavior disturbances and abnormal thoughts. No age-related precautions have been noted in elderly patients.

Tasks that require mental alertness and motor skills should be avoided until response to the drug is established. CBC, WBC count with differential, and platelets should be monitored. Baseline height and weight should be obtained at the beginning and periodically throughout therapy.

## Storage

Store at room temperature; keep tightly closed.

#### Administration

Take dexmethylphenidate without regard to food. Take the last dose of the day several hours before bedtime to prevent insomnia.

Do not crush or chew extendedrelease capsule. Capsules may be opened and sprinkled over a spoonful of cool applesauce. Capsules given once daily in the morning. Avoid abrupt discontinuation.

#### Dextran

dex′tran ★ Gentran Do not confuse with Genprine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Plasma expanders

## **MECHANISM OF ACTION**

A branched polysaccharide that produces plasma volume expansion as a result of high colloidal osmotic effect. Draws interstitial fluid into the intravascular space. May also increase blood flow in microcirculation. *Therapeutic Effect:* Increases central venous pressure, cardiac output, stroke volume, BP, urine output, capillary perfusion, and pulse pressure. Decreases heart rate, peripheral resistance, and blood viscosity. Corrects hypovolemia.

#### AVAILABILITY

Injection (High Molecular Weight [Gentran]): 6% dextran 70 in 500 mL 0.9% NaCl.

Injection (Low Molecular Weight [Gentran LMD]): 10% dextran 40 in 500 mL D5W, 10% dextran 40 in 500 mL 0.9% NaCl.

#### INDICATIONS AND DOSAGES • Volume expansion, shock

IV

Adults, Elderly (Dextran 40 or 70). 500-1000 mL at a rate of 20-40 mL/min. Maximum dose: 20 mL/kg for first 24 h and 10 mL/kg thereafter. *Children (Dextran 40 or 70).* Total dose not to exceed 20 mL/kg on day 1 and 10 mL/kg/day thereafter.

## Prevention of venous thrombosis/ pulmonary embolism

IV (DEXTRAN 40) *Adults*. 50-100 g on day of surgery, then 50 g every 2-3 days as needed based on risk, up to 2 wks.

## CONTRAINDICATIONS

Hypervolemia, renal failure with severe oliguria or anuria, severe bleeding disorders, severe cardiac decompensation, severe thrombocytopenia.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Prolongs bleeding time and depresses platelet count. Decreases clotting factors V, VIII, and IX. May falsely elevate glucose assays.

## IV INCOMPATIBILITIES

Do not add medications to dextran solution.

#### SIDE EFFECTS

#### Occasional

Mild hypersensitivity reaction, including urticaria, nasal congestion, wheezing.

#### SERIOUS REACTIONS

 Severe or fatal anaphylaxis, manifested by marked hypotension and cardiac or respiratory arrest, may occur early during IV infusion, generally in those not previously exposed to IV dextran.

- · Renal failure has occurred.
- · Fluid overload.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with chronic hepatic disease and extreme dehydration and in patients with active hemorrhage. Observe for bleeding, and monitor hematocrit to keep above 30%. Fluid overload can occur; use with caution in patients with hypovolemia. Be aware of signs and symptoms of fluid overload, such as peripheral or pulmonary edema, and impending congestive heart failure. Women may experience a heavier menstrual flow than usual. An electric razor and soft toothbrush should be used to prevent bleeding during dextran therapy. Do not take any medications, including OTC drugs (especially aspirin), without physician approval.

Notify the physician of bleeding from the surgical site, chest pain, dyspnea, black or red stool, coffeeground emesis, dark or red urine, or red-speckled mucus from cough. Urine output, vital signs, and laboratory values, such as bleeding time, platelet count, and clotting factors, should be monitored. Central venous pressure (CVP) should also be assessed to detect blood volume overexpansion. **Storage** 

Store at room temperature. Use only clear solutions, and discard partially used containers.

#### Administration

I Therapy should not continue longer than 5 days.

Give by IV infusion only. Monitor closely during first 15 min of infusion for anaphylactic reaction. Monitor vital signs every 5 min. Monitor urine flow rate during administration. Discontinue dextran 40 and give an osmotic diuretic, as prescribed, if oliguria or anuria occurs to minimize vascular overloading. If dextran is given by rapid injection, monitor CVP. Immediately discontinue the drug and notify the physician if CVP rises precipitously. Monitor BP diligently during infusion. Stop the infusion immediately if marked hypotension occurs, a sign of imminent anaphylactic reaction. If evidence of blood volume overexpansion occurs, discontinue the drug until blood volume is adjusted by diuresis.

#### Dextroamphetamine

dex-troe-am-fet'a-meen Procentra, Dexedrine Spansule Do not confuse dextroamphetamine with dextromethorphan, or Dexedrine with Dextran or Excedrin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Adrenergic agonists, amphetamines, stimulants

#### **MECHANISM OF ACTION**

An amphetamine that enhances the action of dopamine and norepinephrine by blocking their reuptake from synapses; also inhibits monoamine oxidase and facilitates the release of catecholamines. *Therapeutic Effect:* Increases motor activity and mental alertness; decreases motor restlessness, drowsiness, and fatigue; suppresses appetite.

#### AVAILABILITY

Capsules, Sustained Release (Dexedrine Spansule): 5 mg, 10 mg, 15 mg. Tablets: 5 mg, 10 mg. Oral Solution (Procentra): 1 mg/mL.

Dextroamphetamine (Generic Name)

# INDICATIONS AND DOSAGES Narcolepsy

PO

D

Adults, Children older than 12 yr: Initially, 10 mg/day. Increase by 10 mg/day at weekly intervals until therapeutic response is achieved. Maximum: 60 mg/day. *Children 6-12 yr*: Initially, 5 mg/day. Increase by 5 mg/day at weekly intervals until therapeutic response is achieved. Maximum dose: 60 mg/day. > Attention deficit hyperactivity disorder (ADHD)

#### PO

Adults: Initially, 5 mg once or twice daily. Titrate at weekly intervals. Usual maximum: 60 mg/day. Children 6 yr and older. Initially, 5 mg once or twice a day. Increase by 5 mg/day at weekly intervals until therapeutic response is achieved. Maximum: 40 mg/day. Usual dose: 5-20 mg/day. Children 3-5 yr. Initially, 2.5 mg/day. Increase by 2.5 mg/day at weekly intervals until therapeutic response is achieved. Maximum dose: 40 mg/day. Usual range 0.1-0.5 mg/kg/day. Do not use Spansule.

## • Appetite suppressant PO

Adults, Children older than 12 yr. 5-30 mg daily in divided doses of 5-10 mg each, given 30-60 min before meals; or 1 extended-release capsule in the morning. Usually no longer than 3-6 wks.

## CONTRAINDICATIONS

Advanced arteriosclerosis, agitated states, glaucoma, history of drug abuse, hypersensitivity to sympathomimetic amines, hyperthyroidism, moderate to severe hypertension, symptomatic cardiovascular disease, use within 14 days of MAOIs.

#### INTERACTIONS Drug

Antihypertensives: May decrease efficacy of antihypertensives. Antipsychotics: Efficacy of antipsychotics may be decreased.  $\beta$ -Blockers: May increase the risk of bradycardia, heart block, and hypertension.

**Digoxin:** May increase the risk of arrhythmias.

MAOIs, linezolid: May prolong and intensify the effects of dextroamphetamine, including severe hypertensive episodes.

**Meperidine:** May increase the risk of hypotension, respiratory depression, seizures, and vascular collapse.

#### Other CNS stimulants:

May increase the effects of dextroamphetamine.

**SSRIs:** May increase risk of serotonin syndrome.

**Thyroid hormones:** May increase the effects of either drug.

Tricyclic antidepressants: May increase cardiovascular effects.

Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase plasma corticosteroid concentrations.

## SIDE EFFECTS

#### Frequent

Irregular pulse, increased motor activity, talkativeness, nervousness, mild euphoria, insomnia.

#### Occasional

Headache, chills, dry mouth, GI distress, worsening depression in patients who are clinically depressed, tachycardia, palpitations, chest pain, dizziness, decreased appetite.

## SERIOUS REACTIONS

 CNS stimulant use associated with serious cardiovascular events and sudden death in patients with cardiac abnormalities or serious heart problems.

• Overdose may produce skin pallor or flushing, arrhythmias, and psychosis.

• Abrupt withdrawal after prolonged use of high doses may produce lethargy lasting for weeks.

• Prolonged administration to children with ADHD may inhibit growth.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in debilitated and elderly patients; in those with hypertension, psychiatric disorders, seizure disorder, and Tourette's syndrome; and in those who are tartrazine sensitive. Safety and efficacy have not been established in children. Distributed in breast milk; breastfeeding should be avoided. Mental status, BP, and weight should be assessed. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established. Notify the physician if decreased appetite, dizziness, dry mouth, or pronounced nervousness occurs.

#### Administration

Take the last dose of the day several hours before bedtime to prevent insomnia. Tolerance to the drug's appetite-suppressant and mood-elevating effects usually occurs within a few weeks. Dexedrine Spansule is not for initial therapy; patients should be established on regularrelease formulations first. Spansule is usually administered once daily. Avoid abrupt discontinuation.

## Dextromethorphan

dex-troe-meth-or'fan ★ Buckley's DM Cough, Buckley's Mixture Suspension, Delsym 12-Hour, Robitussin Honey/Cough, Robitussin Maximum Strength, Silphen-DM, Vicks Formula 44

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC

**Classification:** Antitussive, nonnarcotic

#### **MECHANISM OF ACTION**

A chemical relative of morphine without the narcotic properties that acts on the cough center in the medulla oblongata by elevating the threshold for coughing. *Therapeutic Effect:* Suppresses cough.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Distributed into cerebrospinal fluid (CSF). Extensively and poorly metabolized in liver to dextrorphan (active metabolite). Excreted unchanged in urine. *Half-life:* 1.4-3.9 h (parent compound), 3.4-5.6 h (dextrorphan). Onset of action: 15-30 min.

#### AVAILABILITY

Suspension (Extended Release): 30 mg/5 mL (Delsym). Syrup: 10 mg/5 mL (Robitussin Honey Cough, Silphen-DM), 12.5 mg/5 mL (Buckley's DM), 15 mg/5 mL (Robitussin Maximum Strength Cough), 30 mg/15 mL (Vicks Formula 44).

#### INDICATIONS AND DOSAGES • Cough PO

#### 454 Diazepam

Adults, Elderly, Children 12 yr and older. 10-20 mg q4h or 30 mg q6-8h or extended release 60 mg twice a day. Maximum: 120 mg/day. Children 6-12 yr. 5-10 mg q4h or 15 mg q6-8h or extended release 30 mg twice a day. Maximum: 60 mg/day. Children 4-5 yr. 2.5-7.5 mg q4-8h or extended release 15 mg twice a day.

# Maximum: 30 mg/day.

Coadministration with monoamine oxidase inhibitors (MAOIs), hypersensitivity to dextromethorphan or its components.

#### INTERACTIONS

#### Drug

#### Other cough/cold products:

Read ingredients carefully to avoid duplication and potential overdose.

## MAOIs, phenelzine, SSRIs,

**sibutramine:** May increase the risk of serotonin syndrome. MAOIs are contraindicated.

Haloperidol, quinidine, CYP2D6 inhibitors: May increase adverse effects associated with dextromethorphan.

#### Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Rare

Abdominal discomfort, constipation, dizziness, drowsiness, GI upset, nausea.

#### SERIOUS REACTIONS

• Overdosage may result in muscle spasticity, increase or decrease in BP, blurred vision, blue fingernails and lips, nausea, vomiting, hallucinations, and respiratory depression.

#### PRECAUTIONS & CONSIDERATIONS

Dextromethorphan has become a drug of abuse. Be aware that dextromethorphan should not be used for chronic and persistent cough accompanying a disease state or cough associated with excessive secretions. It is unknown whether dextromethorphan crosses the placenta or is distributed in breast milk. Be aware that dextromethorphan is not recommended for use in children younger than 4 yr of age. No age-related precautions have been noted in elderly patients. If fever, rash, headache, or sore throat persists, notify the physician.

#### Storage

Store syrup, suspension, liquid at room temperature.

#### Administration

Give dextromethorphan without regard to meals.

Shake oral suspension well before use.

## Diazepam

dye-az'e-pam Diastat, Diazepam Intensol, Valium Apo-Diazepam, Diazemuls, Diastat, Vivol, Valium Do not confuse diazepam with diazoxide or Ditropan, or Valium with Valcyte.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D Controlled Substance Schedule: IV

*Classification:* Anxiolytics, benzodiazepines, relaxants, skeletal muscle

Diazepam (Generic Name)

## **MECHANISM OF ACTION**

A benzodiazepine that depresses all levels of the central nervous system (CNS) by enhancing the action of  $\gamma$ -aminobutyric acid, a major inhibitory neurotransmitter in the brain. *Therapeutic Effect:* Produces anxiolytic effect, elevates the seizure threshold, produces skeletal muscle relaxation.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	1-2 h	2-3 h
IV	1-5 min	15 min	15-60 min
IM	15 min	30-90 min	30-90 min

Well absorbed from the GI tract. Widely distributed. Protein binding: 98%. Metabolized in the liver to active metabolite. Excreted in urine. Minimally removed by hemodialysis. *Half-life:* 20-70 h (increased in patients with hepatic dysfunction and in elderly patients).

## AVAILABILITY

Oral Concentrate (Diazepam Intensol): 5 mg/mL. Oral Solution: 5 mg/5 mL. Tablets: 2 mg, 5 mg, 10 mg. Injection: 5 mg/mL. Rectal Gel (Diastat): 2.5 mg, 5 mg, 20 mg; or Accudial delivery system, 10 mg, 20 mg.

## INDICATIONS AND DOSAGES

 Anxiety, skeletal muscle relaxation

PO Adults. 2-10 mg 2-4 times a day. Elderly. 2.5 mg twice a day. Children. 0.12-0.8 mg/kg/day in divided dosses q6-8h. IV, IM Adults. 2-10 mg repeated in 3-4 h. *Children.* 0.04-0.3 mg/kg/dose q2-4h. Maximum: 0.6 mg/kg in an 8-h period.

Preanesthesia

## IV

Adults, Elderly. 5-15 mg 5-10 min before procedure.

*Children*. 0.2-0.3 mg/kg. Maximum: 10 mg.

#### Alcohol withdrawal PO

Adults, Elderly. 10 mg 3-4 times during first 24 h, then reduced to 5-10 mg 3-4 times a day as needed. IV, IM Adults, Elderly. Initially, 10 mg,

followed by 5-10 mg q3-4h as needed.

#### Status epilepticus IV

*Adults, Elderly.* 5-10 mg q10-15 min up to 30 mg/8 h.

Children 5 yr and older.

0.05-0.3 mg/kg/dose q15-30 min.

Maximum: 10 mg/dose.

Children 1 mo to 5 yr.

0.05-0.3 mg/kg/dose q15-30 min. Maximum: 5 mg/dose.

## Control of increased seizure activity in patients with refractory epilepsy who are on stable regimens of anticonvulsants

RECTAL GEL

Adults, Elderly, Children 12 yr and older: 0.2 mg/kg; may be repeated in 4-12 h. Round dose up to nearest dosage form for adults and down for elderly.

*Children 6-11 yr*: 0.3 mg/kg; may be repeated in 4-12 h.

*Children 2-5 yr.* 0.5 mg/kg; may be repeated in 4-12 h.

#### Dose in hepatic dysfunction (cirrhosis)

Consider reduced dosage, but no specific recommendations are available.

## **OFF-LABEL USES**

Treatment of panic disorder, tremors, benzodiazepine withdrawal, insomnia.

#### CONTRAINDICATIONS

Angle-closure glaucoma, coma, children younger than 6 mo, pregnancy.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. CYP2C19, CYP3A4 inhibitors: May increase levels/effects of diazepam.

**CYP2C19, CYP3A4 inducers:** May decrease levels/effects of diazepam.

## Herbal

Kava kava, valerian: May increase CNS depression.

## Food

**Grapefruit juice:** May increase sedative effect by increasing diazepam levels.

## DIAGNOSTIC TEST EFFECTS

May elevate serum LDH, alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels. May produce abnormal renal function test results. Therapeutic serum drug level is 0.5-2 mcg/mL; toxic serum drug level is > 3 mcg/mL.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), alfentanil (Alfenta), amikacin (Amikar), aminophylline, amphotericin B cholesteryl (Amphotec), amphotericin B liposomal (AmBisome), ampicillin, ampicillin/ sulbactam (Unasyn), ascorbic acid, atracurium (Tracrium), atropine, azathioprine, aztreonam (Azactam), benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefazolin, cefepime

(Maxipime), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chloramphenicol, chlorpromazine, cimetidine (Tagamet), cisplatin, clindamycin (Cleocin), cyanocobalamin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), dantrolene, dexamethasone sodium phosphate, dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dopamine (Intropin), doripenem (Doribax), doxorubicin (Adriamycin), enalaprilat, ephedrine, epinephrine, epirubicin (Ellence), epoetin alfa (Procrit), ertapenem (Invanz), erythromycin lactobionate, esmolol (Brevibloc), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil, folic acid, foscarnet (Foscavir), furosemide (Lasix), ganciclovir, gemcitabine (Gemzar), gentamicin, granisetron (Kytril), haloperidol (Haldol), heparin, hetastarch, hydralazine, hydrocortisone sodium succinate (Solu-Cortef), hydroxyzine, imipenem/ cilastatin (Primaxin), insulin (regular, Humulin R, Novolin R), isoproterenol (Isuprel), ketorolac, labetalol, lactated Ringer's, lansoprazole (Prevacid), levofloxacin (Levaquin), lidocaine, linezolid (Zyvox), magnesium sulfate, mannitol, meperidine (Demerol), meropenem (Merrem IV), methicillin, methotrexate, methylprednisolone sodium succinate, metoclopramide (Reglan), metoprolol (Lopressor),

metronidazole (Flagyl), midazolam (Versed), milrinone (Primacor), minocycline (Minocin), mitoxantrone (Novantrone), multiple vitamins injection, nalbuphine (Nubain), naloxone (Narcan), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), oxacillin, oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pancuronium, pemetrexed (Alimta), pencillin G potassium, penicillin G sodium, pentobarbital, phenobarbital, phenytoin, piperacillin, potassium chloride, procainamide, prochloperazine, promethazine propofol (Diprivan), propranolol, quinupristin/ dalfopristin (Synercid), ranitidine (Zantac), rocuronium (Zemuron), sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sulfamethoxazole/trimethoprim, tacrolimus (Prograf), theophylline, ticarcillin (Ticar), ticarcillin/ clavulanate (Timentin), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, vancomycin, vasopressin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), vitamin B complex with C, voriconazole (Vfend).

## 🗏 IV COMPATIBILITIES

Daptomycin (Cubicin), docetaxel (Taxotere), methadone, piperacillin/ tazobactam (Zosyn), teniposide (Vumon).

## SIDE EFFECTS

#### Frequent

Pain with IM injection, somnolence, fatigue, ataxia.

#### Occasional

Slurred speech, confusion, depression, orthostatic hypotension,

headache, hypoactivity, constipation, nausea, blurred vision. Rare

Paradoxical CNS reactions, such as hyperactivity or nervousness in children and excitement or restlessness in elderly or debilitated patients (generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain).

## SERIOUS REACTIONS

• IV administration may produce pain, swelling, thrombophlebitis, and carpal tunnel syndrome.

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal or muscle cramps, diaphoresis, vomiting, and seizures.

· Anterograde amnesia may occur.

 Abrupt withdrawal in patients with epilepsy may produce an increase in the frequency or severity of seizures.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hypoalbuminemia, hepatic and renal impairment, impaired gag reflex, respiratory depression, uncontrolled pain, history of drug abuse, depression, and in those who are taking other CNS depressants. Diazepam crosses the placenta and is distributed in breast milk. Diazepam may increase the risk of fetal abnormalities if administered during the first trimester of pregnancy. Chronic diazepam use during pregnancy may produce withdrawal symptoms in the patient and CNS depression in the neonate. For children and elderly patients, expect to administer a reduced dose initially and to increase dosage gradually to prevent ataxia and excessive sedation. Females should use effective contraception during therapy and notify the physician immediately if they become or suspect they are pregnant.

Drowsiness and dizziness may occur. Change positions slowly from recumbent to sitting before standing to prevent dizziness. Alcohol, caffeine, and tasks that require mental alertness or motor skills should also be avoided. Autonomic responses, such as cold, clammy hands and diaphoresis, and motor responses, such as agitation, trembling, and tension, should be assessed. Seizure frequency and intensity should be assessed. BP, pulse rate, and respiratory rate, rhythm, and depth should be obtained immediately before giving diazepam. The duration, location, onset, and type of pain should be recorded, and immobility, stiffness, and swelling should be assessed in those being treated for musculoskeletal spasm.

#### Storage

Store unopened vials at room temperature.

#### Administration

Take oral diazepam without regard to food. Crush tablets as needed, but do not crush or break capsules. Dilute the oral concentrate with juice, water, or a carbonated beverage or mix it with a semisolid food, such as applesauce or pudding.

For IV use, administer IV push into the tubing of a free-flowing IV solution as close to the vein insertion point as possible. Be aware of solution incompatibilities, which are many. Administer directly into a large vein to reduce the risk of phlebitis and thrombosis. Do not use small veins, such as those of the wrist or dorsum of the hand. Administer IV at a rate not exceeding 5 mg/min (adults). For children, give over a 3-min period because a too-rapid IV may result in hypotension and respiratory depression. Monitor respirations every 5-15 min for 2 h. Stay recumbent for up to 3 h after parenteral administration to reduce the drug's hypotensive effect.

For IM use, inject the IM dose deep into the deltoid muscle. IM injection may be painful. I For rectal use, do not administer the rectal gel more often than once every 5 days or 5 times a month. See specialized instructions for use. If using the Accudial dose form, a pharmacist must dial in the dose and lock the rectal syringe prior to dispensing. It is ready when the "Green Ready Band" is clearly visible.

#### Diclofenac

dye-kloe'fen-ak

Cataflam, Flector, Solaraze, Voltaren Emulgel, Voltaren Ophthalmic, Voltaren Rapid, Zipsor

Novo-Difenac, Voltaren Do not confuse diclofenac with Diflucan or Duphalac, or Voltaren with Verelan.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (topical), C (oral, transdermal; D if used in third trimester or near delivery), C (ophthalmic solution)

**Classification:** Analgesics, nonnarcotic, nonsteroidal anti-inflammatory drugs, ophthalmics

Diclofenac (Generic Name)

## MECHANISM OF ACTION

An NSAID that inhibits prostaglandin synthesis, reducing the intensity of pain. Also constricts the iris sphincter. May inhibit angiogenesis (the formation of blood vessels) by inhibiting substance P or blocking the angiogenic effects of prostaglandin E. *Therapeutic Effect:* Produces analgesic and anti-inflammatory effects. Prevents miosis during cataract surgery. May reduce angiogenesis in inflamed tissue.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	2-3 h	Up to 8 h

Completely absorbed from the GI tract; penetrates cornea after ophthalmic administration (may be systemically absorbed). Topical absorption 6%-10%. Protein binding: > 99%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 1.2-2 h, patch 12 h. Diclofenac potassium more rapid onset than diclofenac sodium.

#### AVAILABILITY

Topical Gel (Solaraze): 3%. Topical Gel (Voltaren): 1%. Topical Patch (Flector): 1.3%. Tablets (Cataflam): 50 mg. Tablets (Enteric-Coated, Delayed-Release Diclofenac Sodium): 25 mg, 50 mg, 75 mg. Tablets (Extended Release [Voltaren XR]): 100 mg. Ophthalmic Solution (Voltaren Ophthalmic): 0.1%. Capsules (Liquid-Filled, Zipsor): 25 mg.

## INDICATIONS AND DOSAGES • Osteoarthritis

PO (CATAFLAM, DICLOFENAC DELAYED RELEASE)

*Adults, Elderly.* 50 mg 2-3 times a day or delayed release 75 mg twice a day.

## PO (VOLTAREN XR)

Adults, Elderly. 100 mg/day as a single dose.

TOPICAL GEL (VOLTAREN GEL) Adults. Apply 4 g to knee, ankle, foot 4 times a day (maximum 16 g/joint daily). Apply 2 g to elbow, hand, wrist 4 times a day (maximum 8 g/joint a day). Maximum 32 g/day total for all joints.

#### Rheumatoid arthritis

PO (CATAFLAM, DICLOFENAC DELAYED RELEASE) Adults, Elderly. 50 mg 2-4 times a day or delayed release 75 mg twice a day. Maximum: 225 mg/day. PO (VOLTAREN XR) Adults, Elderly. 100 mg once a day. Maximum: 100 mg twice a day.

## Ankylosing spondylitis

PO (DICLOFENAC DELAYED RELEASE) Adults, Elderly. 100-125 mg/day in 4-5 divided doses.

Analgesia, primary dysmenorrhea
 PO (CATAFLAM)

Adults, Elderly. 50 mg 3 times a day. • Usual pediatric dosage

#### PO

*Children*. 2-3 mg/kg/day in 2-4 divided doses.

#### Actinic keratoses

TOPICAL GEL (SOLARAZE) *Adults, Adolescents.* Apply twice a day to lesion for 60-90 days.

## Cataract surgery

OPHTHALMIC

*Adults, Elderly.* Apply 1 drop to eye 4 times a day commencing 24 h after cataract surgery. Continue for 2 wks afterward.

OPHTHALMIC

*Adults, Elderly.* Apply 1 drop to affected eye 1 h before surgery, within 15 min after surgery, then 4 times a day for 3 days.

#### Acute pain from sprains, contusions

TOPICAL PATCH *Adults*. Apply patch twice a day to the affected area.

## **OFF-LABEL USES**

Treatment of vascular headaches (oral).

## CONTRAINDICATIONS

Hypersensitivity to aspirin, diclofenac, and other NSAIDs; perioperative use with CABG.

## INTERACTIONS

#### Drug

Acetylcholine, carbachol: May decrease the effects of these drugs (with ophthalmic diclofenac). Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, other salicylates: May increase the risk of GI side effects such as bleeding. NSAID use may negate cardioprotective effect. Bone marrow depressants: May

increase the risk of hematologic reactions.

Cyclosporine: Diclofenac may increase risk for nephrotoxicity. Epinephrine, other antiglaucoma medications: May decrease the antiglaucoma effect of these drugs.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of these drugs.

**Lithium:** May increase the blood concentration and risk of toxicity of lithium.

Methotrexate: May increase the risk of methotrexate toxicity. Probenecid: May increase

diclofenac blood concentration. SSRIs, SNRIs: Increased risk of GI bleeding.

#### Herbal

Supplements with antiplatelet or anticoagulant effects (e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow): May increase effects on platelets or risk of bleeding.

#### Food

Alcohol: May increase dizziness; may increase risk of G1 bleeding.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level; urine protein level; and serum LDH, potassium, alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels. May decrease serum uric acid level.

#### SIDE EFFECTS

#### Frequent (4%-9%)

PO: Headache, abdominal cramps, constipation, diarrhea, nausea, dyspepsia. Ophthalmic (6%-30%): Lacrimation,

keratitis, increased intraocular pressure, burning or stinging on instillation, ocular discomfort. Topical: Pruritus, rash, dry skin, pain, numbness.

#### Occasional (1%-3%)

PO: Flatulence, dizziness, epigastric pain.

Ophthalmic (5%-10%): Ocular itching or tearing, corneal changes, blurred/ abnormal vision, eyelid swelling. Rare (< 1%)

PO: Rash, peripheral edema or fluid retention, visual disturbances, vomiting, drowsiness.

#### SERIOUS REACTIONS

• Overdose may result in acute renal failure.

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, a severe hepatic reaction (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), and a severe hypersensitivity reaction (bronchospasm or angioedema) or serious skin reactions, such as Stevens-Johnson syndrome.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal impairment, a predisposition to fluid retention, and history of GI tract disease such as active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding or ulceration. Use the lowest effective dose for the shortest time. Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Do not use in patients with aspirin-sensitive asthma. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution with fluid retention, heart failure, or hypertension. Use the lowest effective dose for the shortest time. Risk of myocardial infarction and stroke may be increased following coronary artery bypass graft surgery. Do not administer within 4-6 halflives before surgical procedures. Diclofenac crosses the placenta; it is unknown whether the drug is distributed in breast milk. Notify the physician of pregnancy. Diclofenac should not be used during the last trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. The safety and efficacy of diclofenac have not been

established in children. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may necessitate dose reduction.

Notify the physician of persistent headache, black stools, changes in vision, pruritus, rash, or weight gain. Pattern of daily bowel activity and stool consistency should be assessed. Therapeutic response, such as decreased pain, stiffness, swelling, tenderness, improved grip strength, and increased joint mobility, should be evaluated.

#### Storage

Store at controlled room temperature. Protect gels from heat and avoid freezing. Keep patches in sealed pouch until time of use.

#### Administration

Do not crush or break enteric-coated tablets. Take diclofenac with food, milk, or antacids if GI distress occurs.

For ophthalmic use, place a finger on the lower eyelid and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket, and place the prescribed number of drops in the pocket. Gently close the eye, and apply digital pressure to the lacrimal sac for 1-2 min to minimize drainage into the nose and throat, reducing the risk of systemic effects. Remove excess with a tissue. Do not use Hydrogel soft contact lenses during ophthalmic therapy.

Topical gels: Follow prescribed use. For external use only; avoid eyes and mucous membranes. Voltaren gel has dose card to measure dosage. Wash hands after application.

Topical patch: Remove liner before adhering to normal intact skin. Patch should be applied to affected area. Apply only 1 patch at a time.

## Dicloxacillin

dye-klox'a-sill-in **Do not confuse dicloxacillin with dicyclomine.** 

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antibiotics, antistaphylococcal penicillins, penicillinase-resistant penicillins

#### **MECHANISM OF ACTION**

A penicillin that acts as a bactericidal in susceptible microorganisms. *Therapeutic Effect:* Inhibits bacterial cell wall synthesis.

## PHARMACOKINETICS

Absorption 35%-76% from the GI tract. Rate and extent reduced by food. Distributed throughout body, including CSF (low). Protein binding: 96%. Partially metabolized in liver. Primarily excreted in feces and urine. Not removed by hemodialysis. *Half-life:* 0.7 h.

#### AVAILABILITY

Capsules: 250 mg, 500 mg.

#### INDICATIONS AND DOSAGES

 Infections due to susceptible penicillinase-producing staphylococci

Adults, Elderly, Children weighing 40 kg. 125-250 mg q6h. Children weighing < 40 kg. 25-50 mg/kg/day divided q6h.

## CONTRAINDICATIONS

Hypersensitivity to any penicillin.

#### INTERACTIONS Drug

**Oral contraceptives**: May decrease the effects of oral contraceptives. **Probenecid**: May increase blood concentration and risk for dicloxacillin toxicity. **Warfarin**: May decrease effects of warfarin.

## DIAGNOSTIC TEST EFFECTS

May cause positive Coombs' test.

## SIDE EFFECTS

Frequent

GI disturbances (mild diarrhea, nausea, or vomiting), headache. Occasional

Generalized rash, urticaria.

## SERIOUS REACTIONS

 Altered bacterial balance may result in potentially fatal superinfections and antibioticassociated colitis as evidenced by abdominal cramps, watery or severe diarrhea, and fever.

 Severe hypersensitivity reactions, including anaphylaxis and acute interstitial nephritis, occur rarely. Immediate reactions occur within 20 min to 48 h and include anaphylaxis, pruritus, urticaria, hypotension, laryngospasm. Delayed allergic reactions occur after 48 h and include serum sickness-like symptoms.

 Neurotoxic reactions may occur with large intravenous doses, especially in patients with renal dysfunction.

## PRECAUTIONS & CONSIDERATIONS

Be aware that dicloxacillin crosses the placenta and is distributed in breast milk in low concentrations. Be aware that dicloxacillin use should be avoided in neonates due to immature elimination processes.

Dicloxacillin (Generic Name)

No age-related precautions have been noted for elderly patients. History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. If diarrhea, rash, or symptoms occur during treatment, notify the physician.

#### Storage

Store at room temperature. Administration

Best to take on empty stomach 1 h before or 2 h after meals. Continue dicloxacillin for the full length of treatment.

## Dicyclomine

dye-sye'kloe-meen ★ Bentyl ★ Bentylol, Formulex, Protylol Do not confuse dicyclomine with doxycycline or dyclomine, or Bentyl with Aventyl or Benadryl.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Anticholinergics, gastrointestinals

#### MECHANISM OF ACTION

A GI antispasmodic and anticholinergic agent that directly acts as a relaxant on smooth muscle. *Therapeutic Effect:* Reduces tone and motility of GI tract.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1-2 h	N/A	4 h

Readily absorbed from the GI tract. Widely distributed. Metabolized in the liver. *Half-life:* 9-10 h.

#### AVAILABILITY

Capsules: 10 mg. Tablets: 20 mg. Syrup, Solution: 10 mg/5 mL. Injection: 10 mg/mL.

## INDICATIONS AND DOSAGES Functional disturbances of GI motility

PO

Adults. 20 mg 4 times a day, then increase up to 40 mg 4 times/day. Children older than 2 yr. 10 mg 3-4 times a day. Children 6 mo to 2 yr. 5 mg 3-4 times a day. Elderly. 10-20 mg 4 times a day. May increase up to 40 mg 4 times/day. IM Adults. 20 mg 4 times a day for 1-2 days, switch to PO as soon as possible.

#### CONTRAINDICATIONS

Bladder neck obstruction, myasthenia gravis in patients not treated with neostigmine, narrow-angle glaucoma, obstructive disease of the GI tract, paralytic ileus, severe ulcerative colitis, tachycardia, unstable cardiovascular status in acute hemorrhage, reflux esophagitis, breastfeeding, infants < 6 mo.

#### INTERACTIONS

#### Drug

Antacids: May decrease the absorption of dicyclomine.

Antidiarrheals: Additive effects and may increase risk for toxic megacolon.

**Digoxin:** May increase absorption of digoxin.

**Ketoconazole:** May decrease the absorption of ketoconazole.

Other anticholinergics: May increase the effects of dicyclomine. Potassium chloride: May increase the severity of GI lesions with the

Dicyclomine (Generic Name)

wax matrix formulation of potassium chloride.

## Herbal

None known.

Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent

Dry mouth (sometimes severe), dizziness, constipation, blurred vision, nausea, diminished sweating ability.

#### Occasional

Photophobia; urinary hesitancy; somnolence (with high dosage); agitation, excitement, confusion, or somnolence noted in elderly patients (even with low dosages); transient light-headedness (with IM route), irritation at injection site (with IM route).

#### Rare

Confusion, hypersensitivity reaction, increased intraocular pressure, vomiting, unusual fatigue.

## SERIOUS REACTIONS

 Overdose may produce temporary paralysis of ciliary muscle; pupillary dilation; tachycardia; palpitations; hot, dry, or flushed skin; absence of bowel sounds; hyperthermia; increased respiratory rate; ECG abnormalities; nausea; vomiting; rash over face or upper trunk; central nervous system (CNS) stimulation.

Heat prostration.

 Psychosis (marked by agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, and delusions, followed by depression).

## PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used with autonomic neuropathy, diarrhea, known or suspected GI infections, and mild to moderate ulcerative colitis. Caution is also warranted with congestive heart failure, chronic obstructive pulmonary disease, coronary artery disease, or hiatal hernia associated with reflux esophagitis, gastric ulcer, hyperthyroidism, hypertension, hepatic or renal disease, tachyarrhythmias, prostatic hypertrophy, and in elderly patients. It is unknown whether dicyclomine crosses the placenta. Dicyclomine is excreted in breast milk and is contraindicated during lactation. Infants and young children are more susceptible to the drug's toxic effects. Dicyclomine use in elderly patients may cause agitation, confusion, somnolence, or excitement. Avoid hot baths, saunas, and becoming overheated while exercising in hot weather because this may cause heatstroke. Tasks that require mental alertness or motor skills should also be avoided until response to the drug has been established. Antacids or antidiarrheals should not be taken within 1 h of taking dicyclomine because they will decrease dicyclomine's effectiveness.

BP, body temperature, pattern of daily bowel activity and stool consistency, and hydration status should be monitored. The patient should void before taking the drug to reduce the risk of urine retention.

#### Storage

Store capsules, tablets, syrup, and parenteral form at room temperature. Do not freeze.

#### Administration

Dicyclomine may be given without regard to meals.

The injection normally appears colorless. Do not administer IV or subcutaneously. Inject IM deep into large muscle mass. Do not give for longer than 2 days, as prescribed.

## **Didanosine (ddl)**

dye-dan'o-seen Videx, Videx-EC Videx-EC

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiretrovirals, nucleoside reverse transcriptase inhibitors

## **MECHANISM OF ACTION**

A purine nucleoside analog that is intracellularly converted into a triphosphate, which interferes with RNA-directed DNA polymerase (reverse transcriptase). *Therapeutic Effect*: Inhibits replication of retroviruses, including HIV.

#### PHARMACOKINETICS

Variably absorbed from the GI tract. Protein binding: < 5%. Rapidly metabolized intracellularly to active form. Primarily excreted in urine. Partially (20%) removed by hemodialysis. *Half-life:* 1.5 h; metabolite: 8-24 h.

#### AVAILABILITY

Capsules (Delayed Release): 125 mg, 200 mg, 250 mg, 400 mg. Pediatric Powder for Oral Solution: 10 mg/mL.

## INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals)

## PO

DELAYED-RELEASE CAPSULES Adults, Children 13 yr and older, weighing 60 kg or more. 400 mg once a day.

Adults, Children 13 yr and older, weighing < 60 kg. 250 mg once a day. PEDIATRIC POWDER FOR ORAL SOLUTION

Adults, Children 13 yr and older weighing 60 kg or more. 250 mg q12h. Adults, Children 13 yr and older weighing < 60 kg. 167 mg q12h.

Children 2 wks to 8 mo.  $100 \text{ mg/m}^2$  twice daily.

*Children* > 8 mo. 120 mg/m<sup>2</sup> twice daily.

#### Dosage if taken with tenofovir

For adults or adolescents weighing 60 kg or more: Reduce dose to 250 mg once daily.

Adults or adolescents weighing <60 kg: Reduce dose to 200 mg once daily.

Dosage in renal impairment

For adults or adolescents weighing 60 kg or more:

CrCl (mL/min)	Powder for Oral Solution	Delayed- Release Capsule
30-59	100 mg twice daily	200 mg daily
10-29	167 mg daily	125 mg daily
< 10	100 mg daily	125 mg daily

For adults or adolescents weighing < 60 kg:

CrCl (mL/min)	Powder for Oral Solution	Delayed- Release Capsule	
30-59	100 mg twice daily	125 mg daily	

Didanosine (ddI) (Generic Name)

CrCl (mL/min)	Powder for Oral Solution	Delayed- Release Capsule	
10-29	100 mg daily	125 mg daily	
< 10	100 mg daily	Do not use capsule	

## CONTRAINDICATIONS

Hypersensitivity to didanosine or any of its components. Use of allopurinol or ribavirin with didanosine is contraindicated.

#### INTERACTIONS

#### Drug

Allopurinol: May increase didanosine concentration. Contraindicated. Atazanavir: Levels of both drugs may be decreased.

Dapsone, fluoroquinolones, itraconazole, ketoconazole, tetracyclines: May decrease

absorption of these drugs.

**Delavirdine, indinavir**: Levels of these agents may be decreased. Administer 1 h before didanosine.

## Medications producing pancreatitis or peripheral

**neuropathy**: May increase the risk of pancreatitis or peripheral neuropathy. **Methadone**: Decreased didanosine levels may occur.

**Stavudine**: May increase the risk of fatal lactic acidosis in pregnancy.

**Tenofovir, ribavirin**: Increased levels of didanosine and toxicity including pancreatitis, hyperglycemia, lactic acidosis, and peripheral neuropathy. Ribavirin is contraindicated.

#### Herbal

None known.

#### Food

All foods: Decreases absorption of didanosine.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, amylase, bilirubin, lipase, triglyceride, AST (SGOT), ALT (SGPT), and uric acid levels. May decrease serum potassium levels.

#### SIDE EFFECTS Frequent

Adults (> 10%): Diarrhea, neuropathy, chills, and fever. Children (> 25%): Chills, fever, decreased appetite, pain, malaise, nausea, vomiting, diarrhea, abdominal pain, headache, nervousness, cough, rhinitis, dyspnea, asthenia, rash, pruritus. Occasional

Adults (2%-9%): Rash, pruritus, headache, abdominal pain, nausea, vomiting, pneumonia, myopathy, decreased appetite, dry mouth, dyspnea, accumulation of fat in waist, abdomen, or back of neck. Children (10%-25%): Failure to thrive, weight loss, stomatits, oral thrush, ecchymosis, arthritis, myalgia, insomnia, epistaxis, pharyngitis.

## SERIOUS REACTIONS

- Immune reconstitution syndrome.
- Pneumonia and opportunistic
- infections occur occasionally.

• Peripheral neuropathy, potentially fatal pancreatitis, lactic acidosis, severe hepatomegaly with steatosis, retinal changes, and optic neuritis are the major toxic effects.

· Myocardial infarction.

#### PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used in patients with history of pancreatitis. Caution is warranted with alcoholism, elevated triglycerides, and renal or liver dysfunction, T-cell counts < 100 cells/mm<sup>3</sup>, and phenylketonuria and sodiumrestricted diets because didanosine contains phenylalanine and sodium. Myocardial infarction risk may be greatest in patients with recent use and those with existing risk factors for heart disease. Be aware that didanosine should be used during pregnancy only if clearly needed and that breastfeeding should be discontinued. Pregnancy increases risk for fatal lactic acidosis. Be aware that didanosine is well tolerated in children older than 3 mo. Elderly patients are at higher risk for pancreatitis. In elderly patients, age-related renal impairment may require dosage adjustment. Didanosine is not a cure for HIV infection, nor does it reduce risk of transmission to others. Avoid alcohol.

Contact the physician if abdominal pain, elevated serum amylase or triglycerides, nausea, and vomiting occur, because these symptoms may indicate pancreatitis. Assess for signs and symptoms of peripheral neuropathy, including burning feet, "restless legs syndrome" (unable to find comfortable position for legs and feet), and lack of coordination, and for signs and symptoms of opportunistic infections, including cough or other respiratory symptoms, fever, or oral mucosa changes. Assess for nausea, abdominal pain, vomiting, and weight loss as well as visual or hearing difficulty. Expect to obtain baseline values for complete blood count (CBC), renal and liver function tests, vital signs, and weight.

#### Storage

Store at room temperature. Pediatric powder for oral solution, following reconstitution as directed, is stable for 30 days refrigerated.

## Administration

Take oral didanosine 1 h before or 2 h after meals because food decreases the rate and extent of didanosine absorption.

Add 100 mL or 200 mL water to 2 or 4 g of the unbuffered pediatric powder, respectively, to provide a concentration of 20 mg/mL. Immediately mix with an equal amount of an antacid to provide a concentration of 10 mg/mL. Shake thoroughly before removing each dose. Recommended antacid: Maximum strength Mylanta. Keep in mind antacids decrease absorption of some medications and may need to separate administration times.

Swallow enteric-coated capsules whole; take them on an empty stomach.

#### **Diethylpropion** die-ethyl-prop'ion

**R**adtue

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B Controlled Substance Schedule: IV

**Classification:** Anorexiants, stimulants, central nervous system

#### MECHANISM OF ACTION

A sympathomimetic amine that stimulates the release of norepinephrine and dopamine. *Therapeutic Effect:* Decreases appetite.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Widely distributed. Metabolized in liver to active metabolite and undergoes extensive first-pass metabolism. Excreted in urine. Unknown whether removed by hemodialysis. *Half-life:* 4-6 h.

#### AVAILABILITY

Tablets: 25 mg. Tablets (Extended Release): 75 mg.

Diethylpropion (Generic Name)

# INDICATIONS AND DOSAGES Obesity PO

*Adults.* 25 mg 3 times/day before meals *or* Extended Release: 75 mg at midmorning.

## CONTRAINDICATIONS

Agitated states, use of MAOIs within 14 days, glaucoma, history of drug abuse, hyperthyroidism, advanced arteriosclerosis or severe cardiovascular disease, severe hypertension, pulmonary hypertension, glaucoma, history of drug abuse, other anorectic agents, and hypersensitivity to sympathomimetic amines. Do not use with sibutramine.

## INTERACTIONS

#### Drug

Anorectic agents,

**sympathomimetics**: May increase the risk of cardiac effects of diethylpropion.

**Anesthetics**: May increase the risk of arrhythmias.

Antidiabetic agents, insulin: May alter blood glucose concentrations. **Guanethidine**: May decrease the effects of guanethidine.

**MAOIs, linezolid**: May increase the risk of hypertensive crisis. MAOI use is contraindicated.

**Phenothiazines**: May decrease the effects of diethylpropion.

**Tricyclic antidepressants**: May increase the cardiac and CNS effects of diethylpropion.

Sibutramine: Contraindicated due to risk of increased heart rate and BP.

## Herbal

None known.

## Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

(+) Urine screen for amphetamines.

#### SIDE EFFECTS Frequent

Elevated blood pressure, nervousness, insomnia.

#### Occasional

Dizziness, drowsiness, tremor, headache, nausea, stomach pain, fever, rash. **Rare** 

Blurred vision.

## SERIOUS REACTIONS

• Overdose may produce agitation, tachycardia, palpitations, cardiac irregularities, chest pain, psychotic episode, seizures, and coma.

 Hypersensitivity reactions, psychosis, cerebrovascular accident, seizures, and blood dyscrasias occur rarely.

• Primary pulmonary hypertension and valvular heart disease have been associated with anorexients.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is required in patients with diabetes, epilepsy, Tourette's syndrome, hypertension, and cardiovascular disease. Diethylpropion crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in elderly patients. Safety and efficacy have not been evaluated in pediatric patients. Alcohol should be avoided during therapy. Should not be used if other anorexients used within the past year.

#### Storage

Store at room temperature. Administration

Generally, do not take in the afternoon or evening because the drug can cause insomnia. Do not crush or break sustained-release capsules. Take immediate-release tablets 1 h before meals. Expect to reassess weight loss after 4 wks to determine risk/benefit of continued use.

## Diflorasone

die-flor'a-sone

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Corticosteroids, topical; dermatologics, high-potency

#### MECHANISM OF ACTION

A high-potency, fluorinated corticosteroid that decreases inflammation by suppression of migration of polymorphonuclear leukocytes and reversal of increased capillary permeability. The exact mechanism of the anti-inflammatory process is unclear. *Therapeutic Effect:* Decreases or prevents tissue response to the inflammatory process.

## PHARMACOKINETICS

Poor absorption; occlusive dressings increase absorption. Metabolized in liver. Primarily excreted in urine.

## AVAILABILITY

Cream: 0.05%. Ointment: 0.05%.

# INDICATIONS AND DOSAGES Corticosteroid-responsive dermatoses

TOPICAL Adults, Elderly. Cream: Apply sparingly 2-4 times/day. Ointment: Apply sparingly 1-3 times/day. Maximum: 50 grams/wk topically.

#### CONTRAINDICATIONS

History of hypersensitivity to diflorasone or other corticosteroids.

#### INTERACTIONS

Drug None known.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Rare

Itching, redness, dryness, irritation, burning at site of application, hypertrichosis, folliculitis, maceration, atrophy, secondary skin infection.

#### SERIOUS REACTIONS

 Overdosage symptoms include moon face, central obesity, hypertension, diabetes, hyperlipidemia, peptic ulcer, increased susceptibility to infection, electrolyte and fluid imbalance, psychosis, and hallucinations.

• The serious reactions of longterm therapy and the addition of occlusive dressings are reversible hypothalamic-pituitaryadrenal (HPA) axis suppression, manifestations of Cushing's syndrome, hyperglycemia, and glucosuria.

 Kaposi sarcoma has been reported with prolonged treatment with corticosteroids.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used over large surface areas, with prolonged use, addition of occlusive dressings, and uncontrolled infections. Skin irritation should be reported. HPA axis suppression should be evaluated by ACTH stimulation test, AM plasma cortisol test, or urinary free cortisol test. It is unknown whether diflorasone diacetate crosses the placenta or is distributed in breast milk. Children may absorb larger amounts and may be more susceptible to toxicity. Safety and efficacy of diflorasone diacetate have not been established in children or in elderly patients.

#### Storage

Store at room temperature. Administration

Diflorasone diacetate ointments are recommended for dry, scaly lesions; creams are recommended for moist lesions. Gently cleanse area before application. Use occlusive dressings only as directed. Apply a thin film over affected area and rub into area gently and thoroughly. Wash hands after application. In general, avoid face, groin, and axillae.

## Diflunisal

dye-floo'ni-sal

★ Dolobid ♥ Apo-Diflunisal Do not confuse diflunisal with Dicarbosil, or Dolobid with Slo-Bid.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Analgesics, antiinflammatory agents, salicylates

#### MECHANISM OF ACTION

A nonsteroidal anti-inflammatory and difluorophenyl derivative of salicylic acid that inhibits prostaglandin synthesis, reducing inflammatory response and intensity of pain stimulus reaching sensory nerve endings. *Therapeutic Effect*: Produces analgesic and anti-inflammatory effect.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	2-3 h	8-12 h

Completely absorbed from the GI tract. Widely distributed. Protein binding: > 99%. Metabolized in liver. Unlike other salicylates, not metabolized to salicylic acid. Primarily excreted in urine as metabolites. Not removed by hemodialysis. *Half-life:* 8-12 h.

#### AVAILABILITY

Tablets: 500 mg.

# INDICATIONS AND DOSAGES Mild to moderate pain

PO

*Adults, Elderly.* Initially, 0.5-1 g, then 250-500 mg q8-12h. Maximum: 1.5 g/day.

## Rheumatoid arthritis, osteoarthritis PO

Adults, Elderly. 0.5-1 g/day in 2 divided doses. Maximum: 1.5 g/day.

#### **OFF-LABEL USES**

Treatment of psoriatic arthritis, migraine, vascular headache.

## CONTRAINDICATIONS

Active GI bleeding, hypersensitivity to aspirin or NSAIDs, perioperative use with coronary artery bypass graft.

#### INTERACTIONS

#### Drug

Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, antiplatelets, salicylates: May increase the risk of GI bleeding and side effects. NSAID may diminish cardioprotective effect of ASA. Bisphosphonates, corticosteroids: Increased risk of GI ulceration.

Diflunisal (Generic Name)
**Bone marrow depressants**: May increase the risk of hematologic reactions.

**Cyclosporine, pemetrexed**: May increase levels and effects of cyclosporine, pemetrexed.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of these drugs.

Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate**: May increase the risk of toxicity of methotrexate.

**Probenecid**: May increase diflunisal blood concentration.

#### Herbal

Supplements with antiplatelet or anticoagulant effects e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow, etc.: May increase effects on platelets or risk of bleeding.

### Food

Alcohol: May increase dizziness; may increase risk of GI bleeding.

### DIAGNOSTIC TEST EFFECTS

May increase serum AST (SGOT) and ALT (SGPT) levels. May decrease serum uric acid levels.

### SIDE EFFECTS

Side effects are less common with short-term treatment.

#### Occasional (0%-3%)

Nausea, dyspepsia (heartburn, indigestion, epigastric pain), diarrhea, headache, rash.

# Rare (1%-3%)

Vomiting, constipation, flatulence, dizziness, somnolence, insomnia, fatigue, tinnitus.

### SERIOUS REACTIONS

• Overdosage may produce drowsiness, vomiting, nausea, diarrhea, hyperventilation, tachycardia, diaphoresis, stupor, and coma.

Peptic ulcer, GI bleeding, gastritis, and severe hepatic reaction, including cholestasis, jaundice occur rarely.
Nephrotoxicity, including dysuria, hematuria, proteinuria, and nephrotic syndrome, and severe hypersensitivity reaction, marked by bronchospasm and angioedema, or serious skin rashes, like Stevens-Johnson syndrome, occur rarely.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with hepatic or renal impairment, a predisposition to fluid retention, and a history of GI tract disease such as active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding or ulceration. Use the lowest effective dose for the shortest duration. Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Do not use in patients with aspirinsensitive asthma. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution with fluid retention, heart failure, or hypertension. Use the lowest effective dose for the shortest duration. Risk of myocardial infarction and stroke may be increased following coronary artery bypass graft surgery. Do not administer within 4-6 half-lives before surgical procedures.

Caution is also warranted in patients with factor VII or factor IX deficiencies, platelet and bleeding disorders, and vitamin K deficiency. Be aware that diflunisal crosses the placenta and is distributed in breast milk. Avoid diflunisal use during the last trimester of pregnancy, since the drug may adversely affect the fetal cardiovascular system, causing premature closure of the ductus arteriosus. Be aware that the safety and efficacy of this drug have not been established in children. Reye's syndrome is possible with diflunisal. In elderly patients, GI bleeding or ulceration is more likely to cause serious adverse effects. In elderly patients, age-related renal impairment may require a lower dose.

Notify the physician if GI distress, headache, or rash occurs. Baseline laboratory tests, including PT, aPTT, renal and liver function studies, and CBC, should be obtained. Skin for rash, pattern of daily bowel activity and stool consistency, and therapeutic response should be assessed.

### Storage

Store at room temperature. Administration

Take diflunisal with meals, milk, or water. Do not crush or break film-coated tablets.

# Digoxin

di-jox'in

★ Lanoxin ₩ Toloxin Do not confuse digoxin with Desoxyn or doxepin, or Lanoxin with Levsinex or Lonox.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, cardiac glycosides, inotropes

## **MECHANISM OF ACTION**

A cardiac glycoside that increases the influx of calcium from extracellular to intracellular cytoplasm. *Therapeutic Effect:* Potentiates the activity of the contractile cardiac muscle fibers and increases the force of myocardial contraction. Slows the heart rate by decreasing conduction through the SA and AV nodes.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5-2 h	2-8 h	3-4 days
IV	5-30 min	1-4 h	3-4 days

Readily absorbed from the GI tract. Widely distributed. Protein binding: 30%. Partially metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life (adults):* 36-48 h (increased with impaired renal function and in elderly patients).

### AVAILABILITY

*Elixir:* 50 mcg/mL. *Tablets (Lanoxin):* 125 mcg, 250 mcg. *Injection (Lanoxin):* 250 mcg/mL, 100 mcg/mL.

### INDICATIONS AND DOSAGES

Rapid loading dose for the management and treatment of CHF; control of ventricular rate in patients with atrial fibrillation; treatment and prevention of recurrent paroxysmal atrial tachycardia PO

Adults, Elderly. Initially, 0.5-0.75 mg, additional doses of 0.125-0.375 mg at 6- to 8-h intervals. Range: 0.75-1.25 mg. Children older than 10 yr. 10-15 mcg/kg. Children 5-10 yr. 20-35 mcg/kg. Children 2-5 yr: 30-40 mcg/kg. Children 1-24 mo. 35-60 mcg/kg. Neonate, full-term. 25-35 mcg/kg. Neonate, premature. 20-30 mcg/kg. One-half of loading dose given initially, followed by equal portions of the remaining dose at 4- to 8-h intervals. IV

Digoxin (Generic Name)

*Adults, Elderly.* Initially, 0.25-0.5 mg, usually followed by additional doses of 0.125-0.25 mg at 6- to 8-h intervals for 2-3 doses, then switch to maintenance dosing.

Children older than 10 yr. 8-12 mcg/kg.

Children 5-10 yr. 15-30 mcg/kg. Children 2-5 yr. 25-35 mcg/kg. Children 1-24 mo. 30-50 mcg/kg. Neonates, full-term. 20-30 mcg/kg. Neonates, premature. 15-25 mcg/kg. One-half of loading dose given initially, followed by equal portions of the remaining dose at 4- to 8-h intervals.

### Maintenance dosage for CHF; control of ventricular rate in patients with atrial fibrillation; treatment and prevention of recurrent paroxysmal atrial tachycardia PO, IV

*Adults, Elderly*. 0.125-0.375 mg/day.

*Children.* If giving IV, dose is roughly 25%-35% loading dose (20%-30% for premature neonates) divided every 12 h in children < 10 yr.

General guidelines as follows for PO children's maintenance dose per day (Note: If child < 10 yr, usually divide daily dose into 2 doses):

Children > 10 yr. 3-5 mcg/kg/day. Children 5-10 yr. 7-10 mcg/kg/ day. Doses as low as 5 mcg/kg/day recommended.

*Children 2-5 yr.* 10-15 mcg/kg/day. Doses as low as 7.5 mcg/kg/day recommended.

Children < 2 yr. 10-15 mcg/kg/day. Full-term neonates. 6-10 mcg/kg/day. Preterm neonates. 5-7.5 mcg/kg/day.

### Dosage in renal impairment

Dosage adjustment is based on creatinine clearance. Total digitalizing dose: Decrease by 50% in end-stage renal disease.

Creatinine Clearance	Adult Dosage		
10-50 mL/min	25%-75% usual or every 36 h		
Less than 10 mL/min	10%-25% usual or every 48 h		

# CONTRAINDICATIONS

Hypersensitivity to digoxin or other digitalis preparations, ventricular fibrillation, ventricular tachycardia unrelated to congestive heart failure.

# INTERACTIONS

### Drug

Amiodarone: May increase digoxin blood concentration and risk of toxicity; may have an additive effect on the SA and AV nodes. Reduce digoxin dose by 50% when initiating amiodarone.

Amphotericin, glucocorticoids, potassium-depleting diuretics:

May increase risk of toxicity due to hypokalemia.

**Antiarrhythmics, parenteral calcium, sympathomimetics**: May increase risk of arrhythmias.

Antidiarrheals, cholestyramine, colestipol, sucralfate: May decrease absorption of digoxin.

**β-Blockers:** May have additive effect on heart rate.

**Carvedilol, diltiazem, fluoxetine, quinidine, verapamil**: May increase digoxin blood concentration. Reduce dose 25%-50% when initiating quinidine. Reduce digoxin dose with others.

**Cyclosporine, itraconazole**: May increase digoxin levels.

**Parenteral magnesium**: May cause cardiac conduction changes and heart block.

### Herbal

Siberian ginseng: May increase serum digoxin levels.

Licorice: Hypokalemic effects may increase digoxin toxicity. Food

None known.

# DIAGNOSTIC TEST EFFECTS

Prolongs PR interval of ECG. Clinical status, not serum levels, guide treatment. Roughly  $\frac{1}{2}$  of adults considered adequately digitalized (without toxicity) have serum digoxin concentrations 0.8-2 ng/mL. However, many have clinical benefits at levels below this "therapeutic" range. About  $\frac{3}{2}$  of patients with toxicity have serum digoxin concentrations > 2 ng/mL, but  $\frac{1}{3}$  will have clinical toxicity within the "normal" range. Values < 2 ng/mL do not rule out digoxin toxicity.

# IV INCOMPATIBILITIES

Amiodarone, all forms of amphotericin B, caspofungin (Cancidas), dantrolene, diazepam (Valium), doxorubicin (Adriamycin), fluconazole (Diflucan), foscarnet (Foscavir), lansoprazole (Prevacid), minocycline (Minocin), mitoxantrone (Novantrone), paclitaxel (Taxol), phenytoin, propofol (Diprivan), quinupristin/ dalfopristin (Synercid), sulfamethoxazole/trimethoprim.

### SIDE EFFECTS

Most side effects occur at doses greater than needed for therapeutic effect. However, there is a very narrow margin of safety between a therapeutic and a toxic result. Longterm therapy may produce mammary gland enlargement in women, but this is reversible when the drug is withdrawn.

### Occasional (<10%)

Dizziness, headache, mental disturbances, diarrhea, nausea, rash.

## SERIOUS REACTIONS

 The most common early manifestations of digoxin toxicity are GI disturbances (anorexia, nausea, vomiting) and neurologic abnormalities (fatigue, headache, depression, weakness, drowsiness, confusion, nightmares). In children, the early signs are cardiac arrhythmias, including sinus bradycardia.

 Facial pain, personality change, and ocular disturbances (photophobia, light flashes, halos around bright objects, yellow or green color perception) may be noted.

• Proarrhythmic effects occur with digoxin.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients who have had an acute myocardial infarction (i.e., within 6 mo), advanced cardiac disease, heart failure, cor pulmonale, hypokalemia, hypomagnesemia, hypothyroidism, impaired hepatic or renal function, incomplete AV block, sinus nodal disease, or pulmonary disease. Digoxin crosses the placenta and is distributed in breast milk. Premature infants are more susceptible to toxicity. Keep in mind that infants and children experience signs of overdose differently than adults do. The first sign of overdose in children is usually an arrhythmia, such as bradycardia, followed by nausea, vomiting, diarrhea, anorexia, and CNS disturbances. In elderly patients, age-related hepatic or renal function impairment may require dosage adjustment. Also, there is an increased risk of loss of appetite in this age group. Withhold or reduce dose 1-2 days before elective electrical cardioversion.

Notify the physician if decreased appetite, diarrhea, nausea, visual changes, or vomiting occurs. Apical pulse should be assessed for 60 seconds or 30 seconds if the person is receiving maintenance therapy. If the pulse rate is 60 beats/min or lower in adults or 70 beats/min or lower in children, withhold the drug and contact the physician. Blood samples for digoxin level should be obtained 6-8 h after digoxin administration or just before administration of the next digoxin dose. Be aware that signs and symptoms of digoxin toxicity are GI disturbances and neurologic abnormalities.

### Storage

Store at room temperature. Administration

Avoid giving digoxin by the IM route, because the drug may cause severe local irritation and is erratically absorbed (IV preferred). Only if no other route is possible, give deep into the muscle followed by massage. Give no more than 2 mL at any one site. Expect to adjust the digoxin dosage in elderly patients and in those with renal dysfunction. Know that larger digoxin doses are often required for adequate control of ventricular rate with atrial fibrillation or flutter. Administer digoxin loading dosage in several doses at 4- to 8-h intervals, as prescribed.

! The difference in bioavailability between digoxin injection and that of digoxin elixir or tablets should be considered when changing from one dosage form to another. IV doses may need to be reduced by roughly 20% compared to previous oral dosing.

May take oral digoxin without regard to meals. Crush tablets if necessary. Do not increase or skip digoxin doses. Carefully measure oral solution to ensure accurate dosage. For IV use, give undiluted or dilute with at least a fourfold volume of sterile water for injection, NS, or D5W, because using less than this amount may cause a precipitate to form. Use immediately. Give IV slowly over at least 5 min. If tuberculin syringes are used to measure very small doses, be aware of the problem of inadvertent overadministration of digoxin. The syringe should not be flushed after its contents are expelled into an indwelling vascular catheter.

# Digoxin Immune Fab

di-jox'in im'myoon-fab ★ Digibind, DigiFab Do not confuse digoxin with Desoxyn or doxepin.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antidotes

# **MECHANISM OF ACTION**

An antidote that binds molecularly to digoxin in the extracellular space and the complex is excreted by kidneys. *Therapeutic Effect:* Makes digoxin unavailable for binding at its site of action on cells in the body.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	30 min	N/A	3-4 days

Widely distributed into extracellular space. Excreted in urine. *Half-life:* 15-20 h.

### AVAILABILITY

*Powder for Injection (Digibind):* 38-mg vial.

*Powder for Injection (DigiFab):* 40-mg vial.

### INDICATIONS AND DOSAGES > Potentially life-threatening digoxin overdose IV

Adults, Elderly, Children. Dosage varies according to amount of digoxin to be neutralized. Refer to manufacturer's dosing calculation guidelines. In general, 20 vials are adequate to treat most life-threatening *accute* ingestions. Monitor for volume overload in children. Consider up to 10 vials, observing patient's response, and following with an additional 10 vials if indicated. Most cases of toxicity were reversed with 10 vials in clinical trials. For toxicity from *chronic* use, 6 vials are usually adequate to reverse most cases of toxicity.

### CONTRAINDICATIONS

None known.

### INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May cause a decline in serum potassium level as toxicity is reversed; monitor serum potassium frequently. Serum digoxin concentration may increase precipitously and persist for up to 1 wk until Fab/digoxin complex is eliminated from the body.

## IV INCOMPATIBILITIES

None known.

### SIDE EFFECTS

Allergic reaction, phlebitis.

### SERIOUS REACTIONS

 Hyperkalemia may occur as a result of digitalis toxicity. Signs and symptoms of hyperkalemia include diarrhea, paresthesia of extremities, heaviness of legs, decreased BP, cold skin, grayish pallor, hypotension, mental confusion, irritability, flaccid paralysis, tented T waves, widening QRS interval, and ST depression.

 Hypokalemia may develop rapidly when the effect of digitalis is reversed. Signs and symptoms of hypokalemia include muscle cramping, nausea, vomiting, hypoactive bowel sounds, abdominal distention, difficulty breathing, and orthostatic hypotension.

 Low cardiac output and congestive heart failure exacerbations may occur rarely when digoxin level is reduced.

### PRECAUTIONS & CONSIDERATIONS

Use with caution if a history of allergy to sheep proteins or mannitol, or to other components of the products. Caution is warranted with impaired cardiac and renal function. Be aware of signs and symptoms of digoxin toxicity, including anorexia, nausea, and vomiting, as well as visual changes. It is unknown whether digoxin immune Fab crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children. In elderly patients, age-related renal impairment may require cautious use.

BP, ECG, serum potassium level, and temperature should be monitored during and after drug administration. Changes from the initial assessment should be assessed. Hypokalemia may result in cardiac arrhythmias, changes in mental status, muscle cramps, muscle strength changes, or tremor. Hyperkalemia may result in cold and clammy skin, confusion, and diarrhea. Signs and symptoms of an arrhythmia (such as palpitations) or heart failure (such as dyspnea and edema) should also be assessed if the digoxin level falls below the therapeutic level.

### Storage

Refrigerate vials. After reconstitution, use the solution immediately. If it is not used immediately, store the solution in the refrigerator for up to 4 h.

### Administration

Serum digoxin level should be obtained before administering the drug. If the serum digoxin level was drawn < 6 h before the last digoxin dose, the serum digoxin level may be unreliable. Impaired renal function may require more than 1 wk before serum digoxin assay is reliable; however, this fact does not alter recommendations for acute treatment. Monitor for prolonged toxicity.

Reconstitute each 38-mg vial with 4 mL sterile water for injection to provide a concentration of 9.5 mg/mL. Reconstitute each 40-mg vial with 4 mL of sterile water for injection to provide a concentration of 10 mg/mL. The reconstituted product (total dosage) may be diluted with 0.9% NaCl to a convenient volume. Infuse over 30 min. It is recommended that the solution be infused through a 0.22-µm filter. If cardiac arrest is imminent, may give drug by IV push. In children, may need to watch for fluid overload, depending on the number of vials to be given.

Dihydroergotamine

dye-hye-droe-er-got'a-meen D.H.E. 45, Migranal

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Ergot alkaloids and derivatives

# **MECHANISM OF ACTION**

An ergotamine derivative,  $\alpha$ -adrenergic blocker that directly stimulates vascular smooth muscle. May also have antagonist effects on serotonin. *Therapeutic Effect:* Peripheral and cerebral vasoconstriction.

## PHARMACOKINETICS

Slow, incomplete absorption from the GI tract; rate of absorption of intranasal varies. Protein binding: > 90%. Undergoes extensive first-pass metabolism in liver. Metabolized to active metabolite. Eliminated in feces via biliary system. *Half-life:* 7-9 h.

### AVAILABILITY

*Injection:* 1 mg/mL (D.H.E. 45). *Nasal Spray:* 4 mg/mL (0.5 mg/ spray) (Migranal).

# INDICATIONS AND DOSAGES Migraine headaches, cluster headaches

IM/SUBCUTANEOUS/IV Adults, Elderly. 1 mg at onset of headache; repeat hourly if needed for up to 3 total doses. Usual maximum for IV use: 2 mg/24 h. Maximum: 3 mg/day; 6 mg/wk. INTRANASAL Adults, Elderly. 1 spray (0.5 mg) into

each nostril; repeat in 15 min, up to 4 sprays. Maximum: 6 sprays/day; 8 sprays/wk.

### **OFF-LABEL USES**

Orthostatic hypotension.

### CONTRAINDICATIONS

Previous hypersensitivity to ergot alkaloids, coronary artery disease, angina, hypertension, impaired liver or renal function, malnutrition, peripheral vascular diseases, such as thromboangiitis obliterans, syphilitic arteritis, severe arteriosclerosis, thrombophlebitis, coronary artery vasospasm/ Prinzmetal angina, hemiplegic or basilar migraine, Raynaud's disease, sepsis, severe pruritus (biliary disease), high-dose aspirin therapy, potent CYP3A4 inhibitors, within 24 h of serotonin agonists, within 2 wks of MAOIs, pregnancy, breastfeeding.

### INTERACTIONS

Drug

**β-Blockers**: May increase the risk of vasospasm.

Potent CYP3A4 inhibitors (e.g., ritonavir, nelfinavir, indinavir, erythromycin, clarithromycin, troleandomycin, ketoconazole, itraconazole): Increase toxicity of dihydroergotamine.

Contraindicated.

Ergot alkaloids, systemic vasoconstrictors: May increase pressor effect.

Less potent CYP3A4 inhibitors (e.g., saquinavir, nefazodone, fluconazole, fluoxetine, other azole antifungals): May increase risk of ergotism.

MAOIs, serotonin agonists, ("triptans"), sibutramine: May increase risk of serotonin syndrome. Contraindicated.

Nicotine: Nicotine may provoke vasoconstriction.

Nitroglycerin: May decrease the effect of nitroglycerin.

### Herbal

None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent (> 25%) Nasal spray: Rhinitis.

### Occasional

Nasal spray: Nausea, cough, dizziness, altered taste, throat and nose irritation, pharyngitis.

# Rare

Muscle pain, fatigue, diarrhea, upper respiratory infection, dyspepsia.

# SERIOUS REACTIONS

 Prolonged administration or excessive dosage may produce ergotamine poisoning manifested as nausea, vomiting, weakness of legs, pain in limb muscles, numbness and tingling of fingers or toes, precordial pain, tachycardia or bradycardia, and hypertension or hypotension.

• Coronary artery vasospasm, myocardial ischemia, myocardial infarction, ventricular tachycardia, ventricular fibrillation,

cerebrovascular hemorrhage, stroke.Localized edema and itching

due to vasoconstriction of peripheral arteries and arterioles may occur.

• Feet or hands will become cold, pale, and numb.

• Muscle pain may occur when walking and later, even at rest.

- · Gangrene may occur.
- Pleural and retroperitoneal fibrosis have occurred with prolonged daily use.

• Occasionally confusion, depression, drowsiness, and seizures appear.

### **PRECAUTIONS & CONSIDERATIONS**

Dihydroergotamine use is contraindicated in pregnancy because it produces uterine stimulant action, resulting in possible fetal death or retarded fetal growth, and it increases vasoconstriction of placental vascular bed. It is distributed in breast milk and may prohibit lactation.

Dihydroergotamine use may produce diarrhea or vomiting in the neonate. It may be used safely in children older than 6 yr, but use only when the patient is unresponsive to other medication. In elderly patients, age-related occlusive peripheral vascular disease increases the risk of peripheral vasoconstriction. In elderly patients, age-related renal impairment may require caution.

Irregular heartbeat, nausea, numbness or tingling of the fingers and toes, pain or weakness of the extremities, and vomiting should be reported.

### Storage

Store at room temperature below 77° F. Protect from light. Do not refrigerate or freeze. Do not refrigerate or freeze injection or nasal spray.

### Administration

Injection may be given subcutaneously, IM, or IV.

Before intranasal administration, nasal spray must be primed (pumped 4 times). Use no more than 4 sprays (2 mg) for a single administration; do not use > 6 sprays in a 24-h period or 8 sprays in a week. Inhale deeply through the nose while spraying or immediately after spraying to allow the drug to be absorbed through the skin in the nose. Do not tilt the head back or inhale through the nose. Initiate treatment at the first sign of symptom of an attack. Nasal spray may be administered at any time during a migraine attack. Once spray is prepared, use within 8 h. Discard unused solution.

### Diltiazem

dil-tye'a-zem Cardizem, Cardizem CD, Cardizem LA, Cartia XT, Dilacor XR, Diltia XT, Taztia XT, Tiazac Cardizem CD, Nu-Diltiaz, Tiazac, Tiazac XC Do not confuse Cardizem with Cardene or Cardene SR, or Tiazac with Ziac.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, class IV, antianginals, antihyper-tensives, calcium channel blockers

### MECHANISM OF ACTION

An antianginal, antihypertensive, and antiarrhythmic agent that inhibits calcium movement across cardiac and vascular smooth-muscle cell membranes. This action causes the dilation of coronary arteries, peripheral arteries, and arterioles. *Therapeutic Effect:* Decreases BP, heart rate, and myocardial contractility; slows SA and AV conduction; and decreases total peripheral vascular resistance by vasodilation.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	0.5-1 h	2-3 h	N/A
PO (extended release)	2-3 h		10-18 h N/A
IV	3 min		15 min N/A

Diltiazem (Generic Name)

Well absorbed from the GI tract. Protein binding: 70%-80%. Undergoes first-pass metabolism in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life* (immediate-release tablet): 3-4.5 h. *Half-life* (extended-release tablet): 6-9 h. *Half-life* (extended-release capsules): 5-10 h.

## AVAILABILITY

Capsules (Sustained Release [Diltiazem Sustained Release]): 60 mg, 90 mg, 120 mg. Capsules (Extended Release [Cardizem CD]): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg. Capsules (Extended Release [Cartia XT]): 120 mg, 180 mg, 240 mg, 300 mg. Capsules (Extended Release [Dilacor XR]): 120 mg, 180 mg, 240 mg. Capsules (Extended Release [Diltia XT]): 120 mg, 180 mg, 240 mg. Capsules (Extended Release [Taztia XT]): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg. Capsules (Extended Release [Tiazac]): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. Tablets (Cardizem): 30 mg, 60 mg, 90 mg, 120 mg. Tablets (Extended Release [Cardizem LA]): 120 mg, 180 mg, 240 mg, 300 mg, 360 mg, 420 mg. Injection (Solution): 5 mg/mL. Injection (Powder): 100 mg.

### INDICATIONS AND DOSAGES

### Angina related to coronary artery spasm (Prinzmetal variant), chronic stable angina (effort-associated) PO

*Adults, Elderly.* Initially, 30 mg 4 times a day. Increase up to 180-360 mg/day in 3-4 divided doses at 1- to 2-day intervals. Adults, Elderly (Cardizem LA). Initially, 180 mg/day. May increase at intervals of 7-14 days up to 360 mg/day.

Adults, Elderly (Cardizem CD, Cartia XT, Dilacor XR, Diltia XT, Tiazac). Initially, 120-180 mg/day; titrate over 7-14 days. Range: Up to 480 mg/day.

# Essential hypertension PO

Adults, Elderly. (Cardizem CD, Cartia XT, Dilacor XR, Diltia XT): Initially, 180-240 mg once a day. May increase at 2-wk intervals. Maintenance 240-360 mg/day. Maximum: 480 mg once a day (Cardizem CD, Cartia XT, Dilacor XR). Maximum: 540 mg once a day (Diltia XT). (Cardizem LA): Initially, 180-240 mg once a day. May increase at 2-wk intervals. Maintenance: 120-

540 mg/day.

(*Taztia XT, Tiazac*): Initially, 120-240 mg once a day. May increase at 2-wk intervals. Maximum: 540 mg once a day.

### Temporary control of rapid ventricular rate in atrial fibrillation or flutter, rapid conversion of paroxysmal supraventricular tachycardia to normal sinus rhythm IV BOLUS

*Adults, Elderly.* Initially, 0.25 mg/kg actual body weight over 2 min. May repeat in 15 min at dose of 0.35 mg/kg actual body weight. Subsequent doses individualized.

IV INFUSION

*Adults, Elderly.* After initial bolus injection, may begin infusion at 5-10 mg/h; may increase by 5 mg/h up to a maximum of 15 mg/h. Infusion duration should not exceed 24 h.

# **OFF-LABEL USES**

Migraine prophylaxis, diabetic nephropathy, unstable angina, dilated cardiomyopathy.

# CONTRAINDICATIONS

Acute myocardial infarction, pulmonary congestion, severe hypotension (< 90 mm Hg, systolic), sick sinus syndrome, second- or third-degree AV block (except in the presence of a pacemaker), IV administration within hour of IV β-blockers, ventricular tachycardia, hypersensitivity.

# INTERACTIONS

### Drug

**α-Blockers:** Increased hypotensive effect.

Aprepitant/fosaprepitant: May increase levels of each drug. β-Blockers: May have additive effect.

**Carbamazepine:** May decrease levels of diltiazem. May increase levels of carbamazepine.

**Cyclosporine:** Levels of each drug may be increased.

**CYP3A4 inhibitors/inducers:** May increase or decrease levels and effects of diltiazem, respectively.

CYP3A4 substrates, HMG-CoA reductase inhibitors: Diltiazem may increase levels of substrates. Taking with statins may increase risk of myopathy. When taken with simvastatin, the dose of simvastatin should not exceed 10 mg/day and the dose of diltiazem should not exceed 240 mg/day.

**Digoxin:** May increase serum digoxin concentration.

**Procainamide, quinidine:** May increase risk of QT-interval prolongation.

# Herbal

**St. John's wort:** May decrease levels of diltiazem.

### Food

None known.

# DIAGNOSTIC TEST EFFECTS

PR interval may be increased.

# IV INCOMPATIBILITIES

Acetazolamide (Diamox), acyclovir (Zovirax), allopurinol (Aloprim), aminophylline, amphotericin B liposomal (AmBisome), ampicillin, ampicillin/sulbactam (Unasyn), cefepime (Maxipime), chloramphenicol, dantrolene, diazepam (Valium), fluorouracil, furosemide (Lasix), ganciclovir (Cytovene), heparin, insulin, ketorolac, lansoprazole (Prevacid), methotrexate, micafungin (Micardis), nafcillin, pantoprazole (Protonix), pentobarbital, phenobarbital, phenytoin (Dilantin), piperacillin/tazobactam (Zosyn), rifampin (Rifadin), sodium bicarbonate, thiopental.

# **IV COMPATIBILITIES**

Albumin, alfentanil (Alfenta), amifostine (Ethyol), amikacin (Amikar), amiodarone, argatroban, atenolol, atracurium (Tracrium), aztreonam (Azactam), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), busulfan (Busulfex), butorphanol (Stadol), calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefazolin (Ancef), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chlorpromazine, cimetidine (Tagamet), ciprofloxacin (Cipro), cisatracurium (Nimbex), cisplatin, clindamycin (Cleocin), cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), daptomycin (Cubicin), dexamethasone sodium phosphate, dexmedetomidine (Precedex), digoxin (Lanoxin), diphenhydramine (Benadryl),

dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doripenem (Doribax), doxorubicin (Adriamycin), doxycycline, droperidol, enalaprilat, ephedrine, epinephrine, epirubicin (Ellence), ertapenem (Invanz), erythromycin lactobionate, esmolol (Brevibloc), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), fluconazole (Diflucan), fludarabine (Fludara), foscarnet (Foscavir), fosphenytoin (Cerbyx), gemcitabine (Gemzar), granisetron (Kytril), haloperidol (Haldol), gentamicin (Garamycin), hydromorphone (Dilaudid), hydroxyzine, imipenem/cilastatin (Primaxin), isoproterenol (Isuprel), labetalol, levofloxacin (Levaguin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, mannitol, melphalan (Alkeran), meperidine (Demerol), meropenem (Merrem), metoclopramide (Reglan), metoprolol (Lopressor), metronidazole (Flagyl), midazolam (Versed), milrinone (Primacor), minocycline (Minocin), mitoxantrone (Novantrone), morphine, multivitamins, nalbuphine (Nubain), naloxone (Narcan), nesiritide (Natrecor), nicardipine (Cardene), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pancuronium, pemetrexed (Alimta), penicillin G potassium, piperacillin, potassium chloride, potassium phosphate, prochlorperazine, promethazine, propranolol, quinupristin/dalfopristin (Synercid), ranitidine (Zantac), remifentanil (Ultiva), sodium acetate, succinvlcholine, sufentanil

(Sufenta), sulfamethoxazole/ trimethoprim, tacrolimus (Prograf), teniposide (Vumon), theophylline, thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin/clavulanate (Timentin), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, vancomycin, vasopressin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend), zidovudine (Retrovir).

### SIDE EFFECTS

#### Frequent (1%-5%)

Peripheral edema, dizziness, light-headedness, headache, pain, bradycardia, asthenia (loss of strength, weakness), dyspepsia.

# Occasional (2%-5%)

Nausea, constipation, flushing, ECG changes, injection site reactions (burning, itching).

### Rare (< 2%)

Rash, micturition disorder (polyuria, nocturia, dysuria, frequency of urination), abdominal discomfort, somnolence.

# SERIOUS REACTIONS

 Abrupt withdrawal may increase frequency or duration of angina.
 AV block, bradycardia. Congestive heart failure (CHF) and second- and third-degree AV block occur rarely.
 Overdose produces nausea, somnolence, confusion, slurred

speech, and profound bradycardia.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with CHF, hypertrophic obstructive cardiomyopathy, and impaired hepatic or renal function. It is unclear whether diltiazem crosses the placenta. It should be used during pregnancy only if the benefit to the mother outweighs the risk to the fetus. Diltiazem is distributed in breast milk. No age-related precautions have been noted in children. In elderly patients, age-related renal impairment may require cautious use. Tasks that require alertness and motor skills should also be avoided.

Dizziness or light-headedness may occur. Rise slowly from a lying to a sitting position and wait momentarily before standing to avoid diltiazem's hypotensive effect. Notify the physician of constipation, irregular heartbeat, nausea, pronounced dizziness, or shortness of breath. The onset, type (sharp, dull, or squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, such as exertion and emotional stress, should be documented before therapy. Pulse, BP, and renal and hepatic function test results should be monitored before and during therapy. Skin should be assessed for flushing and peripheral edema, especially behind the medial malleolus.

#### Storage

Store oral products at room temperature.

Refrigerate single-use solution for injection (may store at room temperature 1 mo). Store powder for reconstitution at room temperature. After dilution, solution is stable for 24 h.

### Administration

Take oral immediate-release diltiazem before meals and at bedtime. Taztia XT and Tiazac capsules may be opened and sprinkled on applesauce. Do not crush or open other sustained-release capsules. In general administer at the same time each day for extendedrelease dosage forms. Dilacor XR or Diltia XT should be given on an empty stomach. Other extendedrelease capsules are taken without regard to food. IV bolus given over 2 min. Add 125 mg to 100 mL D5W or 0.9% NaCl to provide an IV infusion concentration of 1 mg/mL. The maximum concentration is 5 mg/mL. Infuse per dilution or rate chart provided by manufacturer.

### Dimenhydrinate

dye-men-hye'dri-nate ★ Dramamine, Driminate, Wal-Dram ★ Dinate, Gravol, Nausetrol

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Anticholinergics, antiemetics/antivertigo OTC, Rx

# **MECHANISM OF ACTION**

An antihistamine and anticholinergic that competes for  $H_1$  receptor sites on effector cells of the GI tract, blood vessels, and respiratory tract. The anticholinergic action diminishes vestibular stimulation and depresses labyrinthine function. *Therapeutic Effect:* Prevents symptoms of motion sickness.

### AVAILABILITY

Tablets, Chewable: 50 mg. Tablets: 50 mg. Injection: 50 mg/mL.

### INDICATIONS AND DOSAGES

Motion sickness PO

Adults, Elderly, Children older than 12 yr. 50-100 mg q4-6h. Maximum: 400 mg/day. Children 6-12 yr. 25-50 mg q6-8h.

Maximum: 150 mg/day.

*Children 2-5 yr*: 12.5-25 mg q6-8h. Maximum: 75 mg/day.

#### IM/IV

*Adults.* 50 mg as needed every 4 h. Maximum: 300 mg/day. *Children.* 1.25 mg/kg or 37.5 mg/m<sup>2</sup> 4 times daily. Maximum 300 mg a day. Do not use in neonates.

# CONTRAINDICATIONS

Hypersensitivity to dimenhydrinate. Do not use in neonates because injectable product contains benzyl alcohol.

### INTERACTIONS

#### Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS depression.

**Aminoglycosides**: Masks signs and symptoms of ototoxicity associated with aminoglycosides.

Other anticholinergics: Increases anticholinergic effect.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Dry mouth, drowsiness. Occasional

Hypotension, palpitations, tachycardia, headache, somnolence, dizziness, paradoxical stimulation (especially in children), anorexia, constipation, dysuria, blurred vision, tinnitus, wheezing, chest tightness, thickened bronchial secretions.

### Rare

Photosensitivity, rash, urticaria.

### SERIOUS REACTIONS

· None significant.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with asthma, bladder neck obstruction, cardiovascular disease, history of seizures, angle-closure glaucoma, thyroid dysfunction, and benign prostatic hyperplasia. Alcohol, tasks that require mental alertness or motor skills, and excessive exposure to sunlight should be avoided. Skin should not come in contact with the oral concentrate and syrup because it can cause contact dermatitis. Should not be used in children younger than 2 yr. Elderly patients are more susceptible to side effects.

Drowsiness, dizziness, and dry mouth may occur. BP should be monitored. Be alert for paradoxical reactions, especially in children, and signs and symptoms of motion sickness.

### Storage

Store at room temperature. Protect from moisture and light.

## Administration

Take without regard to meals. Chewable tablets may be chewed or swallowed whole with or without water. For motion sickness, take dimenhydrinate 1-2 h before the activity that may cause motion sickness.

IM: Inject into large muscle mass. IV: Dilute dose in 10 mL of 0.9% NaCl, give by slow IV push over 2 min.

# Dimercaprol

dye-mer-kap'role

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antidotes, chelators

# **MECHANISM OF ACTION**

A chelating agent that contains two sulfhydryl groups that form a stable, nontoxic chelate 5-membered heterocyclic ring with heavy metals. *Therapeutic Effect:* Prevents the metal from combining with sulfhydryl groups on physiologic proteins and keeps them inactive until they can be excreted.

# PHARMACOKINETICS

Time to peak after IM administration occurs in 30-60 min. Widely distributed to all tissues, including the brain and, mainly, intracellular space. Rapidly metabolized by the liver to inactive metabolites. Excreted in the urine and bile. Removed by hemodialysis. *Half-life:* 4 h.

# AVAILABILITY

Injection, Oil: 100 mg/mL (BAL in Oil).

# INDICATIONS AND DOSAGES Poisoning, arsenic (mild)

IM

*Adults, Elderly, Children.* 2.5 mg/kg 4 times/day for 2 days, 2 times on day 3, then once daily for 10 days or recovery.

# Poisoning, arsenic (severe) IM

*Adults, Elderly, Children.* 3 mg/kg q4h for 2 days, 4 times on day 3, then twice daily for 10 days or until recovery.

# Poisoning, gold (mild) IM

*Adults, Elderly, Children.* 2.5 mg/kg 4 times/day for 2 days, 2 times on day 3, then once daily for 10 days or until recovery.

# Poisoning, gold (severe) IM

*Adults, Elderly, Children.* 3 mg/kg q4h for 2 days, 4 times on day 3, then twice daily for 10 days or until recovery.

# Poisoning, lead (mild) IM

*Adults, Elderly, Children.* Initially, 4 mg/kg, then 3 mg/kg q4h for 2-7 days in combination with edetate calcium disodium injection beginning with second dose at different injection sites.

# Poisoning, lead (severe) IM

Adults, Elderly, Children. 4 mg/kg q4h usually for 5 days. In combination with edetate calcium disodium injection beginning with second dose at different injection sites. A second 5-day course may be used in severe poisoning. Wait at least 5-7 days before administering a third course, if needed.

### Poisoning, mercury IM

Adults, Elderly, Children. 5 mg/kg for 1 day, followed by 2.5 mg/kg 1 or 2 times/day for 10 days.

### Dosage in renal impairment Quantitative dosage

The manufacturer states the drug should be discontinued or used with extreme caution if acute renal insufficiency occurs during treatment.

# **OFF-LABEL USES**

Antimony poisoning, bismuth poisoning, silver poisoning, vanadium poisoning.

# CONTRAINDICATIONS

Hepatic insufficiency (unless due to arsenic poisoning); use in iron, cadmium, or selenium poisoning; hypersensitivity to dimercaprol or any component of the formulations, such as peanut oil. Use with caution in patients with peanut allergy.

# INTERACTIONS

### Drug

**Gold compounds**: Compromise anti-inflammatory effect by chelating gold.

### Iron, cadmium, selenium, uranium:

May increase risk of toxicity, especially to the kidneys.

# DIAGNOSTIC TEST EFFECTS

Iodine (<sup>131</sup>I) thyroidal uptake values may be decreased. May result in falsepositive reaction with nitroprusside test. May increase ALT and AST values.

# IV INCOMPATIBILITIES

Edetate calcium disodium.

# SIDE EFFECTS

### Frequent

Dose-related hypertension and/or tachycardia, headache. Injection site reactions occur in 30% of children.

## Occasional

Nausea, vomiting.

### Rare

Burning eyes, lips, mouth, throat, and penis; nervousness; pain at injection site; salivation; fever; dysuria.

# SERIOUS REACTIONS

 Abscess formation at injection site, blepharospasm, convulsions, thrombocytopenia, and transient neutropenia occur rarely.

• Fever may occur and persist in children.

Paresthesias.

· Potential for renal dysfunction.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with hypotension because of doserelated increase in blood pressure and heart rate; renal impairment including oliguria; and glucose 6-phosphate dehydrogenase (G6PD) deficiency. Contains peanut oil. Ensure alkalinization of urine to protect the kidney. Caution is also necessary with people receiving iron supplementation. Avoid use until 24 h after last dose of dimercaprol.

Be aware that dimercaprol is effective for acute poisoning by

mercury salts if therapy is initiated within 1-2 h after ingestion. Dimercaprol is not effective for chronic mercury poisoning. Serum alkaline phosphatase concentration, blood urea nitrogen (BUN) concentration, serum calcium, creatinine, electrolyte concentrations, hemoglobin (especially in mercury toxicity), and phosphorus concentrations should be monitored. **Storage** 

Store ampules at room temperature. Administration

Be careful not to mix with edetate calcium disodium. Administer at different sites.

Administer deep IM injection only. Adjust dose if receiving dialysis.

The injection is painful and causes a sterile abscess in some patients.

# Diphenhydramine

dye-fen-hye'dra-meen Altaryl, Banophen, Benadryl, Ben-Tann, Diphedryl, Diphenhist, Dytan, ElixSure, Genahist, Nytol, Pediacare Nighttime, Q-Dryl, Quenalin, Siladryl, Silphen, Sominex Allerdryl, Hydramine Nytol

Do not confuse diphenhydramine with dimenhydrinate, or Benadryl with benazepril, Bentyl, or Benylin, or Banophen with Baclophen.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC

*Classification:* Antihistamines, H<sub>1</sub>, sedating

# **MECHANISM OF ACTION**

An ethanolamine that competitively blocks the effects of histamine

Diphenhydramine (Generic Name)

at peripheral  $H_1$  receptor sites. *Therapeutic Effect:* Produces anticholinergic, antipruritic, antitussive, antiemetic, antidyskinetic, and sedative effects.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15-30 min	1-4 h	4-6 h
IV, IM	< 15 min	1-4 h	4-6 h

Well absorbed after PO or parenteral administration. Protein binding: 98%-99%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. *Half-life:* 2-10 h.

# AVAILABILITY

Capsules (Banophen, Benadryl, Diphedryl, Diphenhist, Genahist, Q-Dryl): 25 mg, 50 mg (generic). Capsules (Nytol): 50 mg. Elixir (Banophen): 12.5 mg/5 mL. Oral solution (Altaryl, Banophen, Benadryl, Diphenhist, ElixSure, Genahist, Hydramine, Pediacare Nighttime, Q-Dryl, Siladryl): 12.5 mg/5 mL. Oral Suspension (Ben-Tann, Dytan): 25 mg/5 mL. Syrup (Quenalin, Silphen): 12.5 mg/5 mL. Tablets (Banophen, Benadryl, Diphedryl, Diphenhist, Genahist): 25 mg. Tablets (Nytol, Sominex): 25 mg, 50 mg. Chewable Tablets: 12.5 mg (Benadryl Allergy), 25 mg (Dytan). Orally Disintegrating Tablets (Benadryl Fastmelt): 19 mg. Strips, Oral Dissolving Film (Benadryl Quick Dissolve): 12.5 mg, 25 mg. Injection: 50 mg/mL. Cream (Benadryl): 2%. Topical Gel (Benadryl): 2%.

Topical Solution (Benadryl Stick): 2%. Spray: 2%.

# INDICATIONS AND DOSAGES Moderate to severe allergic

# reaction

PO, IV, IM Adults, Elderly. 10-50 mg q4-6h. Maximum: 400 mg/day. Children. 5 mg/kg/day in divided doses q6-8h. Maximum: 300 mg/ day.

# Dystonic reaction

IV, IM

*Adults, Elderly.* 10-50 mg/single dose. May repeat in 20-30 min if needed. *Children.* 0.5-1 mg/kg/dose.

### Motion sickness, minor allergic rhinitis

### РО

Adults, Elderly, Children 12 yr and older. 25-50 mg q4-6h. Maximum: 300 mg/day.

*Children 6-11 yr.* 12.5-25 mg q4-6h. Maximum: 150 mg/day.

Children 2-5 yr. 6.25 mg q4-6h.

Maximum: 37.5 mg/day.

# Antitussive

### PO

Adults, Elderly, Children 12 yr and older. 25 mg q4h. Maximum: 150 mg/day. Children 6-11 yr. 12.5 mg q4h. Maximum: 75 mg/day. Children 2-5 yr. 6.25 mg q4h. Maximum: 37.5 mg/day. NOTE: The FDA recommends against use in children < 6 years of age (2008).

Nighttime sleep aid

PO

Adults, Elderly. 25-50 mg at bedtime. **Pruritus** 

TOPICAL Adults, Elderly, Children 2 yr and older. Apply 2% cream or spray 3-4 times a day.

# CONTRAINDICATIONS

Acute exacerbation of asthma, use within 14 days of MAOIs, newborn

# **Dinoprostone** (PGE<sub>2</sub>)

dye-noe-prost'one ★ Cervidil, Prepidil Gel, Prostin E2 Do not confuse Cervidil or

Prepidil with bepridil, or Prostin with Prostigmin.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Oxytocics, prostaglandins, abortifacents (suppositories)

# **MECHANISM OF ACTION**

A prostaglandin that directly acts on the myometrium, causing softening and dilation effect of the cervix. *Therapeutic Effect:* Stimulates myometrial contractions in gravid uterus, promotes cervical ripening.

# PHARMACOKINETICS

Undergoes rapid enzymatic deactivation, primarily in maternal lungs. Protein binding: 73%. Primarily excreted in urine. *Half-life:* < 5 min. Onset of action (vaginal suppository): Within 10 min. Duration (vaginal insert): 12 h. Duration (vaginal suppository): 2-3 h.

# AVAILABILITY

Vaginal Gel (Prepidil): 0.5 mg. Vaginal Inserts (Cervidil): 10 mg. Vaginal Suppositories (Prostin E2): 20 mg.

# INDICATIONS AND DOSAGES

 Incomplete miscarriage, hydatidiform mole, or intrauterine fetal death, or for second-trimester pregnancy termination INTRAVAGINAL *Adults.* 20 mg (one suppository) high into vagina. May repeat at 3- to 5-h intervals until abortion occurs. Do not administer for > 2 days.

### • Ripening of unfavorable cervix INTRACERVICAL

Adults. Initially, 0.5 mg (2.5 mL) (Prepidil); if no cervical or uterine response, may repeat 0.5-mg dose in 6 h. Maximum: 1.5 mg (7.5 mL) for a 24-h period. Alternatively 10 mg (Cervidil) over 12-h period; remove upon onset of active labor or 12 h after insertion.

# CONTRAINDICATIONS

Suppository: Active cardiac, hepatic, pulmonary, or renal disease; acute pelvic inflammatory disease; hypersensitivity to dinoprostone or other prostaglandins. Gel, insert: Fetal malpresentation/ distress; hypersensitivity to dinoprostone or other prostaglandins; significant cephalopelvic disproportion; more than 6 previous term pregnancies; unexplained vaginal bleeding; obstetrical emergencies.

# INTERACTIONS

### Drug

**Oxytocics:** May cause uterine hypertonus, possibly resulting in uterine rupture or cervical laceration. Wait 6-12 h after dinoprostone gel administration or at least 30 min after removal of vaginal insert before initiating oxytocin.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

### Frequent

Vomiting, temperature elevations, diarrhea, nausea.

### Occasional

Headache, chills or shivering, transient diastolic BP decrease,

hives, bradycardia, increased uterine pain accompanying abortion, peripheral vasoconstriction.

Rare

Flushing, vulvar edema.

### SERIOUS REACTIONS

• Overdose may cause uterine hypertonicity with spasm and tetanic contraction, leading to cervical laceration or perforation, and uterine rupture or hemorrhage.

• Uterine hyperstimulation with or without fetal distress.

• Rare increased risk of postpartum disseminated intravascular coagulation (DIC).

## **PRECAUTIONS & CONSIDERATIONS**

Do not exceed recommended doses. Suppository: Caution is warranted in patients with anemia, cardiovascular disease, cervicitis, compromised or scarred uterus, diabetes mellitus, epilepsy, hepatic disease, history of asthma, hypertension or hypotension, infected endocervical lesions or acute vaginitis, jaundice, renal disease, and uterine fibroids. Notify the physician if chills, fever, foul-smelling or increased vaginal discharge, or uterine cramps or pain occurs.

Gel, vaginal insert: Caution is warranted with ruptured membranes, nonsingle pregnancy, glaucoma, asthma, nonvertex pregnancy, renal and hepatic impairment.

The character of the cervix, including dilation and effacement, fetal status, including heart rate as well as uterine activity, including the onset of uterine contractions, should be monitored in those receiving the vaginal gel. Bishop score should be monitored before and after therapy. Uterine tone and duration, frequency, and strength of contractions should be checked if receiving the suppository form. Vital signs should be monitored every 15 min until stable and then hourly until abortion is complete. Expect to give medications to relieve GI adverse effects, if indicated, or abdominal cramps in those receiving the suppository form.

### Storage

Refrigerate gel; bring to room temperature just before use to avoid forcing warming process. Keep suppository frozen (< 4° F [15.6° C]); bring to room temperature just before use. Remove foil wrapper after suppository reaches room temperature. Vaginal insert should be stored in freezer.

### Administration

I Only for use by qualified personnel in hospital setting. Use gel with caution when handling to prevent skin contact. Wash hands thoroughly with soap and water following administration. Assemble dosing apparatus as described in manufacturer's insert. Place the person in the dorsal position, and use a speculum to visualize the cervix. Introduce gel into cervical canal just below level of internal os. After administration, remain in the supine position for at least 15-30 min to minimize leakage of the drug from the cervical canal.

Administer suppository only in a hospital setting, with emergency equipment available. Avoid skin contact because of risk of absorption. Insert high in the vagina. Remain supine for 10 min after administration. or premature infants, breastfeeding, narrow-angle glaucoma, prostatic hypertrophy, bladder neck obstruction, pyloroduodenal obstruction, stenosing peptic ulcer.

### **INTERACTIONS**

Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS-depressant effects. Anticholinergics: May increase anticholinergic effects. CYP2D6 substrates: Levels of substrates may be increased. MAOIs: May increase the anticholinergic and CNS-depressant effects of diphenhydramine. Herbal and Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May suppress wheal and flare reactions to antigen skin testing unless the drug is discontinued 4 days before testing.

# IV INCOMPATIBILITIES

Allopurinol (Aloprim), aminophylline, amphotericin B cholesteryl (Amphotec), ampicillin, azathioprine, cefazolin, cefepime (Maxipime), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftriaxone (Rocephin), cefuroxime (Zinacef), chloramphenicol, dantrolene, dexamethasone (Decadron), diazepam (Valium), fluorouracil, foscarnet (Foscavir), furosemide (Lasix), ganciclovir (Cytovene), insulin (regular, Humulin R, Novolin R), ketorolac, lansoprazole (Prevacid), methylprednisolone sodium succinate (Solu-Medrol), metronidazole (Flagyl), milrinone (Primacor), nitroprusside sodium

(Nitropress), pantoprazole (Protonix), pentobarbital, phenobarbital, phenytoin, sodium bicarbonate, sulfamethoxazole/ trimethoprim.

# SIDE EFFECTS

### Frequent

Somnolence, dizziness, muscle weakness, hypotension, urine retention, thickening of bronchial secretions, dry mouth, nose, throat, or lips; in elderly, sedation, dizziness, hypotension.

### Occasional

Epigastric distress, flushing, visual or hearing disturbances, paresthesia, diaphoresis, chills. Contact dermatitis may occur with topical application.

# SERIOUS REACTIONS

 Hypersensitivity reactions, eczema, pruritus, rash, cardiac disturbances, and photosensitivity may occur.

 Overdose symptoms may vary from CNS depression, including sedation, apnea, hypotension, cardiovascular collapse, and death, to severe paradoxical reactions, such as hallucinations, tremor, and seizures.

 Children and neonates may experience paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremors.

• Overdosage in children may result in hallucinations, seizures, and death.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with asthma, cardiovascular disease, chronic obstructive pulmonary disease (COPD), hypertension, hyperthyroidism, angle-closure glaucoma, increased intraocular pressure, peptic ulcer disease, benign prostatic hyperplasia, pyloroduodenal or bladder neck obstruction, and seizure disorders. Diphenhydramine crosses the placenta and appears in breast milk. Its use by breastfeeding women may inhibit lactation and produce irritability in breastfeeding infants. Use of the drug during the third trimester of pregnancy increases the risk of seizures in neonates and premature infants. Diphenhydramine is not recommended for neonates or premature infants. The FDA recommends that OTC cough and cold medications not be used in children < 2 yr old. FDA also recommends against use as a sleep aid in children. Elderly patients are at increased risk for developing confusion, dizziness, hyperexcitability, hypotension, and sedation. Avoid drinking alcoholic beverages and performing tasks that require alertness or motor skills until response to the drug is established.

Drowsiness, dizziness, and dry mouth may occur; tolerance usually develops to sedative effects. Respiratory rate, depth, and rhythm; pulse rate and quality; BP; and therapeutic response should be monitored.

### Storage

Store at room temperature. Administration

Take diphenhydramine without regard to food. Crush scored tablets as needed. Do not crush, break, or open capsules or film-coated tablets.

For IM use, inject diphenhydramine deep into a large muscle mass.

For IV use, diphenhydramine may be given undiluted. Administer IV injection no faster than 25 mg/min. Topical products are for external use only. Avoid mucous membranes. Apply gently to affected area; discontinue use if sensitivity noted.

### Diphenoxylate and Atropine

dye-fen-ox'i-late, a'troe-peen ★ Lomotil, Lonox ▲ Lomotil Do not confuse Lomotil with Lamictal, or Lonox with Lanoxin, Loprox, or Lovenox.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

Classification: Antidiarrheals

### **MECHANISM OF ACTION**

A meperidine derivative that acts locally and centrally on gastric mucosa. *Therapeutic Effect:* Reduces intestinal motility.

### PHARMACOKINETICS

Well absorbed from the GI tract. Metabolized in the liver to active metabolite. Primarily eliminated in feces. *Half-life:* 2.5 h; metabolite, 12-24 h. Onset: 45-60 min. Duration 3-4 h.

### AVAILABILITY

Tablets (Lomotil, Lonox): 2.5 mg/0.025 mg. Liquid (Lomotil): 2.5 mg/0.025 mg per 5 mL.

### INDICATIONS AND DOSAGES Diarrhea PO

*Adults, Elderly.* Initially, 5 mg 4 times a day, then reduce dose to 2.5 mg 2-3 times per day. Maximum: 20 mg/day.

Diphenoxylate and Atropine (Generic Name)

### 490 Diphenoxylate and Atropine

*Children 2-12 yr.* 0.3-0.4 mg/kg/day in 4 divided doses, then reduce dose. Maximum: 10 mg/day. Use liquid form only.

### CONTRAINDICATIONS

Hypersensitivity, children younger than 2 yr, obstructive jaundice, narrow-angle glaucoma, diarrhea from pseudomembranous colitis, or enterotoxin-producing bacteria.

### INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS-depressant effects. Anticholinergics: May increase the effects of atropine. MAOIs: May precipitate hypertensive crisis.

#### Herbal

None known. Food

None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum amylase level.

### SIDE EFFECTS

#### Frequent

Somnolence, light-headedness, dizziness, nausea.

### Occasional

Headache, dry mouth. **Rare** 

#### Rare

Flushing, tachycardia, urine retention, constipation, paradoxical reaction (marked by restlessness and agitation), blurred vision.

### SERIOUS REACTIONS

• Hypersensitivity reactions, including pruritus, gum swelling, urticaria, anaphylaxis.

 Paralytic ileus and toxic megacolon (marked by constipation, decreased appetite, and stomach pain with nausea or vomiting) occur rarely.  Severe anticholinergic reaction, manifested by severe lethargy, hypotonic reflexes, and hyperthermia, may result in severe respiratory depression and coma.

### PRECAUTIONS & CONSIDERATIONS

Dehydration may aggravate electrolyte imbalance. Correct fluid balance before administering. Caution is warranted in patients with acute ulcerative colitis, cirrhosis, hepatic or renal disease, and renal impairment. It is unknown whether diphenoxylate crosses the placenta or is distributed in breast milk. Diphenoxylate is not recommended for use in children < 2 yrs because of the increased risk of toxicity, which can lead to respiratory depression. Use extreme caution in young children. Elderly patients are more susceptible to the anticholinergic effects of diphenoxylate, and they may experience confusion and respiratory depression. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established. Alcohol and barbiturates should also be avoided during drug therapy.

Notify the physician if abdominal distention, fever, palpitations, or persistent diarrhea occurs. Pattern of daily bowel activity and stool consistency and hydration status should be monitored.

#### Storage

Store at room temperature; store liquid in original container.

# Administration

Take without regard to meals. If GI irritation occurs, give with food. Administer only the liquid form to children 2-12 yr of age using a graduated dropper for accurate measurement.

# Dipyridamole

dye-peer-id'a-mole ★ Persantine ★ Apo-Dipyridamole, Persantine Do not confuse dipyridamole with disopyramide, or Persantine with Periactin.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Platelet inhibitors

# **MECHANISM OF ACTION**

A blood modifier and platelet aggregation inhibitor that inhibits the activity of adenosine deaminase and phosphodiesterase, enzymes causing accumulation of adenosine and cyclic adenosine monophosphate. *Therapeutic Effect:* Inhibits platelet aggregation; may cause coronary vasodilation.

# PHARMACOKINETICS

Slowly, variably absorbed from the GI tract. Widely distributed. Protein binding: 91%-99%. Metabolized in the liver. Primarily eliminated via biliary excretion. *Half-life*: 10-15 h.

# AVAILABILITY

Tablets: 25 mg, 50 mg, 75 mg. Injection: 5 mg/mL.

# INDICATIONS AND DOSAGES

# Prevention of thromboembolic disorders after cardiac valve replacement

PO Adults, Elderly, Children 12 yr and older. 75-100 mg four times/day in combination with other medications.

# Diagnostic aid, coronary artery disease IV

Adults, Elderly (based on weight). 0.142 mg/kg/min infused over 4 min; although a maximum has not been determined, doses > 60 mg have been determined to be unnecessary for any patient.

# **OFF-LABEL USES**

Prevention of myocardial reinfarction, treatment of transient ischemic attacks.

# CONTRAINDICATIONS

None known.

# INTERACTIONS

### Drug

Anticoagulants, aspirin, heparin, salicylates, thrombolytics: May increase the risk of bleeding with these drugs.

Adenosine: Effects may be increased.

Caffeine, theophylline:

Methylxanthines, through antagonism of adenosine, may cause falsenegative results from dipyridamolethallium 201 stress testing.

# Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# **IV INCOMPATIBILITIES**

No information available via Y-site administration. Do not mix with other medications.

# SIDE EFFECTS

Oral: Frequent (14%) Dizziness. Occasional (2%-6%) Abdominal distress, headache, rash. Rare (< 2%) Diarrhea, vomiting, flushing, pruritus.

Dipyridamole (Generic Name)

Injection: Frequent (12%-20%)

Angina pectoris exacerbation, dizziness, headache. Occasional (2%-10%)

Hypotension, ECG changes, nausea, pain, flushing, hypertension. Rare (< 2%) Fatigue, paresthesia.

## SERIOUS REACTIONS

• Overdose produces peripheral vasodilation, resulting in hypotension.

• Hepatic failure and enzyme elevations have occurred.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hypotension, unstable angina, recent myocardial infarction, or hepatic impairment. Dipyridamole is distributed in breast milk. Safety and efficacy of dipyridamole have not been established in children. No age-related precautions have been noted in elderly patients. Avoid alcohol because it increases the risk of stomach bleeding and dizziness, possibly resulting in a fall.

Dizziness may occur. Do not rise suddenly from a lying or sitting position. Notify the physician of unusual bleeding or chest pain. BP for hypotension and skin for erythema and rash should be monitored.

### Storage

Store injection and tablets at room temperature.

### Administration

Take oral dipyridamole on an empty stomach with full glass of water. Therapeutic response may not be achieved before 2-3 mo of continuous therapy.

For IV use, dilute to at least 1:2 ratio with 0.9% NaCl or D5W for total volume of 20-50 mL because undiluted solution may cause irritation. Infuse over 4 min. Inject thallium within 5 min after dipyridamole infusion has ended, as prescribed.

# Disopyramide

dye-soe-peer'a-mide ★ Norpace, Norpace CR ★ Rythmodan Do not confuse disopyramide with desipramine or dipyridamole, or Rythmodan with Rythmol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiarrhythmics, class IA

# **MECHANISM OF ACTION**

An antiarrhythmic that prolongs the refractory period of the cardiac cell by direct effect, decreasing myocardial excitability and conduction velocity. *Therapeutic Effect*: Depresses myocardial contractility. Has anticholinergic and negative inotropic effects.

# AVAILABILITY

Capsules (Norpace): 100 mg, 150 mg. Capsules (Extended Release [Norpace CR]): 100 mg, 150 mg.

# INDICATIONS AND DOSAGES

 Suppression and prevention of ventricular ectopy, unifocal or multifocal premature ventricular contractions, paired ventricular contractions (couplets), and episodes of ventricular tachycardia PO

! Do not use extended-release capsules for rapid control. *Adults, Elderly weighing 50 kg and more.* 150 mg q6h (300 mg ql2h with extended-release capsules).

Disopyramide (Generic Name)

*Adults, Elderly weighing* < 50 kg. 100 mg q6h (200 mg q12h with extended-release capsules).

# • Rapid control of arrhythmias PO

Adults, Elderly weighing 50 kg and more. Initially, 300 mg (immediate release), then 150 mg q6h or 300 mg (controlled release) q12h. Adults, Elderly weighing < 50 kg. Initially, 200 mg (immediate release), then 100 mg q6h or 200 mg (controlled release) q12h.

#### • Severe refractory arrhythmias NOTE: Patient should be

hospitalized during the initial treatment period.

### PO

*Adults, Elderly.* Up to 400 mg q6h. *Children 12-18 yr.* 6-15 mg/kg/day in divided doses q6h.

*Children 5-12 yr.* 10-15 mg/kg/day in divided doses q6h.

*Children 1-4 yr*. 10-20 mg/kg/day in divided doses q6h.

Children younger than 1 yr.

10-30 mg/kg/day in divided doses q6h.

### Dosage in renal impairment

NOTE: Do not use extended-release form in patients with  $CrCl \le 40 \text{ mL/}$  min.

With or without loading dose of 150 mg:

# Creatinine

Clearance (mL/min)	Dosage
≥ 40	100 mg q6h (extended release, 200 mg q12h)
30-39	100 mg q8h
15-29	100 mg q12h
< 15	100 mg q24h

### Dosage in liver impairment

*Adults, Elderly weighing 50 kg and more.* 100 mg q6h (200 mg q12h with extended-release capsules).

### Dosage in cardiomyopathy, cardiac decompensation

Adults, Elderly weighing 50 kg and more. No loading dose; 100 mg q6-8h with gradual dosage adjustments.

## **OFF-LABEL USES**

Prophylaxis and treatment of supraventricular tachycardia (atrial fibrillation, atrial flutter).

# CONTRAINDICATIONS

Cardiogenic shock, narrowangle glaucoma (unless patient is undergoing cholinergic therapy), preexisting second- or thirddegree atrioventricular (AV) block, congenital QT syndrome.

# INTERACTIONS

### Drug

**CYP3A4 inducers/inhibitors**: May decrease/increase levels and effects of disopyramide.

Other antiarrhythmics, including diltiazem, propranolol, verapamil: May prolong cardiac conduction,

decrease cardiac output.

**Pimozide**: May increase cardiac arrhythmias.

**QT-prolonging agents**: May increase risk for QT prolongation. **Herbal and Food** 

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease blood glucose levels. May cause ECG changes. May increase serum cholesterol and triglyceride levels. Therapeutic serum level is 2-8 mcg/mL, and the toxic serum level is > 8 mcg/mL.

# SIDE EFFECTS

### Frequent (> 9%)

Dry mouth (32%), urinary hesitancy, constipation.

#### Occasional (3%-9%)

Blurred vision; dry eyes, nose, or throat; urinary retention; headache; dizziness; fatigue; nausea.

### Rare (<1%)

Impotence, hypotension, edema, weight gain, shortness of breath, syncope, chest pain, nervousness, diarrhea, vomiting, decreased appetite, rash, itching.

# SERIOUS REACTIONS

May produce or aggravate congestive heart failure (CHF).
May produce severe hypotension, shortness of breath, chest pain, syncope (especially in patients with primary cardiomyopathy or CHF).
May cause arrhythmias, monitor for QT prolongation.

· Hepatotoxicity occurs rarely.

# **PRECAUTIONS & CONSIDERATIONS**

Reserve drug use for those with lifethreatening ventricular arrhythmias. Caution is warranted in patients with atrial fibrillation or flutter, bundle-branch block, CHF, impaired liver or renal function, myasthenia gravis, prostatic hypertrophy (avoid use), glaucoma (avoid use), sick sinus syndrome (sinus bradycardia alternating with tachycardia), and Wolff-Parkinson-White syndrome. Nasal decongestants or OTC cold preparations, especially those containing stimulants, should be avoided without the physician's approval. Alcohol and salt consumption should also be avoided. Dizziness and light-headedness may occur. Notify the physician if cough or shortness of breath occurs. The patient should urinate before taking this drug to reduce the risk of urine retention. BP; ECG for cardiac changes; blood glucose; liver enzyme and serum alkaline phosphatase, bilirubin, and potassium should be assessed.

#### Storage

Store at room temperature. A compounded oral suspension is stable for 4 wks refrigerated in an amber glass bottle.

### Administration

Dosage must be individualized. Do not chew or break extendedrelease capsules. For children, the manufacturer provides for an oral suspension that may be compounded from immediate-release capsules. Shake well before each use.

# **Disulfiram**

die-sul′fi-ram ★ Antabuse

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Substance abuse agents, alcohol deterrent

## **MECHANISM OF ACTION**

A thiuram derivative and an irreversible aldehyde dehydrogenase inhibitor. When taken with alcohol, there is an increase in serum acetaldehyde levels. *Therapeutic Effect:* Produces an acute sensitivity to alcohol.

### PHARMACOKINETICS

Slowly absorbed from the GI tract. Metabolized in liver. Primarily excreted in urine. Up to 20% of dose remains in body for at least 1 wk. *Half-life:* Unknown.

### AVAILABILITY

Tablets: 250 mg, 500 mg

### INDICATIONS AND DOSAGES

 Adjunct in management of selected chronic alcoholic patients who want to remain in state of enforced sobriety PO

Disulfiram (Generic Name), Antabuse (Brand Name)

*Adults, Elderly.* Initially, administer maximum of 500 mg daily given as a single dose for 1-2 wks. Maintenance: 250 mg daily (normal range: 125-500 mg). Do not exceed maximum daily dose of 500 mg.

### CONTRAINDICATIONS

Severe heart disease, psychosis, hypersensitivity to disulfiram or any component of the formulation; patients receiving or using ethanol, metronidazole, paraldehyde, or ethanol-containing products.

## DRUG INTERACTIONS

Alcohol, alcohol-containing syrups, elixirs, solutions: Increased disulfiram reaction Contraindicated. Long-acting benzodiazepines: Increased central nervous system

(CNS) depression.

Metronidazole (do not use), tricyclic antidepressants: Risk of psychosis.

**Phenytoin:** Increased phenytoin levels.

**Isoniazid:** May increase neurotoxicity.

Warfarin: Increased anticoagulant effect. Monitor INR.

**CYP2C9 substrates:** Disulfiram inhibits metabolism of these drugs. **Food** 

Alcohol-containing extracts, vinegars, ciders, foods: Increased disulfiram reaction.

# DIAGNOSTIC TEST EFFECTS

Increased liver enzymes.

### SIDE EFFECTS

Frequent Drowsiness.

Occasional

# Occasional

Headache, restlessness, optic neuritis (impaired color perception, altered vision), peripheral neuropathy, metallic or garlic taste, rash.

### SERIOUS REACTIONS

 Disulfiram-alcohol reactions to ingestion of alcohol in any form include flushing/throbbing in head and neck, throbbing headache, nausea, copious vomiting, diaphoresis, dyspnea, hyperventilation, tachycardia, hypotension, marked uneasiness, vertigo, blurred vision, confusion, and death.

• Hepatitis and hepatic failure occur rarely.

### **PRECAUTIONS & CONSIDERATIONS**

Never administer to patient in state of alcohol intoxication or without patient's full knowledge. Do not administer until patient has abstained from alcohol for at least 12 h. Fully inform patient of the disulfiram-alcohol reaction. Advise patients to avoid all alcohol-containing products, including mouthwashes, OTC products, and skin products. Use with caution in patients with diabetes mellitus, hypothyroidism, seizure disorders, cerebral damage, chronic or acute nephritis, or hepatic disease. Safety and effectiveness have not been established in children. Unique precautions have not been observed in the elderly. Not known if excreted in breast milk; do not breastfeed.

Storage

Store at room temperature.

### Administration

May be taken in the evening if causes sedation. Tablets may be crushed and mixed with water or juice.

### Dobutamine

doe-byoo'ta-meen **Do not confuse dobutamine with Dopamine.** 

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Adrenergic agonists, inotropes

# **MECHANISM OF ACTION**

A direct-acting inotropic agent acting primarily on  $\beta_2$ -adrenergic receptors. *Therapeutic Effect:* Decreases preload and afterload, and enhances myocardial contractility, stroke volume, and cardiac output. Improves renal blood flow and urine output indirectly.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-2 min	10 min	Length of
			infusion

Metabolized in the liver and tissues. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2 min.

# AVAILABILITY

*Injection (Premix with Dextrose):* 1000 mg/250 mL, 250 mg/250 mL, 250 mg/500 mL, 500 mg/250 mL, 500 mg/500 mL. *Injection:* 12.5-mg/mL vial.

# INDICATIONS AND DOSAGES Short-term management of cardiac

decompensation IV INFUSION

Adults, Elderly, Children. 2.5-15 mcg/kg/min. Rarely, drug can be infused at a rate of up to 40 mcg/kg/ min to increase cardiac output.

# CONTRAINDICATIONS

Idiopathic hypertrophic subaortic stenosis, sulfite sensitivity.

### INTERACTIONS

#### Drug

**β-Blockers:** May antagonize the effects of dobutamine. **Digoxin:** May increase the risk of arrhythmias and enhance the

inotropic effect of both drugs. MAOIs, oxytocics, tricyclic

antidepressants: May increase the adverse effects of dobutamine, such as arrhythmias and hypertension. MAOIs are contraindicated. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

Decreases serum potassium level.

# IV INCOMPATIBILITIES

Acyclovir (Zovirax), alteplase (Activase), aminophylline, amphotericin B cholesteryl (Amphotec), amphotericin B liposomal (AmBisome), ampicillin, ampicillin/sulbactam (Unasyn), azathioprine, cefazolin, cefotetan (Cefotan), cefoxitin (Mefoxin), ceftriaxone (Rocephin), cefuroxime (Zinacef), chloramphenicol, dantrolene, dexamethasone sodium phosphate, ertapenem (Invanz), fluorouracil, folic acid, foscarnet (Foscavir), ganciclovir, hydrocortisone sodium succinate (Solu-Cortef), indomethacin, ketorolac, lansoprazole (Prevacid), methicillin, methotrexate, micafungin (Mycamine), oxacillin, pantoprazole (Protonix), pemetrexed (Alimta), penicillin G potassium, penicillin G sodium, pentobarbital, phenobarbital, phenytoin, piperacillin, piperacillin/ tazobactam (Zosyn), sodium bicarbonate, sulfamethoxazole/ trimethoprim, ticarcillin (Ticar), ticarcillin/clavulanate (Timentin), warfarin.

# **IV COMPATIBILITIES**

Alfentanil (Alfenta), alprostadil (Prostin VR), amifostine (Ethyol), amikacin (Amikar), amiodarone (Cordarone), anidulafungin (Eraxis), argatroban, ascorbic acid, atracurium (Tracrium), atropine, aztreonam (Azactam), benztropine (Cogentin), bretylium, buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, carboplatin, caspofungin (Cancidas), chlorpromazine, cimetidine (Tagamet), ciprofloxacin (Cipro), cisatracurium (Nimbex), cisplatin, cladribine (Leustatin), clonidine, cyanocobalamin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), daptomycin (Cubicin), dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), docetaxel (Taxotere), doxorubicin (Adriamycin), doxorubicin liposomal (Doxil), enalaprilat, ephedrine, epinephrine, epirubicin (Ellence), erythromycin lactobionate, etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), fluconazole (Diflucan), fludarabine (Fludara), gemcitabine (Gemzar), gentamicin, granisetron (Kytril), hydromorphone (Dilaudid), hydroxyzine, isoproterenol (Isuprel), labetalol, levofloxacin (Levaguin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), mannitol, meperidine (Demerol), methylprednisolone sodium succinate, metoclopramide (Reglan), metoprolol (Lopressor), milrinone (Primacor), minocycline (Minocin), mitoxantrone (Novantrone), morphine, nafcillin, nalbuphine (Nubain), naloxone (Narcan), nicardipine (Cardene), nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pancuronium, potassium chloride, procainamide, prochlorperazine, promethazine, propofol (Diprivan), propranolol, ranitidine (Zantac), remifentanil

(Ultiva), rituximab (Rituxan), sodium acetate, streptokinase, succinylcholine, sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiotepa (Thioplex), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, trastuzumab (Herceptin), vancomycin, vasopressin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend), zidovudine (Retrovir).

### SIDE EFFECTS

Frequent (> 5%) Increased heart rate, increased BP. Occasional (3%-5%)

Pain at injection site, phlebitis. **Rare** (1%-3%)Nausea, headache, anginal pain, shortness of breath. fever.

# SERIOUS REACTIONS

 Overdose may produce a marked increase in heart rate (by 30 beats/ min or higher), marked increase in BP (by 50 mm Hg or higher), anginal pain, and premature ventricular contractions (PVCs).

 May cause hypotension in some patients. Tachycardia, marked increases in BP, or ventricular ectopy may occur.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with atrial fibrillation, aortic stenosis, hypovolemia, post-myocardial infarction, and hypertension. Hypovolemia should be corrected with volume expanders. It is unknown whether dobutamine crosses the placenta or is distributed in breast milk; therefore, it is not administered to pregnant women. No age-related precautions have been noted in children or in elderly patients. Start at
lower end of dosage range for elderly patients.

Notify the physician of chest pain or palpitations during infusion or pain or burning at the IV site. Cardiac monitoring should be performed continuously to check for arrhythmias. BP, heart rate, urine output, and respiration should be checked before and during treatment. Serum potassium and dobutamine plasma levels should be monitored; keep in mind that dobutamine's therapeutic range is 40-190 ng/mL.

#### Storage

Store at room temperature because freezing produces crystallization. Pink discoloration of the solution, caused by oxidation, does not indicate loss of potency if the solution is used within the recommended period. Further diluted solution for infusion must be used within 24 h.

Pre-mix infusion stored at room temperature in overwrap until time of use; do not freeze.

#### Administration

! Dobutamine dosage is determined by the patient's response to the drug. Plan to correct hypovolemia with volume expanders before dobutamine infusion. Expect to administer digoxin to patients with atrial fibrillation before infusion. Administer by IV infusion only.

For IV use, further dilute the injection concentrate with either D5W or 0.9% NaCl. Usual final concentrations are 2000 mcg/mL or 4000 mcg/mL. Maximum should not exceed 5000 mcg/mL. Infuse into a large vein. Also available in premixed solutions for infusion.

During CPR, may be infused via the intraosseous route if IV is not available. Use infusion pump to control flow rate. Titrate dosage to individual response, as prescribed.

## Docosanol

do-cos'ah-nole

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC

Classification: Topical antiviral

#### MECHANISM OF ACTION

A highly lipophilic, fatty alcohol that prevents fusion of lipid-enveloped viruses with cell membranes, thereby blocking viral replication.

## PHARMACOKINETICS

Topical: Negligible absorption.

#### AVAILABILITY

Cream: 10%.

#### INDICATIONS AND DOSAGES • Recurrent herpes labialis

TOPICAL

Adult, Children older than 12 yr. Apply a small amount to the affected area on the face or lips or at the first sign of lesion 5 times a day until healed.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

Drug None reported.

#### SIDE EFFECTS

**CNS**: Headache. **Integument**: Site reaction, rash, pruritus, dry skin, acne.

#### PRECAUTIONS & CONSIDERATIONS

Avoid application into eyes or mouth; for external use only. Not for use in children less than 12 yr of age.

#### Storage

Store at room temperature. Do not freeze.

### Administration

Wash hands before and after use.

## Docusate

dok'yoo-sate ★ Colace, Correctol, Diocto, Doc-Q-Lace, DOK, Kao-Tin, Phillips' Stool Softener, Silace, Sur-O-Lax

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

Classification: Laxatives, stool softeners

## **MECHANISM OF ACTION**

A laxative that decreases surface film tension by mixing liquid and bowel contents. *Therapeutic Effect:* Increases infiltration of liquid to form a softer stool.

## PHARMACOKINETICS

Minimal absorption from the GI tract. Acts in small and large intestines. Results usually occur 1-2 days after first dose but may take 3-5 days.

## AVAILABILITY

Capsules (Docusate Sodium; Colace, DOK): 50 mg, 100 mg, 250 mg. Capsules, Liquid Filled (Correctol, Doc-Q-Lace, Phillips'): 100 mg. Capsules (Docusate Calcium; Sur-Q-Lax): 240 mg. Capsules, Liquid Filled (Docusate Calcium; Kao-Tin: 240 mg. Syrup (Colace, Diocto): 50 mg/ 5 mL, 60 mg/15 mL, 20 mg/5 mL (Silace). 

#### PO

Adults, Elderly, Children 12 yr and older: 50-300 mg/day in 1-4 divided doses. Children 6-11 yr. 40-150 mg/day in 1-4 divided doses. Children 3-5 yr. 20-60 mg/day in 1-4 divided doses. Children younger than 3 yr. 10-40 mg/day in 1-4 divided doses.

## CONTRAINDICATIONS

Acute abdominal pain, concomitant use of mineral oil, intestinal obstruction, nausea, vomiting, hypersensitivity.

## INTERACTIONS

#### Drug

Mineral oil: May increase the absorption of mineral oil. Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Occasional

Mild GI cramping, throat irritation (with liquid preparation), diarrhea.

Rash.

## SERIOUS REACTIONS

None known.

#### **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether docusate is distributed in breast milk, considered compatible with breastfeeding. No age-related precautions have been noted in elderly patients.

Notify the physician if unrelieved constipation, dizziness, muscle cramps or pain, rectal bleeding, or weakness occurs. Maintain adequate fluid intake. Monitor pattern of daily bowel activity and stool consistency.

Docusate (Generic Name)

#### Storage

Store at room temperature. Protect capsules from moisture.

## Administration

Drink 6-8 glasses of water a day to aid in stool softening. Take each dose with full glass of water or fruit juice. Administer docusate liquid with infant formula, fruit juice, or milk to mask the bitter taste. To promote defecation, increase fluid intake, exercise, and eat a high-fiber diet.

## **Dofetilide**

doe-fet'ill-ide ★ Tikosyn

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, class III

#### **MECHANISM OF ACTION**

A selective potassium channel blocker that prolongs repolarization without affecting conduction velocity by blocking one or more time-dependent potassium currents. Dofetilide has no effect on sodium channels or adrenergic  $\alpha$  or  $\beta$  receptors. *Therapeutic Effect:* Terminates reentrant tachyarrhythmias, preventing reinduction.

## AVAILABILITY

*Capsules:* 125 mcg, 250 mcg, 500 mcg.

## INDICATIONS AND DOSAGES

#### Maintain normal sinus rhythm after conversion from atrial fibrillation or flutter

NOTE: Patient must be hospitalized during the initial treatment period. PO *Adults, Elderly.* Individualized using a seven-step dosing algorithm dependent on calculated creatinine clearance and QT-interval measurements. See prescribing information. Usual range: 125-500 mcg twice daily. Maximum: 500 mcg twice daily.

#### Starting dosage in renal impairment

CrCl > 60 mL/min: 500 mcg twice a day.

CrCl 40-60 mL/min: 250 mcg twice a day.

CrCl 20-39 mL/min: 125 mcg twice a day.

CrCl < 20 mL/min: Do not use.

## CONTRAINDICATIONS

Hypersensitivity to dofetilide; concurrent use of drugs that prolong the QT interval; concurrent use of amiodarone, cimetidine, hydrochlorothiazide, megestrol, metformin, prochlorperazine, trimethoprim, or verapamil; congenital or acquired prolonged QT syndrome; paroxysmal atrial fibrillation; severe renal impairment.

## INTERACTIONS

#### Drug

Amiloride, megestrol, metformin, prochlorperazine, triamterene: May increase plasma levels of dofetilide. Contraindicated. Bepridil, phenothiazines, tricyclic antidepressants, other OT-interval prolonging agents: May prolong the OT interval. Cimetidine, verapamil: Increases levels of dofetilide. Contraindicated. Diuretics, drugs that deplete potassium or magnesium: May increase dofetilide toxicity. Hydrochlorothiazide contraindicated. Ketoconazole, itraconazole, trimethoprim: Increase plasma

Dofetilide (Generic Name), Tikosyn (Brand Name)

concentration of dofetilide. Contraindicated.

#### Food

**Grapefruit juice:** Can increase dofetilide plasma levels.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional (<15%)

Headache, chest pain, dizziness, dyspnea, nausea, insomnia, back and abdominal pain, diarrhea, rash.

#### SERIOUS REACTIONS

 Angioedema, bradycardia, cerebral ischemia, facial paralysis, and serious ventricular arrhythmias or various forms of heart block may be noted.

## PRECAUTIONS & CONSIDERATIONS

Continuous cardiac and BP monitoring should be instituted. ECG for ventricular arrhythmias and for prolongation of the QT interval and serum creatinine level for changes should be monitored. Patients must have continuous ECG monitoring for 3 days, and drug should be initiated in hospital setting. Should reserve dofetilide for symptomatic atrial fibrillation/flutter. Avoid in patients with 2nd- or 3rd-degree heart block or sinus sick syndrome. Correct electrolyte imbalances before and during dofetilide therapy. Caution is warranted in hepatic and renal impairment. Safety and efficacy have not been evaluated in children. Notify the physician if dizziness, severe diarrhea, or other adverse effects occur. Storage

Store at room temperature, tightly closed. Protect from moisture/ humidity.

#### Administration

Lexpect patient to be hospitalized for a minimum of 3 days when

treatment is instituted. Administer dofetilide at the same times each day without regard to food. Follow dosing instructions diligently. Continuous cardiac monitoring is essential at the initiation of treatment.

If dofetilide needs to be discontinued to allow for dosing of potentially interacting drugs, a 2-day washout period should be followed before starting the other drug.

## Dolasetron

doe-lass'eh-tron Anzemet Do not confuse Anzemet with Aldomet.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiemetics, serotonin receptor antagonists

## **MECHANISM OF ACTION**

A 5-HT3 receptor antagonist that acts centrally in the chemoreceptor trigger zone and peripherally at the vagal nerve terminals. *Therapeutic Effect:* Prevents nausea and vomiting.

## PHARMACOKINETICS

Readily absorbed from the GI tract after PO administration. Protein binding: 69%-77%. Metabolized in the liver. Primarily excreted in urine. Unknown if removed by hemodialysis. *Half-life:* 5-10 h.

#### AVAILABILITY

Tablets: 50 mg, 100 mg. Injection: 20 mg/mL in single-use 0.625-mL amps, 0.625-mL fill-in 2-mL Carpuject and 5-mL vials.

Dolasetron (Generic Name), Anzemet (Brand Name)

PO

*Adults.* 100 mg within 2 h of surgery. *Children 2-16 yr.* 1.2 mg/kg within 2 h of surgery. Maximum: 100 mg. IV

*Adults.* 12.5 mg 15 min before cessation of anesthesia or as soon as nausea occurs.

*Children 2-16 yr.* 0.35 mg/kg 15 min before cessation of anesthesia or as soon as nausea occurs. Maximum: 12.5 mg.

## CONTRAINDICATIONS

Hypersensitivity. Contraindicated for the prevention of chemotherapyinduced nausea and vomiting due to high risk of dose dependent QT prolongation in the patients.

## INTERACTIONS

#### Drug

Agents that cause QTc

**prolongation**: Caution should be used with these agents.

## DIAGNOSTIC TEST EFFECTS

May transiently increase AST (SGOT) and ALT (SGPT) levels.

## IV INCOMPATIBILITIES

Amphotericin B liposomal (AmBisome), pantoprazole (Protonix).

## **IV COMPATIBILITIES**

Azithromycin (Zithromax), bivalirudin (Angiomax), caspofungin (Cancidas), cefazolin, cefepime (Maxipime), cefotaxime (Claforan), cyclophosphamide (Cytoxan), daptomycin (Cubicin), dexmedetomidine (Precedex), doxorubicin (Adriamycin), epirubicin (Ellence), ertapenem (Invanz), fenoldopam (Corlopam), levofloxacin (Levaquin), linezolid (Zyvox), mannitol, meperidine (Demerol), oxaliplatin (Eloxatin), oxytocin (Pitocin), pemetrexed (Alimta), quinupristin/ dalfopristin (Synercid), sodium acetate, tacrolimus (Prograf), tigecycline (Tygacil), tirofibran (Aggrastat), vecuronium (Norcuron), vincristine (Vincasar), voriconazole (Vfend).

## SIDE EFFECTS

**Frequent (4%-24%)** Headache, diarrhea, fatigue, hypotension.

#### Occasional (1%-5%)

Fever, dizziness, pruritus, bradycardia, tachycardia, hypertension, dyspepsia.

## SERIOUS REACTIONS

• Overdose may produce a combination of central nervous system (CNS) stimulant and depressant effects.

 Changes in ECG intervals, including QT, have occurred within hours after IV administration and rarely lead to heart block or arrhythmia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with congenital prolonged QT interval syndrome, hypokalemia, hypomagnesemia, and prolonged cardiac conduction intervals. Correct electrolyte abnormalities prior to administration. Caution should also be used with concurrent use of diuretics, because this can cause electrolyte disturbances, antiarrhythmics that may lead to prolonged QT interval, and high doses of anthracyclines. It is unknown whether dolasetron is distributed in breast milk. The safety and efficacy of this drug have not been established in children younger than 2 yr. No age-related precautions have been noted in elderly patients.

#### Storage

Store at room temperature and protect from light. After dilution, store IV for up to 24 h at room temperature or up to 48 h if refrigerated.

#### Administration

Do not cut, break, or chew filmcoated tablets. For children aged 2-16 yr, the injection form may be mixed in apple or apple-grape juice and given orally, if needed; see children's oral dosage. May be at room temperature for 2 h.

For IV use, may administer undiluted or may dilute the injection in 0.9% NaCl, D5W, dextrose 5% in 0.45% NaCl, lactated Ringer's (LR) solution, D5LR, or 10% mannitol injection to 50 mL. Administer by IV push as rapidly as 100 mg/30 seconds or by intermittent or piggyback IV infusion over 15 min.

#### Donepezil

dah-nep'eh-zil Aricept Do not confuse Aricept with Aciphex or Ascriptin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Cholinesterase inhibitors

#### **MECHANISM OF ACTION**

A cholinesterase inhibitor that inhibits the enzyme acetylcholinesterase, thus increasing the concentration of acetylcholine at cholinergic synapses and enhancing cholinergic function in the central nervous system (CNS). *Therapeutic Effect:* Slows the progression of Alzheimer's disease.

## PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 96%. Extensively metabolized. Eliminated in urine and feces. *Half-life:* 70 h.

#### AVAILABILITY

Tablets: 5 mg, 10 mg, 23 mg. Orally Disintegrating Tablets: 5 mg, 10 mg.

## INDICATIONS AND DOSAGES Alzheimer's disease (AD) PO

Adults, Elderly. 5-10 mg/day as a single dose. If initial dose is 5 mg, do not increase to 10 mg for 4-6 wks. For patients with moderate to severe AD, after patient has received 10 mg/day for at least 3 mo, a dose of 23 mg/day may be initiated, if clinically warranted.

#### CONTRAINDICATIONS

History of hypersensitivity to donepezil or piperidine derivatives, acute jaundice, active GI bleeding.

## INTERACTIONS

Drug

Anticholinergics: May decrease the effect of donepezil.

Cholinergic agonists,

neuromuscular blockers,

**succinylcholine:** May increase cholinergic effects.

Ketoconazole, quinidine, CYP3A4

inhibitors: May inhibit the

metabolism of donepezil.

**NSAIDs:** Increase GI irritation. Monitor for GI bleeding.

**Paroxetine, CYP2D6 inhibitors:** May decrease the metabolism and increase the blood concentration of donepezil.

Donepezil (Generic Name), Aricept (Brand Name)

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose, alkaline phosphatase, and serum creatinine kinase and LDH concentrations. May decrease the serum potassium level.

#### SIDE EFFECTS

#### Frequent (8%-19%)

Nausea, diarrhea, headache, insomnia, nonspecific pain, dizziness, infection, anorexia.

## Occasional (3%-6%)

Mild muscle cramps, fatigue, vomiting, ecchymosis.

## Rare (2%-3%)

Depression, abnormal dreams, weight loss, hypertension, arthritis, somnolence, syncope, frequent urination.

## SERIOUS REACTIONS

 Vagotonic effects may include bradycardia, heart block, and syncopal episodes.

 Overdose may result in cholinergic crisis, characterized by severe nausea, increased salivation, diaphoresis, bradycardia, hypotension, flushed skin, abdominal pain, respiratory depression, seizures, and cardiorespiratory collapse. Increasing muscle weakness may result in death if respiratory muscles are involved. The antidote is 1-2 mg IV atropine sulfate with subsequent doses based on therapeutic response.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with asthma; bladder outflow obstruction; prostatic hypertrophy; chronic obstructive pulmonary disease (COPD); peptic ulcer disease; history of seizures, sick sinus syndrome, or other supraventricular conduction disturbances (bradycardia); and concurrent use of NSAIDs. It is unknown whether donepezil is distributed in breast milk. Donepezil is not prescribed for children. No age-related precautions have been noted in elderly patients. Be aware that donepezil is not a cure for Alzheimer's disease but may slow the progression of its symptoms. Safety and efficacy have not been evaluated in children.

Notify the physician if abdominal pain, diarrhea, excessive sweating or salivation, dizziness, or nausea and vomiting occur. Baseline vital signs should be assessed. Cholinergic reactions, such as diaphoresis, dizziness, excessive salivation, facial warmth, abdominal cramps or discomfort, lacrimation, pallor, and urinary urgency, should be monitored. **Storage** 

Store at room temperature. Keep ODT in package until time of use; gently remove from packaging with dry hands.

#### Administration

Take donepezil without regard to food. The drug may be given in the morning or evening; however, best results (limited side effects) may be achieved if it is given at bedtime. Allow orally disintegrating tablet to dissolve on tongue. It can be given with or without liquid.

#### Dopamine

doe'pa-meen **Do not confuse dopamine with dobutamine or Dopram.** 

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Adrenergic agonists, inotropes

## **MECHANISM OF ACTION**

A sympathomimetic (adrenergic agonist) that stimulates adrenergic receptors. Effects are dose dependent. Low dosages (0.5-2 mcg/ kg/min) stimulate dopaminergic receptors, causing renal vasodilation. Low to moderate dosages (2-10 mcg/ kg/min) have a positive inotropic effect by direct action and release of norepinephrine. High dosages (> 10 mcg/kg/min) stimulate a-receptors. Therapeutic Effect: With low dosages, increases renal blood flow, urine flow, and sodium excretion. With low to moderate dosages, increases myocardial contractility, stroke volume, and cardiac output. With high dosages, increases peripheral resistance, renal vasoconstriction, and systolic and diastolic BP.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-2 min	N/A	< 10 min

Widely distributed. Does not cross blood-brain barrier. Metabolized in the liver, kidney, and plasma. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2 min.

## AVAILABILITY

Injection: 40 mg/mL, 80 mg/mL, 160 mg/mL.

Injection (Premix with Dextrose): 200 mg/250 mL, 400 mg/250 mL, 400 mg/500 mL, 800 mg/250 mL, 800 mg/500 mL.

#### INDICATIONS AND DOSAGES

 Treatment and prevention of acute hypotension; shock (associated with cardiac decompensation, myocardial infarction, open heart surgery, renal failure, or trauma);

# treatment of low cardiac output; treatment of congestive heart failure $\rm IV$

Adults, Elderly. 1-5 mcg/kg/min up to 50 mcg/kg/min; titrate to desired response. Increase rate by 1-4 mcg/ kg/min at 10- to 30-min intervals. *Children.* 1-20 mcg/kg/min. Rates > 20 mcg/kg/min in children and infants may result in excessive vasoconstriction. *Neonates.* 1-20 mcg/kg/min.

#### CONTRAINDICATIONS

Pheochromocytoma, sulfite sensitivity, uncorrected tachyarrhythmias, ventricular fibrillation.

## INTERACTIONS

Drug

β-Blockers: May decrease the effects of dopamine.
 Digoxin: May increase the risk of arrhythmias.
 Ergot alkaloids: May increase vasoconstriction.
 MAOIs: May increase cardiac stimulation and vasopressor effects.
 Tricyclic antidepressants, oxytocics: May increase cardiovascular effects.
 Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B cholesteryl (Amphotec), amphotericin B liposomal (AmBisome), ampicillin, azathioprine, cefazolin, cefepime (Maxipime), chloramphenicol, dantrolene, diazepam (Valium), ganciclovir (Cytovene), furosemide (Lasix), indomethacin, lansoprazole (Prevacid), methotrexate, phenytoin, sodium bicarbonate, sulfamethoxazole/trimethoprim.

#### 🗏 IV COMPATIBILITIES

Alfentanil (Alfenta), alprostadil (Prostin VR), amifostine (Ethyol), amikacin (Amikar), aminophylline, amiodarone (Cordarone), anidulafungin (Eraxis), argatroban, ascorbic acid, atracurium (Tracrium), atropine, aztreonam (Azactam), benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chlorpromazine, cimetidine (Tagamet), ciprofloxacin (Cipro), cisatracurium (Nimbex), cisplatin, clindamycin (Cleocin), clonidine, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), daptomycin (Cubicin), dexamethasone sodium phosphate, dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), docetaxel (Taxotere), doripenem (Doribax), doxorubicin (Adriamycin), doxorubicin liposomal (Doxil), droperidol, enalaprilat, ephedrine, epinephrine, epirubicin (Ellence), epoetin alfa (Procrit), ertapenem (Invanz), erythromycin lactobionate, esmolol (Brevibloc), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil, folic acid,

foscarnet (Foscavir), gemcitabine (Gemzar), gentamicin, granisetron (Kytril), heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine, imipenem/cilastatin (Primaxin), isoproterenol (Isuprel), ketorolac, labetalol, levofloxacin (Levaguin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, mannitol, meperidine (Demerol), methicillin, methylprednisolone (Solu-Medrol), metoclopramide (Reglan), metoprolol (Lopressor), micafungin (Mycamine), midazolam (Versed), milrinone (Primacor), minocycline (Minocin), mitoxantrone (Novantrone), morphine, nafcillin, nalbuphine (Nubain), naloxone (Narcan), nicardipine (Cardene), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pancuronium, pemetrexed (Alimta), penicillin G sodium, pentobarbital, phenobarbital, piperacillin, piperacillin/tazobactam (Zosyn), potassium chloride, procainamide, prochloperazine, promethazine, propofol (Diprivan), propranolol, ranitidine (Zantac), remifentanil (Ultiva), rituximab (Rituxan), sargramostim (Leukine), sodium acetate, streptokinase, succinvlcholine, sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin/clavulanate (Timentin), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, trastuzumab (Herceptin), vancomycin, vasopressin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), vitamin B

complex with C, voriconazole (Vfend), warfarin, zidovudine (Retrovir).

#### SIDE EFFECTS

#### Frequent

Headache, ectopic beats, tachycardia, anginal pain, palpitations, vasoconstriction, hypotension, nausea, vomiting, dyspnea.

#### Occasional

Piloerection or goose bumps, bradycardia, widening of QRS complex.

#### SERIOUS REACTIONS

 High doses may produce ventricular arrhythmias, tachycardia.
 Patients with occlusive vascular disease are at high risk for further compromise of circulation to the extremities, which may result in gangrene.

• Tissue necrosis with sloughing may occur with extravasation of IV solution.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with ischemic heart disease, cardiac arrhythmias, post-myocardial infarction, and occlusive vascular disease. Be aware that dopamine dosage may have to be reduced if MAOIs were taken within the last 2-3 wks. It is unknown whether dopamine crosses the placenta or is distributed in breast milk. Closely monitor children, because gangrene attributable to extravasation has been reported. No age-related precautions have been noted in elderly patients.

Cardiac monitoring should be performed continuously to check for arrhythmias. BP, heart rate, urine output, and respiration should be checked before and during treatment. Notify the physician of chest pain, palpitations, arrhythmias, decreased peripheral circulation (marked by cold, pale, or mottled extremities), decreased urine output, or significant changes in BP or heart rate, or burning at the IV site.

#### Storage

Unopened vials are stored at room temperature.

Dopamine is stable for 24 h after dilution. Do not use solutions darker than slightly yellow or solutions that have discolored to brown or pink to purple, because these discolorations indicate decomposition of drug.

Store premix bags at room temperature in original overwrap. Do not freeze.

#### Administration

Lexpect to correct blood volume depletion before administering dopamine. Blood volume replacement may occur simultaneously with dopamine infusion.

For IV use, dilute 200-400 mg vial in 250-500 mL 0.9% NaCl, D5W/0.45% NaCl, D5W/lactated Ringer's, or lactated Ringer's. Keep in mind that the concentration is dependent on the dosage and the patient's fluid requirements. Remember that a 200 mg/250 mL solution yields 800 mcg/mL and that a 200 mg/500 mL solution yields 400 mcg/mL. The maximum infusion concentration is 3200 mcg/mL. The drug is available prediluted in 250 or 500 mL of D5W. Administer into large vein, such as the antecubital or subclavian vein, to prevent drug extravasation. Use an infusion pump to control rate of flow. Titrate dosage to the desired hemodynamic values or optimum urine flow, as prescribed. If extravasation occurs, immediately infiltrate the affected tissue with 10-15 mL 0.9% NaCl solution

containing 5-10 mg phentolamine mesylate, as ordered.

During CPR, if IV is not available, may be administered by intraosseous infusion.

## Doripenem

dor-i-pen'em Doribax Do not confuse Doribax with Zovirax.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antibiotics, carbapenems

## **MECHANISM OF ACTION**

A carbapenem that penetrates the bacterial cell wall of microorganisms and binds to penicillin-binding proteins, inhibiting cell wall synthesis. Good activity against methicillin-sensitive gram-positive and gram-negative nonbetalactamase-forming bacteria, with good activity against *Pseudomonas* species. *Therapeutic Effect:* Produces bacterial cell death.

#### PHARMACOKINETICS

Widely distributed into most body fluids and tissues, including bile, gallbladder, peritoneal and retroperitoneal fluid, and urine. Plasma protein binding: 8.1%. Minimally metabolized to an inactive metabolite (doripenem-M1) via dehydropeptidase-I. Primarily excreted unchanged by kidneys into the urine. Removed (52%) by hemodialysis. *Half-life:* 1 h (increased with renal impairment).

#### AVAILABILITY

*Injection Powder for Reconstitution:* 250 mg, 500 mg.

## INDICATIONS AND DOSAGE

 Complicated intra-abdominal infection or complicated UTI (e.g., pyelonephritis)

IV INFUSION Adults, Elderly. 500 mg every 8 h. Dosage in renal impairment (adults)

CrCl > 50 mL/min	No change	
CrCl 30-50 mL/min	250 mg q8h IV	
CrCl 11-29 mL/min	250 mg q12h IV	
CrCl < 10 mL/min or ESRD with dialysis	Insufficient data for recommendations	

## CONTRAINDICATIONS

History of hypersensitivity to doripenem or other carbapenems (imipenem, meropenem, ertapenem) or anaphylaxis to  $\beta$ -lactams.

#### INTERACTIONS

#### Drug

Probenecid: Reduces renal excretion by interfering with active tubular secretion of doripenem, increases concentration. Avoid co-use. Valproic acid: Reduces serum levels

of valproic acid. Monitor levels and adjust dose.

Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels. May decrease platelet count, WBC count, and serum potassium level.

## **IV INCOMPATIBILITIES**

The manufacturer recommends that doripenem not be mixed with or added to solutions containing other drugs. Known Y-site incompatibilities include amphotericin B (conventional and liposomal forms), diazepam (Valium), phenytoin, potassium phosphates, propofol (Diprivan).

#### SIDE EFFECTS

#### Frequent (≥ 5%)

Headache, nausea, diarrhea, rash, infused vein complications (phlebitis); anemia.

#### Occasional (2%-5%)

Pruritus, hepatic enzyme elevation. Rare (< 2%)

Dizziness, insomnia, oral or vulva or vaginal candidiasis, colitis.

#### SERIOUS REACTIONS

 Antibiotic-associated colitis (e.g., *Clostridium dificile* associated diarrhea [CDAD]) and other superinfections may occur.

• Anaphylactic reactions have been reported.

• Serious skin rashes, such as Stevens-Johnson syndrome.

 Seizures may occur in those with central nervous system (CNS) disorders (including patients with brain lesions or a history of seizures), bacterial meningitis, or severe renal impairment, but seizures are more rare with doripenem versus other drugs in the carbapenem class.

 Inhalation of the drug has caused pneumonitis; interstitial pneumonitis reported with infusional use very rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Doripenem is not effective treatment for ventilator or hospital-associated pneumonia and should not be used for these infections.

Caution is warranted with CNS disorders (particularly with brain lesions or history of seizures), renal impairment or end-stage renal disease, or a hypersensitivity to cephalosporins, penicillins, or other  $\beta$ -lactams. It is not known if doripenem is distributed in breast milk. There are no adequate studies in pregnancy. Be aware that the safety and efficacy have not been established in children. In elderly patients, age-related renal dysfunction may prompt dosage adjustment.

History of allergies, particularly to  $\beta$ -lactams, cephalosporins, and penicillins, should be obtained before beginning drug therapy. Hydration status, nausea, vomiting, skin (for rash), sleep pattern, and mental status should be evaluated. Report any diarrhea, rash, seizures, tremors, or other new symptoms.

#### Storage

Store vials at room temperature. Constituted vials may be held for up to 1 h prior to further dilution in the infusion bag. Diluted infusion solutions are stable for up to 12 h in 0.9% NaCl or 4 h in D5W at room temperature OR under refrigeration for up to 72 h in 0.9% NaCl or 24 h in D5W. Do not freeze. Administration

For IV infusion only. For IV use, first dilute 500-mg vial with 10 mL of sterile water for injection or 0.9% NaCl. Gently shake to form an even suspension. Must be diluted further before infusion. Further dilute with 100 mL 0.9% NaCl or D5W for a 500-mg dose. Shake the bag gently until clear. Final concentration is 4.5 mg/mL. For a 250-mg dose, dilute 250-mg vial with 10 mL of sterile water for injection or 0.9% NaCl. Gently shake to form an even suspension. Must be diluted further before infusion. Further dilute with either 50 mL or 100 mL 0.9% NaCl or

D5W. Shake the bag gently until clear. Give doses by intermittent IV infusion (piggyback). Do not give IV push. Infuse over 1 h (60 min).

D

## **Dornase Alfa**

door'nace al'fa

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Enzymes, respiratory, recombinant DNA origin

## **MECHANISM OF ACTION**

An enzyme that selectively splits and hydrolyzes DNA in sputum. *Therapeutic Effect:* Reduces sputum viscosity and elasticity.

## AVAILABILITY

*Inhalation:* 2.5-mg ampules for nebulization.

## INDICATIONS AND DOSAGES

 To improve management of pulmonary function in patients with cystic fibrosis

NEBULIZATION Adults, Children 3 mo and older: 2.5 mg (1 ampule) once daily by recommended nebulizer. May increase to 2.5 mg twice daily.

## CONTRAINDICATIONS

Sensitivity to dornase alfa.

## INTERACTIONS

Drug, Herbal, and Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (> 10%)

Pharyngitis, fever, rhinitis, dyspnea, chest pain or discomfort, voice changes.

Occasional (3%-10%)

Conjunctivitis, hoarseness, dyspepsia, rash.

## SERIOUS REACTIONS

• None significant.

## **PRECAUTIONS & CONSIDERATIONS**

Hoarseness, chest pain, and sore throat may occur during dornase alfa therapy. Viscosity of pulmonary secretions should be checked. Drink plenty of fluids. Use in children < 5 yr is limited.

#### Storage

Refrigerate unopened ampules and protect them from light. Keep in foil pouch until ready to use.

#### Administration

For nebulization, do not mix any other medications in the nebulizer with dornase alfa.

## Doxepin

dox'eh-pin Novo-Doxepin, Prudoxin, Silenor, Zonalon Do not confuse doxepin with doxapram, doxazosin, or Doxidan.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (B for topical form)

*Classification:* Antidepressants, tricyclic; dermatologics

## **MECHANISM OF ACTION**

A tricyclic antidepressant, antianxiety agent, antineuralgic agent, antipruritic agent, and

Doxepin (Generic Name)

#### Doxapram

dox'a-pram ★ Dopram Do not confuse doxapram with doxepin or Ultram.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

#### **Classification:** Analeptics, stimulants, central nervous system (CNS)

#### **MECHANISM OF ACTION**

A CNS stimulant that directly stimulates the respiratory center in the medulla or indirectly by effects on the carotid. *Therapeutic Effect:* Increases pulmonary ventilation by increasing resting minute ventilation, tidal volume, respiratory frequency, and inspiratory neuromuscular drive and enhances the ventilatory response to carbon dioxide.

## PHARMACOKINETICS

IV onset 20-40, peak 1-2 min, duration 5-12 min. Metabolized in the liver to metabolites, ketodoxapram (active), and desethyldoxapram (inactive). Partially excreted in the urine. Not removed by hemodialysis. *Half-life:* 2.4-9.9 h.

#### AVAILABILITY

Injection: 20 mg/mL (Dopram).

#### INDICATIONS AND DOSAGES • Chronic obstructive pulmonary disease (COPD) IV INFUSION

Adults, Elderly, Children older than 12 yr. Initially, 1-2 mg/min. Maximum: 3 g/day for no more than 2 h.

#### Drug-induced CNS depression IV INJECTION

Adults, Elderly, Children older than 12 yr: Initially, 1-2 mg/kg, repeat after 5 min. May repeat at 1- to 2-h intervals, until sustained consciousness. Maximum: 3 g/day. IV INFUSION

Adults, Elderly, Children older than 12 yr. Initially, bolus dose of 1-2 mg/kg, repeat after 5 min. If no response, wait 1-2 h and repeat. If stimulation is noted, initiate infusion at 1-3 mg/min. Infusion should not be continued for more than 2 h. Maximum: 3 g/day.

#### Respiratory depression following anesthesia

#### IV INJECTION

Adults, Elderly, Children older than 12 yr. Initially, 0.5-1 mg/kg. May repeat at 5-min intervals in patients who demonstrate initial response. Maximum: 2 mg/kg.

IV INFUSION

Adults, Elderly, Children older than 12 yr: Initially, 5 mg/min until adequate response or adverse effects are seen. Decrease to 1-3 mg/min. Maximum: 4 mg/kg.

#### **OFF-LABEL USES**

Sleep apnea, postanesthetic shivering.

## CONTRAINDICATIONS

Convulsive disorders, cardiovascular impairment, cerebral edema, head injury or cerebrovascular accident, severe hypertension, pulmonary embolism, mechanical ventilation disorders, hypersensitivity to doxapram.

#### INTERACTIONS

Drug Cyclopropane, enflurane, halothane: May increase catecholamine release. Delay the initiation of doxapram therapy for at least 10 min following discontinuation of these anesthetics known to sensitize the myocardium.

#### **CNS-stimulant medications:**

May increase risk of stimulation to excessive levels, causing nervousness, insomnia, irritability, or possibly cardiac arrhythmias or seizures.

#### **MAOIs, sympathomimetic agents:** May increase the pressor effects of these medications or doxapram.

Herbal None known.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin, hematocrit, or red blood cell counts. May further decrease WBC in the presence of preexisting leukopenia. May increase BUN and albuminuria.

#### IV INCOMPATIBILITIES

Alkaline solutions, aminophylline, ascorbic acid, cefotaxime (Claforan), cefotetan (Cefotan), cefuroxime (Zinacef), clindamycin (Cleocin), dexamethasone sodium phosphate, diazepam (Valium), digoxin, dobutamine, folic acid, furosemide (Lasix), hydrocortisone sodium succinate (Solu-Cortef), ketamine (Ketalar), methylprednisolone, minocycline (Minocin), sodium bicarbonate, thiopental (Pentothal), ticarcillin (Ticar).

#### 🗏 IV COMPATIBILITIES

Amikacin (Amikin), ampicillin, bumetanide (Bumex), caffeine citrate (Cafcit), calcium chloride, calcium gluconate, cefazolin, ceftazidime (Fortaz), chlorpromazine, cimetidine (Tagamet), cisplatin, cyclophosphamide (Cytosar), deslanoside, dopamine, doxycycline (Doxy-100), epinephrine, erythromycin lactobionate, fentanyl (Sublimaze), gentamicin, heparin, insulin (regular, Humulin R, Novolin R), hydroxyzine, isoniazid (Nydrazid), lincomycin (Lincocin), methotrexate, metoclopramide (Reglan), metronidazole (Flagyl), oxacillin, phenobarbital, phytonadione, pyridoxine, ranitidine (Zantac), terbutaline (Brethine), thiamine, tobramycin (Nebcin), vancomycin, vincristine.

#### SIDE EFFECTS Occasional

Flushing, sweating, pruritus, disorientation, headache, dizziness, hyperactivity, convulsions, dyspnea, cough, tachypnea, hiccough, rebound hypoventilation, phlebitis, variations in heart rate, arrhythmias, chest pain, nausea, vomiting, diarrhea, stimulation of urinary bladder with spontaneous voiding.

#### SERIOUS REACTIONS

 Overdosage may produce extensions of the pharmacologic effects of the drug. Excessive pressor effect, skeletal muscle hyperactivity, tachycardia, and enhanced deep tendon reflexes may be early signs of overdosage.

• May cause severe CNS toxicity, including seizures.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypermetabolic states, such as hyperthyroidism and pheochromocytoma as well as arrhythmias, diabetes mellitus, glaucoma, hypertension, impaired renal or liver function, peptic ulcer disease. It is unknown whether doxapram crosses the placenta or is excreted in breast milk, so it is not administered to pregnant women. No age-related precautions have been noted for the elderly. Safety and efficacy have not been evaluated in children younger than 12 yr. Be aware that doxapram is contraindicated in neonates. Benzyl alcohol may cause gasping syndrome in neonates. Storage

Store vials at room temperature. Administration

Doxapram dosage is determined by response to the drug. Discontinue if sudden hypotension or dyspnea develops. The rate of infusion should not be increased in severely ill patients with chronic obstructive pulmonary disease (COPD). Monitor closely during administration and for some time afterward until the patient is fully alert for 30-60 min to ensure that reflexes have been restored and to prevent rebound hypoventilation. Before doxapram administration, ensure adequate airway and oxygenation in postanesthetic or drug-induced respiratory depression. Avoid extravasation or use of a single injection site over an extended period. Local irritation or thrombophlebitis may result. Doxapram is stable and compatible with D5W, D10W, or 0.9% NaCl. antiulcer agent that increases synaptic concentrations of norepinephrine and serotonin. *Therapeutic Effect:* Produces antidepressant and anxiolytic effects.

#### PHARMACOKINETICS

Rapidly and well absorbed from the GI tract. Protein binding: 80%-85%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 6-8 h. *Topical:* Absorbed through the skin to levels similar to those of oral administration. Distributed to body tissues. Metabolized to active metabolite. Excreted in urine.

## AVAILABILITY

Capsules: 10 mg, 25 mg, 50 mg, 75 mg, 100 mg, 150 mg. Oral Concentrate: 10 mg/mL. Cream (Prudoxin, Zonalon): 5%. Tablets (Silenor): 3 mg, 6 mg.

## INDICATIONS AND DOSAGES Depression, anxiety

PO

*Adults.* 25-150 mg/day at bedtime or in 2-3 divided doses. May increase to 300 mg/day.

*Elderly.* Initially, 10-25 mg at bedtime. May increase by 10-25 mg/ day every 3-7 days. Maximum: 75 mg/day.

*Adolescents.* Initially, 25-50 mg/day as a single dose or in divided doses. May increase to 100 mg/day.

#### Pruritus associated with eczema TOPICAL

*Adults, Elderly.* Apply thin film 4 times a day with at least 3-4 h between applications.

 Insomnia with difficulty in sleep maintenance

PO (SILENOR):

*Adults.* 6 mg once daily within 30 min of bedtime; 3 mg PO may be sufficient in some.

*Elderly.* 3 mg PO once daily within 30 min of bedtime; may increase to 6 mg if clinically indicated.

#### **OFF-LABEL USES**

Treatment of neurogenic pain, panic disorder; prevention of vascular headache, pruritus in idiopathic urticaria.

## CONTRAINDICATIONS

Angle-closure glaucoma, hypersensitivity to other tricyclic antidepressants, urine retention, acute post-myocardial infarction period.

## INTERACTIONS

#### Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS and respiratory depression and the hypotensive effects of doxepin.

Anticholinergics: Additive anticholinergic effects may occur. Antithyroid agents: May increase the risk of agranulocytosis.

**Bupropion:** May increase doxepin levels.

**Cimetidine:** May increase doxepin blood concentration and risk of toxicity.

**Clonidine, guanadrel:** May decrease the effects of these drugs.

**CYP1A2 inducers/inhibitors:** May decrease/increase levels and effects of doxepin.

**CYP2D6 inhibitors:** May increase levels and effects of doxepin.

**CYP3A4 inducers/inhibitors:** May decrease/increase levels and effects of doxepin.

Lithium: Increased risk of neurotoxicity.

MAOIs, linezolid: May increase the risk of seizures, hyperpyrexia,

#### 512 Doxepin

and hypertensive crisis. MAOIs are contraindicated.

**Phenothiazines:** May increase the anticholinergic and sedative effects of doxepin.

**Sympathomimetics:** May increase cardiac effects.

**QT-prolonging agents:** May increase risk of QT prolongation of tricyclics.

## Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

May alter blood glucose levels and ECG readings. Therapeutic serum drug level is 110-250 ng/mL; toxic serum drug level is > 300 ng/mL.

#### SIDE EFFECTS

#### Frequent

Oral: Orthostatic hypotension, somnolence, dry mouth, headache, increased appetite, weight gain, nausea, unusual fatigue, unpleasant taste. Topical: Drowsiness; edema; increased itching, eczema, burning, or stinging at application site; altered taste; dizziness; somnolence; dry skin; dry mouth; fatigue; headache; thirst. Occasional

Oral: Blurred vision, confusion, constipation, hallucinations, difficult urination, eye pain, irregular heartbeat, fine muscle tremors, nervousness, impaired sexual function, diarrhea, diaphoresis, heartburn, insomnia. Topical: Anxiety, skin irritation or

cracking, nausea.

## Rare

Oral: Allergic reaction, alopecia, tinnitus, breast enlargement. Topical: Fever, photosensitivity.

#### SERIOUS REACTIONS

• Overdose may produce confusion; seizures; severe somnolence; fast,

slow, or irregular heartbeat; fever; hallucinations; agitation; dyspnea; vomiting; and unusual fatigue or weakness.

· Jaundice (rare).

 Abrupt withdrawal after prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

#### PRECAUTIONS & CONSIDERATIONS

Antidepressants increase the risk of suicidal ideation in children, adolescents, and young adults with depression and psychiatric disorders. Closely monitor when initiating therapy, especially the first 2 mo.

Caution is warranted with cardiac disease, diabetes mellitus, glaucoma, hiatal hernia, history of seizures, history of urinary obstruction or urine retention, hyperthyroidism, increased intraocular pressure, renal or hepatic disease, benign prostatic hyperplasia, mania, bipolar disorder, and schizophrenia. Doxepin crosses the placenta and is distributed in breast milk. The safety and efficacy of this drug have not been established in children. Lower doxepin dosages are recommended for elderly patients because they are at increased risk for toxicity. Exposure to sunlight, sunlamps, or tanning beds should be avoided.

Drowsiness and dizziness may occur. Change positions slowly from recumbent to sitting, before standing, to prevent dizziness. Alcohol, caffeine, and tasks that require mental alertness or motor skills should also be avoided until drug effects are known. BP, pulse rate, weight, and ECG should also be monitored. Appearance, behavior, level of interest, mood, and speech pattern should be assessed.

#### Storage

Store at room temperature, protect from light and excessive heat.

## Administration

Take doxepin with food or milk if GI distress occurs. Dilute the oral concentrate in 8 oz fruit juice (such as grapefruit, orange, pineapple, or prune), milk, or water. Avoid diluting in carbonated drinks because they are incompatible with doxepin. Maintenance dose for depression may be administered as daily dose at bedtime to reduce daytime sedation and improve sleep. An improvement should occur within 2-5 days of starting therapy, but the maximum therapeutic effect for depression usually takes 2-3 wks to appear.

Topical cream is for external use only; apply to affected area and rub in gently.

### Doxercalciferol

dox-er-cal-sif'er-ol

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Vitamins/ minerals, vitamin D analogs

#### **MECHANISM OF ACTION**

A fat-soluble vitamin that is essential for absorption, utilization of calcium phosphate, and normal calcification of bone. *Therapeutic Effect:* Stimulates calcium and phosphate absorption from small intestine, promotes secretion of calcium from bone to blood, promotes renal tubule phosphate resorption, acts on bone cells to stimulate skeletal growth and on parathyroid gland to suppress hormone synthesis and secretion.

#### PHARMACOKINETICS

Readily absorbed from small intestine. Metabolized in liver. Partially eliminated in urine. Not removed by hemodialysis. *Half-life:* Up to 96 h.

#### AVAILABILITY

*Capsule:* 0.5 mcg, 2.5 mcg. *Injection:* 2 mcg/mL.

#### INDICATIONS AND DOSAGES > Secondary hyperparathyroidism, dialysis patients IV

*Adults, Elderly.* Titrate dose to lower immunoreactive parathyroid hormone (iPTH) to 150-300 pg/mL. Adjust dose at 8-wk intervals to a maximum dose of 18 mcg/wk. Initially, if iPTH level is more than 400 pg/mL, give 4 mcg 3 times/wk after dialysis, administered as a bolus dose.

Dose titration:

The iPTH level decreased by 50% and more than 300 pg/mL: Dose may be increased by 1-2 mcg at 8-wk intervals as needed.

iPTH level 150-300 pg/mL: Maintain the current dose.

iPTH level < 100 pg/mL: Suspend drug for 1 wk and resume at a reduced dose of at least 1 mcg lower. PO

Adults, Elderly. Dialysis patients: Titrate dose to lower iPTH to 150-300 pg/mL. Adjust dose at 8-wk intervals to a maximum dose of 20 mcg 3 times/wk. Initially, if iPTH is more than 400 pg/mL, give 10 mcg 3 times/wk at dialysis.

Dose titration:

Level decreased by 50% and more than 300 pg/mL: Increase dose to 12.5 mcg 3 times/wk for 8 wks or longer. This titration process may continue at 8-wk intervals. Each increase should be by 2.5 mcg/dose.

Doxercalciferol (Generic Name), Hectorol (Brand Name)

iPTH level 150-300 pg/mL: Maintain current dose.

iPTH level < 100 pg/mL: Suspend drug for 1 wk and resume at a reduced dose. Decrease each dose by at least 2.5 mcg.

## Secondary hyperparathyroidism, predialysis patients

Adults, Elderly. Titrate dose to lower iPTH to 35-70 pg/mL with stage 3 disease or to 70-110 pg/ mL with stage 4 disease. Dose may be adjusted at 2-wk intervals with a maximum dose of 3.5 mcg/day. Begin with 1 mcg/day.

Dose titration:

iPTH level more than 70 pg/mL with stage 3 disease or more than 110 pg/ mL with stage 4 disease: Increase dose by 0.5 mcg every 2 wks as needed.

iPTH level 35-70 pg/mL with stage 3 disease or 70-110 pg/mL with stage 4 disease: Maintain current dose.

iPTH level is < 35 pg/mL with stage 3 disease or < 70 pg/mL with stage 4 disease: Suspend drug for 1 wk, then resume at a reduced dose of at least 0.5 mcg lower.

## CONTRAINDICATIONS

Hypercalcemia, vitamin D toxicity, hypersensitivity to doxercalciferol or other vitamin D analogs.

## INTERACTIONS

#### Drug

Aluminum-containing antacid (long-term use): May increase aluminum concentration and aluminum bone toxicity. Calcium-containing preparations, thiazide diuretics: May increase the

risk of hypercalcemia. **Magnesium-containing antacids**: May increase magnesium concentration.

## Vitamin D, other supplements:

May increase risk of toxicity. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

Decreases iPTH levels. May increase serum cholesterol, calcium, magnesium, and phosphate levels. May decrease serum alkaline phosphatase.

## SIDE EFFECTS

#### Occasional

Edema (34%), headache (28%), malaise (28%), dizziness (12%), nausea (24%), vomiting (24%), dyspnea (12%).

#### Rare (< 10%)

Bradycardia, sleep disorder, pruritus, anorexia, constipation.

## SERIOUS REACTIONS

• Excessive vitamin D may cause progressive hypercalcemia, hypercalciuria, hyperphosphatemia, and adynamic bone disease.

• Early signs of overdosage are manifested as weakness, headache, somnolence, nausea, vomiting, dry mouth, constipation, muscle and bone pain, and metallic taste sensation.

• Later signs of overdosage are evidenced by polyuria, polydipsia, anorexia, weight loss, nocturia, photophobia, rhinorrhea, pruritus, disorientation, hallucinations, hyperthermia, hypertension, and cardiac arrhythmias.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is necessary with coronary artery disease, kidney stones, and hepatic impairment. Correct hyperphosphatemia before starting therapy. Mineral oil should be avoided during doxercalciferol use. It is unknown whether doxercalciferol crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children. No agerelated precautions have been noted in elderly patients.

During titration, iPTH, serum calcium, and serum phosphorus levels should be obtained weekly. If hypercalcemia, hyperphosphatemia, or a serum calcium times phosphorus product > 70 is noted, the drug should be immediately suspended until these parameters are appropriately lowered; then, the drug should be restarted at a lower dose.

#### Storage

Store at room temperature. Protect from light.

#### Administration

Individualize dosing based on serum iPTH levels. Injection for IV use only. Give oral doxercalciferol without regard to food. Swallow whole and avoid crushing, chewing, or opening the capsules.

#### Doxycycline

dox-i-sye'kleen

Adoxa, Alodox, Doryx, Doxy-100, Monodox, Oraxyl, Periostat, Vibramycin Apo-Doxy, Doxycin, Vibra-Tabs **Do not confuse doxycycline with dicyclomine or doxylamine, or Monodox with Monopril.** 

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antibiotics, tetracyclines

#### MECHANISM OF ACTION

A tetracycline antibiotic that inhibits bacterial protein synthesis by binding to ribosomes. *Therapeutic Effect:* Bacteriostatic.

## PHARMACOKINETICS

Well absorbed after oral administration. Protein binding: 90%. Widely distributed except in the central nervous system (CNS; poor). Excreted in urine and feces. *Half-life*: 12-15 h.

#### AVAILABILITY

Capsules (Doxycycline, Monodox): 50 mg, 75 mg, 100 mg. Capsules (Vibramvcin): 100 mg. Capsules (Adoxa): 150 mg. Capsules (Oraxyl): 20 mg. Capsules, Delaved Release: 75 mg, 100 mg. Capsules, Delayed Release (Oracea): 40 mg. Oral Suspension (Vibramycin): 50 mg/5 mL, 25 mg/5 mL. Svrup (Vibramvcin): 50 mg/5 mL. Tablets (Adoxa): 50 mg, 75 mg, 100 mg, 150 mg. Tablets (Alodox, Periostat): 20 mg. Tablet, Delayed Release (Doryx): 75 mg, 100 mg. Injection, Powder for Reconstitution (Doxy-100): 100 mg.

## INDICATIONS AND DOSAGES

Respiratory, skin, and soft-tissue infections; urinary tract infection; pelvic inflammatory disease (PID); brucellosis; trachoma; Rocky Mountain spotted fever; typhus; Q fever; rickettsia; severe acne (Adoxa); smallpox; psittacosis; ornithosis; granuloma inguinale; lymphogranuloma venereum; intestinal amebiasis (adjunctive treatment); prevention of rheumatic fever

PO

Adults, Elderly, Children older than 8 yr and weighing > 45 kg. Initially, 100 mg q12h, then 100 mg/day as

Doxycycline (Generic Name)

## Doxorubicin

dox-oh-roo'bi-sin Adriamycin, Doxil Adriamycin, Caelyx, Myocet Do not confuse with daunorubicin, Idamycin, or idarubicin. Do not confuse conventional doxorubicin with doxorubicin liposomal (Doxil) due to different indications and dosage regimens. Do not confuse Doxil with Paxil.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, anthracyclines

## **MECHANISM OF ACTION**

An anthracycline antibiotic that inhibits DNA and DNA-dependent RNA synthesis by binding with DNA strands. Liposomal encapsulation increases uptake by tumors, prolongs action, and may decrease toxicity. *Therapeutic Effect:* Prevents cellular division.

#### PHARMACOKINETICS

Widely distributed. Protein binding: Unknown. Metabolized in liver. Minimal excretion in urine. *Half-life:* 45-55 h.

#### AVAILABILITY

Injection, Powder for Solution: 10 mg, 20 mg, 50 mg, 150 mg. Injection, Solution: 2 mg/mL. Liposomal Injection (Doxil): 2 mg/mL.

#### INDICATIONS AND DOSAGES

NOTE: Regimens vary with indication for use, and other medications employed. Consult specialized references to confirm protocols.

#### Acute lymphocytic leukemia (ALL) IV INFUSION

Adults, Children. Conventional doxorubicin. 30 mg/m<sup>2</sup> IV once weekly for 4 wks, or 30 mg/m<sup>2</sup> IV on days 1, 2, and 14 of induction, or 20 mg/m<sup>2</sup> IV on days 15, 16, and 17 as part of a multidrug regimen.

## Acute myelogenous leukemia (AML)

IV INFUSION

Adults, Children. Conventional doxorubicin. 30 mg/m<sup>2</sup>/day IV bolus for 3 days of induction in combination with cytarabine.

### For treatment of small cell lung cancer (SCLC):

IV INFUSION

*Adults*. Conventional doxorubicin. 40-50 mg/m<sup>2</sup>/dose IV once monthly in combination with other antineoplastics.

#### Adjuvant treatment in early breast cancer with axillary lymph nodes IV INFUSION

Adults. Conventional doxorubicin. 60 mg/m<sup>2</sup> with cyclophosphamide (600 mg/m<sup>2</sup>) administered on day 1 of each 21-day cycle for 4 cycles. Give 75% of usual dose for neutropenic fever/infection. Delay next cycle if needed until ANC  $\geq$  1000 cells/mm<sup>3</sup> and platelet count  $\geq$  100,000 cells/ mm<sup>3</sup> and nonhematologic toxicities resolved.

#### AIDS-related Kaposi sarcoma IV INFUSION

Adults. Liposomal doxorubicin. 20 mg/m<sup>2</sup> over 30 min q3wk.

 Neoplastic conditions (ovarian, breast, prostate, thyroid, gastric, lung cancers; lymphomas)
 IV INFUSION

Adults. Conventional doxorubicin. As a single agent, 60-75 mg/m<sup>2</sup> q3wk. In combination with other chemotherapy, 40-60 mg/m<sup>2</sup> q3-4wk.

## Ovarian cancer progressed despite platinum treatment

IV INFUSION Adults. Liposomal doxorubicin. 50 mg/m<sup>2</sup> q4wk.

#### Dosage in hepatic impairment (both forms of doxorubicin)

If serum bilirubin 1.2-3 mg/dL, give 50% of usual dose. If serum bilirubin > 3 mg/dL, give 25% of usual dose. If bilirubin is > 5 mg/dL, then dose is held.

## CONTRAINDICATIONS

Myelosuppression; previous receipt of complete cumulative doses of doxorubicin, daunorubicin, idarubicin, or other anthracyclines; nursing mothers, hypersensitivity to doxorubicin compounds or daunorubicin.

## DRUG INTERACTIONS

**Cyclosporine:** Increased doxorubicin concentrations and toxicity.

Live vaccines: Increased risk infection by vaccine.

#### IV INCOMPATIBILITIES Conventional doxorubicin:

Allopurinol, aminophylline, cephalothin, dexamethasone, diazepam, ertapenem (Invanz), etoposide, fluorouracil, fosphenytoin, furosemide, gallium nitrate, heparin, hydrocortisone, lansoprazole (Prevacid IV), magnesium sulfate, meropenem (Merrem), pantoprazole (Protonix), phenytoin, piperacillin sodium/ tazobactam, potassium or sodium phosphates, rituximab (Rituxan), TPN, vincristine, voriconazole (VFend).

Liposomal doxorubin: Benzyl alcohol. Doxorubicin liposomal should not be mixed with any other medications.

## SIDE EFFECTS

#### Conventional doxorubicin: Frequent

Nausea, vomiting, alopecia, mucositis, myelosuppression, malaise.

#### Occasional

Anorexia, diarrhea, hyperpigmentation of nailbeds, phalangeal and dermal creases, bradycardia.

#### Rare

Fever, chills, urticaria, conjunctivitis, lacrimation.

#### Liposomal doxorubicin: Frequent (> 20%)

Asthenia, fatigue, fever, anorexia, nausea, vomiting, stomatitis, diarrhea, constipation, hand and foot syndrome, rash, neutropenia, thrombocytopenia, anemia.

## SERIOUS REACTIONS

• Bone marrow depression manifested as hematologic toxicity (principally leukopenia and, to a lesser extent, anemia, thrombocytopenia) may occur.

• Cardiotoxicity noted as either acute, transient abnormal ECG findings or cardiomyopathy manifested as congestive heart failure may occur.

• Acute infusion-related reactions with liposomal doxorubicin.

#### PRECAUTIONS & CONSIDERATIONS

Probability of cardiac toxicity increases with higher total cumulative dose. Maximum lifetime cumulative dosage of doxorubicin is 550 mg/m<sup>2</sup> IV; 450 mg/m<sup>2</sup> IV in patients who have received previous mediastinal radiation. Risk of cardiotoxicity increased in patients with prior mediastinal irradiation, concurrent cyclophosphamide therapy, concurrent calcium channel blocker therapy, preexisting heart disease, or early or advanced age. Monitor cardiac function. Use with caution in patients with impaired hepatic function. Women of childbearing potential should be advised to avoid becoming pregnant. Excreted in breast milk; do not breastfeed.

#### Storage

Store lyophilized powder at room temperature. Protect from light. Store conventional solution in the refrigerator for up to 48 h. Protect from light.

Store liposomal solution in the refrigerator.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

Conventional doxorubicin: Reconstitute lyophilized powder with NS (nonpreserved) to a concentration of 2 mg/mL. Do not administer IM or SC. Severe local tissue damage will occur with IV extravasation. Slowly administer into tubing of a freely running IV infusion of NS or D5W into a large vein. Administer over at least 3 to 5 min. Use of a butterfly needle inserted into a large vein is preferred.

! Do not substitute liposomal doxorubicin for conventional doxorubicin on a mg per mg basis. Do not use in-line filter with liposomal formulation. Dilute liposomal doxorubicin with D5W, not to exceed 90 mg/250 mL D5W. Infuse at an initial rate of 1 mg/min to decrease the risk of infusion reactions. Administer over at least 1 hr. single dose or 50 mg q12h or 100 mg q12h for severe infections. *Children older than 8 yr and weighing < 45 kg.* Initially, 4 mg/kg/day, then 2-4 mg/kg/day

divided q12-24h. Maximum: 200 mg/day.

## IV

Adults, Elderly, Children older than 8 yr and weighing > 45 kg. Initially, 200 mg as 1-2 infusions; then 100-200 mg/day in 1-2 divided doses. Children older than 8 yr and < 45 kg. 2-4 mg/kg/day divided q12-24h. Maximum: 200 mg/day.

#### Acute gonococcal infections PO

*Adults*. 100 mg twice daily for 7 days.

#### Syphilis

PO, IV

Adults. 200 mg/day in divided doses for 14-28 days.

## Traveler's diarrhea, prophylaxis PO

*Adults, Elderly.* 100 mg/day during a period of risk (up to 14 days) and for 2 days after returning home.

#### Periodontitis

#### PO

Adults (Periostat, Alodox, Oraxyl). 20 mg twice a day.

#### Malaria, prophylaxis PO

*Adults.* 100 mg once a day beginning 1-2 days before travel, during travel, and 4 wks after returning home. *Children over 8 yr.* 2 mg/kg once a day beginning 1-2 days before travel, during travel, and 4 wks after returning home.

#### Rosacea

PO (ORACEA) Adults. 40 mg once daily.

## **OFF-LABEL USES**

Treatment of atypical mycobacterial infections, rheumatoid arthritis, gonorrhea, and malaria; prevention of Lyme disease; prevention or treatment of traveler's diarrhea.

## CONTRAINDICATIONS

Children 8 yr and younger, hypersensitivity to tetracyclines or sulfites, pregnancy, severe hepatic dysfunction.

#### INTERACTIONS Drug

Antacids and supplements containing aluminum, calcium, or magnesium and oral iron preparations; laxatives containing magnesium: Decrease doxycycline absorption; separate administration. Barbiturates, carbamazepine, phenytoin: May decrease doxycycline blood concentrations. Cholestyramine, colestipol: May decrease doxycycline absorption; separate administration. Methotrexate: May increase levels of methotrexate. Oral contraceptives: May decrease the effects of oral contraceptives. Warfarin: May increase anticoagulation of warfarin. Herbal None known.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, amylase, bilirubin, AST (SGOT), and ALT (SGPT) levels. May alter CBC.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B cholesteryl (Amphotec), amphotericin B liposomal (AmBisome), ampicillin, ampicillin/ sulbactam (Unasyn), cefazolin, cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), cefuroxime (Zinacef), chloramphenicol, dantrolene, diazepam, erythromycin lactobionate, fluorouracil, folic acid, furosemide (Lasix), ganciclovir (Cytovene), heparin, hydrocortisone sodium succinate (Solu-Cortef), indomethacin, ketorolac, methicillin, methotrexate, methylprednisolone sodium succinate, nafcillin, oxacillin, palonosetron (Aloxi), pemetrexed (Alimta), penicillin G potassium, penicillin G sodium, pentobarbital, phenytoin, piperacillin, piperacillin/tazobactam (Zosyn), sodium bicarbonate, sulfamethoxazole/trimethoprim.

#### SIDE EFFECTS

#### Frequent

Anorexia, nausea, vomiting, diarrhea, dysphagia, possibly severe photosensitivity. Occasional

Rash, urticaria.

#### SERIOUS REACTIONS

Superinfection (especially fungal) and benign intracranial hypertension (headache, visual changes) may occur.
Hepatoxicity, fatty degeneration of the liver, and pancreatitis occur rarely. Autoimmune syndromes have been reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in those who cannot avoid sun or ultraviolet exposure, because such exposure may produce a severe photosensitivity reaction.

History of allergies, especially to tetracyclines or sulfites, should be determined before drug therapy. Caution is warranted in renal impairment. Avoid use in children, because it may cause permanent tooth discoloration, enamel hypoplasia. Pattern of daily bowel activity, stool consistency, food intake and tolerance, renal function, and skin for rash should be assessed. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, diarrhea, and ulceration or changes of the oral mucosa or tongue. Loss of consciousness should be monitored because of the potential for increased intracranial pressure.

#### Storage

Store capsules and tablets at room temperature. Store oral suspension for up to 2 wks at room temperature. After reconstitution, the IV piggyback infusion may be stored for up to 12 h at room temperature or up to 72 h if refrigerated. Protect the drug from direct sunlight. Discard it if a precipitate forms.

#### Administration

Take oral doxycycline with a full glass of fluid. It may also be given with food or milk. An exception is Oracea, which is best taken on an empty stomach 1 h before or 2 h after a meal. Take oral doxycycline 1-2 h before or after antacids that contain aluminum, calcium, or magnesium; laxatives that contain magnesium; or oral iron preparations, because these drugs may impair doxycycline absorption. Shake suspension well before use.

! Do not administer doxycycline IM or subcutaneously. Space doses evenly around the clock. Reconstitute each 100-mg vial with 10 mL of sterile water for injection to yield a concentration of 10 mg/ mL. Further dilute each 100 mg with at least 100 mL to concentration of 0.1 mg/mL to 1 mg/mL with D5W, 0.9% NaCl, or lactated Ringer's solution. Give the intermittent IV (piggyback) infusion over 1-4 h. Avoid extravasation.

## Dronabinol

droe-nab'i-nol Marinol Do not confuse dronabinol with droperidol.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C Controlled Substance Schedule: III

**Classification:** Antiemetics/ antivertigo, appetite stimulant

## **MECHANISM OF ACTION**

An antiemetic and appetite stimulant that may act by inhibiting vomiting control mechanisms in the medulla oblongata. *Therapeutic Effect:* Inhibits vomiting and stimulates appetite.

## PHARMACOKINETICS

Well absorbed after oral administration. Distributes to adipose tissue. Protein binding > 97%. Metabolized in liver, extensive first-pass effect. *Half-life:* 25-36 h. Primarily excreted in feces. Onset of action: 1 h. Duration of appetite stimulation: 24 h.

## AVAILABILITY

Capsules (Gelatin): 2.5 mg, 5 mg, 10 mg.

## INDICATIONS AND DOSAGES

#### Prevention of chemotherapyinduced nausea and vomiting PO

Adults, Children. Initially, 5 mg/m<sup>2</sup> 1-3 h before chemotherapy, then q2-4h after chemotherapy for total of 4-6 doses a day. May increase by 2.5 mg/m<sup>2</sup> up to 15 mg/m<sup>2</sup> per dose.

 Appetite stimulant in patients with AIDS or cancer (off-label use)
 PO *Adults*. Initially, 2.5 mg twice a day (before lunch and dinner). Range: 2.5-20 mg/day.

## CONTRAINDICATIONS

Hypersensitivity to marijuana or any cannabinoid or sesame oil.

## INTERACTIONS

Drug

Alcohol, other CNS depressants: May increase CNS depression.

Amphetamines, cocaine,

**sympathomimetics**: Hypertension, tachycardia, cardiotoxicity may occur.

## Anticholinergics, antihistamines:

Additive tachycardia drowsiness may occur.

#### Tricyclic antidepressants:

Tachycardia, hypertension, or drowsiness may occur.

Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

**Frequent (3%-24%)** Euphoria, dizziness, paranoid reaction, somnolence, abnormal thinking.

#### Occasional (1%-3%)

Asthenia, ataxia, confusion, abdominal pain, depersonalization, palpitations, sinus tachycardia, flushing, vasodilation.

## Rare (<1%)

Diarrhea, depression, nightmares, speech difficulties, headache, anxiety, tinnitus, flushed skin.

## SERIOUS REACTIONS

• Withdrawal symptoms may occur upon abrupt discontinuation.

• Mild intoxication may produce increased sensory awareness (including taste, smell, and sound),

Dronabinol (Generic Name)

altered time perception, reddened conjunctiva, dry mouth, and tachycardia.

• Moderate intoxication may produce memory impairment and urine retention.

 Severe intoxication may produce lethargy, decreased motor coordination, slurred speech, and orthostatic hypotension.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with heart disease, hypertension, a history of drug or alcohol abuse, hepatic impairment, seizure disorder, depression, mania, and schizophrenia. Dependence has been noted. Use with caution in elderly patients because postural hypotension can occur.

Dronabinol use is not recommended for children with AIDS-related anorexia. Alcohol, barbiturates, other CNS depressants, should be avoided. Patients should be specifically warned not to drive, operate machinery, or engage in any hazardous activity until it is established that they are able to tolerate the drug and perform such tasks safely. BP, heart rate, and behavioral and mood reactions should be monitored. **Storage** 

Keep tightly closed. Store in refrigerator. Protect from freezing. Administration

Take dronabinol before lunch and dinner to stimulate appetite. Relief from nausea and vomiting generally occurs within 15 min of drug administration. A dose of the drug is usually given 1-3 h prior to chemotherapy.

#### **Dronedarone**

Dro-neh'da-rone Multaq Do not confuse dronedarone with amiodarone.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: X

Classification: Antiarrhythmics

#### MECHANISM OF ACTION

A benzofuran derivative of amiodarone with a complex electrophysical profile. Possesses antiarrhythmic properties belonging to all four Vaughan-Williams classes. Like class III agents (e.g., amiodarone), lengthens cardiac action potential and refractory periods by inhibiting the potassium currents. Also inhibits sodium channels and inhibits the slow L-type calcium channels. Exhibits some antiadrenergic properties. Prolongs the PR and OT interval. Therapeutic Effect: Suppresses atrial arrhythmias; keeps heart in sinus rhythm longer than without the medication.

## PHARMACOKINETICS

Presystemic first-pass metabolism; bioavailability without food is low, about 4%, but improves to 15% when taken with a high-fat meal. Peak plasma concentrations of drug and main active metabolite are reached within 3-6 h. After repeated administration, steady state reached in 4-8 days. A 2-fold increase in dose results in an approximate 2.5to 3-fold increase with respect to Cmax and AUC of main metabolite and parent drug. Protein binding: > 98%, mainly to albumin. Extensively metabolized in liver,

Dronedarone (Generic Name), Multaq (Brand Name)

## D

mainly by CYP3A. There are over 30 uncharacterized inactive metabolites. Mainly excreted in the feces as metabolites, only 6% excreted in urine. *Half-life:* 13-19 h.

#### AVAILABILITY

Tablets (Multaq): 400 mg.

#### INDICATIONS AND DOSAGES

 Paroxysmal AFib or AFlutter with recent episode now in sinus rhythm or to be cardioverted, with CV risk factors

PO

Adults, Elderly. 400 mg twice per day.

## CONTRAINDICATIONS

Permanent atrial fibrillation. hepatic injury with amiodarone, QT prolongation, severe hepatic impairment, pregnancy, breastfeeding, NYHA class IV heart failure or NYHA class II- III heart failure with a recent decompensation, 2nd- or 3rd-degree AV block or sick sinus syndrome (except with functioning pacemaker), bradycardia < 50 bpm, concomitant use of strong CYP3A inhibitors OR concomitant use of drugs/herbals that prolong the QT interval and might increase the risk of torsades de pointes (see Interactions).

## INTERACTIONS

#### Drug

Antiarrhythmics: May increase cardiac effects. Do not give with class I or class III antiarrhythmics due to risk of torsades.

Strong CYP3A inhibitors or QT-prolonging drugs (e.g., azole antifungals, cisapride, cyclosporine, pimozide, fluoroquinolones, macrolides, nefazodone, ranolazine, ritonavir and certain other protease inhibitors, thioridazine, ziprasidone,

## phenothiazines, tricyclic

antidepressants): Contraindicated. Risk of cardiac arrhythmias, including torsades de pointes, may be increased, either due to decreased dronedarone metabolism or due to additive QT prolongation. List may not be complete for all strong CYP3A inhibitors or drugs that prolong the QT interval.

**β-Blockers:** May increase effect of β-blockers.

CYP2D6 substrates (e.g., fluoxetine and other SSRIs) or CYP3A substrates (e.g., midazolam, alprazolam, triazolam, pimozide, sirolimus, tacrolimus): May increase concentrations of these drugs; monitor for dose adjustment. CYP3A inducers: Avoid rifampin or other CYP3A inducers such as phenobarbital, carbamazepine, phenytoin, because they decrease dronedarone exposure significantly. Dabigatran: Increased exposure to dabigatran. Lower dabigatran dose if patient also has renal impairment. Monitor closely for bleeding. Digoxin: May increase drug concentration and risk of toxicity of digoxin; additive cardiac effects; lower dose of digoxin recommended.

**Diuretics:** May cause electrolyte imbalances that could increase risk of arrhythmia. Monitor closely.

HMG-CoA reductase inhibitors ("statins"): May increase risk of myopathy/rhabdomyolysis; follow statin labeling recommendations. For example, simvastatin dose should not exceed 10 mg/day.

Verapamil or diltiazem: Increased dronedarone exposure; monitor closely.

Warfarin: Possible increased anticoagulant effect; closely monitor INR.

Herbal

**St. John's wort:** Significantly reduces dronedarone concentrations. Avoid.

#### Food

**All foods:** Food increases the extent of absorption. Dose with meals.

**Grapefruit juice:** Increased dronedarone concentrations. Avoid grapefruit juice.

#### DIAGNOSTIC TEST EFFECTS

Commonly increases serum creatinine roughly 0.1 mg/dL due to a reduction in kidney tubular secretion. May increase AST (SGOT), ALT (SGPT) levels. Prolongs PR and QT interval of ECG.

#### SIDE EFFECTS

#### Frequent (≥ 3%)

Diarrhea, nausea, abdominal pain, bradycardia, and asthenia, skin rashes (generalized, macular, maculopapular, erythematous).

#### Occasional (1%-2%)

Headache, dyspepsia, vomiting, pruritus, eczema, allergic dermatitis. Rare (< 1%)

Decreased libido, dizziness, dysguesia, paresthesias, photosensitivity, fatigue, tremor.

#### SERIOUS REACTIONS

 QTc prolongation. May worsen existing arrhythmias or produce new arrhythmias (called proarrhythmias).

- · Worsening heart failure.
- Serious allergic reactions/ hypersensitivity.

• Hepatic dysfunction or hepatic failure.

#### PRECAUTIONS & CONSIDERATIONS

Certain patients with heart failure must not be given dronedarone due to a noted increase in mortality (see Contraindications). Patients with stable, mild heart failure should be monitored very closely. Caution is warranted with thyroid disease and hepatic impairment, in patients receiving diuretic therapy or who have a history of potassium or magnesium imbalance. Per animal studies, dronedarone crosses the placenta and adversely affects fetal development. Contraindicated during pregnancy. Effective contraception must be used if the female is of childbearing potential. It readily crosses into breast milk; breastfeeding is contraindicated. Safety and efficacy have not been established in children. Elderly patients may be more sensitive to dronedarone's effects. The drug may cause photosensitivity; wear sunscreen and sun-protective clothing.

ECG, liver enzyme tests, serum electrolytes, and serum creatinine should be obtained at baseline and during therapy. Apical pulse and BP should be assessed immediately before giving. Withhold the medication and notify the physician if the pulse rate is 55 beats/min or lower or the systolic BP is < 90 mm Hg, unless physician has given other parameters. Pulse rate for bradycardia, an irregular rhythm, and quality should be monitored. ECG for changes such as widening of the QRS complex and prolonged PR and QT intervals should be assessed. Signs and symptoms of heart failure should be assessed in patients with potential risk factors, including dyspnea, edema, fatigue. Also watch for liver dysfunction.

#### Storage

Store tablets at room temperature. Administration

Take with meals; one tablet with morning meal and one with evening meal. Do not take with grapefruit juice.

! Treatment with class I or III antiarrhythmics (e.g., amiodarone, flecainide, propafenone, quinidine, disopyramide, dofetilide, sotalol) or drugs that are strong inhibitors of CYP3A must be stopped before starting this drug.

## **Droperidol**

droe-pear'ih-dall

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiemetics

#### **MECHANISM OF ACTION**

A general anesthetic and antiemetic agent that antagonizes dopamine neurotransmission at synapses by blocking postsynaptic dopamine receptor sites; partially blocks adrenergic receptor binding sites. *Therapeutic Effect:* Produces tranquilization, antiemetic effect.

#### PHARMACOKINETICS

Onset of action occurs within 3-10 min, peak 30 min. Well absorbed. Metabolized in liver. Excreted in urine and feces. Duration of action: 2-4 h. *Half-life:* 2.3 h.

#### AVAILABILITY

Injection: 2.5 mg/mL.

#### INDICATIONS AND DOSAGES

## Prevention of nausea and vomiting with surgery

IM/IV Adults, Elderly, Children 12 yr and older. Initially, up to 2.5 mg. Additional doses of 1.25 mg may be given.

*Children 2-12 yr*. Initially, up to 0.1 mg/kg.

## CONTRAINDICATIONS

Known or suspected QT prolongation, hypersensitivity to

droperidol or any component of the formulation. Droperidol is not recommended for any use other than for the treatment of perioperative nausea and vomiting in patients for whom other treatments are ineffective or inappropriate.

## INTERACTIONS

#### Drug

Central nervous system (CNS) depressants: May increase CNSdepressant effect. Class I, IA, or III antiarrhythmics, cisapride, cyclobenzaprine, phenothiazines, pimozide, quinolone antibiotics, tricylic antidepressants: May increase risk of QT prolongation. Hypotensive agents: May increase hypotension. Metoclopramide: Increased risk for extrapyramidal symptoms. Propofol: Increased nausea and vomiting. Herbal None known. Food None known.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B cholesteryl (Amphotec), amphotericin B liposomal (AmBisome), cefepime (Maxipime), ertapenem (Invanz), fluorouracil, foscarnet (Foscavir), furosemide (Lasix), lansoprazole (Prevacid), leucovorin, nafcillin, pantoprazole (Protonix), pemetrexed (Alimta), piperacillin/tazobactam (Zosyn).

## **IV COMPATIBILITES**

Amifostine (Ethyol), azithromycin (Zithromax), aztreonam (Azactam), bivalirudin (Angiomax), bleomycin (Blenoxane), carboplatin, caspofungin (Cancidas), cisatracurium (Nimbex), cisplatin, cladribine (Leustatin), cyclophosphamide (Cytoxan), cytarabine, dactinomycin (Cosmegen), daptomycin (Cubicin), dexmedetomidine (Precedex), diltiazem (Cardizem), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Adriamycin), doxorubicin liposomal (Doxil), epirubicin (Ellence), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), filgrastim (Neupogen), fluconazole (Diflucan), fludarabine (Fludara), gemcitabine (Gemzar), granisetron (Kytril), hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), idarubicin (Idamycin), ketamine (Ketalar), levofloxacin (Levaquin), linezolid (Zyvox), lorazepam (Ativan), melphalan (Alkeran), meperidine (Demerol), metoclopramide (Reglan), milrinone (Primacor), mitoxantrone (Novantrone), oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), potassium chloride, quinupristin/dalfopristin (Synercid), rituximab (Rituxan), sargramostim (Leukine), tacrolimus (Prograf), teniposide (Vumon), thiotepa (Thioplex), tigecycline (Tygacil), tirofibran (Aggrastat), trastuzumab (Herceptin), vasopressin, vecuronium (Norcuron), vinblastine (Velban), vincristine (Vincasar), vinorelbine (Navelbine), vitamin B complex with C, voriconazole (Vfend).

#### SIDE EFFECTS

#### Frequent

Mild to moderate hypotension. Occasional

Tachycardia, postoperative drowsiness, dizziness, chills, shivering.

#### Rare

Postoperative nightmares, facial sweating, bronchospasm.

#### SERIOUS REACTIONS

• Extrapyramidal symptoms may appear as akathisia (motor restlessness) and dystonias: torticollis (neck muscle spasm), opisthotonos (rigidity of back muscles), and oculogyric crisis (rolling back of eyes).

 Overdosage includes symptoms of hypotension, tachycardia, hallucinations, and extrapyramidal symptoms.

 Prolonged QT interval (> 10%), torsade de pointes, seizures, neuroleptic malignant syndrome, orthostatic hypotension, and arrhythmias have been reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with risk factors for QT prolongation, such as congenital risks, uncorrected electrolyte abnormalities, or taking other medications that might prolong the QT interval. All patients should have ECG prior to administration to determine if QT interval is prolonged.

Caution is warranted in patients with impaired hepatic, renal, or cardiac function, bradycardia, seizure disorder, pheochromocytoma, myasthenia gravis, or glaucoma. Droperidol readily crosses the placenta, and it is unknown whether droperidol is distributed in breast milk. Be aware that dystonias are more likely in children. Be aware that elderly patients may be more susceptible to sedative and hypotensive effects. Safety and efficacy have not been established in children < 2 yr of age. Monitor ECG.

Change positions slowly to avoid orthostatic hypotension and avoid tasks that require mental alertness or motor skills.

#### Storage

Store vials at room temperature. Protect from light.

#### Administration

Be aware that the person must remain recumbent for 30-60 min in head-low position with legs raised, to minimize hypotensive effect.

For IM administration, inject slow and deep into upper outer quadrant of gluteus maximus.

For IV administration, may give undiluted as IV push at a rate of 10 mg or less over 1 min.

**Drotrecogin Alfa** 

droh-tree-koh'gen al'fa

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Thrombolytics

## **MECHANISM OF ACTION**

A recombinant form of humanactivated protein C that exerts an antithrombotic effect by inhibiting factors Va and VIIIa and may exert an indirect profibrinolytic effect by inhibiting plasminogen activator inhibitor-1 and limiting the generation of activated thrombin-activatable fibrinolysisinhibitor. The drug may also exert an anti-inflammatory effect by inhibiting tumor necrosis factor (TNF) production by monocytes, by blocking leukocyte adhesion to selectins, and by limiting thrombininduced inflammatory responses. Therapeutic Effect: Produces antiinflammatory, antithrombotic, and profibrinolytic effects.

## PHARMACOKINETICS

Inactivated by endogenous plasma protease inhibitors. Clearance occurs

within 2 h of initiating infusion. *Half-life:* 1.6 h.

#### AVAILABILITY

Powder for Infusion: 5 mg, 20 mg.

#### **INDICATIONS AND DOSAGES**

#### Severe sepsis (Apache II score ≥ 25)

IV INFUSION

*Adults, Elderly.* 24 mcg/kg/h for 96 h. Dose is based on actual body weight.

#### CONTRAINDICATIONS

Active internal bleeding, evidence of cerebral herniation, intracranial neoplasm or mass lesion, presence, of an epidural catheter, recent (within the past 3 mo) hemorrhagic stroke, recent (within the past 2 mo) intracranial or intraspinal surgery or severe head trauma, trauma with an increased risk of life-threatening bleeding.

#### INTERACTIONS

#### Drug

Antiplatelets, anticoagulants, thrombolytics: May increase risk for bleeding. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May prolong aPTT.

#### IV INCOMPATIBILITIES

Do not mix drotrecogin alfa with other medications.

#### 🗏 IV COMPATIBILITIES

Lactated Ringer's solution, 0.9% NaCl, and dextrose are the only solutions that can be administered through the same line.

#### SIDE EFFECTS

Occasional Bleeding, bruising.

#### SERIOUS REACTIONS

 Bleeding (intrathoracic, retroperitoneal, GI, genitourinary, intra-abdominal, intracranial) occurs in about 2% of patients.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with chronic, severe hepatic disease, intracranial aneurysm, platelet count < 30,000/mm<sup>3</sup>, INR > 3, or prolonged PT, and in those who have had GI bleeding within the past 6 wks. Caution should be used in those who are using heparin concurrently and in those who have had thrombolytic therapy within the past 3 days or anticoagulant or aspirin therapy within the past 7 days. Caution should also be used when administering other drugs that affect hemostasis. It is unknown whether drotrecogin alfa causes fetal harm or is excreted in breast milk. The safety and efficacy of drotrecogin alfa have not been established in children or in elderly patients.

The following criteria must be met before initiating drotrecogin alfa therapy: age of at least 18 yr; weight < 135 kg; no pregnancy or breastfeeding; 3 or more systemic inflammatory response criteria (fever, heart rate > 90 beats/min, respiratory rate > 20 breaths/min, increased WBC count); and at least 1 sepsis-induced organ or system failure (cardiovascular, hepatic, renal, respiratory, or unexplained metabolic acidosis). Monitor for hemorrhagic complications. Bleeding may occur for up to 28 days after treatment. Notify the physician if signs and symptoms of unusual bleeding occur. Study in pediatric patients was terminated early due to lack of efficacy and increased side effects.

#### Storage

Store unreconstituted vials at room temperature. Reconstituted vials should be used within 3 h to prepare infusion. If not used immediately, the infusion may be refrigerated for up to 12 h, but the maximum time limit for use of the IV solution is 24 h from the time of vial dilution.

#### Administration

! If clinically important bleeding occurs, immediately stop the infusion.

Reconstitute the 5- and 20-mg vials by slowly adding 2.5 mL or 10 mL of sterile water for injection, respectively, to yield a concentration of 2 mg/mL. Swirl the vial gently to mix; do not shake or invert it. Must further dilute, either in infusion bags or in syringe-pump syringes. Add the reconstituted drug to an infusion bag containing 0.9% NaCl, and dilute to a final concentration of 100-200 mcg/mL. Direct the stream to the side of the bag to minimize agitation. Invert the infusion bag to mix the solution. If using syringes, slowly withdraw the reconstituted Xigris solution from the vial(s) into a syringe that will be used in the syringe pump. Into the same syringe, slowly withdraw 0.9% NaCl to obtain the desired final volume. Gently invert and/or rotate to mix. The syringe pump must be primed according to manufacturer's directions before use. Start the infusion within 3 h after reconstitution. Administer the drug through a dedicated IV line or a dedicated lumen of a multilumen central venous catheter at a rate of 24 mcg/kg/h for 96 h. If the infusion is interrupted, restart it at 24 mcg/kg/h, as prescribed. Stop infusion 2 h before invasive procedures. Resume immediately after minimally

invasive procedures; delay for 12 h after major invasive procedures or surgery.

## **Duloxetine**

D

du-lox'uh-teen Cymbalta Do not confuse Cymbalta with Symbyax, or duloxetine with fluoxetine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, selective serotonin/norepinephrine (SNRI) reuptake inhibitor

## **MECHANISM OF ACTION**

An antidepressant that appears to inhibit serotonin and norepinephrine reuptake at neuronal presynaptic membranes; is a less potent inhibitor of dopamine reuptake. *Therapeutic Effect:* Relieves depression.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: > 90%. Extensively metabolized to active metabolites. Excreted primarily in urine and, to a lesser extent, in feces. *Half-life*: 8-17 h.

## AVAILABILITY

*Capsules, Delayed Release:* 20 mg, 30 mg, 60 mg.

## INDICATIONS AND DOSAGES

• Major depressive disorder PO

*Adults.* 20 mg twice a day, increased up to 60 mg/day as a single dose or in 2 divided doses. Maximum: 120 mg/day.

#### Diabetic neuropathy PO

Adults. 60 mg once daily.

#### Fibromyalgia PO

Adults. 30 mg/day, titrated to 60 mg/ day after 1 wk.

## Chronic musculoskeletal pain (such as chronic low back pain and pain of osteoarthritis)

Adults. 30 mg/day, titrated to 60 mg/ day after 1 wk.

Generalized anxiety

*Adults.* 60 mg once daily (may start at 30 mg once daily for 1 wk, then titrate). Maximum: 120 mg/day.

Dosage in renal impairment

Consider lower starting dosage. If creatinine clearance < 30 mL/min, use is not recommended.

## **OFF-LABEL USES**

Stress incontinence.

## CONTRAINDICATIONS

Uncontrolled angle-closure glaucoma; use within 14 days of MAOIs. Avoid use with linezolid or IV methylene blue due to an increased risk of serotonin syndrome.

## INTERACTIONS

#### Drug

Alcohol: Increases the risk of hepatic injury. Buspirone, meperidine,

serotonin agonists, SSRIs/SNRIs, sibutramine, tramadol, trazodone: May increase risk of serotonin syndrome.

**CYP1A2 inhibitors/inducers:** May increase/decrease duloxetine levels and effects. Potent inhibitors of CYP1A2 should be avoided (e.g., cimetidine, ciprofloxacin, fluvoxamine).

Fluoxetine, fluvoxamine, paroxetine, quinidine, quinolone antimicrobials, CYP2D6

inhibitors: May increase duloxetine plasma concentration.

Duloxetine (Generic Name), Cymbalta (Brand Name)

MAOIs, linezolid: May cause serotonin syndrome, characterized by autonomic hyperactivity, coma, diaphoresis, excitement, hyperthermia, and rigidity. MAOIs are contraindicated. Thioridazine: May produce ventricular arrhythmias. Warfarin: May increase warfarin concentration; monitor INR. Herbal

St John's wort: May increase adverse effects.

#### DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

#### Frequent (11%-20%)

Nausea, dry mouth, diarrhea, constipation, insomnia, somnolence, headache.

#### Occasional (9%-59%)

Dizziness, fatigue, anorexia, diaphoresis/hyperhidrosis, vomiting.

#### Rare (2%-4%)

Blurred vision, erectile dysfunction, delayed or failed ejaculation, anorgasmia, anxiety, decreased libido, hot flashes, increased BP.

#### SERIOUS REACTIONS

• Duloxetine use may slightly increase the patient's heart rate or cause orthostatic hypotension.

 Serious skin rashes such as Stevens-Johnson syndrome and toxic epidermal necrolysis occur rarely.

• Colitis, dysphagia, gastritis, hepatotoxicity, and irritable bowel syndrome occur rarely.

 Activation of mania or hypomania in bipolar patients can occur.
 Monotherapy is not recommended in these patients.

• SIADH and hyponatremia occur with SSRIs and SNRIs.

• Withdrawal syndrome may occur with abrupt discontinuation. Gradually taper dose.

#### **PRECAUTIONS & CONSIDERATIONS**

Antidepressants increase the risk of suicidal ideation in children, adolescents, and young adults with depression and psychiatric disorders. Closely monitor when initiating therapy, especially the first 2 mo.

Caution is warranted with conditions that may slow gastric emptying, hepatic impairment, history of anemia, history of seizures, renal impairment, mania, hypomania, bipolar, and suicidal tendencies. Be aware that duloxetine use in pregnant women may produce neonatal adverse reactions, including constant crying, feeding difficulty, hyperreflexia, and irritability. Be aware that duloxetine is distributed in breast milk. Breastfeeding is not recommended. Be aware that the safety and efficacy of duloxetine have not been established in children. Exercise caution when increasing duloxetine doses in elderly patients.

Drowsiness and dizziness may occur, so avoid alcohol and tasks that require mental alertness or motor skills. Blood chemistry tests to assess hepatic and renal function should be performed before and periodically during therapy.

#### Storage

Store at room temperature. Administration

Take without regard to meals. Take with food or milk if GI distress occurs. Do not crush or chew enteric-coated capsules. Do not sprinkle capsule contents on food or mix with liquids. The therapeutic effects will be noted within 1-4 wks. Do not abruptly discontinue duloxetine.

## **Dutasteride**

du-tas'tur-ide ★ → Avodart

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** 5-α-reductase inhibitors, antiandrogens, hormones/hormone modifiers

## **MECHANISM OF ACTION**

An androgen hormone inhibitor that inhibits 5- $\alpha$  reductase, an intracellular enzyme that converts testosterone into dihydrotestosterone (DHT) in the prostate gland, reducing the serum DHT level. *Therapeutic Effect*. Reduces size of the prostate gland and BPH symptoms.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	24 h	N/A	3-8 wks

Moderately absorbed after PO administration; can be absorbed through skin. Widely distributed. Protein binding: 99%. Metabolized in the liver. Primarily excreted in feces. *Half-life*: Up to 5 wks.

## AVAILABILITY

Capsule: 0.5 mg.

#### INDICATIONS AND DOSAGES • Benign prostatic hyperplasia (BPH)

# PO

Adults, Elderly. 0.5 mg once a day.

## **OFF-LABEL USES**

Treatment of hair loss in males.

## CONTRAINDICATIONS

Females, physical handling of capsules by those who are or may be pregnant, hypersensitivity to dutasteride or other 5- $\alpha$ -reductase inhibitors, children.

#### INTERACTIONS

Drug Calcium channel antagonists, cimetidine, CYP3A4 inhibitors: May increase dutasteride concentrations. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

Decreases the serum prostate-specific antigen (PSA) level; testosterone increased; TSH increased.

## SIDE EFFECTS

#### Occasional

Gynecomastia, sexual dysfunction (decreased libido, impotence, and decreased volume of ejaculate).

## SERIOUS REACTIONS

Toxicity may be manifested as rash, diarrhea, and abdominal pain.
Allergic reaction, angioedema,

pruritus, rash, urticaria may occur.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with hepatic impairment, preexisting sexual dysfunction (such as impotence and decreased libido), and obstructive uropathy. The drug has a pregnancy risk category of X and carries the risk of causing anomalies in the male fetus. Pregnant women or women trying to conceive should not consume or handle dutasteride.

Dutasteride may cause impotence and decrease ejaculate volume. Serum PSA determinations should be obtained before and periodically during therapy.

Dutasteride (Generic Name), Avodart (Brand Name)

A new baseline must be established after 3-6 mo of use. Intake and output and improvement in BPH signs and symptoms should also be monitored. Avoid blood donation during therapy and for 6 mo after last dose. Safety and efficacy have not been established in children; contraindicated.

#### Storage

Store at room temperature of 77° F or lower. Higher temps may cause capsules to become soft, leak, or stick together.

## Administration

Do not break, crush, or open capsules. Take dutasteride without regard to food. Urinary flow may not improve for up to 6 mo after beginning treatment.

Women who are pregnant or are trying to become pregnant should not handle open or broken capsules or capsule contents.

## **Dyphylline**

dye'fi-lin ★ Dylix, Lufyllin Do not confuse dyphylline with Dilacor.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Bronchodilators, xanthine derivatives

#### MECHANISM OF ACTION

A xanthine derivative that acts as a bronchodilator by directly relaxing smooth muscle of the bronchial airway and pulmonary blood vessels similar to theophylline. *Therapeutic Effect:* Relieves bronchospasm, increases vital capacity, produces cardiac and skeletal muscle stimulation.

#### PHARMACOKINETICS

Rapid absorption after PO administration. Protein binding:

Unknown. Not metabolized to theophylline in vivo. Excreted in urine. *Half-life:* 2 h.

## AVAILABILITY

*Elixir:* 100 mg/15 mL (Dylix). *Tablet:* 200 mg, 400 mg (Lufyllin).

#### INDICATIONS AND DOSAGES • Chronic bronchospasm, asthma PO

*Adults, Elderly.* 15 mg/kg up to 4 times/day. Individualize dosage to condition and response; patients may respond to lower dosage.

Dosage in renal impairment

## Creatinine

Clearance (mL/min)	Dosage Percent
50-80	Administer 75% of dose
10-50	Administer 50% of dose
< 10	Administer 25% of dose

## CONTRAINDICATIONS

History of hypersensitivity to dyphylline, related xanthine derivatives, or any component of the formulation.

#### INTERACTIONS

Drug

Adenosine, benzodiazepines: Effects may be decreased by dyphylline.

**β-Blockers, nonselective:** May decrease bronchodilator effects of dyphylline.

Cimetidine, ciprofloxacin, erythromycin, norfloxacin, probenecid, zileuton: May increase dyphylline concentrations and risk of toxicity.

**Glucocorticoids:** May produce hypernatremia.

**Phenytoin, primidone, rifampin:** May increase dyphylline metabolism. **Smoking:** May decrease dyphylline concentrations.

#### Herbal

Ma huang, ephedra: Increased CNS stimulation.

Food Caffeine: Increased CNS stimulation.

## SIDE EFFECTS

Frequent

Tachycardia, nervousness, restlessness.

#### Occasional

Heartburn, vomiting, headache, mild diuresis, insomnia, nausea.

#### SERIOUS REACTIONS

• Ventricular arrhythmias, hypotension, circulatory failure, seizures, hyperglycemia, and syndrome of inappropriate antidiuretic hormone (SIADH) have been reported.

#### PRECAUTIONS & CONSIDERATIONS

Uncontrolled arrhythmias, hyperthyroidism.

Caution is necessary with congestive heart failure (CHF), hypertension, impaired cardiac or renal function, hyperthyroidism, peptic ulcer disease, and seizure disorder. Be aware that dyphylline is equivalent to 70% theophylline. Dyphylline should not be used to treat status asthmaticus. Serious dosing errors can occur if dyphylline serum levels are monitored by theophylline serum assay. Smoking, charcoal-broiled food, and a highprotein, low-carbohydrate diet may decrease dyphylline level. Caffeine derivatives such as chocolate, coffee, cola, cocoa, and tea should be avoided.

Oxygen depletion may occur and is evident by blue or gray lips, blue or dusky-colored fingernails in light-skinned patients, and gray fingernails in dark-skinned persons. **Storage** 

Store at room temperature.

#### Administration

Give oral dyphylline with food to avoid GI distress. Give with plenty of water.

## **Ecallantide**

e-kal'lan-tide ★ 🐏 Kalbitor

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Kallikrein inhibitors

## **MECHANISM OF ACTION**

A potent, selective, reversible inhibitor of kallikrein that blocks the production of kallikrein, a precursor to bradykinin. *Therapeutic Effect:* Reduces edema, improving symptoms based on the site of the hereditary angioedema (HAE) attack.

## PHARMACOKINETICS

Time to peak serum concentration 2-3 h; ecallantide is a small protein (7054 Da), and renal elimination via the urine has been demonstrated. *Half-life:* About 2 h.

## AVAILABILITY

Injection Solution: 10 mg/mL.

## INDICATIONS AND DOSAGES Acute attacks of hereditary angioedema (HAE)

SC

Adults and Children 16 yr and older: 30 mg (given as three 10-mg injections). If attack persists, may give an additional 30-mg dose within a 24-h period.

## CONTRAINDICATIONS

Ecallantide hypersensitivity.

## INTERACTIONS

Drug, Herbal, Food None known.

## **DIAGNOSTIC TEST EFFECTS**

Neutralizing antibodies form in roughly 4.7% of patients. aPTT prolongation has been observed with intravenous use.

## SIDE EFFECTS

Frequent (≥10%)

Headache, nausea, fatigue, diarrhea, upper respiratory infection.

## Occasional (3%-9%)

Injection site reactions, nasopharyngitis, vomiting, pruritus, abdominal pain, pyrexia.

## SERIOUS REACTIONS

• Hypersensitivity reactions: Anaphylaxis occurs in 3.9% of patients and is similar in appearance to the disease itself. Pruritus, rash, and urticaria may also be present.

## **PRECAUTIONS & CONSIDERATIONS**

Administer in a setting equipped to manage anaphylaxis and hereditary angioedema. Given the similarity in hypersensitivity symptoms and acute HAE symptoms, monitor patients closely for hypersensitivity reactions. There are no data in pregnant women. It is unknown if the drug is excreted in breast milk. The safety and efficacy of ecallantide have not been established in children under 16 yr of age. There are no data in patients with renal or hepatic dysfunction.

#### Storage

Refrigerate. Do not freeze. Protect from light; store in original carton until administration. The solution should be colorless and clear. Administration

For subcutaneous use only. Using aseptic technique, withdraw 1 mL (10 mg) from the vial using a large-bore needle. Change the needle on the syringe to a 27 gauge, or other needle suitable for subcutaneous injection. Inject into the skin of the abdomen, thigh, or upper arm. Repeat procedure until all 3 vials (entire dose) administered. Each of the injections may be in the same or in different anatomic locations (abdomen, thigh, upper arm). There is no need for site rotation. Separate each injection by at least 2 inches (5 cm) and keep away from the anatomical site of attack. The same instructions apply to an additional dose administered within 24 h. Different injection sites or the same anatomical location (as used for the first administration) may be used.

## **Econazole**

e-kone'a-zole

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antifungals, azole antifungals

#### **MECHANISM OF ACTION**

An imidazole derivative that changes the permeability of the fungal cell wall. *Therapeutic Effect:* Inhibits fungal biosynthesis of triglycerides, phospholipids. Fungistatic.

#### PHARMACOKINETICS

Penetrates into stratum corneum, but low systemic absorption. Less than 1% of applied dose recovered in urine or feces as metabolites.

#### AVAILABILITY

Cream: 1%.

## INDICATIONS AND DOSAGES

 Treatment of tinea pedis, tinea cruris, tinea corporis, tinea versicolor

## TOPICAL

*Adults, Elderly, Children.* Apply once daily to affected area for 2-4 wks. Tinea pedis for 1 mo.

#### Treatment of cutaneous candidiasis

TOPICAL *Adults, Elderly, Children.* Apply twice daily to affected area for 2 wks.

#### CONTRAINDICATIONS

Hypersensitivity to econazole.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Occasional (1%-10%)

Burning, itching, stinging, redness at application site. Rare (<1%) Contact dermatitis.

## SERIOUS REACTIONS

None known.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used during pregnancy. Econazole should be avoided during the first trimester of pregnancy. Use only if clearly needed in the second and third trimesters. It is unknown whether econazole is distributed in breast milk.

#### Storage

Store at room temperature. Protect from heat and light.

#### Administration

Apply and rub gently into affected areas. Prolonged therapy over weeks or months may be necessary. Avoid occlusive dressings and wear light clothing for ventilation. Avoid getting in the eyes.

## **Eculizumab**

e'coo-liz'oo-mab Soliris Do not confuse Soliris with Solage or Solaraze.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Biologic response modifiers, monoclonal antibodies, complement inhibitors

## **MECHANISM OF ACTION**

A monoclonal antibody that specifically and with high affinity binds to the complement protein C5, thereby inhibiting its cleavage to C5a and C5b and preventing the generation of the terminal complement complex C5b-9. *Therapeutic Effect:* Inhibits terminal complement-mediated intravascular hemolysis in PNH patients, lowering need for RBC transfusion and improving fatigue.

## PHARMACOKINETICS

Complement activity inhibited for less than 2 wks following single dose. Reduction of hemolysis (as determined by reduction in LDH concentrations) is maintained at least 52 wks. Metabolic fate not well characterized; catabolized in various tissues via diffuse cellular processes. Minimal excretion in urine expected due to large molecular size. Small quantities found in bile. *Half-life:* Approximately 272 h.

## AVAILABILITY

*Injection Solution:* 300 mg (10 mg/mL).

## INDICATIONS AND DOSAGES

NOTE: For all indications, give at the recommended time points, or within 2 days of these time points.

## Reduction of hemolysis from paroxysmal nocturnal hemoglobinuria (PNH)

IV INFUSION

*Adults.* 600 mg every 7 days for 4 wks, then 900 mg for the 5th dose given 7 days later, and then 900 mg every 14 days.

# Atypical hemolytic uremic syndrome (aHUS) IV INFUSION

*Adults.* 900 mg every 7 days for 4 wks, then 1200 mg for the 5th dose given 7 days later, and then 1200 mg every 14 days.

*Children 2 months up to 18 yr.* Dosage is weight based; see manufacturer weight-based dosing table for precise pediatric dosages.

#### Dosage adjustments for aHUS when supported with plasma exchange or plasmapheresis sessions

NOTE: Supplemental dosing is required following a session of plasmapheresis or plasma exchange; or fresh frozen plasma infusion; see manufacturer label for details.

## CONTRAINDICATIONS

Patients with unresolved serious *Neisseria meningitidis* infection or who are not currently vaccinated against *N. meningitidis*, unless the risks of delaying treatment outweigh the risks of these infections.

#### INTERACTIONS

Drug, Herbal, Food None known.

## DIAGNOSTIC TEST EFFECTS

A reduction in LDH should correspond with reduction in hemolysis during treatment.

#### SIDE EFFECTS

#### **Frequent (≥ 10%)**

Headache, rhinitis, sore throat, back pain, nausea, fatigue.

#### Occasional (2%-9%)

Myalgia, sinusitis, respiratory tract infection, herpes infection, constipation, pain in an extremity, flu-like symptoms.

#### Rare

Infusion reactions.

#### SERIOUS REACTIONS

• Serious and potentially lifethreatening infections (e.g., sepsis, meningitis); the drug increases the risk of meningococcal infection, which may rapidly become life threatening or fatal if not recognized and treated early. Also increases infection risk of those infections due to *Haemophilus influenza*, *Streptococcus pneumoniae*, and other encapsulated bacteria.

 As with other protein infusions, potential for anaphylaxis or other hypersensitivity reactions (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Serious meningococcal infections have occurred during treatment. Patients being treated with eculizumab will automatically be enrolled in a registry (Soliris Safety Registry) established to monitor long-term safety of the drug and limit distribution to those patients enrolled in the program with their prescribers. Patients should carry a card stating they are receiving eculizumab treatment. Patients are required to receive a meningococcal vaccination at least 2 wks prior to receiving the first dose, if they have not previously been vaccinated. They must be revaccinated according to current medical guidelines while on therapy. Animal data indicate

the drug may cause fetal harm in pregnancy. It is unknown if the drug is excreted in breast milk. The safety and efficacy of eculizumab have not been established in children under the age of 2 mos for aHUS, the only indication for which there is pediatric approval. Infants and children should receive their vaccinations according to current guidelines to help prevent infection. There are no particular precautions for elderly patients.

Monitor patient for infusion-related reactions. Between treatments, patients should immediately report signs or symptoms of infection, particularly high fever (> 103° F) and photophobia, severe headache, stiff neck, flu-like symptoms, or other severe or unusual symptoms. Patients should receive their treatments within 2 days of their dose due date. If treatments are suddenly discontinued, rebound hemolysis and associated symptoms of the disease may occur; if patients must stop treatments, they should be carefully monitored for at least 8 wks for PNH and 12 weeks for aHUS. Storage

#### Refrigerate unopened vials and keep in original carton until time of use. Do not freeze; protect from light; do not shake. Infusions are stable for 24 h under refrigeration and at room temperature.

#### Administration

For IV infusion only. Do not administer as an intravenous push or bolus. Withdraw the required amount for the dose from the vials into a sterile syringe. Transfer the recommended dose to an infusion bag. Dilute to a final infusion concentration of 5 mg/mL by adding the appropriate (equal) amount of 0.9% NaCl, 0.45% NaCl, D5W, or Ringer's injection to the infusion bag. The final admixed infusion volume is 120 mL for 600-mg doses or 180 mL for 900-mg doses. Gently invert the infusion bag to ensure thorough mixing of the product and diluent. Discard any unused portion left in a vial, as the product contains no preservatives. Allow the infusion to come to room temperature before infusion; do not heat.

Administer IV infusion over 35 min. If an adverse reaction occurs during infusion, the infusion may be slowed or stopped at the discretion of the physician. If the infusion is slowed, the total infusion time should not exceed 2 h. Monitor patient for 1 h after every infusion for infusion-related reactions.

## Edetate Calcium Disodium (Calcium EDTA)

ed-eh-tate kal-see-um dye-sow-dee-um Calcium Disodium Versenate **Do not confuse with edetate** disodium. Do not use EDTA as abbreviation

to avoid potential confusion.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antidotes, heavy metal

#### **MECHANISM OF ACTION**

A chelating agent that reduces the blood concentration of heavy metals, especially lead, forming stable complexes. *Therapeutic Effect:* Allows heavy metal excretion in urine.

#### PHARMACOKINETICS

Well absorbed after parenteral administration; poorly absorbed from the GI tract. Penetrates to extracellular fluid and slowly diffuses into cerebrospinal fluid (CSF). No metabolism occurs. Excreted in the urine either unchanged or as the metal chelates. *Half-life:* 20-60 min (IV), 1.5 h (IM). Onset for chelation of lead: 1 h.

#### AVAILABILITY

Injection: 200 mg/mL.

#### INDICATIONS AND DOSAGES • Diagnosis of lead poisoning IM/IV

Adults, Elderly for 8-h or 24-h mobilization test. 500 mg/m<sup>2</sup> IV over 1 h or IM. Maximum: 1g. Adults, Eldery for 8-h mobilization test. 50 mg/kg. Maximum: 1g IM as one dose is alternate. IM/IV

Children for 24-h mobilization test. 500 mg/m<sup>2</sup> as single-dose IV over 1h, or 500 mg/m<sup>2</sup> IM divided into doses at 12-h intervals (maximum: 1 g). NOTE: Mobilization tests should not be performed in symptomatic patients or those with blood levels > 55 mg/dL as therapy is indicated.

#### Symptomatic (without encephalopathy), or asymptomatic lead poisoning with blood lead levels > 70 mcg/dL IM/IV

Adults, Elderly, Children. 1-1.5 g/m<sup>2</sup> daily as 8-24 h IV infusion or divided every 12 h or 167 mg/m<sup>2</sup> IM every 4 h for 3-5 days (if blood lead concentration > 70 mcg/dL, calcium edetate usually given with dimercaprol until levels < 50 mcg/ dL). Allow at least 2-4 days, up to 2-3 wks, between courses of therapy. Adults should not be given more than 2 courses of therapy.

 Lead poisoning (with encephalopathy) with or without blood lead levels > 70 mcg/dL IM

Adults, Elderly, Children. Initially, dimercaprol 4 mg/kg; then give

#### 532.e4 Edetate Calcium Disodium (Calcium EDTA)

dimercaprol 4 mg/kg and calcium EDTA 250 mg/m<sup>2</sup> IM 4 h later and q4h for 5 days. Can also be given IV 50 mg/kg/day as 24-h continuous infusion or 1-1.5 g/m<sup>2</sup> as 8- to 24-h infusion or divided into 2 doses every 12 h. Allow at least 2 days before considering repeating course. Give dimercaprol for at least first 3 days.

## Asymptomatic lead poisoning in children with blood lead level 45-69 mcg/dL

IV

1 g/m<sup>2</sup>/day IV infusion over 8-24 h is preferred regimen. 25 mg/kg/day for 5 days as an 8- to 24-h infusion or divided into 2 doses every 12 h. May also give dose IM at 8- to 12-h intervals.

## CONTRAINDICATIONS

Anuria, severe renal disease, hepatitis, hypersensitivity to EDTA or any component of the formulation.

#### INTERACTIONS

#### Drug

**Insulin preparations:** May bind to zinc components of some insulin preparations increasing active amount of insulin while decreasing duraction of action.

**Zinc:** May decrease the effects of zinc.

Herbal and Food None known.

#### IV INCOMPATIBILITIES

Amphotericin B cholesteryl (Amphotec), hydralazine, dextrose 10%, lactated Ringer's, Ringer's.

## **IV COMPATIBILITIES**

Epinephrine.

#### SIDE EFFECTS

#### Frequent

Chills, fever, anorexia, headache, histamine-like reaction (sneezing,

stuffy nose, watery eyes), decreased BP, nausea, vomiting, thrombophlebitis, pain at IM injection site.

## Rare

Frequent urination, secondary gout (severe pain in feet, knees, elbows).

#### SERIOUS REACTIONS

 Drug may produce same signs of renal damage as severe acute lead poisoning (proteinuria, microscopic hematuria). Transient anemia/bone marrow depression, hypercalcemia (constipation, drowsiness, dry mouth, metallic taste) occur occasionally.

## PRECAUTIONS & CONSIDERATIONS

Edetate calcium disodium is capable of producing toxic effects that can be fatal. Dosage schedules should be followed, and at no time should the recommended daily dose be increased. It is unknown whether EDTA is distributed in breast milk. Lead encephalopathy is usually rare in adults but occurs more often in children. No age-related precautions have been noted in children or elderly patients. Edetate calcium disodium can produce the same renal damage as lead poisoning, such as proteinuria and microscopic hematuria. Discontinue if severe oliguria or anuria occurs. Monitor for cardiac arrhythmias.

Do not confuse with edetate disodium. The FDA recommends that edetate disodium never be given for chelation therapy as fatal hypocalcemia can occur if edetate disodium is used instead of edetate calcium disodium for chelation. Do not use abbreviation EDTA. Only edetate calcium disodium should be used for lead intoxication. Administration

Be aware that when administering IV, calcium EDTA may be given in 2 divided doses at 12-h intervals

or 8- to 24-h infusions; when administered IM and used alone, it may be given in divided doses at 8- to 12-h intervals; when given IM with dimercaprol in divided doses, administer at 4-h intervals.

Be aware that total dose is dependent on severity of lead poisoning, patient response, and tolerance to medication. Consult specific protocols.

For IV administration, add total daily dose to 250-500 mL of 0.9% NaCl or D5W. Preferably infused over 8-12 hr. Avoid rapid infusion.

Patients with lead encephalopathy and cerebral edema may experience a lethal increase in intracranial pressure following IV infusion; the IM route is preferred for these patients. In cases where the IV route is necessary, avoid rapid infusion. The dosage schedule should be followed, and at no time should the recommended daily dose be exceeded. Rapid IV infusion may be lethal due to increased intracranial pressure.

For IM injection, should add lidocaine or prilocaine to injection: 1 mL of 1% procaine hydrochloride or lidocaine 1% to each mL of edetate calcium disodium to minimize pain at injection site. The total daily dose is usually divided into equal doses given 8-12 h apart.

## Edetate Disodium

d'ch-tate dye-sow'dee-um Do not confuse with edetate calcium disodium. Do not use EDTA as abbreviation to avoid potential confusion.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidotes, chelators

## **MECHANISM OF ACTION**

A chelating agent that forms a soluble chelate with calcium, resulting in rapid decrease in plasma calcium concentrations. *Therapeutic Effect:* Allows calcium to be excreted in urine.

## PHARMACOKINETICS

Distributed in extracellular fluid and does not appear in red blood cells. No metabolism occurs. Rapidly excreted in the urine. *Half-life:* 1.4-3 h. Prolonged in renal impairment. Chelation occurs in 24-48 h.

## AVAILABILITY

Injection: 150 mg/mL.

#### INDICATIONS AND DOSAGES Digitalis toxicity (ventricular arrhythmia), hypercalcemia IV

Adults, Elderly. 50 mg/kg/day over 3 h or more, daily for 5 days, skip 2 days, repeat as needed up to 15 doses. Maximum: 3 g/day. Children. 40 mg/kg/day over 3 h or more, daily for 5 days, skip 5 days, repeat as needed. Maximum: 70 mg/kg/day.

#### CONTRAINDICATIONS

Anuria, renal impairment, hypersensitivity to edetate disodium or any component of the formulation.

#### INTERACTIONS

#### Drug

Insulin: May increase the effects of some forms of insulin containing zinc. Herbal None known. Food

None known.

## SIDE EFFECTS

#### Frequent

Abdominal cramps or pain, diarrhea, nausea, vomiting, circumoral

paresthesia, headache, numbness, postural hypotension.

#### Rare

Exfoliative dermatitis, toxic skin and mucous membrane reactions, thrombophlebitis (at injection site).

## SERIOUS REACTIONS

• Nephrotoxicity may occur with excessive dosages.

 Hypomagnesemia may occur with prolonged use.

• Hypokalemia can occur as potassium excretion may increase.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, clinical or subclinical hypokalemia, intracranial lesions, seizures, renal impairment, and limited cardiac reserve or incipient congestive heart failure. Be aware that edetate sodium is recommended only when the severity of the clinical condition justifies the aggressive measures associated with this type of therapy. It is unknown whether edetate disodium is distributed in breast milk. No age-related precautions have been noted in children or elderly patients.

Stop edetate sodium immediately and notify physician if frequent or sudden urges to urinate occur.

Do not confuse with edetate calcium disodium. The FDA recommends that edetate disodium never be given for chelation therapy as fatal hypocalcemia can occur if edetate disodium is used instead of edetate calcium disodium for chelation. Do not use abbreviation EDTA. Only edetate calcium disodium should be used for lead intoxication. Administration

Be aware that edetate disodium is rarely used to treat digitalis-induced ventricular arrhythmias because other, more effective agents are available. It should be used only in emergency situations. It is not for IM use.

Dilute solution for injection with 500 mL of D5W or 0.9% NaCl before IV administration; in pediatric patients, concentration should not exceed 3% (30 mg/mL). Administer by IV infusion only after dilution. Be careful not to exceed recommended dose or rate of administration (over at least 3 h). A precipitous drop in serum calcium concentrations may occur. Calcium replacement suitable for IV administration should be instantly available.

## Efavirenz

e-fahv'er-ins Sustiva Do not confuse with Survanta. Do not confuse efavirenz with etravirine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Antiretroviral, nonnucleoside reverse transcriptase inhibitor

## **MECHANISM OF ACTION**

A nonnucleoside reverse transcriptase inhibitor that inhibits the activity of HIV reverse transcriptase of HIV-1 and the transcription of HIV-1 RNA to DNA. *Therapeutic Effect:* Interrupts HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration, increased by fatty meals. Protein binding: 99% (primarily albumin). Metabolized to inactive metabolites in the liver via CYP3A4 and CYP2B6. Eliminated in urine and feces. *Halflife*: 40-55 h.

## AVAILABILITY

*Capsules:* 50 mg, 200 mg. *Tablets:* 600 mg.

# INDICATIONS AND DOSAGES

# HIV infection (in combination with other antiretrovirals)

Adults, Elderly, Children 3 yr and older weighing 40 kg or more. 600 mg once a day at bedtime. *Children 3 yr and older weighing* 32.5 kg to < 40 kg. 400 mg once a day.

*Children 3 yr and older weighing* 25 kg to < 32.5 kg. 350 mg once a day.

Children 3 yr and older weighing 20 kg to < 25 kg. 300 mg once a day.

Children 3 yr and older weighing 15 kg to < 20 kg. 250 mg once a day. Children 3 yr and older weighing 10 kg to < 15 kg. 200 mg once a day.

#### Dosage adjustment with voriconazole (adults)

The voriconazole maintenance dose should be increased to 400 mg every 12 h, and the efavirenz dose should be decreased to 300 mg once daily using the capsule formulation (one 200-mg and two 50-mg capsules or six 50-mg capsules).

• Dosage adjustment with rifampin (adults and patients  $\geq$  50 kg)

Increase efavirenz to 800 mg once daily.

## CONTRAINDICATIONS

Efavirenz as monotherapy; hypersensitivity to efavirenz. The following drugs are contraindicated with efavirenz: ergot alkaloids, midazolam, triazolam, bepridil, cisapride, pimozide, and St. John's wort.

## INTERACTIONS

#### Drug

Alcohol, benzodiazepines, psychoactive drugs: May produce additive central nervous system (CNS) effects.

Amprenavir, atazanavir, diltiazem, HMG-CoA reductase inhibitors, indinavir, itraconazole, lopinavir, methadone, saquinavir, sertraline, voriconazole: Decreases the plasma concentrations of these

Efavirenz (Generic Name), Sustiva (Brand Name)

drugs. Some of these medications significantly increase efavirenz concentrations.

**Carbamazepine:** Levels of carbamazepine and/or efavirenz may decrease.

**Clarithromycin:** Decreases clarithromycin plasma levels.

**CYP2B6, CYP3A4 inducers:** May decrease concentration of efavirenz.

CYP2C9, CYP2C19 substrates: May increase concentration of

substrates.

**CYP3A4 substrates:** Concentration of substrates may be altered.

Ergot derivatives, midazolam, triazolam: May cause serious or life-threatening reactions, such as arrhythmias, prolonged sedation, or respiratory depression. Contraindicated.

Nelfinavir, ritonavir, ethinyl estradiol: Increases the plasma concentrations of these drugs.

#### Phenobarbital, rifabutin,

rifampin: Lowers efavirenz plasma concentration.

**Warfarin:** Alters warfarin plasma concentration.

#### Herbal

**St. John's wort:** Decreases efavirenz concentration; contraindicated.

#### Food

**High-fat meals:** May increase drug absorption.

## DIAGNOSTIC TEST EFFECTS

May produce false-positive urine test results for cannabinoid and increased total cholesterol, AST (SGOT), ALT (SGPT), serum amylase, and serum triglyceride levels.

#### SIDE EFFECTS

## Frequent (52%)

Mild to severe: Dizziness, vivid dreams, insomnia, confusion,

impaired concentration, amnesia, agitation, depersonalization, hallucinations, euphoria, somnolence (mild symptoms do not interfere with daily activities; severe symptoms interrupt daily activities). Insomnia is often transient.

#### Occasional

Mild to moderate: Maculopapular rash (27%); nausea, fatigue, headache, diarrhea, fever, cough (< 26%) (moderate symptoms may interfere with daily activities). **Rare** 

Fat redistribution syndrome with buffalo hump, asymptomatic amylasemia, visual impairment, convulsions.

## SERIOUS REACTIONS

 Convulsions and immune reconstitution syndrome rarely occur.
 Psychiatric symptoms, including aggressive behavior, paranoid reactions, severe depression, suicidal ideations, and manic reactions, may occur.

· Pancreatitis or hepatic failure.

• Serious skin rashes, including Stevens-Johnson syndrome (rare, but may be more common in children).

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with a history of liver impairment, mental illness, or substance abuse. Breastfeeding is not recommended for mothers with HIV-1 infection. Reports of neural tube defects in infants born to women with first-trimester exposure, includes cases of meningomyelocele and Dandy-Walker syndrome; data indicate drug may cause fetal harm when administered during the first trimester. Pregnancy should be avoided in women receiving efavirenz. Barrier contraception must be used in combination with other methods (e.g., hormonal contraceptives). Use of adequate contraceptive measures for 12 wks after discontinuation of the drug is recommended. The safety and efficacy of efavirenz have not been established in children younger than 3 yr. In children, there may be an increased incidence of rash. No age-related precautions have been noted in elderly patients. Efavirenz is not a cure for HIV infection, nor does it reduce risk of transmission to others. Use in combination with other antiretrovirals; do not use as monotherapy.

Expect to obtain history of all prescription and nonprescription medications before giving the drug because efavirenz interacts with several drugs. Monitor for signs and symptoms of adverse CNS psychological side effects, such as abnormal dreams, dizziness, impaired concentration, insomnia, severe acute depression including suicidal ideation or attempts, and somnolence. Avoid tasks that require mental alertness or motor skills until response to the drug is established. Storage

#### Store at room temperature. Administration

Take on empty stomach at bedtime. Giving drug at bedtime helps attenuate some CNS effects. Administration with food may increase side effects; avoid. Take the medication every day as prescribed. Do not alter the dose or discontinue the medication without first notifying the physician. eh-floor'nigh-theen

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antiprotozoals, depilatory agents, dermatologics

## **MECHANISM OF ACTION**

A topical that inhibits ornithine decarboxylase cell division and synthetic function in the skin. When given systemically, the drug has antiprotozoal activity. *Therapeutic Effect:* Reduces rate of hair growth. Treats protozoal infection systemically.

#### PHARMACOKINETICS

Absorption is < 1% from intact skin. Not metabolized. Primarily excreted as unchanged drug in urine. *Halflife*: 8 h.

#### AVAILABILITY

Cream: 13.9%.

## INDICATIONS AND DOSAGES For reduction of unwanted facial hair in women

#### Topical

*Adults, Elderly.* Apply a thin layer to affected area of the face and adjacent involved areas under chin; rub in thoroughly. Use twice daily at least 8 h apart. Do not wash area for at least 4 h.

#### **OFF-LABEL USES**

Outside of U.S., systemic forms used for pneumocystis pneumonia (PCP), African sleeping sickness.

#### CONTRAINDICATIONS

Hypersensitivity to efformithine or any component of the formulation. **INTERACTIONS Drug, Herbal, and Food** None known.

## DIAGNOSTIC TEST EFFECTS

May elevate serum transaminases.

## SIDE EFFECTS

Frequent (> 10%) Acne, pseudofolliculitis barbae. Occasional (2%-10%)

Headache, stinging/burning skin, tingling skin, dry skin, pruritus, erythema, dyspepsia.

#### Rare (<1%)

Bleeding skin, rash, herpes simplex, folliculitis, rosacea.

#### SERIOUS REACTIONS

• Bleeding skin, cheilitis, contact dermatitis, herpes simplex, lip swelling, nausea, and weakness have been reported.

#### **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether effornithine is distributed in breast milk. Safety and efficacy of effornithine have not been established in children. No agerelated precautions have been noted in elderly patients.

Transient stinging or burning may occur when applied to broken or abraded skin.

#### Storage

Store at room temperature; do not freeze.

#### Administration

Continue to use other hair-removal techniques in conjunction with eflornithine. Apply eflornithine more than 5 min after hair removal. Avoid application on abraded or broken skin. Cosmetics or sunscreen may be applied over treated areas after cream has dried. Therapeutic improvement noted in 4-8 wks. Condition may return to pretreatment levels 8 wks after discontinuing treatment.

#### Eletriptan

elé-trip′tan

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

**Classification:** Migraine agents, serotonin agonists

## **MECHANISM OF ACTION**

A serotonin receptor agonist that binds selectively to vascular serotonin 5-HT1B, 5-HT1D, and 5-HT1F receptors, producing a vasoconstrictive effect on cranial blood vessels. *Therapeutic Effect:* Relieves migraine headache.

## PHARMACOKINETICS

Well absorbed after PO administration (50% bioavailability), peaks with 1.5 h. Metabolized by the liver to inactive metabolite by CYP3A4. Eliminated in urine (90%). *Half-life:* 4.4 h increased in patients with hepatic impairment and in elderly patients (older than 65 yr).

#### AVAILABILITY

Tablets: 20 mg, 40 mg.

#### INDICATIONS AND DOSAGES

## Acute migraine headache with or without aura

PO

*Adults, Elderly.* 20-40 mg. If headache improves but then returns, dose may be repeated after 2 h. Maximum: 80 mg/day.

## CONTRAINDICATIONS

Hypersensitivity to eletriptan, arrhythmias associated with angina, conduction disorders, coronary artery disease, ischemic heart disease, history of myocardial

Eletriptan (Generic Name), Relpax (Brand Name)

infarction, cerebrovascular disease, peripheral vascular disease, ischemic bowel disease, hemiplegic or basilar migraine, severe hepatic impairment, uncontrolled hypertension. Eletriptan should not be used within 24 h of another serotonin agonist (triptan) or an ergot-type medication; do not use within 72 h of a potent CYP3A4 inhibitor.

## INTERACTIONS

#### Drug

Clarithromycin, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, CYP3A4 inhibitors: May decrease eletriptan metabolism. Contraindicated within 72 h of eletriptan use. This list is not inclusive of all potent CYP3A4 inhibitors.

Ergotamine-containing medications: May produce a vasospastic reaction. Contraindicated within 24 h of eletriptan use. Sibutramine: May produce serotonin syndrome (marked by altered level of consciousness, CNS irritability, motor weakness, myoclonus, and shivering). Serotonin reuptake inhibitors/ serotonin agonists (triptans): May increase risk of serotonin syndrome. Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

**Common (5%-6%)** Dizziness, somnolence, asthenia, nausea.

#### Occasional (2%-4%)

Paresthesia, headache, dry mouth, warm or hot sensation, dyspepsia, dysphagia. Rare (< 2%)

Vomiting.

## SERIOUS REACTIONS

 Cardiac reactions (including ischemia, coronary artery vasospasm, and myocardial infarction) and noncardiac vasospasm-related reactions (such as hemorrhage and cerebrovascular accident [CVA]) occur rarely, particularly in patients with hypertension, diabetes, or a strong family history of coronary artery disease; obese patients; smokers; males older than 40 yr; and postmenopausal women.

• Serotonin syndrome has occurred; avoid concomitant use of serotonergic drugs. Increased BP and hypertensive crisis have occurred in patients with and without a history of hypertension.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with controlled hypertension, mild to moderate hepatic or renal impairment, and a history of CVA. Eletriptan should not be given to patients with risk factors predictive of coronary artery disease unless clinical evaluation demonstrates that the patient is free of cardiovascular disease. Eletriptan is distributed in breast milk, and caution should be exercised in lactating women. Eletriptan effects in pregnancy are unknown and may suppress ovulation. The safety and efficacy of eletriptan have not been established in children. Elderly patients are at increased risk for hypertension. Tasks that require mental alertness or motor skills should be avoided.

Notify the physician immediately if palpitations, pain or tightness in the chest or throat, pain or weakness in the extremities, or sudden or severe abdominal pain occurs. BP for evidence of uncontrolled hypertension should be assessed before treatment. Migraines and associated symptoms, including nausea and vomiting, photophobia, and phonophobia (sound sensitivity), should be assessed before and during treatment.

#### Storage

Store at room temperature. Protect from light and moisture.

#### Administration

Take film-coated tablets whole with fluids; don't crush or break them.

## Eltrombopag

el-trom'bo-pag

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Hemostatic agents, thrombopoietin receptor agonist (TPO-RA)

## **MECHANISM OF ACTION**

TPO-receptor agonist that interacts with the transmembrane domain of the human TPO-receptor and initiates signaling cascades that induce proliferation and differentiation of megakaryocytes from bone marrow progenitor cells. *Therapeutic Effect:* Improves platelet counts thereby reducing bleeding risk in idiopathic thrombocytopenic purpura (ITP).

## PHARMACOKINETICS

Peak concentrations occur 2-6 h after a dose; 52% bioavailable. Trivalent and divalent cations reduce absorption. Protein binding: > 99%. Concentrates in blood cells. CYP1A2 and CYP2C8 are responsible for the oxidative metabolism and UGT1A1 and UGT1A3 are responsible for the glucuronidation of the drug. Eltrombopag inhibits organic anion transporting polypeptide OATP1B1 and breast cancer resistance protein (BCRP). Mostly excreted in feces as metabolites; 20% excreted unchanged. *Half-life:* 26-35 h in ITP patients (increased in hepatic impairment).

#### AVAILABILITY

Tablets: 12.5 mg, 25 mg, 50 mg, 75 mg.

#### INDICATIONS AND DOSAGES Chronic idiopathic thrombocytopenic purpura (ITP) nonresponsive to other treatments PO

*Adults*. Initially, 50 mg once daily. Adjust based on patient response (see table).

#### Initial dose for hepatic impairment or in patients of East-Asian ancestry:

Initially, 25 mg PO once daily. If the patient is of Asian ancestry *and* has hepatic impairment, use 12.5 mg once daily.

# Dose adjustments according to CBC with differential:

#### Platelet Count | Dose Adjustment

< 50,000/mm <sup>3</sup>	Increase daily dose
following	by 25 mg to a
at least 2	maximum of 75
weeks of use	mg/day.
	For patients who
	were taking 12.5
	mg/day, increase
	the dose to 25 mg
	once daily before
	increasing the
	dose amount by
	25 mg.
200,000/mm <sup>3</sup> up	Decrease daily
to 400,000/	dose by 25 mg.
mm <sup>3</sup> at any	Reassess in 2
time	weeks.

Platelet Count	Dose Adjustment
>400,000/mm <sup>3</sup>	Stop the drug; increase monitoring of platelets to twice weekly. Once platelet count is < 150,000/mm <sup>3</sup> reini- tiate by reducing dose by 25 mg/day. For patients who were taking 25 mg/ day, reduce to 12.5 mg once daily.
>400,000/mm <sup>3</sup> after 2 weeks of therapy at lowest dose	Discontinue the drug.

## CONTRAINDICATIONS

None.

## INTERACTIONS

#### Drug

Antacids, iron preparations, calcium or magnesium supplements, multivitamins with minerals, selenium, sucralfate, zinc supplements: Decrease eltrombopag absorption via chelation. Separate times of administration by 4 hours. Moderate or strong inhibitors of CYP1A2 (e.g., ciprofloxacin or fluvoxamine) or CYP2C8 (e.g., gemfibrozil, trimethoprim): Monitor patients closely; eltrombopag exposure may increase. Substrates OATP1B1 and (BCRP), such as atorvastatin, fluvastatin, pravastatin, rosuvastatin, methotrexate, nateglinide, repaglinide, rifampin, doxorubicin: Eltrombopag may increase blood levels of these drugs; use with

caution and monitor closely. Herbal

#### Unknown.

#### Food

**Dairy products:** Reduce absorption of eltrombopag by chelation. Must separate dose from ingestion of these foods by 4 hours.

## DIAGNOSTIC TEST EFFECTS

Increases platelet counts. Goal is to achieve and maintain a platelet count  $\geq 50,000/\text{mm}^3$ , but not to normalize platelet count. May cause elevated hepatic enzymes and increased bilirubin. May increase alkaline phosphatase.

## SIDE EFFECTS

#### Frequent (> 3%)

Nausea, diarrhea, upper respiratory tract infection, vomiting, increased ALT or AST (LFTs), myalgia, urinary tract infection, increased bilirubin.

#### Occasional

Fatigue, oropharyngeal pain, pharyngitis, headache, myalgia, back pain, influenza, paresthesia, cataract formation, and rash.

## Rare

Alopecia.

## SERIOUS REACTIONS

· Hepatotoxicity.

• Bone fibrosis. Blood cell abnormalities on CBC may prompt need for bone marrow biopsy.

• Thrombotic or thromboembolic events from an increase in platelet counts.

• May increase the risk for hematologic malignancy (risk unknown).

## **PRECAUTIONS & CONSIDERATIONS**

Do not use the drug to try to completely correct platelet counts (see dosage). Use with caution in patients with known risk factors for thromboembolism (e.g., Factor V Leiden, antithrombin III deficiency, antiphospholipid syndrome, chronic liver disease), those with renal impairment, and those with preexisting hepatic disease. Animal data indicate the drug may cause fetal harm during pregnancy; it is not known if the drug is excreted in breast milk. Safety and efficacy have not been established in children. Patients of Asian descent need lower starting dosages.

Patients should avoid medications and activities that could increase the risk of bleeding. Obtain CBCs with differentials (including platelet counts) weekly during dose adjustment and monthly with stable dosing, and then weekly for at least 4 weeks following discontinuation of the drug. Measure serum alanine aminotransferase (ALT), aspartate aminotransferase (AST), and bilirubin prior to initiation and every 2 weeks during the dose adjustment phase, and monthly once on stable dose. If bilirubin is elevated, perform fractionation. If any liver test abnormal, confirm testing within 3-4 days. If any abnormalities are confirmed, monitor serum liver tests weekly until the abnormality(ies) resolve, stabilize, or return to baseline levels. Discontinue the drug if LFTs increase to  $\geq 3$  times the upper limit of normal (ULN) and are progressive, or persistent for  $\geq$  4 weeks, or accompanied by increased direct bilirubin, or there are clinical symptoms of liver injury or evidence for hepatic decompensation.

#### Storage

Store tablets at room temperature. Administration

Take eltrombopag tablets on an empty stomach (1 hour before or 2 hours after a meal). Do not take dairy products, antacids, or other medications or supplements containing divalent or trivalent cations (such as aluminum, calcium, magnesium, iron, or zinc) within 4 hours before or after a dose. Do not skip doses.

#### Emedastine

eh-med'ah-steen ★ ➡ Emadine

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

**Classification:** Ophthalmic antihistamine

## MECHANISM OF ACTION

An ophthalmic H<sub>1</sub> receptor antagonist that inhibits histaminestimulated vascular permeability in the conjunctiva. *Therapeutic Effect:* Relieves ocular itching associated with allergic conjunctivitis.

#### PHARMACOKINETICS

Negligible absorption after ophthalmic administration; amounts mostly below detection limits for assay.

#### AVAILABILITY

Ophthalmic Solution: 0.05%.

## INDICATIONS AND DOSAGES

 Allergic conjunctivitis
 OPHTHALMIC
 Adults, Elderly, Children 3 yr and older. 1 drop in affected eye(s) up to 4 times daily.

#### CONTRAINDICATIONS

Hypersensitivity to emedastine or any other component of the formulation.

#### DRUG INTERACTIONS

Drug None reported. Herbal and Food None known.

#### SIDE EFFECTS

Frequent Headache.

#### Occasional

Abnormal dreams, asthenia (loss of strength, energy), bad taste, blurred vision, burning or stinging, dry eyes, foreign body sensation, tearing.

## Rare

· Somnolence and malaise occur rarely.

## SERIOUS REACTIONS

None reported.

#### **PRECAUTIONS & CONSIDERATIONS**

For topical ophthalmic use only. Safety and effectiveness have not been established in children < 3 yr of age. Not known to what extent it is distributed in breast milk: use with caution.

#### Storage

Store at room temperature. Do not use more than 30 days after opening. Administration

Wash hands before use. Tilt head back slightly and gently pull the lower eyelid to form a pouch. Instill the drops and gently close eyes. Do not touch the tip of the dropper to any surface. Wait at least 10 min after use before inserting contact lenses.

## Emtricitabine

em-tri-site'uh-been 🛨 🍟 Emtriva

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Antiretroviral. nucleoside reverse transcriptase inhibitors

## MECHANISM OF ACTION

An antiretroviral that inhibits HIV-1 reverse transcriptase by incorporating itself into viral DNA, resulting in chain termination.

Therapeutic Effect: Interrupts HIV replication, slowing the progression of HIV infection.

## PHARMACOKINETICS

Rapidly and extensively absorbed from the GI tract. Bioavailability of capsules 93%, oral solution 75%. Relative bioavailability of oral solution approximately 80% of capsules. Excreted primarily in urine (86%) and, to a lesser extent, in feces (14%); 30% removed by hemodialysis. Unknown whether removed by peritoneal dialysis. Half-life: 10 h, children 5-18 h.

## **AVAILABILITY**

Capsules: 200 mg. Oral Solution: 10 mg/mL.

#### INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals)

PO

Adults, Elderly. 200-mg capsule or 240-mg (24-mL) oral solution once a day.

Children 3 months to 17 yr. 6 mg/kg (maximum 240 mg) of oral solution once daily.

Infants 0-3 months. 3mg/kg once daily (oral solution).

Adult dosage in renal impairment Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Capsule Dosage	Oral Solution Dosage
30-49	200-mg capsule q24h	120 mg (12 mL) q24h
15-29	200-mg capsule q72h	80 mg (8 mL) q24h
< 15	200-mg capsule q72h	60 mg (6 mL) q24h

Emtricitabine (Generic Name)

▶ Hemodialysis patients (give after hemodialysis) Adults. 200 mg q96h capsule or 60 mg q24h oral solution.

## **OFF-LABEL USES**

Part of non-occupational and occupational postexposure prophylaxis regimen for HIV infection (adults and children), reduction of perinatal transmission from HIVinfected mother to newborn.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

**Ribavirin, interferons:** Risk of hepatic decompensation may be increased.

#### **Herbal and Food**

None known.

## **DIAGNOSTIC TEST EFFECTS**

May elevate serum amylase, lipase, ALT (SGPT), AST (SGOT), creatinine kinase, and triglyceride levels. May alter blood glucose levels.

## SIDE EFFECTS

#### Frequent (13%-23%)

Headache, rhinitis, rash, diarrhea, nausea, fever, skin hyperpigmentation (especially children).

#### Occasional (4%-14%)

Cough, vomiting, abdominal pain, insomnia, abnormal dreams, depression, paresthesia, fatigue, dizziness, peripheral neuropathy, dyspepsia, myalgia.

#### Rare (2%-3%)

Arthralgia, redistribution of body fat.

## SERIOUS REACTIONS

 Lactic acidosis and hepatomegaly with steatosis occur rarely and may be severe. Severe acute exacerbations of hepatitis B may occur. • Anemia has been reported more commonly in children.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired liver, and dosage adjustments recommended for renal dysfunction. Be aware that breastfeeding is not recommended. In elderly patients, age-related decreased renal function may require dosage adjustment. Emtricitabine is not a cure for HIV infection, nor does it reduce risk of transmission to others. Emtricitabine is not indicated for hepatitis B. Patients with hepatitis B may have flare-ups on discontinuation, and liver function should be monitored closely.

Expect to obtain baseline laboratory testing, especially liver function tests and triglycerides, before beginning emtricitabine therapy and at periodic intervals during therapy. Assess for any nausea or vomiting and skin for rash and urticaria. Determine pattern of bowel activity and stool consistency.

#### Storage

Store capsules at room temperature. Store the oral solution in a refrigerator; do not freeze. May keep at room temperature for up to 3 mo; discard any remaining solution after that time.

#### Administration

Take without regard to food, at approximately the same time daily. Continue emtricitabine therapy for the full length of treatment.

## Enalapril

en-al'a-pril Vasotec Do not confuse with Anafranil, Eldepryl, or ramipril.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D (C if used in first trimester)

*Classification:* Antihypertensives, angiotensin-converting enzyme inhibitors

## **MECHANISM OF ACTION**

This angiotensin-converting enzyme (ACE) inhibitor suppresses the reninangiotensin-aldosterone system and prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; it may inhibit angiotensin II at local vascular, renal sites. Decreases plasma angiotensin II, increases plasma renin activity, and decreases aldosterone secretion. Therapeutic Effect: In hypertension, reduces peripheral arterial resistance. In congestive heart failure (CHF), increases cardiac output; decreases peripheral vascular resistance, BP, pulmonary capillary wedge pressure, heart size.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	4-6 h	24 h
IV	15 min	1-4 h	6 h

Readily absorbed from the GI tract (not affected by food). Protein binding: 50%-60%. Enalaprilat, the IV form, is rapidly converted to active metabolite. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 11 h (half-life is increased in those with impaired renal function).

## AVAILABILITY

*Tablets:* 2.5 mg, 5 mg, 10 mg, 20 mg. *Injection:* 1.25 mg/mL.

## INDICATIONS AND DOSAGES

## Hypertension alone or in combination with other antihypertensives

*Adults, Elderly.* Initially, 2.5-5 mg/day. Range: 10-40 mg/day in 1-2 divided doses.

Children > 1 mo. 0.08 mg/kg/day (up to 5 mg) in 1-2 divided doses. Maximum: 0.58 mg/kg/day (not to exceed 40 mg). IV

Adults, Elderly. 0.625-1.25 mg q6h

up to 5 mg q6h. *Children >1 mo.* 5-10 mcg/kg/dose q8-24h.

# Adjunctive therapy for congestive heart failure PO

#### O dults. Ela

*Adults, Elderly.* Initially, 2.5-5 mg/ day. Range: 5-20 mg/day in 2 divided doses. Maximum dose: 40 mg/day in 2 divided doses.

## Adult oral dosage in renal impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	% Usual PO Dose
10-50	75-100
< 10	50

Enalapril should not be used in children with  $CrCl \le 30 \text{ mL/min}$ .

## **OFF-LABEL USES**

Treatment of diabetic nephropathy, nondiabetic kidney disease, or renal crisis in scleroderma, left ventricular dysfunction after myocardial infarction, Raynaud's phenomenon.

Enalapril (Generic Name)

# CONTRAINDICATIONS

Hypersensitivity or history of angioedema from previous treatment with ACE inhibitors, idiopathic or hereditary angioedema, bilateral renal artery stenosis.

# INTERACTIONS

#### Drug

#### Alcohol, antihypertensives,

diuretics: May increase the effects of enalapril.

Aspirin: May decrease effectiveness of enalapril.

**Lithium:** Increased risk of lithium toxicity.

**NSAIDs:** Renal adverse effects may be increased.

Potassium-sparing diuretics, drospirenone, potassium supplements: Increased risk of hyperkalemia. Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, SGOT (AST), and SGPT (ALT) levels. May decrease serum sodium levels. May cause positive ANA titer or decreased WBC.

# IV INCOMPATIBILITIES

Amphotericin B (Fungizone), caspofungin (Cancidas), cefepime (Maxipime), dantrolene, diazepam (Valium), lansoprazole (Prevacid), nesiritide (Natrecor), phenytoin.

# SIDE EFFECTS

### Frequent (5%-7%)

Headache, dizziness, hypotension, increased serum creatinine.

# Occasional (2%-3%)

Orthostatic hypotension, fatigue, diarrhea, cough, syncope.

# Rare (< 2%)

Angina, abdominal pain, vomiting, nausea, rash, asthenia (loss of strength, energy), syncope.

# SERIOUS REACTIONS

• Excessive hypotension (first-dose syncope) may occur in patients with CHF and in those who are severely salt or volume depleted.

• Angioedema (swelling of face, lips; especially after first dose).

• Hyperkalemia may occur, especially with concomitant potassium-altering agents.

• Agranulocytosis and neutropenia may be noted in collagen vascular diseases, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in those with history of renal disease.

• Cholestatic jaundice, which may progress to hepatic necrosis.

• Renal dysfunction may occur. Increases in serum creatinine may occur after initiation of therapy. Monitor serum creatinine and discontinue if progressive or severe decline in function.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cerebrovascular and coronary insufficiency, hypovolemia, renal impairment, unilateral renal artery stenosis, valvular stenosis, sodium depletion, and those on dialysis or receiving diuretics or anesthesia. Be aware that enalapril crosses the placenta and is distributed in breast milk. Enalapril may cause fetal or neonatal morbidity or mortality and should not be used during pregnancy. Discontinue as soon as pregnancy is detected. Enalapril is not used in neonates or in children with severe renal impairment. Elderly patients

may be more susceptible to the hypotensive effects of enalapril.

Dizziness may occur. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the person in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning enalapril therapy, then every 2 wks for the next 3 mo, and periodically thereafter.

#### Storage

Store tablets and vials at room temperature; compounded oral suspension should be refrigerated and used within 30 days of preparation.

#### Administration

Tablets: May administer without regard to meals.

IV: May be administered undiluted, or in up to 50 mL of a compatible IV solution (e.g., D5W, 0.9% NaCl). Administer IV over at least 5 min.

The manufacturer allows for the preparation of an oral suspension if needed for children; shake well before each use.

# Enfuvirtide

en-few'vir-tide Fuzeon Do not confuse Fuzeon with Furoxone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antivirals, fusion inhibitors

#### MECHANISM OF ACTION

A fusion inhibitor that interferes with the entry of HIV-1 into CD4<sup>+</sup> cells by inhibiting the fusion of vial and cellular membranes. *Therapeutic Effect:*  Impairs HIV replication, slowing the progression of HIV infection.

# PHARMACOKINETICS

Comparable absorption when injected into subcutaneous tissue of abdomen, arm, or thigh. Protein binding: 92% (mainly albumin). Undergoes catabolism to amino acids. *Half-life:* 3.8 h.

#### AVAILABILITY

*Powder for Injection:* 108-mg (approximately 90 mg/mL when reconstituted) single-use vials.

# INDICATIONS AND DOSAGES

 HIV infection (in combination with other antiretrovirals)

SUBCUTANEOUS

Adults, Elderly. 90 mg (1 mL) twice a day.

#### Pediatric dosing guidelines

*Children 6-16 yr.* 2 mg/kg twice a day. Maximum: 90 mg twice a day.

Weight (kg)	mg/Dose (ml)
11-15.5	27 (0.3) (give BID)
15.6-20	36 (0.4) (give BID)
20.1-24.5	45 (0.5) (give BID)
24.6-29	54 (0.6) (give BID)
29.1-33.5	63 (0.7) (give BID)
33.6-38	72 (0.8) (give BID)
38.1-42.5	81 (0.9) (give BID)
> 42.5	90 (1) (give BID)

#### CONTRAINDICATIONS

Hypersensitivity to enfuvirtide or any of its components.

#### INTERACTIONS

None known.

#### DIAGNOSTIC TEST EFFECTS

May elevate blood glucose and serum amylase, CK, lipase, triglyceride, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin levels and WBC count.

#### SIDE EFFECTS

#### Expected (98%)

Local injection site reactions (pain, discomfort, induration, erythema, nodules, cysts, pruritus, ecchymosis).

Frequent (16%-26%)

Diarrhea, nausea, fatigue. Occasional (4%-11%)

Insomnia, peripheral neuropathy, depression, cough, decreased appetite or weight loss, sinusitis, anxiety, asthenia, myalgia, cold sores, infections.

#### Rare (2%-3%)

Constipation, influenza, upper abdominal pain, anorexia, conjunctivitis, infection at injection site, flu-like syndrome.

#### SERIOUS REACTIONS

 Enfuvirtide use may potentiate bacterial pneumonia.

· Hypersensitivity (rash, fever, chills, rigors, hypotension), thrombocytopenia, neutropenia, and renal insufficiency or failure may occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with liver function impairment. Breastfeeding is not recommended because of the possibility of HIV transmission. Be aware that the safety and efficacy of enfuvirtide have not been established in children younger than 6 yr of age. No agerelated precautions have been noted in elderly patients. Increased rate of bacterial pneumonia has occurred with enfuvirtide use. Seek medical attention if cough with fever, rapid breathing, or shortness of breath occurs. Enfuvirtide is not a cure for HIV infection, nor does it reduce risk of transmission to others.

Expect to obtain baseline laboratory testing, especially liver function tests

and serum triglyceride levels, before beginning enfuvirtide therapy and at periodic intervals during therapy. Assess for hypersensitivity reaction and local injection site reaction, fatigue or nausea, depression, and insomnia. Storage

Store at room temperature or in a refrigerator. Do not freeze. Refrigerate reconstituted solution; use within 24 h. Bring reconstituted solution to room temperature before injection. Administration

Reconstitute with 1.1 mL sterile water for injection. Gently tap vial for 10 seconds and then gently roll between the hands to avoid foaming and to ensure that all particles of drug are in contact with the liquid and no drug remains on the vial wall. Allow to stand until the powder goes completely into solution, which could take up to 45 min. Reconstitution time can be reduced by gently rolling the vial between the hands until completely dissolved. Ensure solution is clear, colorless, and without bubbles. Final concentration is 90 mg/mL. Discard unused portion. Administer subcutaneously into the upper abdomen, anterior thigh, or upper arm. Administer each injection at a different site and only where there is no injection site reaction. Continue taking enfuvirtide for the full length of treatment.

#### Enoxaparin

e-nox-ah-pair'in 🗙 🍟 Lovenox Do not confuse Lovenox with Lotronex.

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

Classification: Anticoagulants. low-molecular-weight heparins

# **MECHANISM OF ACTION**

A low-molecular-weight heparin that potentiates the action of antithrombin III and inactivates coagulation factor Xa. *Therapeutic Effect:* Produces anticoagulation. Does not significantly influence bleeding time, PT, or aPTT.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
Subcutaneous	N/A	3-5 h	12 h

Well absorbed after subcutaneous (SC) administration. Eliminated primarily in urine. Not removed by hemodialysis. *Half-life:* 4.5 h.

# AVAILABILITY

*Injection:* 30 mg/0.3 mL, 40 mg/0.4 mL, 60 mg/0.6 mL, 80 mg/0.8 mL, 100 mg/mL, 120 mg/0.8 mL, 150 mg/mL in prefilled syringes. Multidose vial 100 mg/mL (3 mL).

# INDICATIONS AND DOSAGES

# Prevention of deep vein thrombosis (DVT) after hip and knee surgery

SC

Adults, Elderly. 30 mg twice a day, generally for 7-10 days. Initial dose 12-24 h after surgery (if hemostasis established). For hip replacement, initial dose may be given 12 h before surgery. After initial thromboprophylaxis in hip replacement, 40 mg once daily for 3 wks is recommended.

# Prevention of DVT after abdominal surgery

SC

*Adults, Elderly.* 40 mg once a day for 7-10 days. Initial dose given 2 h before surgery.

 Prevention of long-term DVT in nonsurgical acute illness
 SC *Adults, Elderly.* 40 mg once a day for 6-11 days, up to 14 days in clinical trials.

# Prevention of ischemic complications of unstable angina and non-Q-wave MI (with oral aspirin therapy)

SC

*Adults, Elderly.* 1 mg/kg q12h. Should be given for minimum of 2 days and until clinical stabilization, usual duration 2-8 days.

#### Treatment of acute ST-segment elevation myocardial infarction IV/SC

*Adults.* Bolus 30 mg IV once followed by 1 mg/kg SC, then 1 mg/kg SC q12h (maximum 100 mg for first two doses, followed by 1 mg/kg dosing for remaining doses).

*Elderly* > 75 yr. Do not give IV bolus. Start with 0.75 mg/kg SC q12h (maximum 75 mg for the first two doses, followed by 0.75 mg/kg dosing for remaining doses). Note, all STEMI patients: When administered in conjunction with a thrombolytic, give between 15 min before and 30 min after the start of therapy. All patients should receive aspirin for STEMI and be maintained with 75-325 mg once daily unless contraindicated. Treatment duration until hospital discharge. For patients managed with percutaneous coronary intervention (PCI): If the last SC administration was given < 8 h before balloon inflation, no additional dosing is needed. If the SC administration was given more than 8 h before balloon inflation, an IV bolus of 0.3 mg/kg should be administered.

# Acute DVT

SC

*Adults, Elderly.* 1 mg/kg q12h or 1.5 mg/kg once daily. Initiate warfarin within 72 h. Continue

enoxaparin for minimun of 5 days and until therapeutic INR achieved (INR 2-3).

# • Usual pediatric dosage SC

*Children* > 2 mo to 18 yr. 0.5 mg/kg q12h (prophylaxis); 1 mg/kg q12h (treatment).

Dosage in renal impairment

Clearance of enoxaparin is decreased when creatinine clearance is < 30 mL/min. Monitor patient and adjust dosage as necessary. Monitoring of anti-factor Xa activity may be warranted. When enoxaparin is used in abdominal, hip, or knee surgery or acute illness, the adult dosage in renal impairment is 30 mg once a day. When used to treat DVT, angina, or non-Q-wave MI, the dosage in renal impairment is 1 mg/kg once a day. Treatment of acute ST-segment elevation MI (< 75 yr of age) dose is 30 mg IV bolus plus 1 mg/kg SC dose followed by 1 mg/kg SC once daily. Treatment of acute ST-segment elevation MI (> 75 yr) is 1 mg/kg SC once daily.

# IV INCOMPATIBILITIES

Do not mix with other medications.

# **OFF-LABEL USES**

Prevention of DVT following general surgical procedures, acute arterial thrombosis, prevention of thrombosis with hemodialysis, lichen planus, thrombophilia in pregnancy.

# CONTRAINDICATIONS

Active major bleeding, concurrent heparin therapy, hypersensitivity to heparin or pork products, hypersensitivity to benzyl alcohol (multidose vial), thrombocytopenia associated with positive in vitro test for antiplatelet antibodies.

#### INTERACTIONS Drug

Anticoagulants, platelet inhibitors: May increase bleeding. Herbal

Supplements with antiplatelet or anticoagulant effects (e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow, etc.): May increase effects on platelets or risk of bleeding.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

Increases (reversible) LDH, serum alkaline phosphatase, AST (SGOT), ALT (SGPT), and anti-factor Xa levels. May decrease platelet counts.

# SIDE EFFECTS

Occasional (1%-4%)

Injection site hematoma, fever, nausea, hemorrhage, peripheral edema.

# SERIOUS REACTIONS

• Overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage. Antidote: Protamine sulfate (1% solution) equal to the dose of enoxaparin injected. 1 mg protamine sulfate neutralizes 1 mg enoxaparin. A second dose of 0.5 mg protamine sulfate per 1 mg enoxaparin may be given if aPTT tested 2-4 h after first injection remains prolonged.

• Spinal or epidural hematomas resulting in paralysis have occurred. Risk is increased in patients with postoperative indwelling epidural catheters.

· Heparin-induced thrombocytopenia.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with conditions associated with

increased risk of hemorrhage (e.g., bacterial endocarditis, congenital or acquired bleeding disorders, active ulcerative and angiodysplastic GI disease, hemorrhagic stroke, or shortly after brain, spinal, or ophthalmologic surgery, or in patients treated concomitantly with platelet inhibitors), history of recent GI ulceration and hemorrhage, history of heparin-induced thrombocytopenia, impaired renal function, uncontrolled arterial hypertension, thrombocytopenia, indwelling epidural catheters, and in elderly patients. Enoxaparin should be used with caution in pregnant women, particularly during the last trimester and immediately postpartum, because it increases the risk of maternal hemorrhage. It is unknown whether enoxaparin is excreted in breast milk. Safety and efficacy of enoxaparin have not been established in children. Elderly patients may be more susceptible to bleeding. Women may experience heavier menstrual flow. Other medications, including OTC drugs, should be avoided. An electric razor and soft toothbrush should be used to prevent bleeding during therapy.

Notify the physician of abdominal or back pain, severe headache or neurologic impairment, black or red stool, coffee-ground vomitus, dark or red urine, or red-speckled mucus from cough. CBC and stool for occult blood should be periodically monitored. Be aware of signs of bleeding, including bleeding at injection or surgical sites or from gums, blood in stool, bruising, hematuria, and petechiae. **Storage** 

# Store at room temperature. Administration

! Do not give IM. Give initial dose as soon as possible after surgery but not

more than 24 h after surgery.

The patient should lie down before administering by deep subcutaneous injection. Inject between the left and right anterolateral and left and right posterolateral abdominal wall. Introduce entire length of needle (one-half inch) into skinfold held between thumb and forefinger, holding skinfold during injection. Alternate sites of administration; do not rub injection site after administration.

For IV use: Use the multiple-dose vial and use a graduated syringe to ensure proper dosing.

Give IV bolus through line. Do not mix or give with other drugs. Flush the IV access port with a sufficient amount of compatible IV solution before and after administration. May be safely administered with 0.9% NaCl or D5W.

#### Entacapone

en-tak'a-pone

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, COMT inhibitors

#### MECHANISM OF ACTION

An antiparkinsonian agent that inhibits the enzyme catechol *O*-methyltransferase (COMT), potentiating dopamine activity and increasing the duration of action of levodopa. *Therapeutic Effect:* Decreases signs and symptoms of Parkinson's disease.

# PHARMACOKINETICS

Rapidly absorbed after PO administration (peak effect 1 h). Protein binding: 98% (primarily

Entacapone (Generic Name), Comtan (Brand Name)

albumin). Metabolized in the liver. Primarily eliminated by biliary excretion. Not removed by hemodialysis. *Half-life:* 2.4 h.

# AVAILABILITY

Tablets: 200 mg.

# INDICATIONS AND DOSAGES Adjunctive treatment of Parkinson's disease

PO

*Adults, Elderly.* 200 mg concomitantly with each dose of carbidopa and levodopa up to a maximum of 8 times a day (1600 mg).

### CONTRAINDICATIONS

Hypersensitivity, use within 14 days of nonselective MAOIs.

#### INTERACTIONS

#### Drug

Ampicillin, cholestyramine, erythromycin, probenecid: May decrease the excretion of entacapone. Bitolterol, dobutamine, dopamine, epinephrine, isoetharine, isoproterenol, epinephrine, methyldopa, norepinephrine: May increase the risk of arrhythmias and changes in BP. Nonselective MAOIs (including phenelzine): May inhibit

catecholamine metabolism and increase risk of cardiovascular side effects such as hypertensive crisis. Contraindicated.

Other central nervous system (CNS) depressants: May increase CNS depression.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent (> 10%)

Dyskinesia, hyperkinesia, nausea, dark yellow or orange urine and sweat, diarrhea.

### Occasional (3%-9%)

Abdominal pain, vomiting, constipation, hallucinations, dry mouth, fatigue, back pain.

Rare (< 2%)

Anxiety, somnolence, agitation, dyspepsia, flatulence, diaphoresis, asthenia, dyspnea.

### SERIOUS REACTIONS

 Rhabdomyolysis and neuroleptic malignant syndrome have occurred rarely.

• Rare reports of loss of impulse control, such as urge to gamble excessively or unusual sexual urges.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with hepatic or renal impairment, dyskinesia, orthostatic hypotension, and syncope. It is unknown whether entacapone is distributed in breast milk. There are no human pregnancy data. This drug is not indicated for children. No age-related precautions have been noted in elderly patients.

Tasks that require mental alertness or motor skills should be avoided until drug effects are known. Notify the physician if uncontrolled movement of the hands, arms, legs, eyelids, face, mouth, or tongue occurs. Baseline vital signs should be obtained. Relief of symptoms, such as improvement of mask-like facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should be assessed during treatment. Dyskinesia, diarrhea, and orthostatic hypotension should also be monitored. Do not withdraw abruptly as rapid withdrawal may lead to hyperpyrexia and confusion

resembling neuroleptic malignant syndrome.

#### Storage

Store at room temperature.

#### Administration

! Always administer entacapone with carbidopa and levodopa.

Take entacapone without regard to food.

Entecavir

en-te'ca-veer 📩 齡 Baraclude

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antivirals,

nucleoside reverse transcriptase inhibitors

# **MECHANISM OF ACTION**

A guanosine nucleoside analog with activity against HBV polymerase. Drug inhibits all three activities of the HBV polymerase (reverse transcriptase): (1) base priming, (2) reverse transcription of the negative strand from the pregenomic messenger RNA, and (3) synthesis of the positive strand of HBV DNA. NOTE: Unlike other NRTIs, entecavir is not recommended as monotherapy in HBV-positive patients coinfected with the HIV virus due to the development of drug resistance. Therapeutic Effect: Interrupts HBV replication, slowing the progression of or improving the clinical status of hepatitis infection.

#### PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Administration with food significantly decreases oral absorption. Protein binding: 13%. Widely distributed. Primarily excreted in urine predominantly unchanged and small amounts of glucuronide and sulfate metabolites via glomerular filtration and net tubular secretion. Some removal by hemodialysis. *Terminal half-life*: 128-149 h (intracellular), 15 h (serum, adults), (increased in impaired renal function).

#### AVAILABILITY

Oral Solution: 0.05 mg/mL. Tablets: 0.5 mg, 1 mg.

# INDICATIONS AND DOSAGES

# Chronic hepatitis B (compensated)

For nucleoside-treatment-naïve patients:

PO

*Adults, Children* > 16 yr. 0.5 mg once daily. Optimal duration of therapy unknown.

For patients with lamivudine or telbivudine resistance:

PO

*Adults, Children* > *16 yr.* 1 mg once daily. Optimal duration of therapy unknown.

# Chronic hepatitis B (decompensated liver disease) PO

*Adults.* 1 mg once daily. Optimal duration of therapy unknown.

#### Dosage in renal impairment (adult and adolescent)

Dosage and frequency are modified based on creatinine clearance. Use once-daily dose options whenever possible. NOTE: For doses less than 0.5 mg, use the oral solution.

CrCl (mL/min)	Naïve Patients	Lamivudine- Refractory Patients
≥ 50	Use usual dose	Use usual dose
30-49	0.25 mg QD or 0.5 mg a48h	0.5 mg ΩD or 1 mg q48h

or CAPD)*	every 7	7 days	
	days		

*CAPD*, continuous ambulatory peritoneal dialysis.

\*If administered on a hemodialysis day, administer after the hemodialysis session.

# CONTRAINDICATIONS

Hypersensitivity.

# INTERACTIONS

#### Drug

Metformin: Theoretically, competition for tubular secretion may increase risk of lactic acidosis. Herbal

None known.

#### Food

All food: Decreases oral absorption. Take on empty stomach.

# DIAGNOSTIC TEST EFFECTS

May increase serum AST (SGOT) and ALT (SGPT). Occasionally see elevated blood glucose, serum creatinine, or serum lipase.

### SIDE EFFECTS

#### Frequent

Headache, fatigue, dizziness, nausea. Occasional

Diarrhea, dyspepsia/indigestion, vomiting, sleepiness, insomnia.

#### Rare

Rash, alopecia.

### SERIOUS REACTIONS

- · Anaphylactoid reactions occur rarely.
- · Lactic acidosis.
- · Severe hepatomegaly with steatosis.

# **PRECAUTIONS & CONSIDERATIONS**

Entecavir may cause development of HIV resistance in hepatitis B patients coinfected with HIV. Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported with the use of nucleoside analogs alone or in combination with antiretrovirals; females appear to have a higher risk. Obesity and prolonged nucleoside exposure may be risk factors. Caution is warranted in patients with impaired renal function. Be aware that the drug is likely to cross the placenta, and that there are no adequate data in pregnant women. It is unknown whether entecavir is distributed in breast milk. Breastfeeding is not recommended in patients coinfected with HIV due to risk of HIV transmission. Be aware that the safety and efficacy of this drug have not been established in children younger than 16 yr. In elderly patients, age-related renal impairment may require dosage adjustment.

Before starting drug therapy, check baseline lab values, especially renal function. Expect to monitor serum liver function tests, BUN, and serum creatinine. Assess for altered sleep patterns, dizziness, headache, nausea, and pattern of daily bowel activity and stool consistency. Avoid activities that require mental acuity if dizziness occurs until the effects of the drug are known. Patients should be advised not to stop taking the drug suddenly, as this can cause a worsening of hepatitis that may be sudden. Hepatic function should be monitored closely for at least several months after discontinuation. Treatment with entecavir does not reduce the risk

of transmission of HBV to others through sexual contact or blood contamination.

#### Storage

Store at room temperature in tightly closed container. Protect from moisture and light.

# Administration

Take on an empty stomach (2 h before or 2 h after meals) at about the same time each day. If using the oral solution, use the dosing spoon provided. Rinse the spoon with water after each use and allow it to air dry.

# Ephedrine

eh-fed'rin **Do not confuse with epinephrine.** 

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Adrenergic agonists, decongestants, vasopressors.

# **MECHANISM OF ACTION**

An adrenergic agonist that stimulates  $\alpha$ -adrenergic receptors causing vasoconstriction and pressor effects;  $\beta_1$ -adrenergic receptors, resulting in cardiac stimulation; and  $\beta_2$ -adrenergic receptors, resulting in bronchial dilation and vasodilation. *Therapeutic Effect:* Increases BP and pulse rate.

# PHARMACOKINETICS

Well absorbed after oral, nasal, and parenteral absorption. Metabolized in liver to small extent. Excreted in urine. *Half-life:* 3-6 h. Onset of bronchodilation: 15 min to 1 h. Duration (oral): 3-6 h.

### AVAILABILITY

Injection: 50 mg/mL.

# INDICATIONS AND DOSAGES Asthma

IM/IV/SQ

Adults. 12.5-25 mg. Maximum dose: 150 mg/day. Children > 2 yr. 2-3 mg/kg/day or 100 mg/m<sup>2</sup>/day divided into 4-6 doses/day. > Hypotension

#### IM

Adults. 25-50 mg as a single dose. Maximum: 150 mg/day. IV Adults. 5 mg/dose slow IVP as prevention. 10-25 mg/dose slow IVP repeated q5-10 min as treatment. Maximum: 150 mg/day. *Children*. 0.2-0.3 mg/kg/dose slow IVP q4-6h. SUBCUTANEOUS Adults. 25-50 mg q4-6h. Maximum: 150 mg/day. *Children*. 3 mg/kg/day in divided doses q4-6 h.

# CONTRAINDICATIONS

Anesthesia with cyclopropane or halothane, diabetes (ephedrine injection), hypersensitivity to ephedrine or other sympathomimetic amines, hypertension or other cardiovascular disorders, myocardial infarction, angina, arrhythmias, obstetrics with maternal blood pressure above 130/80, thyrotoxicosis, angle-closure glaucoma.

#### INTERACTIONS Drug

Atropine, MAOIs, oxytocics, tricyclic antidepressants: May increase cardiovascular effects. α-Adrenergic, β-adrenergic blockers: May blunt ephedrine vasopressor effects. Caffeine: May increase cardiac stimulation. Cardiac glycosides, sympathomimetics, theophylline, general anesthetics: May increase toxic cardiac stimulation.

#### Herbal

Ephedra (ma huang) guarana, kola nut, green tea, bitter

orange, yohimbe: May increase central nervous system (CNS) and cardiovascular stimulation and effects.

#### Food

Excessive amounts of caffeine such as in chocolate, cocoa, coffee, cola, or tea should be avoided.

# DIAGNOSTIC TEST EFFECTS

May result in false-positive amphetamine EMIT assay. Lactic acid serum values may be increased.

# IV INCOMPATIBILITIES

Dantrolene, diazepam, hydrocortisone sodium succinate (Solu-Cortef), pantoprazole (Protonix), phenobarbital (Luminal), phenytoin, thiopental (Thioplex).

# **IV COMPATIBILITIES**

Chloramphenicol, etomidate (Amidate), fenoldopam (Corlopam), lidocaine, methotrexate, milrinone (Primacor), nafcillin (Unipen), penicillin G, propofol (Diprivan), tetracycline, tigecycline (Tygacil), vecuronium (Norcuron).

# SIDE EFFECTS

#### Frequent

Hypertension, anxiety, agitation. Occasional

Nausea, vomiting, palpitations, tremor, chest pain, BP changes, tachycardia, hallucinations, restlessness, diaphoresis, xerostomia.

Nasal: Burning, stinging, runny nose. Rare

Psychosis, decreased/painful urination, necrosis at injection site from repeated injections.

# SERIOUS REACTIONS

• Excessive doses may cause hypertension, intracranial hemorrhage, anginal pain, arrhythmias (including ventricular tachycardia), myocardial infarction, cardiac arrest.

• Stroke, transient ischemic attack, seizures.

 Prolonged or excessive use may result in metabolic acidosis as a result of increased serum lactic acid concentrations.

 Observe for disorientation, weakness, hyperventilation, headache, nausea, vomiting, and diarrhea.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with angina, coronary artery disease, diabetes, hypoxia (lack of oxygen), heart attack, psychiatric disorders, tachycardia, severe liver or kidney impairment, seizure disorder, thyroid disorders, prostatic hypertrophy, and in elderly patients. Ephedrine crosses the placenta and is distributed in breast milk and breastfeeding should be avoided. Changes in vital signs and proper lung function should be monitored.

## Storage

Injectable should be stored at room temperature and protected from light. Administration

Ampule should be shaken thoroughly. Solution should not be used if it appears discolored or contains a precipitate. A tuberculin syringe for subcutaneous injection into lateral deltoid muscle region should be used and injection site massaged.

For IV use, each 1 mg of 1:1000 solution is diluted with 10 mL 0.9% NaCl to provide 1:10,000 solution, and injected as each 1 mg or fraction thereof over more than 1 min. For infusion, preparation should be further diluted with 250-500 mL D5W. Maximum concentration is 64 mg/250 mL, the recommended rate of IV infusion is 1-10 mcg/min, adjusted to desired response.

# **Epinastine**

ep'i-nas'teen ★ Elestat

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Antihistamines, H<sub>1</sub>, ophthalmics

# **MECHANISM OF ACTION**

An ophthalmic  $H_1$  receptor antagonist that inhibits the release of histamine from the mast cell. *Therapeutic Effect:* Prevents pruritus associated with allergic conjunctivitis.

# PHARMACOKINETICS

Low systemic exposure. Protein binding: 64%. Less than 10% is metabolized. Excreted primarily in urine and, to a lesser extent, in feces. *Half-life*:12 h.

# AVAILABILITY

Ophthalmic Solution: 0.05% (5 mL).

# INDICATIONS AND DOSAGES Allergic conjunctivitis

OPHTHALMIC

Adults, Elderly, Children 3 yr and older: 1 drop in each eye twice a day. Continue treatment until period of exposure (pollen season, exposure to offending allergen) is over.

# CONTRAINDICATIONS

Hypersensitivity to epinastine or any of its components.

### INTERACTIONS

Drug None known.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

SIDE EFFECTS

# Occasional

Ocular (1%-10%): Burning sensation in the eye, hyperemia, pruritus. Nonocular (10%): Cold symptoms, upper respiratory tract infection. Rare (1%-3%)

Headache, rhinitis, sinusitis, increased cough, pharyngitis.

# SERIOUS REACTIONS

None known.

# PRECAUTIONS & CONSIDERATIONS

Not to be used to treat contact lensassociated irritation. It is not known whether epinastine is distributed in breast milk. The safety and efficacy of epinastine have not been established in children younger than 3 yr. No age-related precautions have been noted in elderly patients. Therapeutic response should be monitored.

#### Storage

Store bottle at room temperature. Administration

For ophthalmic use, place a finger on the lower eyelid, and pull it out until a pocket is formed between the eye and lower lid. Don't let the applicator tip touch any surface. Place the prescribed number of drops in the pocket. Close the affected eye gently. Apply gentle pressure to the lacrimal sac at the inner canthus for 1 min after installation to lessen the risk of systemic absorption. Remove contact lenses before instilling epinastine because the lenses may absorb the drug's preservatives. The lenses may be reinserted 10 min after administration unless the treated eye is red.

Epinephrine

ep-i-nef'rin Adrenalin, Adrenaclick, EpiPen, EpiPen Jr., S2, Twinject Do not confuse epinephrine with ephedrine.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Rx: Injection, topical solution

**Classification:** Adrenergic agonists, bronchodilators, inotropes

# **MECHANISM OF ACTION**

A sympathomimetic, adrenergic agonist that stimulates  $\beta$ -adrenergic receptors, causing vasoconstriction and pressor effects;  $\beta_1$ -adrenergic receptors, resulting in cardiac stimulation; and  $\beta_2$ -adrenergic receptors, resulting in bronchial dilation and vasodilation. *Therapeutic Effect:* Relaxes smooth muscle of the bronchial tree, produces cardiac stimulation, and dilates skeletal muscle vasculature.

# PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration (h)
IM	5-10	20	1-4
Subcutaneous	5-10	20	1-4
Inhalation	1-5	20	1-3

Well absorbed after parenteral administration; minimally absorbed after inhalation. Metabolized in the liver, other tissues, and sympathetic nerve endings. Excreted in urine.

# AVAILABILITY

Injection: 0.1 mg/mL, 1 mg/mL. Injection (EpiPen): 0.3 mg/0.3 mL, 0.15 mg/0.3 mL. Injection (Twinject): 0.15 mg/0.15 mL and 0.3 mg/0.3 mL. Inhalation, Solution: 2.25% (racepinephrine).

# INDICATIONS AND DOSAGES Asystole IV

Adults, Elderly. 1 mg q3-5min up to 0.1 mg/kg q3-5min. Infants, Children. 0.01 mg/kg (0.1 mL/ kg of 1:10,000 solution). May repeat q3-5min. Subsequent doses of 0.1 mg/ kg (0.1 mL/kg) of a 1:1000 solution q3-5min. Maximum: 1 mg (10 mL). ENDOTRACHEAL Adults. 2-2.5 mg via ET, may repeat every 3-5 min. Children, Infants. 0.1 mg/kg (0.1 mL/kg of 1:1000 solution). May repeat q3-5min. Maximum: 10 mg. Bradycardia IV INFUSION Adults, Elderly. 1-10 mcg/min titrated to desired effect. IV Infants, Children. 0.01 mg/kg (0.1 mL/kg of 1:10,000 solution) q3-5min. Maximum: 1 mg (10 mL). Bronchodilation IM, SUBCUTANEOUS Adults, Elderly. 0.3-0.5 mg (1:1000) q20min to 4 h for 3 doses. SUBCUTANEOUS Children. 10 mcg/kg (0.01 mL/kg of 1:1000). Maximum: 0.5 mg every 5 min up to 3 doses. NEBULIZER Adults, Elderly, Children 4 yr and older. 1-3 deep inhalations. Give subsequent doses no sooner than 3 h. Hypersensitivity reaction IM, SUBCUTANEOUS Adults, Elderly. 0.3-0.5 mg q15-20min. SUBCUTANEOUS

*Children.* 0.01 mg/kg q15min for 2 doses, then q4h. Maximum single dose: 0.5 mg. AUTOINJECTORS *Adults.* Twinject (subcutaneous/IM) 0.3 mg. EpiPen (IM) 0.3 mg. May repeat once after 10-20 min. *Children* 15-30 kg. Twinject (subcutaneous/IM) 0.15 mg. EpiPen (IM) 0.15 mg. *Children* > 30 kg. Twinject (subcutaneous/IM) 0.3 mg. EpiPen (IM) 0.3 mg.

# **OFF-LABEL USES**

Treatment of gingival or pulpal hemorrhage, priapism.

# CONTRAINDICATIONS

Cardiac arrhythmias, cerebrovascular insufficiency, hypertension, hyperthyroidism, ischemic heart disease, labor, narrow-angle glaucoma, shock (except anaphylactic).

### INTERACTIONS

#### Drug

β-Blockers: May decrease the effects of β-blockers.

Digoxin, sympathomimetics, halogenated inhalational

**anesthetics:** May increase the risk of arrhythmias and toxicity.

**Ergonovine, methergine, oxytocin:** May increase vasoconstriction.

MAOIs, tricyclic antidepressants: May increase cardiovascular effects. Contraindicated within 2 wks of MAOI.

#### Herbal

Ephedra (ma huang), bitter orange, yohimbe: May increase central nervous system (CNS) and cardiovascular stimulation and effects. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level.

# IV INCOMPATIBILITIES

Acyclovir (Zovirax), aminophylline, azathioprine, ampicillin, dantrolene, diazepam (Valium), fluorouracil, ganciclovir (Cytovene), indomethacin, micafungin (Mycamine), pantoprazole (Protonix), pentobarbital, phenobarbital, phenytoin, thiopental, sodium bicarbonate, sulfamethoxazole/trimethoprim.

# **IV COMPATIBILITIES**

Alfentanil (Alfenta), amikacin (Amikar), amiodarone, amphotericin B liposomal (AmBisome), anidulafungin (Eraxis), ascorbic acid, atracurium (Tracrium), atropine, aztreonam (Azactam), benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), bupivacaine, calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefazolin, cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chloramphenicol, chlorpromazine, cimetidine (Tagamet), cisatracurium (Nimbex), cisplatin, clindamycin (Cleocin), clonidine, cyanocobalamin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), daptomycin (Cubicin), dexamethasone sodium phosphate, dexmedetomidine (Precedex), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Adriamycin), edetate calcium disodium, enalaprilat, ephedrine, epirubicin (Ellence), epoetin alfa (Procrit), ertapenem (Invanz),

erythromycin lactobionate, esmolol (Brevibloc), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), fluconazole (Diflucan), fludarabine (Fludara), folic acid, furosemide (Lasix), gemcitabine (Gemzar), gentamicin, granisetron (Kytril), heparin, hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine, imipenem/cilastatin (Primaxin), isoproterenol (Isuprel), ketorolac, labetalol, levofloxacin (Levaquin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, mannitol, meperidine (Demerol), methicillin, methotrexate, methylprednisolone sodium succinate, metoclopramide (Reglan), metoprolol (Lopressor), metronidazole (Flagyl), midazolam (Versed), milrinone (Primacor), minocycline (Minocin), mitoxantrone (Novantrone), morphine, multiple vitamins injection, nafcillin, nalbuphine (Nubain), naloxone (Narcan), nicardipine (Cardene), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), pancuronium, pemetrexed (Alimta), penicillin G potassium, penicillin G sodium, phytonadione, potassium chloride, procainamide, prochlorperazine, promethazine, propofol (Diprivan), propranolol, quinupristin/dalfopristin (Synercid), ranitidin (Zantac), remifentanil (Ultiva), streptokinase, succinylcholine, sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), ticarcillin (Ticar), ticarcillin/clavulanate (Timentin), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin,

vancomycin, vasopressin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), vitamin B complex with C, voriconazole (Vfend), warfarin.

#### SIDE EFFECTS

#### Frequent

Systemic: Tachycardia, palpitations, nervousness, dizziness. Ophthalmic: Headache, eye irritation, watering of eyes.

# Occasional

Systemic: Dizziness, lightheadedness, facial flushing, headache, diaphoresis, increased BP, nausea, trembling, insomnia, vomiting, fatigue, urinary retention. Ophthalmic: Blurred or decreased vision, eye pain.

#### Rare

Systemic: Chest discomfort or pain, arrhythmias, bronchospasm, dry mouth or throat.

#### SERIOUS REACTIONS

Excessive doses may cause acute hypertension or arrhythmias or cerebrovascular hemorrhage.
Prolonged or excessive use may result in metabolic acidosis as a result of increased serum lactic acid concentrations. Metabolic acidosis may cause disorientation, fatigue, hyperventilation, headache, nausea, vomiting, and diarrhea.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with angina, diabetes, coronary artery disease, cerebrovascular disease, thyroid disease, seizure disorders, prostatic hypertrophy, hypoxia (lack of oxygen), heart attack, psychiatric disorders, tachycardia, severe liver or kidney impairment, and in elderly patients. Avoid extravasation as tissue necrosis can occur. Epinephrine crosses the placenta and is distributed in breast milk. Changes in vital signs and proper lung function should be monitored.

#### Storage

Injectable solutions should be stored at room temperature.

#### Administration

For racepinephrine, vial should be shaken thoroughly. Do not use if brown or cloudy in appearance. For use in a hand-held rubber bulb nebulizer. Add 0.5 mL (contents of one vial) of solution to nebulizer and administer as directed.

For injection, each 1 mg of 1:1000 solution is diluted with 10 mL 0.9% NaCl to provide 1:10,000 solution, and injected as each 1 mg or fraction thereof over more than 1 min. For continuous IV infusion: Dilute 1 mg epinephrine in 250 or 500 mL of D5W or other compatible IV solution to a concentration of 4 or 2 mcg/mL, respectively. Administer into a large vein, if possible. Concentrated solutions (e.g., 16 to 32 mcg/mL) may be used when administered through a central line. The recommended rate of IV infusion is 1-10 mcg/min, adjusted to desired response.

# Eplerenone

e-plear'a-nown Inspra Do not confuse Inspra with Spiriva.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Antihypertensives, selective aldosterone receptor antagonist

# **MECHANISM OF ACTION**

An aldosterone receptor antagonist that binds to the mineralocorticoid receptors in the kidney, heart, blood vessels, and brain, blocking the binding of aldosterone. *Therapeutic Effect:* Reduces BP and promotes sodium, chloride, and water excretion.

#### PHARMACOKINETICS

Absorption is unaffected by food. Protein binding: 50%. Metabolized by CYP3A4. No active metabolites. Excreted in the urine with a lesser amount eliminated in the feces. Not removed by hemodialysis. *Half-life:* 4-6 h. Onset of full hypertensive effect may take 4 wks.

#### AVAILABILITY

Tablets: 25 mg, 50 mg.

# INDICATIONS AND DOSAGES Hypertension PO

Adults, Elderly. 50 mg once a day. If 50 mg once a day produces an inadequate BP response, may increase dosage to 50 mg twice a day (max dose). If patient is concurrently receiving erythromycin, saquinavir, verapamil, or fluconazole, reduce initial dose to 25 mg once a day.

# Congestive heart failure following myocardial infarction

Adults, Elderly. Initially, 25 mg once a day. If tolerated, titrate up to 50 mg once a day within 4 wks. If potassium < 5 mEq/L, increase the dose from 25 mg every other day to 25 mg daily or increase dose from 25 to 50 mg daily. No dose adjustment if potassium 5-5.4 mEq/L. If potassium 5.5-5.9 mEq/L, decrease the dose from 50 to 25 mg daily or from 25 mg daily to 25 mg every other day

Eplerenone (Generic Name)

or 25 mg every other day to withhold. If potassium > 6 mEq/L, withhold dose until potassium < 5.5 mEq/L, then give 25 mg every other day.

# CONTRAINDICATIONS

ALL patients: Serum K+ > 5.5 mEq/L at initiation, CrCl ≤ 30 mL/ min, concomitant administration of strong CYP3A4 inhibitors (e.g., ketoconazole, itraconazole, nefazodone, troleandomycin, clarithromycin, ritonavir, and nelfinavir).

For patients being treated for HTN: Type 2 diabetes with microalbuminuria, SCr > 2 mg/dL in males or > 1.8 mg/dL in females, CrCl < 50 mL/min, or concurrent use of potassium supplements or potassiumsparing diuretics (e.g., amiloride, spironolactone, triamterene).

#### INTERACTIONS

#### Drug

ACE inhibitors, angiotensin II antagonists, potassium-sparing diuretics, potassium supplements: Increases the risk of hyperkalemia. CYP3A4 inhibitors such as calcium channel blockers, erythromycin, fluconazole, saquinavir, verapamil: May increase levels and toxicity such as hyperkalemia. Strong inhibitors such as clarithromycin, itraconazole, and ketoconazole should not be used concomitantly.

**CYP3A4 inducers:** May decrease levels of eplerenone.

NSAIDs: May decrease antihypertensive effect. Herbal

St. John's wort: Decreases eplerenone effectiveness. Food

**Grapefruit juice:** Produces small increase in exposure to eplerenone (25%).

# **DIAGNOSTIC TEST EFFECTS**

May increase serum potassium level, serum creatinine, triglycerides, cholesterol, ALT, and GGT levels. May decrease serum sodium level.

### SIDE EFFECTS

#### Common (≥ 2%)

Patients with CHF: Hyperkalemia and increased serum creatinine. Patients with HTN: Dizziness, diarrhea, cough, fatigue, and flu-like symptoms.

#### Rare

Abdominal pain, abnormal vaginal bleeding, gynecomastia.

# SERIOUS REACTIONS

 Hyperkalemia may occur, particularly in patients with type 2 diabetes mellitus and microalbuminuria. Monitor closely.
 Rare reports of angioneurotic edema or rash.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hyperkalemia and hepatic or renal impairment. Diabetic patients with CHF, post-MI, or proteinuria should be treated with particular caution, due to increased rates of hyperkalemia. It is unknown whether eplerenone crosses the placenta or is distributed in breast milk. The safety and efficacy of eplerenone have not been established in children. No age-related precautions have been noted in elderly patients. Exercising outside during hot weather should be avoided because of the risks of dehydration and hypotension.

Dizziness and light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided. Apical heart rate and BP should be obtained immediately before each dose, in addition to regular monitoring. Be alert to BP fluctuations. If an excessive reduction in BP occurs, place in the supine position with feet slightly elevated, and notify the physician. Pattern of daily bowel activity and stool consistency and potassium and sodium levels should also be monitored.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Film-coated tablets should not be broken, crushed, or chewed. May give without regard to food.

# Epoetin Alfa (Erythropoietin)

eh-poh'ee-tin al'fa Epogen, Procrit Eprex Do not confuse Epogen with Neupogen.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Hematopoietic agents, erythropoiesis-stimulating agents (ESAs)

#### MECHANISM OF ACTION

A glycoprotein that stimulates division and differentiation of erythroid progenitor cells in bone marrow. *Therapeutic Effect:* Induces erythropoiesis and releases reticulocytes from bone marrow to raise hemoglobin and hematocrit.

## PHARMACOKINETICS

Well absorbed after subcutaneous (SC) administration. Following administration, an increase in reticulocyte count occurs within 10 days, and increases in hemoglobin, hematocrit, and RBC count are seen within 2-6 wks. *Half-life:* 4-13 h (chronic renal failure); half-life is shorter in those without renal dysfunction.

#### AVAILABILITY

Injection, Single-Dose Vials: 2000 units/mL, 3000 units/mL, 4000 units/mL, 10,000 units/mL, 40,000 units/mL.

# INDICATIONS AND DOSAGES Treatment of anemia in chemotherapy patients

IV, SC Adults, Elderly. 150 units/kg/dose SC 3 times/wk. Maximum: 1200 units/kg/wk. Weekly dosing: 40,000 units SC weekly. Reduce dose by 25% when hemoglobin approaches 12 g/dL or increases by more than 1 g/dL in any 2-wk period. If hemoglobin exceeds 12 g/dL, hold dose until hemoglobin is < 11 g/dL and restart at 25% reduction in previous dose. If hemoglobin does not increase 1 g/dL or more after 4 wks for weekly dosing, increase dose to 60,000 units/wk. If hemoglobin does not increase with 3 times/wk dosing, after 8 wks increase dose to 300 units/kg 3 times/wk. Children: 600 units/kg IV once per week. Maximum: 40,000 units/ dose. If hemoglobin does not increase 1 g/dL or more after 4 wks, increase dose to 900 units/kg IV weekly.

#### Reduction of allogenic blood transfusions in elective surgery SC

Adults, Elderly. 300 units/kg/day 10 days before, the day of, and 4 days after surgery. Alternate dose: 600 units/kg once weekly (21, 14, and 7 days before surgery) and the day of surgery.

#### Chronic renal failure

IV BOLUS, SC

Adults, Elderly. Initially, 50-100 units/ kg 3 times a week. Target hemoglobin for patients not on dialysis 10-12 g/ dL. Hematocrit range: 30%-36%. Adjust dosage no earlier than 1-mo intervals unless prescribed. Decrease dosage if hemoglobin is approaching 12 g/dL, reduce dose by 25%. If level continues to increase, withhold dose until hemoglobin decreases and restart at 25% reduction. If increase in hemoglobin is < 1 g/dL in 4 wks (with adequate iron stores), increase dose by 25% of previous dose. Maintenance: For patients on dialysis, 75 units/kg 3 times/wk. Range: 12.5-525 units/kg. For patients not on dialysis, 75-150 units/kg/wk. Children on dialysis. Initially, 50 units/kg 3 times/wk. Maintenance: For children on hemodialysis, median dose of 167 units/kg/wk administered in divided doses 2-3 times weekly. For children on peritoneal dialysis, median dose of 76 units/kg/wk in divided doses 2-3 times weekly. HIV infection in patients treated

# with zidovudine (AZT)

Adults. Initially, 100 units/kg 3 times a week for 8 wks; may increase by 50-100 units/kg 3 times a week. Evaluate response q4-8wk thereafter. Adjust dosage by 50-100 units/kg 3 times/wk. If dosages larger than 300 units/kg 3 times/wk are not eliciting response, it is unlikely patient will respond. Maintenance: Titrate to maintain desired hematocrit; hemoglobin not to exceed 12 g/dL.

## OFF-LABEL USES

Prevention of anemia in patients donating blood before elective surgery to reduce autologous transfusion, treatment of anemia in critical illness, and treatment of anemia from hepatitis C treatments.

#### CONTRAINDICATIONS

History of sensitivity to hamster cell-derived products or human albumin, uncontrolled hypertension.

#### INTERACTIONS

#### Drug

Heparin: An increase in RBC volume may enhance blood clotting. Heparin dosage may need to be increased. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum phosphorus, serum potassium, serum creatinine, serum uric acid, and sodium levels. May decrease bleeding time, iron concentration, and serum ferritin levels.

# IV INCOMPATIBILITIES

Do not mix with other medications. Amphotericin B cholesteryl sulfate complex (Amphotec), chlorpromazine, dantrolene, diazepam (Valium), haloperidol (Haldol), inamrinone, midazolam, minocycline (Minocin), phenytoin, prochlorperazine, sulfamethoxazole/ trimethoprim, vancomycin.

# 🗏 IV COMPATIBILITIES

Alfentanil (Alfenta), amikacin (Amikar), aminophylline, ascorbic acid, atracurium (Tracrium), atropine, azathioprine, aztreonam (Azactam), benztropine (Cogentin), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, calcium gluconate, cefazolin, cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chloramphenicol, cimetidine (Tagamet), clindamycin (Cleocin), cyanocobalamin, cyclosporine (Sandimmune), dexamethasone sodium phosphate, digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), dopamine (Intropin), enalaprilat, ephedrine, epinephrine, erythromycin lactobionate, esmolol (Brevibloc), famotidine (Pepcid), fentanyl (Sublimaze), fluconazole (Diflucan), folic acid, furosemide (Lasix), ganciclovir (Cytovene), heparin, hydrocortisone sodium succinate (Solu-Cortef), hydroxyzine, imipenem/cilastatin (Primaxin), insulin (regular, Humulin R, Novolin R), isoproterenol (Isuprel), ketorolac, labetalol, lidocaine, magnesium sulfate, mannitol, meperidine (Demerol), methicillin, methylprednisolone sodium succinate, metoclopramide (Reglan), metoprolol (Lopressor), metronidazole (Flagyl), morphine, multiple vitamins injection, nafcillin, nalbuphine (Nubain), naloxone (Narcan), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxytocin (Pitocin), penicillin G potassium, penicillin G sodium, pentobarbital, phenobarbital, phytonadione, potassium chloride, procainamide, promethazine, propranolol, ranitidine (Zantac), sodium bicarbonate, streptokinase, succinylcholine, sufentanil (Sufenta), theophylline, ticarcillin (Ticar), ticarcillin/clavulanate (Timentin), tobramycin, vasopressin, verapamil.

# SIDE EFFECTS > Patients receiving chemotherapy Frequent (17%-20%)

Fever, diarrhea, nausea, vomiting, edema.

Occasional (11%-13%)

Asthenia, shortness of breath, paresthesia.

Rare (3%-5%)

Dizziness, trunk pain.

 Patients with chronic renal failure Frequent (11%-24%)

Hypertension, headache, nausea, arthralgia.

#### Occasional (7%-9%)

Fatigue, edema, diarrhea, vomiting, chest pain, skin reactions at administration site, asthenia, dizziness, clotted access.

# Patients with HIV infection treated with AZT

Frequent (15%-38%)

Fever, fatigue, headache, cough, diarrhea, rash, nausea.

Occasional (9%-14%)

Shortness of breath, asthenia, skin reaction at injection site, dizziness.

# SERIOUS REACTIONS

• Hypertensive encephalopathy, thrombosis, cerebrovascular accident, myocardial infarction (MI), and seizures have occurred rarely.

• Epoetin alfa increased the risk for death and serious cerebrovascular events in controlled clinical trials when administered to target a hemoglobin of more than 12 g/dL and in cancer patients receiving chemotherapy. There is increased risk of serious arterial and venous thromboembolic reactions, including MI, stroke, congestive heart failure (CHF), and hemodialysis graft occlusion. To reduce cerebrovascular risks, use the lowest dose of epoetin alfa that will gradually increase the

#### 564 Epoprostenol (Prostacyclin)

hemoglobin concentration to a level sufficient to avoid the need for RBC transfusion. The hemoglobin concentration should not exceed 12 g/dL; the rate of hemoglobin increase should not exceed 1 g/dL in any 2-wk period.

• Epoetin alfa has shortened time to tumor progression and reduced survival time in solid tumor patients with target hemoglobin > 12 g/dL.

 Hyperkalemia occurs occasionally in patients with chronic renal failure, usually in those who do not conform to medication regimen, dietary guidelines, and frequency of dialysis regimen.

 Cases of pure red cell aplasia and severe anemia, with or without other cytopenias, associated with neutralizing antibodies to erythropoietin, have been reported in patients treated with epoetin alfa. This has been reported predominantly in patients with chronic renal failure (CRF) receiving epoetin alfa by SC administration.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with a history of seizures and known porphyria (an impairment of erythrocyte formation in bone marrow). It is unknown whether epoetin alfa crosses the placenta or is distributed in breast milk. Safety and efficacy of epoetin alfa have not been established in children 1 mo of age and younger. No age-related precautions have been noted in elderly patients. Avoid potentially hazardous activities during the first 90 days of therapy. There is an increased risk of seizure development in those with chronic renal failure during the first 90 days of therapy.

Notify the physician of severe headache. Hemoglobin and hematocrit should be monitored diligently. The dosage should be reduced if hematocrit level increases more than 4 points in 2 wks. Hemoglobin should not exceed 12 g/dL or increase by 1 g/dL in any 2-wk period. CBC should also be monitored. In addition, BP must be monitored aggressively for an increase because 25% of persons taking epoetin alfa require antihypertensive therapy and dietary restrictions. Keep in mind that most patients need supplemental iron therapy.

#### Storage

Refrigerate vials. Do not shake. Protect from light.

#### Administration

! Avoid excessive agitation of vial; do not shake because it can denature medication, rendering it inactive.

IV route is preferred for patients on hemodialysis. For IV use, reconstitution is not necessary. May be given as an IV bolus. To limit adherence to the tubing, inject while blood is still in the IV line, followed by a saline flush.

For SC administration, use 1 dose per vial; do not reenter vial. Discard unused portion. To minimize SC injection site discomfort, may dilute singleuse vial dose in a 1:1 ratio with bacteriostatic 0.9% NaCl injection with benzyl alcohol 0.9%.

# Epoprostenol (Prostacyclin)

e-poe-pros'ten-ol

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

**Classification:** Platelet inhibitors, vasodilators

# **MECHANISM OF ACTION**

An antihypertensive that directly dilates pulmonary and systemic arterial vascular beds and inhibits platelet aggregation. *Therapeutic Effect:* Reduces right and left ventricular afterload; increases cardiac output and stroke volume.

### AVAILABILITY

*Injection, Powder for Reconstitution:* 0.5 mg, 1.5 mg.

# INDICATIONS AND DOSAGES

Long-term treatment of New York Heart Association Class III and IV primary pulmonary hypertension and pulmonary hypertension associated with scleroderma spectrum of disease in New York Heart Association Class II and IV who do not respond adequately to conventional therapy IV INFUSION

*Adults, Elderly.* Procedure to determine dose range: Initially, 2 ng/kg/min, increased in increments of 2 ng/kg/min q15min until dose-limiting adverse effects occur.

Increments in dose should be considered if symptoms of pulmonary hypertension persist or recur after improving. The infusion should be increased by 1- to 2-ng/kg/min increments at intervals sufficient to allow assessment of clinical response; these intervals should be at least 15 min. In clinical trials, incremental increases in dose occurred at intervals of 24-48 h or longer. Avoid abrupt withdrawal or sudden large dose reductions.

#### **OFF-LABEL USES**

Primary pulmonary arterial hypertension in children.

#### CONTRAINDICATIONS

Long-term use in patients with CHF (severe ventricular systolic dysfunction) or chronically in patients who develop pulmonary edema during initiation.

# INTERACTIONS

#### Drug

Acetate in dialysis fluids, other vasodilators, antihypertensives, diuretics: May increase hypotensive effect.

Anticoagulants, antiplatelets: May increase the risk of bleeding. Vasoconstrictors: May decrease effects of epoprostenol.

#### Herbal

Supplements with antiplatelet or anticoagulant effects (e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow, etc.): May increase effects on platelets or risk of bleeding.

# Food

None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

# IV INCOMPATIBILITIES

Do not mix epoprostenol with other medications.

#### 🗏 IV COMPATIBILITIES

Bivalirudin (Angiomax).

# SIDE EFFECTS

#### Frequent

Acute phase: Flushing (58%), headache (49%), nausea (32%), vomiting (32%), hypotension (16%), anxiety (11%), chest pain (11%), dizziness (8%). Chronic phase (> 20%): Dyspnea, asthenia, dizziness, headache, chest pain, nausea, vomiting, palpitations, edema, jaw pain, tachycardia, flushing, myalgia, nonspecific muscle pain, diarrhea, anxiety, chills, fever, or flu-like symptoms.

#### Occasional

Acute phase (2%-5%): Bradycardia, abdominal pain, muscle pain, dyspnea, back pain. Chronic phase (10%-20%): Rash, depression, hypotension, paresthesia, pallor, syncope, bradycardia, ascites, tachycardia.

#### Rare

Acute phase: Paresthesia, diaphoresis, dyspepsia, tachycardia.

# SERIOUS REACTIONS

• Angina, myocardial infarction, and thrombocytopenia occur rarely.

 Abrupt withdrawal, including a large reduction in dosage or interruption in drug delivery, may produce rebound pulmonary hypertension as evidenced by dyspnea, dizziness, and asthenia.
 Sepsis during long-term

follow-up.

# PRECAUTIONS & CONSIDERATIONS

Interruptions in the IV infusion should be avoided because even a short break in the infusion can result in rebounding pulmonary hypertension. The patient should be closely monitored during initiation of therapy. Use epoprostenol cautiously in elderly patients.

Before beginning therapy, a backup infusion pump and IV infusion sets should be obtained to avoid interruptions in therapy. A central venous catheter must be in place. Vital signs should be monitored before and during therapy. Standing and supine BP should be monitored for several hours after a dosage adjustment. Therapeutic evidence is evidenced by decreased chest pain, dyspnea on exertion, fatigue, pulmonary arterial pressure, pulmonary vascular resistance, and syncope, and improved pulmonary function.

#### Storage

Store unopened vial at room temperature. Do not freeze. Reconstituted solutions are stable for up to 48 h if refrigerated. Discard if frozen or if reconstituted > 48 h. Administration

! Infuse epoprostenol continuously through an indwelling central venous catheter. If necessary and on a temporary basis, infuse through a peripheral vein. Use only the diluent provided by the manufacturer.

Follow instructions of manufacturer for dilution to specific concentrations; use only sterile water for injection or 0.9% NaCl. Give as pump infusion only. Adjustments to dose should be done only by physician.

# Eprosartan eh-pro-sar'tan

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: D

**Classification:** Antihypertensive agents, angiotensin II receptor antagonists

### **MECHANISM OF ACTION**

An angiotensin II receptor antagonist that blocks the vasoconstrictor and aldosterone-secreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT1 receptors. *Therapeutic Effect*: Causes vasodilation, decreases peripheral resistance, and decreases BP.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 98%. Minimally metabolized in liver. Excreted in urine (90%) and biliary

Eprosartan (Generic Name), Teveten (Brand Name)

system. Minimally removed by hemodialysis. *Half-life:* 5-9 h.

# AVAILABILITY

Tablets: 400 mg, 600 mg.

# INDICATIONS AND DOSAGES

# Hypertension

PO

*Adults, Elderly.* Initially, 600 mg/day (given in 1 or 2 doses). Range: 400-800 mg/day.

# CONTRAINDICATIONS

Hypersensitivity to eprosartan.

# INTERACTIONS

#### Drug

Potassium-sparing diuretics, potassium supplements: May increase risk of hyperkalemia.

#### Herbal

Licorice, ma huang, yohimbine: May decrease the effectiveness of eprosartan.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, potassium, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin levels.

### SIDE EFFECTS

#### Occasional (2%-8%)

Upper respiratory infection, rhinitis, cough, abdominal pain.

#### Rare (< 2%)

Muscle pain, fatigue, diarrhea, urinary tract infection, depression, hypertriglyceridemia, hyperkalemia.

#### SERIOUS REACTIONS

• Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often.

Angioedema is rare.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with preexisting renal insufficiency, significant aortic and mitral stenosis, hyperaldosteronism, and bilateral or unilateral renal artery stenosis. Salt and volume-depletion should be corrected before starting therapy. Eprosartan has caused fetal or neonatal morbidity or mortality, particularly in 2nd and 3rd trimesters; discontinue as soon as pregnancy is known. Also, because of the potential for adverse effects on the infant, patients taking eprosartan should not breastfeed. Safety and efficacy of eprosartan have not been established in children. No age-related precautions have been noted in elderly patients.

Apical pulse and BP should be assessed immediately before each eprosartan dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the person in the supine position with feet slightly elevated and notify the physician. Tasks that require mental alertness or motor skills should be avoided. BUN, serum electrolytes, serum creatinine levels, heart rate for tachycardia, and urinalysis results should be obtained before and during therapy.

# Administration

Take eprosartan without regard to food. Do not crush or break tablets.

Eptifibatide ep-tih-fib'ah-tide

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Platelet inhibitors, glycoprotein IIb/IIIa inhibitors

### **MECHANISM OF ACTION**

A glycoprotein IIb/IIIa inhibitor that rapidly inhibits platelet aggregation by preventing binding of fibrinogen to receptor sites on platelets. *Therapeutic Effect:* Prevents closure of treated coronary arteries. Also prevents acute cardiac ischemic complications.

### AVAILABILITY

Injection Solution: 0.75 mg/mL, 2 mg/mL.

# INDICATIONS AND DOSAGES Adjunct to percutaneous coronary intervention (PCI)

IV BOLUS, IV INFUSION Adults, Elderly. 180 mcg/kg bolus (maximum 22.6 mg) before PCI initiation; then continuous drip of 2 mcg/kg/min and a second 180 mcg/kg bolus (maximum 22.6 mg) 10 min after the first. Maximum: 15 mg/h. Continue until hospital discharge or for up to 18-24 h. Minimum 12 h is recommended. Concurrent aspirin and heparin therapy is recommended.

#### Acute coronary syndrome

IV BOLUS, IV INFUSION Adults, Elderly. 180 mcg/kg bolus (max 22.6 mg) then 2 mcg/kg/min until discharge or coronary artery bypass graft, up to 72 h. Maximum: 15 mg/h. Concurrent aspirin and heparin therapy is recommended.

#### **Dosage in renal impairment** Serum creatinine 2-4 mg/dL or

CrCl < 50 mL/min: Use 180 mcg/kg bolus (maximum 22.6 mg) and 1 mcg/kg/min infusion (maximum 7.5 mg/h). For PCI, a second bolus dose should be administered (180 mcg/kg, maximum 22.6 mg) 10 min after the first bolus.

### CONTRAINDICATIONS

Active internal bleeding within previous 30 days, history of

stroke within 30 days, or any history of hemorrhagic stroke, recent (6 wks or less) surgery or trauma, severe uncontrolled hypertension, thrombocytopenia (< 100,000 cells/µL), renal dialysis, administration of another parenteral GP IIb/IIIa inhibitor, hypersensitivity.

# INTERACTIONS

#### Drug

Anticoagulants, heparin: May increase the risk of hemorrhage. Dextran, drotrecogin alfa, other platelet aggregation inhibitors (such as aspirin), thrombolytic agents: May increase the risk of bleeding. Herbal None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

Increases aPTT, PT, and clotting time. Decreases platelet count.

# IV INCOMPATIBILITIES

Administer in separate line; do not add other medications to infusion solution. Furosemide (Lasix).

# 🗏 IV COMPATIBILITIES

Alteplase (Activase), amiodarone, argatroban, atropine, bivalirudin (Angiomax), daptomycin (Cubicin), dobutamine, ertapenem (Invanz), heparin, lidocaine, meperidine (Demerol), metoprolol (Lopressor), micafungin (Mycamine), midazolam, morphine, nitroglycerin, oxytocin (Pitocin), palonosetron (Aloxi), potassium chloride, teniposide (Vumon), tigecycline (Tygacil), tirofibran (Aggrastat), verapamil, 0.9% NaCl, 0.9% NaCl-D5%W.

### SIDE EFFECTS

Occasional (7%) Hypotension.

# SERIOUS REACTIONS

 Minor to major bleeding complications may occur, most commonly at arterial access site for cardiac catheterization.

 Thrombocytopenia, intracranial hemorrhage and stroke, anaphylaxis have occurred rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with PTCA < 12 h from the onset of symptoms of acute myocardial infarction, prolonged PTCA that is > 70 min, and failed PTCA. Caution should also be used in persons who weigh < 75 kg or are older than 65 yr; have a history of GI disease or GI or genitourinary bleeding; have an AV malformation or aneurysm, intracranial tumors, platelet count < 100,000, renal dysfunction, hemorrhagic retinopathy; or are receiving aspirin, heparin, or thrombolytics. It is unknown whether eptifibatide causes fetal harm or can affect reproduction capacity. It is unknown whether eptifibatide is distributed in breast milk. Safety and efficacy of eptifibatide have not been established in children. In elderly patients, the risk of major bleeding is increased.

Hemoglobin, hematocrit, and platelet count should be obtained before treatment. If platelet count is < 90,000/mm<sup>3</sup>, additional platelet counts should be obtained routinely to avoid development of thrombocytopenia. Nasogastric tube and urinary catheter use should be avoided, if possible.

#### Storage

Store vials in refrigerator. Vials may be stored at room temperature for up to 2 mo.

#### Administration

Solution normally appears clear and is colorless. Do not shake. Discard unused portions. Also discard if preparation contains any opaque particles. Withdraw bolus dose from 10-mL vial (2 mg/mL); for IV infusion, withdraw from 100-mL vial (0.75 mg/mL). May give IV push and infusion undiluted. Give bolus dose IV push over 1-2 min. Infusion should be given via a controlled infusion pump.

# **Ergoloid Mesylates**

ur'go-loyd mess'ah-lates

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Ergot alkaloids and derivatives

#### MECHANISM OF ACTION

There is no specific evidence that clearly establishes the mechanism by which ergoloid mesylates preparations produce mental effects, nor is there conclusive evidence that the drug particularly affects cerebral arteriosclerosis or cerebrovascular insufficiency.

#### PHARMACOKINETICS

Rapidly, incompletely absorbed from GI tract. Metabolized in liver. Eliminated primarily in feces. *Halflife*: 2-5 h.

#### AVAILABILITY

Tablets: 1 mg.

# INDICATIONS AND DOSAGES Age-related decline in mental

#### capacity PO

*Adults, Elderly.* Initially, 1 mg 3 times/day. Range: 1.5-12 mg/day. Usual dose: 1-2 mg 3 times/day.

Ergoloid Mesylates (Generic Name)

## CONTRAINDICATIONS

Acute or chronic psychosis (regardless of etiology), hypersensitivity to ergoloid mesylates, or any component of the formulation; pregnancy.

#### INTERACTIONS Drug

#### Potent CYP450 3A4 inhibitors:

May increase risk of ergotism (nausea, vomiting, vasospastic ischemia).

Frovatriptan, naratriptan, rizatriptan, sumatriptan, zolmitriptan, other serotonergic agents: May prolong vasospastic reactions (ergot derivatives).

#### Herbal

None known.

#### Food

**Grapefruit juice:** May increase risk of ergotism (nausea, vomiting, vasospastic ischemia).

# SIDE EFFECTS

#### Occasional

GI distress, transient nausea, sublingual irritation.

# SERIOUS REACTIONS

• Overdose may produce blurred vision, dizziness, syncope, headache, flushed face, nausea, vomiting, decreased appetite, stomach cramps, and stuffy nose.

#### PRECAUTIONS & CONSIDERATIONS

It is unknown whether ergoloid mesylates cross the placenta or are distributed in breast milk. Most ergot alkaloids are excreted into breast milk and are considered contraindicated during pregnancy because of their oxytocic and uterine stimulant properties. Be aware that the safety and efficacy of ergoloid mesylates have not been established in children. There are no age-related precautions noted in elderly patients.

Clinical improvement is gradual, and results may not be noted for 3-4 wks.

#### Storage

Store at room temperature.

#### Administration

Give with food to avoid GI upset.

# Ergotamine & Ergotamine-Caffeine

er-got'a-meen Ergotamine: ★ Ergomar Ergotamine-Caffeine: ★ ▲ Cafergot, Migergot

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Ergot alkaloids and derivatives

### MECHANISM OF ACTION

An ergotamine derivative and  $\alpha$ -adrenergic blocker that directly stimulates vascular smooth muscle, resulting in peripheral and cerebral vasoconstriction. May also have antagonist effects on serotonin. *Therapeutic Effect:* Suppresses vascular headaches.

# PHARMACOKINETICS

Slowly and incompletely absorbed from the GI tract; rapidly and extensively absorbed after rectal administration. Protein binding: > 90%. Undergoes extensive first-pass metabolism in the liver to active metabolite. Eliminated in feces by the biliary system. *Halflife*: 2 h.

### AVAILABILITY

Tablets (Sublingual [Ergomar]): 2 mg.

Ergotamine & Ergotamine-Caffeine (Generic Name)

Tablets (Ergotamine and Caffeine [Cafergot]): 1 mg, with 100 mg caffeine.

Suppositories (Ergotamine and Caffeine [Migergot]): 2 mg, with 100 mg caffeine.

# INDICATIONS AND DOSAGES Vascular headaches

PO (CAFERGOT [FIXED COMBINATION OF ERGOTAMINE AND CAFFEINE]) Adults, Elderly. 1-2 tablets at onset of headache, then 1-2 tablets q30min. Maximum: 6 tablets/episode; 10 tablets/wk.

*Children.* 1 tablet at onset of headache, then 1 tab q30min as needed. Maximum: 3 mg/episode. SUBLINGUAL (ERGOMAR) *Adults, Elderly.* 1 tablet at onset of headache, then 1 tablet q30min as needed. Maximum: 3 tablets/24 h; 5 tablets/wk.

SUBLINGUAL (ERGOMAR) *Children* > 10 yr. 1 mg at onset of headache, then 1 mg q30min. Maximum: 3 mg/episode. RECTAL (MIGERGOT) *Adults, Elderly.* 1 suppository at onset of headache; may repeat dose in 1 h. Maximum: 2 suppositories/ episode; 5 suppositories/wk. *Children* > 10 yr. One-fourth to onehalf of suppository; may repeat dose in 1 h. Maximum: 2 mg ergotamine/ attack.

### CONTRAINDICATIONS

Coronary artery disease, hypertension, impaired hepatic or renal function, malnutrition, peripheral vascular diseases (such as thromboangiitis obliterans, syphilitic arteritis, severe arteriosclerosis, thrombophlebitis, and Raynaud's disease), sepsis, severe pruritus, pregnancy. Ergotamine use is contraindicated with protease inhibitors for HIV and other potent inhibitors of CYP3A4 (e.g., ketoconazole, itraconazole).

# INTERACTIONS

#### Drug

**β-Blockers:** May increase the risk of vasospasm.

**CYP3A4 inhibitors:** May increase levels and effects of ergotamine. Ketoconazole, itraconazole, protease inhibitors, and macrolide antibiotics are contraindicated.

Ergot alkaloids, systemic vasoconstrictors: May increase pressor effect.

MAOIs, serotonergic agonists, SSRIs: May increase risk of serotonin syndrome. Do not use within 24 h of a serotonin agonist for migraine ("triptan").

Nitroglycerin: May decrease the effects of nitroglycerin.

## Herbal

None known.

# Food

**Caffeine:** May increase caffeine levels.

**Grapefruit:** May increase ergotamine levels.

### DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent (6%-10%) Nausea, vomiting. Occasional (2%-5%) Cough, dizziness.

Rare (< 2%)

Myalgia, fatigue, diarrhea, dry mouth, upper respiratory tract infection, dyspepsia, confusion, drowsiness, pruritis, anal/rectal ulcer.

# SERIOUS REACTIONS

 Prolonged administration or excessive dosage may produce ergotamine poisoning, manifested

as nausea and vomiting; paresthesia, muscle pain, or weakness; precordial pain; angina; tachycardia or bradycardia; and hypertension or hypotension. Vasoconstriction of peripheral arteries and arterioles may result in localized edema and pruritus. Muscle pain will occur when walking and later, even at rest. Other rare effects include confusion, depression, drowsiness, seizures, pancreatitis, ischemic colitis, myocardial infarction, and gangrene. Ergotismy can occur at dose < 5 mgbut are most likely to occur with > 15 mg/24 h or 40 mg in a few days.

# PRECAUTIONS & CONSIDERATIONS

Ergotamine use is contraindicated in pregnancy because it may result in fetal harm and even death. Ergotamine is distributed in breast milk and may inhibit lactation. Ergotamine use may produce diarrhea or vomiting in neonates; it may be used safely in children 10 yr and older but should be used only when patient is unresponsive to other drugs. In elderly patients, age-related occlusive peripheral vascular disease increases the risk of peripheral vasoconstriction; in addition, agerelated renal impairment may require cautious use.

Notify the physician immediately if the drug does not relieve the headache or if irregular heartbeat, nausea or vomiting, numbness or tingling of the fingers and toes, or pain or weakness of the extremities occurs. Peripheral circulation, including the temperature, color, and strength of pulses in the extremities, should be assessed.

#### Storage

Store rectal suppositories in refrigerator. Store tablets at room temperature, protected from light and moisture.

#### Administration

! Do not exceed daily, per attack, or weekly dosage limits. Patients should not use serotonin agonist (triptans) within 24 h of ergot use.

For sublingual use, place the sublingual tablet under the tongue, let it dissolve, and swallow the saliva. Do not administer it with water.

Tablets may be taken with fluids. For rectal suppository, if too soft, run wrapper under cool water. Remove wrapper; moisten with water before insertion.

# Erlotinib er-low'tih-nib

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, miscellaneous

#### MECHANISM OF ACTION

A human epidermal growth factor that inhibits tyrosine kinases (TKs) associated with transmembrane cell surface receptors found on both normal and cancer cells. One such receptor is epidermal growth factor receptor (EGFR). *Therapeutic Effect*: TK activity appears to be vitally important to cell proliferation and survival.

#### AVAILABILITY

Tablets: 25 mg, 100 mg, 150 mg.

#### INDICATIONS AND DOSAGES

 Locally advanced or metastatic non-small cell lung cancer after failure of first-line therapy PO
 Advise Elderky 150 mo(day)

Adults, Elderly. 150 mg/day.

Erlotinib (Generic Name), Tarceva (Brand Name)

## Locally advanced, unresectable, or metastatic pancreatic cancer, firstline therapy

Adults, Elderly. 100 mg/day with gemcitabine.

#### Concomitant therapy with strong CYP3A4 inhibitor

Consider erlotinib dose reduction if adverse reactions occur.

#### Concomitant therapy with strong CYP3A4 inducer

Consider treatments lacking CYP3A4-inducing activity or consider dose > 150 mg.

#### Dosage-hepatic impairment

Expect to interrupt or reduce dose treatment if severe changes in total bilirubin or liver transaminase levels occur.

## **OFF-LABEL USES**

Metastatic renal cell carcinoma.

## CONTRAINDICATIONS

Pregnancy.

## INTERACTIONS

Drug

**CYP3A4 inducers, aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, rifampin:** May decrease the levels and effects of erlotinib.

CYP3A4 inhibitors, azole antifungals, ciprofloxacin, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, ketoconazole, nefazodone, nicardipine, propofol, protease inhibitors, quinidine, verapamil: May increase the levels and effects of erlotinib.

## Herbal

**St. John's wort:** May increase metabolism and decrease serum erlotinib concentration. Avoid.

#### Food

**All foods:** Give erlotinib at least 1 h before or 2 h after ingestion of food. Bioavailability without food 60%, with food 100%.

## Other

**Cigarette smoking:** Decreases erlotinib exposure. Advise patients to quit smoking.

## DIAGNOSTIC TEST EFFECTS

May increase hepatic enzyme levels.

## SIDE EFFECTS

## Frequent (10%-88%)

Acneiform rash, pruritus, diarrhea, fatigue, pyrexia, anorexia, nausea, edema, constipation, bone pain, anxiety, headache, dry skin, vomiting, mucositis, dry mouth, depression, dizziness, insomnia, erythema, alopecia, dyspepsia, weight loss, abdominal pain, myalgia, arthralgia, rigors, paresthesia, dyspnea, cough, infection.

#### Occasional (4%-9%)

Keratitis, pneumonitis, deep vein thrombosis.

## SERIOUS REACTIONS

- · Renal dysfunction.
- Interstitial lung disease has been reported.
- · Myocardial infarction,

cerebrovascular accident, and microangiopathic hemolytic anemia with thrombocytopenia.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with dehydration, hepatic or severe renal impairment. Erlotinib may cause fetal harm and should not be used during pregnancy or lactation. Safety and efficacy have not been established in children. No agerelated precautions have been noted in elderly patients.

#### Storage

Store at controlled room temperature.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling and administering cytotoxic drugs. Take erlotinib at least 1 h before or 2 h after ingestion of food (on an empty stomach). Administer at roughly the same time each day.

## Ertapenem

er-ta-pen'em invanz Do not confuse Invanz with Avinza.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antibiotics, carbapenems

## **MECHANISM OF ACTION**

A carbapenem that penetrates the bacterial cell wall of microorganisms and binds to penicillin-binding proteins, inhibiting cell wall synthesis. Not effective against methicillin-resistant *Staphylococcus, Enterococcus* spp., penicillin-resistant strains of *S. pneumoniae*, β-lactamasepositive strains of *Haemophilus influenzae*, or most *Pseudomonas aeruginosa. Therapeutic Effect:* Produces bacterial cell death.

## PHARMACOKINETICS

Almost completely absorbed after IM administration. Protein binding: 85%-95%. Widely distributed. Primarily excreted in urine with smaller amount eliminated in feces. Removed by hemodialysis. *Half-life:* 4 h.

## AVAILABILITY

*Injection Powder for Reconstitution:* 1 g.

# INDICATIONS AND DOSAGES Intra-abdominal infection

IM, IV Adults, Elderly, Children 13 yr and older. 1 g/day for 5-14 days. Children 3 mo to 12 yr. 15 mg/kg twice daily (maximum 1 g/ day) for 5-14 days.

# • Skin and skin-structure infection IM, IV

Adults, Elderly, Children 13 yr and older. 1 g/day for 7-14 days. Children 3 mo to 12 yr. 15 mg/kg twice daily (maximum 1 g/day) for 7-14 days.

## Community-acquired pneumonia, urinary tract infection (UTI) IM, IV

Adults, Elderly, Children 13 yr and older. 1 g/day for 10-14 days. Children 3 mo to 12 yr. 15 mg/kg twice daily (maximum 1 g/day) for 10-14 days.

### Pelvic/gynecologic infection IM, IV

Adults, Elderly, Children 13 yr and older. 1 g/day for 3-10 days. Children 3 mo to 12 yr. 15 mg/kg twice daily (maximum 1 g/day) for 3-10 days.

#### Prophylaxis of surgical site infection following colorectal surgery IV

*Adults, Elderly.* 1 g given 1 h before surgical incision.

#### Dosage in renal impairment

For adults and elderly patients with creatinine clearance  $\leq 30$  mL/min or on hemodialysis, dosage is 500 mg once a day.

## CONTRAINDICATIONS

History of hypersensitivity to other carbapenems (imipenem, meropenem) or anaphylaxis to beta-lactams, hypersensitivity to lidocaine or amide-type local anesthetics (IM).

## INTERACTIONS

#### Drug

Probenecid: Reduces renal excretion of ertapenem, increases concentration. Valproic acid: Reduces serum levels of valproic acid. Monitor levels and adjust dose. Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. May decrease platelet count, blood hematocrit and hemoglobin levels, and serum potassium level.

## IV INCOMPATIBILITIES

Do not use diluents or IV solutions containing dextrose. Allopurinol (Aloprim), amiodarone, amphotericin B cholesteryl sulfate complex (Amphotec), anidulafungin (Eraxis), caspofungin (Cancidas), chlorpromazine, dantrolene, daunorubicin (Cerubidine), diazepam (Valium), dobutamine, doxorubicin (Adriamycin), droperidol, epirubicin (Ellence), hydralazine, hydroxyzine, idarubicin (Idamycin PFS), midazolam, minocycline (Minocin), mitoxantrone (Novantrone), nicardipine (Cardene), ondansetron (Zofran), phenytoin, prochlorperazine, promethazine, quinupristin/dalfopristin (Synercid), topotecan (Hycamtin), verapamil.

## **IV COMPATIBILITIES**

Acyclovir (Zovirax), alfentanil (Alfenta), amifostine (Ethyol), amikacin (Amikar), aminocaproic acid, aminophylline, amphotericin

B lipid complex (Abelcet), amphotericin B liposome (AmBisome), argatroban, arsenic trioxide (Trisenox), atenolol, atracurium (Tracrium), azithromycin (Zithromax), aztreonam (Azactam), bivalirudin (Angiomax), bleomycin (Blenoxane), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), busulfan (Bulsulfex), butorphanol (Stadol), calcium chloride, calcium gluconate, carboplatin, carmustine (BiCNU), cimetidine (Tagamet), ciprofloxacin (Cipro), cisatracurium (Nimbex), cisplatin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), cytarabine (Tarabine), dacarbazine (DTIC-Dome), dactinomycin (Cosmegen), daptomycin (Cubicin), dexamethasone sodium phosphate, dexrazoxane (Zinecard), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), docetaxel (Taxotere), dopamine, enalaprilat, ephedrine, epinephrine, eptifibatide (Integrilin), erythromycin lactobionate, esmolol (Brevibloc), etoposide (VePesid), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil, foscarnet (Foscavir), fosphenytoin (Cerebyx), furosemide (Lasix), ganciclovir (Cytovene), gemcitabine (Gemzar), gentamicin, granisetron (Kytril), haloperidol lactate (Haldol), heparin, hetastarch in NS, hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), ifosfamide (Ifex), insulin (regular, Humulin R, Novolin R), irinotecan (Camptosar), isoproterenol (Isuprel), ketorolac, labetalol, leucovorin, levofloxacin (Levaquin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, melphalan

E

(Alkeran), meperidine (Demerol), mesna (Mesnex), methotrexate, methylprednisolone sodium succinate, metoclopramide (Reglan), metronidazole (Flagyl), milrinone (Primacor), mitomycin (Mutamycin), morphine, moxifloxacin (Avelox), nalbuphine (Nubain), naloxone (Narcan), nesiritide (Natrecor), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), pamidronate (Aredia), pantoprazole (Protonix), pemetrexed (Alimta), pentobarbital, phenobarbital, phenylephrine, potassium acetate, potassium chloride, potassium phosphates, procainamide, propranolol, ranitidine (Zantac), remifentanil (Ultiva), rocuronium (Zemuron), sodium acetate, sodium phosphates, succinylcholine (Anectine, Quelicin), sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiotepa (Thioplex), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, vancomycin, vasopressin, vecuronium (Norcuron), vinblastine (Velban), vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend), water for injection, 0.9% NaCl, zidovudine (Retrovir), zolendronic acid (Zometa).

#### SIDE EFFECTS

#### Frequent (6%-10%)

Diarrhea, nausea, headache, infused vein complications.

Occasional (2%-5%)

Altered mental status, insomnia, rash, abdominal pain, constipation, vomiting, edema, fever.

#### Rare (< 2%)

Dizziness, cough, oral candidiasis, anxiety, tachycardia, hypertension, hypotension, phlebitis at IV site, extravasation.

### SERIOUS REACTIONS

· Antibiotic-associated colitis and other superinfections may occur.

· Anaphylactic reactions have been reported.

· Seizures may occur in those with central nervous system (CNS) disorders (including patients with brain lesions or a history of seizures), bacterial meningitis, or severe renal impairment.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with CNS disorders (particularly with brain lesions or history of seizures), a hypersensitivity to cephalosporins, penicillins, or other allergens, and impaired renal function. Be aware that ertapenem is distributed in breast milk. Be aware that the safety and efficacy of ertapenem have not been established in children younger than 3 mo. In elderly patients, advanced renal insufficiency and end-stage renal insufficiency may require dosage adjustment.

History of allergies, particularly to β-lactams, cephalosporins, and penicillins, should be obtained before beginning drug therapy. Hydration status, nausea, vomiting, skin for rash, sleep pattern, and mental status should be evaluated. Report any diarrhea, rash, seizures, tremors, or other new symptoms.

#### Storage

Store vials at room temperature. Solution normally appears colorless to yellow (variation in color does not affect potency). Discard if solution contains precipitate. Reconstituted solution is stable for 6 h at room temperature, 24 h if refrigerated and used within 4 h after removing. Administration

For IM use, reconstitute with 3.2 mL 1% lidocaine HCl injection (without epinephrine). Shake vial thoroughly. Give deep IM injections slowly

to minimize patient discomfort. To further minimize discomfort, administer IM injections into the gluteus maximus instead of the lateral aspect of the thigh. Administer IM within 1 h after preparation.

For IV use, dilute 1-g vial with 10 mL, 0.9% NaCl or bacteriostatic water for injection. Shake well to dissolve. Further dilute with 50 mL 0.9% NaCl to concentration 20 mg/ mL or less. Give by intermittent IV infusion (piggyback). Do not give IV push. Infuse over 20-30 min. Dextrose solutions are not compatible with ertapenem.

## Erythromycin

er-ith-roe-mye'sin Akne-Mycin, E.E.S., Emcin, Emgel, EryDerm, Erygel, EryPed, Ery-Tab, Erythrocin, My-E, PCE AK-Mycin, Diomycin, EES, EryBID, Eryc, Erymycin, Erythrocin, Erythro-S, PCE Do not confuse with Emct, azithromycin, Ethmozine, or Pedialyte.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Anti-infectives, macrolides

#### **MECHANISM OF ACTION**

A macrolide that reversibly binds to bacterial ribosomes, inhibiting bacterial protein synthesis. *Therapeutic Effect:* Bacteriostatic.

#### PHARMACOKINETICS

Variably absorbed from the GI tract (depending on dosage form used; better with salt forms than base form). Protein binding: 70%-90%. Widely distributed. Metabolized in the liver by CYP3A4. Primarily eliminated in feces by bile. Not removed by hemodialysis. *Half-life*: 1.4-2 h (increased in impaired renal function).

#### AVAILABILITY

Topical Gel (Emgel, Erygel): 2%. Injection Powder for Reconstitution (Ervthrocin): 500 mg, 1 g. Ophthalmic Ointment: 5 mg/g (0.5%). Topical Ointment (Akne-Mycin): 2%. Oral Suspension (EryPed, E.E.S): 200 mg/5 mL, 400 mg/5 mL. Topical Solution (EryDerm): 2%. Capsule (Delayed Release): 250 mg. Tablets (Ery-Tab): 250 mg, 333 mg, 500 mg. Tablets (E.E.S): 400 mg. Tablets (Erythrocin): 250 mg, 500 mg. Tablets (PCE): 333 mg, 500 mg. Topical Medicated Pledget (Emcin Clear, Erv): 2%.

#### INDICATIONS AND DOSAGES

 Mild to moderate infections of the upper and lower respiratory tract, pharyngitis, skin infections

Adults, Elderly (base). 250 mg q6h, 500 mg q12h, or 333 mg q8h. Maximum: 4 g/day. Adults, Elderly (ethylsuccinate). 400-800 mg q6-12h. Maximum: 4 g/day.

*Children.* 30-50 mg/kg/day in 2-4 divided doses up to 60-100 mg/kg/ day for severe infections.

Adults, Elderly, Children. 15-20 mg/ kg/day in divided doses q6h or 500-1000 mg q6h. Maximum: 4 g/day.

# Preoperative intestinal antisepsis PO

*Adults, Elderly.* 1 g at 1 PM, 2 PM, and 11 PM on the day before surgery (with neomycin).

Erythromycin (Generic Name)

*Children.* 20 mg/kg at 1 PM, 2 PM, and 11 PM on day before surgery (with neomycin).

### Acne vulgaris

TOPICAL

*Adults, Children.* Apply thin layer to affected area twice a day. PO

Adults. 250 mg 4 times daily. Gonococcal ophthalmia

## neonatorum prevention

OPHTHALMIC *Neonates.* 0.5-2 cm to each eye no later than 1 h after delivery.

## **OFF-LABEL USES**

Systemic: Chancroid, *Campylobacter enteritis*, gastroparesis, Lyme disease. Ophthalmic: Treatment of blepharitis, conjunctivitis, keratitis, chlamydial trachoma.

## CONTRAINDICATIONS

Administration of fixed-combination product; history of hepatitis due to macrolides; hypersensitivity to macrolides; preexisting hepatic disease (estolate only).

## INTERACTIONS

#### Drug

Buspirone, cyclosporine, felodipine, lovastatin, simvastatin: May increase the blood concentration and toxicity of these drugs. Carbamazepine: May inhibit the metabolism of carbamazepine. Chloramphenicol, clindamycin: May decrease the effects of these drugs. Hepatotoxic medications: May increase the risk of hepatotoxicity. Theophylline: May increase the risk of theophylline toxicity. Warfarin: May increase warfarin's effects. Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels.

## IV INCOMPATIBILITIES

Amphotericin B cholesteryl sulfate complex (Amphotec), amphotericin B liposome (AmBisome), ascorbic acid, aztreonam (Azactam), cefazolin, cefepime (Maxipime), cefoxitin (Mefoxin), chloramphenicol, dantrolene, dexamethasone sodium phosphate, diazepam (Valium), fluconazole (Diflucan), furosemide (Lasix), ganciclovir (Cytovene), indomethacin, ketorolac, linezolid (Zyvox), minocycline (Minocin), nitroprusside sodium (Nitropress), pemetrexed (Alimta), pentobarbital, phenobarbital, phenytoin, rocuronium (Zemuron), sulfamethoxazole/trimethoprim, ticarcillin (Ticar), ticarcillin/ clavulanate (Timentin).

## 🗏 IV COMPATIBILITIES

Acyclovir (Zovirax), alfentanil (Alfenta), amikacin (Amikar), aminophylline, amiodarone (Cordarone), anidulafungin (Eraxis), atracurium (Tracrium), atropine, azathioprine, benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, calcium gluconate carboplatin, caspofungin (Cancidas), cefotaxime (Claforan), ceftriaxone (Rocephin), cefuroxime (Zinacef), chlorpromazine, cimetidine (Tagemet), cisplatin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), daptomycin (Cubicin), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl),

dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Adriamycin), enalaprilat, ephedrine, epinephrine, epirubicin (Ellence), epoetin alfa (Procrit), ertapenem (Invanz), esmolol (Brevibloc), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), fludarabine (Fludara), fluorouracil, folic acid, foscarnet (Foscavir), gemcitabine (Gemzar), gentamicin, granisetron (Kytril), hydrocortisone sodium succinate, hydromorphone (Dilaudid), hydroxyzine, idarubicin (Idamycin), imipenem/ cilastatin (Primaxin), insulin (regular, Humulin R, Novolin R), isoproterenol (Isuprel), labetalol, levofloxacin (Levaquin), lidocaine, lorazepam (Ativan), meperidine (Demerol), methicillin, methotrexate, methylprednisolone sodium succinate, metoclopramide (Reglan), metronidazole (Flagyl), midazolam (Versed), milrinone, mitoxantrone (Novantrone), morphine, multivitamins, nafcillin, nalbuphine (Nubain), naloxone (Narcan), nicardipine (Cardene), nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), perphenazine, piperacillin, piperacillin/ tazobactam (Zosyn), procainamide, prochlorperazine, promethazine, propranolol, protamine, pyridoxine, ranitidine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiotepa (Thioplex), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, vancomycin, vasopressin, vecuronium (Norcuron), verapamil,

vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend), zidovudine (Retrovir).

## SIDE EFFECTS

#### Frequent

IV: Abdominal cramping or discomfort, phlebitis or thrombophlebitis. Topical: Dry skin (50%).

#### Occasional

Nausea, vomiting, diarrhea, rash, urticaria.

#### Rare

Ophthalmic: Sensitivity reaction with increased irritation, burning, itching, and inflammation. Topical: Urticaria.

## SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may occur.

- High dosages in patients with renal or hepatic impairment may lead to reversible hearing loss.
- Anaphylaxis and hepatotoxicity occur rarely.

 Ventricular arrhythmias and prolonged QT interval occur rarely with the IV drug form.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic dysfunction. Caution should also be used with the combination drug Pediazole (erythromycin and sulfisoxazole) in patients with impaired renal or hepatic function, severe allergies, bronchial asthma, or glucose-6-phosphate dehydrogenase deficiency. Major inhibitor of CYP3A4, which may lead to serious drug interactions. Use with caution in patients with myasthenia gravis (aggravation of disease). Infantile hypertrophic pyloric stenosis has occurred in infants. Determine whether there is a history of hepatitis or allergies to erythromycin or other

macrolides before beginning therapy. Erythromycin crosses the placenta and is distributed in breast milk. Erythromycin estolate may increase liver function test results in pregnant women. Elderly patients may be at increased risk for hearing loss or torsades de pointes at doses > 4 g/day.

WBC should be monitored to determine whether the infection is improving. Diarrhea, GI discomfort, headache, nausea, pattern of daily bowel activity and stool consistency, as well as signs and symptoms of superinfection, including anal or genital pruritus, moderate to severe diarrhea, abdominal cramps, fever, and sore mouth or tongue, should be assessed. Signs of hearing loss should be monitored because high dosages can cause hearing loss with hepatic and renal dysfunction. **Storage** 

## Store capsules and tablets at room temperature. The oral suspension is stable for 14 days at room

temperature. Store the parenteral form at room temperature. The initial reconstituted solution in vial is stable for 8 h at room temperature and 2 wks if refrigerated. Diluted IV solutions are stable for 8 h at room temperature and 24 h if refrigerated. Discard the solution if a precipitate forms.

### Administration

Administer erythromycin base or stearate 1 h before or 2 h after a meal. Erythromycin estolate and ethylsuccinate may be given without regard to food but are absorbed better when given on an empty stomach. Give tablets or capsules with 8 oz of water. If the patient has difficulty swallowing, sprinkle the capsule contents in a teaspoonful of applesauce and follow with water. Chew or crush chewable tablets.

For IV use, reconstitute each 500-mg vial with 10 mL or each 1-g vial with 20 mL sterile water for

injection without a preservative to provide a concentration of 50 mg/ mL. Further dilute with 100-250 mL D5W or 0.9% NaCl. Administer intermittent IV infusion (piggyback) over 20-60 min. Administer continuous infusion over 6-24 h. Assess for pain along vein frequently.

For topical use, gently cleanse and dry area before application. Apply thin film. Avoid eyes and mucous membranes.

For ophthalmic use, place a gloved finger on the lower eyelid and pull it out until a pocket is formed between the eye and the lower lid. Place ¼ to ½ inch of ointment into the pocket. Close the eye for 1-2 min and roll the eyeball gently to increase the drug's distribution. Remove excess ointment around the eye with tissue.

## Escitalopram es-sy-tal'oh-pram

📩 Lexapro 🐏 Cipralex

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidepressants, selective serotonin reuptake inhibitors (SSRIs)

## MECHANISM OF ACTION

A selective serotonin reuptake inhibitor that blocks the uptake of the neurotransmitter serotonin at neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression.

### PHARMACOKINETICS

Well absorbed after PO administration. Primarily metabolized in the liver. Primarily excreted in feces, with a lesser amount eliminated in urine. *Half-life:* 35 h, extended with

Escitalopram (Generic Name), Lexapro (Brand Name)

hepatic impairment. Oral solution and tablet bioequivalent.

## AVAILABILITY

Oral Solution: 1 mg/mL (240 mL). Tablets: 5 mg, 10 mg, 20 mg.

## INDICATIONS AND DOSAGES Depression, general anxiety disorder (GAD)

PO

Adults. Initially, 10 mg once a day in the morning or evening. May increase to 20 mg after a minimum of 1 wk. Elderly. 10 mg/day for depression; up to 20 mg/day for anxiety. Children 12 yr and older. Initially, 10 mg once a day (indicated for depression only). May increase to 20 mg after a minimum of 3 wks.

## Dose adjustment for hepatic impairment

Limit dose to 10 mg/day PO.

## **OFF-LABEL USES**

Trichotillomania, panic disorder.

## CONTRAINDICATIONS

Use within 14 days of MAOIs, hypersensitivity to eitalopram or escitalopram; use with pimozide. Do not use with linezolid or IV methylene blue due to risk of serotonin syndrome.

## INTERACTIONS

Drug

Alcohol, other CNS depressants: May increase CNS depression. Anticoagulants, antiplatelets, NSAIDs: May increase risk of bleeding.

Antifungals, cimetidine, macrolide antibiotics, CYP3A4 inhibitors: May increase plasma level of

escitalopram. Carbamazepine, CYP2C19

inducers, CYP3A4 inducers: May decrease plasma level of escitalopram.

# CYP2C19 inhibitors, delavirdine, fluconazole, gemfibrozil,

**omeprazole:** May increase plasma level of escitalopram.

MAOIs, linezolid, meperidine, selegiline: May cause serotonin syndrome, marked by autonomic hyperactivity, coma, diaphoresis, excitement, hyperthermia, and rigidity, and neuroleptic malignant syndrome. Avoid combination with MAOIs and allow 14-day washout. Metoprolol: Increases plasma level of metoprolol.

**Pimozide:** Increases QTc interval significantly; mechanism unknown. Contraindicated.

**SSRIs, SNRIs, buspirone, sibutramine, tramadol, triptans:** May increase risk for serotonin syndrome.

Herbal

St. John's wort: May increase risk for serotonin syndrome and/or decrease escitalopram plasma level. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May reduce serum sodium level.

## SIDE EFFECTS

#### Frequent (9%-21%)

Nausea, dry mouth, somnolence, insomnia, abnormal ejaculation. Occasional (4%-8%)

Tremor, diarrhea, diaphoresis, dyspepsia, fatigue, anxiety, decreased libido.

#### Rare (2%-3%)

Sinusitis, vomiting, constipation, anorexia, sexual dysfunction, menstrual disorder, abdominal pain, agitation.

## SERIOUS REACTIONS

 Overdose is manifested as dizziness, drowsiness, tachycardia, somnolence, confusion, and seizures.  Serotonin syndrome, activation of hypomania/mania, abnormal bleeding, hyponatremia/SIADH.

### **PRECAUTIONS & CONSIDERATIONS**

Antidepressants increased the risk of suicidal thinking and behavior (suicidality) in short-term studies in children and adolescents with depression and other psychiatric disorders. Caution is warranted with hepatic or severe renal impairment; those with a history of hypomania, mania, or seizures; and patients concurrently using CNS depressants. Neonates exposed to escitalopram late in the third trimester have developed complications requiring prolonged hospitalization, respiratory support, and tube feeding. Consider tapering escitalopram in the third trimester of pregnancy. Escitalopram is distributed in breast milk. Escitalopram use may increase anticholinergic effects and hyperexcitability in children. Elderly patients are more sensitive to the drug's anticholinergic effects, such as dry mouth, and are more likely to experience confusion, dizziness, hyperexcitability, and sedation.

Alcohol and tasks that require mental alertness or motor skills should be avoided until the effects of the drug are known. CBC and liver and renal function tests should be performed before and periodically during therapy, especially with long-term use. Gradual discontinuation is advised to avoid withdrawal symptoms. Storage

Store at room temperature. Administration

! Make sure at least 14 days elapse between the use of MAOIs and escitalopram.

Take escitalopram without regard to food. Do not crush film-coated

tablets. Do not abruptly discontinue escitalopram or increase the dosage.

## Esmolol

ess'moe-lol

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiadrenergics, β-blocking; antiarrhythmics, class II

## **MECHANISM OF ACTION**

An antiarrhythmic that selectively blocks  $\beta_1$ -adrenergic receptors. *Therapeutic Effect:* Slows sinus heart rate, decreases cardiac output, reducing BP.

## AVAILABILITY

Injection: 10 mg/mL (250 mL, 10 mL), 20 mg/mL (5 mL, 100 mL). Premixed IV Infusion: 2500 mg/250 mL; 2000 mg/100 mL.

## INDICATIONS AND DOSAGES

Supraventricular tachyarrhythmias, including sinus tachycardia or paroxysmal supraventricular tachycardia (PSVT) or to control ventricular rate in patients with atrial fibrillation (AFib) or atrial flutter (AFlutter) IV

Adults, Elderly. Initially, a loading dose of 500 mcg/kg over 1 min, followed by 50 mcg/kg/min for 4 min. If optimum response is not attained in 5 min, give a second loading dose of 500 mcg/kg/min for 1 min, followed by infusion of 100 mcg/kg/min for 4 min. An additional loading dose can be given and infusion increased by 50 mcg/kg/min, up to 200 mcg/kg/ min, for 4 min. Once the desired response is attained, cease loading dose and decrease infusion by no more than 25 mcg/kg/min at 10-min intervals. Infusion is usually administered over 24-48 h in most patients. Range: 50-200 mcg/kg/min, with average dose of 100 mcg/kg/min.

#### Intraoperative tachycardia or hypertension (immediate control) IV

Adults, Elderly. Initially, 80 mg over 30 seconds, then 150 mcg/kg/ min infusion up to 300 mcg/kg/min. Titrate to desired heart rate and/or BP.

## **OFF-LABEL USES**

Postoperative hypertension and PSVT in children.

## CONTRAINDICATIONS

Cardiogenic shock, overt cardiac failure, second- and third-degree heart block, sinus bradycardia, pregnancy (2nd and 3rd trimesters).

## INTERACTIONS

#### Drug

**Calcium channel blockers:** Effects of verapamil, nifedipine may be potentiated. Diltiazem, felodipine, nicardipine may increase esmolol effects.

**Digoxin:** Increase in digoxin levels. **Insulin, oral hypoglycemics:** May mask symptoms of hypoglycemia and prolong hypoglycemic effect of these drugs.

**MAOIs:** May cause significant hypertension or bradycardia. **Morphine:** Increase in esmolol levels.

**Succinylcholine:** Prolonged duration of neuromuscular blockade.

**Sympathomimetics, xanthines:** May mutually inhibit effects.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B cholesteryl sulfate complex (Amphotec), azathioprine, cefotetan (Cefotan), dantrolene, dexamethasone sodium phosphate, diazepam (Valium), furosemide (Lasix), ganciclovir (Cytovene), indomethacin, ketorolac, lansoprazole (Prevacid), minocycline (Minocin), oxacillin, pantoprazole (Protonix), pentobarbital, phenobarbital.

## **IV COMPATIBILITIES**

Alfentanil (Alfenta), amikacin (Amikar), aminophylline, amiodarone (Cordarone), amphotericin B liposomal (AmBisome), ascorbic acid, atracurium (Tracrium), atropine, aztreonam (Azactam), benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefazolin, cefotaxime (Claforan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chlorpromazine, cimetidine (Tagamet), cisatracurium (Nimbex), cisplatin, clindamycin (Cleocin), cyanocobalamin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune), dactinomycin (Cosmegen), daptomycin (Cubicin), dexmedetomidine (Precedex),

digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Adriamycin), enalaprilat, ephedrine, epinephrine, epoetin alfa (Procrit), ertapenem (Invanz), erythromycin lactobionate, etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fentanyl (Sublimaze), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil, folic acid, gemcitabine (Gemzar), gentamicin, granisetron (Kytril), heparin, hydromorphone (Dilaudid), hydroxyzine, imipenem/cilastatin (Primaxin), insulin (regular, Humulin R, Novolin R), isoproterenol (Isuprel), labetalol, levofloxacin (Levaquin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, mannitol, meperidine (Demerol), methicillin, methotrexate, metoclopramide (Reglan), metoprolol (Lopressor), metronidazole (Flagyl), micafungin (Mycamine), midazolam (Versed), mitoxantrone (Novantrone), morphine, multiple vitamins injection, nalbuphine (Nubain), naloxone (Narcan), nicardipine (Cardene), nitroglycerin, nitroprusside sodium (Nitropress), norepinephrine (Levophed), ondansetron (Zofran), oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pancuronium, pemetrexed (Alimta), penicillin G potassium, penicillin G sodium, phytonadione, potassium chloride, prochloperazine, promethazine, propofol (Diprivan), propranolol, quinupristin/dalfopristin (Synercid), ranitidin (Zantac), remifentanil (Ultiva), sodium bicarbonate,

streptokinase, succinylcholine, sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin/ clavulanate (Timentin), tigecycline (Tygacil), tirofibran (Aggrastat), tobramycin, vancomycin, vasopressin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), voriconazole (Vfend), warfarin.

#### SIDE EFFECTS

Esmolol is generally well tolerated, with transient and mild side effects. Frequent (> 10%)

Hypotension (systolic BP < 90 mm Hg) asymptomatic or symptomatic manifested as dizziness, nausea, diaphoresis, headache, cold extremities, fatigue.

#### Occasional

Nausea, dizziness, anxiety, drowsiness, flushed skin, vomiting, confusion, pain or inflammation at injection site, fever.

#### SERIOUS REACTIONS

 Overdose may produce profound hypotension, bradycardia, dizziness, syncope, drowsiness, breathing difficulty, bluish fingernails or palms of hands, and seizures.

- Esmolol administration may potentiate insulin-induced hypoglycemia in diabetic patients.
- · Skin necrosis at infusion site.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with bronchial asthma, conduction disorder (e.g., sinus sick syndrome), bronchitis, congestive heart failure, diabetes, emphysema, history of allergy, myasthenia gravis, depression, peripheral vascular disease, and impaired renal function. Extravasation may cause tissue necrosis. Safety and efficacy have not been evaluated in children.

Notify the physician of cold extremities, dizziness, faintness, or nausea. BP for hypotension, respiratory status for shortness of breath, pattern of daily bowel activity and stool consistency, ECG for arrhythmias, and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 55 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of congestive heart failure, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain, should also be assessed.

#### Storage

After dilution, solution is stable for 24 h. Store unopened vials at room temperature.

Premixed infusions are stored at room temperature in overwrap until time of use.

#### Administration

! Give esmolol by IV infusion. Avoid using butterfly needles and very small veins.

For IV administration, use only clear and colorless to light yellow solution. Discard solution if it is discolored or if precipitate forms. For IV infusion, make sure the prescribed amount of esmolol is diluted to provide a concentration of 10 mg/mL or 20 mg/mL. Premixed bags are available. Administer by controlled infusion device, and titrate according to the patient's tolerance and response. Infuse IV loading dose over 1-2 min. Monitor the patient for hypotension (a systolic BP of < 90mm Hg), especially during the first 30 min of infusion.

Esomeprazole es-om-eh-pray'zole

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Gastrointestinal agents, antiucler agents, protonpump inhibitors (PPIs).

## MECHANISM OF ACTION

A proton-pump inhibitor that is converted to active metabolites that irreversibly bind to and inhibit hydrogen-potassium adenosine triphosphates, an enzyme on the surface of gastric parietal cells. Inhibits hydrogen ion transport into gastric lumen. *Therapeutic Effect:* Increases gastric pH, reducing gastric acid production.

## PHARMACOKINETICS

Well absorbed after oral administration. Protein binding: 97%. Extensively metabolized by the liver by CYP219 and CYP3A4. Primarily excreted in urine. *Half-life:* 1-1.5 h.

#### AVAILABILITY

Capsules (Delayed Release): 20 mg, 40 mg.

Suspension (Delayed Release): 10 mg/ packet, 20 mg/packet, 40 mg/packet. Injection, Powder for Reconstitution: 20 mg, 40 mg.

#### INDICATIONS AND DOSAGES • Erosive esophagitis healing PO

Adults, Elderly, Adolescents. 20-40 mg once daily for 4-8 wks. Children 1-11 yr of age weighing < 20 kg. 10 mg once daily for up to 8 wks.

Esomeprazole (Generic Name), Nexium (Brand Name)

*Children 1-11 yr of age weighing* > 20 kg. 10-20 mg once daily for up to 8 wks.

Infants 1-12 months of age. Weight 3 kg to 5 kg: 2.5 mg once daily for up to 6 weeks.

Weight > 5 kg to 7.5 kg: 5 mg once daily for up to 6 weeks.

Weight > 7.5 kg to 12 kg: 10 mg once daily for up to 6 weeks.

## To maintain healing of erosive esophagitis

PO

Adults, Elderly. 20 mg/day.

### Gastroesophageal reflux disease PO

Adults, Elderly. 20 mg once a day for 4-8 wks.

Adolescents aged 12-17 yr.

20-40 mg once daily for up to 8 wks. *Children aged 1-11 yr.* 10 mg once daily for up to 8 wks.

IV

Adults, Elderly. 20-40 mg once daily.

IV INFUSION

*Children 1 to 17 yr.* If weight < 55 kg: Give 10 mg once daily. If weight 55 kg or greater, give 20 mg once daily.

Infants 1-12 months. Give 0.5 mg/kg once daily.

## Duodenal ulcer caused by Helicobacter pylori PO

*Adults, Elderly.* 40 mg (esomeprazole) once a day, with amoxicillin 1000 mg and clarithromycin 500 mg twice a day for 10-14 days.

## Prevention of NSAID-induced gastric ulcer PO

*Adults, Elderly.* 20-40 mg once daily for up to 6 mo.

## Hypersecretory conditions (e.g., Zollinger-Ellison syndrome) PO

Adults, Elderly. 40 mg twice daily.

## Dose in hepatic impairment (Child-Pugh Class C) PO

*Adults, Elderly.* Dose should not exceed 20 mg/day.

## CONTRAINDICATIONS

Hypersensitivity to other PPIs or esomeprazole.

### INTERACTIONS Drug

Digoxin, iron, ketoconazole, atazanavir, indinavir: May decrease the concentration of digoxin, iron, atazanavir, indinavir, and ketoconazole. Benzodiazepines (diazepam,

midazolam, triazolam): May increase levels of benzodiazepines metabolized by oxidation.

**CYP2C19 inhibitors:** May increase esomeprazole level.

**Methotrexate:** May increase risk of methotrexate toxicity.

**Rifampin:** May decrease the levels and efficacy of esomeprazole.

## Herbal

St. John's wort: May decrease the levels of esomeprazole. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT), ALT (SGPT), serum alkaline phosphatase, bilirubin levels. May reduce platelet, RBC, and WBC counts. May decrease serum magnesium in chronic use.

## IV INCOMPATIBILITIES

Do not administer concomitantly with any other medications through the same IV site and/or tubing. Specific incompatibilities include tacrolimus (Prograf).

## **IV COMPATIBILITIES**

Doripenem (Doribax).

## SIDE EFFECTS

Frequent (> 10%)

Headache.

#### Occasional (2%-9%)

Diarrhea, abdominal pain, flatulence, nausea, hypertension, pain, anxiety, insomnia, local injection site reaction (IV).

### Rare (< 2%)

Dizziness, dyspepsia, asthenia or loss of strength, vomiting, constipation, rash, cough, anemia.

## SERIOUS REACTIONS

• Hepatitis or other hepatic effects (rare).

Serious hypersensitivity/

dermatologic reactions (rare), such as angioedema, anaphylaxis, Stevens-Johnson syndrome.

- · Neutropenia or thrombocytopenia.
- In chronic use, may cause hypomagnesemia.

• In chronic use, may increase risk of bone fracture.

 Possible alteration of GI microflora which increases risk of *C. dificile* associated diarrhea (CDAD).

#### PRECAUTIONS & CONSIDERATIONS

It is unknown whether esomeprazole crosses the placenta or is distributed in breast milk. However, omeprazole is distributed in breast milk. Safety and efficacy of esomeprazole have not been established in neonates. No agerelated precautions have been noted in elderly patients. Notify the physician if headache, diarrhea, discomfort, or nausea occurs during esomeprazole therapy.

#### Storage

Store oral product and unopened IV vials at room temperatue, protected from light. Once IV reconstituted with LR or NaCl, use within 12 h. If infusion in D5W, use within 6 h.

#### Administration

Take 1 h or more before eating. Do not crush or open capsule; swallow the capsule whole. May open the capsule and mix pellets with 1 tbsp of applesauce; swallow the spoonful without chewing. Mix contents of oral suspension packet with 1 tbsp (15 mL) of water, then leave 2-3 min to thicken. Stir and drink within 30 min. If any material remains after drinking, add more water, stir, and drink immediately.

In adults, IV may be given as either IV injection or IV infusion. In children and infants, give as IV infusion only. NOTE: The IV line should always be flushed with either 0.9% NaCl, lactated Ringer's, or D5W both prior to and after giving the drug. To prepare injection, dilute either 20 mg or 40 mg with 5 mL of 0.9% NaCl and give IV over no less than 3 min. For IV infusion, further dilute vial to a final volume of 50 mL with 0.9% NaCl, lactated Ringer's, or D5W. Infuse over a period of 10-30 min.

#### Estazolam es-tay'zoe-lam

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: IV

*Classification:* Sedatives/ hypnotics, benzodiazepines

## **MECHANISM OF ACTION**

A benzodiazepine that enhances action of gamma aminobutyric acid (GABA) neurotransmission in

Estazolam (Generic Name)

the central nervous system (CNS). *Therapeutic Effect:* Produces depressant effect at all levels of CNS.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Onset of action 1 h. Protein binding: 93%. Metabolized in liver extensively. Primarily excreted in urine, minimal in feces. *Half-life:* 10-24 h.

## AVAILABILITY

Tablets: 1 mg, 2 mg.

# INDICATIONS AND DOSAGES Insomnia

PO

Adults (older than 18 yr). 1-2 mg at bedtime.

*Elderly, debilitated, liver disease, low serum albumin.* 0.5-1 mg at bedtime.

#### CONTRAINDICATIONS

Pregnancy, hypersensitivity to other benzodiazepines, contraindicated with ketoconazole and itraconazole.

### INTERACTIONS

#### Drug

Alcohol, CNS depressants: May increase CNS and respiratory depression and have hypotensive effects.

Ketoconazole and itraconazole:

Impair estazolam metabolism; contraindicated. Use other CYP3A4 inhibitors with caution.

#### Herbal

Kava kava, valerian: May increase CNS depressant effect. Food

None known.

## SIDE EFFECTS

#### Frequent

Drowsiness, sedation, hypokinesia, rebound insomnia (may occur for 1-2 nights after drug is discontinued), dizziness, confusion, euphoria, abnormal coordination.

#### Occasional

Weakness, anorexia, diarrhea. Rare

Paradoxical CNS excitement, restlessness (particularly noted in elderly or debilitated patients).

## SERIOUS REACTIONS

• Overdosage results in somnolence, confusion, diminished reflexes, and coma.

Hypersensitivity reactions, including anaphylaxis and angioedema, have been reported.
Complex behaviors such as "sleepdriving" (i.e., driving while not fully awake after ingestion of a sedativehypnotic, with amnesia for the event) or other behaviors, with amnesia after the events, have been reported; consider discontinuation if they occur.

### PRECAUTIONS & CONSIDERATIONS

Caution should be used with impaired renal or liver function, respiratory disease, decreased gag reflex, or depression. Be aware that estazolam is contraindicated in pregnancy. Estazolam crosses the placenta and is distributed in breast milk. Safety and efficacy of estazolam have not been established in children. Use small initial doses and gradually increase them to avoid excessive sedation or ataxia as evidenced by muscular incoordination in elderly patients. Patients taking benzodiazepines are at risk for falls. Rebound insomnia may occur when drug is discontinued after short-term therapy.

Drowsiness and dizziness are expected side effects. Avoid tasks that require mental alertness or motor skills. Concomitant use with alcohol should also be avoided. **Storage** 

Store at room temperature.

#### Administration

Take at bedtime. May be taken without regard to meals.

## Estradiol

ess-tra-dye'ole Alora, Climara, Delestrogen, Depo-Estradiol, Divigel, Elestrin, Estrace, Estraderm, Estrasorb, EstroGel, Estring, Evamist, Femring, Femtrace, Gynodiol, Menostar, Vagifem, Vivelle-Dot. Do not confuse Estraderm with Testoderm.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: X

*Classification:* Estrogens, hormones/hormone modifiers

#### MECHANISM OF ACTION

An estrogen that increases the synthesis of DNA, RNA, and proteins in target tissues; reduces release of gonadotropin-releasing hormone from the hypothalamus; and reduces follicle-stimulating hormone and luteinizing hormone (LH) release from the pituitary. Therapeutic Effect: Promotes normal growth, promotes development of female sex organs, and maintains genitourinary function and vasomotor stability. Prevents accelerated bone loss by inhibiting bone resorption, restoring balance of bone resorption and formation. Inhibits LH and decreases serum testosterone concentration.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Widely distributed. Protein binding: 50%-80%. Metabolized in the liver. Primarily excreted in urine. *Half-life:* 1-2 h.

## AVAILABILITY

Tablets (micronized, Estrace, Femtrace, Gynodiol): 0.5 mg, 1 mg, 1.5 mg, 2 mg. Tablets (acetate, Femtrace): 0.45 mg, 0.9 mg, 1.8 mg. Emulsion (Topical [Estrasorb]): 2.5 mg/g (0.25%). Injection (Cypionate [Depo-Estradiol]): 5 mg/mL. Injection (Valerate [Delestrogen]): 10 mg/mL, 20 mg/mL, 40 mg/mL. Topical Gel (Divigel, Elestrin, EstroGel): 0.06%, 0.1%. Topical Sprav (Evamist): 1.53 mg/actuation. Transdermal System (Alora): twice weekly: 0.025 mg, 0.05 mg, 0.075 mg, 0.1 mg. Transdermal System (Climara): once weekly: 0.025 mg, 0.0375 mg, 0.05 mg, 0.06 mg, 0.075 mg, 0.1 mg. Transdermal System (Estraderm): twice weekly: 0.05 mg, 0.1 mg. Transdermal System (Menostar): once a week: 1 mg estradiol (14 mcg/24 h). Transdermal System (Vivelle-Dot): twice weekly: 0.025 mg, 0.0375 mg, 0.05 mg, 0.075 mg, 0.1 mg. Vaginal Cream (Estrace): 0.1 mg/g (0.01%). Vaginal Ring (Estring): 2 mg. Vaginal Ring (Femring): 0.05 mg, 0.1 mg. Vaginal Tablet (Vagifem): 25 mcg.

# INDICATIONS AND DOSAGES Prostate cancer (palliative)

IM (VALERATE) Adults, Elderly. 30 mg or more q1-2 wk.

Estradiol (Generic Name)

#### PO

*Adults, Elderly.* 10 mg 3 times a day for at least 3 mo.

# Breast cancer (palliative) PO

*Adults, Elderly.* 10 mg 3 times a day for at least 3 mo.

## Osteoporosis prophylaxis in postmenopausal females PO

If intact uterus, give 14 days progestin every 6-12 mo. *Adults, Elderly.* 0.5 mg/day cyclically (3 wks on, 1 wk off). TRANSDERMAL (CLIMARA)

Adults, Elderly. Initially, 0.025 mg weekly, adjust dose as needed. TRANSDERMAL (ALORA, VIVELLE-DOT)

*Adults, Elderly.* Initially, 0.025 mg patch twice weekly, adjust dose as needed.

TRANSDERMAL (ESTRADERM) Adults, Elderly. 0.05 mg twice weekly. TRANSDERMAL (MENOSTAR) Adults, Elderly. 1 mg weekly.

# Female hypoestrogenism PO

Adults, Elderly. 1-2 mg/day, adjust dose as needed.

IM (ESTRADIOL CYPIONATE) Adults, Elderly. 1.5-2 mg monthly. IM (ESTRADIOL VALERATE) Adults, Elderly. 10-20 mg q4wk. TRANSDERMAL (CLIMARA) Adults, Elderly. 0.025 mg once weekly.

## Vasomotor symptoms associated with menopause

PO

Adults, Elderly. 1-2 mg/day cyclically (3 wks on, 1 wk off), adjust dose as needed. IM (ESTRADIOL CYPIONATE) Adults, Elderly. 1-5 mg q3-4wk. IM (ESTRADIOL VALERATE) Adults, Elderly. 10-20 mg q4wk. TOPICAL EMULSION (ESTRASORB)

Adults, Elderly. 3.84 g once a day in the morning. TOPICAL GEL (ESTROGEL) Adults, Elderly. 1.25 g/day. TOPICAL GEL (DIVIGEL) Adults, Elderly. 0.25 g/day. Range 0.25-1 g/day. TOPICAL GEL (ELESTRIN) Adults, Elderly. 0.87 g/day. TOPICAL SPRAY (EVAMIST) Adults, Elderly. One spray/day. Range 1-3 sprays/day based on response. TRANSDERMAL (CLIMARA) Adults, Elderly. 0.025 mg weekly. Adjust dose as needed. TRANSDERMAL (ALORA, ESTRADERM, VIVELLE-DOT) Adults, Elderly. 0.05 mg twice a week. VAGINAL RING (FEMRING) Adults, Elderly. 0.05 mg once q90 days. May increase to 0.1 mg if needed.

#### Vaginal atrophy

VAGINAL RING (ESTRING) Adults, Elderly. 2 mg once q90 days. VAGINAL CREAM (ESTRACE) Adults, Elderly. 2-4 g/day for 2 wks, then reduce to ½ initial dose for 2 wks, then 1 g 1-3 times a week. TOPICAL GEL (ESTROGEL) Adults, Elderly. 1.25 g/day. TOPICAL GEL (ELESTRIN) Adults, Elderly. 0.87 g/day. TRANSDERMAL (CLIMARA) Adults, Elderly. 0.025 mg once a week.

#### Atrophic vaginitis

VAGINAL TABLET (VAGIFEM) *Adults, Elderly.* Initially, 1 tablet/ day for 2 wks. Maintenance: 1 tablet twice a week.

## **OFF-LABEL USES**

Treatment of Turner's syndrome.

## CONTRAINDICATIONS

Abnormal vaginal bleeding, active arterial thrombosis, blood dyscrasias, estrogen-dependent cancer, known or suspected breast cancer, pregnancy, thrombophlebitis or thromboembolic disorders, thyroid dysfunction, severe hepatic dysfunction.

## INTERACTIONS

#### Drug

Aromatase inhibitors: May interfere with effects of aromatase inhibitors.

**Bromocriptine:** May interfere with the effects of bromocriptine.

**Corticosteroids:** May increase effects of hydrocortisone and prednisone.

**Cyclosporine:** May increase blood cyclosporine concentration and the risk of hepatotoxicity and nephrotoxicity.

**CYP3A4 inducers/inhibitors:** May alter levels of estradiol.

Hepatotoxic medications,

**cyclosporine:** May increase the risk of hepatotoxicity. May increase the level of cyclosporine.

**Thyroid medications:** May decrease effects of thyroid medications.

## Herbal

Saw palmetto: Increases the effects of saw palmetto.

St. John's wort: May decrease effects of estradiol.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose, HDL, serum calcium, and triglyceride levels. May decrease serum cholesterol levels and LDH concentrations. May affect metapyrone testing and thyroid function tests.

## SIDE EFFECTS

#### Frequent

Anorexia, nausea, swelling of breasts, peripheral edema marked by swollen ankles and feet.

Transdermal: Skin irritation, redness.

#### Occasional

Vomiting, especially with high doses; headache that may be severe; intolerance to contact lenses; hypertension; glucose intolerance; brown spots on exposed skin. Vaginal: Local irritation, vaginal discharge, changes in vaginal bleeding, including spotting, and breakthrough or prolonged bleeding.

## Rare

Chorea or involuntary movements, hirsutism or abnormal hairiness, loss of scalp hair, depression, anxiety, or emotional lability.

## SERIOUS REACTIONS

 Prolonged administration increases the risk of gallbladder disease, thromboembolic disease, and breast, cervical, vaginal, endometrial, and hepatic cancer.

• Myocardial infarction, stroke, venous thromboembolism.

- · Cholestatic jaundice occurs rarely.
- · Retinal vascular thrombosis.

## **PRECAUTIONS & CONSIDERATIONS**

Unopposed estrogen increases risk of endometrial cancer in those with an intact uterus. Estrogen therapy should not be used to prevent cardiovascular disease, and other options for osteoporosis should be considered if being used solely for prevention of osteoporosis because it increases the risk of cardiovascular events. Use with caution in patients with cardiovascular disease. Use with caution in patients with history of cholestatic jaundice with past estrogen use or pregnancy. Estrogen therapy should be used for the shortest duration and lowest dose possible. Caution is warranted in patients with diseases exacerbated by fluid retention and with hepatic or renal insufficiency and with gallbladder disease,

hypocalcemia, porphyria, or lupus. Should be discontinued at least 4 wks before and for 2 wks following surgical procedures or prolonged immobilizations (risk of thromboembolism). Estradiol is distributed in breast milk and may be harmful to the infant. Estradiol should not be used during breastfeeding. Estradiol should be used cautiously in children whose bone growth is not complete because the drug may accelerate epiphyseal closure. The risk of dementia is increased in postmenopausal women aged > 65 yr.

Avoid smoking because of the increased risk of blood clot formation and myocardial infarction. Limit alcohol and caffeine intake.

Notify the physician of calf or chest pain, depression, numbness or weakness of an extremity, severe abdominal pain, shortness of breath, speech or vision disturbance, sudden headache, unusual bleeding, or vomiting. BP, weight, blood glucose, hepatic enzyme, and serum calcium levels should be monitored.

#### Storage

Store all products at room temperature; do not freeze. Alcohol-based topical products are flammable; avoid heat and flame exposure. Keep transdermal systems and vaginal ring in sealed pouch until time of use.

#### Administration

Take oral estradiol at the same time each day.

For IM use, rotate the vial to disperse drug in oil. Give deep IM injection into the gluteus maximus. *not* for intravenous use.

For vaginal use, apply estradiol cream at bedtime for best absorption. To administer, insert the end of the filled applicator into the vagina, directing the applicator slightly toward the sacrum; push the plunger down completely. To prevent topical absorption of the drug, do not allow the cream to contact the skin.

Apply topical gels, lotions, and spray at the same time each day topically as directed for each specific product. Let products dry well. Manufacturers of most products recommend to cover treated areas with clothing to avoid unintentional exposure of others, because the products may transfer (e.g., children, partners).

Apply vaginal rings high in vagina as directed; they are left in place for 90 days, then removed and replaced. ! Transdermal Climara is administered once weekly; many transdermal forms of estradiol are applied twice weekly. Follow the directions for each specific brand.

To apply the transdermal system, remove the old patch and select a new site. Consider using the buttocks as an alternative application site. Peel off the protective strip on the patch to expose the adhesive surface. Apply to clean, dry, intact skin on the trunk of the body in an area with as little hair as possible. Press in place for at least 10 seconds. Do not apply the patch to breasts or waistline.

## Estrogens, Conjugated

ess'troe-jenz
 Cenestin, Enjuvia, Premarin
 C.E.S., Congest, Premarin
 Do not confuse with Primaxin
 or Remeron. Do not confuse
 Enjuvia with Januvia.

CATEGORY AND SCHEDULE Pregnancy Risk Category: X

**Classification:** Estrogens, hormones/hormone modifiers

## **MECHANISM OF ACTION**

An estrogen that increases the synthesis of DNA, RNA, and various proteins in target tissues; reduces release of gonadotropin-releasing hormone from the hypothalamus; and reduces follicle-stimulating hormone (FSH) and luteinizing hormone (LH) release from the pituitary gland. Therapeutic Effect: Promotes normal growth, promotes development of female sex organs, and maintains genitourinary function and vasomotor stability. Prevents accelerated bone loss by inhibiting bone resorption, restoring balance of bone resorption and formation. Inhibits LH and decreases serum concentration of testosterone.

## PHARMACOKINETICS

Well absorbed from the GI tract. Widely distributed. Protein binding: 50%-80%. Metabolized in the liver. Primarily excreted in urine. *Half-life* (*metabolite*): 27 h.

## AVAILABILITY

*Tablets (Cenestin, Premarin):* 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg. *Tablets (Enjuvia):* 0.3 mg, 0.45 mg, 0.625 mg, 0.9 mg, 1.25 mg. *Injection:* 25 mg. *Vaginal Cream:* 0.625 mg/g.

## INDICATIONS AND DOSAGES

## Vasomotor symptoms associated with menopause, atrophic vaginitis, kraurosis vulvae

PO

*Adults, Elderly.* 0.3-0.625 mg/day cyclically (21 days on, 7 days off) or continuously.

INTRAVAGINAL

Adults, Elderly. 0.5-2 g/day

cyclically, such as 21 days on and 7 days off.

### Female hypogonadism PO

*Adults.* 0.3-0.625 mg/day in divided doses for 20 days; then a rest period of 10 days.

## Female castration, primary ovarian failure

PO

Adults. Initially, 1.25 mg/day cyclically. Adjust dosage, upward or downward, according to severity of symptoms and patient response. For maintenance, adjust dosage to lowest level that will provide effective control.

## Osteoporosis

## PO

*Adults, Elderly.* 0.3-0.625 mg/day, cyclically, such as 25 days on and 5 days off.

#### Breast cancer palliation PO

Adults, Elderly. 10 mg 3 times a day for at least 3 mo.

# Prostate cancer (palliative) PO

Adults, Elderly. 1.25-2.5 mg 3 times a day.

#### Abnormal uterine bleeding PO

*Adults.* 1.25 mg q4h for 24 h, then 1.25 mg/day for 7-10 days. IV, IM *Adults.* 25 mg; may repeat once in 6-12 h.

## **OFF-LABEL USES**

Prevention of estrogen deficiencyinduced premenopausal osteoporosis. *Cream:* Prevention of nosebleeds.

## CONTRAINDICATIONS

Breast cancer (with some exceptions), severe hepatic disease, thrombophlebitis or thromboembolic disorders, undiagnosed vaginal bleeding, active arterial thrombosis, blood dyscrasias, estrogendependent cancer, pregnancy, thyroid dysfunction.

## INTERACTIONS

#### Drug

Aromatase inhibitors: May interfere with effects of aromatase inhibitors.

**Bromocriptine:** May interfere with the effects of bromocriptine. **Corticosteroids:** May increase effects of hydrocortisone and prednisone.

**Cyclosporine:** May increase blood cyclosporine concentration and the risk of hepatotoxicity and nephrotoxicity.

**CYP3A4 inducers/inhibitors:** May alter levels of estrogens.

Hepatotoxic medications: May increase the risk of hepatotoxicity.

**Thyroid medications:** May decrease effects of thyroid medications.

#### Herbal

**St. John's wort:** May decrease the effects of estrogens.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose, HDL, serum calcium, and triglyceride levels. May decrease serum cholesterol levels and LDH concentrations. May affect serum metapyrone testing and thyroid function tests.

## IV INCOMPATIBILITIES

Pantoprazole.

## 🗏 IV COMPATIBILITIES

Heparin, hydrocortisone sodium succinate, potassium chloride, vitamin B complex with C.

## SIDE EFFECTS

## Frequent

Vaginal bleeding, such as spotting or breakthrough bleeding; breast pain or tenderness; gynecomastia.

## Occasional

Headache, hypertension, intolerance to contact lenses.

High doses: Anorexia, nausea.

#### Rare

Loss of scalp hair, depression, anxiety, or emotional lability.

## SERIOUS REACTIONS

 Prolonged administration may increase the risk of gallbladder disease, thromboembolic disease, and breast, cervical, vaginal, endometrial, and hepatic cancer.

- Myocardial infarction, stroke, venous thromboembolism.
- · Cholestatic jaundice occurs rarely.
- · Retinal vascular thrombosis.

## **PRECAUTIONS & CONSIDERATIONS**

Unopposed estrogen increases risk of endometrial cancer in those with an intact uterus. Estrogen therapy should not be used to prevent cardiovascular disease; because of the increased risk of cardiovascular disease, other options for osteoporosis should be considered if it is being used solely for prevention of osteoporosis. Use with caution in patients with cardiovascular disease. Use with caution in patients with a history of cholestatic jaundice with past estrogen use or pregnancy. Estrogen therapy should be used for the shortest duration and lowest dose possible. Caution is warranted in patients with diseases exacerbated by fluid retention, such as high blood pressure, asthma, cardiac dysfunction, diabetes mellitus, epilepsy, migraine headaches, heart failure, and renal impairment. Caution is warranted in patients with hepatic disease, gallbladder disease, hypocalcemia, porphyria, lupus. Should be discontinued at least 4 wks before and for 2 wks following surgical procedures or

prolonged immobilizations (risk of thromboembolism). Conjugated estrogens are distributed in breast milk and may be harmful to the infant. The drug should be discontinued in a pregnant woman. Estrogens should not be used during breastfeeding. Safety and efficacy of conjugated estrogens have not been established in children. Estrogens should be used cautiously in children whose bone growth is not complete because the drug may accelerate epiphyseal closure. The risk of dementia is increased in postmenopausal women aged > 65 yr. Avoid smoking because of the increased risk of blood clot formation and MI. Limit alcohol and caffeine intake.

Notify the physician of weight gain of more than 5 lb in a week, abnormal vaginal bleeding, depression, or signs and symptoms of blood clots. Also, signs and symptoms of thromboembolic or thrombotic disorders, including loss of coordination, numbness or weakness of an extremity, shortness of breath, speech or vision disturbance, sudden severe headache, and pain in the chest, leg, or groin, should be reported immediately. Breast self-examinations should be made monthly. Weight and BP should be monitored. Storage

## Store tablets and vaginal cream

at room temperature. Refrigerate injection. The reconstituted solution is stable for 60 days refrigerated. Do not use if solution darkens or precipitate forms.

#### Administration

Take at the same time each day with food or milk if nausea occurs. Tablet shell may be observed in stool.

Administer vaginal cream at bedtime. Use applicator provided and fill to mark corresponding with dose. After use, wash applicator with warm (not hot), soapy water.

For IV and IM use, reconstitute with 5 mL sterile water for injection containing benzyl alcohol (provided). Slowly add diluent, shaking gently. Avoid vigorous shaking. For the IV form, give slowly to prevent flushing. (no more than 5 mg/min).

# Estrogens, Esterified

★ Menest 👾 Estragyn

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Estrogens, hormones/hormone modifiers

#### **MECHANISM OF ACTION**

A combination of sodium salts of sulfate esters of estrogenic substances (principal component is estrone) that increases synthesis of DNA, RNA, and various proteins in responsive tissues. Reduces release of gonadotropinreleasing hormone, reducing folliclestimulating hormone (FSH) and luteinizing hormone (LH). Therapeutic Effect: Promotes vasomotor stability, maintains genitourinary function, normal growth, development of female sex organs. Prevents accelerated bone loss by inhibiting bone resorption, restoring balance of bone resorption and formation.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. Widely distributed. Protein binding: 50%-80%. Rapidly metabolized in liver and GI tract to estrone sulfate and conjugated and unconjugated metabolites. Excreted in urine and bile. *Half-life:* Unknown. **AVAILABILITY** *Tablets:* 0.3 mg, 0.625 mg, 1.25 mg.

## INDICATIONS AND DOSAGES

 Vasomotor symptoms associated with menopause, atrophic vaginitis, kraurosis vulvae

PO Adults, Elderly. 0.3-1.25 mg/day cyclically.

#### Female hypogonadism PO Adults 2 5 7 5 mg/day in d

*Adults*. 2.5-7.5 mg/day in divided doses for 20 days; rest 10 days.

## Female castration, primary ovarian failure

PO

Adults. Initially, 1.25 mg/day cyclically.

# Breast cancer palliation PO

Adults, Elderly. 10 mg 3 times/day for at least 3 mo.

## Prostate cancer

PO Adults, Elderly. 1.25-2.5 mg 3 times/ day.

#### Osteoporosis in postmenopausal women

PO Adults, Elderly. 0.3-1.25 mg/day cyclically.

## CONTRAINDICATIONS

Breast cancer (with some exceptions), liver disease, thrombophlebitis or thromboembolic disorders, undiagnosed vaginal bleeding, active arterial thrombosis, blood dyscrasias, estrogendependent cancer, pregnancy, thyroid dysfunction, severe hepatic dysfunction.

## INTERACTIONS

#### Drug

Aromatase inhibitors: May interfere with effects of aromatase inhibitors.

**Bromocriptine:** May interfere with effects of bromocriptine.

**Corticosteroids:** May increase effects of hydrocortisone and prednisone.

**Cyclosporine:** May increase blood concentration and nephrotoxicity of cyclosporine.

Liver toxic medications: May increase the risk of liver toxicity. CYP3A4 inducers/inhibitors: May alter levels of estrogens.

**Thyoid medications:** May decrease effects of thyroid medications.

#### Herbal

St. John's wort: May decrease levels of esterified estrogens.

Black cohosh, dong quai: May increase estrogenic activity.

Red clover, saw palmetto, ginseng: May increase hormonal effects.

## DIAGNOSTIC TEST EFFECTS

May affect metapyrone testing, thyroid function tests. May decrease serum cholesterol levels and LDH concentrations. May increase blood glucose levels, HDL concentrations, serum calcium and triglyceride levels.

## SIDE EFFECTS

#### Frequent

Change in vaginal bleeding, such as spotting or breakthrough bleeding, breast pain or tenderness, gynecomastia.

## Occasional

Headache, increased BP, intolerance to contact lenses, nausea.

## Loss of scalp hair, clinical depression,

anxiety, or emotional lability.

## SERIOUS REACTIONS

 Prolonged administration may increase risk of gallbladder or thromboembolic disease, and breast, cervical, vaginal, endometrial, and liver cancer.

- Myocardial infarction, stroke, venous thromboembolism.
- Cholestatic jaundice occurs rarely.
- Retinal vascular thrombosis.

#### **PRECAUTIONS & CONSIDERATIONS**

Unopposed estrogen increases risk of endometrial cancer in those with an intact uterus.

Estrogen therapy should not be used to prevent cardiovascular disease. Other options for osteoporosis should be considered if estrogen therapy is being used solely for prevention of osteoporosis because of the increased risk of cardiovascular events. Use with caution in patients with cardiovascular disease. Use with caution in patients with history of cholestatic jaundice with past estrogen use or pregnancy. Estrogen therapy should be used for the shortest duration and lowest dose possible. Caution is warranted in patients with diseases exacerbated by fluid retention, such as asthma, cardiac dysfunction, diabetes mellitus, epilepsy, migraine headaches, and renal impairment. Caution is warranted with hepatic insufficiency and with gallbladder disease, hypocalcemia, porphyria, or lupus. Should be discontinued at least 4 wks before and for 2 wks following surgical procedures or prolonged immobilizations (risk of thromboembolism). Be aware that esterified estrogen is distributed in breast milk and may be harmful to infants. Esterified estrogen should not be used during breastfeeding or pregnancy. Be aware that the safety and efficacy of this drug have not been established in children. Esterified estrogen should be used

cautiously in children whose bone growth is not complete because the drug may accelerate epiphyseal closure. The risk of dementia is increased in postmenopausal women aged > 65 yr. Smoking should be strongly discouraged because of increased risk of blood clot formation and myocardial infarction. Limit alcohol and caffeine intake.

Signs and symptoms of thromboembolic or thrombotic disorders are evident by loss of coordination; numbness or weakness of an extremity; pain in the chest, leg, or groin; shortness of breath; speech or vision disturbance; or sudden severe headache. Abnormal vaginal bleeding, tenderness, and swelling may be signs and symptoms of blood clots.

#### Storage

Store at room temperature.

#### Administration

Administer at the same time each day. Give esterified estrogen with food or milk if the patient experiences nausea.

## Estropipate es-tro-pip'ate

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: X

**Classification:** Estrogens, hormones/hormone modifiers

#### MECHANISM OF ACTION

An estrogen that increases synthesis of DNA, RNA, and proteins in target tissues; reduces release of gonadotropin-releasing hormone from the hypothalamus; and reduces follicle-stimulating hormone (FSH)

Estropipate (Generic Name)

and luteinizing hormone (LH) from the pituitary. *Therapeutic Effect:* Promotes normal growth, promotes development of female sex organs, and maintains genitourinary function and vasomotor stability. Prevents accelerated bone loss by inhibiting bone resorption, restoring balance of bone resorption and formation. Inhibits LH and decreases serum testosterone concentration.

## AVAILABILITY

*Tablets:* 0.625 mg (0.75 mg estropipate), 1.25 mg (1.5 mg estropipate), 2.5 mg (3 mg estropipate).

## INDICATIONS AND DOSAGES

 Vasomotor symptoms of menopause, atrophic vaginitis, kraurosis vulvae

*Adults, Elderly.* 0.625-5 mg/day (0.75-6 mg estropipate) cyclically.

## Female hypogonadism, castration, primary ovarian failure

Adults, Elderly. 1.25-7.5 mg/day (1.5-9 mg estropipate) for 21 days; then off for 8-10 days. Repeat if bleeding does not occur by end of off cycle.

# Prevention of osteoporosis PO

*Adults, Elderly.* 0.625 mg/day (0.75 mg estropipate) (25 days of 31-day cycle).

## CONTRAINDICATIONS

Abnormal vaginal bleeding, active arterial thrombosis, blood dyscrasias, estrogen-dependent cancer, known or suspected breast cancer, pregnancy, thrombophlebitis or thromboembolic disorders, thyroid dysfunction, severe liver disease.

#### INTERACTIONS Drug

Aromatase inhibitors: May interfere with effects of aromatase inhibitors.

**Bromocriptine:** May interfere with the effects of bromocriptine.

**Corticosteroids:** May increase effects of hydrocortisone and prednisone.

**Cyclosporine:** May increase blood cyclosporine concentration and the risk of hepatotoxicity and nephrotoxicity.

**CYP3A4 inducers/inhibitors:** May alter levels of estropipate.

Hepatotoxic medications: May increase the risk of hepatotoxicity. Thyroid medications: May decrease effects of thyroid medications.

Herbal

**Saw palmetto:** Increases the effects of saw palmetto.

**St. John's wort:** May decrease levels of estropipate.

Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose, HDL, serum calcium, and triglyceride levels. May decrease serum cholesterol and LDH concentrations. May affect metapyrone testing and thyroid function tests.

## SIDE EFFECTS

#### Frequent

Anorexia, nausea, swelling of breasts, peripheral edema marked by swollen ankles and feet.

#### Occasional

Vomiting, especially with high doses; headache that may be severe; intolerance to contact lenses; hypertension; glucose intolerance; brown spots on exposed skin. Vaginal: Local irritation, vaginal discharge, changes in vaginal bleeding, including spotting, and breakthrough or prolonged bleeding. **Rare** 

Chorea or involuntary movements, hirsutism or abnormal hairiness, loss of scalp hair, depression, anxiety or emotional lability.

## SERIOUS REACTIONS

 Prolonged administration increases the risk of gallbladder disease; thromboembolic disease; and breast, cervical, vaginal, endometrial, and hepatic cancer.

• Myocardial infarction, stroke, venous thromboembolism.

· Retinal vascular thrombosis.

• Cholestatic jaundice occurs rarely.

PRECAUTIONS & CONSIDERATIONS

Unopposed estrogen increases risk of endometrial cancer in those with an intact uterus. Estrogen therapy should not be used to prevent cardiovascular disease. Because of the increased risk for cardiovascular events, other options for osteoporosis should be considered if estrogen therapy is being used solely for the prevention of osteoporosis. Use with caution in patients with cardiovascular disease. Use with caution in patients with a history of cholestatic jaundice with past estrogen use or pregnancy. Estrogen therapy should be used for the shortest duration and lowest dose possible. Caution is warranted with diseases exacerbated by fluid retention such as asthma, cardiac dysfunction, diabetes, epilepsy, migraine headaches, and renal insufficiency. Caution is warranted in patients with hepatic insufficiency and with gallbladder disease, hypocalcemia, porphyria, or lupus. Should be discontinued

at least 4 wks before and for 2 wks following surgical procedures or prolonged immobilizations (risk of thromboembolism). Estropipate is distributed in breast milk and may be harmful to the infant. Estropipate should not be used during breastfeeding. Estropipate should be used cautiously in children whose bone growth is not complete because the drug may accelerate epiphyseal closure. The risk of dementia is increased in postmenopausal women aged > 65 yr. Limit alcohol and caffeine intake. Avoid smoking because of the increased risk of blood clot formation and myocardial infarction.

Notify the physician of depression or abnormal vaginal bleeding. Signs and symptoms of thromboembolic or thrombotic disorders, including peripheral paresthesia, shortness of breath, speech or vision disturbance, and sudden headache, should be immediately reported. BP, weight, blood glucose, hepatic enzyme, and serum calcium levels should be monitored.

#### Storage

Store in a tightly-closed container at room temperature.

#### Administration

Take estropipate at the same time each day. Administration with food may decrease GI upset.

### Eszopiclone es-zoe-pick'lone Lunesta

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Classification: Sedatives/ hypnotics

Eszopiclone (Generic Name), Lunesta (Brand Name)

## **MECHANISM OF ACTION**

A nonbenzodiazepine that may interact with GABA-receptor complexes at binding domains located close to or allosterically coupled to benzodiazepine receptors. *Therapeutic Effect:* Induces sleep and helps maintain sleep at night.

## AVAILABILITY

*Tablets (Film-Coated):* 1 mg, 2 mg, 3 mg.

## INDICATIONS AND DOSAGES Insomnia

## P()

Adults. 2 mg immediately before bedtime. Maximum: 3 mg. Adults using CYP3A4 inhibitors concurrently. 1 mg before bedtime; may be increased to 2 mg if needed.

*Elderly (difficulty falling asleep).* 1 mg before bedtime. Maximum: 2 mg.

*Adults, Elderly (difficulty maintaining sleep).* 2 mg before bedtime. Maximum: 3 mg.

# Severe hepatic impairment PO

*Adults*. Initially, 1 mg at bedtime. Maximum: 2 mg.

## CONTRAINDICATIONS

None known.

## INTERACTIONS

#### Drug

Alcohol, olanzapine: May lead to decreased psychomotor function. Aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, rifampicin, CYP3A4 inducers: May decrease the blood level and effects of eszopiclone. Clarithromycin, ketoconazole, nefazodone, nelfinavir, ritonavir,

#### traconazole, troleandomycin, CYP3A4 inhibitors: May increase

the blood level and effects of eszopiclone.

**CNS depressants:** May increase adverse effects.

#### Herbal

Gotu kola, kava kava, St. John's wort, valerian: May increase CNS depression.

## Food

**Heavy meals:** May reduce onset of eszopiclone action if taken with or immediately after a heavy meal.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Frequent (21%-34%)

Unpleasant taste, headache. Occasional (4%-10%)

Somnolence, dry mouth, dyspepsia, dizziness, nervousness, pain, nausea, rash, pruritus, depression, diarrhea.

## Rare (2%-3%)

Hallucinations, anxiety, confusion, abnormal dreams, decreased libido, neuralgia, dysmenorrhea, gynecomastia.

## SERIOUS REACTIONS

• Chest pain and peripheral edema occur occasionally.

• Complex, bizarre, and potentially risky behavior, agitation, and "sleep driving" while not fully awake, often with amnesia to the events.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with clinical depression, drug abuse, hepatic impairment, and compromised respiratory function. Abnormal thinking and behavioral changes may occur, so monitor. Amnesia, CNS depression, and
hypersensitivity reactions can occur. Use cautiously in elderly patients and reduce dose. Safety and efficacy have not been evaluated in children. Avoid abrupt cessation of therapy to avoid withdrawal symptoms.

#### Administration

Take immediately before bedtime. Do not take with, or immediately following, a high-fat meal. Do not crush or break tablets. Patients should be able to devote time for a full night's rest.

# Etanercept

e-tan'er-cept Enbrel Do not confuse Enbrel with Levbid.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Diseasemodifying antirheumatic drugs, immunomodulators, tumor necrosis factor modulators

# **MECHANISM OF ACTION**

A protein that binds to tumor necrosis factor (TNF), blocking its interaction with cell surface receptors. Elevated levels of TNF, which is involved in inflammatory and immune responses, are found in the synovial fluid of rheumatoid arthritis patients. *Therapeutic Effect*: Relieves the symptoms of rheumatoid arthritis, psoriasis, and other inflammatory conditions.

# PHARMACOKINETICS

Well absorbed after subcutaneous administration. *Half-life:* 115 h. Onset of action: 1-3 wks.

#### AVAILABILITY

Powder for Injection: 25 mg. Prefilled Syringe: 50 mg/mL.

#### INDICATIONS AND DOSAGES > Rheumatoid arthritis, psoriatic arthritis, ankylosing spondylitis SUBCUTANEOUS

Adults, Elderly. 25 mg twice weekly given 72-96 h apart or 50 mg as one injection or two 25-mg injections on the same day.

#### • Juvenile rheumatoid arthritis SUBCUTANEOUS

*Children 2-17 yr.* 0.8 mg/kg/wk. Once-weekly dosing maximum is 50 mg/dose. Alternatively, 0.4 mg/ kg (maximum 25-mg dose) twice weekly given 72-96 h apart.

#### Plaque psoriasis SUBCUTANEOUS

Adults, Elderly. 50 mg twice a week (give 3-4 days apart) for 3 mo. Maintenance: 50-mg/week given as once-weekly 50-mg injection or as a 25-mg injection twice weekly 3-4 days apart.

# CONTRAINDICATIONS

Serious active infection or sepsis, hypersensitivity to etanercept, significant hematologic abnormalities, latex hypersensitivity (autoinjection), benzyl alcohol hypersensitivity (diluent for powder for injection).

#### INTERACTIONS Drug

Abatacept, anakinara: May increase the risk of infection. Cyclophosphamide: Increase in risk for noncutaneous solid malignancies when used concurrently, avoid concomitant use.

Live vaccines: Secondary transmission of infection by the live vaccine may occur.

#### **Herbal and Food**

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent (20%-37%)

Injection site erythema, pruritus, pain, and swelling; abdominal pain (children 19%), upper respiratory infection.

#### Occasional (4%-19%)

Headache, rhinitis, dizziness, pharyngitis, cough, asthenia, abdominal pain (adults 5%), stomatitis, dyspepsia, vomiting (more common in children than adults), rash, nausea.

#### Rare (< 3%)

Sinusitis, allergic reaction, lupus-like symptoms.

#### SERIOUS REACTIONS

 Infections (such as pyelonephritis, cellulitis, osteomyelitis, wound infection, leg ulcer, septic arthritis, diarrhea, bronchitis, and pneumonia) occur in 29%-38% of patients.

• Rare adverse effects include heart failure, hypertension, hypotension, pancreatitis, GI hemorrhage, and dyspnea. The patient also may develop autoimmune antibodies.

• Nervous system problems such as seizures, optic neuritis, weakness of arms or legs (rare).

 Rare reports of malignancies (leukemia, lymphoma, nonmelanoma skin cancer) in patients receiving TNF blockers.

## **PRECAUTIONS & CONSIDERATIONS**

Serious infections (including bacterial sepsis and tuberculosis) leading to hospitalization or death have been observed in patients treated with etanercept. Screen patients for latent tuberculosis infection before beginning etanercept. Patients should be educated about the symptoms of infection and closely monitored for signs and symptoms of infection during and after treatment with the drug. Patients who develop an infection should be evaluated for appropriate antimicrobial treatment and, in patients who develop a serious infection, etanercept should be discontinued. Use with caution in patients with seizure disorders, preexisting neurological conditions, multiple sclerosis, or with preexisting heart failure.

Caution is warranted in patients with history of recurrent infections and illnesses that predispose to infection, such as diabetes mellitus. It is unknown whether etanercept is excreted in breast milk. No agerelated precautions have been noted in elderly patients or in children 4 yr and older. Avoid receiving live-virus vaccines during treatment. Discontinue therapy and expect to treat with varicella-zoster immune globulin, as prescribed, if the patient experiences significant exposure to varicella virus during treatment.

Notify the physician of bleeding, bruising, pallor, or persistent fever. CBC and erythrocyte sedimentation rate or C-reactive protein level should be monitored. Signs of a therapeutic response, including improved grip strength, increased joint mobility, reduced joint tenderness, and relief of pain, stiffness, and swelling, should be assessed.

#### Storage

Refrigerate unopened vials and prefilled syringes. Do not freeze. Protect from light. Once reconstituted, the drug may be stored for up to 14 days in the refrigerator. Administration

! Do not add other medications to the solution. Do not use a filter during reconstitution or administration.

Allow to come to room temperature before administering prefilled syringes or autoinjector syringe. If using vials, reconstitute only with 1 mL sterile bacteriostatic water for injection (containing 0.9% benzyl alcohol). Slowly inject the diluent into the vial. Some foaming will occur. To avoid excessive foaming, slowly swirl the contents until the powder is dissolved (< 5 min). The reconstituted solution normally appears clear and colorless. Discard if it contains particles or becomes cloudy or discolored. Withdraw all the solution into the syringe. The final volume should be approximately 1 mL.

Subcutaneously inject into the abdomen, thigh, or upper arm. Rotate injection sites. Administer each new injection at least 1 inch. from an old site, avoiding tender, bruised, hard, or red areas. Injection site reactions generally occur in the first month of treatment and decrease in frequency with continued etanercept therapy.

# Ethambutol

e-tham'byoo-tole Myambutol Etibi Do not confuse ethambutol or Myambutol with Nembutal or Ethmozine

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antimycobacterials

# **MECHANISM OF ACTION**

An isonicotinic acid derivative that interferes with RNA synthesis. *Therapeutic Effect:* Suppresses the multiplication of mycobacteria.

# PHARMACOKINETICS

Rapidly and well absorbed from the GI tract (80%). Protein binding: 20%-30%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 3-4 h (increased in impaired renal function).

# AVAILABILITY

Tablets: 100 mg, 400 mg.

# INDICATIONS AND DOSAGES Tuberculosis PO

Adults, Elderly, Adolescents 13 yr and older. 15-25 mg/kg/day as a single dose (maximum 1600 mg/dose) or 50 mg/kg 2 times/wk (maximum 4 g/ dose). Consult recommended initial dosing and retreatment schedules, because treatment regimens can vary. *Children 6-12 yr (off-label)*. 20 mg/ kg/day as a single dose (maximum 2.5 g/day).

#### Dosage in renal impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance (ml /min)	Dosage Interval
10-50	q24-36h
< 10	q48h

# **OFF-LABEL USES**

Treatment of atypical mycobacterial infections, use in children 6-13 yr.

# CONTRAINDICATIONS

Optic neuritis and patients who cannot report visual changes, hypersensitivity to ethambutol.

# INTERACTIONS

#### Drug

Neurotoxic medications: May increase the risk of neurotoxicity.

Ethambutol (Generic Name)

Aluminum antacids: Decrease

absorption of ethambutol, administer 4 h apart.

Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum uric acid levels, may elevate liver enzyme levels.

# SIDE EFFECTS

#### Occasional

Acute gouty arthritis (chills, pain, swelling of joints with hot skin), confusion, abdominal pain, nausea, vomiting, anorexia, headache.

#### Rare

Rash, fever, blurred vision, eye pain, red-green color blindness.

#### SERIOUS REACTIONS

 Optic neuritis and sometimes irreversible blindness (more common with high-dosage or long-term ethambutol therapy), peripheral neuritis, liver toxicities, myocarditis, and an anaphylactoid reaction occur rarely.

· Thrombocytopenia.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cataracts, diabetic retinopathy, gout, recurrent ocular inflammatory conditions, and renal dysfunction. Ethambutol use is not recommended for children younger than 13 yr of age. Be aware that ethambutol crosses the placenta and is excreted in breast milk. In elderly patients, age-related renal impairment may require dosage adjustment.

Initial complete blood count (CBC) and renal and liver function test results should be evaluated. Uric acid levels should be monitored and signs and symptoms of gout, including hot, painful, or swollen joints, especially in the ankle, big toe, or knee, should be assessed. Signs and symptoms of peripheral neuritis as evidenced by burning, numbness, or tingling of the extremities should also be assessed. Notify the physician if peripheral neuritis occurs. In addition, notify the physician immediately of any visual problems. Monthly eye exams are advised. Visual effects are generally reversible after ethambutol is discontinued, but in rare cases visual problems may take up to a year to disappear or may become permanent. **Storage** 

Store at room temperature. Protect from light and moisture.

#### Administration

Administer daily doses at roughly the same time each day. Give with food to decrease GI upset. Do not skip drug doses and take ethambutol for the full length of therapy, which may be months or years.

# Ethionamide

e-thye-on'am-ide Trecator Do not confuse with Tricor.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

# Classification:

Antimycobacterials

#### **MECHANISM OF ACTION**

An antitubercular agent that inhibits peptide synthesis. *Therapeutic Effect:* Suppresses mycobacterial multiplication. Bactericidal.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Widely distributed. Protein binding: 30%. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 2-3 h (increased with impaired renal function).

# AVAILABILITY

Tablets: 250 mg (Trecator).

# INDICATIONS AND DOSAGES

#### Tuberculosis

PO

Adults, Elderly. 15-20 mg/kg/day; initiate dose at 250 mg/day for 1-2 days, then 250 mg twice daily for 1-2 days; increase to highest tolerated dose; average adult dose 750 mg/ day. Maximum 1000 mg/day in 3-4 divided doses.

*Children.* 10-20 mg/kg/day in 2 or 3 divided doses or 15 mg/kg once daily. Maximum: 1 g/day.

# **OFF-LABEL USES**

Treatment of atypical mycobacterial infections.

# CONTRAINDICATIONS

Severe hepatic impairment, hypersensitivity to ethionamide.

#### INTERACTIONS

#### Drug

Cycloserine, isoniazid: May

increase the risk of toxicity. **Rifampin:** May increase the risk of hepatotoxicity.

#### Herbal

None known.

#### Food

**Ethanol:** Psychotic reaction has occurred. Avoid alcoholic beverages.

### DIAGNOSTIC TEST EFFECTS

May increase ALT and AST, may increase TSH.

# SIDE EFFECTS

#### Occasional

Abdominal pain, nausea, vomiting, weakness, postural hypotension,

psychiatric disturbances, drowsiness, dizziness, headache, confusion, anorexia, headache, metallic taste, diarrhea, stomatitis, peripheral neuritis, acne, alopecia, photosensitivity, impotence. **Rare** 

Rash, fever, blurred vision, seizures, hypothyroidism, hypoglycemia, gynecomastia, thrombocytopenia, jaundice, hypersensitivity reaction.

# SERIOUS REACTIONS

• Peripheral neuropathy, anorexia, seizures, and joint pain rarely occur.

• Optic neuritis and loss of vision may occur.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients receiving cycloserine or isoniazid, diabetics, patients with thyroid disease, epileptics, and psychiatric illness. Ethionamide crosses the placenta and is excreted in breast milk.

In elderly patients, age-related renal impairment may require dosage adjustment.

Stomach upset, loss of appetite, metallic taste, burning, numbness, tingling of the feet or hands, and pain and swelling of joints should be reported.

#### Storage

Store at room temperature. Administration

May take without regard to food. However, administration at mealtimes usually improves GI tolerance. Do not skip drug doses and take for the full length of therapy.

Expect use with pyridoxine to help decrease neurotoxicity.

# **Ethosuximide**

eth-oh-sux'i-mide Zarontin Do not confuse with Zaroxolyn or Neurontin.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Anticonvulsants, succinimides

# **MECHANISM OF ACTION**

An anticonvulsant that increases the seizure threshold and suppresses paroxysmal spike-andwave pattern in absence seizures; depresses nerve transmission in the motor cortex. *Therapeutic Effect:* Produces anticonvulsant activity.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Metabolized in the liver. Excreted in urine. Removed by hemodialysis. *Half-life:* 50-60 h (in adults); 30 h (in children). Time to peak: 2-4 h (capsule), < 2-4 h (syrup).

#### AVAILABILITY

Capsule: 250 mg. Syrup: 250 mg/5 mL.

# INDICATIONS AND DOSAGES Absence seizures

PO Adults, Elderly, Children older than 6 yr. Initially, 250-500 mg/day or 15 mg/kg/day in 2 divided doses. Maintenance: 15-40 mg/kg/day in 2 divided doses. Maximum: 1.5 g/day in 2 divided doses.

*Children 3-6 yr.* Initially, 250 mg/ day in 2 divided doses, increased by 250 mg as needed every 4-7 days. Maintenance: 20-40 mg/kg/day in 2 divided doses. Maximum: 1.5 g/ day in 2 divided doses.

# CONTRAINDICATIONS

Hypersensitivity to succinimides.

#### **INTERACTIONS**

Drug

Alcohol, central nervous system (CNS) depressants: May increase CNS depression.

Carbamazepine, phenobarbital, phenytoin, primidone, valproic acid, CYP3A4 inducers: May decrease ethosuximide blood concentration.

Azole antifungals, ciprofloxacin, clarithromycin, isoniazid, quinidine, protease inhibitors, verapamil, CYP3A4 inhibitors: May increase ethosuximide blood concentration.

#### Herbal

**Evening primrose oil:** May decrease effectiveness of ethosuximide.

**Ginkgo:** May decrease effectiveness of ethosuximide.

St. John's wort: May decrease ethosuximide blood concentrations. Food

Alcohol: CNS depression; avoid use.

# DIAGNOSTIC TEST EFFECTS

May lower WBC counts, alter other blood parameters. A relationship between ethosuximide toxicity and plasma levels has not been established. Usual serum levels are 40-100 mcg/mL, although levels as high as 150 mcg/mL have been reported without signs of toxicity.

#### SIDE EFFECTS Occasional

Dizziness, drowsiness, double vision, headache, ataxia, nausea, diarrhea, vomiting, somnolence, urticaria.

Ethosuximide (Generic Name)

#### Rare

Agranulocytosis, gum hypertrophy, leukopenia, myopia, swelling of the tongue, systemic lupus erythematosus, vaginal bleeding, inability to concentrate.

### SERIOUS REACTIONS

• Abrupt withdrawal may increase seizure frequency.

 Blood dyscrasias, Stevens-Johnson syndrome, systemic lupus erythematosus have been associated with succinimides.

• Overdosage results in nausea, vomiting, and CNS depression including coma with respiratory depression.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used with renal or hepatic function impairment. Ethosuximide should be used cautiously when given alone in mixed types of epilepsy. Antiepileptic drugs (AEDs) may increase the risk of suicidal thoughts or behavior. Monitor for the emergence of worsening of depression, suicidal thoughts or behavior, and/or any unusual changes in mood or behavior. Ethosuximide crosses the placenta; use in pregnancy and during breastfeeding only when clearly needed.

Alcohol and tasks that require mental alertness and motor skills should be avoided until response to the drug is established. Have patients promptly report any easy bruising, fever, joint pain, mouth ulcerations, sore throat, and unusual bleeding.

#### Storage

Store at room temperature; protect from light. Do not freeze.

# Administration

Take with meals to reduce risk of GI distress. Do not abruptly discontinue.

#### Etidronate

ee-tid'roe-nate Didronel **Do not confuse etidronate with etidocaine or etomidate.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Bisphosphonates

#### **MECHANISM OF ACTION**

A bisphosphonate that decreases mineral release and matrix in bone and inhibits osteocytic osteolysis. *Therapeutic Effect:* Decreases bone resorption.

#### AVAILABILITY

Tablets: 200 mg, 400 mg.

#### INDICATIONS AND DOSAGES > Paget's disease

PO

*Adults, Elderly.* Initially, 5-10 mg/kg/day not to exceed 6 mo, or 11-20 mg/kg/day not to exceed 3 mo. Repeat only after drug-free period of at least 90 days.

# Heterotopic ossification caused by spinal cord injury

Adult, Elderly. 20 mg/kg/day for 2 wks; then 10 mg/kg/day for 10 wks.

#### Heterotopic ossification complicating total hip replacement PO

Adults, Elderly. 20 mg/kg/day for 1 mo before surgery; then 20 mg/kg/day for 3 mo after surgery.

# Hypercalcemia associated with malignancy

PO

*Adults, Elderly.* 20 mg/kg/day for 30 days. If needed, maximum 90 days.

Etidronate (Generic Name)

**OFF-LABEL USES** 

Postmenopausal osteoporosis.

# CONTRAINDICATIONS

Clinically overt osteomalacia, renal failure (SCr  $\geq$  5 mg/dL), hypersensitivity to etidronate or other bisphosphonates.

# INTERACTIONS

#### Drug

Antacids containing aluminum, calcium, magnesium; calcium

**supplements**, **iron**: May decrease the absorption of etidronate. Separate by at least 2 h.

**Warfarin:** Concurrent use may alter bleeding times.

#### Herbal

None known.

#### Food

**Foods with calcium:** May decrease the absorption of etidronate.

# DIAGNOSTIC TEST EFFECTS

May increase serum phosphate.

# SIDE EFFECTS

#### Frequent

Nausea; diarrhea; continuing or more frequent bone pain in patients with Paget's disease.

#### Occasional

Bone fractures, especially of the femur. Metallic, altered taste.

#### Rare

Hypersensitivity reaction.

#### SERIOUS REACTIONS

 Nephrotoxicity, including hematuria, dysuria, and proteinuria, has occurred with parenteral route.

- · Serious hypersensitivity (rare).
- · Osteonecrosis of the jaw.
- Esophageal irritation occurs if not administered as recommended.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hyperphosphatemia, impaired renal function, and restricted calcium and vitamin D intake. Patients with Paget's disease may be at increased risk for osteomalacia and fracture of long bones when used for periods > 6 mo. Etidronate may cause skeletal malformations in the fetus. It is unknown whether etidronate is excreted in breast milk. Do not give to women who are breastfeeding. Safety and efficacy of etidronate have not been established in children.

Notify the physician of diarrhea. Serum electrolytes, BUN, fluid intake and output should be monitored. Storage

Store at room temperature. Administration

Take on an empty stomach. Swallow with a full glass of water (6-8 oz). Patients should not lie down after taking to avoid esophageal irritation. If GI discomfort occurs, the dose may be divided. Take etidronate 2 h before antacids, food, or vitamins. The full therapeutic response may take up to 3 mo.

#### **Etodolac**

e-toe-doe'lak 🌑 Taro-Etodolac

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

Classification: Analgesics, nonsteroidal anti-inflammatory drugs

# **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic* 

Etodolac (Generic Name)

*Effect:* Reduces the inflammatory response and intensity of pain.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (analgesic)	30 min	N/A	4-12 h

Well absorbed from the GI tract. Protein binding: > 99%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Halflife:* 6-7 h. Onset of analgesia: 2-4 h. Maximum anti-inflammatory: Several days.

#### AVAILABILITY

Capsules: 200 mg, 300 mg. Tablets: 400 mg, 500 mg. Tablets (Extended Release): 400 mg, 500 mg, 600 mg.

#### INDICATIONS AND DOSAGES • Osteoarthritis or rheumatoid arthritis

PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 300 mg 2-3 times a day or 400-500 mg twice daily. Maintenance: 600-1200 mg/day. PO (EXTENDED RELEASE) Adults, Elderly. Initially, 400 mg once daily. Maximum: 1000 mg once daily.

#### Analgesia

PO (IMMEDIATE RELEASE) Adults, Elderly. 200-400 mg q6-8h as needed. Maximum: 1200 mg/day.

#### Juvenile rheumatoid arthritis

PO (EXTENDED RELEASE) Children 6-16 yr. 20-30 kg: 400 mg once daily. 31-45 kg: 600 mg once daily. 46-60 kg: 800 mg once daily. > 60 kg: 1000 mg once daily.

#### **OFF-LABEL USES**

Treatment of acute gouty arthritis, vascular headache.

#### CONTRAINDICATIONS

History of hypersensitivity to aspirin or NSAIDs, within 10-14 days of coronary artery bypass graft (CABG).

#### INTERACTIONS

#### Drug

ACE inhibitors, ARBs: May increase risk of renal dysfunction. Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, antiplatelets, other salicylates, corticosteroids: May increase the risk of GI side effects such as bleeding. NSAID use may negate cardioprotective effect of ASA. Bisphosphonates: Increased risk for gastrointestinal ulceration.

**Bone marrow depressants:** May increase the risk of hematologic reactions.

**Cyclosporine:** Nephrotoxicity and cyclosporine levels may be increased.

Heparin, oral anticoagulants, thrombolytics: May increase the bleeding effects of these drugs. Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Pemetrexed:** May increase levels and effects of pemetrexed. Avoid etodolac 2-5 days before pemetrexed and 2 days following.

**Probenecid:** May increase etodolac blood concentration.

SSRIs, SNRIs: Increased risk of GI bleeding.

Vancomycin: May increase level of vancomyin.

#### Herbal

Supplements with antiplatelet or anticoagulant effects (e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow, etc.): May increase effects on platelets or risk of bleeding.

#### Food

Alcohol: May increase dizziness; may increase risk of GI bleeding.

#### DIAGNOSTIC TEST EFFECTS

May increase bleeding time, liver function test results, and serum creatinine level. May decrease serum uric acid level.

#### SIDE EFFECTS

#### Occasional (4%-9%)

Dizziness, headache, abdominal pain or cramps, bloated feeling, diarrhea, nausea, indigestion, flatulence, weakness.

#### Rare (1%-3%)

Constipation, rash, pruritus, visual disturbances, tinnitus, depression, nervousness.

## SERIOUS REACTIONS

• Overdose may result in acute renal failure.

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, severe hepatic reactions (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), and a severe hypersensitivity reaction (bronchospasm, angioedema).

• Hepatic and renal impairment have occurred.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic or renal impairment, a predisposition to fluid retention, and history of GI tract disease such as active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding or ulceration. Use the lowest effective dose for the shortest duration of time. Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Do not use in patients with aspirin-sensitive asthma. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures. It is unknown whether etodolac crosses the placenta or is distributed in breast milk. Etodolac should not be used during the last trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. Notify the physician if the patient is pregnant. The safety and efficacy of etodolac have not been established in children < 6 yr of age. In elderly paients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may increase the risk of hepatotoxicity or renal toxicity; a decreased dosage is recommended. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established.

Notify the physician of edema, GI distress, headache, rash, signs of bleeding, or visual disturbances. CBC and blood chemistry studies should be monitored to assess hepatic and renal function. Therapeutic response, such as decreased pain, stiffness, swelling, or tenderness, improved grip strength, and increased joint mobility, should be evaluated.

#### Storage

Store at room temperature. Administration

Do not crush, open, or break capsules or extended-release tablets. Take etodolac with food or milk, or antacids if GI distress occurs.

# **Etoposide, VP-16**

e-toe-poe'side topophos, Toposar VePesid Do not confuse etoposide with Etopophos.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastics, epipodophyllotoxins

Etoposide, VP-16 (Generic Name)

# **MECHANISM OF ACTION**

An epipodophyllotoxin that induces single- and doublestranded breaks in DNA. Cell cycle-dependent and phasespecific; most effective in the S and G<sub>2</sub> phases of cell division. *Therapeutic Effect:* Inhibits or alters DNA synthesis.

# PHARMACOKINETICS

Variably absorbed from the GI tract (25%-75%). Rapidly distributed, low concentrations in cerebrospinal fluid (CSF). Protein binding: 97%. Metabolized in the liver. Etoposide phosphate rapidly converted to etoposide in plasma. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 3-12 h, children 6-8 h.

# AVAILABILITY

Capsules (VePesid): 50 mg.

Injection Solution (Toposar): 20 mg/mL. Powder for Injection (water-soluble etoposide phosphate [Etopophos]): 100-mg vial.

#### INDICATIONS AND DOSAGES • Refractory testicular tumors IV

*Adults.* 50-100 mg/m<sup>2</sup>/day on days 1-5, or 100 mg/m<sup>2</sup>/day on days 1, 3, 5 (as combination therapy) every 3-4 wks.

# Acute myelocytic leukemia

*Children*. Remission: 150 mg/m<sup>2</sup>/ day for 2-3 days and 2-3 cycles. Intensification or consolidation: 250 mg/m<sup>2</sup>/day for 3 days courses 2-5.

# Malignant glioma

*Children.* 150 mg/m<sup>2</sup>/day on days 2 and 3 of treatment course.

Neuroblastoma

IV

*Children.* 100 mg/m<sup>2</sup>/day on days 1-5 of treatment course; repeated q4wk.

#### Small cell lung cancer PO

Adults. Twice the IV dose rounded to nearest 50 mg. Give once a day for doses 400 mg or less or in divided doses for dosages > 400 mg. IV

Adults. 35 mg/m<sup>2</sup>/day for 4 consecutive days; up to 50 mg/ m<sup>2</sup>/day for 5 consecutive days (as combination therapy) every 3-4 wks.

## Dosage in renal impairment

Creatinine clearance 15-50 mL/min. 75% of normal dose. Creatinine clearance < 15 mL/min. 50% of normal dose.

# **OFF-LABEL USES**

Treatment of acute myelocytic leukemia, AIDS-associated Kaposi's sarcoma, Ewing's sarcoma, Hodgkin's disease, non-Hodgkin's lymphoma, platinum-resistant ovarian cancer.

# CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS Drug

Bone marrow depressants: May increase myelosuppression. Cyclosporine: High-dose cyclosporine has increased etoposide levels by 80%. Monitor for increased toxic effects of etoposide if cyclosporine is initiated, the dose is increased, or it has been recently discontinued.

**Live-virus vaccines:** May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

Herbal and Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Decreased platelet counts, WBC, RBC.

#### IV INCOMPATIBILITIES

VePesid: Cefepime (Maxipime), filgrastim (Neupogen), idarubicin (Idamycin), lansoprazole (Prevacid), pantoprazole (Protonix). Etopophos: Allopurinol (Aloprim), amphotericin B (Fungizone), amphotericin B liposomal (Ambisome), cefepime (Maxipime), chlorpromazine (Thorazine), dantrolene, diazepam (Valium), imipenem/cilastatin (Primaxin), methylprednisolone sodium succinate (Solu-Medrol), mitomycin (Mutamycin), pantoprazole (Protonix), phenytoin, prochlorperazine (Compazine).

#### SIDE EFFECTS

# Frequent (43%-66%)

Mild to moderate nausea and vomiting, alopecia, ovarian failure, amenorrhea.

#### Occasional (6%-13%)

Diarrhea, anorexia, stomatitis. **Rare (Up to 2%)** Hypotension (with rapid infusion), peripheral neuropathy.

# SERIOUS REACTIONS

 Myelosuppression may result in hematologic toxicity, manifested as anemia, leukopenia (occurring 5-7 days after drug administration), thrombocytopenia (occurring 9-16 days after administration), anemia, and, to lesser extent, pancytopenia. Bone marrow recovery occurs by day 20-28.

- · Hepatotoxicity occurs occasionally.
- Anaphylactic reaction to IV infusion.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with myelosuppression or hepatic or renal impairment. Patients with low serum albumin or displaced binding due to elevated bilirubin may be more at risk for toxicity. Because of the risk of fetal harm, pregnant women should not take etoposide, especially during the first trimester. Doselimiting bone marrow suppression is the most significant toxicity associated with etoposide therapy. Treatment should be withheld for platelets < 50,000/mm<sup>3</sup> or absolute neutrophil count (ANC) < 500/mm<sup>3</sup>. Use with caution and reduce dose in patients with hepatic or renal dysfunction. Breastfeeding women also should not take this drug. The safety and efficacy of etoposide have not been established in children. Preparations with polysorbate 80 should be avoided in neonates. Anaphylactic reactions have been reported in children. In elderly patients, age-related renal impairment may require dosage adjustment. Vaccinations and coming in contact with anyone who has recently received a live-virus vaccine should be avoided.

Notify the physician of easy bruising, fever, signs of local infection, sore throat, or unusual bleeding from any site. Hematology test results should be monitored before and frequently during etoposide therapy. WBC counts, hemoglobin and hematocrit levels, pattern of daily bowel activity and stool consistency, signs and symptoms of paresthesia and peripheral neuropathy, signs and symptoms of stomatitis should be assessed. Alopecia may occur and is reversible, but new hair growth may have a different color or texture. Storage

Refrigerate gelatin capsules. Do not freeze.

Store most etoposide injections at room temperature before dilution. Reconstituted solution is stable at room temperature for up to 96 h at 0.2 mg/mL and 48 h at 0.4 mg/mL. Discard solution if crystallization occurs. Refrigerate Etopophos vials before reconstitution. Protect from light. After reconstitution, Etopophos is stable for up to 24 h at room temperature or refrigerated. Etoposide injection diluted for oral use to 10 mg/mL in NS may be stored at room temperature for 22 days. Mix with apple or orange juice to concentration < 0.4 mg/mL and use within 3 h.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

! Etoposide dosage is individualized based on clinical response and tolerance of the drug's adverse effects. Treatment is repeated at 3- to 4-wk intervals. Administer parenteral etoposide by slow IV infusion.

Etoposide solution concentrate for injection normally is clear and vellow. For IV use, dilute each 100-mg (5-mL) vial with at least 250 mL D5W or 0.9% NaCl to provide a concentration of 0.4 mg/mL (or 500 mL for a concentration of 0.2 mg/mL). Stability is concentration dependent and precipitates may occur > 0.4 mg/mL. Infuse slowly, over 30-60 min. Rapid IV infusion may produce marked hypotension. Monitor for an anaphylactic reaction manifested as back, chest, or throat pain; chills; diaphoresis; dyspnea; fever; lacrimation; and sneezing.

For Etopophos IV, reconstitute each 100 mg of Etopophos with 5-10 mL sterile water for injection, D5W, or 0.9% NaCl to provide a concentration of 20 mg/mL or 10 mg/ mL, respectively. Etopophos may be given without further dilution or may be further diluted with 0.9% NaCl or D5W to a concentration as low as 0.1 mg/mL. Administer Etopophos over 5-10 min, as appropriate.

# **Etravirine**

e-tra-vir'een to intelence Do not confuse with efavirenz.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antiretroviral, nonnucleoside reverse transcriptase inhibitor

# **MECHANISM OF ACTION**

A nonnucleoside reverse transcriptase inhibitor that inhibits the activity of HIV reverse transcriptase of HIV-1 and the transcription of HIV-1 RNA to DNA. *Therapeutic Effect:* Interrupts HIV replication, slowing the progression of HIV infection.

# PHARMACOKINETICS

Absolute oral bioavailability unknown; fasting decreases absorption by 50% so the drug should be taken with food. Protein binding: 99.9% (primarily albumin). Metabolized to inactive metabolites in the liver via CYP3A4 and CYP2C9, and CYP2C19. Eliminated primarily (> 93%) in the feces; no unchanged drug found in urine. *Halflife*: 21-61 h.

# AVAILABILITY

Tablets: 100 mg.

# INDICATIONS AND DOSAGES HIV infection (in combination with

other antiretrovirals) PO

Adults, Elderly. 200 mg (two 100-mg tablets) twice daily following meals.

# CONTRAINDICATIONS

Etravirine as monotherapy; hypersensitivity to etravirine.

# INTERACTIONS

NOTE: Etravirine is an inducer of CYP3A and inhibitor of CYP2C9, CYP2C19, and P-glycoprotein and may alter the therapeutic effect or adverse reaction profile of the coadministered drug(s). See manufacturer literature for specific recommendations on management. **Drug** 

Alcohol, benzodiazepines, psychoactive drugs: May produce additive central nervous system (CNS) effects.

**Potent CYP3A4 inhibitors:** May significantly increase etravirine concentrations.

**CYP3A4 substrates:** Concentration of substrates may be altered. **Clopidogrel:** May negate clopidogrel effectiveness.

Carbamazepine, phenobarbital, rifabutin, rifampin: Lower etravirine plasma concentration.

HMG-CoA reductase inhibitors ("statins"): May increase or

decrease some statin concentrations and risk for adverse effects.

**Warfarin:** Alters warfarin plasma concentration. May increase bleeding risk. Monitor INR.

Herbal

St. John's wort: May decrease etravirine concentration. Avoid. Food

Meals: Increase drug absorption.

# DIAGNOSTIC TEST EFFECTS

May increase total cholesterol, AST (SGOT), ALT (SGPT), and serum triglyceride levels. May increase serum amylase, lipase, serum creatinine, or blood glucose. Decreased WBC, platelets, or hemoglobin may occur.

# SIDE EFFECTS

Frequent (4%-10%)

Rash, peripheral neuropathy, nausea.

Etravirine (Generic Name), Intelence (Brand Name)

#### Common

Fatigue, dyspepsia, flatulence, anxiety, sleep disorders, disorientation, nervousness, headache, nightmares, hyperglycemia, vertigo, blurred vision, increased blood pressure. **Rare** 

Fat redistribution syndrome with buffalo hump.

#### SERIOUS REACTIONS

- · Immune reconstitution syndrome.
- · Pancreatitis or hepatic failure.

• Serious skin rashes, including Stevens-Johnson syndrome and erythema multiforme.

Rhabdomyolysis (rare cases).

#### PRECAUTIONS & CONSIDERATIONS

Severe, potentially life-threatening, and fatal skin reactions have been reported. These include cases of Stevens-Johnson syndrome, toxic epidermal necrolysis, and erythema multiforme. Hypersensitivity reactions have also been reported and were characterized by rash, constitutional findings, facial swelling, oral lesions, and sometimes organ dysfunction, including hepatic failure. Discontinue immediately if such skin reactions occur. Caution is warranted in patients with a history of liver impairment. Breastfeeding is not recommended for mothers with HIV-1 infection due to the risk of transmission of the virus. There are no adequate data during pregnancy. The safety and efficacy of etravirine have not been established in children. Etravirine is not a cure for HIV infection, nor does it reduce risk of transmission to others.

Expect to obtain history of all prescription and nonprescription medications before giving the drug because etravirine interacts with multiple drugs. Monitor for signs and symptoms of serious skin rashes, liver dysfunction, and adverse CNS side effects. Patients should report skin rashes promptly for evaluation. Avoid tasks that require mental alertness or motor skills until response to the drug is established. **Storage** 

Store at room temperature in the original bottle. Keep the bottle tightly closed and protect from moisture. Do *not* remove the desiccant pouches.

#### Administration

Take the doses following a meal. If patient unable to swallow the tablets whole, disperse the tablets in a glass of water. Once dispersed, stir well and drink immediately. Rinse glass with water several times and completely swallow to ensure the entire dose is consumed. Take the medication every day as prescribed. Do not alter the dose or discontinue the medication without first notifying the physician.

#### **Everolimus**

e-ve-ro'li-mus Afinitor, Zortress Do not confuse Afinitor with Zortress due to different indications and dosages.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (Zortress), D (Afinitor)

**Classification:** Antineoplastics, immunosuppressants

#### MECHANISM OF ACTION

An immunosuppressant with antineoplastic activity that inhibits T-lymphocyte proliferation. Prevents activation of the enzyme target of rapamycin (mTOR), a key regulatory kinase in cell-cycle progression. As an inhibitor of mTOR, the drug results in complex formation and inhibition of mTOR kinase activity. Everolimus reduced the activity of cellular protein synthesis and reduced the expression of vascular endothelial growth factor (VEGF). *Therapeutic Effect:* Suppresses the immunologically mediated inflammatory response; prevents kidney organ transplant rejection. Fights cancer by reducing cell proliferation, angiogenesis.

# PHARMACOKINETICS

Variably absorbed after PO administration. Protein binding: 74%-97%. Extensively metabolized in the liver. Excreted in feces. Not removed by hemodialysis. *Half-life:* 11.7 h, with a range up to 30 h.

# AVAILABILITY

*Tablets (Afinitor):* 2.5 mg, 5 mg, 7.5 mg, 10 mg. *Tablets (Zortress):* 0.25 mg, 0.5 mg, 0.75 mg.

# INDICATIONS AND DOSAGES

#### Prevention of kidney transplant rejection

PO (ZORTRESS) Adults. Initially, 0.75 mg every 12 h in combination with basiliximab induction, cyclosporine USP modified, and corticosteroids. Therapeutic drug monitoring of everolimus and cyclosporine is recommended for all patients to guide adjustments. If needed, adjust everolimus dose at 4-5 day

# intervals. Zortress -Dosage adjustment for hepatic impairment

For Child-Pugh class B hepatic impairment, reduce daily dose by half and monitor blood concentrations.

# Advanced renal cell carcinoma after failure with sunitinib or sorafenib

PO (AFINITOR) Adults. 10 mg once daily.

 Subependymal giant cell astrocytoma (SEGA)

PO (AFINITOR)

Adults and Children > 3 yr: Initial dose based on BSA BSA of  $\ge 2.2 \text{ m}^2$ : 7.5 mg once daily. BSA of 1.3-2.1 m<sup>2</sup>: 5 mg once daily. BSA of 0.5-1.2 m<sup>2</sup>: 2.5 mg once daily.

For all patients, adjust dose at 2-week intervals based on drug levels, tolerability, clinical responce, and concomitant drugs. If a dose reduction is needed in a patient receiving 2.5 mg/day PO, then go to alternate-day dosing.

# Progressive pancreatic neuroendocrine tumor (PNET) PO (AFINITOR)

Adults. 10 mg once daily. Continue as long as clinical benefit is observed or toxicity develops. Reduce dose to 5 mg once if required to manage toxicity.

#### Afinitor -If moderate inhibitors of CYP3A4 or P-glycoprotein (Pgp) are required

Reduce dose to 2.5 mg once daily; if tolerated, consider increase to 5 mg once daily.

#### Afinitor -If strong inducers of CYP3A4 are required

Increase dose in 5-mg increments to a max of 20 mg once daily.

#### Afinitor -Dosage adjustment for hepatic impairment

For Child-Pugh class B hepatic impairment, reduce dose to 5 mg once daily.

#### Afinitor -Dosage adjustment for side effects

Interruption and/or dose reduction to 5 mg daily may be needed to manage adverse drug reactions.

#### **OFF-LABEL USES**

Metastatic breast cancer in females.

#### CONTRAINDICATIONS

Hypersensitivity to everolimus, other rapamycin derivatives, or ingredients in the formulation.

#### INTERACTIONS

#### Drug

E

ACE inhibitors: Increased risk for angioedema.

Aminoglycosides, amphotericin B, cisplatin: May increase the risk of renal dysfunction.

**CYP3A4 inhibitors or Pgp inhibitors:** May affect everolimus concentrations. Blood concentration monitoring is recommended; consider dose adjustment. Avoid if possible.

Azole antifungals, calcium channel blockers, clarithromycin, diltiazem, erythromycin, protease inhibitors, verapamil: Increase everolimus blood concentration and risk of toxicity.

CYP3A4 inducers (e.g., carbamazepine, efavirenz, nevirapine, phenobarbital, phenytoin, rifampin): Decrease everolimus blood concentration. Blood concentration monitoring is recommended; consider dose adjustment. Avoid if possible.

# **Cyclosporine and other immunosuppressants:** May increase the risk of nephrotoxicity, or immunosuppression. Cyclosporine inhibits CYP3A and Pgp and raises everolimus blood

concentrations.

**Digoxin:** Inhibits Pgp and may decrease the efflux of everolimus from intestinal cells and increase everolimus blood concentrations.

HMG-CoA reductase inhibitors ("statins"): May increase risk of statin side effects, like myopathy. Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine. Avoid live-virus vaccines during treatment.

#### Herbal

**St. John's wort:** May decrease the effects of everolimus.

Food

**Grapefruit, grapefruit juice:** May alter the effects of the drug. Avoid.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose and serum creatinine levels. May decrease WBC, RBC indices, and platelet counts. Increases cholesterol and triglycerides. May alter serum liver function tests, potassium or magnesium levels. May cause proteinuria. Trough concentrations of everolimus are monitored; target troughs are dependent on indication of use; for kidney transplant range is 3-8 ng/mL. For cancer indications, 5-15 ng/mL.

# SIDE EFFECTS

#### Common

Peripheral edema, constipation, hypertension, nausea, anemia, UTI or other infections, hyperlipidemia, stomatitis, cough, diarrhea, headache.

#### Occasional

Rash, pruritus, anorexia, asthenia, dyspepsia, abdominal pain, fatigue, dry skin, taste disturbance, dyspnea, epistaxis, dizziness, paresthesia, delayed wound healing, photosensitivity, new-onset hyperglycemia/ diabetes, proteinuria, arthralgia. Azoospermia and infertility possible in men.

#### SERIOUS REACTIONS

- · Hypersensitivity.
- Nephrotoxicity or acute renal failure.

- Noninfectious pneumonitis; rarely fatal. Be alert for dyspnea and cough.
- Pericardial and pleural effusions or ascites.
- Kidney arterial or venous thrombosis of transplant graft.
- Increased risk of sepsis; opportunistic infections occur occasionally.
- Possible risk of lymphoma or other malignancy (i.e., non-melanoma skin cancers). Appears related to intensity and duration of use of the immunosuppressant drug.
- Increased mortality noted when used in de novo heart transplant.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in those patients with a listed hypersensitivity to similar medications (e.g., sirolimus). Caution is warranted in patients with chickenpox, herpes zoster, hepatitis B, and other infection. Use with caution in those with immunosuppression, hypertension, diabetes, actively healing wounds, and hepatic impairment. Patients with rare disorders of galactose intolerance should not use the drug. Everolimus crosses the placenta and may cause fetal harm. The drug is distributed to breast milk; women taking this drug should not breastfeed. This drug may cause infertility or sperm changes in males. Patients should use an effective method of contraception during therapy and for 8 wks after ending treatment. The safety and efficacy of everolimus have not been established in children.

Review all medications, including nonprescription, prior to prescribing to manage drug interactions. Avoid crowds and people with infection. Also avoid exposure to sunlight and artificial light because these may cause a photosensitivity reaction. Notify the physician of change in mental status, chest pain, dizziness, headache, decreased urination, rash, respiratory infection, difficulty breathing, or unusual bleeding or bruising. CBC should be monitored routinely. Liver function test results and serum creatinine and potassium levels should also be assessed regularly.

#### Storage

Store in the original container at room temperature; protect from light and moisture.

#### Administration

May take without regard to food. Do not break, chew, or crush Afinitor tablets. Zortress 0.75-mg tablets are scored if a dose needs to be divided. Swallow with a full glass of water. Take doses at about the same time daily. Do not give this drug with grapefruit juice.

#### Exemestane

ex-uh-mess'tane

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Aromatase inhibitors, hormones/hormone modifiers

#### MECHANISM OF ACTION

Inactivates aromatase, the principal enzyme that converts androgens to estrogens in both premenopausal and postmenopausal women, thereby lowering the circulating estrogen level. *Therapeutic Effect*: Inhibits the growth of breast cancers that are stimulated by estrogens.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 90%. Distributed extensively into

Exemestane (Generic Name), Aromasin (Brand Name)

tissues. Metabolized extensively in the liver; eliminated in urine and feces. *Half-life*: 24 h.

# AVAILABILITY

Tablets: 25 mg.

# INDICATIONS AND DOSAGES Breast cancer, advanced after tamoxifen therapy

PO Adults, Elderly. 25 mg once a day after a meal. If potent CYP3A4 inducer coprescribed, give 50 mg once daily after a meal.

# CONTRAINDICATIONS

Hypersensitivity to exemestane; pregnancy; also contraindicated in premenopausal women with breast cancer as efficacy is not demonstrated.

# **INTERACTIONS**

Drug

**CYP3A4 inducers:** May decrease levels and effects of exemestane. **Herbal** 

St. John's wort: May decrease levels and effects of exemestane. Avoid use. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), ALT (SGPT), creatinine, and bilirubin levels.

# SIDE EFFECTS

#### Frequent (10%-22%)

Fatigue, nausea, depression, hypertension, alopecia, arthralgia, hot flashes, pain, insomnia, anxiety, dyspnea.

#### Occasional (5%-8%)

Headache, dizziness, vomiting, dermatitis, peripheral edema, abdominal pain, weight gain, anorexia, flu-like symptoms, diaphoresis, constipation, visual disturbances. **Rare (4%)** Diarrhea.

# SERIOUS REACTIONS

 Myocardial infarction, angina, and thromboembolism have been reported.

# **PRECAUTIONS & CONSIDERATIONS**

Exemestane is not for use in premenopausal women. Exemestane is indicated only for postmenopausal women. Use with caution in renal or hepatic insufficiency. This drug is not used in children. No age-related precautions have been noted in elderly patients. Should not be used during pregnancy due to potential for fetal harm; do not breastfeed during treatment.

Potential side effects, including dizziness, headache, insomnia, depression, may occur. Notify the physician if hot flashes or nausea become unmanageable. Nausea and vomiting may be prevented or treated with an antiemetic. Baseline vital signs, especially BP, should be assessed because exemestane may cause hypertension.

#### Storage

Store at room temperature. Administration Give oral exemestane after a meal.

Sive of a exemestance after a me

# Exenatide

ex-en'a-tide 📩 🏰 Byetta, Bydureon

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, incretin mimetics

# **MECHANISM OF ACTION**

A synthetic peptide initially derived from the saliva of the Gila monster lizard; some of the peptide sequence overlaps with human glucagon-like peptide-1 (GLP-1). Incretins, such as GLP-1, enhance glucose-dependent insulin secretion and exhibit other antihyperglycemic actions following their release into the circulation from the gut. Exenatide is a GLP-1 receptor agonist that enhances glucose-dependent insulin secretion by the pancreatic  $\beta$ -cell, suppresses inappropriately elevated glucagon secretion, and slows gastric emptying. Therapeutic Effect: Lowers blood glucose concentration and also HbA1c over time.

# PHARMACOKINETICS

Native GLP-1 has a very short halflife (< 1 min) and is not clinically useful; exenatide has an extended therapeutic profile in comparison. Median plasma concentration occurs 2.1 h after subcutaneous injection. Primarily eliminated by glomerular filtration followed by proteolytic degradation. *Half-life*: 2.4 h (significantly prolonged in

2.4 h (significantly prolonged in severe renal impairment and end-stage renal disease).

NOTE: Extended-release injection displays different pharmacokinetics and is gradually released from microspheres. Approximately 10 weeks after discontinuation, plasma concentrations fall below detectable levels.

# AVAILABILITY

*Byetta Injection Solution (250 mcg/ mL):* Available in 5-mcg and 10-mcg prefilled pens containing 60 doses each.

*Bydureon Powder for Injection Suspension:* Available in 2 mg per vial. Trays contain 4 doses per package.

# INDICATIONS AND DOSAGES Type 2 diabetes mellitus

SC (BYETTA INJECTION SOLUTION)

*Adults, Elderly.* Initially, 5 mcg twice daily, with dose given 60 min prior to morning and evening meals (or before the 2 main meals of the day with doses at least 6 h apart). Increase to 10 mcg twice daily after 1 mo based on clinical response.

SC (BYDUREON EXTENDED-RELEASE SUSPENSION) *Adults, Elderly.* 2 mg once every 7 days. Dosage due date is determined by date of last dose.

Dosage in renal impairment Use caution in increasing doses for those with mild or moderate renal impairment. Do not use in patients with severe renal impairment (CrCl < 30 mL/min) or end-stage renal disease.

# CONTRAINDICATIONS

Hypersensitivity to exenatide or product components. Not for type 1 diabetes mellitus or diabetic ketoacidosis. For patients with a history of pancreatitis, selection of other antidiabetic medications is strongly suggested (see Serious Reactions). Do not use in severe renal impairment or end-stage renal disease. Bydureon is additionally contraindicated if patient history or family history of medullary thyroid carcinoma (MTC) or multiple endocrine neoplasia syndrome type 2 (MEN 2).

# INTERACTIONS

#### Drug

**β-Blockers:** May mask signs of hypoglycemia.

Oral medications (e.g., oral contraceptives, antibiotics):

Exenatide slows GI transit times. For oral medications dependent on normal transit times efficacy, such as contraceptives and antibiotics, patients should be advised to take those drugs at least 1 h before exenatide, or at a meal or snack when exenatide is not administered.

Corticosteroids: May increase blood sugar.

**Sulfonylureas:** May increase risk of hypoglycemia; lower sulfonylurea dose may be needed.

Warfarin: May increase the effects of warfarin, resulting in increased INR. Monitor INR closely.

# Herbal

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle: May enhance hypoglycemic effects. Food

Alcohol: Hypoglycemia is more likely to occur if alcohol is ingested. High and chronic alcohol use may increase risk for pancreatitis.

#### DIAGNOSTIC TEST EFFECTS

Lowers blood sugar. May increase serum creatinine, amylase, or lipase.

#### SIDE EFFECTS

#### Frequent

Nausea, hypoglycemia, vomiting, diarrhea, nervousness, dizziness, headache, dyspepsia. Nausea subsides with time.

#### Occasional

Gastroesophageal reflux (GERD), decreased appetite, asthenia, hyperhidrosis.

#### Rare

Injection site reaction, abdominal pain, eructation, flatulence, abdominal distention, taste disturbance, pruritus, urticaria, maculopapular rash.

#### SERIOUS REACTIONS

• Overdose may produce severe hypoglycemia, along with severe GI symptoms and vomiting.

• Pancreatitis, including nonfatal hemorrhagic and necrotizing pancreatitis.

• Rare reports of serious allergic reactions, including angioedema and serious rashes.

• Worsened renal function or acute renal failure.

• Increased risk for thymoid tumors based on animal studies.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with debilitation, impaired renal function, potential risk factors for pancreatitis (hypertriglyceridemia, alcoholism, other), and significant GI disease (e.g., gastroparesis) where slowing of GI transit time may aggravate the condition. Be alert to conditions that alter blood glucose requirements or dietary intake, such as fever, increased activity, stress, or a surgical procedure. There are no data regarding exenatide use during pregnancy. It is unknown whether the drug is distributed in breast milk: caution is recommended. The drug may alter the efficacy of oral hormonal contraceptives and the choice of an additional or alternate contraceptive may be desirable. Safety and efficacy of exenatide have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients. With time, development of

antibodies to the drug may present as treatment failure.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors), or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia.

Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy. **Storage** 

For Byetta, store unopened pens in the original carton in a refrigerator. Do not freeze. Once opened and set up for first use, the pen can be kept at a temperature not to exceed 77° F for up to 30 days. Always protect the pen from light and keep it dry. Do not store the pen with the needle attached, as this will cause leakage from the pen and air bubbles may form in the cartridge.

For Bydureon, the unopened suspension vial trays should be stored in the refrigerator at 36-46° F (2-8° C). Do not freeze and protect from light. Each single-dose tray can be kept at room temperature under 77° F (25° C) for no more than 4 weeks, if needed. Prepare the dose immediately before use and do not store.

#### Administration

Byetta is for subcutaneous injection only; doses are given any time within the 60 min prior to the start of a main meal. If using a new pen, make sure you have prepared the pen for routine use. For routine use, wash hands. Check that the right pen is selected. Pull off blue pen cap. The cartridge liquid should be clear, colorless, and free of particles. Attach the needle and dial in the pen dose as the manufacturer directs. Inject the dose SC as directed in the thigh, abdomen, or upper arm; rotate injection sites with each use. After injection, reset the pen, remove and dispose of the used needle properly, and store the pen for next use by replacing the blue pen cap.

Bydureon is injected subcutaneously (SC) only once every 7 days; it must not be injected IV or IM. The day of week may be changed as long as the last dose was administered 3 days or more before the new day of the week. Do not substitute needles or any other components in the dose tray. Remove the syringe from the tray. The liquid in the syringe should be clear with no particles in it. Tap the drug vial against a hard surface to loosen the powder. Prepare the vial by connecting it to the orange connector, then break the white cap off the syringe. Twist the orange connector onto the syringe. Mix the diluent from the syringe into the vial, and it will become well mixed and look cloudy. Draw the medicine from the vial into syringe. Then attach the provided needle onto the syringe. Inject immediately after the powder is suspended in the diluent and transferred to the syringe. Give as a SC injection at any time on the weekly dosing day, in the abdomen, thigh, or upper arm region. Use a different injection site each week.

# **Ezetimibe**

eh-zet'eh-mibe ★ Zetia ★ Ezetrol Do not confuse Zetia with Zestril.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antihyperlipidemics

# **MECHANISM OF ACTION**

An antihyperlipidemic that inhibits cholesterol absorption in the small intestine, leading to a decrease in the delivery of intestinal cholesterol to the liver. *Therapeutic Effect:* Reduces total serum cholesterol, LDL cholesterol, and triglyceride levels and increases HDL cholesterol concentration.

#### PHARMACOKINETICS

Variable absorption following oral administration. Protein binding: > 90%. Metabolized in the small intestine and liver. Excreted by the kidneys and bile. *Half-life:* 22 h.

# AVAILABILITY

Tablets: 10 mg.

# INDICATIONS AND DOSAGES Hypercholesterolemia PO

Adults, Elderly, Children > 10 yr. Initially, 10 mg once a day, given with or without food. If the patient is also receiving a bile acid sequestrant, give ezetimibe at least 2 h before or at least 4 h after the bile acid sequestrant.

# CONTRAINDICATIONS

Hypersensitivity to ezetimibe. NOTE: If given with an HMG-CoA reductase inhibitor ("statin"), follow statin contraindications (e.g., patients with active hepatic disease or unexplained persistent elevations in serum transaminase levels, moderate or severe hepatic insufficiency, pregnancy, breastfeeding).

# INTERACTIONS

#### Drug

Aluminum and magnesiumcontaining antacids: Decrease ezetimibe plasma concentration. Cholestyramine: Decreases drug effectiveness. Administer 2 h before or 4 h after bile acid sequestrants.

**Cyclosporine:** Increases ezetimibe concentration; cyclosporine level may also increase.

Fenofibrate, gemfibrozil: Increases ezetimibe plasma concentration. Fibrates may increase risk of cholelithiasis.

# **Herbal and Food**

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, serum bilirubin, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

Frequent (> 10%) Upper respiratory tract infection.

Occasional (3%-9%) Headache, back pain, diarrhea, myalgia, arthralgia, sinusitis, abdominal pain, chest pain.

Rare (2%)

Cough, pharyngitis, fatigue.

#### SERIOUS REACTIONS

• None known.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with chronic renal failure, diabetes, hypothyroidism, liver function impairment, and obstructive liver disease. It is unknown whether

Ezetimibe (Generic Name), Zetia (Brand Name)

ezetimibe crosses the placenta or is distributed in breast milk. Safety and efficacy of ezetimibe have not been established in children 10 yr of age and younger. This drug is not recommended for use in patients with moderate or severe hepatic impairment.

Notify the physician of any abdominal disturbances and back pain. Pattern of daily bowel activity and stool consistency should be assessed. Serum cholesterol and triglyceride levels should be checked at baseline and periodically thereafter. **Storage** 

#### Stora et ree

Store at room temperature. Protect from moisture.

#### Administration

Take ezetimibe without regard to food. Separate administration from that of bile sequestrants.

# Ezogabine

e-zog'a-been Do potiga Do not confuse Potiga with Potoba or Portia.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anticonvulsants

#### **MECHANISM OF ACTION**

An anticonvulsant that enhances transmembrane potassium currents mediated by binding to the KCNQ family of ion channels, stabilizing the resting membrane potential and reducing brain excitability. May also exert therapeutic effects through augmentation of  $\gamma$ -aminobutyric acid (GABA), the main inhibitory brain neurotransmitter. *Therapeutic Effect:* Inhibits seizures.

#### Pharmacokinetics

Rapid absorption orally; 60% bioavailable. Meals do not change the extent of absorption. Protein binding: 80%. Two metabolic pathways exist: glucuronidation and acetylation. CYP450 enzymes not involved. The N-acetyl metabolite (NAMR) is active but less potent than the parent drug. Renal excretion is the primary elimination route of ezogabine and NAMR. *Half-life:* 7 to 11 h (increased in hepatic and renal impairment, and in the elderly).

#### AVAILABILITY

*Tablets:* 50 mg, 200 mg, 300 mg, 400 mg.

# INDICATIONS AND DOSAGES Adjunctive treatment of partial seizures

PO

Adults. Initially, 100 mg 3 times daily for 1 week. Titrate by increasing dose weekly by no more than 150 mg/ day (e.g., 50 mg increase 3 times per day). Optimize dosage between 200 mg 3 times daily (600 mg/day) to 400 mg 3 times daily (1200 mg/ day). Usual maximum effective and tolerated dose is 300 mg 3 times daily (900 mg/day).

*Elderly.* Initially, 50 mg 3 times daily for 1 week. Titrate by increasing dose by no more than 150 mg/day (e.g., 50 mg 3 times per day) at weekly intervals. Maximum: 250 mg 3 times daily.

Dosage in hepatic impairment For moderate impairment: Initially, 50 mg 3 times daily for 1 week. Titrate by increasing dose weekly by no more than 150 mg/day (e.g., 50 mg increase 3 times per day). Maximum: 250 mg 3 times daily. For severe impairment: Initially, 50 mg 3 times daily for 1 week. Titrate by increasing dose weekly by no more than 150 mg/day. Maximum 200 mg 3 times daily.

> Dosage in renal impairment:

*CrCl* < 50 ml/min: Initially, 50 mg 3 times daily for 1 week. Titrate to maintenance dosage by increasing dose weekly by no more than 150 mg/day (e.g., 50 mg increase 3 times per day). Maximum: 200 mg 3 times daily.

#### CONTRAINDICATIONS

Hypersensitivity to ezogabine.

#### INTERACTIONS

#### Drug

Alcohol: Additive effects on CNS and may decrease seizure threshold. Anticholinergics: Potential for additive effect on urinary retention.

**Carbamazepine, phenytoin:** May decrease ezogabine levels; consider increased dose.

**CNS depressants:** Additive sedation.

**Digoxin:** May reduce digoxin renal clearance; monitor digoxin levels. **QT-prolonging drugs:** May have additive effect on QT interval; use caution. Some drugs may be contraindicated.

#### Herbal

None known. Food None known

#### None known.

# DIAGNOSTIC TEST EFFECTS

A therapeutic range is not established. May increase LFTs. Rare occurrence of lowered WBC or platelet counts.

#### SIDE EFFECTS

#### Frequent ( $\geq 4\%$ )

Dizziness, somnolence, fatigue, nausea, confusional state, vertigo, tremor, abnormal coordination, diplopia, disturbance in attention, memory impairment, asthenia, blurred vision, gait disturbance, aphasia, dysarthria, and balance disorder.

# Occasional (2%-4%)

Constipation, dyspepsia, amnesia, anxiety, weight gain, dysphagia, paresthesia, urinary hesitancy, dysuria.

#### Rare

Myoclonus, hallucinations, elevated hepatic enzymes, neutropenia, leukopenia, and thrombocytopenia.

#### SERIOUS REACTIONS

• Severe urinary retention may require intervention and may cause hydronephrosis.

 Psychosis or other severe mood disorders.

QT prolongation is rare.

#### PRECAUTIONS & CONSIDERATIONS

Antiepileptic drugs (AEDs) increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, and/ or any unusual changes in mood or behavior. Use with caution in those with risk factors for OT prolongation. including heart failure, hypokalemia or hypomagnesemia, or familial QT prolongation risks, ventricular hypertrophy, or other drug therapies that may prolong QT interval. Correct any electrolyte imbalances prior to use; consider ECG monitoring in those with continued risk for electrolyte imbalance. Animal data indicate possible potential for fetal harm; a pregnancy registry exists. Avoid breastfeeding during use if possible. Safety of use in children has not been established. Caution is warranted in patients with hepatic or renal impairment, in the elderly, and in those who take other CNS depressants concurrently. Risk factors for urinary retention, such

as prostatic hypertrophy, should be noted.

Dizziness may occur, so change positions slowly—from recumbent to sitting position before standing. Alcohol and tasks requiring mental alertness or motor skills should be avoided until effects are known. History of the seizure disorder, including the duration, frequency, and intensity of seizures, should be reviewed before and during therapy. CBCs and blood chemistry tests to assess hepatic and renal function should be performed before and during treatment. Consider urologic exam prior to prescribing the drug. Monitor for urinary retention, which may require catheterization.

#### Storage

Store tablets at room temperature. Protect from light and moisture. Administration

# Ezogabine may be taken without regard to food; swallow tablets whole.

To avoid increase in seizure frequency, do not abruptly discontinue the drug. A gradual taper over 3 weeks is recommended if the drug will be discontinued.

# Factor IX Complex and Factor IX Concentrates

 ★ AlphaNine SD, Bebulin VH, BeneFIX, Mononine, Profilnine SD
 ◆ BeneFIX, Immunine VH

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antihemophilic agents, blood clotting factors

# **MECHANISM OF ACTION**

A blood modifier that raises the plasma levels of factor IX, restoring hemostasis in patients with factor IX deficiency. *Therapeutic Effect:* Increases blood clotting factor IX to restore hemostasis.

# **PHARMACOKINETICS**

Mean half-time is 22 h (range, 11-36 h). Mean increase in circulating factor IX activity after infusion is 0.67-1.15 units/dL rise per units/kg body weight.

# AVAILABILITY

Injection: Number of units is indicated on each vial. AlphaNine SD: Contains factor IX; contains only low or nontherapeutic levels of factors II, VII, and X. Mononine: Purified by monoclonal antibody process to isolate factor IX. BeneFIX: Recombinant human factor IX.

*Profilnine SD, Bebulin VH:* Contains factor IX; also contains some factors, II, VII, and X and proteins S and C.

# INDICATIONS AND DOSAGES > Bleeding caused by factor IX deficiency (hemophilia B, Christmas disease)

# IV INFUSION

Adults, Elderly, Children. Amount of factor IX required is individualized.

Dosage depends on degree of deficiency, level of each factor desired, patient's weight, and severity of bleeding.

# **OFF-LABEL USES**

Emergency reversal of oral anticoagulant effects.

# CONTRAINDICATIONS

Sensitivity to mouse protein (Mononine) or hamster protein (BeneFIX).

# INTERACTIONS

Drug and Food Aminocaproic acid: May increase the risk of thrombosis. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# IV INCOMPATIBILITIES

Do not mix with other medications.

# SIDE EFFECTS

# Rare

Mild hypersensitivity reaction marked by fever, chills, change in BP and pulse rate, rash, and urticaria. Nausea, discomfort at IV site, altered taste, burning sensation in the jaw and skull, allergic rhinitis, light-headedness, headache, dizziness, chest tightness, phlebitis, or cellulitis at IV site. Rapid infusion rate: headache, flushing, changes in BP or pulse rate, transient fever, chills, tingling, urticaria, nausea, and vomiting may occur. Symptoms disappear promptly on discontinuation. Except in the most reactive individuals, the infusion may be resumed at a slower rate. Chills and fever (particularly when large doses are used).

# SERIOUS REACTIONS

• There is a high risk of venous thrombosis during the postoperative period.

 Acute hypersensitivity reaction or anaphylactic reaction may occur.

• There is a risk of transmitting viral hepatitis and other viral diseases.

 High doses may be associated with myocardial infarction, disseminated intravascular coagulation, venous thrombosis, and pulmonary embolism.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic impairment, recent surgery, and sensitivity to factor IX. OTC medications should be avoided without physician approval. Efficacy and safety in children under age 6 yr have not been evaluated.

Notify the physician of abdominal or back pain, gingival bleeding, black or red stool, coffee-ground emesis, dark or red urine, or red-speckled mucus from cough. Intake and output and vital signs should be monitored. IV site should be assessed for oozing every 5-15 min for 1-2 h after administration.

Factor levels and hematologic and coagulation tests are frequently monitored during and between treatments.

#### Storage

AlphaNine SD: May also be stored at room temperature not to exceed 86° F (30° C) for up to 1 mo.

BeneFIX: May also be stored at room temperature, not to exceed  $77^{\circ}$  F (25° C) for up to 6 mo. Reconstituted solution at room temperature should be used within 3 h. Mononine: May also be stored at room temperature not to exceed 77° F (25° C) for up to 1 mo.

# Administration

Gently agitate vial until powder is completely dissolved so that the active components will not be removed when the solution is filtered during administration. Bring diluent and factors to room temperature before combining. Filter before administration. Begin administration within 3 h of reconstitution. Administer by IV infusion. Infuse slowly, no faster than 2 mL/min (Bebulin and Mononine), 10 mL/ min (Profilnine and AlphaNine), and over several minutes (BeneFIX). Too rapid an IV infusion may produce a change in BP and pulse rate, headache, flushing, and a tingling sensation

# Famciclovir

fam-si'klo-veer Famvir Do not confuse Famvir with Femhrt.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Antivirals

#### MECHANISM OF ACTION

A synthetic nucleoside that inhibits viral DNA synthesis. *Therapeutic Effect:* Suppresses replication of herpes simplex virus and varicellazoster virus.

#### PHARMACOKINETICS

Rapidly and extensively absorbed after PO administration. Protein binding: 20%-25%. Rapidly metabolized to penciclovir by enzymes in the GI wall, liver, and

Famciclovir (Generic Name)
plasma. Eliminated unchanged in urine. Removed by hemodialysis. *Half-life:* 2 h.

# AVAILABILITY

Tablets: 125 mg, 250 mg, 500 mg.

# INDICATIONS AND DOSAGES

# Herpes zoster (shingles) PO

Adults. 500 mg q8h for 7 days. CrCl 40-59 mL/min: Administer 500 mg every 12 h.

CrCl 20-39 mL/min: Administer 500 mg every 24 h.

CrCl < 20 mL/min: Administer 250 mg every 24 h.

Hemodialysis: Administer 250 mg after each dialysis session.

# Recurrent genital herpes PO

*Adults.* 1000 mg twice a day for 1 day within 6 h of symptom onset. CrCl 40-59 mL/min: Administer 500 mg every 12 h for 1 day.

CrCl 20-39 mL/min: Administer 500 mg as a single dose.

CrCl < 20 mL/min: Administer 250 mg as a single dose.

Hemodialysis: Administer 250 mg as a single dose after dialysis session.

# Suppression of recurrent genital herpes

PO

Adults. 250 mg twice a day for up to 1 yr.

CrCl 20-39 mL/min: Administer 125 mg every 12 h.

CrCl < 20 mL/min: Administer 125 mg every 24 h.

Hemodialysis: Administer 125 mg after each dialysis session.

# Recurrent herpes labialis (cold sores)

*Adults.* 1500 mg as a single dose earliest sign or symptom of a cold sore. CrCl 40-59 mL/min: Administer 750 mg as a single dose. CrCl 20-39 mL/min: Administer 500 mg as a single dose.

CrCl < 20 mL/min: Administer 250 mg as a single dose.

Hemodialysis: Administer 250 mg as a single dose after dialysis session.

 Recurrent orolabial or genital herpes simplex infection in patients with HIV infection

*Adults.* 500 mg twice a day for 7 days. CrCl 20-39 mL/min: Administer 500 mg every 24 h. CrCl < 20 mL/min: Administer 250 mg every 24 h. Hemodialysis: Administer 250 mg after each dialysis session.

# **OFF-LABEL USES**

Bell's palsy, prophylaxis of postherpetic neuralgia.

# CONTRAINDICATIONS

Hypersensitivity to famciclovir or penciclovir.

# INTERACTIONS

Drug

**Probenecid:** May inhibit active tubular secretion and increase levels of penciclovir.

# Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

Increases in AST, ALT. Decreases in WBC.

SIDE EFFECTS

Frequent (> 10%) Headache, nausea. Occasional (2%-10%) Diarrhea, abdominal pain, dysmenorrhea, fatigue, vomiting, pruritus, flatulence, paresthesia.

# Rare (< 2%)

Insomnia, migraine, rash.

# SERIOUS REACTIONS

• Acute renal failure in patients with underlying renal dysfunction.

 Delirium or disorientation; reported more commonly in elderly patients.

 Rare allergic reactions, including pruritus, erythema multiforme, Stevens-Johnson syndrome, or toxic epidermal necrolysis.

• Rare reports of cholestatic jaundice.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with renal impairment because acute renal failure may occur with inappropriately high doses. Dose adjustment is recommended for patients with CrCl < 60 mL/min. The efficacy of famciclovir has not been established for initialepisode genital herpes infection, ophthalmic zoster, disseminated zoster, or in immunocompromised patients with herpes zoster. Famciclovir tablets contain lactose. Patients with rare hereditary problems of galactose intolerance, a severe lactase deficiency, or glucose-galactose malabsorption should not take famciclovir tablets. It is unknown whether famciclovir crosses the placenta or is distributed in breast milk. Efficacy and safety have not been established in children. No agerelated precautions have been noted in elderly patients.

#### Storage

Store at room temperature.

#### Administration

May be taken without regard to meals.

# **Famotidine**

fam-oh'tah-deen ★ Pepcid, Pepcid AC ◆ Pepcid, Pepcid AC, Peptic Guard, Ulcidine

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B Rx (10-mg tablets, 20-mg tablets, 40-mg tablets, injection, orally disintegrating tablets, oral suspension) OTC (10-mg tablets, 20-mg tablets)

Classification: Gastrointestinal agents, antiulcer agents, histamine H<sub>2</sub> receptor antagonist

# **MECHANISM OF ACTION**

An antiulcer agent and gastric acid secretion inhibitor that inhibits histamine action at  $H_2$  receptors of parietal cells. *Therapeutic Effect:* Inhibits gastric acid secretion when fasting, at night, or when stimulated by food, caffeine, or insulin.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	1-4 h	10-12 h
IV	0.5-1 h	0.5-3 h	10-12 h

Rapidly, incompletely absorbed from the GI tract. Protein binding: 15%-20%. Partially metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 2.5-3.5 h (increased with impaired renal function).

#### AVAILABILITY

Tablets (OTC): 10 mg, 20 mg. Chewable tablets (OTC): 10 mg. Gelcaps (OTC): 10 mg. Tablets (Rx): 10 mg, 20 mg, 40 mg.

Famotidine (Generic Name)

Orally Disintegrating Tablets (Rx): 20 mg, 40 mg. Oral Suspension (Rx): 40 mg/5 mL.

Injection (Rx): 10 mg/mL (1-mL, 2-mL, 4-mL, 20-mL, 50-mL vials; premixed 20 mg/50 mL).

#### INDICATIONS AND DOSAGES Acute treatment of duodenal and gastric ulcers PO

Adults, Elderly, Children 17 yr and older: 40 mg/day at bedtime. Children 1-16 yr. 0.5 mg/kg/day at bedtime. Maximum: 40 mg/day.

#### Duodenal ulcer maintenance PO

Adults, Elderly, Children 17 vr and older: 20 mg/day at bedtime.

# Gastroesophageal reflux disease (GERD)

PO

Adults, Elderly, Children 12 yr and older: 20 mg twice a day (maximum 40 mg BID).

Children aged 1-11 yr. 1 mg/kg/day in 2 divided doses (maximum 40 mg BID).

Children aged 3-12 mo. 0.5 mg/kg/ dose twice a day.

Children younger than 3 mo. 0.5 mg/ kg/dose once a day.

# Esophagitis

PO

Adults, Elderly, Children 12 yr and older. 20-40 mg twice a day.

#### Hypersecretory conditions PO

Adults, Elderly, Children 12 yr and older. Initially, 20 mg q6h. May increase up to 160 mg q6h.

#### Acid indigestion, heartburn (OTC) PO

Adults, Elderly, Children 12 yr and older. 10-20 mg 15-60 min before eating. Maximum: 2 doses per day.

Usual parenteral dosage IV

Adults, Elderly, Children 12 yr and older: 20 mg q12h. Children 1-11 yr: 0.25-0.5 mg 1 kg

q12h.

# Dosage in renal impairment

Dosing frequency is modified on the basis of creatinine clearance. May decrease dose by 50% or modify frequency, as follows:

# Creatinine

Clearance (mL/min)	Dosage Interval	
10-50	q36-48h	
< 10	q36-48h	

# OFF-LABEL USES

Urticaria, prevention of paclitaxel hypersensitivity reactions, stress ulcer prophylaxis in critically ill.

# CONTRAINDICATIONS

Hypersensitivity to famotidine or other H2 antagonists.

# INTERACTIONS

#### Drug

Causes decreased oral absorption of following medications: May decrease the absorption of azole antifungals (monitor), atazanavir (boost with ritonovir), cefpodoxime (separate oral doses by 2 h), cefuroxime (separate oral doses by 2 h), dasatinib (avoid), saquinavir (monitor), gefitinib (monitor), cefditoren (avoid use), some modified release dosage forms may be altered as well.

Cyclosporine: Histamine H<sub>2</sub> antagonists may increase the serum concentration of cyclosporine (monitor).

#### Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May rarely cause decreases in WBC counts.

#### IV INCOMPATIBILITIES

Amphotericin B cholesteryl sulfate complex (Amphotec), azathioprine, azithromycin (Zithromax), cefepime (Maxipime), dantrolene, diazepam (Valium), ganciclovir (Cytovene), lansoprazole (Prevacid), minocycline (Minocin), pantoprazole (Protonix), piperacillin/tazobactam (Zosyn), rocuronium (Zemuron), sulfamethoxazole/trimethoprim.

#### 厦 IV COMPATIBILITIES

Acyclovir (Zovirax), alfentanil (Alfenta), allopurinol (Aloprim), amifostine (Ethyol), aminophylline, amiodarone, anakinra (Kineret), anidulafungin (Eraxis), ascorbic acid, atracurium (Tracrium), atropine, aztreonam (Azactam), benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefazolin, cefotaxime (Claforan), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), cefuroxime (Zinacef), chlorpromazine, cisatracurium (Nimbex), cisplatin, cladribine (Leustatin), clindamycin (Cleocin), cyclophosphamide (Cytoxan), cytarabine (Tarabine), dactinomycin (Cosmegen), daptomycin (Cubicin), dexamethasone sodium phosphate, dextran 40, digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine, docetaxel (Taxotere), dopamine, doripenem (Doribax), doxorubicin (Adriamycin), doxorubicin liposome (Doxil), droperidol (Inapsine), enalaprilat, epinephrine, epirubicin (Ellence), ertapenem (Invanz), erythromycin lactobionate, esmolol (Brevibloc),

etoposide (VePesid), fenoldopam (Corlopam), fentanyl citrate (Sublimaze), filgrastim (Neupogen), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil, folic acid, gemcitabine (Gemzar), gentamicin, granisetron (Kytril), heparin, hydrocortisone, hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine, imipenem/cilastatin (Primaxin), isoproterenol (Isuprel), ketorolac, labetalol (Trandate), levofloxacin (Levaquin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, mannitol, melphalan (Alkeran), meperidine (Demerol), methotrexate, methylprednisolone sodium succinate (Solu-Medrol), metoclopramide (Reglan), metoprolol (Lopressor), metronidazole (Flagyl), midazolam, milrinone (Primacor), mitoxantrone (Novantrone), morphine, nafcillin, naloxone (Narcan), nicardipine (Cardene), nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxaliplatin (Eloxatin), oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pemetrexed (Alimta), penicillin G potassium, penicillin G sodium, phenylephrine (Neo-Synephrine), phytonadione, potassium chloride, potassium phosphates, procainamide, promethazine, propofol (Diprivan), propranolol (Inderal), protamine, ranitidine (Zantac), remifentanil (Ultiva), rituximab (Rituxan), sargramostim (Leukine), sodium acetate, sodium nitroprusside (Nitropress), succinylcholine (Anectine, Quelicin), sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiamine, thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin/

clavulanate potassium (Timentin), tigecycline (Tygacil), tirofiban (Aggrastat), tobramycin, trastuzumab (Herceptin), vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend).

# SIDE EFFECTS

Occasional (2%-10%)

Headache. **Rare (≤ 1%)** Constipation, diarrhea, dizziness.

#### SERIOUS REACTIONS

• Rare: agranulocytosis, pancytopenia, leukopenia, thrombocytopenia.

 QT prolongation and CNS disturbances if doses not appropriately adjusted for renal dysfunction.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with moderate to severe renal impairment because CNS adverse reactions may occur and, rarely, cardiovascular events like QT prolongation. Famotidine crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in elderly patients. RPD and chewable tablets contain aspartame (caution: phenylketonuria).

#### Storage

Store tablets at controlled room temperature.

Store injection vials in the refrigerator; do not freeze. Store premixed infusion at room temperature. If solution freezes, bring to room temperature; allow sufficient time to solubilize.

Solution is stable for 7 days at room temperature when added to or diluted with most commonly used IV solutions. When added to or diluted with sodium bicarbonate injection, a precipitate may form. Diluted solutions of famotidine injection should be refrigerated and used within 48 h.

#### Administration

IV push: Dilute no more than 20 mg to total volume 5 or 10 mL and inject over not < 2 min.

IV infusion: Dilute with 50-100 mL of solution and administer over 15-30 min.

Shake oral suspension well prior to each use. For oral use to relieve symptoms, may give without regard to meals. To prevent symptoms, give 60 min before eating food that causes heartburn.

#### Febuxostat

feb-ux′oh-stat ★ ₩ Uloric

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antigout agents, antihyperuricemic, xanthine-oxidase inhibitor

# **MECHANISM OF ACTION**

A xanthine oxidase inhibitor that decreases uric acid production by inhibiting xanthine oxidase, an enzyme. *Therapeutic Effect:* Reduces uric acid concentrations in both serum and urine.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: Roughly 99%. Widely distributed. Metabolized in the liver to four active metabolites. Excreted in urine and feces as unchanged drug and metabolites. Removed by hemodialysis. *Half-life:* 

Febuxostat (Generic Name), Uloric (Brand Name)

5-8 h (febuxostat); metabolites, 12-30 h.

# AVAILABILITY

Tablet: 40 mg, 80 mg.

#### INDICATIONS AND DOSAGES For chronic management of hyperuricemia due to gout PO

*Adults, Elderly.* Initially, 40 mg once daily. Testing for the target serum uric acid level of less than 6 mg/dL may be performed as early as 2 wks after initiating therapy.

After 2 wks may increase to 80 mg once daily if needed to achieve goal. No dose modifications are needed in mild or moderate renal or hepatic impairment. Use caution in patients with CrCl < 30 mL/min.

# CONTRAINDICATIONS

History of hypersensitivity to febuxostat, and in patients being treated with azathioprine or mercaptopurine.

#### INTERACTIONS

#### Drug

#### Azathioprine, mercaptopurine:

May increase toxicity of azathioprine and mercaptopurine via inhibition of xanthine oxidase. Contraindicated.

**Theophylline:** May rarely increase toxicity of theophylline via inhibition of xanthine oxidase.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Expected to lower uric acid level. May increase AST (SGOT) and ALT (SGPT) levels. May alter blood counts. Increased blood glucose, lipids, serum creatinine occasionally reported.

#### SIDE EFFECTS

#### Occasional ( $\geq 1\%$ )

Liver function enzyme increase, nausea, arthralgia, and rash. Rare (< 1%)

Headache, change in appetite, constipation, insomnia, alopecia, urinary disturbances.

#### SERIOUS REACTIONS

- · Severe hypersensitivity is rare.
- · Bone marrow depression.
- · Hepatic toxicity occurs very rarely.
- · Increased rate of thromboembolic

events, such as heart attack and stroke; these occur rarely and causality is not established.

#### **PRECAUTIONS & CONSIDERATIONS**

No recommended for patients who have asymptomatic hyperuricemia. Caution is warranted with cardiac disease, diabetes mellitus, hypertension, and severely impaired renal or hepatic function. It is unknown whether febuxostat crosses the placenta. It is likely the drug is excreted in breast milk based on animal studies; use with caution in nursing women. No age-related precautions have been noted in elderly patients. Not approved for use in children. The drug should be discontinued if rash or other evidence of allergic reaction appears. Avoid tasks that require mental alertness or motor skills until response to the drug has been established.

Encourage good fluid intake. Gout flares occur in early therapy but treatment can be continued. Monitor CBC, liver function tests, and serum uric acid levels. Signs and symptoms of a therapeutic response, including improved joint range of motion and reduced redness, swelling, and tenderness, should be evaluated.

#### Storage

Store at room temperature. Protect from light.

#### Administration

May take with food or antacids. Drink enough fluid daily to maintain good urine output. It may take 1-2 wks for the full therapeutic effect of the drug to be evident.

#### Felbamate fel'ba-mate

Felbatol

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

# **Classification:** Anticonvulsant (carbamate derivative)

#### **MECHANISM OF ACTION**

An anticonvulsant, structurally similar to meprobamate, that weakly blocks repetitive, sustained firing of neurons by enhancing the ability of  $\gamma$ -aminobutyric acid (GABA) and antagonizes the strychnineinsensitive glycine recognition site of the *N*-methyl-d-aspartate receptor-ionophore complex. *Therapeutic Effect:* Decreases seizure activity.

#### PHARMACOKINETICS

Rapidly and almost completely absorbed after PO administration. Protein binding: 22%-25%, primarily to albumin. Partially excreted unchanged in the urine (40%-50% of absorbed dose). Unidentified metabolites and conjugates account for 40% of dose. *Half-life:* 20-23 h.

#### AVAILABILITY

Tablets: 400 mg, 600 mg.

Oral Suspension: 600 mg/5mL (240 mL and 960 mL).

# INDICATIONS AND DOSAGES

Not indicated as first-line antiepileptic treatment.

#### Monotherapy or adjunctive therapy in the treatment of partial seizures, with and without generalization PO

Adults, Children 14 vr and older. Initially, 1200 mg/day in divided doses 3-4 times a day. Increase the felbamate dosage by 600-mg increments every 2 wks to 2400 mg/day based on clinical response up to 3600 mg/day as clinically indicated. Reduce the dosage of other antiepileptic drugs (AEDs) by one third of their original dosage at initiation of felbamate. At wk 2, increase dose of felbamate to 2400 mg/day and reduce dose of other AEDs by an additional one third of their original dose. At wk 3, increase the felbamate dosage up to 3600 mg/day and continue to reduce the dosage of other AEDs as clinically indicated.

#### Adjunctive therapy in the treatment of partial seizures, with and without generalization PO

Adults, Children 14 yr and older: Add 1200 mg/day in divided doses 3-4 times a day while reducing present AEDs by 20% in order to control plasma concentrations of concurrent phenytoin, valproic acid, and carbamazepine and its metabolites. Increase dosage by 1200 mg/day increments at weekly intervals to 3600 mg/day. Continuous reduction of the other AEDs may be necessary to control side effects.

#### Lennox-Gastaut syndrome PO

*Children 2-14 yr.* Add felbamate at 15 mg/kg/day in divided doses

Felbamate (Generic Name)

3-4 times a day while reducing present AEDs by 20% in order to control plasma concentrations of concurrent phenytoin, valproic acid, and carbamazepine and its metabolites. Increase the dosage of felbamate by 15 mg/kg/day increments at weekly intervals to 45 mg/kg/day. Continuous reduction of the other AEDs may be necessary to control side effects.

#### Dosage in renal impairment

Manufacturer recommends reducing usual dosages by 50%.

#### **OFF-LABEL USES**

None known.

# CONTRAINDICATIONS

History of any blood dyscrasia or hepatic dysfunction, hypersensitivity to felbamate, its ingredients, or known sensitivity to other carbamates.

#### INTERACTIONS

#### Drug

Carbamazepine: Concentration of carbamazepine decreased, felbamate concentration decreased. Carbamazepine epoxide metabolite concentration increased. CYP inducers and inhibitors: May affect felbamate concentrations. Phenobarbital: Concentration of phenobarbital increased. Phenytoin: Concentration of

phenytoin increased, felbamate decreased (20% reduction in phenytoin dose resulted in phenytoin levels similar to baseline). Valproate: Concentration of

valproate increased.

Herbal and Food

# None known.

# DIAGNOSTIC TEST EFFECTS

Hemoglobin decreases. AST, ALT, GGT increases. Prothrombin increased or decreased. Be alert to decreased WBC, platelet, or reticulocyte counts.

# SIDE EFFECTS

Frequent (> 10%)

Anorexia, vomiting, insomnia, nervousness, nausea, headache, dizziness, somnolence, fatigue, constipation, dyspepsia, fever (children), upper respiratory infection.

#### Occasional (1%-10%)

Rhinitis, tremor, diplopia, taste perversion, abnormal vision, abnormal gait, abdominal pain, depression, anxiety, ataxia, paresthesia, rash, acne, intramenstrual bleeding, weight decrease, facial edema, myalgia, pharyngitis, chest pain, dry mouth, weight increase, palpitations, tachycardia, psychologic disturbance, aggressive reaction.

#### Rare (<1%)

Anaphylactoid reaction, delusion, hallucinations, urinary retention, acute renal failure.

#### SERIOUS REACTIONS

• Aplastic anemia has been reported during felbamate therapy.

 Hepatic failure resulting in death has been reported. Hepatotoxicity can develop without warning signs; discontinue drug if liver enzymes are ≥ 2 times the upper limit of normal.

#### **PRECAUTIONS & CONSIDERATIONS**

Warning of increased risk of aplastic anemia, hepatic failure; safety and efficacy in children with other types of seizures have not been established. Rapid withdrawal of antiepileptic drugs could result in rebound seizures. Should be used with caution in renal dysfunction. Antiepileptic drugs (AEDs) may increase the risk of suicidal thoughts or behavior; monitor for the emergence or worsening of depression, suicidal thoughts, and/or any unusual changes in mood or behavior. Felbamate is likely to cross the placenta and is excreted in breast milk. Do not use during lactation.

Seizure frequency, liver function, and CBC should be regularly monitored.

#### Storage

Store at room temperature; keep tightly closed.

#### Administration

Administer without regard to food. Shake suspension well before use.

**Felodipine** 

fell-oh'da-peen ★ Plendil ▲ Renedil Do not confuse Plendil with Pletal or Prinivil.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antihypertensive agents, calcium channel blockers

#### **MECHANISM OF ACTION**

An antihypertensive and antianginal agent that inhibits calcium movement across cardiac and vascular smooth-muscle cell membranes. Potent peripheral vasodilator (does not depress SA or AV nodes) (dihydropyridine derivative). *Therapeutic Effect:* Increases myocardial contractility, heart rate, and cardiac output; decreases peripheral vascular resistance and BP.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2-5 h	N/A	24 h

Rapidly, completely absorbed from the GI tract. Protein binding: > 99%. Undergoes first-pass metabolism in the liver (205%). Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 11-16 h.

#### AVAILABILITY

*Tablets, Extended Release:* 2.5 mg, 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults*. Initially, 5 mg/day as single dose. Adjust dosage at no less than 2-wk intervals. Usual range: 2.5-10 mg/day.

*Elderly, Patients with impaired hepatic function.* Initially, 2.5 mg/day. Adjust dosage at no less than 2-wk intervals. Maintenance: 2.5-10 mg/day.

#### **OFF-LABEL USES**

Chronic angina pectoris, pediatric hypertension.

#### CONTRAINDICATIONS

Hypersensitivity, sick sinus syndrome, second- or third-degree heart block, SBP < 90 mm Hg.

# INTERACTIONS

#### Drug

**Amiodarone:** May result in bradycardia, atrioventricular block, and/or sinus arrest.

β-Blockers: Increased

pharmacodynamic effects.

**Carbamazepine, phenobarbital, phenytoin:** Decreased felodipine concentration.

**CYP inducers and inhibitors:** May affect felodipine concentrations. **CYP2C8 substrates:** Felodipine may inhibit metabolism of substrates. **Fentanyl:** May result in severe hypotension.

Itraconazole (and other azole antifungals), erythromycin, cimetidine, cyclosporine: Increased felodipine concentration.

Felodipine (Generic Name)

Nafcillin, rifampin: Decreased felodipine concentration. NSAIDs: Decreased hypotensive

effect or increased risk for GI complications.

#### Sildenafil, tadalafil, vardenafil:

Additive hypotensive effects possible. **Tacrolimus:** Concentration increased by felodipine.

#### Herbal

St. John's wort: May decrease felodipine levels.

# Food

**Grapefruit juice:** Increases felodipine concentration.

#### SIDE EFFECTS

Frequent (> 10%) Headache, peripheral edema. Occasional (1%-10%)

Flushing, respiratory infection, dizziness, light-headedness, palpitations, dyspepsia, asthenia (loss of strength, weakness), constipation, mild gingival hyperplasia.

#### Rare

Paresthesia, abdominal discomfort, nervousness, muscle cramping, cough, diarrhea.

#### SERIOUS REACTIONS

 Overdose produces nausea, somnolence, confusion, slurred speech, hypotension, and bradycardia. Contact Poison Control Center if overdose suspected.

 Hypotension, syncope, reflex tachycardia. Arrhythmia, myocardial infarction.

#### PRECAUTIONS & CONSIDERATIONS

Congestive heart failure, hypotension < 90 mm Hg systolic, hepatic injury/impairment, children, renal disease, elderly patients. It is unknown whether felodipine is distributed in breast milk; there are no adequate data in human pregnancy.

#### Storage

Store at room temperature; keep tightly closed and protect from light.

#### Administration

Take without food or give only with a light meal. Swallow whole and do not crush or chew. Generally avoid taking with grapefruit juice to avoid increased maximal concentrations.

# Fenofibrate

fee-no-fye'brate ★ Antara, Fenoglide, Lipofen, Lofibra, TriCor, Triglide ▲ Apo-Fenofibrate, Feno-Micro, Fenomax, Lipidil Do not confuse Tricor with Tracleer.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antihyperlipidemics, fibric acid derivatives

#### **MECHANISM OF ACTION**

An antihyperlipidemic that enhances synthesis of lipoprotein lipase and reduces triglyceride-rich lipoproteins and VLDLs. *Therapeutic Effect:* Reduces total and LDL cholesterol and reduces triglyceride levels. Increases HDL (good cholesterol) levels.

# PHARMACOKINETICS

Well absorbed from the GI tract. Micronized and nonmicronized forms are bioequivalent. Absorption increased when given with food. Protein binding: 99%. Rapidly metabolized in the liver to active metabolite. Excreted primarily in urine; lesser amount in feces. Not removed by hemodialysis. *Half-life:* 16-23 h.

Fenofibrate (Generic Name)

# AVAILABILITY

F

*Tablets:* 40 mg, 48 mg, 50 mg, 54 mg, 107 mg, 120 mg, 145 mg, 160 mg. *Capsules:* 50 mg, 150 mg. *Capsules, Micronized Fenofibrate:* 43 mg, 67 mg, 130 mg, 134 mg, 200 mg.

INDICATIONS AND DOSAGES

Hypertriglyceridemia
PO

Adults, Elderly. Antara (micronized) capsule: Initially, 43-130 mg/day; may increase to 130 mg/day. Fenoglide (nonmicronized) tablet: Initially, 40-120 mg/day; may increase to 120 mg/day. Lipofen (nonmicronized) capsule: Initially, 50-150 mg/day; may increase to 150 mg/day. Lofibra (micronized) capsule: Initially, 67-200 mg/day; may increase to 200 mg/day. Lofibra (nonmicronized) tablet: Initially, 54-160 mg/day; may increase to 160 mg/day. TriCor (nonmicronized) tablet: Initially, 48-145 mg/day; may increase to 145 mg/day. Triglide (nonmicronized) tablet: Initially, 50-160 mg/ day; may increase to 160 mg/day. Dosage in renal impairment Antara (micronized) capsule: Initially, 43 mg/day. Fenoglide (nonmicronized) tablet: CrCl 31-80 mL/min initially, 40 mg/day, CrCl < 30 mL/min contraindicated. Lipofen (nonmicronized) capsule: Initially, 50 mg/day. Lofibra (micronized) capsule: Initially, 67 mg/day. Lofibra (nonmicronized) tablet: Initially, 54 mg/day. TriCor (nonmicronized) tablet: CrCl 31-80 mL/min initially, 48 mg/day, CrCl < 30 mL/min contraindicated.

*Triglide (nonmicronized) tablet:* CrCl 11-49 mL/min initially, 50 mg/day. CrCl < 10 mL/min contraindicated.

# **OFF-LABEL USES**

Hyperuricemia, gout, metabolic syndrome.

# CONTRAINDICATIONS

Gallbladder disease, hypersensitivity to fenofibrate, severe renal or hepatic dysfunction (including primary biliary cirrhosis, unexplained persistent liver function abnormality).

# INTERACTIONS

Drug Bile acid sequestrants: Decrease absorption of fenofibrate (give fenofibrate 1 h before or 4-6 h after). Cyclosporine: Concomitant use may

lead to renal dysfunction.

HMG-CoA reductase

- inhibitors (atorvastatin,
- fluvastatin, lovastatin,
- pravastatin, rosuvastatin,

simvastatin): May increase the risk of myopathy and rhabdomyolysis. Extreme caution is warranted if used concomitantly

or avoid use. Monitor.

**Warfarin:** May increase the anticoagulant effect of warfarin; monitor INR closely and adjust warfarin dose as needed.

# Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

Lowers triglycerides. Increased liver function tests (AST, ALT). May increase CPK, serum creatinine, GGT. May lower hemoglobin, WBC, or platelet counts.

### SIDE EFFECTS

#### Occasional (1%-10%)

AST/ALT elevation, respiratory disorder, abdominal pain, back pain, headache, flu symptoms, asthenia, nausea, vomiting, diarrhea, rhinitis, constipation, asthenia.

#### Rare (<1%)

Anxiety, acne, anorexia, anemia, edema, arthralgia, insomnia, polyuria, cough, abnormal vision, eye floaters, earache.

#### SERIOUS REACTIONS

• May increase excretion of cholesterol into bile, leading to cholelithiasis.

· Rhabdomyolysis.

 Hypersensitivity reactions may include severe skin rashes such as Stevens-Johnson syndrome and toxic epidermal necrolysis.

• Acute renal failure, pancreatitis, hepatitis, agranulocytosis, or thrombocytopenia all occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Monitor liver function; may lead to pancreatitis or cholelithiasis; can be associated with myositis, myopathy, or rhabdomyolysis; renal function impairment; discontinue use if no response in 2 mo; adjust dose in elderly based on renal function; monitor for adverse effects. Patients with hypothyroidism or diabetes may be at increased risk for myopathy and side effects.

Not recommended for use in pregnancy or lactation due to potential tumorigenicity. Safety and efficacy in children have not been established. Storage

Store at room temperature. Protect from moisture and light.

# Administration

Fenoglide, Lofibra, Lipofen should be administered with meals.

Antara, TriCor may be administered with or without meals.

Triglide may be administered with or without meals.

# **Fenofibric Acid**

fee-no-fye'bric acid Fibricor, Trilipix Do not confuse Trilipix or Fibricor with Tricor.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Antihyperlipidemics, fibric acid derivatives

# **MECHANISM OF ACTION**

An antihyperlipidemic that is an active form of fenofibrate. The drug is a peroxisome proliferatoractivated receptor- $\alpha$  activator, which enhances synthesis of lipoprotein lipase and reduces triglyceride-rich lipoproteins and very-low-density lipoproteins (VLDLs). *Therapeutic Effect:* Reduces total and LDL cholesterol and reduces triglyceride levels. Increases HDL (good cholesterol) levels.

#### PHARMACOKINETICS

Food does not significantly affect absorption from GI tract. Protein binding: 99%. Fenofibric acid is primarily conjugated with glucuronic acid and then excreted in urine. Not removed by hemodialysis. *Half-life*: 20 h.

## AVAILABILITY

Tablets (Fibricor): 35 mg, 105 mg. Capsules (Delayed Release [Trilipix]): 45 mg, 135 mg.

#### INDICATIONS AND DOSAGES >Severe hypertriglyceridemia: PO

Adults, Elderly. Fibricor: Initially, 35-105 mg per day. Individualize and adjust based on lipid determinations at 4- to 8-wk intervals. Maximum: 105 mg/day.

Adults, Elderly. Trilipix: Initially, 45-135 mg per day. Individualize and adjust based on lipid determinations at 4- to 8-wk intervals. Maximum: 135 mg/day.

# Primary hyperlipidemia or mixed dyslipidemia:

PO

Adults, Elderly. Fibricor: 105 mg per day.

Adults, Elderly. Trilipix: 135 mg per day.

#### Dosage in renal impairment:

*Fibricor:* CrCl 31-80 mL/min initially, 35 mg/day and increase only after careful evaluation of renal function and lipid response at this dose. If CrCl < 30 mL/min, do not use.

*Trilipix:* CrCl 31-80 mL/min initially, 45 mg/day. If CrCl < 30 mL/ min, do not use.

# CONTRAINDICATIONS

Gallbladder disease, hypersensitivity to fenofibric acid *or* fenofibrate, severe renal or hepatic dysfunction (including primary biliary cirrhosis, unexplained persistent liver function abnormalities, or patient on dialysis); breastfeeding.

# INTERACTIONS

#### Drug

**Bile acid sequestrants:** Decrease absorption of fenofibric acid (give fenofibric acid 1 h before or 4-6 h after).

#### Cyclosporine, tacrolimus:

Concomitant use may lead to renal dysfunction. Monitor renal function.

#### HMG-CoA reductase inhibitors (e.g., atorvastatin, fluvastatin, lovastatin, pravastatin,

rosuvastatin, simvastatin): May increase the risk of myopathy and rhabdomyolysis. Use caution in concurrent use; in general, do not use maximum statin dosages.

Warfarin: May increase the anticoagulant effect of warfarin; monitor INR closely and adjust warfarin dose as needed. Herbal

Red yeast rice: May increase risk for myopathy, rhabdomyolysis. Food

None known.

# DIAGNOSTIC TEST EFFECTS

Lowers triglycerides. Increased liver function tests (AST, ALT). May increase CPK, serum creatinine, GGT. May lower hemoglobin, WBC, or platelet counts.

# SIDE EFFECTS

#### Common (≥ 3%)

Increased liver function tests, diarrhea, nasopharyngitis, back pain, myalgia, nausea, constipation, arthralgia, upper respiratory infection, and headache.

Occasional (1%-3%)

Fatigue, muscle spasm, dizziness. Rare (< 1%) Asthenia, vomiting.

# SERIOUS REACTIONS

• May increase excretion of cholesterol into bile, leading to cholelithiasis.

· Rhabdomyolysis or myopathy.

• Hypersensitivity reactions may include severe skin rashes such as Stevens-Johnson syndrome and toxic epidermal necrolysis.

 Acute renal failure, pancreatitis, hepatitis, agranulocytosis, or thrombocytopenia all occur rarely.

# **PRECAUTIONS & CONSIDERATIONS**

The effect of fenofibric acid use on cardiovascular outcomes is not firmly established. Use in patients with hepatic impairment has not been evaluated. May lead to pancreatitis or cholelithiasis; may be associated with myositis, myopathy, or rhabdomyolysis. Discontinue use if no response in 2 months. Adjust dose in elderly and in patients with renal impairment based on renal function, and monitor for adverse effects. Patients with hypothyroidism or diabetes may be at increased risk for myopathy and side effects. Not recommended for use in pregnancy or lactation due to potential tumorigenicity. Safety and efficacy in children have not been established.

Patients should continue to follow an appropriate lipid-lowering diet. Promptly investigate any reports of any muscle pain, tenderness, or weakness; onset of abdominal pain; or any other new symptoms. Monitor CBC, liver function, and renal function throughout treatment periodically, particularly in the first 12 months.

#### Storage

Store at room temperature. Protect from moisture and light.

#### Administration

Take fenofibric acid without regard to meals.

# Fenoprofen

fen-oh-proe'fen Malfon Do not confuse Nalfon with Naldecon.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs

# **MECHANISM OF ACTION**

An NSAID that produces analgesic, antipyretic, and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces the inflammatory response, fever, and intensity of pain.

# AVAILABILITY

Capsules: 200 mg, 400 mg. Tablets: 600 mg.

# INDICATIONS AND DOSAGES

# Mild to moderate pain PO

Adults, Elderly. 200 mg q4-6h as needed.

# Rheumatoid arthritis, osteoarthritis PO

*Adults, Elderly.* 400-600 mg 3-4 times a day. Total daily dose should not exceed 3200 mg.

# **OFF-LABEL USES**

Treatment of ankylosing spondylitis, migraine, psoriatic arthritis, tendinitis, vascular headaches.

#### CONTRAINDICATIONS

Active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding or ulceration, history of hypersensitivity to aspirin or NSAIDs, significant renal impairment; use within 14 days of coronary artery bypass graft (CABG) surgery.

#### INTERACTIONS Drug

Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, other salicylates: May increase the risk of GI side effects such as bleeding. NSAID use may negate cardioprotective effect of ASA.

**Bile acid sequestrants:** May decrease absorption.

Fenoprofen (Generic Name)

**Corticosteroids:** May increase risk of GI ulceration.

**Cyclosporine:** May increase nephrotoxicity and serum levels of cyclosporine.

Heparin, oral anticoagulants, antiplatelets, thrombolytics:

May increase the effects of these drugs.

**Lithium:** May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity and methotrexate levels.

**SSRIs, SNRIs:** Increased risk of GI bleeding.

**Warfarin:** Effects on GI bleeding are synergistic; risk of serious GI bleeding higher than users of either drug alone.

Vancomycin: May increase levels of vancomycin.

#### Herbal

Supplements with antiplatelet or anticoagulant effects (e.g., feverfew, garlic, ginger, ginkgo biloba, ginseng, red clover, sweet clover, white willow): May increase effects on platelets or risk of bleeding.

#### Food

Alcohol: May increase risk of dizziness or GI irritation/bleeding.

# DIAGNOSTIC TEST EFFECTS

May increase bleeding time, BUN and blood glucose levels, and serum protein, alkaline phosphatase, LDH, creatinine, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

#### Frequent (3%-10%)

Headache, somnolence, dyspepsia, nausea, vomiting, constipation, dizziness, sweating, pruritus, rash, blurred vision.

#### Occasional (1%-2%)

Dizziness, nervousness, asthenia, diarrhea, abdominal cramps, flatulence, tinnitus, peripheral edema, tremor, confusion, and fluid retention.

# SERIOUS REACTIONS

• Overdose may result in acute hypotension and tachycardia.

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, severe hepatic reaction (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), and a severe hypersensitivity reaction (bronchospasm, angioedema).

• Hypersensitivity may include serious skin rash such as Stevens-Johnson syndrome.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatic or renal impairment and history of GI disease. Caution is warranted in patients with a history of active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding, or ulceration. Use the lowest effective dose for the shortest duration of time. Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery.

Fenoprofen crosses the placenta and is distributed in breast milk. Fenoprofen should not be used during the last trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. The safety and efficacy of fenoprofen have not been established in children. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and agerelated renal impairment may increase the risk of hepatotoxicity or renal toxicity; a decreased drug dosage is recommended. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established.

Baseline bleeding time, BUN and blood glucose levels, creatinine, liver function tests, and urinary protein levels should be obtained at the beginning of therapy. Pattern of daily bowel activity and stool consistency should be assessed. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness, improved grip strength, and increased joint mobility, should be evaluated. Storage

Store at room temperature. Administration

Swallow whole; do not crush, open, or break. Administer with food to decrease GI irritation.

#### Fentanyl

fen'ta-nil

Abstral, Actiq, Duragesic, Fentora, Lazanda, Onsolis, Sublimaze, Subsys 💽 Duragesic Do not confuse fentanyl with alfentanil, remifentanil, or sufentanil.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

Classification: Analgesics, narcotic; anesthetics, general

#### MECHANISM OF ACTION

An opioid agonist that binds to opioid receptors in the CNS, reducing stimuli from sensory nerve endings and inhibiting ascending pain pathways. Therapeutic Effect: Alters pain reception and increases the pain threshold.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-2 min	3-5 min	0.5-1 h
IM	7-15 min	20-30 min	1-2 h
Transder- mal	6-8 h	24 h	72 h
Transmu- cosal	5-15 min	20-30 min	1-2 h

Well absorbed after IM or topical administration. Transmucosal form absorbed through the buccal mucosa and GI tract. Protein binding: 80%-85%. Metabolized in the liver by CYP3A4. Primarily eliminated by biliary system. Half-life: 2-4 h IV; 17 h transdermal patch; 3.2-5.9 h transmucosal lozenge; 3-12 h buccal tablet.

# **AVAILABILITY**

Nasal Spray (Lazanda): 100 mcg/ actuation OR 400 mcg/actuation. Sublingual Tablet (Abstral): 100 mcg, 200 mcg, 300 mcg, 400 mcg, 600 mcg, 800 mcg. Sublingual Sprav (Subsys): 100 mcg/actuation, 200 mcg/ actuation, 400 mcg/actuation, 600 mcg/actuation, 800 mcg/ actuation, 1200 mcg/actuation, 1600 mcg/actuation. Injection (Sublimaze): 50 mcg/mL. Transdermal Patch (Duragesic): 12.5 mcg/h, 25 mcg/h, 50 mcg/h, 75 mcg/h, 100 mcg/h.

*Transmucosal Lozenges (Actiq):* 200 mcg, 400 mcg, 600 mcg, 800 mcg, 1200 mcg, 1600 mcg. *Transmucosal Buccal Tablets:* 100 mcg, 200 mcg, 400 mcg, 600 mcg, 800 mcg.

*Transmucosal Buccal Film (Onsolis):* 200 mcg, 400 mcg,

600 mcg, 800 mcg, 1200 mcg.

# INDICATIONS AND DOSAGES Premedication

IV, IM

*Adults, Elderly, Children 12 yr and older.* 50-100 mcg/dose 30-60 min before surgery.

#### Adjunct to general anesthesia IV

Adults, Elderly, Children 12 yr and older. Low dose: 0.5-2 mcg/kg/ dose; moderate dose: 2-20 mcg/kg/ dose; high dose: 20-50 mcg/kg. *Children 2-12 yr.* Induction and maintenance. 2-3 mcg/kg/dose.

#### Adjunct to regional anesthesia IV, IM

Adults, Elderly, Children 12 yr and older. 25-100 mcg over 1-2 min.

# Postoperative pain

IM

Adults, Elderly, Children 12 yr and older. 50-100 mcg every 1-2 h as needed.

#### Chronic pain management

USUAL TRANSDERMAL DOSE Adults, Elderly, Children 12 yr and older. Use dose conversion chart to convert patients from oral or IV opioids. May increase after 3 days and then every 6 days thereafter. Should not be used in opioid-naïve patients. Upon system removal, 17 h or more are required for a 50% decrease in serum fentanyl concentrations. Effects on respiratory system may persist for longer.

#### Breakthrough cancer pain

NOTE: Patients receiving these dose forms should be opiate tolerant, and under specialized prescriber care. Do *not* substitute one product for another due to differing characteristics. USUAL TRANSMUCOSAL DOSE (LOZENGE)

Adults, Children. Initial 200 mcg. May start second unit 15 min after completing first if needed. If more than one lozenge is needed per episode for several episodes, consider prescribing next highest strength.

USUAL TRANSMUCOSAL DOSE (BUCCAL TABLET) Adults, Children. Initial 100 mcg;

Adults, Children. Initial 100 mcg; redosing can occur 30 min after start of first tablet, if necessary. Dose titration should be done in 100-mcg increments up to 400 mcg. See prescribing information for converting from lozenge. USUAL TRANSMUCOSAL DOSE

(BUCCAL FILM)

Adults: Initial 200 mcg; redosing can occur 2 h after start of first film, if necessary. Dose titration should be done in 200-mcg increments. Maximum is 4 × 200 mcg films or one 1200 mcg film per dose. Not more than 4 doses per day are allowed; doses should be separated by at least 2 h. See prescribing information. USUAL SUBLINGUAL DOSE (SUBLINGUAL TABLET, ABSTRAL)

*Adults:* Initially, 100 mcg. During an episode, an additional dose of t

an episode, an additional dose of the same strength may be taken after 30 min. Do not use more than 2 doses per episode of breakthrough pain. At least 2 h must elapse before treating another episode. Titrate dose using 100 mcg and/or 200 mcg tablets in a stepwise manner. Doses per episode > 800 mcg have not been studied. Do not exceed 4 sublingual tablets at one time. Not more than 4 doses per day are allowed. See prescribing information.

USUAL SUBLINGUAL DOSE (SUBLINGUAL SPRAY, SUBSYS) Adults: Initially, 100 mcg. During an episode, an additional dose of the same strength may be taken after 30 min. Do not use more than 2 doses per episode of breakthrough pain. At least 4 h must elapse before treating another episode. Titrate dose using 200 mcg/spray in a stepwise manner. Do not exceed 2 sublingual sprays of any given dose strength at one time. Maximum dose per episode is 2 × 800 mcg spray (1600 mcg total dose). Not more than 4 doses per day are allowed. See prescribing information.

USUAL INTRANASAL DOSE (NASAL SPRAY, LAZANDA) Adults: Initially, 100 mcg. given in 1 nostril. At least 2 h must elapse before treating another episode. Titrate dose in a stepwise manner. For example, the next dosage titration would be 100 mcg in each nostril (total, 200 mcg total dose). Next titration would be 400 mcg in 1 nostril. Do not exceed 1 spray per nostril of any given dose strength at one time; maximum intranasal dose per episode is 800 mcg total dose. Not more than 4 doses per day are allowed. See prescribing information.

USUAL EPIDURAL DOSE *Adults, Elderly.* Bolus dose of 100 mcg, followed by continuous infusion of 10 mcg/mL concentration at 4-12 mL/h.

#### Continuous analgesia IV

Adults, Elderly, Children 1-12 yr: Bolus dose of 1-2 mcg/kg, followed by continuous infusion of 1 mcg/ kg/h. Range: 1-5 mcg/kg/h. *Children younger than 1 yr.* Bolus dose of 1-2 mcg/kg, followed by continuous infusion of 0.5-1 mcg/kg/h.

# Dosage in renal impairment

Dosage is modified based on creatinine clearance.

Creatinine Clearance	Dosage
10-50 mL/min	75% of usual dose
< 10 mL/min	50% of usual dose

# CONTRAINDICATIONS

Increased intracranial pressure, severe hepatic or renal impairment, severe respiratory depression, severe bronchial asthma, paralytic ileus. Hypersensitivity to fentanyl. Fentanyl lozenge, buccal tablet, or film, nasal spray, sublingual tablet, sublingual spray, and transdermal patch are contraindicated for acute or postoperative pain and opioid-naïve patients.

# INTERACTIONS

#### Drug

**Amiodarone:** Profound bradycardia, sinus arrest, and hypotension have occurred with coadministration.

Benzodiazepines, CNS

**depressants:** May increase the risk of hypotension and respiratory depression, sedation.

**Buprenorphine:** May decrease the effects of fentanyl.

**CYP3A4 inhibitors:** May increase concentration of fentanyl. This may result in serious interactions that can increase fentanyl's risk of respiratory depression.

**CYP3A4 inducers (e.g., Rifampin):** May decrease concentration of fentanyl.

MAOIs: Should not be used.

**Ritonavir:** Increases fentanyl concentrations.

Herbal St. John's wort: May decrease fentanyl levels. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase concentrations.

# IV INCOMPATIBILITIES

Azithromycin (Zithromax), dantrolene, hydroxocobalamin, pantoprazole (Protonix), phenytoin (Dilantin), sulfamethoxazole/ trimethoprim.

#### 🗏 IV COMPATIBILITIES

Abciximab (Reopro), acyclovir (Zovirax), alfentanil (Alfenta), alprostadil (Prostin VR), amikacin (Amikin), aminophylline, amiodarone, amphotericin B cholesteryl complex (Amphotec), amphotericin B liposome (AmBisome), anidulafungin (Eraxis), argatroban, ascorbic acid, atracurium (Tracrium), atropine, azathioprine, aztreonam (Azactam), benztropine (Cogentin), bivalirudin (Angiomax), bretylium, bumetanide (Bumex), bupivacaine (Marcaine, Sensorcaine), buprenorphine (Buprenex), butorphanol (Stadol), caffeine citrate (Cafcit), calcium chloride, calcium gluconate, carboplatin, caspofungin (Cancidas), cefazolin, cefotaxime (Claforan), cefoxitin (Mefoxin), ceftazidime (Ceptaz, Fortaz, Tazicef, Tazidime), ceftizoxime (Cefizox), cefuroxime (Zinacef), chloramphenicol, chlorpromazine, cimetidine, cisatracurium (Nimbex), cisplatin, clindamycin (Cleocin), clonidine (Duraclon), cyanocobalamin, cyclophosphamide (Cytoxan), cyclosporine (Sandimmune),

dactinomycin (Cosmegen), daptomycin (Cubicin), dexamethasone sodium phosphate, digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doripenem (Doribax), doxorubicin (Adriamycin), droperidol (Inapsine), emolol (Brevibloc), enalaprilat, ephedrine, epinephrine, epirubicin (Ellence), epoetin alfa (Procrit), erythromycin lactobionate, etomidate (Amidate), etoposide phosphate (Etopophos), famotidine (Pepcid), fenoldopam (Corlopam), fluconazole (Diflucan), fludarabine (Fludara), folic acid, furosemide (Lasix), ganciclovir (Cytovene), gemcitabine (Gemzar), gentamicin, glycopyrrolate, granisetron (Kytril), heparin, hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine, imipenem/ cliastatin (Primaxin), inamrinone, insulin (regular, Humulin R, Novolin R), isoproterenol (Isuprel), ketamine (Ketalar), ketorolac, labetalol, lansoprazole (Prevacid), levofloxacin (Levaguin), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, mannitol, meperidine (Demerol), methicillin, methotrexate, methylprednisolone sodium succinate, metoclopramide (Reglan), metoprolol (Lopressor), metronidazole (Flagyl), midazolam, milrinone (Primacor), minocycline (Minocin), mitoxantron (Novantrone), mivacurium (Mivacron), morphine, nafcillin, nalbuphine (Nubain), naloxone (Narcan), nesiritide (Natrecor), nicardipine (Cardene), nitroglycerin, nitroprusside (Nitropress), norepinephrine (Levophed), ondansetron (Zofran), oxacillin, oxytocin (Pitocin), paclitaxel (Taxol), palonosetron (Aloxi), pancuronium, pemetrexed

(Alimta), pencillin G potassium, pencillin G sodium, phenobarbital, phytonadione, piperacillin, piperacillin/tazobactam (Zosyn), potassium chloride, procainamide, promethazine, propofol (Diprivan), propranolol (Inderal), protamine, pyridoxine, quinupristin/dalfopristin (Synercid), ranitidine (Zantac), remifentanil (Ultiva), rituximab (Rituxan), sargramostim (Leukine), scopolamine, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine (Anectine, Quelicin), sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline, thiamine, thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin/clavulanate (Timentin), tigecycline (Tygacil), tirofiban (Aggrastat), tobramycin, trastuzumab (Herceptin), vancomyin, vecuronium (Norcuron), verapamil, vincristine (Vincasar), vinorelbine (Navelbine), voriconazole (Vfend).

#### SIDE EFFECTS

#### Frequent

IV: Postoperative drowsiness, nausea, vomiting, dizziness. Transdermal (3%-10%): Headache, pruritus, nausea, vomiting, diaphoresis, dyspnea, confusion, dizziness, somnolence, diarrhea, constipation, decreased appetite. Lozenge (> 10%): Nausea, dizziness, somnolence, vomiting, constipation. Buccal tablet (> 10%): Dizziness, nausea, headache, somnolence, asthenia, constipation.

#### Occasional

IV: Postoperative confusion, blurred vision, chills, hypertension, orthostatic hypotension, constipation, difficulty urinating.

Transdermal (1%-3%): Chest pain, arrhythmias, erythema, pruritus, swelling of skin, syncope, agitation, tingling or burning of skin. Lozenge (2%-10%): Asthenia, headache, confusion, constipation, dyspnea, anxiety, abnormal gait, nervousness, pruritus, rash, sweating, abnormal vision, vasodilation. Buccal tablet (2%-10%): Application-site reactions (pain, ulcer, irritation), vomiting, fatigue, confusion, depression, insomnia, abdominal pain, diarrhea, anorexia, weight decreased, arthralgia, back pain.

#### SERIOUS REACTIONS

 Respiratory depression, apnea, rigidity, and bradycardia are most common serious adverse reactions.
 If untreated, could lead to respiratory arrest, circulatory depression, or cardiac arrest.

 Overdose or too-rapid IV administration may produce severe respiratory depression and skeletal and thoracic muscle rigidity (which may lead to apnea), laryngospasm, bronchospasm, cold and clammy skin, cyanosis, and coma.

• The patient who uses fentanyl repeatedly may develop a tolerance to the drug's analgesic effect.

#### **PRECAUTIONS & CONSIDERATIONS**

Be aware that fentanyl can cause potentially life-threatening hypoventilation. Caution is warranted with bradycardia; head injuries; altered level of consciousness; hepatic, renal, or respiratory disease; history of drug abuse; and concurrent use of MAOIs within 14 days of fentanyl administration. Fentanyl readily crosses the placenta; it is unknown whether fentanyl is distributed in breast milk. Fentanyl may prolong labor if administered in the latent phase of the first stage of labor or before the cervix has dilated 4-5 cm. Fentanyl may cause respiratory depression in the neonate if it is given to the mother during labor. Safety and efficacy of many forms of fentanyl have not been established in children. The transdermal form of fentanyl is not recommended for children younger than 12 yr or children younger than 18 yr and < 50 kg. Neonates and elderly patients are more susceptible to the drug's respiratory depressant effects. Age-related renal impairment may require a dosage adjustment in elderly patients. Abrupt discontinuation after prolonged use may result in withdrawal.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. BP, heart rate, respiratory rate, oxygen saturation, pattern of daily bowel activity and stool consistency, and clinical improvement of pain should be monitored.

#### Storage

Store the parenteral form at room temperature. Keep sublingual, buccal, and transmucosal forms away from moisture and protect from freezing. Transdermal patches should be kept in foil overwrap until time of application. Keep sublingual tablets in blister package until time of use. Store nasal spray at up to 77° F (32° C). Do not freeze and protect from light. Return the bottle to the child-resistant container after each use. Dispose of all dosage forms properly to avoid overdose or poisoning.

#### Administration

! Keep in mind that fentanyl may be combined with a local anesthetic, such as bupivacaine. Discontinue fentanyl slowly after long-term use.

For IV use, make sure resuscitative equipment and an opiate antagonist (naloxone 0.5 mcg/kg) are readily available before administering the drug. For initial anesthesia induction, give a small amount by tuberculin syringe, as prescribed. Give by slow IV push, over 1-2 min. A too-rapid IV infusion increases the risk of severe adverse reactions, such as anaphylaxis, bronchospasm, laryngospasm, peripheral circulatory collapse, cardiac arrest, and skeletal and thoracic muscle rigidity (which may result in apnea).

For transdermal patch use, clean the patch site before application; use only water, because soap and oils may irritate the skin. Allow the skin to dry. Apply the patch to a flat, unirritated, nonhairy (or clip hair; do not shave) area of intact skin on the upper torso, chest, back, flank, or upper arm. Apply immediately after removing from sealed package. Do not cut or alter patch. Press the patch onto the skin firmly and evenly for 30 seconds, ensuring that it comes in full contact with the skin, especially around the edges. Each patch should be worn continuously for 72 h. Rotate application sites. Patients must avoid exposing the patch to excessive heat, because this promotes the release of fentanyl from the patch and increases the absorption of fentanyl through the skin, which can result in fatal overdose. Monitor patients with a fever carefully. Carefully fold used patches so that they adhere to themselves, and discard them in the toilet. Patients should dispose of any patches remaining from a prescription as soon as they are no longer needed. Unused patches should be removed from their pouches, folded so that the adhesive side of the patch adheres to itself, and flushed down the toilet.

If the gel from the drug reservoir accidentally contacts the skin of the patient or caregiver, the skin should be washed with copious amounts of water. Do not use soap, alcohol, or other solvents to remove the gel, because they may enhance the drug's ability to penetrate the skin. Keep out of the reach of children. Oral ingestion of gel from patches may cause fatality.

Transmucosal lozenge: Open the blister package with scissors immediately before product use. Place the unit in the patient's mouth between the cheek and lower gum, moving it from one side to the other, using the handle. Instruct the patient to suck, not chew, the lozenge for 15 min for optimal efficacy. If signs of excessive opioid effects appear before the unit is consumed, remove the drug matrix from the patient's mouth immediately and decrease future doses. Fentanyl lozenge contains medicine in an amount that could be fatal to a child. Dispose of units remaining from a prescription as soon as they are no longer needed. Dispose of all units immediately after use. Partially consumed units represent a special risk because they are no longer protected by the child-resistant pouch and yet may contain enough medicine to be fatal to a child. A temporary storage bottle is provided to be used in the event that a partially consumed unit cannot be disposed of promptly.

Transmucosal buccal tablet: Open the blister pack immediately before use. The blister backing should then be peeled back to expose the tablet. Patients should *not* attempt to push the tablet through the blister because to do so may cause damage to the tablet. The tablet should not be stored once it has been removed from the blister package because the tablet's integrity may be compromised and because this increases the risk of accidental exposure to the tablet. Remove the tablet from the blister unit and immediately place the entire fentanyl buccal tablet in the buccal cavity (above a rear molar, between the upper cheek and gum). Patients should not attempt to split the tablet. Do not suck, chew, or swallow tablet because to do so will result in lower plasma concentrations than when taken as directed. The fentanyl buccal tablet should be left between the cheek and gum until it has disintegrated, which usually takes approximately 14-25 min. After 30 min, if remnants from the fentanyl buccal tablet remain, they may be swallowed with a glass of water. Dispose of any remaining tablets immediately. May be fatal to a child.

Transmucosal buccal film: Apply to the inside of the cheek. Wet the affected area with tongue or with water prior to application. Open package with dry hands. Do not cut or tear the film. Using a dry finger on the white side of the film, place 1 film in the mouth with the pink side facing the cheek; hold in place for approximately 5 seconds to adhere. If using more than 1 film per dose, place films separately, using both sides of the mouth as needed; do not overlap. Allow to dissolve over 15 to 30 min. Do not chew or swallow. Do not drink within 5 min after application or eat before the film has fully dissolved.

Sublingual tablet: Remove tablet from blister package with dry hands. Place on the floor of the mouth directly under the tongue immediately after removal from the blister unit. Do not chew, suck, or swallow sublingual tablets. Allow to completely dissolve in the sublingual cavity. Advise patients not to eat or drink anything until the tablet is completely dissloved. If the patient's mouth is dry, water may be used to moisten the buccal mucosa before administration.

Sublingual spray: Spray the entire contents of 1 unit (check for proper dose) under the tongue. Dispose of the unit in the provided bag and discard in trash out of reach of children and pets.

Intranasal spray: For use in the nose only. Prime the device before first use by spraying into the pouch (4 sprays total); follow instructions supplied with the unit. Insert the nozzle a short distance (about ½ inch or 1 cm) into the nose and point toward the bridge of the nose, tilting the bottle slightly. Press down firmly on the finger grips until a "click" is heard and the spray counter window advances by one. Breathe in gently through the nose and out through the mouth. Advise patients that the fine mist spray is not always felt on the nasal mucosal membrane and to rely on the "click" and the advancement of the dose counter to confirm a spray has been administered. Remain seated for 1 min after use; do not blow nose for 30 min.

# **Ferrous Salts**

fer-rous

 ★ Femiron, Feostat, Ferretts, Ferro-Sequels, Hemocyte, Nephro-Fer, Fergon, Fer-Gen-Sol, Fer-In-Sol, Fer-Iron, Slow-Fe
 ▲ Apo-Ferrous Gluconate, Apo-Ferrous Sulfate, Palafer

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A OTC

Classification: Hematinics

#### MECHANISM OF ACTION

An enzymatic mineral that is an essential component in the formation of hemoglobin, myoglobin, and enzymes. Promotes effective erythropoiesis and transport and utilization of oxygen (O<sub>2</sub>). *Therapeutic Effect:* Prevents and treats iron deficiency.

# PHARMACOKINETICS

Absorbed in the duodenum and upper jejunum. Ten percent absorbed in patients with normal iron stores; increased to 20%-30% in those with inadequate iron stores. Bound primarily to serum transferrin. Excreted in urine, sweat, and sloughing of intestinal mucosa and by menses. *Half-life:* 6 h.

# AVAILABILITY

Ferrous Fumarate Tablets (Femiron): 63 mg (20 mg elemental iron). Tablets (Ferretts): 325 mg (106 mg elemental iron). Tablets (Hemocyte): 324 mg (106 mg elemental iron). Tablets (Nephro-Fer): 350 mg (115 mg elemental iron). Tablets (Chewable [Feostat]): 100 mg (33 mg elemental iron). Tablets (Timed Release [Ferro-Sequels]): 150 mg (50 mg elemental iron).

#### **Ferrous Gluconate**

*Tablets:* 325 mg (36 mg elemental iron).

*Tablets (Fergon):* 240 mg (27 mg elemental iron).

#### **Ferrous Sulfate**

*Tablets:* 325 mg (65 mg elemental iron).

*Tablets, Exsiccated:* 200 mg (65 mg elemental iron).

Tablets (Timed Release [Slow FE]): 160 mg (50 mg elemental iron).

*Elixir:* 220 mg/5 mL (44 mg elemental iron per 5 mL). *Oral Drops (Fer-Gen-Sol, Fer-In-Sol, Fer-Iron):* 75 mg/0.6 mL (15 mg/0.6 mL elemental iron).

# INDICATIONS AND DOSAGES Iron deficiency anemia

Dosage is expressed in terms of milligrams of elemental iron, degree of anemia, patient weight, and presence of any bleeding. Expect to use periodic hematologic determinations as guide to therapy. PO

*Adults, Elderly.* Ferrous fumarate: 60-100 mg twice a day; ferrous gluconate: 60 mg 2-4 times a day; ferrous sulfate: 325 mg 2-4 times a day.

*Children.* Ferrous fumarate, ferrous gluconate, ferrous sulfate: 3-6 mg/kg/day in 2-3 divided doses.

# Prevention of iron deficiency anemia

PO Adults, Elderly. Ferrous fumarate: 60-100 mg/day; ferrous gluconate: 60 mg/day; ferrous sulfate: 325 mg/day.

*Children.* Ferrous fumarate, ferrous gluconate, ferrous sulfate: 1-2 mg/kg/day, maximum 15 mg/day.

# CONTRAINDICATIONS

Hemochromatosis, hemosiderosis, hemolytic anemias, peptic ulcer disease, regional enteritis, ulcerative colitis.

# INTERACTIONS

#### Drug

Ascorbic acid: May increase absorption of iron by > 30%. Antacids, H<sub>2</sub> antagonists, proton-pump inhibitors, calcium supplements, pancreatin, pancrelipase: May decrease the

absorption of ferrous fumarate, ferrous gluconate, and ferrous sulfate. Etidronate, levodopa, levothyroxine, quinolones, tetracyclines: May decrease the absorption of etidronate, levodopa, levothyroxine, quinolones, and tetracyclines. Herbal

None known.

Food Eggs, dietary fiber, coffee, milk: Inhibit ferrous fumarate absorption.

# DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin level. May decrease serum calcium level. May obscure occult blood in stools.

# SIDE EFFECTS

Occasional

Mild, transient nausea.

Rare

Heartburn, anorexia, constipation, diarrhea.

# SERIOUS REACTIONS

• Large doses may aggravate existing GI tract disease, such as peptic ulcer disease, regional enteritis, and ulcerative colitis.

 Severe iron poisoning occurs most often in children and is manifested as vomiting, severe abdominal pain, diarrhea, and dehydration, followed by hyperventilation, pallor or cyanosis, and cardiovascular collapse. If accidental overdose occurs, contact the Poison Control Center immediately.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bronchial asthma and iron hypersensitivity. Iron crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children or elderly patients. Urine may darken in color. Hemoglobin, reticulocyte count, ferritin and serum iron levels, and total iron-binding capacity should be monitored. Daily bowel activity and stool consistency should be assessed. Clinical improvement should also be assessed, and relief of iron deficiency symptoms (fatigue, headache, irritability, pallor, and paresthesia of extremities) should be recorded.

#### Storage

Store all forms, including tablets, capsules, suspension, and drops, at room temperature and out of reach of children.

#### Administration

Take between meals with water unless GI discomfort occurs; if so, give with meals. To avoid transient staining of mucous membranes and teeth, place liquid on back of tongue with a dropper or straw. Do not crush the sustained-release form. Avoid simultaneous administration of antacids.

# **Fesoterodine**

fes'oh-ter'oh-deen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticholinergics, urinary antispasmodics, urinary incontinence agents

#### MECHANISM OF ACTION

An antispasmodic that exhibits potent antimuscarinic activity by selectively blocking cholinergic muscarinic receptors, particularly in the bladder. Inhibits urinary bladder contraction and decreases detrussor pressure. Therapeutic Effect: Decreases urinary frequency, urgency.

#### PHARMACOKINETICS

Rapidly and well absorbed after PO administration. Protein binding: Only 50%. Once absorbed, rapidly metabolized to an active metabolite. Extensively metabolized in the liver (CYP2D6 and CYP3A4) to inactive metabolites. Metabolites excreted primarily (70%) in urine. Unknown whether removed by hemodialysis. *Half-life*: 7-9 h.

#### AVAILABILITY

Tablets (Extended Release): 4 mg, 8 mg.

# INDICATIONS AND DOSAGES

# Overactive bladder

PO (EXTENDED RELEASE) *Adults, Elderly.* Initially, 4 mg once a day, may increase to 8 mg once a day if needed and tolerated.

# Dosage in severe renal impairment or taking strong inhibitors of CYP3A4

PO (EXTENDED RELEASE) *Adults, Elderly.* Do not exceed 4 mg once a day.

• Severe hepatic impairment Do not use.

#### CONTRAINDICATIONS

Urinary retention, gastric retention, uncontrolled narrow-angle glaucoma, known hypersensitivity to fesoterodine or tolterodine, due to cross-sensitivity.

# INTERACTIONS

# Drug

Anticholinergics: May have additive anticholinergic effects.

Clarithromycin, erythromycin, itraconazole, ketoconazole, and other strong inhibitors of CYP3A4 (e.g., ritonavir): May increase

Fesoterodine (Generic Name), Toviaz (Brand Name)

fesoterodine concentration. Use lowered fesoterodine dose. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

None known or expected.

# SIDE EFFECTS

**Frequent** ( $\geq$  4%) Dry mouth, constipation. **Occasional** (1%-4%)

Headache, abdominal pain, dysuria, dyspepsia (heartburn, indigestion, epigastric discomfort), urinary tract infection, urinary retention, dry eyes, nausea, back pain, insomnia.

# Rare

Dizziness, fatigue, somnolence, abnormal vision (accommodation problems), rash, dry skin.

# SERIOUS REACTIONS

 Overdose can result in severe anticholinergic effects, including abdominal cramps, facial warmth, excessive salivation or lacrimation, diaphoresis, pallor, urinary urgency, blurred vision, and prolonged QT interval.

• Rare reports of hypersensitivity, including angioedema.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with renal impairment, hepatic impairment, myasthenia gravis, clinically significant bladder outflow obstruction (increases risk of urine retention), GI obstructive disorders such as pyloric stenosis (increases risk of gastric retention and reduces gastric motility), and treated angleclosure glaucoma. It is unknown whether the drug is distributed in breast milk. However, breastfeeding is not recommended. The safety and efficacy of this drug have not been established in children. No age-related precautions have been noted in elderly patients.

Blurred vision, GI upset, constipation, and dry eyes and dry mouth may occur. Notify the physician of a change in vision. Incontinence and residual urine in the bladder should be determined.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Take fesoterodine without regard to food. Take with liquid and swallowed whole. Do not chew, divide, or crush extended-release tablets.

# **Fexofenadine**

fex-oh-fen'eh-deen ★ ♪ Allegra

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Rx and OTC

*Classification:* Antihistamines, H<sub>1</sub> receptor antagonists, non-sedating

# **MECHANISM OF ACTION**

A piperidine that competes with histamine for  $H_1$  receptor sites on effector cells. *Therapeutic Effect:* Relieves allergic rhinitis symptoms.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 60%-70%. Does not cross the blood-brain barrier. Minimally metabolized. Eliminated in feces and urine. Not removed by hemodialysis. *Half-life*: 14.4 h (increased in renal impairment).

Fexofenadine (Generic Name)

# AVAILABILITY

Tablets: 30 mg, 60 mg, 180 mg. Oral Disintegrating Tablets (ODT): 30 mg. Oral Suspension: 30 mg/5 mL.

#### INDICATIONS AND DOSAGES Allergic rhinitis, chronic idiopathic urticaria

F

PO

Adults, Elderly, Children 12 yr and older. 60 mg twice a day or 180 mg once a day.

Children aged 6-11 yr. 30 mg twice a day.

#### Dosage in renal impairment

Adults, Elderly, and Children 12 yr and older. Dosage is reduced to 60 mg once a day. For children aged 6-11 yr, dosage is reduced to 30 mg once a day.

# Allergic rhinitis, chronic idiopathic urticaria PO

*Children aged 2-11 yr.* Oral suspension 30 mg twice a day. For children with renal dysfunction, dosage is reduced to 30 mg once daily.

#### • Chronic idiopathic urticaria PO

*Children aged 6 mo to 2 yr:* Oral suspension 15 mg twice a day. For children with renal dysfunction, dosage is reduced to 15 mg once daily.

# CONTRAINDICATIONS

Hypersensitivity.

# INTERACTIONS

#### Drug

Antacids: May decrease fexofenadine absorption if given within 15 min of a fexofenadine dose. Herbal None known. Food

Fruit juice.

# DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing unless drug is discontinued at least 4 days before testing.

# SIDE EFFECTS

# Rare (< 2%)

Somnolence, headache, fatigue, nausea, vomiting, abdominal distress, dysmenorrhea.

# SERIOUS REACTIONS

• Rare serious hypersensitivity reactions.

# **PRECAUTIONS & CONSIDERATIONS**

ODTs contain phenylalanine (phenylketonuria).

Caution is warranted with severe renal impairment. It is unknown whether fexofenadine crosses the placenta or is distributed in breast milk. Do not self-treat children < 2years; use in very young children is under a doctor's supervision. No age-related precautions have been noted in elderly patients.

Drowsiness may occur. Avoid drinking alcoholic beverages and performing tasks that require alertness or motor skills until response to the drug is established. Respiratory rate, depth, and rhythm; pulse rate and quality; BP; and therapeutic response should be monitored.

#### Storage

Store at room temperature. ODT should be kept protected from moisture and not removed from blister foil until administration time.

#### Administration

Take fexofenadine without regard to food. ODTs are designed to disintegrate on the tongue, followed by swallowing with or without water, and should be taken on an empty stomach. Do not chew ODT. Shake oral suspension well before each use.

# **Fidaxomicin**

Fye-dax-oh-mye'sin ★ Dificid

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anti-infectives, macrolides

# **MECHANISM OF ACTION**

A macrolide that is bactericidal against *Clostridium difficile*; it inhibits RNA synthesis by RNA polymerases. *Therapeutic Effect:* Treats *C. difficile* diarrhea, antimicrobial resistance rarely occurs.

#### PHARMACOKINETICS

Minimally absorbed from the GI tract. Acts locally. Transformed by hydrolysis to form its main and microbiologically active metabolite, OP-1118. Both parent and metabolite primarily eliminated in feces. *Halflife*: 9-10 h.

#### AVAILABILITY

Tablets: 200 mg.

# INDICATIONS AND DOSAGES Clostridium difficile-associated

diarrhea (CDAD): PO Adults, Elderly. 200 mg twice daily for 10 days.

#### CONTRAINDICATIONS

None known, except previous hypersensitivity. Note the drug is *not* active for systemic infections, or any other infection in GI tract except *C. difficile*.

#### INTERACTIONS

Drug None known. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

Increased alkaline phosphatase, decreased serum bicarbonate, increased liver enzymes (AST and ALT levels), decreased WBC or platelet count.

#### SIDE EFFECTS

Frequent (> 5%) Nausea, vomiting, abdominal pain. Occasional (2%-5%)

GI hemorrhage, anemia, neutropenia. Rare (< 2%)

Abdominal distension, tenderness, dyspepsia, dysphagia, flatulence, intestinal obstruction, hyperglycemia.

#### SERIOUS REACTIONS

 Antibiotic-resistance or superinfections may occur.
 Megacolon is rare complication.

• Hypersensitivity is possible, such as pruritus, drug eruption/rash, urticaria.

#### PRECAUTIONS & CONSIDERATIONS

This drug does not treat systemic infections, nor will it treat fungal or viral infection. Determine whether there is a history of allergies to other macrolides before beginning therapy; it is not clear if cross-sensitivity may occur. There are no data in human pregnancy. It is unlikely the drug is distributed in breast milk; however, use caution. Safety and efficacy have not been established in children < 18 yr of age. There are no particular precautions for use in the elderly.

Pattern of daily bowel activity and stool consistency, as well as signs and symptoms of superinfection, including anal or genital pruritus,
moderate to severe diarrhea, abdominal cramps, fever, and sore mouth or tongue, should be assessed. **Storage** 

Store tablets at room temperature. Administration

May administer fidaxomicin without regard to food.

## Filgrastim

fil-gra'stim Meupogen Do not confuse Neupogen with Epogen or Nutramigen.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Hematopoietic agents, recombinant DNA origin

## **MECHANISM OF ACTION**

A biologic modifier that stimulates production, maturation, and activation of neutrophils to increase their migration and cytotoxicity. *Therapeutic Effect:* Increases neutrophil count and enhances count recovery. Decreases incidence of infection.

## PHARMACOKINETICS

Readily absorbed after subcutaneous (SC) administration. Not removed by hemodialysis. *Half-life:* 3.5 h.

## AVAILABILITY

Injection, Single-Dose Vials: 300 mcg/mL, 480 mcg/0.8 mL. Prefilled Syringes (Single Ject): 300 mcg, 480 mcg.

## INDICATIONS AND DOSAGES Myelosuppression from

chemotherapy IV OR SC INFUSION, SC INJECTION Adults, Elderly. Initially, 5 mcg/ kg/day. May increase by 5 mcg/kg for each chemotherapy cycle based on duration or severity of absolute neutrophil count (ANC) nadir. Administer daily for up to 2 wks until the ANC has reached 10,000/mm<sup>3</sup> following the expected chemotherapyinduced neutrophil nadir.

#### • Bone marrow transplant IV OR SC INFUSION

*Adults, Elderly.* 10 mcg/kg/day given as an IV infusion of 4 or 24 h or as a continuous 24-h SC infusion. Adjust dosage daily during period of neutrophil recovery based on neutrophil response.

• Mobilization progenitor cells SC INJECTION OR INFUSION Adults. 10 mcg/kg/day beginning at least 4 days before first leukapheresis and continuing until last leukapheresis.

## Chronic neutropenia, congenital neutropenia

SC

Adults, Children. 6 mcg/kg/dose twice a day.

Idiopathic or cyclic neutropenia
 SC

Adults, Children. 5 mcg/kg/dose once a day.

## **OFF-LABEL USES**

Treatment of AIDS-related neutropenia; drug-induced agranulocytosis; febrile neutropenia; myelodysplastic syndrome.

## CONTRAINDICATIONS

Hypersensitivity to *Escherichia coli*-derived proteins; use within 24 h before or after cytotoxic chemotherapy.

## INTERACTIONS

#### Drug

**Lithium:** May increase white blood cell count greater than expected.

Topotecan: May prolong the duration of neutropenia. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Transient increase in neutrophils occurs 1-2 days after initiation. May increase LDH concentrations, leukocyte alkaline phosphatase (LAP) scores, and serum alkaline phosphatase and uric acid levels.

#### IV INCOMPATIBILITIES

Amphotericin (Fungizone), cefepime (Maxipime), cefotaxime (Claforan), cefoxitin (Mefoxin), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), clindamycin (Cleocin), dactinomycin (Cleocin), dactinomycin (Cosmegen), etoposide (VePesid), fluorouracil, furosemide (Lasix), heparin, mannitol, methylprednisolone (Solu-Medrol), metronidazole (Flagyl), mitomycin (Mutamycin), piperacillin, thiotepa (Thioplex), prochlorperazine (Compazine).

## SIDE EFFECTS

#### Frequent

Nausea or vomiting (57%), mild to severe bone pain (22%) that occurs more frequently with highdose IV form and less frequently with low-dose subcutaneous form; alopecia (18%), diarrhea (14%), fever (12%), fatigue (11%), petechiae.

#### Occasional (5%-9%)

Anorexia, dyspnea, headache, cough, rash.

#### Rare (< 5%)

Psoriasis, hematuria or proteinuria, osteoporosis, splenomegaly.

#### SERIOUS REACTIONS

 Long-term administration occasionally produces chronic neutropenia and splenomegaly.

• Splenic rupture, allergic-type reactions, and sickle cell crisis have occurred.

• Alveolar hemorrhage has occurred in healthy patients undergoing peripheral blood progenitor cell mobilization.

Thrombocytopenia, myocardial infarction, and arrhythmias occur rarely.
Adult respiratory distress syndrome may occur in patients with sepsis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with gout, malignancy with myeloid characteristics (because of the potential for granulocytecolony-stimulating factor to act as a growth factor), preexisting cardiac conditions, and psoriasis. It is unknown whether filgrastim crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children or elderly patients. Avoid situations that might present risk for contracting an infectious disease, such as influenza.

Notify the physician of chest pain, chills, fever, palpitations, or severe bone pain. BP should be monitored for a transient decrease. Also, body temperature, hematocrit, CBC, and hepatic enzyme and serum uric acid levels should be assessed. CBC should be obtained before the start of filgrastim therapy and twice weekly thereafter. Those with preexisting cardiac conditions should be closely watched. Be alert for adult respiratory distress syndrome in those with sepsis. Abdominal exams should include palpation for splenomegaly.

#### Storage

Refrigerate vials for IV use. Filgrastim is stable for up to 24 h at room

temperature, provided vial contents are clear and contain no particulate matter. The drug remains stable if accidentally exposed to freezing temperature. Store vials for SC use in refrigerator, but remove before use and allow to warm to room temperature.

## Administration

! May be given by subcutaneous injection or short IV infusion (15-30 min) or by continuous IV infusion. Begin filgrastim therapy at least 24 h after last dose of chemotherapy; discontinue at least 24 h before next dose of chemotherapy. Begin therapy at least 24 h after bone marrow infusion.

For IV administration, use singledose vial. Do not reenter vial. Do not shake. Dilute with 10-50 mL D5W to a concentration of 15 mcg/ mL or higher. For a concentration from 5 to 14 mcg/mL, add 2 mL of 5% albumin to each 50 mL D5W to provide a final concentration of 2 mg/mL. Do not dilute to a final concentration of < 5 mcg/mL. For intermittent infusion (piggyback), infuse over 15-30 min. For continuous infusion, give single dose over 4-24 h. In all situations, flush IV line with D5W before and after administration.

## **Finasteride**

feen-as'ter-ide Propecia, Proscar Do not confuse Proscar with Posicor, ProSom, Prozac, or Psorcon.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** 5-α-Reductase inhibitors, antiandrogens, hormones/hormone modifiers

#### **MECHANISM OF ACTION**

An androgen hormone inhibitor that inhibits 5- $\alpha$ -reductase, an intracellular enzyme that converts testosterone into dihydrotestosterone (DHT) in the prostate gland, resulting in a decreased serum DHT level. *Therapeutic Effect:* Reduces size of the prostate gland, decreases BPH symptoms, increases hair growth.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	24 h	2-6 h	5-7 days

Rapidly absorbed from the GI tract. Protein binding: 90%. Widely distributed. Metabolized in the liver. *Half-life:* 6-8 h. Onset of clinical effect: 3-6 mo of continued therapy.

#### AVAILABILITY

Tablets (Propecia): 1 mg. Tablets (Proscar): 5 mg.

#### INDICATIONS AND DOSAGES • Benign prostatic hyperplasia (BPH)

PO

*Adults, Elderly.* 5 mg once a day (for a minimum of 6 mo).

#### Male-pattern hair loss PO

Adults. 1 mg/day (for a minimum of 3 mo).

## **OFF-LABEL USES**

Adjuvant monotherapy after radical prostatectomy in treatment of prostate cancer, female hirsutism, prophylaxis of prostate cancer.

## CONTRAINDICATIONS

Hypersensitivity, exposure to the patient's semen or handling of finasteride tablets, or ingestion by those who are or may become pregnant.

Finasteride (Generic Name)

## INTERACTIONS

Drug

Androgens: Oppose finasteride. Herbal

Saw palmetto: Effects may be additive on prostate tissue, but unstudied. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Decreases (falsely) the serum prostate-specific antigen (PSA) level, even in patients with prostate cancer. After 6 mo of use, the PSA value should be doubled for comparison with normal levels in untreated men.

## SIDE EFFECTS

## Frequent(> 5%)

Sexual dysfunction (impotence), weakness.

#### Rare (1%-4%)

Gynecomastia, sexual dysfunction (decreased libido, decreased volume of ejaculate, ejaculation disorder), postural hypotension, dizziness.

## SERIOUS REACTIONS

• Male breast neoplasia has been reported. High-grade prostate cancer has been reported.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic impairment. Finasteride is not indicated for use in children. The efficacy of this drug has not been established in elderly patients. It is unknown whether finasteride is excreted in breast milk, and it should not be taken by pregnant or lactating women.

Finasteride may cause impotence and decrease ejaculate volume. Be aware that urinary flow might not improve, even if the prostate gland shrinks. Serum PSA determinations should be obtained before and periodically during therapy. Intake and output should also be monitored.

## Storage

Store at room temperature tightly closed and protect from light and moisture.

## Administration

Do not break or crush film-coated tablets. Take finasteride without regard to food. Full therapeutic effect may take up to 6 mo.

Women should not handle crushed or broken finasteride tablets when they are pregnant or may potentially be pregnant because of possible exposure to finasteride and the subsequent potential risk to a male fetus. Tablets are coated and this will normally prevent contact with the active ingredient, provided that the tablets are not broken or crushed.

## Fingolimod

fin-gol'i-mod ★ 🍁 Gilenya

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Biologic response modifier, multiple sclerosis agents

## **MECHANISM OF ACTION**

Binds to sphingosine 1-phosphate receptors 1, 3, 4, and 5. Fingolimod-phosphate blocks the capacity of lymphocytes to egress from lymph nodes, reducing the number of lymphocytes in peripheral blood. *Therapeutic Effect:* Reduces progression of multiple sclerosis perhaps by reducing lymphocyte migration into the CNS.

## PHARMACOKINETICS

Well absorbed from the GI tract. Primarily metabolized via CYP4F2; 81% is slowly excreted in the urine as inactive metabolites. Fingolimod and fingolimod-phosphate are found in the feces but each represents less than 2.5% of the dose. Half-life: 6-9 days (prolonged in severe liver disease).

## AVAILABILITY

Capsules: 0.5 mg.

## INDICATIONS AND DOSAGES Relapsing forms of multiple sclerosis:

PO

Adults, Elderly. 0.5 mg once daily. Dosage in hepatic impairment:

Monitor closely since exposure is doubled in severe hepatic impairment, and risk of reactions greater.

## CONTRAINDICATIONS

None known, except previous hypersensitivity.

## INTERACTIONS

#### Drug

**Class Ia or Class III** antiarrhythmic drugs: Because of a risk of serious heart rhythm problems, carefully monitor. β-Blockers, diltiazem, verapamil: Additive effect on heart rate; carefully monitor heart rate. Ketoconazole: Fingolimod exposure is increased by 70% and risk of adverse reactions is greater. Vaccines: Avoid live attenuated vaccines during and for 2 months after stopping treatment due to infection risk. Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

Increased liver enzymes (AST and ALT levels).

## SIDE EFFECTS

## Frequent (>10%)

Headache, influenza-like symptoms, diarrhea, back pain, liver transaminase elevations, and cough. Occasional (4%-10%)

Dizziness, paresthesia, migraine, bradycardia, alopecia, weight loss, dyspnea, depression, blurred vision, hypertension, lymphopenia, gastroenteritis.

Rare (≤ 3%)

Leukopenia, eczema, pruritis

## SERIOUS REACTIONS

- · Increased risk of infections.
- · Rare: Ischemic and hemorrhagic strokes, peripheral arterial occlusive disease, and posterior reversible encephalopathy syndrome.
- · Hypersensitivity is possible.
- · Dyspnea or breathing difficulty.
- · Potential increased risk secondary lymphoma.

· Macular edema may threaten vision.

## PRECAUTIONS & CONSIDERATIONS

A decrease in heart rate and/ or atrioventricular conduction may occur after first dose; observe all patients for signs and symptoms of bradycardia for 6 hours after first dose. Obtain baseline ECG before first dose if not recently done. Be cautious in patients receiving antiarrhythmic drugs, those with a low heart rate, history of syncope, sick sinus syndrome, 2nd degree or higher conduction block, ischemic heart disease, or congestive heart failure. Also use caution in those with asthma or COPD. Do not give if active infection is present. Patients with diabetes or a history of uveitis are more likely to develop macular edema. The drug may cause fetal harm. Women of childbearing potential should use effective

contraception during and for 2 months after stopping fingolimod. Avoid breastfeeding. Safety and efficacy are not established in children.

Monitor for dyspnea. Recent CBC, liver function tests should be available before initiating treatment. Also obtain ophthalmic exam before initiating treatment; perform visual acuity exams at 3-4 months following first dose and periodically during treatment at routine exams. Monitor for signs and symptoms of infection during treatment and for 2 months after discontinuation. Discontinue the drug if significant liver injury occurs. **Storage** 

Store capsules at room temperature, in the original blister pack, and in a dry place.

#### Administration

May administer fingolimod without regard to food. Take at same time daily.

## Flavocoxid

fla-vo-cox'id ★ Limbrel Do not confuse Limbrel with Limbitrol.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: Not classified.

**Classification:** Medical food, oral nutritional supplements

## **MECHANISM OF ACTION**

An oral nutritional supplement that inhibits prostaglandin synthesis and arachidonic acid metabolism, reducing the production of leukotrienes. Also acts through an antioxidant mechanism. *Therapeutic Effect:* Produces anti-inflammatory and analgesic effects and increases mobility in osteoarthritis.

#### PHARMACOKINETICS

Undergoes hydrolysis at the gut mucosal border. Food decreases absorption. Little hepatic metabolism.

## AVAILABILITY

Capsules: 250 mg, 500 mg.

## INDICATIONS AND DOSAGES Osteoarthritis

Adults 18 yr and older, Elderly. 250- or 500-mg capsule q12h.

#### CONTRAINDICATIONS

Hypersensitivity to flavocoxid or flavonoids. Foods rich in flavonoids: colored fruits and vegetables, dark chocolate, tea (green tea), red wine, and Brazil nuts.

#### INTERACTIONS

#### Drug

**NSAIDs:** Avoid concomitant use due to some similarities in actions.

## Herbal

None known.

Food

All foods: Decrease the absorption of flavocoxid.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Rare (1% - 4%)

Arthraigia, headache, insomnia, diarrhea, dyspepsia, nausea, edema, abnormal liver function tests, assorted respiratory symptoms such as rhinitis, pharyngitis.

## SERIOUS REACTIONS

• GI bleeding, perforation, and ulceration occur rarely in patients currently or previously treated with

Flavocoxid (Generic Name), Limbrel (Brand Name)

NSAIDs or COX-2 inhibitors or with previous history of GI ulceration or bleeding.

• May cause elevated liver enzymes, jaundice, and hepatotoxicity.

#### PRECAUTIONS & CONSIDERATIONS

Not recommended for patients with a history of peptic ulcer. Not recommended for those with active liver disease. It is unknown whether flavocoxid crosses the placenta or is distributed in breast milk. Flavocoxid use is not recommended during pregnancy. The safety and efficacy of flavocoxid have not been established in children younger than 18 yr. No age-related precautions have been noted in elderly patients.

Therapeutic response, including improved grip strength, increased joint mobility, reduced joint tenderness, and relief of pain, stiffness, and swelling, should be assessed.

#### Storage

Store at room temperature protected from light and moisture.

## Administration

Do not take flavocoxid within 1 h of eating because food decreases the supplement's absorption. However, if GI discomfort occurs, may take with food.

## Flavoxate

fla-vox'ate

Do not confuse flavoxate with fluvoxamine.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

Classification: Antispasmodic

## **MECHANISM OF ACTION**

An anticholinergic that relaxes detrusor and other smooth muscles by cholinergic blockade, counteracting muscle spasm in the urinary tract. *Therapeutic Effect:* Produces anticholinergic, local anesthetic, and analgesic effects, relieving urinary symptoms.

## AVAILABILITY

Tablets: 100 mg.

## INDICATIONS AND DOSAGES

 To relieve symptoms of nocturia, incontinence, suprapubic pain, dysuria, frequency and urgency associated with urologic conditions (symptomatic only)

PO

Adults, Elderly, Children > 12 yr. 100-200 mg 3-4 times a day.

## CONTRAINDICATIONS

Duodenal or pyloric obstruction, GI hemorrhage or obstruction, ileus, lower urinary tract obstruction.

## INTERACTIONS

Drug Anticholinergic agents: May have additive effects. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent

Somnolence, dry mouth and throat. Occasional

Constipation, difficult urination, blurred vision, dizziness, headache, increased light sensitivity, nausea, vomiting, abdominal pain.

Flavoxate (Generic Name)

#### Rare

Confusion (primarily in elderly), hypersensitivity, increased intraocular pressure, leukopenia.

## SERIOUS REACTIONS

 Overdose may produce anticholinergic effects, including unsteadiness, severe dizziness, somnolence, fever, facial flushing, dyspnea, nervousness, and irritability.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with glaucoma. Avoid tasks that require mental alertness and motor skills until response to the drug is established. Use with caution in pregnancy or lactation. Not approved for children < 12 yr of age. Symptomatic relief should be assessed. Notify the physician of symptoms of flavoxate overdose, including unsteadiness, severe dizziness, drowsiness, fever, flushed face, shortness of breath, nervousness, and irritability.

#### Storage

Store at room temperature.

#### Administration

May administer with food if GI upset occurs.

## Flecainide

fle'kah-nide 🗙 🍁 Tambocor

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, class IC

#### MECHANISM OF ACTION

An antiarrhythmic that slows atrial, AV, His-Purkinje, and intraventricular conduction. Decreases excitability, conduction velocity, and automaticity. *Therapeutic Effect:* Controls atrial, supraventricular, and ventricular arrhythmias.

#### AVAILABILITY

Tablets: 50 mg, 100 mg, 150 mg.

#### INDICATIONS AND DOSAGES Life-threatening ventricular arrhythmias, sustained ventricular tachycardia PO

Adults, Elderly. Initially, 100 mg q12h, increased by 100 mg (50 mg twice a day) every 4 days until effective dose or maximum of 400 mg/day is attained. If CrCl 35 mL/ min or less, initiate with 100 mg once daily or 50 mg twice daily.

## Paroxysmal supraventricular tachycardia (PSVT), paroxysmal atrial fibrillation (PAF)

Adults, Elderly: Initially, 50 mg q12h, increased by 100 mg (50 mg twice a day) every 4 days until effective dose or maximum of 300 mg/day is attained.

## CONTRAINDICATIONS

Cardiogenic shock, preexisting second- or third-degree AV block, right bundle-branch block (without presence of a pacemaker), recent MI, and known hypersensitivity to the drug.

## INTERACTIONS

#### Drug

**Amiodarone:** Decrease the usual flecainide dosage by 50%.

Antipsychotic agents, azoles, fluoroquinolones, macrolides, tricyclic antidepressants: May increase risk of cardiotoxicity, QT prolongation.

**β-Blockers:** May increase negative inotropic effects.

Flecainide (Generic Name)

Bupropion, cinacalcet, quinidine,

protease inhibitors: May increase flecainide concentrations. Cimetidine: May increase flecainide concentrations. Digoxin: May increase blood concentration of digoxin. Other antiarrhythmics: May have additive effects. Urinary acidifiers: May increase the excretion of flecainide. Urinary alkalinizers: May decrease the excretion of flecainide. Herbal Black cohosh, gingko, ginseng: May increase flecainide concentrations. Ephedra: May increase risk of cardiotoxicity.

#### Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May prolong QTc interval of ECG. Trough plasma levels are generally targeted between 0.2 and 1 mcg/mL.

## SIDE EFFECTS

## Frequent (10%-19%)

Dizziness, dyspnea, headache. Occasional (4%-9%)

Nausea, fatigue, palpitations, chest pain, asthenia (loss of strength, energy), tremor, constipation.

## SERIOUS REACTIONS

Flecainide may worsen existing arrhythmias or produce new ones.
Congestive heart failure (CHF) may occur, or existing CHF may worsen.
Overdose may increase QRS duration, prolong QT interval, cause conduction disturbances, reduce myocardial contractility, and cause hypotension.

• Very rare reports of serious hypersensitivity, cholestatic jaundice with hepatic failure, or blood dyscrasias.

## **PRECAUTIONS & CONSIDERATIONS**

Only to be used for refractory, life-threatening ventricular arrhythmias. Caution is warranted with CHF, recent MI, impaired myocardial function, second- and third-degree AV block (with pacemaker), and sick sinus syndrome. Nasal decongestant or OTC cold preparations should be avoided without physician approval.

The side effects of flecainide therapy usually disappear with continued use or decreased dosage. Tasks that require mental alertness or motor skills should be avoided. Continuous cardiac monitoring should be given. ECG measurements, including QRS duration and QT interval, should be performed before and periodically during therapy. Pulmonary status, weight gain, intake and output, and dyspnea should be monitored in those with CHF.

#### Storage

Store at room temperature. Keep tightly closed. Protect from light. Administration

Crush scored tablets as needed. May take without regard to food.

## Fluconazole

floo-con'a-zole Diflucan Diflucan, Apo-Fluconazole Do not confuse Diflucan with diclofenac.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D (most indications); C (vaginal candidiasis, single dose only)

**Classification:** Antifungals, azole antifungals

Fluconazole (Generic Name)

## **MECHANISM OF ACTION**

A fungistatic antifungal that interferes with cytochrome P-450, an enzyme necessary for ergosterol formation. *Therapeutic Effect:* Directly damages fungal membrane, altering its function.

## PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed, including to cerebrospinal fluid. Protein binding: 11%. Partially metabolized in the liver. Excreted unchanged, primarily in urine. Partially removed by hemodialysis. *Half-life*: 20-30 h (increased in impaired renal function).

## AVAILABILITY

*Tablets:* 50 mg, 100 mg, 150 mg, 200 mg. *Powder for Oral Suspension:* 10 mg/mL, 40 mg/mL. *Injection:* 2 mg/mL (in 100- or 200-mL containers).

## INDICATIONS AND DOSAGES • Oropharyngeal candidiasis

PO, IV Adults. Elde

Adults, Elderly. 200 mg once, then 100 mg/day for at least 14 days. Children. 6 mg/kg/day once, then 3 mg/kg/day.

## Esophageal candidiasis PO, IV

*Adults, Elderly.* 200 mg once, then 100 mg/day (up to 400 mg/ day) for 21 days and at least 14 days following resolution of symptoms.

*Children.* 6 mg/kg/day once, then 3 mg/kg/day (up to 12 mg/ kg/day) for 21 days and at least 14 days following resolution of symptoms.

## Vaginal candidiasis

Adults. 150 mg once.

## Prevention of candidiasis in patients undergoing bone marrow transplantation

Adults. 400 mg/day.

## Systemic candidiasis

PO, IV

*Adults, Elderly.* 400 mg once, then 200 mg/day (up to 400 mg/day) for at least 28 days and at least 14 days following resolution of symptoms. *Children.* 6-12 mg/kg/day.

## • Cryptococcal meningitis PO, IV

*Adults, Elderly.* 400 mg once, then 200 mg/day (up to 800 mg/day) for 10-12 wks after cerebrospinal fluid becomes negative (200 mg/day for suppression of relapse in patients with AIDS).

*Children.* 12 mg/kg/day once, then 6-12 mg/kg/day (6 mg/kg/day for suppression of relapse in patients with AIDS).

Onychomycosis PO

Adults. 150 mg/wk.

## Dosage in renal impairment (adults)

After a loading dose of 400 mg, the daily dosage is based on creatinine clearance:

Creatinine Clearance	% of Recommended Dose	
> 50 mL/min	100	
21-50 mL/min	50	
11-20 mL/min	25	
Dialysis	Dose after dialysis	

## **OFF-LABEL USES**

Treatment of coccidioidomycosis, cryptococcosis, fungal pneumonia, onychomycosis.

## CONTRAINDICATIONS

Hypersensitivity to fluconazole or other azole antifungal agents. Coadministration of terfenadine is contraindicated in patients receiving ≥ 400 mg/day of fluconazole. Coadministration of drugs known to prolong the QT interval and also metabolized by CYP3A4 (e.g., cisapride, astemizole, pimozide, and quinidine) is contraindicated.

## INTERACTIONS

#### Drug

**Cyclosporine:** High fluconazole doses increase cyclosporine blood concentration.

**Oral antidiabetics:** May increase blood concentration and effects of oral antidiabetics.

**Phenytoin, warfarin:** May decrease the metabolism of these drugs.

**Rifampin:** May increase fluconazole metabolism.

Systemic coadministration with QT-prolonging drugs metabolized by CYP3A4 (e.g., cisapride, pimozide, quinidine, dofetilide, astemizole, terfenadine):

Contraindicated. Do not use. **Theophylline:** May increase theophylline concentrations. **Warfarin:** Anticoagulant effect of warfarin may be increased. Monitor INR.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, serum bilirubin, SGOT (AST), and SGPT (ALT) levels.

## IV INCOMPATIBILITIES

Amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), calcium gluconate, cefotaxime (Claforan), ceftazidime (Fortaz), ceftriaxone (Rocephin), cefuroxime (Zinacef), chloramphenicol (Chloromycetin), clindamycin (Cleocin), co-trimoxazole (Bactrim), dantrolene (Dantrium), diazepam (Valium), digoxin (Lanoxin), erythromycin (Erythrocin), furosemide (Lasix), haloperidol (Haldol), hydroxyzine (Vistaril), imipenem and cilastatin (Primaxin), pantoprazole (Protonix), sulfamethoxazole, and trimethoprim.

## **IV COMPATIBILITIES**

Acyclovir, aldesleukin, alfentanil, allopurinol, amifostine, amikacin, aminophylline, amiodarone, ascorbic acid, atracurium, atropine, azathioprine, aztreonam, benztropine, bivalirudin, bretylium, bumetanide, buprenorphine, butorphanol, calcium chloride, carboplatin, cefamandole, cefazolin, cefepime, cefmetazole, cefonicid, cefoperazone, cefotetan, cefoxitin, ceftizoxime, cephalothin, chlorpromazine, cimetidine, cisatracurium, cisplatin, cyanocobalamin, cyclophosphamide, cyclosporine, dactinomycin, daptomycin, dexamethasone, diltiazem (Cardizem), dimenhydrinate, diphenhydramine, dobutamine (Dobutrex), docetaxel, dopamine (Intropin), doripenem, doxacurium, doxycycline, droperidol, drotecogin alfa, enalaprilat, ephedrine sulfate, epinephrine, epirubicin, epoetin alfa, ertapenem, erythromycin lactobionate, esmolol, etoposide, famotidine, fenoldopam, fentanyl, filgrastim, fludarabine, fluorouracil, folic acid, foscarnet, furosemide, gallium nitrate, ganciclovir, gatifloxacin, gemcitabine, gentamicin, glycopyrrolate, granisetron, heparin, hetastarch 6% (Hextend), hydrocortisone sodium phosphate, hydrocortisone

sodium succinate, hydromorphone, hydroxyzine, immune globulin, inamrinone lactate, indomethacin, insulin-regular, isoproterenol, ketorolac, labetolol, lactated Ringer's, lansoprazole, leucovorin, levofloxacin, lidocaine, linezolid, lorazepam (Ativan), magnesium sulfate, mannitol, meclorethamine, melphalan, meperidine, meropenem, metaraminol, methicillin, methoxamine, methyldopate, methylprednisolone, metoclopramide, metoprolol tartrate, metronidazole, mezlocillin, miconazole, midazolam (Versed), milrinone, minocycline, mitoxantrone, morphine sulfate, moxalactam, multiple vitamins, nafcillin, nalbuphine, naloxone, netilmicin, nitroglycerin, nitroprusside sodium, norepinephrine, ondansetron, oxacillin, paclitaxel, palonosetron, pancronium, pantoprazole, papaverine, pemetrexed, penicillin G potassium, penicillin G sodium, pentamidine, pentazocine, pentobarbital, phentolamine, phenylephrine, phytanadione, piperacillin and tazobactam, polymixin B, potassium chloride, procainamide, prochlorperazine, promethazine, propofol (Diprivan), propranolol, protamine sulfate, pyridoxine, quinidine, quinupristin and dalfopristin, ranitidine, remifentanil, ritodrine, rituximab, sargramostim, sodium acetate, sodium bicarbonate, streptokinase, succinylcholine, sufentanil, tacrolimus, teniposide, theophylline, thiotepa, ticarcillin, ticarcillin and clavulanate, tigecycline, tirofiban, tobramycin, tolazoline, trastuzumab, trimetaphan, urokinase, vancomycin, vasopressin, vecuronium, verapamil, vincristine, vinorelbine, voriconazole, zidovudine.

## SIDE EFFECTS

#### Occasional (1%-4%)

Hypersensitivity reaction (including chills, fever, pruritus, and rash), dizziness, drowsiness, dyspepsia, headache, constipation, diarrhea, nausea, vomiting, abdominal pain, taste perversion.

#### SERIOUS REACTIONS

• Exfoliative skin disorders, serious hepatic effects, QT prolongation, torsade de pointes, seizures, and blood dyscrasias (such as eosinophilia, thrombocytopenia, anemia, and leukopenia) have been reported rarely.

Rare reports of anaphylaxis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with liver or renal impairment; hypersensitivity to other triazoles, such as itraconazole or terconazole; or hypersensitivity to imidazoles, such as butoconazole and ketoconazole. Fluconazole may be teratogenic, especially in first trimester use; skeletal abnormalities have been reported. Effective contraception is recommended during treatment. Be aware that it is unknown whether fluconazole is excreted in breast milk. No age-related precautions have been noted in children. In elderly patients, age-related renal impairment may require dosage adjustment.

Expect to monitor the complete blood count (CBC), liver and renal function test results, platelet count, and serum potassium levels. Report any itching or rash promptly. Monitor the temperature daily. Assess the daily pattern of bowel activity and stool consistency. Evaluate for dizziness and provide assistance as needed; do not drive or use machinery until response to the drug is established. If dark urine, pale stool, rash with or without itching, or yellow skin or eyes occur, notify the physician. Patients with oropharyngeal infections should be taught good oral hygiene. Administer with caution in patients with proarrhythmic conditions. **Storage** 

Store at room temperature.

#### Administration

Give oral fluconazole without regard to meals. Be aware that PO and IV therapy are equally effective. Shake oral suspension well before each use.

For IV administration, do not remove from outer wrap until ready to use. Squeeze inner bag to check for leaks. Do not use parenteral form if the solution is cloudy, a precipitate forms, the seal is not intact, or it is discolored. Do not add another medication to the solution. Do not exceed maximum flow rate of 200 mg/h.

#### Flucytosine

floo-sye'toe-seen

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antifungals

## MECHANISM OF ACTION

An antifungal that penetrates fungal cells and is converted to fluorouracil, which competes with uracil interfering with fungal RNA and protein synthesis. *Therapeutic Effect:* Damages fungal membrane.

#### PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed, including cerebrospinal fluid. Protein binding: 2%-4%. Metabolized in liver. Partially removed by hemodialysis. *Half-life:* 3-8 h (half-life is increased with impaired renal function).

## AVAILABILITY

Capsule: 250 mg, 500 mg.

## INDICATIONS AND DOSAGES

 Fungal infections, candidiasis, cryptococcosis
 PO

Adults, Elderly, Children. 50-150 mg/ kg/day in equally divided doses q6h.

#### Dosage in renal function impairment

Based on creatinine clearance:

Creatinine Clearance (mL/min)	Dosage Interval
20-40	q12h
10-20	q24h
0-10	q24-48h

## CONTRAINDICATIONS

Hypersensitivity to flucytosine.

## INTERACTIONS

Drug

Amphotericin B: May increase the effects of flucytosine. Cytarabine: May decrease flucytosine efficacy. Zidovudine: May increase the risk of hematologic toxicity. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Measurement of serum creatinine should be determined by the Jaffe reaction or other modern laboratory

Flucytosine (Generic Name), Ancobon (Brand Name)

methods, as the drug does not interfere with these methods. Most automated equipment makes use of non-interfering assays. Therapeutic blood serum level is 25-100 mcg/ mL. Prolonged serum levels over this range may result in hematologic changes or hepatitis. Drug may cause decreased WBC, platelets, or increased liver function tests.

### SIDE EFFECTS

#### Occasional

Pruritus, rash, photosensitivity, dizziness, drowsiness, headache, diarrhea, nausea, vomiting, abdominal pain, increased liver enzymes, jaundice, increased BUN and creatinine, weakness, hearing loss.

## SERIOUS REACTIONS

 Hepatic dysfunction and severe bone marrow suppression occur rarely.

- Ventricular dysfunction and cardiac arrest reported rarely.
- · Renal dysfunction.

## **PRECAUTIONS & CONSIDERATIONS**

Closely monitor hematologic, renal, and hepatic status during use. Caution is warranted in patients with liver or renal impairment, hematologic disease, or bone marrow suppression. Monotherapy should be avoided. There are no adequate data in pregnant women. It is unknown whether flucytosine is excreted in breast milk. No age-related precautions have been noted in children. In elderly patients, age-related renal impairment may require dosage adjustment.

Be alert to bone marrow suppressive symptoms. Unexplained fever, sore throat, rash or hives, trouble breathing, yellow skin or eyes, persistent chest pain, or bloody urine should be reported. Blood concentrations, renal and hepatic function, and hematologic status should be monitored routinely.

Because of resistance, this medication should be used in combination with amphotericin B for treatment of systemic candidiasis and cryptococcosis.

#### Storage

Store at room temperature. Administration

To avoid GI upset, take a few capsules at a time over 15 min with food until full dose is taken. Flucytosine doses should be spaced evenly around the clock to promote less variation in peak and trough blood serum levels.

#### **Fludrocortisone**

floo-droe-kor'ti-sone

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Corticosteroid, mineralocorticoid

## **MECHANISM OF ACTION**

A mineralocorticoid that acts at distal tubules. *Therapeutic Effect:* Increases potassium and hydrogen ion excretion. Replaces sodium loss and raises blood pressure (with low dosages). Inhibits endogenous adrenal cortical secretion, thymic activity, and secretion of corticotropin by pituitary gland (with higher dosages).

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 42%. Widely

Fludrocortisone (Generic Name)

distributed. Metabolized in the liver and kidney. Primarily excreted in urine. *Half-life:* 3.5 h.

## AVAILABILITY

Tablets: 0.1 mg.

## INDICATIONS AND DOSAGES Addison's disease

## PO

*Adults, Elderly.* 0.05-0.1 mg/day. Range: 0.1 mg 3 times a week to 0.2 mg/day. Administration with cortisone or hydrocortisone preferred.

## Salt-losing adrenogenital syndrome

PO Adults, Elderly. 0.1-0.2 mg/day. > Usual pediatric dosage Children. 0.05-0.1 mg/day.

## **OFF-LABEL USES**

Diagnosis of acidosis in renal tubular disorders, idiopathic orthostatic hypotension, congenital hypoaldosteronism, postoperative cerebral salt wasting syndrome.

## CONTRAINDICATIONS

Systemic fungal infection, hypersensitivity to fludrocortisone.

## INTERACTIONS

## Drug

Antidiabetic agents (oral agents and insulin): Antidiabetic effect may be decreased. Monitor for signs of hyperglycemia; adjust dose if necessary.

**Digoxin:** May increase the risk of digoxin toxicity caused by hypokalemia.

Hepatic enzyme inducers (such as phenytoin): May increase the metabolism of fludrocortisone.

**Hypokalemia-causing medications:** May increase the effects of fludrocortisone.

## Sodium-containing medications:

May increase BP, incidence of edema, and serum sodium level. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum sodium level. May decrease hematocrit and serum potassium level.

## SIDE EFFECTS

## Frequent

Increased appetite, exaggerated sense of well-being, abdominal distention, weight gain, insomnia, mood swings.

High dosages, prolonged therapy, too-rapid withdrawal: Increased susceptibility to infection with masked signs and symptoms, delayed wound healing, hypokalemia, hypocalcemia, GI distress, diarrhea or constipation, hypertension.

## Occasional

Headache, dizziness, menstrual difficulty or amenorrhea, gastric ulcer development.

## Rare

Hypersensitivity reaction.

## SERIOUS REACTIONS

• Long-term therapy may cause muscle wasting (especially in the arms and legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, and peptic ulcer disease.

 Abruptly withdrawing the drug after long-term therapy may cause anorexia, nausea, fever, headache, joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

• Edema and fluid retention rarely lead to heart failure.

• Adrenal suppression and resultant immunosuppression.

## **PRECAUTIONS & CONSIDERATIONS**

Due to sodium retention, caution is warranted with edema, hypertension, and impaired renal function. It is unknown whether fludrocortisone crosses the placenta or is distributed in breast milk. Fludrocortisone use in children may suppress growth and inhibit endogenous steroid production. Effects of fludrocortisone use in elderly patients are unknown.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. Blood glucose level, serum renin, BP, serum electrolyte levels, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms.

#### Storage

Store at room temperature; protect from light and excessive heat.

## Administration

Take fludrocortisone with food or milk. Taper the dosage slowly if fludrocortisone is to be discontinued. Expect to lower dosage if transient hypertension develops.

## Flumazenil

flew-maz'ah-nil Romazicon Anexate Do not confuse Flumazenil with influenza virus vaccine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antidotes

#### MECHANISM OF ACTION

An antidote that antagonizes the effect of benzodiazepines on the  $\gamma$ -aminobutyric acid receptor complex in the CNS. *Therapeutic Effect:* Reverses sedative effect of benzodiazepines.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-2 min	6-10 min	<1h

Duration and degree of

benzodiazepine reversal depend on dosage and plasma concentration. Protein binding: 50%. Metabolized by the liver; excreted in urine.

#### AVAILABILITY

Injection: 0.1 mg/mL.

#### INDICATIONS AND DOSAGES • Reversal of conscious sedation or general anesthesia IV

Adults, Elderly. Initially, 0.2 mg (2 mL) over 15 seconds; may repeat dose in 45 seconds; then at 60-second intervals. Maximum: 1-mg (10-mL) total dose. *Children*. Initially, 0.01 mg/kg; may repeat in 45 seconds, then at 60-second intervals. Maximum: 0.2-mg single dose; 0.05-mg/kg or 1-mg cumulative dose.

#### Benzodiazepine overdose IV

Adults, Elderly. Initially, 0.2 mg (2 mL) over 30 seconds; if desired level of consciousness is not achieved after 30 seconds, 0.3 mg (3 mL) may be given over 30 seconds. Further doses of 0.5 mg (5 mL) may be administered over 30 seconds at 60-second intervals. Maximum: 3 mg (30 mL) total dose. If resedation occurs, may repeat regimen in 20 min. *Children.* Initially, 0.01 mg/kg; may repeat in 45 seconds, then at 60-second intervals. Maximum: 0.2-mg single dose; 1-mg cumulative dose.

## CONTRAINDICATIONS

Anticholinergic signs (such as mydriasis, dry mucosa, and hypoperistalsis), arrhythmias, cardiovascular collapse, history of hypersensitivity to benzodiazepines, patients with signs of serious cyclic antidepressant overdose (such as motor abnormalities), patients who have been given a benzodiazepine for control of a potentially life-threatening condition (such as control of status epilepticus or increased intracranial pressure).

## INTERACTIONS

#### Drug

## Tricyclic antidepressants:

May produce seizures and arrhythmias as flumazenil reverses the sedative effects of tricyclic antidepressants.

## Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

No information available for Y-site administration.

#### 🗏 IV COMPATIBILITIES

Heparin.

## SIDE EFFECTS

#### Frequent (4%-11%)

Agitation, anxiety, dry mouth, dyspnea, insomnia, palpitations, tremors, headache, blurred vision, dizziness, ataxia, nausea, vomiting, pain at injection site, diaphoresis.

#### Occasional (1%-3%)

Fatigue, flushing, auditory disturbances, thrombophlebitis, rash, paresthesias, vasodilation, palpitations. Rare (< 1%)

Urticaria, pruritus, hallucinations.

## SERIOUS REACTIONS

 Toxic effects, such as seizures and arrhythmias, of other drugs taken in overdose, especially tricyclic antidepressants; may emerge with reversal of sedative effect of benzodiazepines.

 Flumazenil may provoke a panic attack in those with a history of panic disorder.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with head injury, impaired hepatic function, alcoholism, or drug dependency. Be aware that it is unknown whether flumazenil crosses the placenta or is distributed in breast milk. It is not recommended during labor and delivery. Be aware that flumazenil is not approved for infants or neonates. Be aware that benzodiazepineinduced sedation tends to be deeper and more prolonged, requiring careful monitoring in elderly patients. Be aware that flumazenil may wear off before effects of benzodiazepines. Repeat dosing may be necessary. Obtain arterial blood gases before and at 30-min intervals during IV administration. Prepare to intervene in reestablishing airway, assisting ventilation. Tasks that require alertness or motor skills, ingestion of alcohol, or taking of nonprescription drugs should be avoided until at least 18-24 h after discharge.

#### Storage

Store parenteral form at room temperature. Discard after 24 h once

medication is drawn into syringe, is mixed with any solutions, or if particulate or discoloration is noted. Administration

Be aware that flumazenil is compatible with D5W, lactated Ringer's, or 0.9% NaCl. Be aware that if resedation occurs, dose should be repeated at 20-min intervals. Maximum: 1 mg (given as 0.2 mg/min) at any one time, 3 mg in any 1 h. Administer through freely running IV infusion into large vein (local injection produces pain, inflammation at injection site). For reversing conscious sedation or general anesthesia, administer over 15 seconds. For benzodiazepine overdose, administer over 30 seconds. Take care to avoid extravasation. Observe patient for at least 2 h for signs of resedation and hypoventilation.

## Flunisolide

floo-niss'oh-lide AeroBid, Aerobid-M Rhinaler Do not confuse flunisolide with fluocinonide, or Nasalide with Nasalcrom.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Corticosteroids, inhalation

#### **MECHANISM OF ACTION**

An adrenocorticosteroid that controls the rate of protein synthesis, depresses migration of polymorphonuclear leukocytes, reverses capillary permeability, and stabilizes lysosomal membranes. *Therapeutic Effect:* Prevents or controls inflammation.

#### PHARMACOKINETICS

After oral inhalation of 1 mg, total systemic availability was 40%. Swallowed flunisolide is rapidly and extensively converted to the  $6\beta$ -OH metabolite and to water-soluble conjugates via first pass through the liver. Therefore, there is low systemic activity. Inhaled flunisolide absorbed through the bronchial tree is converted to the same metabolites. Does not accumulate with repeat inhalations. Intranasal doses act locally with little systemic absorption. *Half-life:* 1.8 h.

#### AVAILABILITY

Aerosol (AeroBid, Aerobid-M): 250 mcg/activation. Nasal Spray: 25 mcg/spray.

#### INDICATIONS AND DOSAGES

 Long-term control of bronchial asthma, assists in reducing or discontinuing oral corticosteroid therapy

INHALATION Adults, Elderly. 2 inhalations twice a day, morning and evening. Maximum: 4 inhalations twice a day. Children 6-15 yr. 2 inhalations twice a day.

## Relief of symptoms of perennial and seasonal rhinitis

INTRANASAL

*Adults, Elderly.* Initially, 2 sprays each nostril twice a day, may increase at 4- to 7-day intervals to 2 sprays 3 times a day. Maximum: 8 sprays in each nostril daily.

*Children aged 6-14 yr.* Initially, 1 spray 3 times a day or 2 sprays twice a day. Maximum: 4 sprays in each nostril daily. Maintenance: 1 spray into each nostril each day.

## **OFF-LABEL USES**

To prevent recurrence of nasal polyps after surgery.

## CONTRAINDICATIONS

Hypersensitivity to any of the products' ingredients, persistently positive sputum cultures for Candida albicans, primary treatment of status asthmaticus, systemic fungal infections, untreated local infection (nasal).

## INTERACTIONS

Drug None significant. **Herbal and Food** None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Inhalation (10%-25%): Unpleasant taste, nausea, vomiting, sore throat, diarrhea, upset stomach, cold symptoms, nasal congestion.

#### Occasional

Inhalation (3%-9%): Dizziness, irritability, nervousness, tremors, abdominal pain, heartburn, oropharynx candidiasis, edema. Nasal: Mild nasopharyngeal irritation or dryness, rebound congestion, bronchial asthma, rhinorrhea, altered taste or altered sense of smell.

## SERIOUS REACTIONS

· An acute hypersensitivity reaction, marked by urticaria, angioedema, and severe bronchospasm, occurs rarely.

· A transfer from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition or may precipitate systemic signs of steroid withdrawal.

· Nasal septal perforation with prolonged or inappropriate use of nasal spray.

· Potential adrenal insufficiency if used to replace systemic corticosteriod use.

· Signs and symptoms of hypercorticism, Cushing's syndrome, HPA supression.

## **PRECAUTIONS & CONSIDERATIONS**

If patient transferred from systemic steroid, be alert to signs of adrenal insufficiency. Use with caution if tuberculosis, fungal, bacterial, or systemic viral infections are present. Although systemic effects have been minimal with recommended doses, the potential for HPA axis suppression increases with excessive dosages. Use nasal form with caution in patients who have experienced recent nasal septal ulcers, recurrent epistaxis, or nasal surgery or trauma. Use with caution during pregnancy and lactation. Safety and efficacy not established for children under 6 yr of age.

Drink plenty of fluids to decrease the thickness of lung secretions. Pulse rate and quality, ABG levels, and respiratory rate, depth, rhythm, and type should be monitored. Notify the physician of nasal irritation or if symptoms, such as sneezing, fail to improve.

#### Storage

Store inhalers and nasal spray at controlled room temperature. Keep inhalation canisters away from excessive heat (may combust).

## Administration

Expect to see improvement of the symptoms within a few days and relief of symptoms within 2 wks. Prepare to discontinue the drug after 3 wks if significant improvement does not occur. Do not abruptly discontinue or change the dosage schedule. The dosage must be tapered gradually under medical supervision.

For inhalation, first shake the container well. Exhale completely and place the mouthpiece between the lips. Inhale and hold breath for as long as possible before exhaling. Allow 1 min between inhalations to promote deeper bronchial penetration. Avoid spraying in the eyes. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness and oral candidiasis. If using a bronchodilator inhaler concomitantly with a steroid inhaler, use the bronchodilator several minutes before using the corticosteroid to help the steroid penetrate into the bronchial tree.

Clear nasal passages prior to intranasal use. Prime the unit before first use. Pump the activator (using care not to spray toward others) 7 or 8 times until a fine spray appears. Reprime the unit if not used in 5 days by pumping the activator once or twice. Tilt head slightly forward. Insert spray tip up into the nostril, pointing toward inflamed nasal turbinates, away from the nasal septum. Spray the drug into the nostril while holding the other nostril closed, and at the same time inhale through the nose.

## Fluocinolone Acetonide

floo-oh-sin'oh-lone a-seat'oh-nide ★ Capex, Derma-Smoothe/FS, Synalar, Tri-Luma ★ Capex, Dermotic, Derma-Smoothe/FS, Fluoderm, Synalar

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Corticosteroids, topical, dermatologics

#### MECHANISM OF ACTION

A fluorinated topical corticosteroid that controls the rate of protein synthesis; depresses migration of polymorphonuclear leukocytes and fibroblasts; reduces capillary permeability; prevents or controls inflammation. *Therapeutic Effect:* Decreases tissue response to inflammatory process.

## PHARMACOKINETICS

Use of occlusive dressings may increase percutaneous absorption. Protein binding: More than 90%. Excreted in urine. *Half-life:* Unknown.

## AVAILABILITY

*Cream:* 0.01%, 0.025% (Synalar, Tri-Luma). *Oil:* 0.01% (Derma-Smoothe/FS). *Ointment:* 0.025% (Synalar). *Shampoo:* 0.01% (Capex, FS). *Solution:* 0.01% (Synalar).

# INDICATIONS AND DOSAGES Corticosteroid-responsive dermatoses

TOPICAL

*Adults, Elderly.* Apply 3-4 times/day. *Children 2 yr and older.* Apply 2 times/day.

## Scalp psoriasis

TOPICAL OIL

*Adults, Elderly.* Apply to damp or wet hair and leave on overnight or for at least 4 h. Remove by washing hair with shampoo.

## Seborrheic dermatitis, scalp SHAMPOO

*Adults, Elderly.* Apply 1 oz once daily. Allow to remain on scalp for at least 5 min.

## CONTRAINDICATIONS

Hypersensitivity to fluocinolone, other corticosteroids, or any components of specific products.

#### 674 Fluoride, Sodium

For example, Derma-Smoothe/ FS contains peanut oil and those with peanut allergy may experience hypersensitivity.

## INTERACTIONS

Drug, Herbal, and Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Occasional

Burning, dryness, itching, stinging. Rare

Allergic contact dermatitis, purpura or blood-containing blisters, thinning of skin with easy bruising, telangiectasis or raised dark red spots on skin.

## SERIOUS REACTIONS

 When applied in excessive quantities, systemic hypercorticism and adrenal suppression may occur.

#### PRECAUTIONS & CONSIDERATIONS

It is unknown whether fluocinolone crosses the placenta and is distributed in breast milk. Be aware that the safety and efficacy of fluocinolone have not been established in children younger than 2 yr. Be aware that children may absorb larger amounts of topical corticosteroids, which should be used sparingly. No age-related precautions have been noted in elderly patients. HPA axis suppression should be monitored by urinary free cortisol tests and an ACTH stimulation test. **Storage** 

Store at room temperature. Shampoo is stable for 3 mo after mixing by pharmacist.

## Administration

Gently cleanse area before topical application. Use occlusive dressings

only as ordered. Apply sparingly, and rub into area thoroughly. When using topical oil preparation on scalp, massage through dampened hair and scalp. Cover with shower cap. Leave on overnight or for at least 4 h. Remove by washing hair with shampoo. When using shampoo preparation, first shake well. Apply to wet hair, massage for 1 min, and allow to remain on scalp for 5 min. Rinse thoroughly.

## Fluoride, Sodium

 Epiflur, Fluorabon, Fluor-A-Day, Fluoritab, Flura-Loz, Ludent, Luride NaFrinse, Prevident, ReNaf
 Fluor-A-Day
 Do not confuse with Fludara.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (topical gels/rinses), C (oral)

**Classification:** Dental preparations, minerals

## MECHANISM OF ACTION

A trace element that increases tooth resistance to acid dissolution. *Therapeutic Effect:* Promotes remineralization of decalcified enamel, inhibits dental plaque bacteria, increases resistance to development of caries, maintains bone strength.

## AVAILABILITY

Oral Solution Drops: 0.25 mg/mL, 0.5 mg/mL. Tablets (Chewable): 0.25 mg, 0.5 mg, 1 mg. NOTE: Many topical fluoride agents exist OTC as dental rinses, toothpastes, and gels (e.g., Prevident).

## INDICATIONS AND DOSAGES

 Dietary supplement for prevention of dental caries in children

Fluoride, Sodium (Generic Name)

#### Fluorescein

flure'e-seen ★ AK-Fluor, Fluorescite, Fluor-I-Strip-AT, Ful-Glo ➡ BioGlo, Diofluor, Flourets Do not confuse with fluoride.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X (parenteral), C (topical)

**Classification:** Diagnostics, nonradioactive, ophthalmic

## **MECHANISM OF ACTION**

An indicator dye used as a diagnostic agent with a low molecular weight, high water solubility, and fluorescence that penetrates any break in epithelial barrier to permit rapid penetration. Emits light at a wavelength of 520-530 nm (green-yellow) when exposed to light in the blue wavelength (465-490 nm). *Therapeutic Effect:* Diagnosis of corneal and conjunctival abnormalities.

#### PHARMACOKINETICS

Rapidly absorbed. Protein binding: 85%. Widely distributed. Metabolized in liver to an active metabolite, fluorescein monoglucuronide. Primarily excreted in urine. *Half-life:* 24 min (parent compound), 4 h (metabolite).

#### AVAILABILITY

*Injection, Solution:* 10% (AK-Fluor, Fluorescite). *Strip, Ophthalmic:* 0.6 mg (Ful-Glo), 1 mg (Fluor-I-Strip-AT, Ful-Glo).

## INDICATIONS AND DOSAGES Retinal angiography

INJECTION

*Adults, Elderly.* Inject contents (500 mg) of ampule or vial of 10% solution rapidly into the antecubital vein. If

laser ophthalmoscope used, a reduced dose of 200 mg may be appropriate. *Children.* 7.7 mg/kg (actual body weight) not to exceed 500 mg.

## Applanation tonometry

OPHTHALMIC STRIPS *Adults, Elderly.* Place strip, which has been moistened with a drop of sterile water, at the fornix in the lower cul-de-sac close to the punctum. Patient should close lid tightly over strip until desired amount of staining is observed or retract upper lid and touch tip of strip to the bulbar conjunctiva on the temporal side until adequate staining is achieved.

## CONTRAINDICATIONS

Concomitant soft contact lens use (ophthalmic strips), hypersensitivity to fluorescein or any component of the formulation.

## INTERACTIONS

Drug, Herbal, and Food None known.

#### 🗏 IV COMPATIBILITIES

Do not mix or dilute with other solutions or drugs.

## DIAGNOSTIC TEST EFFECTS

May interfere with digoxin assay results.

## SIDE EFFECTS

#### Occasional

Ophthalmic: Burning sensation in the eye.

Injection: Stinging, bronchospasm, generalized hives and itching, hypersensitivity, headache,

gastrointestinal distress, nausea,

strong taste, vomiting, hypotension, syncope.

#### Rare

Injection: Anaphylaxis, basilar artery ischemia, cardiac arrest, severe

shock, convulsions, thrombophlebitis at injection site.

#### SERIOUS REACTIONS

 Anaphylactic reactions have occurred, leading to laryngeal edema, bronchospasm, shock, and even death.

## **PRECAUTIONS & CONSIDERATIONS**

Injection preparation should be used cautiously with bronchial asthma or history of allergy. It is unknown whether fluorescein crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children. No agerelated precautions have been noted in elderly patients. Blockages or leakage should be assessed on map location for possible treatment. Normal values will appear normal in size. Skin and urine may temporarily turn yellow. Abnormal results can mean diabetic or other retinopathy, macular degeneration, cancer, tumors, circulatory problems, inflammation or edema, microaneurysms, or swelling of the optic disc.

## Storage

Store at room temperature. Do not freeze.

#### Administration

Allow a few seconds for staining when using ophthalmic preparation. Wash out excess with sterile water or irrigating solution. Blink several times after application of strip.

For fluorescein injection, inject rapidly into antecubital vein (5-10 seconds). Take care to avoid extravasation. Flush IV cannula with saline flush before and after use to prevent physical incompatability with other drugs.

Fluoride Level in Water (ppm)	Age	Oral Dosage (mg/day)*
< 0.3	6 mo to 2 yr	0.25
	3-5 yr	0.5
	6-16 yr	1
0.3-0.6	Younger than 2 yr	None
	3-5 yr	0.25
	6-16 yr	0.5

ppm, parts per million.

\*Expressed as fluoride ion.

## CONTRAINDICATIONS

Arthralgia, GI ulceration, severe renal insufficiency (CrCl < 20 mL/ min), areas where fluoride level in water exceeds 0.6 ppm.

## INTERACTIONS

#### Drug

#### Aluminum hydroxide, calcium:

May decrease the absorption of fluoride.

#### Herbal

None known.

#### Food

**Dairy products:** May decrease fluoride's absorption. Do not eat or drink dairy products within 1 h of fluoride adminsitration.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase and AST (SGOT) levels.

#### SIDE EFFECTS

Rare Oral mucous membrane ulceration.

## SERIOUS REACTIONS

• Hypocalcemia, tetany, bone pain (especially in ankles and feet), electrolyte disturbances, and arrhythmias occur rarely.

• Fluoride use may cause skeletal fluorosis, osteomalacia, and osteosclerosis.

## **PRECAUTIONS & CONSIDERATIONS**

Take care to avoid overdosage. Use in infants < 6 mo is not recommended by current American Dental Association and American Academy of Pediatrics guidelines. Use with caution in pregnancy and lactation. Heavy exposure to fluoride during in utero development may result in skeletal fluorosis, which becomes evident in childhood.

## Storage

Store at room temperature, protected from humidity. Keep solutions tightly closed.

#### Administration

Chewable tablets should be chewed before swallowing. Oral drops can be given directly in mouth or mixed with cereal or fruit juice.

Administration at bedtime after brushing teeth is recommended for tablets.

There are many topical forms of fluoride for dental use. Always supervise young children. Avoid ingestion of any of these products.

## Fluoxetine

floo-ox'e-teen ★ Prozac, Prozac Weekly, Sarafem, Selfemra ★ Prozac

Do not confuse fluoxetine with fluvastatin or with duloxetine or paroxetine; Prozac with Prilosec, Proscar, or ProSom; or Sarafem with Serophene.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, selective serotonin reuptake inhibitors (SSRIs)

Fluoxetine (Generic Name)

#### Fluorouracil, 5-FU

flure-oh-yoor'ah-sill Adrucil, Carac, Efudex, Fluoroplex Efudex, Fluoroplex Do not confuse Efudex with Efidac.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastic, antimetabolite

#### **MECHANISM OF ACTION**

An antimetabolite that blocks formation of thymidylic acid. Cellcycle-specific for S phase of cell division. Therapeutic Effect: Inhibits DNA and RNA synthesis. Topical form destroys rapidly proliferating cells.

#### PHARMACOKINETICS

Widely distributed. Crosses the blood-brain barrier. Rapidly metabolized in tissues to active metabolite, which is localized intracellularly. Primarily excreted by lungs as carbon dioxide. Removed by hemodialysis. *Half-life*: 20 h.

#### AVAILABILITY

Cream: 0.5%, 1%, 5%. Solution, Topical: 2%, 5%. Injection: 50 mg/mL.

#### INDICATIONS AND DOSAGES

 Cancer of breast, colon, pancreas, rectum, and stomach; in combination with levamisole after surgical resection in patients with Duke's stage C colon cancer IV

*Adults, Elderly.* Initially, 12 mg/kg/ day for 4-5 days. Maximum: 800 mg/day. Followed by 6 mg/kg every other day for 4 doses. Maintenance: Repeat initial dose every 30 days; or 10-15 mg/kg/wk as a single dose not to exceed 1 g/wk.

! NOTE: After adult IV doses given, lower dosages are recommended for debilitated patients.

 Multiple actinic or solar keratoses TOPICAL 0.5% CREAM
 Adults, Elderly. Apply once a day. TOPICAL 1% & 5% cream, 2%
 SOLUTION
 Adults, Elderly. Apply twice a day.
 Basal cell carcinoma
 TOPICAL 5% SOLUTION
 Adult, Elderly. Apply twice a day.

## CONTRAINDICATIONS

Myelosuppression, poor nutritional status, potentially serious infections, hypersensitivity to fluorouracil or product ingredients, dihydropyrmidine dehydrogenase enzyme deficiency.

#### INTERACTIONS

#### Drug

Leucovorin, levoleucovorin, metronidazole, tinidazole: Increased 5-FU toxicity. Phenytoin: Altered phenytoin concentrations (mostly lowered) have been reported. Warfarin: Increased risk of bleeding. Live vaccines: Defer vaccination due to potential virus replication, adverse reactions to the virus, immunosuppression. Herbal None reported. Food None reported.

## IV INCOMPATIBILITIES

Aldesleukin, amiodarone, buprenorphine, calcium chloride, caspofungin (Cancidas), ciprofloxacin (Cipro), cisplatin, cytarabine, diazepam, doxorubicin, droperidol, epirubicin, filgrastim, gallium nitrate, haloperidol, idarubicin, lansoprazole (Prevacid IV), leucovorin, levofloxacin (Levaquin), levoleucovorin, lorazepam, methotrexate, metoclopramide, midazolam, morphine, nicardipine, ondansetron, phenytoin, quinupristindalfopristin (Synercid), topotecan, TPN, vancomycin, vinorelbine.

## SIDE EFFECTS

#### Occasional

Parenteral: Anorexia, diarrhea, minimal alopecia, fever, dry skin, skin fissures, scaling, erythema. Topical: Pain, pruritus, hyperpigmentation, irritation, inflammation, and burning at application site; photosensitivity. **Rare** 

Nausea, vomiting, anemia, esophagitis, proctitis, GI ulcer, confusion, headache, lacrimation, visual disturbances, angina, allergic reactions.

#### SERIOUS REACTIONS

 The earliest sign of toxicity, which may occur 4-8 days after beginning therapy, is stomatitis (as evidenced by dry mouth, burning sensation, mucosal erythema, and ulceration at inner margin of lips).

 Hematologic toxicity may be manifested as leukopenia (generally within 9-14 days after drug administration, but possibly as late as the 25th day), thrombocytopenia (within 7-17 days after administration), pancytopenia, or agranulocytosis.

• The most common dermatologic toxicity is a pruritic rash on the extremities or, less frequently, the trunk. Delayed serious hypersensitivity reactions may also occur.

## **PRECAUTIONS & CONSIDERATIONS**

Patients should be hospitalized during the initial course of IV fluorouracil therapy. Use with caution in patients with a history of high-dose pelvic irradiation or previous use of alkylating agents, metastatic bone marrow involvement, or impaired hepatic or renal function. Discontinue therapy in patients developing stomatitis, leukopenia, intractable vomiting, diarrhea, GI ulceration or bleeding, thrombocytopenia, or hemorrhage from any site. Severe toxicity (abdominal pain, bloody diarrhea, neutropenia, neurotoxicity, chills, fever or vomiting) while receiving topical or systemic fluorouracil may occur in those with dipyrimidine dehydrogenase (DPD) deficiency; deficiency results in prolonged fluorouracil clearance. It is not known if fluorouracil is excreted in breast milk; avoid use. Safety and effectiveness of topical fluorouracil have not been established in children. No age-related precautions have been observed in the elderly. Avoid application of topical fluorouracil to mucous membranes. Use with occlusive dressings cautiously; may increase penetration and incidence of inflammatory reactions in adjacent healthy skin. Avoid prolonged exposure to sunlight.

#### Storage

Injectable, topical cream, and solution should be stored at room temperature. Protect from light and freezing. Infusions have extended stability once prepared, but refer to specialized resources for details as stability is concentration dependent.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling and administering cytotoxic drugs.

#### 675.e4 Fluorouracil, 5-FU

Fluorouracil injection should be administered IV, either by slow IV push or IV infusion. Use care to avoid extravasation. No dilution is required. However, the drug is often administered as an IV infusion and diluted in 0.9% NaCl or D5W (usual max concentrations 10 mg/mL dilutions). Protect from light. Cleanse the affected area and wait 10 min before applying topical fluorouracil. Apply with fingertips and wash hands as soon as finish application. A moisturizer/ sunscreen may be applied 2 h after fluorouracil.
### **MECHANISM OF ACTION**

A psychotherapeutic agent that selectively inhibits serotonin uptake in the CNS, enhancing serotonergic function. *Therapeutic Effect:* Relieves depression; reduces obsessive-compulsive and bulimic behavior.

### PHARMACOKINETICS

F

Well absorbed from the GI tract. Crosses the blood-brain barrier. Protein binding: 94%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2-3 days; metabolite 7-9 days.

### AVAILABILITY

Capsules (Prozac): 10 mg, 20 mg, 40 mg. Capsules (Sarafem, Selfemra): 10 mg, 20 mg. Capsules (Enteric Coated [Prozac Weekly]): 90 mg. Oral Solution (Prozac): 20 mg/5 mL. Tablets: 10 mg, 20 mg, 40 mg. Tablets (Sarafem): 10 mg, 15 mg, 20 mg.

### INDICATIONS AND DOSAGES

### Depression, obsessive-compulsive disorder (OCD)

PO

Adults and Elderly. Initially, 20 mg each morning. If therapeutic improvement does not occur after 2 wks, gradually increase to maximum of 80 mg/day in 2 equally divided doses in morning and at noon. Prozac Weekly: 90 mg/wk, begin 7 days after last dose of 20 mg. *Children aged 8 yr and older for depression, 7 yr and older for OCD.* Initially, 10-20 mg/day. Begin with 10 mg/day in lower weight or younger children. Usual dosage is 20 mg/day. Do not exceed 60 mg/day for OCD.

#### Panic disorder PO

*Adults, Elderly.* Initially, 10 mg/day. May increase to 20 mg/day after 1 wk. Maximum: 60 mg/day.

#### Bulimia nervosa PO

*Adults.* 60 mg each morning. May need to titrate up from lower dosage.

#### Premenstrual dysphoric disorder PO

*Adults.* 20 mg/day continuously, or 20 mg/day starting 14 days before the anticipated start of menstruation and continue through the first full day of menses.

### **OFF-LABEL USES**

Treatment of hot flashes, fibromyalgia, post-traumatic stress disorder.

### CONTRAINDICATIONS

Use within 14 days of MAOIs, also contraindicated with thioridazine. Hypersensitivity. Avoid use with linezolid (Zyvox) or IV methylene blue due to serotonin syndrome risk.

### INTERACTIONS

NOTE: Of the SSRI-type drugs, fluoxetine inhibits multiple CYP isozymes significantly (particularly CYP 2D6, 2C19, 3A4 (weak), 2C9, and 2C10. Increased serum concentrations and toxicity of concomitant medications may occur. **Drug** 

Alcohol, other CNS depressants: May increase CNS depression. Highly protein-bound medications (including oral anticoagulants):

May increase adverse effects. **MAOIs:** May produce serotonin syndrome and neuroleptic malignant syndrome. Contraindicated.

**Phenytoin:** May increase phenytoin blood concentration and risk of toxicity.

**Platelet inhibitors:** May increase risk of bleeding.

**Ritonavir:** Fluoxetine dose reduction may be necessary.

Serotonergic agents: Increased risk of serotonin syndrome.

**Thioridazine:** Increased thioridazine concentrations. Contraindicated with fluoxetine.

#### Herbal

**St. John's wort:** May increase fluoxetine's pharmacologic effects and risk of toxicity.

Food

None known.

### DIAGNOSTIC TEST EFFECTS

May increase liver enzymes. May cause lowered serum sodium; may cause platelet dysfunction.

### SIDE EFFECTS

#### Frequent (> 10%)

Headache, asthenia, insomnia, anxiety, nervousness, somnolence, nausea, diarrhea, decreased appetite.

#### Occasional (2%-9%)

Dizziness, tremor, fatigue, vomiting, constipation, dry mouth, abdominal pain, nasal congestion, diaphoresis, rash, yawning, change in libido or sexual dysfunction.

#### Rare (< 2%)

Flushed skin, light-headedness, impaired concentration, platelet dysfunction with or without bleeding.

### SERIOUS REACTIONS

• Overdose may produce seizures, nausea, vomiting, agitation, and restlessness (serotonin syndrome). As a result of long half-life, effects may be prolonged.

 SIADH and hyponatremia have been reported rarely, most commonly in elderly patients.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and renal impairment and in those with a history of hypomania, mania, and seizures. Fluoxetine is distributed in breast milk. Not recommended for use in pregnancy because adverse neonatal outcomes have been reported, including withdrawal syndromes and potential heart defects or neonatal pulmonary hypertension. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments. Elderly patients are more sensitive to the drug's effects, such as dry mouth.

Drowsiness and dizziness may occur, so avoid alcohol and tasks that require mental alertness or motor skills until the drug effects are known. CBC and liver and renal function tests should be performed before and periodically during longterm therapy. Assess pattern of daily bowel activity and stool consistency, skin for rash, and blood glucose level.

### Storage

Store all products at room temperature.

#### Administration

! Make sure that at least 14 days elapse between the use of MAOIs and fluoxetine.

Take fluoxetine with food or milk if GI distress occurs. Avoid administration at night. The therapeutic effects of fluoxetine will be noted within 1 to 4 wks. Do not abruptly discontinue fluoxetine. Divided doses can be given at morning and noon. Prozac Weekly: Swallow whole; do not crush or chew.

### Fluoxymesterone

floo-ox-ih-mes'te-rone

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: III

**Classification:** Androgens, hormones/hormone modifiers

### **MECHANISM OF ACTION**

An androgen that suppresses gonadotropin-releasing hormone, LH, and FSH. *Therapeutic Effect:* Stimulates spermatogenesis, development of male secondary sex characteristics, and sexual maturation at puberty. Stimulates production of red blood cells (RBCs).

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 98%. Metabolized in liver. Excreted in urine. *Half-life:* 9.2 h.

### AVAILABILITY

Tablets: 10 mg.

### INDICATIONS AND DOSAGES

Dosage must be strictly individualized; suggested dose for androgens varies, depending on the age, sex, and diagnosis of the patient. Dosage is adjusted according to the patient's response and the appearance of adverse reactions.

# Males (hypogonadism) PO

Adults. 5-20 mg/day. Males (delayed puberty) PO Adults. 2.5-10 mg/day for 4-6 mo. Maximum: 20 mg/day.

### Females (inoperable breast cancer)

*Adults.* 10-40 mg/day in divided doses for 1-3 mo.

### CONTRAINDICATIONS

Serious cardiac, renal, or hepatic dysfunction, men with carcinomas of the breast or prostate, hypersensitivity to fluoxymesterone or any component of the formulation including tartrazine, known or suspected pregnancy, breastfeeding.

### INTERACTIONS

#### Drug

Cyclosporine: May increase the risk of cyclosporine toxicity. Hepatotoxic medications: May increase the risk of hepatotoxicity. Oral anticoagulants: May increase the effect of these drugs.

### Herbal

Chaparral, comfrey, eucalyptus, germander, Jin Bu Huan, kava kava, pennyroyal, skullcap, valerian: May increase the risk of liver damage.

#### Food

None known.

### DIAGNOSTIC TEST EFFECTS

May decrease levels of thyroxinebinding globulin, total T4 serum levels, and resin uptake of T3 and T4. May increase alkaline phosphatase, SGOT (AST), bilirubin, calcium, potassium, sodium, hemoglobin, hematocrit, LDL. May decrease HDL.

### SIDE EFFECTS

#### Frequent

Females: Amenorrhea, virilism (e.g., acne, enlarged clitoris, male

Fluoxymesterone (Generic Name)

pattern baldness, deepening voice), mastalgia.

Males: Urinary tract infection, breast soreness, gynecomastia, priapism, virilism (e.g., acne, early pubic hair growth).

#### Occasional

Edema, nausea, vomiting, mild acne, diarrhea, stomach pain. Males: Impotence, testicular atrophy.

#### SERIOUS REACTIONS

 Peliosis hepatitis (liver, spleen replaced with blood-filled cysts), hepatic neoplasms, and hepatocellular carcinoma have been associated with prolonged high dosage.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with impaired renal or liver function, benign prostate hypertrophy, hypercalcemia (may be aggravated in patients with metastatic breast cancer), history of myocardial infarction, and diabetes mellitus. This drug should not be used to enhance athletic performance. Fluoxymesterone use is contraindicated during pregnancy and lactation. Safety and efficacy of fluoxymesterone have not been established in children, so use with caution. Fluoxymesterone use in elderly patients may increase the risk of hyperplasia or stimulate growth of occult prostate carcinoma. Acne, nausea, pedal edema, or vomiting should be reported to the physician. In particular, female patients should report deepening of voice, hoarseness, and menstrual irregularities; male patients should report difficulty urinating, frequent erections, and gynecomastia. Patients should be monitored for hypercalcemia.

#### Storage

Store at room temperature.

Administration

Give with food to minimize GI upset.

May cut scored tablet to adjust dosage.

### **Fluphenazine**

floo-fen'a-zeen Modecate Do not confuse fluphenazine decanoate injection with other injectable forms of the drug.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antipsychotics, phenothiazines

### MECHANISM OF ACTION

A phenothiazine that antagonizes dopamine neurotransmission at synapses by blocking postsynaptic dopaminergic receptors in the brain. *Therapeutic Effect:* Decreases psychotic behavior. Also produces weak anticholinergic, sedative, and antiemetic effects and strong extrapyramidal effects.

### PHARMACOKINETICS

Erratic and variable absorption from the GI tract. Widely distributed. Metabolized in liver. Primarily excreted in urine. *Half-life:* 163-232 h.

### AVAILABILITY

*Elixir:* 2.5 mg/5 mL. *Tablets:* 1 mg, 2.5 mg, 5 mg, 10 mg. *Injection:* 2.5 mg/mL. *Injection Suspension (Decanoate):* 25 mg/mL.

Fluphenazine (Generic Name)

# INDICATIONS AND DOSAGES Psychosis

PO

Adults, Elderly. 0.5-10 mg/day in divided doses q6-8h. Doses above 20 mg/day are rarely needed. IM

*Adults, Elderly.* Initially, 1.25-2.5 mg IM q6-8h. Usual effective dose: 1.5-10 mg/day in divided doses q6-8h or 12.5 mg (decanoate) q3wks.

### CONTRAINDICATIONS

Severe CNS depression, comatose states, severe depression, subcortical brain damage, presence of blood dyscrasias or liver damage, hypersensitivity to fluphenazine or any component of the formulation including tartrazine.

### INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase hypotensive and CNS and respiratory depressant effects. Autithurgid agents: May increase

Antithyroid agents: May increase the risk of agranulocytosis.

Extrapyramidal symptomproducing medications: May increase extrapyramidal symptoms.

#### Hypotension-producing

**medications:** May increase hypotension.

**Levodopa:** May decrease the effects of this drug.

**Lithium:** May decrease the absorption of fluphenazine and produce adverse neurologic effects.

**MAOIs, tricyclic antidepressants:** May increase anticholinergic and sedative effects.

#### Herbal and Food

None known.

### DIAGNOSTIC TEST EFFECTS

Causes elevated prolactin levels. May produce false-positive pregnancy and phenylketonuria test results. May cause ECG changes, including Q- and T-wave disturbances.

### SIDE EFFECTS

#### Frequent

Hypotension, dizziness, and syncope (occur frequently after first injection, occasionally after subsequent injections, and rarely with oral doses). Occasional

Somnolence (during early therapy), dry mouth, blurred vision, lethargy, constipation or diarrhea, nasal congestion, peripheral edema, urine retention. Hyperprolactinemia may cause breast or menstrual problems.

### Rare

Ocular changes, altered skin pigmentation (with prolonged use of high doses).

### SERIOUS REACTIONS

 Extrapyramidal symptoms appear to be related to high dosages and are divided into three categories: akathisia (inability to sit still, tapping of feet), parkinsonian symptoms (such as hypersalivation, mask-like facial expression, shuffling gait, and tremors), and acute dystonias (such as torticollis, opisthotonos, and oculogyric crisis).

• Tardive dyskinesia, manifested as tongue protrusion, puffing of the cheeks, and chewing or puckering of the mouth, occurs rarely but may be irreversible.

 Abrupt withdrawal after long-term therapy may precipitate dizziness, gastritis, nausea and vomiting, and tremors.

• Blood dyscrasias, particularly agranulocytosis and mild leukopenia, may occur.

• Fluphenazine use may lower the seizure threshold.

• Neuroleptic malignant syndrome (NMS).

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with Parkinson's disease and seizures. Drowsiness may occur, so tasks that require mental alertness or motor skills should be avoided. Exposure to light and sunlight should also be avoided. Signs of tardive dyskinesia such as fine tongue movement and therapeutic response should be monitored. BP for hypotension, WBC for blood dyscrasias, and therapeutic response should be assessed during therapy. This medication is known to cross the placenta, and it is unknown if it appears in breast milk.

#### Storage

Store at room temperature and protect from light.

### Administration

May take with food to decrease GI effects. Do not take antacids within 1 h.

For IM use, administer deep injection in large muscle mass, keep patient recumbent for 30 min after injection to minimize hypotension.

Administer decanoate injection deep IM into gluteal area.

### Flurandrenolide

flure-an-dren'oh-lide Cordran, Cordran SP

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Corticosteroids, topical, dermatologics

#### MECHANISM OF ACTION

A fluorinated corticosteroid that decreases inflammation by suppression of the migration of polymorphonuclear leukocytes and reversal of increased capillary permeability. *Therapeutic Effect:* Decreases tissue response to inflammatory process. The amount of corticosteroid absorbed from the skin depends on the intrinsic properties of the drug, the vehicle used, the duration of exposure, the skin surface area, and the condition of the skin.

### PHARMACOKINETICS

Repeated applications may lead to percutaneous absorption. Absorption is about 36% from scrotal area, 7% from forehead, 4% from scalp, and 1% from forearm. Metabolized in liver. Excreted in urine. *Half-life:* Unknown.

### AVAILABILITY

Cream: 0.025%, 0.05% (Cordran SP). Lotion: 0.05% (Cordran). Ointment: 0.025%, 0.05% (Cordran). Tape, Topical: 4 mcg/cm<sup>2</sup> (Cordran).

### INDICATIONS AND DOSAGES

 Anti-inflammatory, immunosuppressant, corticosteroid replacement therapy TOPICAL

*Adults, Elderly.* Apply 2-3 times/day. *Children.* Apply 1-2 times/day, once daily if tape used.

#### CONTRAINDICATIONS

Hypersensitivity to flurandrenolide or any component of the formulation; viral, fungal, or tubercular skin lesions.

### INTERACTIONS

Drug None known.

#### Herbal

None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

Occasional Itching, dry skin, folliculitis.

#### Rare

F

Intracranial hemorrhage, acne, striae, miliaria, allergic contact dermatitis, telangiectasis, or raised dark red spots on the skin.

### SERIOUS REACTIONS

• When taken in excessive quantities, systemic hypercorticism and adrenal suppression may occur.

### PRECAUTIONS & CONSIDERATIONS

Caution should be exercised when used over large areas of body, in denuded areas, for prolonged periods, with occlusive dressings, and in small children. It is unknown whether flurandrenolide crosses the placenta or is distributed in breast milk. Be aware that the safety and efficacy of flurandrenolide have not been established in children. Therefore, use the smallest dose necessary to achieve optimal results. Be aware that children are at an increased risk of systemic toxicity and side effects.

No age-related precautions have been noted in elderly patients. Urinary free cortisol test and ACTH stimulation test should be obtained for suspected HPA axis suppression.

#### Storage

Store at room temperature. Administration

Avoid contact with eyes. Gently cleanse area before application.

Use occlusive dressings only as ordered. Apply sparingly and rub into area thoroughly. Children using flurandrenolide tape should use it only once a day.

### Flurazepam

flure-az'e-pam Dalmane SomPam, Somnol Do not confuse with Dialume.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: IV

**Classification:** Benzodiazepines, sedatives/hypnotics

### **MECHANISM OF ACTION**

A benzodiazepine that enhances the action of inhibitory neurotransmitter γ-aminobutyric acid (GABA). *Therapeutic Effect:* Produces hypnotic effect due to central nervous system (CNS) depression.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	15-20 min	3-6 h	7-8 h

Well absorbed from the GI tract. Protein binding: 97%. Crosses the blood-brain barrier. Widely distributed. Metabolized in liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2.3 h; metabolite: 40-114 h.

### AVAILABILITY

Capsules: 15 mg, 30 mg.

### INDICATIONS AND DOSAGES Insomnia

Adults. 15-30 mg at bedtime.

Flurazepam (Generic Name)

Elderly, debilitated, liver disease, low serum albumin, Children 15 yr and older. 15 mg at bedtime.

#### CONTRAINDICATIONS

Acute alcohol intoxication, acute angle-closure glaucoma, pregnancy or breastfeeding, sleep apnea.

### INTERACTIONS

#### Drug

Alcohol, CNS depressants: May increase CNS depression. Digoxin: Increased digoxin serum levels and toxicity may increase.

#### Herbal

Dong quai, kava kava, magnolia, passionflower, skullcap, valerian:

May increase CNS depression. **St. John's wort:** Decreased efficacy of flurazepam.

Food

None known.

### DIAGNOSTIC TEST EFFECTS

Rare increases in AST, ALT.

### SIDE EFFECTS

#### Frequent

Drowsiness, dizziness, ataxia, sedation. Morning drowsiness may occur initially.

#### Occasional

GI disturbances, nervousness, blurred vision, dry mouth, headache, confusion, skin rash, irritability, slurred speech.

### Rare

Paradoxical CNS excitement or restlessness, particularly noted in elderly or debilitated patients.

### SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal after long-term use may result in pronounced restlessness and irritability, insomnia, hand tremors, abdominal or muscle cramps,

vomiting, diaphoresis, and seizures.
Overdose results in somnolence, confusion, diminished reflexes, apnea, and coma.

• Complex behaviors such as "sleepdriving" (i.e., driving while not fully awake after ingestion of a sedativehypnotic, with amnesia for the event) or other behaviors, with amnesia after the events, have been reported; consider discontinuation if they occur.

• Rare reports of angioedema or anaphylaxis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with impaired liver or renal function. Do not use during pregnancy or lactation. Flurazepam crosses the placenta and may be distributed in breast milk. Chronic flurazepam ingestion during pregnancy may produce withdrawal symptoms and CNS depression in neonates. The safety and efficacy of flurazepam have not been established in children younger than 15 yr of age. Use small initial doses with gradual dose increases to avoid ataxia or excessive sedation in elderly patients. Avoid smoking, because it reduces the drug's effectiveness. Flurazepam may be habit-forming. Assess BP, pulse, and respirations immediately before beginning flurazepam administration. Disturbed sleep 1-2 nights after discontinuing the drug may occur.

Drowsiness and dizziness are expected side effects. Avoid tasks that require mental alertness or motor skills. Concomitant use with alcohol should also be avoided.

#### Storage

Store at room temperature and protect from light.

#### Administration

Take flurazepam without regard to meals. If desired, empty capsules and mix with food. Take before bedtime. Do not abruptly withdraw the medication after long-term use.

F

### Flurbiprofen

flure-bi'proe-fen Ansaid, Ocufen Do not confuse Ocufen with Ocuflox.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in third trimester or near delivery; C for ophthalmic solution)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAIDs), ophthalmic anti-inflammatory

### **MECHANISM OF ACTION**

A phenylalkanoic acid that produces analgesic and anti-inflammatory effect by inhibiting prostaglandin synthesis. Also relaxes the iris sphincter. *Therapeutic Effect:* Reduces the inflammatory response and intensity of pain. Prevents or decreases miosis during cataract surgery.

### PHARMACOKINETICS

Well absorbed from the GI tract; ophthalmic solution penetrates cornea after administration, and may be systemically absorbed. Protein binding: 99%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. *Half-life*: 3-4 h.

### AVAILABILITY

*Tablets:* 50 mg, 100 mg. *Ophthalmic Solution:* 0.03%.

### INDICATIONS AND DOSAGES

# Rheumatoid arthritis, osteoarthritis PO

Adults, Elderly. 200-300 mg/day in 2-4 divided doses. Maximum: 100 mg/dose or 300 mg/day.

#### Dysmenorrhea, pain PO

Adults. 50 mg 4 times a day.

Intraoperative miosis
 OPHTHALMIC

*Adults, Elderly, Children.* Apply 1 drop q30min starting 2 h before surgery for total of 4 doses.

### CONTRAINDICATIONS

Active peptic ulcer, chronic inflammation of GI tract, GI bleeding or ulceration, history of hypersensitivity to aspirin or NSAIDs; treatment of perioperative pain following CABG surgery.

### INTERACTIONS

Antihypertensives, diuretics: May decrease the effects of these drugs or increase risk of renal impairment.

Aspirin, other salicylates: May increase the risk of GI side effects such as bleeding. NSAID use may negate cardioprotective effect of ASA.

**Bile acid sequestrants:** May decrease the absorption of NSAIDs. Seperate administration by at least 2 h.

**Corticosteroids:** May increase risk of GI ulceration.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of these drugs.

**Lithium:** may increase the blood concentration and risk of toxicity of lithium.

Methotrexate: May increase the risk of methotrexate toxicity.

SSRIs, SNRIs: Increased risk of GI bleeding.

Flurbiprofen (Generic Name)

#### Herbal

## Herbs with antiplatelet effects (e.g., ginkgo, white willow):

Increased risk of bleeding.

### Food

Alcohol: May increase dizziness or risk of GI bleeding.

### SIDE EFFECTS

#### Occasional

PO: Headache, abdominal pain, diarrhea, indigestion, nausea, fluid retention.

Ophthalmic: Burning or stinging on instillation, keratitis, elevated intraocular pressure.

#### Rare

PO: Blurred vision, flushed skin, dizziness, somnolence, nervousness, insomnia, unusual fatigue, constipation, decreased appetite, vomiting, confusion.

#### SERIOUS REACTIONS

• Overdose may result in acute renal failure.

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, severe hepatic reaction (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria), a severe hypersensitivity reaction (angioedema, bronchospasm), and cardiac arrhythmias.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with CHF, hypertension, fluid retention, dehydration, history of GI disease (bleeding or ulcers), coagulation disorders, asthma, hepatic impairment, or renal impairment. Flurbiprofen should not be used in the third trimester of pregnancy as it may lead to premature closure of the ductus arteriosis. Flurbiprofen is excreted in breast milk; use in nursing mothers is not recommended. Safety and effectiveness have not been established in children. The elderly are at increased risk of adverse effects, particularly GI effects and renal toxicity.

Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Do not use in patients with aspirin-sensitive asthma. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Use the lowest effective dose for the shortest duration. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures.

Notify the physician of edema, GI distress, headache, rash, signs of bleeding, or visual disturbances. CBC and blood chemistry studies should be monitored to assess hepatic and renal function. Therapeutic response, such as decreased pain, stiffness, swelling or tenderness, improved grip strength, and increased joint mobility, should be evaluated.

#### Storage

Store at room temperature.

#### Administration

May be taken with food, milk, or antacid to reduce GI effects.

### **Flutamide**

floo'ta-mide Euflex Do not confuse flutamide with Flumadine.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastics, antiandrogens, hormones/hormone modifiers

### **MECHANISM OF ACTION**

An antiandrogen hormone that inhibits androgen uptake and prevents androgen from binding to androgen receptors in target tissue. Used in conjunction with leuprolide to inhibit the stimulant effects of flutamide on serum testosterone levels. *Therapeutic Effect:* Suppresses testicular androgen production and decreases the growth of prostate carcinoma.

### PHARMACOKINETICS

Completely absorbed from the GI tract. Protein binding: 94%-96%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 6 h (increased in elderly patients).

### AVAILABILITY

Capsules: 125 mg.

### INDICATIONS AND DOSAGES

 Prostatic carcinoma (in combination with leuprolide) PO Adults, Elderly. 250 mg q8h.

### CONTRAINDICATIONS

Severe hepatic impairment, pregnancy, hypersensitivity to the drug.

### INTERACTIONS

#### Drug

Warfarin: May increase risk of bleeding.

### Herbal

Chaparral, comfrey, eucalyptus, germander, Jin Bu Huan, kava kava, pennyroyal, skullcap, valerian: May increase risk of hepatotoxicity. Food

None known.

### DIAGNOSTIC TEST EFFECTS

May increase blood glucose level and serum estradiol, testosterone, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels.

### SIDE EFFECTS

#### Frequent

Hot flashes (50%); decreased libido, diarrhea (24%); generalized pain (23%); asthenia (17%); constipation (12%); nausea, nocturia (11%).

### Occasional (6%-8%)

Dizziness, paresthesia, insomnia, impotence, peripheral edema, gynecomastia.

### Rare (4%-5%)

Rash, diaphoresis, hypertension, hematuria, vomiting, urinary incontinence, headache, flu-like symptoms, photosensitivity.

### SERIOUS REACTIONS

• Hepatoxicity, including hepatic encephalopathy, and hemolytic anemia may be noted.

### **PRECAUTIONS & CONSIDERATIONS**

Flutamide is not used in pregnant women or in children. No age-related precautions have been noted in elderly patients.

Clinical progression and drug therapy may be evaluated by PSA levels.

Flutamide (Generic Name)

Overexposure to the sun or ultraviolet light should be avoided and protective clothing should be worn outdoors until tolerance of ultraviolet light is determined.

Urine may become amber or yellowgreen during flutamide therapy. Liver function test results should be obtained before beginning drug therapy and periodically thereafter. If initial ALT result exceeds upper normal limits, use of the drug is not recommended. Storage

Store at room temperature.

#### Administration

Take oral flutamide without regard to food. Do not abruptly discontinue the drug.

### Fluticasone

flu-tic'a-zone Cutivate, Flonase, Flovent Diskus, Flovent HFA, Veramyst Do not confuse Flonase with Flovent.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Corticosteroids, inhalation, topical

### **MECHANISM OF ACTION**

A corticosteroid that controls the rate of protein synthesis, depresses migration of polymorphonuclear leukocytes, reverses capillary permeability, and stabilizes lysosomal membranes. *Therapeutic Effect*: Prevents or controls inflammation and asthma.

### PHARMACOKINETICS

Inhalation/intranasal: Protein binding: 91%. Undergoes extensive first-pass metabolism in liver. Excreted in urine. *Half-life:* 3-7.8 h. Topical: Amount absorbed depends on affected area and skin condition (absorption increased with fever, hydration, inflamed or denuded skin).

#### AVAILABILITY

Aerosol for Oral Inhalation (Flovent HFA): 44 mcg/inhalation, 110 mcg/ inhalation, 220 mcg/inhalation. Powder for Oral Inhalation (Flovent Diskus): 50 mcg, 100 mcg, 250 mcg. Intranasal Spray (Flonase): 50 mcg/spray. Intranasal Spray (Veramyst): 27.5 mcg/spray. Topical Cream & Lotion (Cutivate): 0.05%. Topical Ointment (Cutivate): 0.005%.

# INDICATIONS AND DOSAGES Allergic rhinitis

INTRANASAL

*Adults, Elderly, and Children 12 yr and older.* Initially, 2 sprays in each nostril once daily for a few days. Maintenance: Some patients can reduce to 1 spray in each nostril once daily.

*Children 2 to 11 yr*. Initially, 1 spray in each nostril once daily. Maximum: 2 sprays/nostril once daily for a short time, then decrease to 1 spray/nostril per day.

 Relief of inflammation and pruritus associated with steroid-responsive disorders, such as contact dermatitis and eczema

TOPICAL Adults, Elderly, Children older than 3 mo. Apply sparingly to affected area once or twice a day.

 Maintenance treatment for asthma for those previously treated with bronchodilators

INHALATION POWDER (FLOVENT DISKUS) Adults, Elderly, Children 12 yr and older: Initially, 100 mcg q12h. Maximum: 500 mcg twice daily. INHALATION (ORAL, FLOVENT HFA)

*Adults, Elderly, Children 12 yr and older.* Initially, 88 mcg twice a day. Maximum: 440 mcg twice a day.

#### Maintenance treatment for asthma for those previously treated with inhaled steroids

INHALATION POWDER (FLOVENT DISKUS) Adults, Elderly, Children 12 yr and older: Initially, 100-250 mcg q12h. Maximum: 500 mcg q12h. INHALATION, ORAL (FLOVENT HFA)

Adults, Elderly, Children 12 yr and older. 88-220 mcg twice a day. Maximum: 440 mcg twice a day.

#### Maintenance treatment for asthma for those previously treated with oral steroids

INHALATION POWDER (FLOVENT DISKUS) Adults, Elderly, Children 12 yr and older. 500-1000 mcg twice a day. INHALATION (ORAL, FLOVENT HFA)

Adults, Elderly, Children 12 yr and older. 440-880 mcg twice a day.

### CONTRAINDICATIONS

Primary treatment of status asthmaticus or other acute asthma episodes (inhalation); severe allergies to milk proteins (inhalation); untreated localized infection of nasal mucosa; hypersensitivity to the drug or components of the various formulations. (e.g., use certain topical creams and lotions cautiously if formaldehyde hypersensitivity present); imidurea in some product releases formaldehyde.

#### INTERACTIONS Drug

#### Ketoconazole, protease inhibitors:

May increase plasma fluticasone concentrations following nasal or inhalational administration of fluticasone.

### Herbal and Food

None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent

Inhalation: Throat irritation, hoarseness, dry mouth, cough, temporary wheezing, oropharyngeal candidiasis (particularly if the mouth is not rinsed with water after each administration).

Intranasal: Mild nasopharyngeal irritation; nasal burning, stinging, or dryness; rebound congestion; rhinorrhea; loss of taste.

### Occasional

Inhalation: Oral candidiasis. Intranasal: Nasal and pharyngeal candidiasis, headache. Topical: Skin burning, pruritus.

### SERIOUS REACTIONS

• Anaphylaxis, hypersensitivity reactions, and glaucoma occur rarely.

 Nasal septal perforation with prolonged innappropriate use.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with active or quiescent tuberculosis, ocular herpes simplex infection, and untreated systemic infections (including fungal, bacterial, or viral). It is unknown whether fluticasone crosses the placenta or is distributed in breast milk. The safety and efficacy of fluticasone have not been established in children younger than 2-4 yr, depending on product. Children may experience growth suppression with prolonged or high doses. No age-related precautions have been noted in elderly patients. Drink plenty of fluids to decrease the thickness of lung secretions. Pulse rate and quality, ABG levels, and respiratory rate, depth, rhythm, and type should be monitored. Notify the physician of nasal irritation or if symptoms, such as sneezing, fail to improve.

#### Storage

Store products at room temperature. Aerosol canisters should not be punctured and should not be used or stored near heat or open flame. Do not freeze or refrigerate.

### Administration
