For inhalation, first shake the container well. Exhale completely and place the mouthpiece between the lips. Inhale and hold the breath for as long as possible before exhaling. Allow 1 min between inhalations to promote deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness and oral candidiasis.

Clear the nasal passages before using nasal spray. Prime nasal spray units before first use by shaking the contents well and releasing 6 sprays into the air away from the face. If unit has not been used for more than 30 days or if the cap has been left off the bottle for 5 days or longer, reprime until fine mist appears. Shake the nasal spray well before each use. Tilt head slightly forward. Insert spray tip up into the nostril, pointing toward the inflamed nasal turbinates, away from nasal septum. Spray the drug into the nostril while holding the other nostril closed, and at the same time inhale through the nose.

For topical fluticasone, rub a thin film gently on the affected area. Use the drug only on the prescribed area and for no longer than prescribed. Keep the preparation away from the eyes.

### Fluvastatin

floo'va-sta-tin Lescol, Lescol XL Do not confuse fluvastatin with fluoxetine.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Antihyperlipidemics, HMG-CoA reductase inhibitors

### **MECHANISM OF ACTION**

An antihyperlipidemic that inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. *Therapeutic Effect:* Decreases LDL cholesterol, VLDL, and triglyceride levels. Slightly increases HDL cholesterol concentration.

### PHARMACOKINETICS

Well absorbed from the GI tract and is unaffected by food. Does not cross the blood-brain barrier. Protein binding: > 98%. Primarily eliminated in feces. *Half-life*: 1.2 h.

#### AVAILABILITY

Capsules (Lescol): 20 mg, 40 mg. Tablets (Extended Release [Lescol XL]): 80 mg.

# INDICATIONS AND DOSAGES Hyperlipoproteinemia PO

*Adults, Elderly.* Initially, 20 mg/day (capsule) in the evening. May increase up to 40 mg/day.

Fluvastatin (Generic Name), Lescol (Brand Name)

Maintenance: 20-40 mg/day in a single dose or divided doses. Patients requiring more than a 25% decrease in LDL cholesterol: 40-mg capsule 1-2 times a day or 80-mg extended-release tablet once a day. *Children 9 yr of age and older*. Initially, 20 mg/day in the evening. May increase slowly at 6-wk intervals to up to 40 mg/day, either as 40 mg twice per day or extended-release 80 mg once daily.

 Dosage in renal impairment Generally recommend not to exceed 40 mg/day.

#### CONTRAINDICATIONS

Active hepatic disease, unexplained increased serum transaminase levels, pregnancy, breastfeeding, hypersensitivity to the drug.

#### INTERACTIONS

#### Drug

Cyclosporine, fibrates, phenytoin, fluconazole, immunosuppressants, niacin: Increases the risk of acute renal failure and rhabdomyolysis with these drugs.

**Bile acid sequestrant:** Administer statin 2 h apart to avoid interaction.

**Glyburide:** At higher fluvastatin doses may see increased hypoglycemic effect.

**Warfarin:** Interactions not expected, but increased INRs reported with other "statins"; monitor INR.

### Herbal and Food

**Red yeast rice:** May increase risk of myopathy due to "statin"-like components. Avoid.

### DIAGNOSTIC TEST EFFECTS

May increase serum CK and transaminase concentrations.

### SIDE EFFECTS

Frequent (5%-8%)

Headache, dyspepsia, back pain, myalgia, arthralgia, diarrhea, abdominal cramping, rhinitis. Occasional (2%-4%)

### Occasional (2%-4%)

Nausea, vomiting, insomnia, constipation, flatulence, rash, pruritus, fatigue, cough, dizziness. **Rare** 

Reversible congnitive impairment or depression, hair loss, may worsen glucose tolerance and increase HbA1C.

### SERIOUS REACTIONS

• Myositis (inflammation of voluntary muscle) with or without increased CK and muscle weakness occur rarely. These conditions may progress to frank rhabdomyolysis and renal impairment.

 Hypersensitivity, such as bullous rash or anaphylaxis, reported rarely.

- · Rare reports of hepatotoxicity.
- · Cataracts may develop.

#### PRECAUTIONS & CONSIDERATIONS

Use fluvastatin cautiously in those who are receiving anticoagulant therapy, have a history of liver disease, or consume substantial amounts of alcohol. Caution is also warranted with hypotension, major surgery, severe acute infection, renal failure secondary to rhabdomyolysis, uncontrolled seizures, and severe electrolyte, endocrine, and metabolic disorders. Expect to discontinue or withhold fluvastatin if these conditions appear. Fluvastatin use is contraindicated in pregnancy because the suppression of cholesterol biosynthesis may cause fetal toxicity. It is unknown whether fluvastatin is distributed in breast milk; therefore, it is contraindicated during lactation. Safety and efficacy of fluvastatin have not been established in children under 9 yr of age. No age-related precautions have been noted in elderly patients.

Notify the physician of any muscle pain and weakness, especially if accompanied by fever or malaise. Pattern of daily bowel activity and stool consistency should be assessed. Serum lipid cholesterol and triglyceride levels and hepatic function should be checked at baseline and periodically during treatment. Therapy with lipid-altering agents should be used in addition to a diet restricted in saturated fat and cholesterol.

#### Storage

Store products at room temperature, tightly closed. Protect from light.

### Administration

Take fluvastatin without regard to food.

### Fluvoxamine

floo-vox'a-meen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, serotonin selective reuptake inhibitors (SSRIs)

#### **MECHANISM OF ACTION**

An antidepressant and antiobsessive agent that selectively inhibits neuronal reuptake of serotonin. *Therapeutic Effect:* Relieves anxiety and symptoms of obsessive-compulsive disorder.

### AVAILABILITY

*Tablets:* 25 mg, 50 mg, 100 mg. *Extended-Release Capsule:* 100 mg, 150 mg.

### INDICATIONS AND DOSAGES

Obsessive-compulsive disorder PO *Adults.* 50 mg at bedtime; may increase by 50 mg every 4-7 days. Dosages > 100 mg/day given in 2 divided doses. Maximum: 300 mg/day. Also may give as extended release, with target dose given once daily at bedtime. Maximum: 300 mg/day. *Children 8-17 yr.* 25 mg at bedtime; may increase by 25 mg every 4-7 days. Dosages > 50 mg/day given in 2 divided doses. Maximum: 200 mg/day.

## Social anxiety disorder PO (EXTENDED RELEASE)

*Adults.* 100 mg po at bedtime. Titrate at 50-mg increments weekly as needed. Maximum: 300 mg/day.

#### **OFF-LABEL USES**

Treatment of depression, panic disorder, anxiety disorders in children.

### CONTRAINDICATIONS

Coadministration of alosetron, tizanidine, thioridazine, or pimozide, and use within 14 days of MAOIs contraindicated; hypersensitivity to fluvoxamine or any of the excipients. Avoid use with linezolid (Zyvox) or IV methylene blue due to serotonin syndrome risk.

#### INTERACTIONS Drug

Benzodiazepines, carbamazepine, clozapine, theophylline: May increase the blood concentration and risk of toxicity of these drugs.

**Lithium, tryptophan:** May enhance fluvoxamine's serotonergic effects.

MAOIs: May produce excess serious reactions, including hyperthermia, rigidity, and myoclonus. Contraindicated.

**Tricyclic antidepressants:** May increase the fluvoxamine blood concentration.

Fluvoxamine (Generic Name)

**Warfarin:** May increase the effects of warfarin.

#### Herbal

**St. John's wort:** May increase fluvoxamine's pharmacologic effects and risk of toxicity.

### Food

None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent

Nausea (40%); headache, somnolence, insomnia (21%-22%). Occasional (8%-14%)

Nervousness, dizziness, diarrhea, dry mouth, asthenia, weakness, dyspepsia,

constipation, abnormal ejaculation.

### Rare (3%-6%)

Anorexia, anxiety, tremor, vomiting, flatulence, urinary frequency, sexual dysfunction, altered taste.

#### SERIOUS REACTIONS

• Overdose may produce seizures, nausea, vomiting, and extreme agitation and restlessness.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and renal impairment and in those with a history of hypomania, mania, and seizures. The drug is distributed in breast milk and should generally not be used during lactation or in pregnancy because adverse neonatal outcomes have been reported, including drug withdrawal syndromes. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for

clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments.

Dizziness, somnolence, and dry mouth may occur. Alcohol and tasks that require mental alertness or motor skills should be avoided. CBC and blood chemistry tests should be performed before and periodically during therapy, especially with longterm use.

#### Storage

Store at room temperature. Keep tightly closed. Protect from humidity and avoid exposure to temperatures above 86° F.

#### Administration

Do not abruptly discontinue the drug. Fluvoxamine's maximum therapeutic response may require 4 wks or more to appear.

Extended release given with or without food as a single daily dose at bedtime. Do not crush or chew extended-release capsules.

# Folic Acid

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A OTC (0.4-mg and 0.8-mg tablets only); Rx only (1-mg tablets and injection)

*Classification:* Vitamins, B vitamins, water soluble

#### MECHANISM OF ACTION

A coenzyme that stimulates production of platelets, RBCs, and WBCs. *Therapeutic Effect:* Essential for nucleoprotein synthesis and maintenance of normal erythropoiesis.

Folic Acid (Generic Name)

### PHARMACOKINETICS

PO form almost completely absorbed from the GI tract (upper duodenum). Protein binding: High. Metabolized in the liver and plasma to active form. Excreted in urine. Removed by hemodialysis.

### AVAILABILITY

Tablets: 0.4 mg, 0.8 mg, 1 mg. Injection: 5 mg/mL.

# INDICATIONS AND DOSAGES Folic Acid deficiency

PO, IV, IM, Subcutaneous Adults, Elderly, Children 12 yr and older. Initially, 1 mg/day. Maintenance: 0.5 mg/day. Children 1-11 yr. Initially 1 mg/day. Maintenance: 0.1-0.4 mg/day. Infants. 50 mcg/day.

#### Dietary supplement

PO, IV, IM, SUBCUTANEOUS Adults, Elderly, Children 4 yr and older: 0.4 mg/day. Children 1 to less than 4 yr. 0.3 mg/day. Children younger than 1 yr. 0.1 mg/day. Pregnant women. 0.8 mg/day.

### CONTRAINDICATIONS

Previous folic acid hypersensitivity. Administration of folic acid monotherapy is improper for pernicious anemia and other megaloblastic anemias in which vitamin B<sub>12</sub> is deficient.

### INTERACTIONS

#### Drug

Analgesics, carbamazepine,

estrogens: May increase folic acid requirements.

Antacids, cholestyramine: May decrease the absorption of folic acid.

**Hydantoin anticonvulsants:** May decrease the effects of these drugs (rare).

#### Methotrexate, triamterene,

trimethoprim: May antagonize the effects of folic acid. Herbal and Food None known.

### **DIAGNOSTIC TEST EFFECTS**

May decrease vitamin  $B_{12}$  concentration.

### IV INCOMPATIBILITIES

Amikacin, calcium chloride, diazepam, dobutamine, doxycycline, gentamicin, haloperidol, hydralazine, inamrinone, methyldopate, morphine, nafcillin, nalbuphine, norepinephrine, phenytoin, promethazine, protamine, tobramycin, verapamil.

### SIDE EFFECTS

No adverse effects commonly reported at usual doses. At high doses (15 mg/day or more) patients may report insomnia, bad taste, nausea, irritability, or other similar effects.

### SERIOUS REACTIONS

• Allergic hypersensitivity occurs rarely.

### PRECAUTIONS & CONSIDERATIONS

Use with extreme caution in patients with undiagnosed anemia. Folic acid corrects the hematologic manifestations of pernicious anemia, while the neurologic complications progress, potentially causing irreversible central nervous system effects. Doses above 0.4 mg/day should be avoided until the diagnosis of pernicious anemia is ruled out. Folic acid is distributed in breast milk. No age-related precautions have been noted in children or elderly patients. Eating foods rich in folic acid, including fruits, vegetables, and organ meats, is encouraged.

Therapeutic improvement, including improved sense of wellbeing and relief from iron deficiency symptoms, such as fatigue, headache, pallor, dyspnea, and sore tongue, should be assessed. Be aware that persons with alcoholism, decreased hematopoiesis, or deficiency of vitamin  $B_6$ ,  $B_{12}$ , C, or E and those using antimetabolic drugs may develop a resistance to treatment. **Storage** 

Store at room temperature protected from light. Folic acid injection mixed in D5W, 0.9% NaCl, or TPN is stable for 24 h at room temperature.

#### Administration

May give orally without regard to food.

Folic acid injection may be given IV, IM, or subcutaneously. For IV use, may give IV directly at a rate of 5 mg over at least 1 min. For infusion, may add dose to any large-volume or piggyback solution containing D5W or saline, or a mixure thereof. May be added to TPN solution.

### Fondaparinux

fawn-da-pear'ih-nux

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anticoagulants, factor Xa inhibitors

### MECHANISM OF ACTION

A factor Xa inhibitor and pentasaccharide that selectively binds to antithrombin and increases its affinity for factor Xa, thereby inhibiting factor Xa and stopping the blood coagulation cascade. *Therapeutic Effect:* Indirectly prevents formation of thrombin and subsequently the fibrin clot.

#### PHARMACOKINETICS

Well absorbed after subcutaneous administration. Undergoes minimal, if any, metabolism. Highly bound to antithrombin III. Distributed mainly in blood and to a minor extent in extravascular fluid. Excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 17-21 h (prolonged in patients with impaired renal function).

#### AVAILABILITY

*Injection, Prefilled Syringes:* 2.5 mg/0.5 mL, 5 mg/0.4 mL, 7.5 mg/0.6 mL, 10 mg/0.8 mL.

# INDICATIONS AND DOSAGES Prevention of venous thromboembolism

SUBCUTANEOUS Adults 50 kg or greater. 2.5 mg once a day for 5-9 days after surgery. Initial dose should be given 6-8 h after surgery. Only approved for patients weighing 50 kg or more. Adults less than 50 kg: Contrain diosted for this indication

Contraindicated for this indication.

▶ Treatment of pulmonary embolism or DVT in conjunction with warfarin Adults. 5 mg SC once daily; if < 50 kg, 50-100 kg 7.5 mg SC once daily; if > 100 kg, 10 mg SC once daily. Usual duration 5-9 days; continue until warfarin treatment achieves INR 2-3.

Dosage in renal impairment Adults. Use cautiously in those with CrCl 30-50 mL/min: CrCl < 30 mL/min: Contraindicated.

#### CONTRAINDICATIONS

Active major bleeding, bacterial endocarditis, severe renal impairment (with creatinine clearance < 30 mL/min), thrombocytopenia associated with

### Fomepizole

foe-mep'i-zoll Antizol Do not confuse fomepizole with omeprazole.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antidotes

### **MECHANISM OF ACTION**

An alcohol dehydrogenase inhibitor that inhibits the enzyme that catalyzes the metabolism of ethanol, ethylene glycol, and methanol to their toxic metabolites. *Therapeutic Effect:* Inhibits conversion of ethylene glycol and methanol into toxic metabolites.

### PHARMACOKINETICS

Protein binding: Low. Rapidly distributes to total body water after IV infusion. Extensively metabolized by the liver. Minimal excretion in the urine. Removed by hemodialysis. *Half-life:* 5 h.

### AVAILABILITY

Solution for Injection: 1 g/mL (Antizol).

### INDICATIONS AND DOSAGES • Ethylene glycol or methanol intoxication

IV INFUSION

Adults, Elderly. 15 mg/kg as loading dose, followed by 10 mg/ kg q12h for 4 doses, then 15 mg/ kg q12h until ethylene glycol or methanol concentrations are below 20 mg/dL. All doses should be administered as a slow IV infusion over 30 min.

#### Dosage in renal impairment

During hemodialysis: 15 mg/kg as a loading dose, followed by 10 mg/kg q4h for 4 doses, then 15 mg/kg q4h until ethylene glycol or methanol concentrations are below 20 mg/dL.

After hemodialysis: If the time between the last dose and end of hemodialysis is < 1 h, do not give dose. If the time between is 1-3 h, give 50% of next scheduled dose. If time is > 3 h, give next scheduled dose.

### **OFF-LABEL USES**

Butoxyethanol intoxication, diethylene glycol intoxication, ethanol sensitivity.

### CONTRAINDICATIONS

Hypersensitivity to fomepizole or other pyrazoles.

### INTERACTIONS

Drug Alcohol: May reduce elimination of both drugs. Herbal and Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### IV INCOMPATIBILITIES

Data not available.

### SIDE EFFECTS

#### Frequent

Hypertriglyceridemia, headache, nausea, dizziness.

### Occasional

Abnormal sense of smell, nystagmus, visual disturbances, ringing in ears, agitation, seizures, anorexia, heartburn, anxiety, vertigo, light-headedness, altered sense of awareness.

#### Rare

Anuria, disseminated intravascular coagulopathy.

#### SERIOUS REACTIONS

Mild allergic reactions including rash and eosinophilia occur rarely.
Overdose may cause nausea, dizziness, and vertigo.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with liver disease or renal impairment. Dialysis should be considered in addition to fomepizole in cases of renal failure. If < 6 h has passed since the last dose, do not give dose. If more than 6 h has passed since the last dose, give the next scheduled dose. It is unknown whether fomepizole crosses the placenta or is distributed in breast milk. Safety and efficacy of fomepizole have not been established in children. Age-related renal impairment may require dosage adjustment in elderly patients.

Monitor for signs or symptoms of allergic reactions during

administration. This medication is given to treat antifreeze or windshield wiper fluid ingestion. If not treated, these poisons will cause kidney damage, eye damage, seizures, coma, and possibly death.

### Storage

Do not freeze. Store unopened vial at room temperature. Fomepizole solidifies at temperatures less than 77° F. If solid in the vial, the solution should be liquefied by running the vial under warm water or by holding in the hand.

Solidification does not affect the efficacy, safety, or stability of the solution. Once mixed for infusion, the infusion solution should be used within 24 h.

#### Administration

Dilute in at least 100 mL of 0.9% NaCl or D5W. Administer fomepizole as a slow IV infusion over 30 min. Do not give undiluted or by bolus injection. antiplatelet antibody formation in the presence of fondaparinux.

### INTERACTIONS

#### Drug

Anticoagulants, platelet inhibitors, thrombolytics: May increase risk of bleeding.

#### Herbal

Ginger, gingko: May increase risk of bleeding.

Food

None known.

### DIAGNOSTIC TEST EFFECTS

Increases reversible serum creatinine, AST (SGOT), and ALT (SGPT) levels. May decrease hemoglobin, hematocrit, and platelet count.

NOTE: The anti-factor Xa activity of the drug can be measured by anti-Xa assay using appropriate calibrator (fondaparinux); it cannot be compared with activities of heparin or low-molecular-weight heparins.

### SIDE EFFECTS

Occasional (14%) Fever.

Rare (1%-4%)

Injection site hematoma, nausea, peripheral edema.

### SERIOUS REACTIONS

 Accidental overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage.

· Thrombocytopenia occurs rarely.

### **PRECAUTIONS & CONSIDERATIONS**

The needle guard of prefilled syringe contains natural latex rubber; use caution in those with latex sensitivity. Caution is warranted in patients with conditions associated with increased risk of hemorrhage, such as concurrent use of antiplatelet agents, GI ulceration, hemophilia,

history of cerebrovascular accident, severe uncontrolled hypertension, history of heparin-induced thrombocytopenia, impaired renal function, indwelling epidural catheter or neuraxial anesthesia, and in elderly patients. Fondaparinux should be used with caution in pregnant women, particularly during the last trimester and immediately postpartum, because it increases the risk of maternal hemorrhage. It is unknown whether fondaparinux is excreted in breast milk. Safety and efficacy of fondaparinux have not been established in children. In elderly patients, age-related decreased renal function may increase the risk of bleeding. Women may experience heavier menstrual flow. Other medications, including OTC drugs, should be avoided. An electric razor and soft toothbrush should be used to prevent bleeding during therapy.

Notify the physician of bleeding from surgical site, chest pain, dyspnea, severe or sudden headache, swelling in the feet or hands, unusual back pain, bruising, weakness, black or red stool, coffeeground vomitus, dark or red urine, or red-speckled mucus from cough. Monitor for neurologic impairment; promptly report any changes in neurologic status. CBC, BUN and creatinine levels, BP, pulse, and stool of occult blood should be monitored. Be aware of signs of bleeding, including bleeding at injection or surgical sites or from gums, blood in stool, bruising, hematuria, and petechiae. Storage

Store at room temperature. Do not freeze. The parenteral form normally appears clear and colorless; discard if discoloration or particulate matter is noted.

#### Administration

For subcutaneous use only. Do not expel the air bubble from the prefilled syringe before injection to avoid expelling drug. Pinch a fold of the patient's skin at the injection site between the thumb and forefinger. Introduce the entire length of subcutaneous needle into the skinfold. Inject into fatty tissue between the left and right anterolateral or the left and right posterolateral abdominal wall. Rotate injection sites.

### Formoterol

for-moe'ter-ol ★ Foradil Aerolizer, Perforomist ◆ Foradil, Oxeze Turbuhaler Do not confuse Foradil with Fortical or Toradol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C **Classification:** Respiratory agents, adrenergic agonists, bronchodilators, long-acting  $\beta_2$ agonist (LABA)

#### **MECHANISM OF ACTION**

A long-acting bronchodilator that stimulates  $\beta_2$ -adrenergic receptors in the lungs, resulting in relaxation of bronchial smooth muscle. Also inhibits release of mediators from various cells in the lungs, including mast cells, with little effect on heart rate. *Therapeutic Effect:* Relieves bronchospasm, reduces airway resistance. Improves bronchodilation, nighttime asthma control, and peak flow rates.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	1-3 min	0.5-1 h	12 h

Absorbed from bronchi after inhalation. Metabolized in the liver. Primarily excreted in urine. Unknown if removed by hemodialysis. *Half-life*: 10 h.

#### AVAILABILITY

Inhalation Powder in Capsules: 12 mcg. Nebulizer Solution: 20 mcg/2 mL.

#### INDICATIONS AND DOSAGES

 Asthma, chronic obstructive pulmonary disease (COPD), exercise-induced bronchospasm INHALATION

*Adults, Elderly, Children 5 yr and older.* 12 mcg q12h. NEBULIZER INHALATION

(COPD)

Adults, Elderly. 20 mcg nebulized twice daily, morning and evening.

#### Exercise-induced bronchospasm INHALATION

Adults, Elderly, Children 5 yr and older: 12 mcg at least 15 min before exercise. Do not repeat for another 12 h.

### CONTRAINDICATIONS

Status asthmaticus. Formoterol should always be administered in conjunction with an inhaled corticosteroid; use without corticosteroid treatment is contraindicated.

#### INTERACTIONS

#### Drug

**β-Blockers:** May antagonize formoterol's bronchodilating effects. **Diuretics, steroids, xanthine derivatives:** May increase the risk of hypokalemia.

Drugs that can prolong QT interval (including erythromycin, quinidine, and thioridazine), MAOIs, tricyclic antidepressants: May potentiate cardiovascular effects.

#### **Herbal and Food**

None known.

### DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level. May increase blood glucose level.

#### SIDE EFFECTS

#### Occasional

Tremor, muscle cramps, tachycardia, insomnia, headache, irritability, irritation of mouth or throat.

### SERIOUS REACTIONS

• Excessive sympathomimetic stimulation may produce palpitations, extrasystole, and chest pain.

#### PRECAUTIONS & CONSIDERATIONS

Formoterol use may increase risk of asthma-related events, such as hospitalization or mortality: use only as adjunct therapy along with other controller medications (such as a corticosteroid) Caution is warranted in patients with cardiovascular disease, hypertension, a seizure disorder, and thyrotoxicosis. It is unknown whether formoterol crosses the placenta or is distributed in breast milk. The safety and efficacy of formoterol have not been established in children vounger than 5 vr. The nebulizer solution is approved only in adults. Elderly patients may be more prone to tachycardia and tremor because of increased sensitivity to sympathomimetics. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Monotherapy with formoterol may increase risk of asthma-related events, such as hospitalization or mortality.

Pulse rate and quality, ECG, respiratory rate, depth, rhythm, and type, ABG, and serum potassium levels should be monitored. Keep a log of measurements of peak flow readings.

### Storage

Before dispensing, store nebulizer solution in refrigerator. After dispensing, may be stored at room temperature for up to 3 mo. The nebulizer solution should remain in the foil pouch until just prior to use. Formoterol capsules for inhalation are kept at room temperature, protected from heat and moisture, in original packaging.

#### Administration

Keep capsules in individual blister packs until immediately before use. Do not swallow the capsules. Do not use with a spacer. Pull off the aerolizer inhaler cover. twisting the mouthpiece in the direction of the arrow to open. Place the capsule in the chamber and twist the mouthpiece closed. Press both buttons on the side of the aerolizer only once. This action punctures the capsule. Exhale completely, then place mouth on the mouthpiece and close the lips. Inhale quickly and deeply through the mouth, which causes the capsule to spin and dispense the drug. Hold breath for as long as possible before exhaling slowly. Check the capsule to make sure all the powder is gone. If not, inhale again to receive the rest of the dose. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness. Never swallow capsules orally. Never wash the aerolizer inhaler.

The nebulizer solution should be administered using a standard jet nebulizer connected to an air compressor. Do not mix with any other drugs.

#### **Fosamprenavir**

fos'am-pren-a-veer

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antivirals, protease inhibitors

### **MECHANISM OF ACTION**

An antiretroviral that is rapidly converted to amprenavir, which inhibits HIV-1 protease by binding to the enzyme's active site, thus preventing the processing of viral precursors and resulting in the formation of immature, noninfectious viral particles. *Therapeutic Effect:* Impairs HIV replication and proliferation.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 90%. Metabolized in the liver. Excreted in urine and feces. *Half-life:* 7.7 h.

### AVAILABILITY

*Tablets:* 700 mg (equivalent to 600 mg amprenavir). *Oral Suspension:* 50 mg/mL (equivalent to 43 mg/mL amprenavir).

#### INDICATIONS AND DOSAGES

### HIV infection in patients who have not had previous protease inhibitor therapy

PO

*Adults, Elderly.* 700 mg given with ritonavir (100 mg) twice daily OR 1400 mg once daily (without ritonavir) OR 1400 mg with ritonavir (100 or 200 mg) once daily. Children 6 yr and older. Oral suspension 30 mg/kg twice daily (maximum 1400 mg twice daily) OR 18 mg/kg (not to exceed 700 mg) plus ritonavir (3 mg/kg, maximum 100 mg/dose) given twice daily. Those  $\geq$  39 kg may receive tablets; those at least 47 kg may receive adult dose regimen.

*Children 2 to 5 yr*. Oral suspension 300 mg/kg twice daily (not to exceed 1400 mg twice daily).

### HIV infection in patients who have had previous protease inhibitor therapy

PO

Adults, Elderly. 700 mg twice daily plus ritonavir 100 mg twice daily. Children 6 yr and older. Oral suspension 18 mg/kg (maximum 700 mg) plus ritonavir (3 mg/kg, maximum 100 mg) given twice daily. Those  $\geq$  39 kg may receive tablets; those at least 47 kg may receive adult regimen.

#### Concurrent therapy with efavirenz PO

*Adults, Elderly.* In patients receiving fosamprenavir plus once-daily ritonavir with efavirenz, an additional 100 mg/day ritonavir (300 mg total/day) should be given.

> Dosage in hepatic impairment Consult prescribing information. Dosages must be adjusted in moderate and severe hepatic impairment.

### CONTRAINDICATIONS

Clinically significant hypersensitivity to fosamprenavir *or* amprenavir. Contraindicated when coadministered with drugs highly dependent on CYP3A4 metabolism when elevated concentrations are associated with serious and/or life-threatening events (see drug interactions and prescribing information). Also see ritonavir contraindications.

### INTERACTIONS

#### Drug

NOTE: The following drugs are CONTRAINDICATED with fosamprenavir:

Alfuzosin: Increased alfuzosin levels and severe hypotension.

**Cisapride, pimozide:** Risk of lifethreatening cardiac arrhythmias.

**Delavirdine:** May cause loss of virologic response to delavirdine, with possible resistance emergence.

Flecainide and propafenone: If used with ritonavir, significant increases in cardiac drug levels and toxicity.

Ergotamine and other ergot alkaloids: May cause ergot toxicity. HMG-CoA reductase inhibitors (statins) (lovastatin and simvastatin): Increased risk of

myopathy.

Midazolam, triazolam: Risk for over sedation and prolonged sedation.

**PDE5 inhibitors (e.g., sildenafil for pulm HTN):** May increase risk for priapism, hypotension.

**Rifampin:** Decreases fosamprenavir blood concentration and reduces antiviral activity.

OTHER IMPORTANT INTERACTIONS:

Antacids, didanosine: May decrease the absorption of fosamprenavir.

**Carbamazepine, phenobarbital, phenytoin:** May decrease the fosamprenavir blood concentration.

Amiodarone, cyclosporine, and other immunosuppressants,

warfarin: May increase blood levels of many medicatons; carefully monitor drugs with narrow therapeutic index.

### Herbal

**St. John's wort:** May decrease the fosamprenavir blood concentration. Contraindicated.

### Food

None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum lipase, triglyceride, AST (SGOT), and ALT (SGPT) levels. May increase blood sugar or decrease WBC count.

### SIDE EFFECTS

Frequent

Nausea, rash, diarrhea.

### Occasional

Headache, vomiting, fatigue, depression, fat redistribution syndrome/buffalo hump, hyperglycemia, hyperlipidemia. **Rare** 

Pruritus, abdominal pain, perioral paresthesia.

### SERIOUS REACTIONS

• Severe and possibly lifethreatening dermatologic reactions occur rarely.

• Other potentially serious reactions include acute hemolytic anemia, new-onset diabetes, nephrolithiasis, immune reconstitution syndrome.

• Hepatitis or reactivation of hepatitis B or C.

• Increased risk of bleeding noted in patients with hemophilia.

### **PRECAUTIONS & CONSIDERATIONS**

Fosamprenavir contains a sulfonamide moiety; use with caution in those allergic to sulfonamide-class drugs. Extreme caution should be used with liver impairment. Caution is also warranted in patients with diabetes mellitus, impaired renal function, and in elderly patients. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Use with caution during pregnancy. Fosamprenavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.

Obtain baseline lab values, including blood glucose, serum lipase, SGPT (ALT), SGOT (AST), and serum triglyceride levels. Find out which other drugs the person is taking. Report any side effects, including rash or diarrhea.

#### Storage

Tablets are stored at room temperature tightly closed. Suspension may be at room temperature or refrigerated; do not freeze. Refrigeration may help palatability of oral suspension.

### Administration

Do not chew, crush, or break filmcoated tablets. May take without regard to food. Shake oral suspension well before each use.

### **Fosaprepitant**

fos'a-pre'pi-tant temend IV Do not confuse fosaprepitant with aprepitant.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiemetics, substance P antagonists

### **MECHANISM OF ACTION**

A selective human substance P and neurokinin-1 (NK1) receptor antagonist that inhibits chemotherapy-induced nausea and vomiting by crossing the blood-brain barrier to act centrally to occupy receptors in the chemoreceptor trigger zone. *Therapeutic Effect:* Prevents the acute and delayed phases of

chemotherapy-induced emesis, including vomiting caused by highdose cisplatin.

### PHARMACOKINETICS

A prodrug that is rapidly converted to aprepitant after administration (within 30 min). The mean aprepitant plasma concentration 24 h after an infusion of fosaprepitant 115 mg IV is similar to that seen with aprepitant 125 mg PO. Plasma protein binding: 95%. Crosses the blood-brain barrier. Aprepitant is extensively metabolized in the liver to weakly active metabolites and is not excreted renally. *Half-life:* 9-13 h.

### AVAILABILITY

*Powder for Injection:* 115-mg vial. NOTE: See aprepitant monograph for oral form.

### INDICATIONS AND DOSAGES

 Prevention of chemotherapyinduced nausea and vomiting IV INFUSION

Adults, Elderly. 115 mg given 30 min prior to chemotherapy as an alternative to the first dose of oral aprepitant on day 1 of the aprepitant-CINV regimen (see aprepitant monograph). Given as part of regimens that include a steroid and a 5-HT3 antagonist.

### CONTRAINDICATIONS

Hypersensitivity to fosaprepitant, aprepitant, or polysorbate 80. Concurrent use of pimozide (Orap), cisapride (Propulsid) is contraindicated due to risk of cardiac arrhythmias.

### INTERACTIONS

#### Drug

Alprazolam, docetaxel, etoposide, ifosfamide, imatinib, irinotecan,

# midazolam, paclitaxel, triazolam, vinblastine, vincristine,

vinorelbine: May increase the plasma concentrations of these drugs that are substrates for CYP3A4.

Antifungals, clarithromycin, diltiazem, nefazodone, nelfinavir, ritonavir: Increase aprepitant plasma concentration; diltiazem concentration may increase.

**Carbamazepine**, phenytoin, rifampin: Decrease aprepitant plasma concentration.

Contraceptives: May decrease the effectiveness of estrogen or progestin contraceptives. Alternative or backup methods of contraception should be used during treatment and for 1 mo following the last dose.

**Corticosteroids:** Increase levels of systemic corticosteroids. If the patient is also receiving a steroid, expect to reduce the IV steroid dose by 25% and the oral dose by 50%. **Paroxetine:** May decrease the effectiveness of either drug. **Warfarin:** Fosaprepitant is an inducer of isoenzyme CYP2C9, an enzyme involved in warfarin metabolism. May decrease the effectiveness of warfarin. Monitor INR.

#### Herbal

St. John's wort: May decrease aprepitant levels. Food None.

### IV INCOMPATIBILITIES

Do not dilute or infuse with any solutions containing divalent cations (e.g., calcium or magnesium), including lactated Ringer's or Hartmann's solution, calcium chloride, calcium gluconate, TPN, magnesium sulfate.

### DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum creatinine, AST (SGOT), and ALT (SGPT) levels. May produce proteinuria.

#### SIDE EFFECTS

Extrapolated from data with oral aprepitant.

#### **Frequent** (≥ 10%)

Fatigue, nausea, hiccups, diarrhea, constipation, anorexia.

### Occasional (4%-9%)

Headache, vomiting, dizziness, dehydration, heartburn or epigastric discomfort, infusion site reactions, tinnitus.

Rare (≤ 3%)

Abdominal pain, gastritis, insomnia, hyperpyrexia.

#### SERIOUS REACTIONS

 Neutropenia and mucous membrane disorders occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Chronic use of this drug is not recommended. Use caution in hepatic impairment; there are no data in patients with severe hepatic impairment. It is unknown whether fosaprepitant crosses the placenta or is distributed in breast milk. The safety and efficacy of fosaprepitant have not been established in children. No agerelated precautions have been noted in elderly patients.

Nausea and vomiting should be relieved shortly after drug administration. Notify the physician if headache or persistent vomiting occurs. Pattern of daily bowel activity and stool consistency should be assessed.

#### Storage

Store vials under refrigeration in original package. Do not freeze. The IV infusion, once prepared,
is stable for 24 h at ambient room temperature.

### Administration

As prescribed, fosaprepitant is given with corticosteroids and a serotonin (5-HT3) antagonist when given prior to chemotherapy.

Fosaprepitant is for intravenous infusion only. To prepare the IV infusion: Dilute vial with 5 mL of 0.9% NaCl (NS), directing toward the wall of the vial to prevent foaming. Swirl the vial gently. Prepare an infusion bag filled with 110 mL of NS. Withdraw the dose from the vial and transfer to the infusion bag. The total volume will be 115 mL, with a final concentration of 1 mg/1 mL. Gently invert the bag 2 to 3 times. Infuse IV over 15 minutes.

### Foscarnet

foss-car'net ★ Foscavir

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antivirals

### **MECHANISM OF ACTION**

An antiviral that selectively inhibits binding sites on virusspecific DNA polymerase and reverse transcriptase. *Therapeutic Effect:* Inhibits replication of herpes virus.

### PHARMACOKINETICS

Sequestered into bone and cartilage. Protein binding: 14%-17%. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 3.3-6.8 h (increased in impaired renal function).

### AVAILABILITY

Injection: 24 mg/mL.

### INDICATIONS AND DOSAGES

### Cytomegalovirus (CMV) retinitis IV

Adults, Elderly. Initially, 60 mg/kg q8h or 100 mg/kg q12h for 2-3 wks. Maintenance: 90-120 mg/kg/day as a single IV infusion.

# Herpes infection (resistant cases)

### IV

*Adults.* 40 mg/kg q8-12h for 2-3 wks or until healed.

Dosage in renal impairment

Dosages are individualized based on creatinine clearance. Refer to the dosing guide provided by the manufacturer.

### CONTRAINDICATIONS

None known.

### INTERACTIONS

### Drug

Nephrotoxic medications: May increase the risk of nephrotoxicity. Pentamidine (IV): May cause reversible hypocalcemia, hypomagnesemia, and nephrotoxicity. Zidovudine (AZT): May increase the risk of anemia. Herbal and Food

None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May decrease serum magnesium and potassium levels. May alter serum calcium and phosphate concentrations.

### IV INCOMPATIBILITIES

Acyclovir (Zovirax), amphotericin B (Fungizone), co-trimoxazole (Bactrim), diazepam (Valium), digoxin (Lanoxin), diphenhydramine (Benadryl), dobutamine (Dobutrex), droperidol (Inapsine), ganciclovir (Cytovene), haloperidol (Haldol), leucovorin, midazolam (Versed), pentamidine (Pentam IV), prochlorperazine (Compazine), vancomycin (Vancocin). Also incompatible with any divalent cations, such as calcium or magnesium.

### 🗏 IV COMPATIBILITIES

Dopamine (Intropin), heparin, hydromorphone (Dilaudid), lorazepam (Ativan), morphine, potassium chloride.

### SIDE EFFECTS

### Frequent

Fever (65%); nausea (47%); vomiting, diarrhea (30%). Occasional ( $\geq$  5%)

### Anorexia, pain and inflammation at injection site, fever, rigors, malaise, headache, paresthesia, dizziness, rash, diaphoresis, abdominal pain.

### Rare (1%-5%)

Back or chest pain, edema, flushing, pruritus, constipation, dry mouth.

### SERIOUS REACTIONS

 Nephrotoxicity occurs to some extent in most patients.

 Seizures and serum mineral or electrolyte imbalances may be life threatening.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with altered serum calcium or other serum electrolyte levels, a history of renal impairment, or cardiac or neurologic abnormalities. Be aware that it is unknown whether foscarnet is distributed in breast milk. Be aware that the safety and efficacy of foscarnet have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment.

The severity of renal impairment is reduced by ensuring sufficient fluid intake to promote diuresis before and during dosing. Frequent monitoring of renal parameters, such as serum creatinine, is essential. Signs and symptoms of anemia, such as bleeding, superinfections, and tremors, should be assessed. Institute safety measures for potential seizures. Report numbness in the extremities, paresthesias, or perioral tingling, during or after infusion, as this may indicate electrolyte abnormalities.

### Storage

Store parenteral vials at room temperature. After dilution, foscarnet is stable for 24 h at room temperature. Do not use if foscarnet solution is discolored or contains particulate material.

### Administration

Use the standard 24 mg/mL solution without diluting it when a central venous catheter is used for infusion; the 24 mg/mL solution must be diluted to 12 mg/mL when giving the drug through a peripheral vein catheter. Use only D5W or 0.9% NaCl injection for dilution. Because foscarnet dosage is calculated on body weight, remove the unneeded quantity before the start of infusion to avoid overdosage. Use an IV infusion pump to administer foscarnet and prevent accidental overdose. Use aseptic technique and administer the solution within 24 h of the first entry into the sealed bottle. Do not give foscarnet as an IV injection or by rapid infusion because these routes increase the drug's

toxicity. Administer foscarnet by IV infusion at a rate not faster than 1 h for doses up to 60 mg/kg and 2 h for doses > 60 mg/kg. To minimize the risk of phlebitis and toxicity, use central venous lines or veins with an adequate blood flow to permit rapid dilution and dissemination of foscarnet. Administer hydration fluid with each dose.

### Fosfomycin

foss-fo-mye'sin Monurol Do not confuse Monurol with Monopril.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antibiotics, miscellaneous, antiseptics, urinary tract

### **MECHANISM OF ACTION**

An antibiotic that prevents bacterial cell wall formation by inhibiting the synthesis of peptidoglycan. *Therapeutic Effect:* Bactericidal.

### AVAILABILITY

Powder for Oral Solution: 3 g.

### INDICATIONS AND DOSAGES

 Uncomplicated urinary tract infection in females PO
 Females. 3 g mixed in 4 oz water as a single dose.
 Uncomplicated urinary tract infection in males

### Males. 3 g/day for 2-3 days.

### CONTRAINDICATIONS

Known hypersensitivity to fosfomycin.

### INTERACTIONS Drug

Metoclopramide: Lowers serum concentration and urinary excretion of fosfomycin. Herbal and Food None known.

### **DIAGNOSTIC TEST EFFECTS**

May increase blood eosinophil count and serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels. May alter platelet and WBC counts. May decrease blood hematocrit and hemoglobin levels.

### SIDE EFFECTS

Occasional (3%-9%)

Diarrhea, nausea, headache, back pain, dizziness, rhinitis.

Rare (< 2%)

Dysmenorrhea, pharyngitis, abdominal pain, rash.

### SERIOUS REACTIONS

• Rare reports of serious hypersensitivity such as angioedema or hepatic reactions.

• Potential for superinfection with prolonged use.

### **PRECAUTIONS & CONSIDERATIONS**

Symptoms should improve 2-3 days after the dose of fosfomycin. Use with caution during pregnancy and lactation. Safety and efficacy not established in children under 12 yr. **Storage** 

### Store sachets at room temperature. Administration

Take fosfomycin without regard to food. Always mix with 3-4 oz of water before consuming. Do not use with hot water. Duration of treatment is always a single dose.

### Fosinopril

fo-sin'o-pril Monopril Do not confuse Monopril with Monurol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

### Classification:

Antihypertensives, angiotensinconverting enzyme inhibitors

### **MECHANISM OF ACTION**

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system and prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. Decreases plasma angiotensin II, increases plasma renin activity, and decreases aldosterone secretion. *Therapeutic Effect*: Reduces peripheral arterial resistance, pulmonary capillary wedge pressure; improves cardiac output, exercise tolerance.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	2-6 h	24 h

Slowly absorbed from the GI tract. Protein binding: 97%-98%. Metabolized in the liver and GI mucosa to active metabolite. Primarily excreted in urine. Minimal removal by hemodialysis. *Half-life:* 11.5 h.

### AVAILABILITY

Tablets: 10 mg, 20 mg, 40 mg.

### INDICATIONS AND DOSAGES Hypertension (monotherapy)

### р РО

Adults, Elderly. Initially, 10 mg/day. Maintenance: 20-40 mg/day. Maximum: 80 mg/day.

# Hypertension (with diuretic) PO

*Adults, Elderly.* Initially, 10 mg/day titrated to patient's needs.

### Heart failure PO

*Adults, Elderly.* Initially, 10 mg once daily. Use 5 mg initially if patient has hypovolemia or moderate to severe renal impairment or is vigorously treated with diuretics. Maintenance: 20-40 mg/day. Target dose: 40 mg/ day if tolerated.

### **OFF-LABEL USES**

Treatment of diabetic and nondiabetic nephropathy, postmyocardial infarction, left ventricular dysfunction, renal crisis in scleroderma.

### CONTRAINDICATIONS

Hypersensitivity or history of angioedema from previous treatment with ACE inhibitors, idiopathic or hereditary angioedema, bilateral renal artery stenosis.

### INTERACTIONS

### Drug

Alcohol, antihypertensives,

**diuretics:** May increase the effects of fosinopril.

**Lithium:** May increase lithium blood concentration and risk of lithium toxicity.

NSAIDs: May decrease the effects of fosinopril.

Potassium-sparing diuretics,

drospirenone, eplerenone,

**potassium supplements:** May cause hyperkalemia.

Fosinopril (Generic Name)

### **Herbal and Food**

None known.

### DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer.

### SIDE EFFECTS

Frequent (9%-12%)

Dizziness, cough. Occasional (2%-4%)

Hypotension, nausea, vomiting, upper respiratory tract infection, hyperkalemia.

### SERIOUS REACTIONS

 Excessive hypotension (first-dose syncope) may occur in patients with congestive heart failure and in those who are severely salt and volume depleted.

• Angioedema (swelling of face and lips) occurs rarely.

• Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in those with history of renal disease.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with cerebrovascular and coronary insufficiency, hypovolemia, renal impairment, sodium depletion, and those on dialysis or receiving diuretics. Fosinopril crosses the placenta, is distributed in breast milk, and may cause fetal or neonatal morbidity or mortality. Safety and efficacy of fosinopril have not been established in children. Neonates and infants may be at increased risk for neurologic abnormalities and oliguria. Elderly patients may be more sensitive to the hypotensive effects of fosinopril.

Dizziness may occur. BP should be obtained immediately before giving each fosinopril dose, in addition to regular monitoring. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the person in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning fosinopril therapy, then every 2 wks for the next 3 mo, and periodically thereafter in patients with autoimmune disease or renal impairment, and in those who are taking drugs that affect immune response or leukocyte count. BUN, serum creatinine, and serum potassium should also be monitored in those who are receiving a diuretic. Crackles and wheezes should be assessed in persons with congestive heart failure.

### Storage

Store at room temperature. Administration

Take fosinopril without regard to food. Crush tablets if necessary.

### Fosphenytoin

fos-fen'i-toyn Cerebyx Do not confuse Cerebyx with Celebrex or Celexa.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: D

**Classification:** Anticonvulsants, hydantoins

### **MECHANISM OF ACTION**

A hydantoin anticonvulsant that stabilizes neuronal membranes by decreasing sodium and calcium ion influx into the neurons. Also decreases post-tetanic potentiation and repetitive discharge. *Therapeutic Effect:* Decreases seizure activity.

### PHARMACOKINETICS

Completely absorbed after IM administration. Protein binding: 95%-99%. Rapidly and completely hydrolyzed to phenytoin after IM or IV administration. Time of complete conversion to phenytoin: 4 h after IM injection; 2 h after IV infusion. *Half-life:* 8-15 min (for conversion to phenytoin).

### AVAILABILITY

*Injection:* 75 mg/mL (equivalent to 50 mg/mL phenytoin).

### INDICATIONS AND DOSAGES

Status epilepticus

IV

*Adults.* Loading dose: 15-20 mg phenytoin equivalent (PE)/kg infused at rate of 100-150 mg PE/min.

### Nonemergent seizures

IV, IM

*Adults.* Loading dose: 10-20 mg PE/kg. Maintenance: 4-6 mg PE/kg/day.

### Short-term substitution for oral phenytoin

IM, IV

*Adults.* May substitute for oral phenytoin at same total daily dose of phenytoin equivalent (PE).

### CONTRAINDICATIONS

Adams-Stokes syndrome, hypersensitivity to fosphenytoin or phenytoin, second- or third-degree AV block, severe bradycardia, sinoatrial block.

### INTERACTIONS

### Drug

NOTE: Like phenytoin, fosphenytoin induces the metabolism of many important drugs.

Alcohol, other CNS depressants: May increase CNS depression. Amiodarone, anticoagulants, cimetidine, disulfiram, fluoxetine, isoniazid, sulfonamides: May increase fosphenytoin blood concentration, effects, and risk of toxicity.

Antiretroviral protease inhibitors:

May decrease protease inhibitor blood concentrations, leading to loss of antiviral effect.

Fluconazole, ketoconazole, miconazole: May increase fosphenytoin blood concentration. Glucocorticoids: May decrease the effects of glucocorticoids.

Lidocaine, propranolol: May increase cardiac depressant

effects. Valproic acid: May increase the blood concentration and decrease the metabolism of fosphenytoin.

Theophylline and other xanthines: May increase the metabolism of xanthines.

**Warfarin:** May alter effects of warfarin; monitor INR.

Herbal and Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase blood glucose, serum GGT, and serum alkaline phosphatase levels.

### IV INCOMPATIBILITIES

Caspofungin, doxorubicin, epirubicin, idarubicin, midazolam (Versed), quinupristin-dalfopristin.

### **IV COMPATIBILITIES**

Lorazepam (Ativan), phenobarbital, potassium chloride.

### SIDE EFFECTS

### Frequent

Dizziness, paresthesia, tinnitus, pruritus, headache, somnolence. Occasional Morbilliform rash.

### SERIOUS REACTIONS

 An elevated fosphenytoin blood concentration may produce ataxia, nystagmus, diplopia, lethargy, slurred speech, nausea, vomiting, and hypotension. As the drug level increases, extreme lethargy may progress to coma.

• Too rapid IV infusion may cause hypotension and cardiac arrhythmias.

Blood dyscrasias.

 Hypersensitivity can manifest as serious skin reactions (e.g., Stevens-Johnson syndrome [SJS] toxic epidermal necrolysis [TEN], or drug reaction with eosinophilia and systemic symptoms [dress]) and may be life-threatening.

 Purple glove syndrome (characterized by limb edema, skin discoloration, and pain distal to the injection site) may progress to limb ischemia.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypoalbuminemia, hypotension, hepatic and renal disease, porphyria, and severe myocardial insufficiency. Fosphenytoin use during pregnancy may increase the risk of congenital malformations in the fetus. It is unknown whether fosphenytoin is excreted in breast milk. The safety of this drug has not been established in children. A lower fosphenytoin dosage is recommended for elderly patients.

Drowsiness and dizziness may occur, so alcohol and tasks that require mental alertness or motor skills should be avoided. Assess history of the seizure disorder, including the duration, frequency, and intensity of seizures. BP, ECG, and cardiac and respiratory function should be monitored during and for 10-20 min after infusion. Blood level of fosphenytoin should be assessed 2 h after IV infusion or 4 h after IM injection.

### Storage

Refrigerate unopened vials. Do not store the drug at room temperature for longer than 48 h; discard vials that contain particulate matter. After dilution, the solution is stable for 8 h at room temperature or 24 h if refrigerated.

### Administration

equivalents (PEs).

 Always confirm dosage and injection amount before administration to avoid overdose.
 Know that 150 mg fosphenytoin yields 100 mg phenytoin and that the dose, concentration solution, and infusion rate of fosphenytoin are expressed in terms of phenytoin

For IV use, dilute the drug in D5W or 0.9% NaCl to a concentration of 1.5-25 mg PE/mL. Administer at < 150 mg PE/min to decrease the risk of hypotension and arrhythmias. The elderly, children, and infants may require slower infusion rates not to exceed 3 mg PE/kg/min or 150 mg PE/ min, whichever is less. May also be given IM.

As with all anticonvulsants, therapy is tapered when discontinued, rather than abruptly discontinued.

### Fospropofol

fos-pro-poe'fall ★ ➡ Lusedra

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B Controlled Substance Schedule: IV

**Classification:** Anesthetics, general

### **MECHANISM OF ACTION**

Fospropofol's action is due to the conversion to propofol, a rapidly acting general anesthetic that appears to depress NMDA-mediated excitatory neurotransmission. It also has agonistic activity at the GABA-A receptor. *Therapeutic Effect*: Produces sedation, anesthesia, and amnesia.

### PHARMACOKINETICS

Following IV injection, fospropofol is metabolized by alkaline phosphatases to propofol, the active drug, and formaldehyde. The conversion time results in differences in onset of activity from propofol.

Route	Onset	Peak	Duration
IV	1-20 min	4-13 min	5-15 min after onset

Rapidly and extensively distributed once propofol liberated. Protein binding: 98%. Propofol is metabolized in the liver. Excreted primarily in urine. *Terminal half-life*: 48-60 min.

### AVAILABILITY

Injection Solution: 1050 mg/30 mL.

# INDICATIONS AND DOSAGES Anesthesia

### IV

(NOTE: The manufacturer provides weight-based dose tables for easy conversions)

Adults, American Society of Anesthesiologists (ASA) I and II patients (dose is weight based). > 90 kg: 577.5 mg IV bolus; then supplemental doses up to 140 mg IV/dose to achieve desired level of sedation; give no more frequently than every 4 min; lower doses may be used for lighter sedation if desired.

61-89 kg: 6.5 mg/kg (maximum 577.5 mg) IV bolus; then as needed, give supplemental doses up to 1.6 mg/kg/dose (maximum 140 mg/ dose) IV to achieve desired level of sedation; give no more frequently than every 4 min; lower doses may be used for lighter sedation if desired.  $\leq 60 \text{ kg}$ : 385 mg IV bolus; then as needed, give supplemental doses up to 1.2 mg/kg/dose (maximum of 105 mg IV/dose) to achieve desired level of sedation; give no more frequently than every 4 min; lower doses may be used for lighter sedation if desired. Elderly, Debilitated, Hypovolemic,

*OR ASA III or IV Adult patients* (*dose is weight based*). Use 75% of the standard dosing regimen based on weight.

### CONTRAINDICATIONS None.

### INTERACTIONS

### Drug

Alcohol, narcotics, sedative hypnotics, antipsychotics, skeletal muscle relaxants, general anesthetics, other CNS depressants: May increase hypotensive and CNS and respiratory depressant effects of fospropofol. Herbal None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### **IV INCOMPATIBILITIES**

Do *not* mix with other drugs prior to administration; fospropofol is *not* compatible with midazolam or meperidine and has not been evaluated with other medications.

### SIDE EFFECTS

### Frequent (> 20%)

Paresthesia, pruritus. Involuntary muscle movements, apnea (common during induction; lasts longer than 60 seconds).

### Occasional

Hypotension, nausea, vomiting, twitching, headache, dizziness, fever, abdominal cramps, coldness, cough, hiccups, facial flushing.

### Rare

Agitation, confusion.

### SERIOUS REACTIONS

• Overdose may result in extreme somnolence, respiratory depression, and circulatory depression; metabolites such as formate may contribute to the toxicities.

• Nonsustained ventricular tachycardia has been reported.

 Hypotension may require supportive measures.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disease, hepatic disease, renal disease, severe respiratory disorder, or history of epilepsy. Use with caution in debilitated patients. Consider the risk for hypotension and resultant decreased perfusion in patients with impaired cerebral circulation and monitor closely. Propofol (active component of fospropofol) crosses the placenta and fospropofol is not recommended for obstetric use. Propofol (active component of fospropofol) is distributed in breast milk and fospropofol is not recommended for breastfeeding women. The safety and efficacy of fospropofol have not been established in children. Lower fospropofol dosages are

recommended for elderly or debilitated patients.

Drug should be administered only by qualified personnel trained in anesthesia; resuscitative equipment should be available. Use supplemental oxygen. Frequent monitoring of ECG is recommended. Physician should be notified if patient's respirations are < 10/min and also for possible CNS changes or cardiac or respiratory dysfunction. Vital signs should be obtained before fospropofol administration. ABG levels, BP, heart and respiratory rates, oxygen saturation, depth of sedation should be monitored. Overdosage is treated by discontinuing the drug, using artificial ventilation, volume replacement, vasopressor agents, or other supportive measures. Storage

Store fospropofol at room temperature. Administration

! Do not give fospropofol through the same IV line as blood or plasma. Prepare immediately before use. Draw medication from vial into a sterile syringe after opening. Discard any unused vials and medication at the end of the procedure.

! Do not mix with other drugs prior to administration. Administer via intravenous (IV) bolus into a freely flowing peripheral IV line of D5W; D5W-0.2% NaCl; D5W-0.45% NaCl; D5LR; LR; 0.45% NaCl; 0.9%NaCl; or D5W-0.45% NaCl with 20 mEq KCl solutions only; do not mix with other fluids. Flush IV line with normal saline before and after administration. Fospropofol does not require filtration prior to use.

### Frovatriptan

fro-va-trip'tan

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Serotonin receptor agonists, antimigraine agents

### **MECHANISM OF ACTION**

A serotonin receptor agonist that binds selectively to vascular receptors, producing a vasoconstrictive effect on cranial blood vessels. *Therapeutic Effect:* Relieves migraine headache.

### PHARMACOKINETICS

Well absorbed after PO administration. Metabolized by the liver to inactive metabolite. Eliminated in urine. *Half-life:* 26 h (increased in hepatic impairment).

### AVAILABILITY

Tablets: 2.5 mg.

## INDICATIONS AND DOSAGES Acute migraine attack

### PO

*Adults, Elderly.* Initially 2.5 mg. If headache improves but then returns, dose may be repeated after 2 h. Maximum: 7.5 mg/day.

### CONTRAINDICATIONS

Basilar or hemiplegic migraine, cerebrovascular or peripheral vascular disease, coronary artery disease, ischemic heart disease (including angina pectoris, history of myocardial infarction, silent ischemia, and Prinzmetal angina), uncontrolled hypertension, use within 24 h of ergotamine-containing preparations or another serotonin receptor agonist.

### **INTERACTIONS**

### Drug

### **Ergotamine-containing**

medications: May produce a vasospastic reaction. Do not use triptan within 24 h of ergot drug. SSRIs, SNRIs: May produce serotonin syndrome.

### Herbal and Food

**St. John's wort:** Additive serotonin effects.

### SIDE EFFECTS

Occasional

Dizziness, paresthesia, fatigue, flushing.

### Rare

Hot or cold sensation, dry mouth, dyspepsia.

### SERIOUS REACTIONS

• Cardiac reactions (including ischemia, coronary artery vasospasm, and MI), and noncardiac vasospasm-related reactions (such as hemorrhage and CVA), occur rarely, particularly in patients with hypertension, diabetes, or a strong family history of coronary artery disease; obese patients; smokers; males older than 40 yr; and postmenopausal women.

### **PRECAUTIONS & CONSIDERATIONS**

Avoid use in patients with risk factors for heart disease unless receive a satisfactory cardiovascular evaluation. Reassess cardiovascular status periodically in all patients receiving frovatriptan. It is unknown if frovatriptan is excreted in breast milk. Safety and effectiveness have not been established in children. No age-related precautions have been identified in the elderly; however, frovatriptan concentrations are increased 1.5 to 2 times in the elderly compared with younger adults.

Frovatriptan (Generic Name), Frovan (Brand Name)

### 712 Furosemide

### Storage

Store at room temperature. Administration Swallow tablets with liquid.

### Furosemide

fur-oh'se-mide Lasix Do not confuse Lasix with Lidex, Luvox, or Luxiq, or furosemide with torsemide.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in pregnancy-induced hypertension)

Classification: Diuretics, loop

### **MECHANISM OF ACTION**

A loop diuretic that enhances excretion of sodium, chloride, and potassium by direct action at the ascending limb of the loop of Henle. *Therapeutic Effect:* Produces diuresis and lowers BP.

### PHARMACOKINETICS

Route	Onset (min)	Peak	Duration (h)
PO	30-60	1-2 h	6-8
IV	5	20-60 min	2
IM	30	N/A	N/A

Well absorbed from the GI tract. Protein binding: 91%-97%. Partially metabolized in the liver. Primarily excreted in urine (nonrenal clearance increases in severe renal impairment). Not removed by hemodialysis. *Halflife:* 30-90 min (increased in renal or hepatic impairment, and in neonates).

### AVAILABILITY

Oral Solution: 10 mg/mL.

Tablets: 20 mg, 40 mg, 80 mg. Injection: 10 mg/mL.

### INDICATIONS AND DOSAGES • Edema, hypertension

### PO

Adults, Elderly. Initially, 20-80 mg/ dose; may increase by 20-40 mg/ dose q6-8h. May titrate up to 600 mg/day in severe edematous states.

*Children*. 1-6 mg/kg/day in divided doses q6-12h.

IV, IM

Adults, Elderly. 20-40 mg/dose; may increase by 20 mg/dose q1-2h. Once desired dosage confirmed, give once or twice daily to maintain effect. Maximum: 80 mg/dose. Usual initial dose for pulmonary edema

is 40 mg. *Children.* 1-2 mg/kg/dose q6-12h. Maximum: 6 mg/kg/day.

Neonates. 1-2 mg/kg/dose q12-24h.

Maximum: 1 mg/kg/day if

premature.

IV INFUSION

*Adults, Elderly.* Bolus of 0.1 mg/kg, followed by infusion of 0.1 mg/kg/h; may double q2h. Maximum: 0.4 mg/kg/h. *Children.* 0.05 mg/kg/h; titrate to desired effect.

### **OFF-LABEL USES**

Hypercalcemia.

### CONTRAINDICATIONS

Anuria, hepatic coma, severe electrolyte depletion, hypersensitivity to furosemide.

### INTERACTIONS Drug

Amphotericin B, nephrotoxic and ototoxic medications: May increase the risk of nephrotoxicity and ototoxicity.

Furosemide (Generic Name)

### **Fulvestrant**

full'veh-strant ★ Faslodex Do not confuse Faslodex with Fosamax.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: D

**Classification:** Antineoplastics, antiestrogens, hormones/hormone modifiers

### **MECHANISM OF ACTION**

An estrogen antagonist that competes with endogenous estrogen at estrogen receptor binding sites. *Therapeutic Effect:* Inhibits tumor growth.

### PHARMACOKINETICS

Extensively and rapidly distributed after IM administration. Protein binding: 99%. Metabolized in the liver. Eliminated by hepatobiliary route; excreted in feces. *Half-life:* 40 days in postmenopausal women. Peak serum levels occur in 7-9 days.

### AVAILABILITY

Prefilled Syringe: 250 mg/5 mL syringe.

### INDICATIONS AND DOSAGES Hormone receptor-positive breast cancer

### IM

*Adults, Elderly.* 500 mg, given as two 5-mL injections, 1 in each buttock, on days 1, 15, 29, and once monthly thereafter.

▶ Patients with hepatic impairment With moderate (Child-Pugh class B) impairment, reduce to 250 mg IM on days 1, 15, 29, and once monthly thereafter. Not studied in severe hepatic impairment (Child-Pugh class C).

### CONTRAINDICATIONS

Known or suspected pregnancy, intravenous use, breastfeeding.

### INTERACTIONS

Drug, Herbal, and Food None known.

### **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

### Frequent (13%-26%)

Nausea, hot flashes, pharyngitis, asthenia, vomiting, vasodilation, headache.

### Occasional (5%-12%)

Injection site pain, constipation, diarrhea, abdominal pain, anorexia, dizziness, insomnia, paresthesia, bone or back pain, depression, anxiety, peripheral edema, rash, diaphoresis, fever, arthralgia.

Rare (1%-2%) Vertigo, weight gain.

### SERIOUS REACTIONS

• Urinary tract infections, vaginitis, anemia, thromboembolic phenomena, and leukopenia occur rarely.

### PRECAUTIONS & CONSIDERATIONS

Due to the IM route of administration, fulvestrant should be used with caution in those receiving anticoagulant therapy and in those with bleeding diathesis, estrogen receptor-negative breast cancer, hepatic disease or reduced hepatic flow, and thrombocytopenia. Do not administer fulvestrant to pregnant women. It is unknown whether fulvestrant is excreted in breast milk. Fulvestrant is not for use in children. No age-related precautions have been noted in elderly patients. Notify the physician if weakness, hot flashes, or nausea becomes unmanageable. An estrogen receptor assay test should be performed before therapy, and a computed tomography scan should be performed before and periodically thereafter during and following fulvestrant therapy. Blood chemistry and lipid levels should also be monitored.

### Storage

Store unopened syringes in original packaging in the refrigerator. Do not freeze. Protect from light.

### Administration

For IM use only; do not give intravenously. Prior to beginning therapy, pregnancy must be excluded. For a 500-mg dose, 2 syringes must be administered. Follow the manufacturer's directions for use of the SafetyGlide needle. Inject IM deeply into the buttock. Administer over 1-2 min. The second syringe should be administered in the opposite buttock. Rotate injection sites. **Lithium:** May increase the risk of lithium toxicity.

Other hypokalemia-causing medications: May increase the risk of hypokalemia. Herbal and Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase blood glucose, BUN, and serum uric acid levels. May decrease serum calcium, chloride, magnesium, potassium, and sodium levels.

### IV INCOMPATIBILITIES

Cimetidine, ciprofloxacin (Cipro), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), doxorubicin (Adriamycin), droperidol (Inapsine), esmolol (Brevibloc), famotidine (Pepcid), filgrastim (Neupogen), fluconazole (Diflucan), gemcitabine (Gemzar), gentamicin (Garamycin), idarubicin (Idamycin), inamrinone, labetalol (Trandate), meperidine (Demerol), metoclopramide (Reglan), midazolam (Versed), milrinone (Primacor), nicardipine (Cardene), ondansetron (Zofran), quinidine, thiopental (Pentothal), vecuronium (Norcuron), vinblastine (Velban), vincristine (Oncovin), vinorelbine (Navelbine).

### **IV COMPATIBILITIES**

Aminophylline, bumetanide (Bumex), calcium gluconate, heparin, hydromorphone (Dilaudid), lidocaine, nitroglycerin, potassium chloride, propofol (Diprivan).

### SIDE EFFECTS

### Expected

Increased urinary frequency and urine volume.

### Frequent

Nausea, dyspepsia, abdominal cramps, diarrhea or constipation, electrolyte disturbances.

### Occasional

Dizziness, light-headedness, headache, blurred vision, paresthesia, photosensitivity, rash, fatigue, bladder spasm, restlessness, diaphoresis. **Rare** Flank pain.

### SERIOUS REACTIONS

• Vigorous diuresis may lead to profound water loss and electrolyte depletion, resulting in hypokalemia, hyponatremia, and dehydration.

• Sudden volume depletion may result in increased risk of thrombosis, circulatory collapse, and sudden death.

• Acute hypotensive episodes may occur, sometimes several days after beginning therapy.

• Ototoxicity—manifested as deafness, vertigo, or tinnitus—may occur, especially in patients with severe renal impairment.

• Furosemide use can exacerbate diabetes mellitus, systemic lupus erythematosus, gout, and pancreatitis.

Blood dyscrasias have been reported.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic cirrhosis. Furosemide crosses the placenta and is distributed in breast milk Neonates may require an increased dosage interval because the drug's half-life is increased in this age group. Elderly patients may be more sensitive to the drug's electrolyte and hypotensive effects and are at increased risk for circulatory collapse and thromboembolic effects. Age-related renal impairment may require a dosage adjustment in elderly patients. Consuming foods high in potassium, such as apricots; bananas; legumes; meat; orange juice; raisins; whole grains, including cereals; and white and sweet potatoes, is encouraged. Avoid prolonged exposure to sunlight.

An increase in the frequency and volume of urination and hearing abnormalities, such as a sense of fullness or ringing in the ears, may occur. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Hyponatremia may result in cold and clammy skin, confusion, and thirst.

### Storage

Store all products at room temperature and protected from light (amber containers).

### Administration

Take furosemide with food to avoid GI upset, preferably with breakfast to help prevent nocturia.

The solution for injection normally appears clear and colorless. Discard yellow solutions. Furosemide is compatible with D5W, 0.9% NaCl, and lactated Ringer's solution, but it may also be given undiluted. Administer each 20-40 mg or less by IV push over 1-2 min. Do not exceed an infusion administration rate of 4 mg/min in adults or 0.5 mg/kg/min in children.

After IM use, monitor for temporary pain at the injection site.

# INDIVIDUAL DRUG MONOGRAPHS

### Gabapentin

ga'ba-pen-tin Neurontin, Gralise, Horizant Do not confuse Neurontin with Noroxin.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticonvulsants, GABA analog

### MECHANISM OF ACTION

An anticonvulsant and antineuralgic agent whose exact mechanism is unknown. May increase the synthesis or accumulation of  $\gamma$ -aminobutyric acid (GABA) by binding to as-yetundefined receptor sites in brain tissue. *Therapeutic Effect:* Reduces seizure activity, neuropathic pain, and restless legs syndrome.

### PHARMACOKINETICS

Well absorbed from the GI tract (not affected by food). Protein binding: < 5%. Widely distributed. Crosses the blood-brain barrier. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 5-7 h (increased in patients with impaired renal function and in elderly patients) NOTE: Different gabapentin brand products are not interchangeble due to different release parameters.

### AVAILABILITY

Capsules (Neurontin): 100 mg, 300 mg, 400 mg. Oral Solution (Neurontin): 250 mg/5 mL. Tablets (Neurontin): 100 mg, 300 mg, 400 mg, 600 mg, 800 mg. Extended-release tablets (Horizant): 300 mg, 600 mg. Film-coated gradual-release tablets (Gralise): 300mg, 600mg.

# INDICATIONS AND DOSAGES Adjunctive therapy for seizure control PO

Adults, Elderly, Children 12 yr and older. Initially, 300 mg 3 times a day. May titrate dosage. Range: 900-1800 mg/day in 3 divided doses. Maximum:

3600 mg/day.

*Children 3-12 yr.* Initially, 10-15 mg/kg/day in 3 divided doses. May titrate up to 25-35 mg/kg/day (for children 5-12 yr) and 40 mg/kg/day (for children 3-4 yr). Maximum: 50 mg/kg/day.

### Postherpetic neuralgia (PHN) PO

Adults, Elderly (Neurontin only). 300 mg on day 1, 300 mg twice a day on day 2, and 300 mg 3 times a day on day 3. Titrate up to 1800 mg/day. PO

Adults, Elderly (Gralise only). 300 mg once daily with PM meal on day 1, 600 mg with PM meal on day 2, and 900 mg with PM meal on day 3. Titrate weekly thereafter by not more than 300 mg/week up to 1800 mg once daily with PM meal. PO

Adults, Elderly (Horizant only). 600 mg once daily in the morning on days 1-3; may titrate at day 4 up to a maximum of 600 mg twice daily.

### Restless legs syndrome (RLS) PO

Adults, Elderly (Horizant only). 600 mg once daily with food at about 5 PM.

### Dosage in renal impairment NEURONTIN

Adults, Children 12 yr and older. Dosage and frequency are modified based on creatinine clearance: See manufacturer prescribing information for full table.

Gabapentin (Generic Name)

CrCl (mL/min)	Dosage
≥60	No dose adjustments needed.
30-59	Total dose range 400-1400 mg/day; PO divided BID.
15-29	Total dose range 200-700 mg/day; give once daily.
= 15	Total dose range 100-300 mg/ day; give once daily.
< 15	Reduce proportionally (e.g., CrCl 7.5 mL/min = give one-half the dose for CrCl 15 mL/min). Hemodialysis: See label for supplemental dosing following HD.

### HORIZANT

Adults.

Dosage and frequency modified based on creatinine clearance.

CrCl (mL/min)	Dosage
≥ 60	See usual dosages.
30-59	300 mg/day; may titrate; max 600 mg BID for PHN.
15-29	300 mg/day; may titrate; max 300 mg BID for PHN.
< 15	300 mg every other day; max 300 mg/day for PHN.
On Hemodialysis	For PHN up to 300 mg after each dialysis session

### GRALISE

Adults.

Dosage and frequency modified based on creatinine clearance.

CrCl (mL/min)	Dosage
≥ 60	No adjustment needed.
30-59	600 mg daily and may titrate to 1800 mg/day.
< 30 OR Hemodialysis	Do not use.

### **OFF-LABEL USES**

Treatment of essential tremor, hot flashes, diabetic neuropathy.

### CONTRAINDICATIONS

Hypersensitivity to gabapentin.

### INTERACTIONS

### Drug

**Antacids:** May decrease gabapentin absorption; separate administration by 2 h.

Hydrocodone: Gabapentin may decrease hydrocodone concentrations. Cimetidine: Appears to slightly reduce gabapentin renal excretion Naproxen: Increases oral absorption of gabapentin by roughly 15%. Morphine: May increase plasma concentrations of gabapentin.

### Herbal

Evening primrose oil, ginkgo: May decrease anticonvulsant effectiveness. Food None known.

### DIAGNOSTIC TEST EFFECTS

May decrease serum WBC count.

### SIDE EFFECTS

Frequent (10%-19%)

Fatigue, somnolence, dizziness, ataxia.

### Occasional (3%-8%)

Nystagmus, tremor, diplopia, rhinitis, weight gain.

### Rare (< 2%)

Nervousness, dysarthria, memory loss, dyspepsia, pharyngitis, myalgia, emotional lability, aggression or hostility.

### SERIOUS REACTIONS

• Abrupt withdrawal may increase seizure frequency.

• Overdosage may result in diplopia, slurred speech, drowsiness, lethargy, and diarrhea.  Children < 12 yr old with epilepsy may experience behavioral problems; hostility or aggressive behavior; concentration problems; hyperkinesia (restlessness and hyperactivity).
 Hypersensitivity can mainfest as a

durg reaction with eosinophila and systemic symptoms (DRESS).

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment. It is unknown whether gabapentin is distributed in breast milk. There are no adequate and well-controlled studies in pregnant women; use only if the benefit justifies the potential fetal risk. The safety and efficacy for seizure control have not been established in children < 3 yr. In elderly patients, agerelated renal impairment may require dosage adjustment. Alcohol and tasks requiring mental alertness or motor skills should be avoided. Antiepileptic drugs (AEDs), including gabapentin, increase the risk of suicidal thoughts or behavior. Monitor for the emergence or worsening of depression, suicidal thoughts, or any unusual changes in mood or behavior.

Seizure disorder, or Restless Leg Syndrome (RLS) episodes, nerve pain, including the onset, duration, frequency, and intensity, should be assessed before and during treatment. Weight, renal function, and behavior should also be monitored.

### Storage

Store capsules and tablets at room temperature. Store oral solution in refrigerator. Do not freeze.

### Administration

! Gralise and Horizant are not interchangeable with other gabapentin products.

! *Neurontin:* The interval between drug doses should not exceed 12 h. Gabapentin may be taken with food

to reduce GI upset. If the scored 600- or 800-mg tablet is divided to administer a half-tablet, the unused half-tablet should be used with the next dose. Half-tablets not used within several days of breaking should be discarded. If gabapentin treatment will be discontinued or another anticonvulsant added to the treatment regimen, expect to make the changes gradually over at least 1 wk to prevent loss of seizure control.

*Horizant:* Take with food and swallow whole. Do not split, crush, or chew the extended-relesed tablets.

*Gralise:* Take once daily with the evening meal and swallow whole. Do not spilt, crush, or chew the gradual-release tablets.

Do not abruptly discontinue extended-release products; dosage should usually be weaned over a period of at least 1 week.

### Galantamine

ga-lan'ta-mene Razadyne Reminyl, Reminyl ER Do not confuse Razadyne with Rozerem or Reyataz.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Cholinesterase inhibitors

### **MECHANISM OF ACTION**

A cholinesterase inhibitor that inhibits the enzyme acetylcholinesterase, thus increasing the concentration of acetylcholine at cholinergic synapses and enhancing cholinergic function in the CNS. *Therapeutic Effect:* Slows the progression of Alzheimer's disease.

Galantamine (Generic Name)

### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 18%. Distributed to blood cells; binds to plasma proteins, mainly albumin. Metabolized in the liver. Excreted in urine. *Half-life*: 7 h.

### AVAILABILITY

Capsule (Extended Release): 8 mg, 16 mg, 24 mg. Oral Solution: 4 mg/mL. Tablets (Immediate Release): 4 mg, 8 mg, 12 mg.

# INDICATIONS AND DOSAGES Alzheimer's disease PO

Adults, Elderly. Initially, 4 mg twice a day (8 mg/day) of the immediate-release tablets or 8 mg once daily of the extendedrelease capsules. After a minimum of 4 wks (if well tolerated), may increase to 8 mg twice a day (16 mg/day) of the immediaterelease tablets or 16 mg once daily of the extended-release capsules. After another 4 wks, may increase to 12 mg twice daily (24 mg/day) of the immediate-release tablets or 24 mg once daily of the extended-release capsules. Range: 16-24 mg/day in 2 divided doses for the immediate-release tablets or once daily for the extended-release capsules.

### Dosage in renal or hepatic impairment

For moderate impairment, maximum dosage is 16 mg/day. Drug is not recommended for patients with severe impairment (CrCl < 9 mL/min or Child-Pugh class C).

### CONTRAINDICATIONS

Hypersensitivity, severe hepatic or renal impairment.

### INTERACTIONS Drug

Anticholinergics: May oppose effects of galantamine. Bethanechol, succinylcholine: May interfere with the effects of these drugs. Cimetidine, erythromycin, ketoconazole, paroxetine: May increase the galantamine blood concentration. Herbal and Food

None known.

### **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

Frequent (5%-17%)

Nausea, vomiting, diarrhea, anorexia, weight loss.

### Occasional (4%-9%)

Abdominal pain, insomnia, depression, headache, dizziness, fatigue, rhinitis.

### Rare (< 3%)

Tremors, constipation, confusion, cough, anxiety, urinary incontinence.

### SERIOUS REACTIONS

• Overdose may cause cholinergic crisis, characterized by increased salivation, lacrimation, severe nausea and vomiting, bradycardia, respiratory depression, hypotension, and increased muscle weakness. Treatment usually consists of supportive measures and an anticholinergic such as atropine.

Heart block, bradycardia.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with asthma, bladder outflow obstruction, chronic obstructive pulmonary disease (COPD), significant GI disease, including peptic ulcer disease, a history of seizures, moderate hepatic or renal impairment, supraventricular conduction disturbances, and concurrent use of NSAIDs. It is unknown whether galantamine crosses the placenta or is distributed in breast milk. Galantamine is not prescribed for children. Be aware that galantamine is not a cure for Alzheimer's disease, but it might slow the progression of its symptoms.

Notify the physician if the patient experiences excessive sweating, tearing, or salivation, depression, dizziness, excessive fatigue, muscle weakness, insomnia, weight loss, or persistent GI disturbances. Liver and renal function test results should be assessed, and periodically monitor pulse rate and quality.

### Storage

Store at room temperature tightly closed. Do not freeze oral solution. Administration

If galantamine therapy is interrupted for several days or longer, reinstitute therapy as prescribed.

Take immediate-release galantamine with morning and evening meals, and take the extended-release capsule with morning meals.

### Ganciclovir

gan-sy'clo-ver 📩 Zirgan, Vitrasert 🏜 Cytovene Do not confuse Cytovene with Cytosar.

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antivirals. nucleoside analog

### MECHANISM OF ACTION

This synthetic nucleoside competes with viral DNA polymerase and is incorporated into growing viral DNA chains. Therapeutic Effect: Interferes with synthesis and replication of viral DNA.

### PHARMACOKINETICS

Widely distributed. Protein binding: 1-2%. Undergoes minimal metabolism. Excreted unchanged primarily in urine. Removed by hemodialysis. Half-life: 2.5-3.6 h (increased in patients with impaired renal function).

### **AVAILABILITY**

Capsules: 250 mg, 500 mg. Powder for Injection (Cytovene): 500 mg. Implant (Vitrasert): 4.5 mg. Ophthalmic Gel (Zirgan): 0.15%.

### INDICATIONS AND DOSAGES Cytomegalovirus (CMV) retinitis IV

Adults, Children 3 mo and older. 10 mg/kg/day in divided doses q12h for 14-21 days, then 5 mg/kg/day as a single daily dose 7 days/wk or 6 mg/kg/day as a single daily dose 5 days/wk.

### Prevention of CMV disease in transplant patients IV

Adults, Children. 10 mg/kg/day in divided doses q12h for 7-14 days, then 5 mg/kg/day as a single daily dose 7 days/wk or 6 mg/kg/day as a single daily dose 5 days/wk. ORAL

Adults. 1000 mg 3 times daily; continue for 14 wks.

### Other CMV infections IV

Adults. Initially, 10 mg/kg/day in divided doses q12h for 14-21 days, then 5 mg/kg/day as a single daily

Ganciclovir (Generic Name)

dose 7 days/wk or 6 mg/kg/day as a single daily dose 5 days/wk. Maintenance: 1000 mg orally 3 times a day or 500 mg q3h (6 times a day) after IV regimen.

*Children*. Initially, 10 mg/kg/day in divided doses q12h for 14-21 days, then 5 mg/kg/day as a single daily dose 7 days/wk or 6 mg/kg/day as a single daily dose 5 days/wk. Maintenance: 30 mg/kg/dose a Ab PO.

### Intravitreal implant

*Adults.* 1 implant q6-9mo plus oral ganciclovir (1-1.5 g 3 times daily). *Children 9 yr and older.* 1 implant q6-9mo plus oral ganciclovir (30 mg/ dose q8h).

### Actue herpes simplex keratitis (dendritic keratitis)

### OPHTHALMIC GEL

Adults, Children 2 yr and older. 1 drop in the affected eye(s) 5 times per day (q3h while awake) until corneal ulcer heals, and then 1 drop in the affected eye(s) 3 times per day for 7 days.

• Adult dosage in renal impairment Dosage and frequency are modified based on CrCl.

CrCl (mL/ min)	IV Induction Dosage	IV Mainten- ance Dosage	Oral
50-69	2.5 mg/kg	2.5 mg/kg	1500 mg/
	q12h	q24h	day
25-49	2.5 mg/kg	1.25 mg/kg	1000 mg/
daily	q24h	q24h	day
10-24	1.25 mg/kg	0.625 mg/	500 mg/
	q24h	kg q24h	day
< 10	1.25 mg/kg 3 times/ wk	0.625 mg/ kg 3 times/ wk	500 mg 3 times/ wk

CrCl, creatinine clearance.

### **OFF-LABEL USES**

Treatment of other CMV infections, such as gastroenteritis, hepatitis, and pneumonitis.

### CONTRAINDICATIONS

Absolute neutrophil count < 500/mm<sup>3</sup>, platelet count < 25,000/mm<sup>3</sup>, hypersensitivity to acyclovir or ganciclovir, immunocompetent patients, patients with congenital or neonatal CMV disease.

### INTERACTIONS

### Drug

Bone marrow depressants: May increase bone marrow depression. Didanosine: May increase ganciclovir levels. Imipenem and cilastatin: May increase the risk of seizures. Nephrotoxic agents: May cause added risk of nephrotoxicity. Probenecid: May decrease the clearance of ganciclovir. Zidovudine (AZT): May increase the risk of hepatotoxicity. Herbal and Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels.

### IV INCOMPATIBILITIES

Aldesleukin (Proleukin), amifostine (Ethyol), amikacin (Amikin), aminophylline, amphotericin B colloidal (Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), amsacrine (Amsa P-D), ascorbic acid, atracurium (Tracrium), azathioprine (Imuran), aztreonam (Azactam), benztropine (Cogentin), bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium chloride, cefamandole (Mandol), cefazolin (Ancef), cefepime (Maxipime), cefmetazole (Zefazone), cefonicid (Monocid), cefoperazone (Cefobid), cefotaxime (Claforan),

cefotetan (Cefotan), cefoxitin (Mefixitin), ceftazidime (Fortaz), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), cephalothin (Keflin), cephapirin (Cefadyl), chloramphenicol (Chloromycetin), chlorpromazine (Thorazine), cimetidine (Tagamet), cisatracurium (Nimbex), clindamycin (Cleocin), cytarabine (ARA-C), dantrolene (Dantrium), diazepam (Valium), diazoxide (Proglycem), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), dopamine (Intropin), doxorubicin (Adriamycin), doxycycline (Vibramycin), ephedrine, epinephrine, epirubicin (Ellence), erythromycin lactobionate (Erythrocin), esmolol (BreviBloc), famotidine (Pepcid), fenoldopam (Corlopam), fludarabine (Fludara), foscarnet (Foscavir), gemcitabine (Gemzar), gentamicin (Garamycin), haloperidol (Haldol), hydralazine (Apresoline), hydrocortisone sodium succinate (Solu-Cortef), inamrinone (Inocor), isoproterenol (Isuprel), ketorolac (Toradol), levofloxacin (Levofloxacin), lidocaine, magnesium sulfate, meperidine (Demerol), metaraminol (Aramine), methicillin (Staphcillin), methoxamine (Vasoxyl), methyldopate (Aldomet), methylprednisolone (Solu-Medrol), metoclopramide (Reglan), metronidazole (Flagyl), mezlocillin (Mezlin), midazolam (Versed), minocycline (Minocin), morphine sulfate (Avinza, Kadian, Robinul), moxalactam (Moxam), multiple vitamins, nalbuphine (Nubain), netilmicin (Netromycin), norepinephrine (Levophed), ondansetron (Zofran), oxacillin (Bactocil), palonosetron (Aloxi), papaverine, penicillin G potassium

(Pfizerpen), penicillin G sodium, pentamidine (Pentam), pentazocine (Talwin), phentolamine (Regitine), phenylephrine, phenytoin (Dilantin), piperacillin (Piperacil), piperacillin and tazobactam (Zosyn), procainamide (Pronestyl), prochlorperazine (Compazine), promethazine (Phenergan), pyridoxine, quinidine, quinupristin and dalfopristin (Synercid), sargramostim (Leukine), sodium bicarbonate, streptokinase (Streptase), succinylcholine (Anectine), sulfamethoxazole and trimethoprim (Bactrim), tacrolimus (Prograf), theophylline (Theodur), thiamine, ticarcillin (Ticar), ticarcillin and clavulanate (Timentin), tobramycin (Nebcin), tolazoline (Tolazolin), urokinase (Abbokinase), vancomycin (Vancocin), verapamil (Calan), vinorelbine (Navelbine).

### DIAGNOSTIC TEST EFFECTS

May decrease blood hematocrit and hemoglobin levels, platelet count, and WBC count.

### SIDE EFFECTS

### Frequent

Diarrhea (41%), fever (40%), nausea (25%), abdominal pain (17%), vomiting (13%). Occasional (6%-11%) Diaphoresis, infection, paresthesia, flatulence, pruritus.

Rare (2%-4%)

Headache, stomatitis, dyspepsia, phlebitis.

### SERIOUS REACTIONS

• Hematologic toxicity occurs commonly: Leukopenia, thrombocytopenia, anemia.

 Intraocular insertion occasionally results in visual acuity loss, vitreous hemorrhage, and retinal detachment.

- · GI hemorrhage occurs rarely.
- Aspermatogenesis.

### PRECAUTIONS & CONSIDERATIONS

Caution should be used in pediatric patients. The long-term safety of this drug has not been determined because of the potential for long-term adverse reproductive and carcinogenic effects. Caution is warranted with impaired renal function, neutropenia, and thrombocytopenia. Be aware that ganciclovir should not be used during pregnancy and that breastfeeding should be discontinued during ganciclovir use. Breastfeeding may be resumed no sooner than 72 h after the last dose of ganciclovir. Be aware that effective contraception should be used during ganciclovir therapy. Ganciclovir may temporarily or permanently inhibit sperm production in males and suppress fertility in females. Barrier contraception should be used during ganciclovir administration and for 90 days after therapy because of mutagenic potential. Be aware that most systemic use in children is not FDA approved; the ocular insert is not established in children < 9 yr of age. In elderly patients, age-related renal impairment may require dosage adjustment.

Specimens (blood, feces, throat culture, urine) should be obtained for culture and sensitivity testing, as ordered, before giving the drug. Keep in mind that test results are needed to support the differential diagnosis and rule out retinal infection as the result of hematogenous dissemination. Intake and output should be monitored as well as adequate hydration (minimum 1500 mL/24 h). Hematology reports for decreased platelets, neutropenia, and thrombocytopenia should be evaluated. Altered vision, complications, and therapeutic improvement should be assessed. **Storage** 

Store products at room temperature. Do not refrigerate. Reconstituted solution in vial is stable for 12 h at room temperature. After dilution, refrigerate and use within 24 h. Discard the solution if precipitate forms or discoloration occurs.

### Administration

CAUTION: Due to pontential mutagenicity, the manufacturer recommends preparation, administration, and handling in a manner similar to cytotoxic drugs.

Give ganciclovir orally with food. Do not open or crush the capsules.

Reconstitute 500-mg vial with 10 mL sterile water for injection to provide a concentration of 50 mg/mL; do not use bacteriostatic water, which contains parabens and is therefore incompatible with ganciclovir. Further dilute with 100 mL D5W, 0.9% NaCl, lactated Ringer's, or any combination thereof, to provide a concentration of 5 mg/mL. Do not give by IV push or rapid IV infusion because these routes increase the risk of ganciclovir toxicity. Administer only by IV infusion over 1 h. Protect from infiltration because the high pH of this drug causes severe tissue irritation. Use large veins to permit rapid dilution and dissemination of ganciclovir and to minimize the risk of phlebitis. Keep in mind that central venous ports tunneled under subcutaneous tissue may reduce catheter-associated infection.

For the ophthalmic gel, wash hands before and after use. Tilt the head back slightly and pull the lower eyelid down to form a pouch. Squeeze the prescribed number of drops. Close eyes to spread drops. Patients should not wear contact lenses during treatment.

### Gatifloxacin

gah-tee-floks′a-sin 🗙 Zymar, Zymaxid 🌺 Zymar

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Antibiotics, quinolones, ophthalmic

### **MECHANISM OF ACTION**

A fluoroquinolone that inhibits two enzymes, topoisomerase II and IV, in susceptible microorganisms. *Therapeutic Effect:* Interferes with bacterial DNA replication. Prevents or delays resistance emergence. Bactericidal.

### AVAILABILITY

Ophthalmic Solution (Zymar): 0.3%. Ophthalmic Solution (Zymaxid): 0.5%.

### INDICATIONS AND DOSAGES

Bacterial conjunctivitis (Zymar)

Adults, Elderly, Children 1 yr and older. 1 drop q2h while awake for 2 days, then 1 drop up to 4 times/day for days 3-7.

### Bacterial conjunctivitis (Zymaxid)

Adults, Elderly, Children 1 yr and older. On day 1, instill 1 drop to affected eye(s) q2h while awake, up to 8 times daily. On days 2-7, instill 1 drop 2-4 times per day while awake.

### CONTRAINDICATIONS

Hypersensitivity to quinolones.

### INTERACTIONS

Drug None known. Herbal None known. Food None known.

### **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

### Occasional (5%-10%)

Ophthalmic: Conjunctival irritation, increased tearing, corneal inflammation.

### Rare (0.1%-3%)

Ophthalmic: Corneal swelling, dry eye, eye pain, eyelid swelling, headache, red eye, reduced visual acuity, altered taste.

### SERIOUS REACTIONS

• Conjunctival hemorrhage has been reported.

- May cause severe hypersensitivity (rare).
- · Risk of superinfection.

### PRECAUTIONS & CONSIDERATIONS

Patients should be advised to avoid contact lens use while they have signs and symptoms of bacterial conjunctivitis. It is unknown if gatifloxacin is distributed in breast milk. The safety and efficacy of gatifloxacin have not been established in children < 1 yr. History of hypersensitivity to gatifloxacin and other quinolones should be determined before therapy.

### Storage

Store at room temperature; do not freeze.

### Administration

Tilt head backward and look up. Gently pull the lower eyelid down until a pocket is formed. Hold the dropper above the pocket, and without touching the eyelid or conjunctival sac, place drops into the center of the pocket. Close the eye, and then apply gentle digital pressure to the lacrimal sac at the inner canthus. Remove excess solution around the eye with a tissue.

### Gefitinib

ge-fi'tye-nib

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic; epidermal growth factor receptor inhibitor

### **MECHANISM OF ACTION**

Blocks the signaling pathway that binds to the epidermal growth factor receptor (EGFR) on the surface of normal and cancer cells. EGFR activates the enzyme tyrosine kinase, which sends signals instructing the cells to grow. *Therapeutic Effect:* Inhibits the growth of cancer cells.

### PHARMACOKINETICS

Slowly absorbed and extensively distributed throughout the body. Protein binding: 90%. Undergoes extensive metabolism in the liver. Excreted in the feces. *Half-life*: 48 h.

### AVAILABILITY

Tablets: 250 mg.

### INDICATIONS AND DOSAGES

 Non-small cell lung cancer (only in those patients showing benefit from current or past use)

Adults, Elderly. 250 mg/day; may increase to 500 mg/day for patients receiving drugs that may decrease gefitinib blood concentrations (CYP3A4 inducers), such as rifampin and phenytoin.

### CONTRAINDICATIONS

Severe hypersensitivity to the drug.

### INTERACTIONS

### Drug

CYP3A4 inducers (e.g.,

rifamycins, phenytoin): Reduce gefitinib concentrations. Dosage adjustment and careful monitoring recommended.

Erythromycin, fluconazole, itraconazole, ketoconazole, and CYP3A4 inhibitors: May increase gefitinib blood concentration and toxicity.

H<sub>2</sub> antagonists (e.g., cimetidine, ranitidine): Decrease absorption of gefitinib.

Vinorelbine: Increased risk of neutropenia.

**Warfarin:** Increases the risk of bleeding.

Herbal

**St. John's wort:** May reduce gefitinib concentrations. Avoid. **Food** 

None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels.

### SIDE EFFECTS

Frequent (25%-48%) Diarrhea, rash, acne. Occasional (8%-13%) Dry skin, nausea, vomiting, pruritus. Rare (2%-7%) Anorexia, asthenia, weight loss, peripheral edema, eye pain.

### SERIOUS REACTIONS

• Pancreatitis and ocular hemorrhage occur rarely.

- Hypersensitivity reaction produces angioedema and urticaria.
- Interstitial lung disease has been reported and if it occurs, requires discontinuation of the drug.
- Rare reports of veno-occlusive disease (VOD); may be fatal.
- Hepatotoxicity.

Gefitinib (Generic Name)

### **PRECAUTIONS & CONSIDERATIONS**

Distribution of this drug is limited under a risk management plan called the Iressa Access Program. The drug is available in the United States only to those persons already on gefitinib treament with good response; no newly treated patients qualify for drug receipt.

Caution is warranted in patients with hepatic impairment and severe renal impairment. Gefitinib may cause fetal harm and result in termination of pregnancy. Pregnant or breastfeeding women should not receive this drug. Pregnancy should be avoided during therapy, and contraceptive methods should be used during treatment and for up to 12 mo afterward. The safety and efficacy of gefitinib have not been established in children. No age-related precautions have been noted in elderly patients. Vaccinations without the physician's approval and crowds and people with known infections should be avoided.

Notify the physician of anorexia, nausea, vomiting, persistent or severe diarrhea, and signs and symptoms of infection, including fever and flu-like symptoms. Periodic liver function monitoring is advised.

Adequate hydration should be maintained. Bowel sounds for hyperactivity and pattern of daily bowel activity and stool consistency should be assessed. Antidiarrheals and antiemetics may help prevent and treat diarrhea, nausea, and vomiting. For those who cannot tolerate diarrhea, expect to interrupt gefitinib therapy for up to 14 days. If dyspnea, cough, or other pulmonary symptoms occur, interrupt therapy until cause is determined.

### Storage

Store at room temperature.

### Administration

Take gefitinib without regard to food. For patients who have difficulty swallowing, the tablets may be dropped in a half glass of noncarbonated drinking water and stirred to dissolve (approximately 10 min); then drink the liquid immediately. Rinse the glass with half a glass of water and drink that as well. The liquid may also be given via nasogastric tube.

### Gemfibrozil

gem-fi'broe-zil ★ ▲ Lopid Do not confuse with Lorabid or Levbid.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antihyperlipidemics, fibric acid derivatives

### MECHANISM OF ACTION

A fibric acid derivative that inhibits lipolysis of fat in adipose tissue, decreases liver uptake of free fatty acids, and reduces hepatic triglyceride production. Inhibits synthesis of VLDL carrier apolipoprotein B. *Therapeutic Effect*: Lowers serum cholesterol and triglycerides (decreases VLDL, LDL; increases HDL).

### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 99%. Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 1.5 h.

### AVAILABILITY

Tablets: 600 mg.

Gemfibrozil (Generic Name)

### Gemcitabine

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, antimetabolites, pyrimidine analogs

### MECHANISM OF ACTION

An antineoplastic agent chemically related to cytarabine. Gemcitabine undergoes intracellular conversion to gemcitabine monophosphate via the enzyme deoxycytidine kinase. Gemcitabine monophosphate is subsequently converted to gemcitabine triphosphate (deoxydifluorocytidine triphosphate, dFdCTP) and gemcitabine diphosphate (deoxydifluorocytidine diphosphate). Gemcitabine triphosphate competes with deoxycytadine triphosphate (dCTP) for incorporation into DNA strands. After insertion of the gemcitabine analog into DNA, an additional base pair is added before DNA polymerase is stopped. The "masked termination" inhibits both DNA replication and repair. Cell cycle-specific for S phase of cell division. Therapeutic Effect: Potent antineoplastic activity; blocks cancer cell replication, particularly in solid tumors.

### PHARMACOKINETICS

Metabolized by cytidine deaminase to the inactive metabolite, 2', 2'-difluorodeoxyuridine (dFdU). Protein binding: Less than 10%. Primarily excreted in urine, with 92%-98% recovery as inactive metabolite and < 10% as active drug. *Half-life:* 40-50 min following 30-min infusion (increased in females and elderly).

### AVAILABILITY

Injection Powder for Solution: 200-mg, 1-g vials.

### INDICATIONS AND DOSAGES

### For metastatic breast cancer with paclitaxel

### IV INFUSION

*Adults, Elderly.* 1250 mg/m<sup>2</sup> on days 1 and 8 of a 21-day cycle in combination with paclitaxel (175 mg/m<sup>2</sup> given on day 1 prior to gemcitabine).

### For ovarian cancer that has relapsed at least 6 mo after platinum-based treatment IV INFUSION

*Adults, Elderly.* 1000 mg/m<sup>2</sup> on days 1 and 8 of a 21-day cycle in combination with carboplatin (AUC4; given on day 1 after gencitabine infusion).

### For non-small cell lung cancer along with cisplatin

IV INFUSION Adults, Elderly. 1000 mg/m<sup>2</sup> on days 1, 8, and 15 of a 28-day cycle OR 1250 mg/m<sup>2</sup> on days 1 and 8 of a 21-day cycle. Cisplatin (100 mg/m<sup>2</sup> IV) is given following the gemcitabine infusion on day 1 of either regimen.

### For pancreatic cancer as a single agent

IV INFUSION

*Adults, Elderly.* 1000 mg/m<sup>2</sup> once weekly for up to 7 wks, followed by 1 wk of rest.

### Dosage modifications

NOTE: Expect to modify the dose regimen as needed based on the cancer type and toxicities that present. See prescribing information for detailed information.

### CONTRAINDICATIONS

Hypersensitivity to gemcitabine.

### INTERACTIONS

### Drug

Paclitaxel: May increase gemcitabine concentrations and risk of toxicity; monitor closely. Warfarin: May increase anticoagulant effect; monitor INR. Live vaccines: Defer vaccination due to potential virus replication, adverse reactions to the virus, immunosuppression. Radiation: Drug has radiosensitizing activity. Herbal None known.

### Food

None known.

### DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels. May decrease blood hematocrit, hemoglobin level, and WBC and platelet count. May cause proteinuria or hematuria.

### IV INCOMPATIBILITIES

Acyclovir, amphotericin B (Abelcet, AmBisome), cefepime (Maxipime), cefotaxime, daptomycin, diazepam, furosemide, ganciclovir (Cytovene), imipenem-cilastatin (Primaxin IV), irinotecan, lansoprazole (Prevacid), methotrexate, methylprednisolone sodium succinate (Solu-Medrol), nafcillin, pantoprazole (Protonix), pemetrexed, phenytoin, piperacillintazobactam (Zosyn), prochlorperazine, thiopental.

### SIDE EFFECTS

### Expected

Leukopenia, neutropenia, thrombocytopenia, anemia. Frequent (> 5%)

Nausea, vomiting, dyspnea, fever, infections, mild hematuria or proteinuria, alopecia, rash.

### Occasional ( $\leq 5\%$ )

Stomatitis, somnolence, paresthesias.

### SERIOUS REACTIONS

 Serious reactions may include myelosuppression (evidenced by neutropenia, thrombocytopenia, and anemia); myelosuppression is the most frequent adverse drug event and often requires dose adjustment.

 Severe pulmonary events/ toxicity.

 Serious hepatotoxicity, including liver failure and death, has been reported very rarely.

- · Hemolytic uremic syndrome
- (HUS) reported rarely.
- · Anaphylactoid reactions are rare.

### **PRECAUTIONS & CONSIDERATIONS**

CAUTION: Prolongation of the infusion time beyond 60 min and more frequent than weekly dosing have been shown to increase toxicity. Myelosuppression is the main side effect. Use cautiously in patients with a history of pulmonary disease or renal or hepatic impairment, and in those receiving radiation treatments. Caution is also warranted in elderly patients. Avoid use in pregnant women. It is unknown whether gemcitabine is distributed in breast milk. Safety and efficacy of the drug have not been established in children.

Monitor for signs of infection or bleeding. Monitor for hematologic toxicity with a CBC, including differential and platelet count prior to each dose or on day 8 of combination therapy and prior to the next cycle. Expect dosage modifications if hematologic toxicity occurs. Monitor renal function and hepatic enzymes, as well as respiratory status, closely.

### Storage

Unopened vials are stored at room temperature. Reconstituted infusions are stable at room temperature for 24 h. Do not refrigerate as this will cause crystallization.
#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

For intravenous administration as an IV infusion. To reconstitute, add 5 mL of 0.9% NaCl to the 200-mg vial or 25 mL to the 1-g vial. Do not use any other diluents. Shake to dissolve. Final vial concentration will be 38 mg/ mL. The appropriate dose of drug may be administered as prepared or further diluted with 0.9% NaCl injection to concentrations as low as 0.1 mg/ mL. Infuse IV over 30 min. Longer infusion times increase toxicity.

#### INDICATIONS AND DOSAGES > Hyperlipidemia, hypertriglyceridemia PO

*Adults, Elderly.* 1200 mg/day in 2 divided doses 30 min before breakfast and dinner.

## CONTRAINDICATIONS

Hypersensitivity, liver dysfunction (including primary biliary cirrhosis), preexisting gallbladder disease, severe renal dysfunction, administration with cerivastatin or with repaglinide.

## INTERACTIONS

#### Drug

**Bile acid sequestrants:** Reduce gemfibrozil absorption; administer 2 h or more apart.

**Cyclosporine:** May potentiate renal problems.

HMG-CoA reductase inhibitors, especially cerivastatin, lovastatin: May increase risk of rhabdomyolysis, leading to acute renal failure.

#### Pioglitazone, repaglinide:

May increase the effect of these drugs. Use with repaglinide contraindicated due to risk of severe hypoglycemia.

**Warfarin:** May increase effects of warfarin; reduce anticoagulant dose and closely monitor INR.

Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, serum bilirubin, serum creatinine kinase, serum LDH concentrations, and SGOT (AST) and SGPT (ALT) levels. May decrease blood hemoglobin and hematocrit levels, leukocyte counts, and serum potassium levels.

## SIDE EFFECTS

Frequent (20%) Dyspepsia. Occasional (2%-10%) Abdominal pain, diarrhea, nausea, vomiting, fatigue. Rare (< 2%)

Constipation, acute appendicitis, vertigo, headache, rash, pruritus, altered taste.

## SERIOUS REACTIONS

 Cholelithiasis, cholecystitis, acute appendicitis, and pancreatitis occur rarely.

• Rhabdomyolysis when administered with a "statin" is rare.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes mellitus, gallbladder disease, receiving estrogen or anticoagulant therapy, and with hypothyroidism. Be aware that it is unknown whether gemfibrozil crosses the placenta or is distributed in breast milk. Animal studies show some tumorigenic potential. Be aware that gemfibrozil use is not recommended in children. In elderly patients, age-related renal impairment may require dosage adjustment.

Notify the physician of any abdominal pain, diarrhea, dizziness, nausea, or vomiting. Pattern of daily bowel activity and stool consistency should be assessed. Serum LDL, VLDL, triglyceride, and cholesterol levels should be checked at baseline and periodically during treatment. Hematology and liver function test results should also be assessed. Blood glucose should be monitored in those with diabetes mellitus.

Be aware of the increased risk of developing rhabdomyolysis when coadministered with a statin. Lovastatin should be limited to a maximum of 20 mg/day if given concomitantly with gemfibrozil. **Storage** 

Store at room temperature. Protect from light and humidity.

#### Administration

Take gemfibrozil 30 min before morning and evening meals.

## Gemifloxacin

gem-ih-flocks'ah-sin

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anti-infectives, fluoroquinolones

#### **MECHANISM OF ACTION**

A fluoroquinolone that inhibits the enzyme DNA gyrase in susceptible microorganisms, interfering with bacterial cell replication and repair. *Therapeutic Effect:* Bactericidal.

#### PHARMACOKINETICS

Rapidly and well absorbed from the GI tract. Protein binding: 70%. Widely distributed. Penetrates well into lung tissue and fluid. Undergoes limited metabolism in the liver. Primarily excreted in feces; lesser amount eliminated in urine. Partially removed by hemodialysis. *Half-life:* 4-12 h.

#### AVAILABILITY

Tablets: 320 mg.

#### INDICATIONS AND DOSAGES Acute bacterial exacerbation of chronic bronchitis PO

Adults, Elderly. 320 mg once a day for 5 days.

## Community-acquired pneumonia PO

Adults, Elderly. 320 mg once a day for 7 days.

#### Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance	
(mL/min)	Dosage
> 40	320 mg once a day
≤ 40	160 mg once a day

#### CONTRAINDICATIONS

Hypersensitivity to gemifloxacin or to other fluoroquinolones.

## INTERACTIONS

#### Drug

Aluminum and magnesiumcontaining antacids, bismuth subsalicylate, didanosine, iron preparations and other metals, sucralfate, zinc preparations: May decrease the absorption of gemifloxacin. Avoid administration within 3 h before or 2 h after gemifloxacin.

Antipsychotics, class 1A and class III antiarrhythmics, erythromycin, tricyclic antidepressants, pimozide, thioridazine: May increase the risk of prolonged

QTc interval and life-threatening arrhythmias.

**Corticosteroids:** May increase risk of tendon rupture, especially in elderly patients.

**Cyclosporine:** Increases the risk of nephrotoxicity.

**Probenecid:** Increases gemifloxacin serum concentration.

**Warfarin:** May increase the effect of warfarin.

#### Herbal and Food

None known.

Gemifloxacin (Generic Name)

#### DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, bilirubin, LDH, creatinine, AST (SGOT), and ALT (SGPT) levels.

#### SIDE EFFECTS

Occasional (2%-4%) Diarrhea, rash, nausea. Rare (≤ 1%) Headache, abdominal pain, dizziness, tremor, nervousness.

#### SERIOUS REACTIONS

 Antibiotic-associated colitis may result from altered bacterial balance.
 Hypersensitivity reactions, including photosensitivity (as evidenced by rash, pruritus, blisters, edema, and burning skin), have occurred in patients receiving fluoroquinolones. With gemifloxacin, serious rashes occur more frequently in women under 40 and women of any age receiving hormone replacement therapy.

• Tendon ruptures and peripheral neuropathy have been reported.

· Convulsions (rare).

 QT interval prolongation and risk of proarrhythmia.

• Pseudotumor cerebri (benign intracranial hypertension).

• Exacerbation of myasthenia, may be severe and lead to weakness of respiratory muscles.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute myocardial ischemia or impaired hepatic or renal function. Use with caution in patients with cardiac arrhythmias; should not be used unmonitored in patients with known QT prolongation. Conditions that might increase the risk of proarrythmia include electrolyte imabalances and use of drugs that prolong the QT interval. Use with caution in patients with neuromuscular disease, such as myasthenia gravis, since condition may be aggravated. Fluoroquinolones increase the risk of tendonitis and tendon rupture, which may be seen more often in the elderly, in those taking corticosteroids, and in patients with organ transplants. There are no adequate data regarding the use of gemifloxacin in pregnancy or breastfeeding. The safety and efficacy of gemifloxacin have not been established in children 18 yr of age and younger. Age-related renal impairment may require a dosage adjustment in elderly patients.

Dizziness, headache, nausea, signs of infection, and skin for rash should be evaluated. Pattern of daily bowel activity and stool consistency should be assessed. Liver function and white blood cell (WBC) count should be monitored. QT interval should be checked for prolongation. History of hypersensitivity to gemifloxacin and other quinolones should be determined before therapy.

Fluoroquinolone use has been associated with hypoglycemia in patients with and without diabetes. Patients with diabetes should be monitored frequently while taking gemifloxacin. Excessive exposure to sunlight and UV light should be avoided due to potential photosensitivity.

#### Storage

Store at room temperature and protect from light.

#### Administration

Take gemifloxacin without regard to food. Do not crush or break tablets. Take 2 h before giving antacids, buffered tablets or solutions, ferrous sulfate, or multivitamins with minerals. Drink plenty of fluids.

## Gentamicin

jen-ta-mye'sin ★ Garamycin, Gentasol, Gentak ★ Diogent, Garamycin, Gentak

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Anti-infectives, ophthalmic, topical, antibiotics, aminoglycosides, dermatologics

## **MECHANISM OF ACTION**

An aminoglycoside antibiotic that irreversibly binds to the protein of bacterial ribosomes. *Therapeutic Effect:* Interferes with protein synthesis of susceptible microorganisms. Bactericidal.

### PHARMACOKINETICS

Rapid, complete absorption after IM administration. Protein binding: < 30%. Widely distributed (does not cross the blood-brain barrier, low concentrations in CSF). Excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 2-4 h (increased in impaired renal function and neonates; decreased in cystic fibrosis and burn or febrile patients).

## AVAILABILITY

Injection: 10 mg/mL, 40 mg/mL. Ophthalmic Solution (Gentasol): 0.3%. Ophthalmic Ointment (Gentak): 0.3%. Cream: 0.1%. Ointment: 0.1%.

## INDICATIONS AND DOSAGES

NOTE: Parenteral doses determined using ideal body weight (IBW), except in obesity, where IBW is adjusted for best calculation of dose.

#### Acute pelvic, bone, intraabdominal, joint, respiratory tract, burn wound, postoperative, and skin or skin-structure infections; complicated urinary tract infection; septicemia; meningitis IV, IM

Adults, Elderly. Usual dosage, 3-6 mg/kg/day in divided doses q8h or 4-7 mg/kg once a day. Children 5-12 yr. Usual dosage 2-2.5 mg/kg/dose q8h. Children younger than 5 yr.

Usual dosage, 2.5 mg/kg/dose q8h. *Neonates.* Usual dosage 2.5-3.5 mg/kg/dose q8-12h.

## Intrathecal (preservative-free injection only)

Adults. 4-8 mg/day. Children 3 mo to 12 yr. 1-2 mg/day. Neonates. 1 mg/day.

Superficial eye infections

OPHTHALMIC OINTMENT *Adults, Elderly.* Usual dosage, apply thin strip to conjunctiva 2-3 times a day.

OPHTHALMIC SOLUTION *Adults, Elderly, Children.* Usual dosage, 1-2 drops q2-4h up to

2 drops/h.

Superficial skin infections
 TOPICAL

Adults, Elderly. Usual dosage, apply 3-4 times/day.

#### Dosage in renal impairment (adults)

IV, IM

For traditional dosing regimens.

Creatinine clearance 40-60 mL/min: Dosage interval q12h.

Creatinine clearance 20-40 mL/min: Dosage interval q24h.

Creatinine clearance < 20 mL/min: Monitor levels to determine dosage interval.

### Hemodialysis

IV, IM

Adults, Elderly. 1-1.7 mg/kg after dialysis.

Children. 1-1.7 mg/kg/dose after dialysis.

#### • "Once daily" dose strategy IV

*Adults:* Common off-label dosing strategies use a "once daily" dose of 5-7.5 mg/kg IV, and then adjust the frequency of administration according to serum levels and medically accepted dosing nomograms.

## CONTRAINDICATIONS

Hypersensitivity to gentamicin, other aminoglycosides (crosssensitivity), or their components. Injection contains sodium metabisulfite, a sulfite that may cause anaphylactic symptoms in certain susceptible people (seen more commonly in those with asthma).

## INTERACTIONS

#### Drug

Nephrotoxic medications, other aminoglycosides, ototoxic medications: May increase the risk of nephrotoxicity or ototoxicity. Neuromuscular blockers and botulinum toxins: May increase neuromuscular blockade. Herbal

None known. Food None known.

DIAGNOSTIC TEST EFFECTS

May increase serum creatinine, serum bilirubin, BUN, serum LDH, SGOT (AST), and SGPT (ALT) levels. May decrease serum calcium, magnesium, potassium, and sodium concentrations. In traditional dose regimens, the therapeutic peak serum level is 6-10 mcg/mL and trough is 0.5-2 mcg/mL. For all regimens, toxic trough level is > 2 mcg/mL.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), cefamandole (Mandol), cefepime (Maxipime), cefotaxime (Claforan), cefotetan (Cefotan), cefuroxime (Ancef), clindamycin (Cleocin), cytarabine (Cytosar), dopamine (Intropin), filgrastim (Neupogen), furosemide (Lasix), heparin, hetastarch (Hespan), idarubicin (Idamycin), indomethacin (Indocin), nafcillin (Unipen), phenytoin (Dilantin), propofol (Diprivan), ticarcillin (Ticar), warfarin (Coumadin).

## **IV COMPATIBILITIES**

Acyclovir (Zovirax), alatrofloxacin (Trovan), amifostine (Ethyol), amiodarone (Cordarone), amsacrine (AMSA), atracurium (Tracrium), aztreonam (Azactam), bleomycin (Blenoxane), cefoxitin (Mefixitin), cimetidine (Tagamet), ciprofloxacin (Cipro), cisatracurium (Nimbex), clarithromycin (Biaxin), cyclophosphamide (Cytoxan), diltiazem (Cardizem), enalaprilat (Vasotec), esmolol (BreviBloc), etoposide (VePesid), famotidine (Pepcid), fluconazole (Diflucan), fludarabine (Fludara), foscarnet (Foscavir), gatifloxacin (Tequin), gemcitabine (Gemzar), granisetron (Kytril), hydromorphone (Dilaudid), insulin, labetolol (Normodyne, Trandate), levofloxacin (Levaquin), lidocaine (Xylocaine), linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, melphalan (Alkeran), meperidine (Demerol), meropenem (Merrem), metronidazole (Flagyl), midazolam (Versed), morphine, multivitamins, ondansetron (Zofran), paclitaxel (Taxol), pancuronium (Pavulon), perphenazine (Trilafon), ranitidine

(Zantac), remifentanil (Ultiva), sargramostim (Leukine), tacrolimus (Prograf), teniposide (Vumon), theophylline (Theodur), thiotepa (Thioplex), tolazone (Tolazolin), vecuronium (Norcuron), verapamil (Calan), vinorelbine (Navelbine), vitamin B complex with C, zidovudine (Retrovir).

## SIDE EFFECTS

#### Occasional

IM: Pain, induration. IV: Phlebitis, thrombophlebitis, hypersensitivity reactions (fever, pruritus, rash, urticaria). Ophthalmic: Burning, tearing, itching, blurred vision. Topical: Redness, itching. Rare

Alopecia, hypertension, weakness.

#### SERIOUS REACTIONS

 Nephrotoxicity (as evidenced by increased BUN and serum creatinine levels and decreased creatinine clearance) may be reversible if the drug is stopped at the first sign of symptoms.

• Irreversible ototoxicity (manifested as tinnitus, dizziness, ringing or roaring in the ears, and diminished hearing) and neurotoxicity (as evidenced by headache, dizziness, lethargy, tremor, and visual disturbances) occur occasionally. The risk of these effects increases with higher dosages or prolonged therapy and when the solution is applied directly to the mucosa.

• Superinfections, particularly with fungal infections, may result from bacterial imbalance no matter which administration route is used.

 Ophthalmic application may cause paresthesia of conjunctiva or mydriasis.

## **PRECAUTIONS & CONSIDERATIONS**

! Cumulative gentamicin effects may occur with concurrent systemic administration and topical application to large areas. Caution is warranted with neuromuscular disorders (because of the potential for respiratory depression), prior hearing loss, renal impairment, and vertigo and in elderly and neonatal patients because of age-related renal insufficiency or immaturity. Gentamicin readily crosses the placenta; it is unknown whether it is distributed in breast milk.

Before giving gentamicin, determine whether the patient has a history of allergies, especially to aminoglycosides, sulfites, and parabens (for topical and ophthalmic forms). Expect to correct dehydration before beginning parenteral therapy. Establish baseline hearing acuity before starting therapy. Intake and output should be monitored. Drink fluids to maintain adequate hydration. Monitor urinalysis results for casts, RBCs, WBCs, and decreased specific gravity. Be alert for ototoxic and neurotoxic side effects. If giving ophthalmic gentamicin, monitor the patient's eye for burning, itching, redness, and tearing. If giving topical gentamicin, monitor for itching and redness. Be alert for signs and symptoms of superinfection, particularly changes in the oral mucosa, diarrhea, and genital or anal pruritus. Monitor peak and trough serum drug levels.

#### Storage

Store ophthalmic preparations, topicals, and solution vials for injection at room temperature. The solution normally appears clear or slightly yellow. Intermittent IV infusion or IV piggyback solution is stable for 24 h at room temperature. Discard the IV solution if a precipitate forms.

#### Administration

! Space parenteral doses evenly around the clock. Gentamicin dosage is based on ideal body weight. As ordered, monitor peak and trough serum drug levels periodically to maintain the desired serum concentrations and to minimize the risk of toxicity.

For IV administration, dilute with 50-200 mL of D5W or 0.9% NaCl. The amount of diluent for infants and children depends on individual needs. Infuse over 30-60 min for adults and older children. Infuse over 60-120 min for infants and young children.

Administer the IM injection slowly and deep in the gluteus maximus rather than the lateral aspect of the thigh to minimize injection site pain.

For intrathecal administration, use only 2 mg/mL of the intrathecal preparation without preservative. Mix with 10% of the estimated cerebrospinal fluid volume or preservative-free 0.9% NaCl. Use the intrathecal form immediately after preparation. Discard any unused portion. Give over 3-5 min.

For ophthalmic use, place a gloved finger on the lower eyelid and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket, and place the correct number of drops (or 1/4 to 1/2 inch of ointment) into the pocket. Close the eye gently. After administering ophthalmic solution, apply digital pressure to the lacrimal sac for 1-2 min to minimize drainage into the nose and throat, thereby reducing the risk of systemic effects. After applying ophthalmic ointment, close eye for 1-2 min. Roll the eyeball to increase the drug's contact

with the eye. Use tissue to remove excess solution or ointment around the eye.

#### Glatiramer

gla-teer'a-mer Copaxone Do not confuse Copaxone with Compazine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Immunosuppressives

## **MECHANISM OF ACTION**

An immunosuppressive whose exact mechanism is unknown. May act by modifying immune processes thought to be responsible for the pathogenesis of multiple sclerosis (MS). *Therapeutic Effect:* Slows progression of MS.

## PHARMACOKINETICS

Substantial fraction of glatiramer is hydrolyzed locally. Some fraction of injected material enters the lymphatic circulation, reaching regional lymph nodes; some may enter systemic circulation intact.

#### AVAILABILITY

Injection: 20 mg/mL in prefilled syringes.

## INDICATIONS AND DOSAGES MS

SUBCUTANEOUS *Adults, Elderly.* 20 mg once a day.

#### CONTRAINDICATIONS

Hypersensitivity to glatiramer or mannitol.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Expected (40%-73%)

Pain, erythema, inflammation, or pruritus at injection site; asthenia. Frequent (18%-27%)

Arthralgia, vasodilation, anxiety, hypertonia, nausea, transient chest pain, dyspnea, flu-like symptoms, rash, pruritus.

#### **Occasional (10%-17%)**

Palpitations, back pain, diaphoresis, rhinitis, diarrhea, urinary urgency. Rare (6%-8%)

Anorexia, fever, neck pain, peripheral edema, ear pain, facial edema, vertigo, vomiting.

#### SERIOUS REACTIONS

- Infection is a common effect.
- · Lymphadenopathy occurs occasionally.
- · Hypertension may occur.
- · Transient eosinophilia may occur.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with an immediate post-injection reaction, including anxiety, chest pain, dyspnea, flushing, palpitations, and urticaria. This reaction is usually transient and self-limiting. Pregnancy should be avoided during therapy. It is unknown whether glatiramer is distributed in breast milk. The safety and efficacy of glatiramer have not been established in children. No information is available on glatiramer use in elderly patients.

Notify the physician of rash, weakness, difficulty breathing or swallowing, or itching or swelling of the legs. Vital signs, including temperature, should be obtained at baseline.

#### Storage

Refrigerate syringes. Do not freeze. Administration

For subcutaneous use only. Bring syringe to room temperature before injecting. To avoid loss of medicine, do not expel or attempt to expel the air bubble from the syringe before use. Each day, pick a different injection site. Do not inject in the same area more than once a week.

Administer as subcutaneous injection in the upper arms, abdomen, thighs, or hips.

## Glimepiride

gly-mep'er-ide ★ 🍁 Amaryl Do not confuse glimepiride with glipizide or glyburide.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antidiabetic agents, sulfonylureas, second generation

#### MECHANISM OF ACTION

A second-generation sulfonylurea that promotes release of insulin from β cells of the pancreas and increases insulin sensitivity at peripheral sites. Therapeutic Effect: Lowers blood glucose concentration.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	N/A	2-3 h	24 h

Glimepiride (Generic Name)

Completely absorbed from the GI tract. Protein binding: > 99%. Metabolized in the liver. Excreted in urine and eliminated in feces. *Half-life:* 5-9.2 h.

## AVAILABILITY

Tablets: 1 mg, 2 mg, 4 mg.

# INDICATIONS AND DOSAGES Type 2 diabetes mellitus PO

Adults, Elderly. Initially, 1-2 mg once a day, with breakfast or first main meal. Maintenance: 1-4 mg once a day. After dose of 2 mg/day is reached, dosage should be increased in increments of up to 2 mg q1-2wk, based on blood glucose response. Maximum: 8 mg/day.

#### Dosage in renal impairment PO

*Adults*. Initially, 1 mg once a day. Titrate with care.

## CONTRAINDICATIONS

Hypersensitivity, type 1 diabetes or diabetic ketoacidosis (with or without coma) as these conditions require insulin.

## INTERACTIONS

#### Drug

**β-Blockers:** May increase the hypoglycemic effect of glimepiride and mask signs of hypoglycemia. **Cimetidine, ciprofloxacin, fluconazole, MAOIs, quinidine, ranitidine, tricyclic antidepressant agents, large doses of salicylates:** May increase the effects of glimepiride.

**Corticosteroids, lithium, thiazide diuretics:** May decrease the effects of glimepiride.

**Inhibitors of CYP2C9:** May increase glimepiride blood concentrations and risk of hypoglycemia.

**Cyclosporine:** Sulfonylureas may increase cyclosporine levels.

**Oral anticoagulants:** May increase the effects of oral anticoagulants. **Herbal** 

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle: May enhance the hypoglycemic effects of glimepiride.

Food

Alcohol: Hypoglycemia is more likely to occur if alcohol is ingested.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and LDH concentrations and serum alkaline phosphatase, creatinine, and AST (SGOT) levels.

## SIDE EFFECTS

#### Frequent

Altered taste sensation, dizziness, somnolence, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, stomach fullness, headache, hypoglycemia.

## Occasional

Increased sensitivity of skin to sunlight, peeling of skin, itching, rash.

## SERIOUS REACTIONS

• Overdose or insufficient food intake may produce hypoglycemia, especially with increased glucose demands.

• GI hemorrhage, cholestatic hepatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic or hemolytic anemia occur rarely.

• Rare reports of angioedema, vasculitis, serious skin reactions, or disulfiram-like reactions with alcohol.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with pervious sulfonamide or sulfonylurea allergies.

Caution is warranted in patients with adrenal insufficiency, debilitation, hepatic disease, impaired renal or hepatic function, intestinal obstruction, malnutrition, pituitary insufficiency, prolonged vomiting, severe diarrhea, uncontrolled hyperthyroidism, and stress situations (including severe infection, trauma, surgery). Be alert to conditions that alter blood glucose requirements, such as fever, increased activity, stress, or a surgical procedure. Glimepiride use is not recommended during pregnancy. It is unknown whether glimepiride is distributed in breast milk. Safety and efficacy of glimepiride have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients. Also, age-related renal impairment may increase sensitivity to glucoselowering effect. Wear sunscreen and protective evewear to prevent the effects of light sensitivity.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors), or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity,

infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store at room temperature.

#### Administration

Take glimepiride with breakfast or the first main meal.

#### Glipizide

glip'i-zide ★ Glucotrol, Glucotrol XL Do not confuse glipizide with glimepiride or glyburide.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, sulfonylureas, second generation

#### MECHANISM OF ACTION

A second-generation sulfonylurea that promotes the release of insulin from  $\beta$  cells of the pancreas and increases insulin sensitivity at peripheral sites. *Therapeutic Effect:* Lowers blood glucose concentration.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	15-30 min	2-3 h	12-24 h
Extended release	2-3 h	6-12 h	24 h

Well absorbed from the GI tract. Protein binding: 99%. Metabolized in the liver. Excreted in urine. *Half-life:* 2-4 h.

Glipizide (Generic Name)

## AVAILABILITY

Tablets (Glucotrol): 5 mg, 10 mg. Tablets (Extended Release [Glucotrol XL]): 2.5 mg, 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Type 2 diabetes mellitus PO

*Adults.* Initially, 5 mg/day or 2.5 mg in elderly patients. Adjust dosage in 2.5- to 5-mg increments at intervals of several days. Maximum single dose: 15 mg. Maximum dose: 40 mg/day (rarely needed). Maintenance (extendedrelease tablet): Usually 5-20 mg once daily.

**Patients with hepatic impairment:** Begin at 2.5 mg once daily; titrate cautiously.

## CONTRAINDICATIONS

Hypersensitivity, type 1 diabetes or diabetic ketoacidosis (with or without coma) as these conditions require insulin.

## INTERACTIONS

#### Drug

**β-Blockers:** May increase the hypoglycemic effect of glipizide and mask signs of hypoglycemia.

Cimetidine, ciprofloxacin, fluconazole, MAOIs, quinidine, ranitidine, large doses of

salicylates: May increase the effects of glipizide.

**Corticosteroids, lithium, thiazide diuretics:** May decrease the effects of glipizide.

**Cyclosporine:** Sulfonylureas may increase cyclosporine levels.

**Oral anticoagulants:** May increase the effects of oral anticoagulants. **Herbal** 

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema,

## marshmallow, stinging nettle: May

enhance the hypoglycemic effects of glipizide.

## Food

Alcohol: Hypoglycemia is more likely to occur if alcohol is ingested.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and LDH concentrations and serum alkaline phosphatase, creatinine, and AST (SGOT) levels.

## SIDE EFFECTS

#### Frequent

Feeling nervous, diarrhea, and gas are most common. Altered taste sensation, dizziness, somnolence, weight gain, constipation, heartburn, nausea, vomiting, stomach fullness, headache.

### Occasional

Increased sensitivity of skin to sunlight, peeling of skin, itching, rash.

## SERIOUS REACTIONS

• Overdose or insufficient food intake may produce hypoglycemia, especially with increased glucose demands.

• GI hemorrhage, cholestatic hepatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic or hemolytic anemia occur rarely.

• Rare reports of angioedema, vasculitis, serious skin reactions, or disulfiram-like reactions with alcohol.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted with adrenal or pituitary insufficiency, hypoglycemic reactions, and impaired hepatic or renal function. Be alert to conditions that alter blood glucose requirements, such as fever, increased activity, stress, or a surgical procedure. Insulin is the drug of choice during pregnancy. Glipizide given within 1 mo of delivery may produce neonatal hypoglycemia. Glipizide crosses the placenta and is minimally distributed in breast milk. Safety and efficacy of glipizide have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients. Also, age-related renal impairment may increase sensitivity to the glucose-lowering effect. Wear sunscreen and protective evewear to prevent the effects of light sensitivity.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Take glipizide 30 min before a meal; the extended-release tablets should be taken with breakfast. Do not cut, crush, or chew extended-release tablets. The tablet shell may be noted in a bowel movement and is not cause for concern.

## Glucagon Hydrochloride

gloo'ka-gon Glucagen Hypokit; Glucagen; Glucagon Diagnostic Kit; Glucagon Emergency Kit Do not confuse glucagon with Glaucon.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

*Classification:* Antihypoglycemics, hormones/hormone modifiers

#### MECHANISM OF ACTION

A glucose-elevating agent that promotes hepatic glycogenolysis, gluconeogenesis. Stimulates the production of cyclic adenosine monophosphate (cAMP), which results in increased plasma glucose concentration, smooth muscle relaxation, and an inotropic myocardial effect. *Therapeutic Effect*: Increases plasma glucose level and relaxes Gl tract.

#### AVAILABILITY

Powder for Injection: 1 mg.

#### INDICATIONS AND DOSAGES • Hypoglycemia

IV, IM, SUBCUTANEOUS *Adults, Elderly, Children weighing more than 20 kg*.1 mg. May give 1 or 2 additional doses if response is delayed.

*Children weighing 20 kg or less.* 0.5 mg or, alternatively, 0.02-0.03 mg/ kg. Maximum: 1 mg.

#### Diagnostic aid IV. IM

*Adults, Elderly.* 0.25-2 mg 10 min before procedure. Use 1-2 mg if given IM.

## **OFF-LABEL USES**

Treatment of esophageal obstruction by solid food (food impaction), toxicity associated with  $\beta$ -blockers or calcium channel blockers.

## CONTRAINDICATIONS

Hypersensitivity to glucagon or beef or pork proteins, known pheochromocytoma or insulinoma.

## INTERACTIONS

#### Drug

Anticoagulants: May increase the effects of these drugs. Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level.

## **()** IV INCOMPATIBILITIES

Do not mix glucagon with any other medications.

## SIDE EFFECTS

#### Occasional

Nausea, vomiting.

#### Rare

Allergic reaction, such as urticaria, respiratory distress, and hypotension.

## SERIOUS REACTIONS

 Overdose may produce persistent nausea and vomiting and hypokalemia, marked by severe weakness, decreased appetite, irregular heartbeat, and muscle cramps.

· Serious allergic reactions are rare.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history suggestive of insulinoma or pheochromocytoma. Be aware of how to recognize symptoms of hypoglycemia, including anxiety, increased sweating, difficulty concentrating, headache, hunger, nausea, nervousness, pale and cool skin, shakiness, unusual fatigue, weakness, and unconsciousness. Treat early signs of hypoglycemia with a simple sugar first, such as hard candy, honey, orange juice, sugar cubes, or table sugar dissolved in water or juice, followed by a protein source, such as cheese and crackers, half a sandwich, or a glass of milk.

#### Storage

Store vials and kits at room temperature. Do not freeze. After reconstitution, use immediately and discard unused portion. Do not store for later use. Do not use glucagon solution unless it is clear.

#### Administration

! Place the patient on his or her side to avoid aspiration because glucagon (as well as hypoglycemia) may produce nausea and vomiting.

If patient fails to respond in

15 min, get emergency assistance. Administer IV dextrose if

the patient fails to respond to glucagon.

May give glucagon intravenously, IM, or subcutaneously. Reconstitute the powder with the diluent supplied by the manufacturer. To provide 1 mg glucagon/ mL, reconstitute the 1-mg vial with 1 mL diluent. Rate of IV administration is 1 mg/min, and glucagon is compatible with dextrose solutions. The patient will usually awaken in 5-20 min. If the patient fails to respond after 1 or 2 additional doses, give IV dextrose as prescribed. When the patient awakens, give oral carbohydrates to restore hepatic glycogen stores and prevent secondary hypoglycemia.

## **Glyburide**

glye<sup>-</sup>byoor-ide DiaBeta, Glynase DiaBeta, Euglucon, Mylan-Glybe Do not confuse glyburide with glimepiride or glipizide.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, sulfonylureas, second generation

## **MECHANISM OF ACTION**

A second-generation sulfonylurea that promotes the release of insulin from  $\beta$  cells of the pancreas and increases insulin sensitivity at peripheral sites. *Therapeutic Effect:* Lowers blood glucose concentration.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.25-1 h	1-2 h	12-24 h

Well absorbed from the GI tract. Protein binding: 99%. Metabolized in the liver to weakly active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 1.4-1.8 h.

## AVAILABILITY

Tablets (DiaBeta): 1.25 mg, 2.5 mg, 5 mg. Tablets (Glynase): 1.5 mg, 3 mg, 6 mg.

# INDICATIONS AND DOSAGES Diabetes mellitus Type 2 PO

Adults. Initially 2.5-5 mg. May increase by 2.5 mg/day at weekly

intervals. Maintenance: 1.25-20 mg/day. Maximum: 20 mg/day. *Elderly*. Initially, 1.25-2.5 mg/day. May increase by 1.25-2.5 mg/day at 1- to 3-wk intervals. PO (MICRONIZED TABLETS [GLYNASE]) *Adults, Elderly*. Initially, 0.75-3 mg/day. May increase by 1.5 mg/day at weekly intervals. Maintenance: 0.75-12 mg/day as a single dose or in divided doses. **> Dosage in renal impairment** Glyburide is not recommended in

patients with creatinine clearance < 50 mL/min.

## CONTRAINDICATIONS

Hypersensitivity, type 1 diabetes or diabetic ketoacidosis (with or without coma) as these conditions require insulin. Concurrent use of bosentan.

## INTERACTIONS

#### Drug

**β-Blockers:** May increase the hypoglycemic effect of glyburide and mask signs of hypoglycemia. **Bosentan:** May increase the risk of hepatotoxicity. Manufacturer of bosentan considers co-use contraindicated.

Cimetidine, ciprofloxacin, fluconazole, MAOIs, quinidine, ranitidine, tricyclic antidepressant agents, large doses of salicylates: May increase the effects of glyburide.

**Corticosteroids, lithium, thiazide diuretics:** May decrease the effects of glyburide.

**Oral anticoagulants:** May increase the effects of oral anticoagulants. **Herbal** 

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger,

Glyburide (Generic Name)

#### ginseng (American), gymnema, marshmallow, stinging nettle:

May increase the risk of hypoglycemia.

## Food

Alcohol: Hypoglycemia is more likely to occur if alcohol is ingested.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and LDH concentrations and serum alkaline phosphatase, creatinine, and AST (SGOT) levels.

## SIDE EFFECTS

#### Frequent

Altered taste sensation, dizziness, somnolence, weight gain, constipation, diarrhea, heartburn, nausea, vomiting, stomach fullness, headache.

#### Occasional

Increased sensitivity of skin to sunlight, peeling of skin, itching, rash.

## SERIOUS REACTIONS

 Overdose or insufficient food intake may produce hypoglycemia, especially in patients with increased glucose demands.

 Cholestatic jaundice, leukopenia, thrombocytopenia, pancytopenia, agranulocytosis, and aplastic or hemolytic anemia occur rarely.

• Rare reports of angioedema, vasculitis, serious skin reactions, or disulfiram-like reactions with alcohol.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with adrenal or pituitary insufficiency, hypoglycemic reactions, sulfonamide hypersensitivity, and impaired hepatic or renal function. Be alert to conditions that alter blood glucose requirements, such as fever, increased activity, stress, or a surgical procedure. Insulin is the drug of choice during pregnancy. Glyburide crosses the placenta and is distributed in breast milk. Glyburide use within 2 wks of delivery may produce neonatal hypoglycemia. Safety and efficacy of glyburide have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients. Also, age-related renal impairment may increase sensitivity to the glucoselowering effect. Wear sunscreen and protective eyewear to prevent the effects of light sensitivity.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store at room temperature in a tightly closed container.

## Administration

Daily doses of glyburide are administered with breakfast or the first main meal. If taking more than 1 dose per day, give with breakfast and dinner.

## Glycerin

gli'ser-in

Advanced Eye Relief Dry Eye Environmental Lubricant Eye Drops, Fleet Babylax, Fleet Liquid Glycerin Suppositories for Adults and Children, Fleet Glycerin Suppositories for Adults, Fleet Glycerin Suppositories for Children, Fleet Maximum-Strength Glycerin Suppositories, Glyrol, Osmoglyn, Sani-Supp

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B OTC (suppositories)

*Classification:* Osmotic diuretic, antiglaucoma, laxative

## **MECHANISM OF ACTION**

An osmotic dehydrating agent that increases osmotic pressure and draws fluid into the colon and stimulates evacuation of inspissated feces. Lowers both intraocular and intracranial pressure by osmotic dehydrating effects. Increases blood flow to ischemic areas, decreases serum free fatty acids, and increases synthesis of glycerides in the brain. *Therapeutic Effect:* Aids in fecal evacuation.

## PHARMACOKINETICS

Well absorbed after PO administration but poorly absorbed after rectal administration. Widely distributed to extracellular space. Rapidly metabolized in liver. Primarily excreted in urine. *Half-life:* 30-45 min.

## AVAILABILITY

*Ophthalmic Solution:* 1% (Advanced Eye Relief Dry Eye Environmental Lubricant Eye Drops).

Oral Solution: 50% (Osmoglyn). Rectal Solution: 2.3 g (Fleet Babylax), 5.6 g (Fleet Liquid Glycerin Suppositories). Suppositories: 1 g (Fleet Glycerin Suppositories for Children), 2 g (Fleet Glycerin Suppositories), 3 g (Fleet Maximum-Strength Glycerin Suppositories), 1g (Sani-Supp).

# INDICATIONS AND DOSAGES Constipation

RECTAL Adults, Elderly, Children 6 yr and older. 3 g/day. Children younger than 6 yr: 1-1.5 g/day. > Dry, irritated eyes

#### OPHTHALMIC Adults, Elderly, Children. 1 or 2 drops as needed.

## Reduction of intraocular pressure (IOP)

#### PO Adults, Elderly. 1-1.5 g/kg. Maximum reduction in IOP occurs in 1 h and lasts approximately 5 h. May give twice to 4 times a day.

## CONTRAINDICATIONS

Hypersensitivity to any component in the preparation, well-established anuria, severe dehydration, frank or impending acute pulmonary edema, severe cardiac decompensation.

#### INTERACTIONS Drug

**PO medications:** Oral glycerin may decrease transit time of concurrently administered oral medication, decreasing absorption.

#### Herbal

**Licorice:** May increase risk of hypokalemia.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Oral: Nausea, headache, vomiting. Rectal: Some degree of abdominal discomfort, nausea, mild cramps, headache, vomiting.

### Occasional

Oral: Diarrhea, dizziness, dry mouth or increased thirst. Ophthalmic: Pain and irritation may occur upon instillation. Rectal: Faintness, weakness, abdominal pain, bloating.

## SERIOUS REACTIONS

• Laxative abuse includes symptoms of abdominal pain, weakness, fatigue, thirst, vomiting, edema, bone pain, fluid and electrolyte imbalance, hypoalbuminemia, and syndromes that mimic colitis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes mellitus because product orally will increase blood sugar and osmotic load. Use caution in patients with hemolytic anemia; altered hydration; or cardiac, renal, or hepatic disease. It is unknown whether glycerin crosses the placenta or is excreted in breast milk. No age-related precautions have been noted in children. Be aware that glycerin may increase the risk of dehydration in elderly patients because it reduces the water in the body. Unrelieved constipation, dizziness, muscle cramps or pain, rectal bleeding, confusion, irregular heartbeat, and weakness should be reported.

#### Storage

Discard ophthalmic preparation 6 mo after dropper is first placed in drug solution. Store at room temperature away from damp places like the bathroom or near the kitchen sink as well as heat and direct light because it may cause the medicine to break down. Refrigerate suppositories. Administration

Instill ophthalmic drops of solution in each lower conjunctival sac. Close eye gently to help spread the solution to all areas of the conjunctiva. Gently wipe away excess solution from the eyelids and surrounding skin with tissue.

Mix oral glycerin unflavored 50% oral solution with orange juice. Pour solution over crushed ice and drink through a straw to improve palatability. Have patient drink over 5-10 min to reduce vomiting risk. May administer doses at 5-h intervals for the reduction of intraocular pressure. Tell the patient to lie down after oral solution to minimize risk of developing headache.

If rectal suppository is too soft, chill for 30 min in refrigerator or run cold water over foil wrapper. Remove wrapper and moisten suppository with cold water before inserting well into rectum. Lie on the left side. Insert suppository high in rectum and retain for 15 min. If administering liquid glycerin rectally, gently insert stem with steady pressure at tip pointing toward the navel and squeeze unit until almost all the liquid has been delivered. A small amount of liquid will remain. Withdraw unit.

Increase fluid intake, exercise, and eat a high-fiber diet to promote defecation. Warn the patient to notify the physician if he or she experiences unrelieved constipation, dizziness, muscle cramps or pain, rectal bleeding, confusion, irregular heartbeat, and weakness.

## **Glycopyrrolate**

glye-koe-pye'roe-late Cuvposa, Robinul, Robinul Forte Do not confuse Robinul with Reminyl.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Anticholinergics, gastrointestinals

## **MECHANISM OF ACTION**

A quaternary anticholinergic that inhibits the action of acetylcholine at postganglionic parasympathetic sites in smooth muscle, secretory glands, and the central nervous system (CNS). *Therapeutic Effect:* Reduces salivation and excessive secretions of respiratory tract; reduces gastric secretions and acidity.

## PHARMACOKINETICS

Poorly and irregularly absorbed from GI tract after oral administration. Metabolized in the liver. Primarily excreted in urine. *Half-life:* 1.7 h.

## AVAILABILITY

Injection: 0.2 mg/mL. Tablets: 1 mg, 2 mg. Oral Solution: 1 mg/5 mL.

## INDICATIONS AND DOSAGES

## Preoperative inhibition of salivation and excessive respiratory tract secretions

IM Adults, Elderly. 4 mcg/kg 30-60 min before procedure. Children 2 yr and older: 4 mcg/kg. Children younger than 2 yr. 4-9 mcg/kg. Do not use in neonates (< 1 mo).

#### To block the effects of anticholinesterase agents IV

*Adults, Elderly, Children.* 0.2 mg for each 1 mg neostigmine or 5 mg pyridostigmine.

Peptic ulcer disease, adjunct
 IV, IM
 IV

Adults, Elderly. 0.1 mg IV or IM 3-4 times a day.

PO

*Adults, Elderly.* 1-2 mg 2-3 times a day. Maximum: 8 mg/day.

## For severe drooling in children with cerebral palsy

*Children 3 to 16 yr.* Initially, 0.02mg/kg 3 times per day and titrate by 0.02 mg/kg q5-7 days as needed and tolerated. Maximum: 0.1 mg/kg 3 times daily, and not to exceed 1.5-3 mg per dose.

## CONTRAINDICATIONS

Acute hemorrhage, myasthenia gravis, narrow-angle glaucoma, obstructive uropathy, paralytic ileus, tachycardia, ulcerative colitis, obstructive diseases of the GI tract, neonates. With chronic use, do not use solid oral dosage forms of potassium chloride.

## INTERACTIONS

## Drug

#### Antacids, antidiarrheals:

May decrease the absorption of glycopyrrolate. Do not take within 1 h of taking oral glycopyrrolate. **Digoxin tablets:** Can increase

digoxin serum levels. Monitor patients closely.

Atenolol or metformin: May increase serum levels of atenolol or metformin.

Haloperidol or levodopa: May decrease serum levels of haloperidol or levodopa.

Glycopyrrolate (Generic Name)

**Ketoconazole:** May decrease the absorption of ketoconazole.

Other anticholinergics: May increase the effects of glycopyrrolate. Potassium chloride: May increase the severity of GI lesions with the wax matrix formulation of potassium chloride.

**Pramlinitide:** May increase anticholinergic effects.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum uric acid levels.

## **()** IV INCOMPATIBILITIES

Chloramphenicol, dexamethasone sodium phosphate (Decadron), diazepam (Valium), dimenhydrinate (Dramamine), methohexital (Brevital), methylprednisolone sodium succinate (Solu-Medrol), pentazocine (Talwin), pentobarbital (Nembutal), secobarbital (Seconal), sodium bicarbonate, thiopental (Pentothal).

## IV COMPATIBILITIES

Atropine, buprenorphine (Buprenex), butorphanol (Stadol), chlorpromazine (Thorazine), cimetidine (Tagamet), codeine, diphenhydramine (Benadryl), droperidol (Inapsine), hydromorphone (Dilaudid), hydroxyzine (Vistaril), levorphanol (Levo-Dromoran), lidocaine, meperidine (Demerol), midazolam (Versed), morphine, nalbuphine (Nubain), neostigmine, ondansetron (Zofran), oxymorphone (Opana), physostigmine, procaine (Pronestyl), prochlorperazine (Compazine), promazine (Sparine), promethazine (Phenergan), propofol (Diprivan), pyridostigmine (Mestinon),

ranitidine (Zantac), scopolamine, triflupromazine (Vesprin), trimethobenzamide (Tigan).

## SIDE EFFECTS

#### Frequent

Dry mouth, decreased sweating, constipation.

#### Occasional

Blurred vision, gastric bloating, urinary hesitancy, somnolence (with high dosage), headache, intolerance to light, loss of taste, nervousness, flushing, insomnia, impotence, mental confusion or excitement (particularly in the elderly and children), temporary lightheadedness (with parenteral form), local irritation (with parenteral form).

#### Rare

Dizziness, faintness, diarrhea.

## SERIOUS REACTIONS

 Overdose may produce temporary paralysis of the ciliary muscle; pupillary dilation; tachycardia; palpitations; hot, dry, or flushed skin; absence of bowel sounds; hyperthermia; increased respiratory rate; ECG abnormalities; nausea; vomiting; rash over face or upper trunk; CNS stimulation; and psychosis (marked by agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, and delusions, followed by depression).

• If diarrhea occurs, discontinue the drug.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with congestive heart failure, diarrhea, fever, GI infections, hepatic or renal disease, prostatic hypertrophy, hypertension, ulcerative colitis, hypothyroidism, and reflux esophagitis. Avoid hot baths, saunas, and becoming overheated while exercising in hot weather because they may cause heatstroke. Tasks that require mental alertness or motor skills should also be avoided until response to the drug has been established.

Dry mouth may occur. BP, body temperature, heart rate, pattern of daily bowel activity and stool consistency, and urine output should be monitored. The patient should void before receiving the drug to reduce the risk of urine retention.

#### Storage

Store tablets and unopened injection vials at room temperature.

#### Administration

For direct injection, administer undiluted through the tubing of a free-flowing compatible IV solution, over 1-2 min.

For IM use, administer undiluted or diluted with  $D_5W$ ,  $D_{10}W$ , or 0.9% NaCl.

Take oral tablets 30-60 min before meals. Oral solution is given 1 h before or 2 h after meals.

#### Golimumab

goe-lim'u-mab

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Immunomodulators, disease-modifying antirheumatic drugs (DMARDs), TNF modulators

#### **MECHANISM OF ACTION**

A monoclonal antibody that neutralizes the biological activity of tumor necrosis factor (TNF)- $\alpha$ by binding to it and blocking its interaction with cell surface TNF receptors, decreasing inflammation and immune responses. *Therapeutic Effect:* Reduces inflammation, swelling, and joint destruction for those with psoriatic arthritis, rheumatoid arthritis, or ankylosing spondylitis, improving symptoms.

## PHARMACOKINETICS

Time to steady state reached at roughly 12 wks of treatment. *Half-life:* Approximately 14 days.

#### AVAILABILITY

Injection: 50 mg/0.5 mL in an autoinjector or prefilled syringes.

## INDICATIONS AND DOSAGES

 Moderate to severe rheumatoid arthritis (RA), psoriatic arthritis, or active ankylosing spondylitis SC

Adults: 50 mg SC given once every month. Treatment is given with methotrexate for RA.

## CONTRAINDICATIONS

None. Withhold in any patient with a clinically important, active, serious infection, especially active TB.

## INTERACTIONS

## Drug

Other biologics for arthritis (e.g., rituximab, etc.) and traditional immunosuppressives: There may be an increased risk of serious infections with combined use. Abetacept co-therapy not recommended. Methotrexate is given with golimumab for the treatment of RA. Narrow therapeutic index drugs metabolized via CYP450 enzymes (e.g., theophylline, cyclosporine, warfarin): Golimumab may alter CYP enzyme activity and thus reduce clearance and increase levels; monitor closely.

## Gold Sodium Thiomalate

gold so'dee-um thye-oh-mah'late

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Diseasemodifying antirheumatic drugs, gold compounds

## **MECHANISM OF ACTION**

A gold compound whose mechanism of action is unknown. May decrease prostaglandin synthesis or alter cellular mechanisms by inhibiting sulfhydryl systems. *Therapeutic Effect*: Decreases synovial inflammation, retards cartilage and bone destruction, suppresses or prevents—but does not cure arthritis and synovitis.

## AVAILABILITY

Injection: 50 mg/mL.

## INDICATIONS AND DOSAGES

#### Rheumatoid arthritis IM

Adults, Elderly. Initially, 10 mg, followed by 25 mg for second dose, then 25-50 mg/wk until improvement noted. Maintenance: 25-50 mg q2wk for 2-20 wks; if stable, may increase intervals to q3-4wk. Maximum: 100 mg/dose. Continued until the cumulative dose reaches 1 g unless toxicity occurs; if no improvement, discontinue use.

## Juvenile rheumotoid arthritis (JRA) or juvenile idiopathic arthritis (JIA)

*Children.* Initially, 10 mg, then 1 mg/kg/wk up to a maximum single dose of 50 mg. Maintenance: 1 mg/kg/dose q2-4wk. Dosage in renal impairment

Dosage is modified based on creatinine clearance.

### CrCL (mL/min) | Dosage

50-80	50% of usual dose
< 50	Not recommended

## **OFF-LABEL USES**

Treatment of psoriatic arthritis.

## CONTRAINDICATIONS

Colitis; concurrent use of antimalarials, immunosuppressive agents, penicillamine, or phenylbutazone; congestive heart failure; exfoliative dermatitis; history of blood dyscrasias; severe hepatic or renal impairment; systemic lupus erythematosus, hypersensitivity to the drug or benzyl alcohol.

## INTERACTIONS

#### Drug

ACE inhibitors: May increase toxic effects of gold sodium thiomalate. Bone marrow depressants, hepatotoxic and nephrotoxic medications: May increase the risk

of toxicity. Penicillamine: May increase the

risk of adverse hematologic or renal effects.

Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May decrease hemoglobin level, hematocrit, and WBC and platelet counts. May increase urine protein level. May alter liver function test results.

## SIDE EFFECTS

#### Frequent

Pruritic dermatitis, stomatitis, diarrhea, abdominal pain, nausea.

#### 745.e2 Gold Sodium Thiomalate

#### Occasional

Vomiting, anorexia, flatulence, dyspepsia, conjunctivitis, photosensitivity.

#### Rare

Constipation, urticaria, rash.

#### SERIOUS REACTIONS

G

• Signs and symptoms of gold toxicity include decreased hemoglobin level, decreased granulocyte count (< 150,000/mm<sup>3</sup>), proteinuria, hematuria, blood dyscrasias (anemia, leukopenia [WBC < 4000 mm<sup>3</sup>], thrombocytopenia, and eosinophilia), glomerulonephritis, nephrotic syndrome, and cholestatic jaundice.

#### PRECAUTIONS & CONSIDERATIONS

Gold therapy may cause significant toxicity (skin, GI, hematologic, pulmonary, hepatic, renal) and requries monitoring of a skilled professional trained in its proper use. Avoid exposure to sunlight, which may turn skin gray or blue. Oral hygiene should be diligently maintained to help prevent stomatitis. Gold appears in breast milk; discontinue breastfeeding during treatment. Gold therapy is avoided during pregnancy.

Pattern of daily bowel activity and stool consistency, urine for hematuria and proteinuria, CBC (particularly hemoglobin level, hematocrit, and WBC and platelet counts), renal and liver function tests (especially BUN level and serum alkaline phosphatase, creatinine, AST [SGOT], and ALT [SGPT] levels), skin for rash, and oral mucous membranes for stomatitis should be monitored. Analyze urine for protein and sediment changes. Therapeutic response, including improved grip strength, increased joint mobility, reduced joint tenderness, and relief of pain, stiffness, and swelling, should also be assessed.

#### Storage

Store at room temperature. Protect from light. Solution should be clear or pale yellow. Vials are for multiple dose use.

#### Administration

! Give gold sodium thiomalate IM only, as prescribed.

Full therapeutic effect may take 6 mo or longer to appear.

Inject intragluteally with patient lying down; intragluteally keep recumbent for 10 min after injection. Vaccines, live: Avoid use. Altered immune response and increased risk of secondary transmission of infection from vaccine.

## DIAGNOSTIC TEST EFFECTS

May increase liver enzymes or decrease various blood cell components.

## SIDE EFFECTS

#### Frequent ( $\geq 5\%$ )

Nasopharyngitis, mild upper respiratory infections (bronchitis, sinusitis, pharyngitis, rhinitis).

## Occasional (1%-5%)

Increased liver enzymes, hypertension, dizziness, injection site erythema, pyrexia, oral herpes, paresthesia.

#### Rare (<1%)

Headache, fatigue. See Serious Reactions.

#### SERIOUS REACTIONS

 Rare reactions include serious hypersensitivity reactions, risk for malignancies (e.g., lymphomas and nonmelanoma skin malignancy), new or worsening heart failure, hepatitis, lupus-like syndromes, neurologic events (demyelinating disorders), and serious infections (such as pneumonia, tuberculosis, reactivation of hepatitis B).

· Post-market reports of pancytopenia, leukopenia, neutropenia, aplastic anemia, and thrombocytopenia in patients receiving similar TNF blockers.

 Rare reports of Guillain-Barré syndrome, paresthesias, and weakness.

· Rare reports of lymphoma and other secondary malignancies with use of TNF blockers.

#### PRECAUTIONS & CONSIDERATIONS

Serious infections, sepsis, tuberculosis, and opportunistic infections have occurred during therapy. Patients should be screened for active or recent infection, tuberculosis risk factors, and latent tuberculosis infection before initiating therapy. Closely monitor patients for the development of infection during therapy. Caution is warranted with neurologic disease, (such as multiple sclerosis or Guillain-Barré), history of sensitivity to monoclonal antibodies, preexisting or recent onset of CNS disturbances, those with heart failure or cardiac disease, or a history of malignancy. There are no adequate data in pregnant women; animal studies do not show teratogenic effects. It is unknown if the drug is excreted in breast milk. The safety and efficacy of golimumab have not been established in children. Cautious use in the elderly is necessary because they may be at increased risk for serious infection and malignancy. Avoid receiving live vaccines during treatment. The needle cover on the product contains latex and may cause sensitivity in those with latex allergy.

#### Storage

Refrigerate. Do not freeze. Protect from light; store in original carton until administration. Do not shake.

#### Administration

For subcutaneous use only; rotate injection sites. The solution should be colorless to slightly yellow and may contain a few small translucent/white particles. Do not use if discolored, cloudy. Do not shake. Allow the autoinjector or prefilled syringe to come to room temperature (roughly 30 min) before use. Injection sites include the front middle thigh, abdominal region, and the outer area of upper arm. Do not inject within 2 inches of the navel. Do not administer where skin is tender, bruised, red,

or hard. Do not rub injection site. Discard any unused portion.

#### Goserelin

go'seh-rel-in 🗙 酔 Zoladex, Zoladex LA

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D (advanced breast cancer), X (endometriosis, endometrial thinning)

#### Classification: Hormones/

hormone modifiers, gonadotropinreleasing hormone analogs

## **MECHANISM OF ACTION**

A gonadotropin-releasing hormone analog and antineoplastic agent that stimulates the release of luteinizing hormone (LH) and folliclestimulating hormone (FSH) from the anterior pituitary gland. Therapeutic Effect: In females, reduces estrogen levels, produces a reduction in ovarian size and function, a reduction in uterine and mammary gland size, and regression of sex-hormoneresponsive tumors. In men, it produces decreased testosterone levels, pharmacologic castration, and decreases the growth of abnormal prostate tissue.

## AVAILABILITY

*Implant:* 3.6 mg (monthly). *Implant:* 10.8 mg (every 3 mo).

## INDICATIONS AND DOSAGES

 Prostatic cancer
 IMPLANT
 Adult males. 3.6 mg every 28 days or
 10.8 mg q12wk subcutaneously into upper abdominal wall.

Breast cancer, endometriosis
 IMPLANT

*Adult females.* 3.6 mg every 28 days subcutaneously into upper abdominal wall. Do not use 10.8-mg implant in females.

## **OFF-LABEL USES**

Uterine fibroids, endometrial thinning before ablation procedure.

## CONTRAINDICATIONS

Pregnancy; hypersensitivity to goserelin products, luteinizing hormone-releasing hormone (LHRH), or LHRH analogs; breastfeeding.

## INTERACTIONS

Drug, Herbal, and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

In men, causes transient increases in serum levels of testosterone at treatment initiation. May increase blood sugar, liver enzymes, or blood lipids.

## SIDE EFFECTS

## Frequent

Headache (60%), hot flashes (55%), depression (54%), diaphoresis (45%), sexual dysfunction (21%), decreased erection (18%), lower urinary tract symptoms (13%). Occasional (5%-10%)

Pain, lethargy, dizziness, insomnia, anorexia, nausea, rash, upper respiratory tract infection, hirsutism, abdominal pain, acne, vaginitis, peripheral edema. **Rare** Pruritus.

#### SERIOUS REACTIONS

Arrhythmias, congestive heart failure, and hypertension occur rarely.
Ureteral obstruction and spinal cord compression have been observed. An immediate orchiectomy may be necessary if these conditions occur. • Deep vein thrombosis has been reported. May increase risk of MI, sudden cardiac death, or stroke.

• Decreased bone mineral density, osteoporosis with long-term use, fractures.

· New onset or worsened diabetes.

#### **PRECAUTIONS & CONSIDERATIONS**

In men at particular risk of developing ureteral obstruction or spinal cord compression, monitor closely. Use with caution in patients with existing diabetes mellitus or cardiovascular risk factors.

Goserelin crosses the placenta and may cause fetal harm. Women who are or may be pregnant should not use this drug. Pregnancy status should be determined before beginning therapy. Women should use nonhormonal contraceptive measures during therapy. It is unknown whether goserelin is excreted in breast milk. The safety and efficacy of goserelin have not been established in children. No age-related precautions have been noted in elderly patients.

Women should notify the physician if regular menstruation persists or if they become pregnant. Breakthrough bleeding may occur if a goserelin dose is missed. Signs and symptoms of worsening of prostatic cancer, especially in the first month, should be monitored in men. Decreased bone mineral density secondary to this medication may be irreversible. **Storage** 

Store at room temperature in original packaging and do not remove from foil pouch until time of use.

#### Administration

! Confirm implant dosage against patient prescription before insertion.

Inspect for damage before opening. If the package is damaged, do not use the syringe. Remove the sterile syringe from the package immediately before use. Check that implant is visible in the translucent chamber. Place patient in a comfortable position with the upper part of the body slightly raised. Prepare area of the anterior abdominal wall below the navel with alcohol. Grasp the safety tab and pull away from the syringe and discard. Remove needle cover. Do not remove air bubbles as this may displace the implant.

Using aseptic technique, pinch up the skin area for subcutaneous implant. With the bevel of the needle up, insert at a 30-45° angle to the skin in one continuous motion until the protective sleeve touches the skin; take care not to penetrate muscle. If the needle penetrates a large vessel, blood will be seen instantly in the syringe chamber. If a vessel is penetrated, withdraw the needle and inject with a new syringe at a different site.

To administer the implant and activate the protective sleeve, grasp the barrel at the finger grip and depress plunger until it cannot depress any further. When the sleeve "clicks," it will automatically begin to slide to cover the needle. Withdraw the needle and allow protective sleeve to cover it. Dispose of in an approved receptacle.

In case of the need to surgically remove the implant, it may be localized by ultrasound.

#### Granisetron

gra-ni'se-tron 🗙 Kytril, Sancuso 🌄 Kytril

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

**Classification:** Antiemetics/ antivertigo, serotonin receptor antagonists

## **MECHANISM OF ACTION**

A 5-HT<sub>3</sub> receptor antagonist that acts centrally in the chemoreceptor trigger zone or peripherally at the vagal nerve terminals. *Therapeutic Effect:* Prevents nausea and vomiting.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-3 min	N/A	24 h

Rapidly and widely distributed to tissues. Protein binding: 65%. Metabolized in the liver to active metabolite. Eliminated in urine and feces. *Half-life:* 10-12 h (increased in the elderly).

## AVAILABILITY

Oral Solution: 1 mg/5 mL. Tablets: 1 mg. Injection: 1 mg/mL, 0.1 mg/mL. Transdermal patch: 3.1 mg/24 h

## INDICATIONS AND DOSAGES

#### Prevention of chemotherapyinduced nausea and vomiting PO

Adults, Elderly, Children 2 yr and older. 2 mg once a day up to 1 h before chemotherapy or 1 mg twice a day, with first dose 1 h before chemotherapy.

TRANSDERMAL PATCH Adults. Apply a single patch 24 h before chemotherapy. May apply up to a maximum of 48 h before chemotherapy as appropriate. Remove 24 h after completion of chemotherapy. Each patch can be worn for up to 7 days depending on the duration of chemo regimen. IV

Adults, Elderly, Children 2 yr and older: 10 mcg/kg/dose (or 1 mg/dose) within 30 min of chemotherapy.

## Prevention of radiation-induced nausea and vomiting

Adults, Elderly. 2 mg once a day given 1 h before radiation therapy.

IV

*Adults, Elderly.* 1 mg as a single postoperative dose.

## CONTRAINDICATIONS

Hypersensitivity to drug or similar agents. (Use caution.)

Hypersensitivity to benzyl alcohol (IV form).

## INTERACTIONS

#### Drug

Apomorphine: May cause

significant hypotension. Hepatic enzyme inducers: May

decrease the effects of granisetron. Ketoconazole and strong CYP3A inhibitors: May reduce granisetron metabolism.

**QT-prolonging drugs:** Use with caution due to potential additive effects on QT interval.

#### Herbal

St. John's wort: May decrease levels of granisetron.

Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase AST (SGOT) and ALT (SGPT) levels.

## IV INCOMPATIBILITIES

Amphotericin B (Fungizone), diazepam, lansoprazole, phenytoin.

## **IV COMPATIBILITIES**

Acyclovir (Zovirax), allopurinol (Aloprim), amifostine (Ethyol), amikacin (Amikin), aminophylline, amphotericin B cholesteryl sulfate complex (Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), amsacrine (Amsa), aztreonam (Azactam), bleomycin (Blenoxane), bumetanide (Bumex), buprenorphine (Buprenex), butorphanol (Stadol), calcium gluconate, carboplatin (Paraplatin), carmustine (BiCNU), cefazolin (Ancef), cefepime (Maxipime), cefoperazone (Cefobid), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefixitin), ceftazidime (Fortaz), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chlorpromazine (Thorazine), cimetidine (Tagamet), ciprofloxacin (Cipro), cisplatin (Platinol), cladribine (Leustatin), clindamycin (Cleocin), co-trimoxazole (Bactrim), cyclophosphamide (Cytoxan), cytarabine (Ara-C), dacarbazine (DTIC-Dome), dactinomycin (Cosmegen), daunorubicin (Cerubidine), dexamethasone (Decadron), diphenhydramine (Benadryl), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Adriamycin), doxycycline (Vibramycin), droperidol (Inapsine), enalaprilat (Vasotec), etoposide (VePesid), famotidine (Pepcid), filgrastim (Neupogen), floxuridine (FUDR), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil (Efurix), furosemide (Lasix), ganciclovir (Cytovene), gatifloxacin (Tequin), gemcitabine (Gemzar), gentamicin (Garamycin), haloperidol (Haldol), heparin, hydrocortisone sodium phosphate, hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine (Vistaril), idarubicin (Idamycin), ifosfamide (Ifex), imipenem and cilastatin (Primaxin), leucovorin, linezolid (Zyvox), lorazepam (Ativan), magnesium, mechlorethamine (Mustargen), melphalan (Alkeran), meperidine

(Demerol), mesna (Mesnex), methotrexate, methylprednisolone sodium succinate (Solu-Medrol), metoclopramide (Reglan), metronidazole (Flagyl), minocycline (Minocin), mitomycin (Mutamycin), mitoxantrone (Novantrone), morphine (Avinza, Kadian, Roxanol), nalbuphine (Nubain), netilmicin (Netromycin), ofloxacin (Floxin), paclitaxel (Taxol), piperacillin (Piperacil), piperacillin and tazobactam (Zosyn), plicamycin (Mithracin), potassium, prochlorperazine (Compazine), promethazine (Phenergan), propofol (Diprivan), ranitidine (Zantac), sargramostim (Leukine), sodium bicarbonate, streptozocin (Zanosar), teniposide (Vumon), thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin and clavulanate (Timentin), tobramycin (Nebcin), topotecan (Hycamtin), vancomycin (Vancocin), vinblastine (Velban), vincristine (Oncovin), vinorelbine (Navelbine), zidovudine (Retrovir).

#### SIDE EFFECTS

Frequent (14%-21%) Headache, constipation, asthenia. Occasional (6%-8%) Diarrhea, abdominal pain. Rare (< 2%) Altered taste, hypersensitivity reaction, increased liver enzymes.

#### SERIOUS REACTIONS

• Serious hypersensitivity and anaphylaxis are rare.

 QT prolongation and risk of arrhythmia, including torsades de pointes.

## **PRECAUTIONS & CONSIDERATIONS**

Should be used with caution in patients with preexisting arrhythmias or cardiac conduction disorders.Patients with cardiac disease, on cardiotoxic chemotherapy, with electrolyte abnormalities, and/or on QT-prolonging medications are particularly at risk. It is unknown whether granisetron is distributed in breast milk. The safety and efficacy of granisetron have not been established in children younger than 2 yr. No age-related precautions have been noted in elderly patients.

Notify the physician if headache occurs. The pattern of daily bowel activity and stool consistency should be assessed.

#### Storage

Keep the bottle of oral solution tightly closed. Protect the bottle from light and store it in an upright position. Store vials for IV use at room temperature; the solution normally appears clear and colorless. After dilution, the solution for injection is stable for at least 24 h at room temperature. Keep patch in sealed pouch until time of use.

#### Administration

! Administer only on days of chemotherapy, as prescribed. Administer oral granisetron within 1 h and the IV form within 30 min before starting chemotherapy.

For IV use, administer granisetron undiluted or dilute it with 20-50 mL 0.9% NaCl or D5W. Do not mix it with other medications. Administer the undiluted drug by IV push over 30 seconds. For IV piggyback, infuse over 5-20 min, depending on the volume of diluent used.

For transdermal patch use, apply to clean, dry, intact healthy skin on the upper outer arm a minimum of 24 h before chemotherapy. Do not place on skin that is red, irritated, or damaged. The patch should not be cut into pieces. Griseofulvin griz-ee-oh-full'vin

CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

Classification: Antifungals

## **MECHANISM OF ACTION**

An antifungal that inhibits fungal cell mitosis by disrupting mitotic spindle structure. *Therapeutic Effect:* Fungistatic.

#### AVAILABILITY

Oral Suspension (Grifulvin V): 125 mg/5 mL. Tablets (Microsize [Grifulvin V]): 500 mg. Tablets (Ultramicrosize [Gris-PEG]): 125 mg, 250 mg.

#### INDICATIONS AND DOSAGES

 Tinea capitis, tinea corporis, tinea cruris, tinea pedis, tinea unguium

MICROSIZE TABLETS, ORAL SUSPENSION Adults. Usually, 500 mg once daily or in 2 divided doses. Children 2 yr and older. Usual dosage, 10-20 mg/kg/day in 1 dose or 2 divided doses. ULTRAMICROSIZE TABLETS Adults. Usual dosage, 300-750 mg/day as a single dose or in divided doses. Children 2 vr and older. 5-10 mg/kg/day.

## CONTRAINDICATIONS

Hepatocellular failure, porphyria, pregnancy, hypersensitivity.

## INTERACTIONS

#### Drug

**Barbiturates:** May decrease the effects of griseofulvin.

**Cyclosporine:** Cyclosporine levels may be decreased.

**Oral contraceptives, warfarin:** May decrease the effects of these drugs.

## Herbal

None known.

#### Food

Alcohol: May cause disulfiram-like reaction.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional

Hypersensitivity reaction (including pruritus, rash, and urticaria), headache, nausea, diarrhea, excessive thirst, flatulence, oral thrush, dizziness, insomnia.

#### Rare

Paresthesia of hands or feet, proteinuria, photosensitivity reaction.

## SERIOUS REACTIONS

- · Granulocytopenia occurs rarely.
- · Hepatotoxicity.

• Rare serious hypersensitivity such as Stevens-Johnson syndrome or toxic epidermal necrolysis (TEN).

## **PRECAUTIONS & CONSIDERATIONS**

Because griseofulvin is produced by a species of Penicillium, patients with penicillin allergy might have cross-sensitivity; however, patients with penicillin allergy have received griseofulvin without adverse effects. Determine any history of allergies, especially to griseofulvin and penicillins, before giving the drug. Caution is warranted in those who are exposed to sun or ultraviolet light because photosensitivity may develop. Avoid alcohol and exposure to sunlight. Maintain good hygiene to help prevent superinfection. Separate personal items that come in direct contact with affected areas.

Do not give to a pregnant woman; considered teratogenic.There are no data of use during lactation; avoid use during lactation.

Monitor the granulocyte count as appropriate. If granulocytopenia develops, notify the physician and expect to discontinue the drug. If headache occurs, establish and document the headache's location, onset, and type. Assess for dizziness. Evaluate skin for rash and therapeutic response to the drug. Assess daily pattern of bowel activity and stool consistency.

#### Storage

Store at room temperature; protect from light.

#### Administration

The duration of treatment depends on the site of infection. Take oral griseofulvin with foods high in fat, such as milk or ice cream, to reduce GI upset and assist in drug absorption. Shake oral suspension well before each use. Keep affected areas dry and wear light clothing for ventilation.

## Guaifenesin

gwye-fen'e-sin ▲ Allfen, Altarussin, Bidex, Diabetic Tussin Mucus Relief, Ganidin NR, Guiatuss, Liquibid, Mucinex, Mucinex Childrens, Mucinex Junior, Organidin NR, Q-Tussin, Robafen, Robitussin, Scott-Tussin, Situssin SA, XPECT ▲ Robitussin Chest Congestion, Balminil, Benylin Chest Congestion, Vicks DayQuil Mucus Control Do not confuse guaifenesin with guanfacine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

Classification: Expectorants

## **MECHANISM OF ACTION**

An expectorant that stimulates respiratory tract secretions by decreasing the adhesiveness and viscosity of phlegm. *Therapeutic Effect:* Promotes removal of viscous mucus.

## PHARMACOKINETICS

Well absorbed from the GI tract. Metabolized in the liver. Excreted in urine.

## AVAILABILITY

Granules (Mucinex Childrens, Mucinex Junior): 50 mg/packet, 100 mg/packet. Tablets: 200 mg, 400 mg. Tablets, Extended Release (Mucinex): 600 mg, 1200 mg. Syrup: 100 mg/5 mL.

# INDICATIONS AND DOSAGES Expectorant

PO Adults, Elderly, Children older than 12 yr. 200-400 mg q4h. Children 6-12 yr. 100-200 mg q4h. Maximum: 1.2 g/day. Children 2-5 yr. 50-100 mg q4h. Children younger than 2 yr. 12 mg/ kg/day in 6 divided doses. PO (EXTENDED RELEASE) Adults, Elderly, Children older than 12 yr. 600-1200 mg q12h. Maximum: 2.4 g/day.

#### CONTRAINDICATIONS

None known.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Rare

Dizziness, headache, rash, diarrhea, nausea, vomiting, abdominal pain.

#### SERIOUS REACTIONS

Overdose may produce nausea and vomiting.

#### **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether guaifenesin crosses the placenta or is distributed in breast milk. Be alert to liquid formulas that may contain alcohol.No age-related precautions have been noted in children or in elderly patients. Use guaifenesin cautiously in children younger than 2 yr with a persistent cough. Avoid tasks that require mental alertness or motor skills until response to the drug has been established. Fluid intake and environmental humidity should be increased to lower the viscosity of secretions.

Notify the physician of cough that persists or is accompanied by fever, rash, headache, or sore throat. Clinical improvement should be assessed.

#### Storage

Store syrup, liquid, and tablets at room temperature.

#### Administration

Take guaifenesin without regard to food. Do not crush or break extended-release tablets. Take extended release at 12-h intervals, as prescribed. Granules may be sprinkled on soft food and then swallowed without chewing or crushing. Do not take for chronic cough.

Maintain adequate fluid intake to aid expectoration.
# Guanabenz

gwan'a-benz Do not confuse with guanfacine.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

#### Classification:

Antihypertensives, central-acting adrenergic agents

# MECHANISM OF ACTION

An  $\alpha$ -adrenergic agonist that stimulates  $\alpha_2$ -adrenergic receptors within the CNS, inhibiting sympatheic nervous system outflow. Inhibits sympathetic cardioaccelerator and vasoconstrictor center to heart, kidneys, peripheral vasculature. *Therapeutic Effect:* Decreases systolic, diastolic BP. Chronic use decreases peripheral vascular resistance.

# PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed. Protein binding: 90%. Metabolized in liver. Excreted in urine and feces. Not removed by hemodialysis. *Half-life:* 6 h.

# AVAILABILITY

Tablets: 4 mg, 8 mg.

# INDICATIONS AND DOSAGES Hypertension

PO

*Adults.* Initially, 4 mg 2 times/day. Increase by 4-8 mg at 1- to 2-wk intervals. Usual effective range is 8-32 mg/day.

*Elderly*. Initially, 4 mg/day. May increase q1-2wk. Maintenance: 8-16 mg/day. Maximum: 32 mg/day.

# CONTRAINDICATIONS

History of hypersensitivity to guanabenz or any component of the formulation.

# INTERACTIONS

Drug

 β-Blockers, hypotensive-producing medications: May increase antihypertensive effect.
 Nitroprusside: May cause additive hypotension.
 Noncardioselective β-blockers: May exacerbate rebound hypertension.
 Tricyclic antidepressant agents: May decrease effects of guanabenz.
 Herbal
 Licorice, yohimbine: May decrease

guanabenz effectiveness. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May decrease cholesterol, total triglyceride concentrations.

# SIDE EFFECTS

Frequent

Drowsiness, dry mouth, dizziness, orthostasis.

Occasional

Weakness, headache, nausea, decreased sexual ability. Rare

Ataxia, sleep disturbances, rash, itching, diarrhea, constipation, altered taste, muscle aches.

# SERIOUS REACTIONS

• Abrupt withdrawal may result in rebound hypertension manifested as nervousness, agitation, anxiety, insomnia, hand tingling, tremor, flushing, and sweating.

 Overdosage produces hypotension, somnolence, lethargy, irritability, bradycardia, and miosis (pupillary constriction).

Guanabenz (Generic Name)

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with severe coronary insufficiency, recent myocardial infarction, cerebrovascular disease, severe hepatic or renal impairment. It is unknown whether guanabenz crosses the placenta or is distributed in breast milk. Safety and efficacy of guanabenz have not been established in children. No age-related precautions have been noted in elderly patients. Diabetic patients should be educated that this medication may mask symptoms of hypoglycemia.

Side effects such as dry mouth, drowsiness, dizziness, headache, decreased sexual ability, and GI upset may occur during the first 2 wks of therapy but generally diminish during continued therapy. If increased or decreased heartbeat or swollen ankles or feet occur, notify the physician. Avoid alcohol, and caution should be used driving or operating machinery until tolerance to medication is established.

#### Storage

Store at room temperature and protect from light.

### Administration

Give with or without food.

Avoid skipping doses or abruptly discontinuing drug because it may produce severe rebound hypertension.

# Guanfacine

gwan'fa-seen Intuniv, Tenex **Do not confuse with guanabenz** or guaifenesin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antihypertensives, central-acting adrenergic agents

# MECHANISM OF ACTION

An  $\alpha$ -adrenergic agonist that stimulates  $\alpha_2$ -adrenergic receptors within CNS, inhibiting sympathetic nervous system outflow to heart, kidneys, peripheral vasculature. Mechanism in ADHD is not clear. *Therapeutic Effect:* Decreases systolic, diastolic BP and peripheral vascular resistance in HTN; in ADHD, improves hyperactivity and impulsiveness and improves attention span.

#### PHARMACOKINETICS

Well absorbed from GI tract. Widely distributed. Protein binding: 71%. Metabolized in liver. Excreted in urine and feces. Not removed by hemodialysis. *Half-life*: 17 h.

# AVAILABILITY

Tablets: 1 mg, 2 mg. Tablets, Extended Release (Intuniv): 1 mg, 2 mg, 3 mg, 4 mg.

# INDICATIONS AND DOSAGES Hypertension PO

*Adults, Elderly.* Initially, 1 mg/day. Increase by 1 mg/day at intervals of 3-4 wks up to 3 mg/day in single or divided doses.

#### Attention deficit hyperactivity disorder (ADHD)

PO (EXTENDED RELEASE, INTUNIV)

*Children 6 yr and older.* Initially, 1 mg once daily and adjust by no more than 1 mg/wk. Dose range 1-4 mg/day. Alternatively, consider weight-based dosing. Starting doses of 0.05-0.08 mg/kg once daily. Doses up to 0.12 mg/kg once daily may provide benefit. Maximum: 4 mg/day. May be used alone or with a psychostimulant.

 Dosage in hepatic or renal impairment (all patients)

Guanfacine (Generic Name)

Drug is equally cleared by hepatic and renal routes; dose adjustments may be needed in either hepatic or renal impairment, but specific recommendations not available.

#### CONTRAINDICATIONS

History of hypersensitivity to guanfacine or any component of the formulation.

# INTERACTIONS

#### Drug

NOTE: To avoid overdoseage, do not take with other guanfacine products for different uses.

**β-Blockers, hypotensive-producing medications:** May increase antihypertensive effect.

**Bupropion:** May increase risk of seizure activity.

Nitroprusside: May have additive hypotensive effects.

Noncardioselective β-blockers: May exacerbate rebound hypertension when guanfacine is withdrawn.

**Tricyclic antidepressant agents:** May decrease the hypotensive effects of guanfacine.

Valproic acid/divalproex: Drug can increase valproic acid concentrations. CYP3A inhibitors: May increase guanfacine concentrations.

**Drugs with sedative properties:** Increase risk of sedation.

Herbal

Licorice, yohimbine: May decrease guanfacine effectiveness.

Ma huang: May increase BP. Food

Alcohol: Manufacturer recommends avoidance.

**High-fat foods:** Increase risk of side effects from extended-release tablets.

# DIAGNOSTIC TEST EFFECTS

May increase growth hormone concentration. May decrease urinary catecholamine and VMA excretion.

# SIDE EFFECTS

#### Frequent

Somnolence, sedation, lowered blood pressure, abdominal pain, dizziness, dry mouth, and constipation.

#### Occasional

Fatigue, headache, asthenia (loss of strength, energy).

#### Rare

Excessive hypotension, syncope, bradycardia (see Serious Reactions).

# SERIOUS REACTIONS

• Overdosage may produce difficult breathing, dizziness, faintness, severe drowsiness, bradycardia.

 Rebound hypertension may occur if drug is withdrawn suddenly or tapered too quickly.

# **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with impaired renal function. Guanfacine crosses the placenta, and it is unknown if it is distributed in breast milk. Be aware that guanfacine is not recommended in treatment of acute hypertension associated with preeclampsia. Safety and efficacy of guanfacine have not been established in children under 6 yr of age. There are no age-related precautions noted in the elderly. Diabetic patients should be educated that this medication may mask symptoms of hypoglycemia.

Therapeutic effect may take 1 wk and peak effect should be noted in 1-3 mo. Avoid alcohol, and caution should be used driving or operating machinery until the effects of the drug are known. Observe patients for excesive somenolence, syncope. Monitor heart rate and blood pressure routinely. For ADHD, monitor patterns in mood, behavior, impulsivity, and irritability.

#### Storage

Store at room temperature and protect from light. Administration

**!** NOTE: Do not substitute immediate-release tablets for the extended-release tablets on a mg-mg basis; they are *not* equivalent.

Give immediate-release tablets at bedtime. For extended-release tablets, do not cut, crush, or chew. Swallow dose whole once daily with water, milk, or liquid and do *not* administer with high-fat foods as this will increase drug exposure.

Avoid skipping doses or abruptly discontinuing drug, which may produce severe rebound hypertension. When discontinuing, taper the dose by no more than 1 mg every 3-7 days. Halcinonide

★ Halog

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Corticosteroids, topical, dermatologics, anti-inflammatory

# **MECHANISM OF ACTION**

A topical high-potency corticosteroid that inhibits accumulation of inflammatory cells, phagocytosis, lysosomal enzyme release, and synthesis or release of mediators of inflammation. *Therapeutic Effect*: Decreases or prevents tissue response to inflammatory process.

# PHARMACOKINETICS

Repeated application results in a cumulative depot effect in the skin, which may lead to a prolonged duration of action and increased systemic absorption. Large variation in absorption among sites. Protein binding: Varies. Metabolized in liver. Primarily excreted in urine.

# AVAILABILITY

Cream: 0.1% (Halog). Ointment: 0.1% (Halog).

# INDICATIONS AND DOSAGES Corticosteroid-responsive

**dermatoses** Topical *Adults, Elderly, Children.* Apply sparingly 1-3 times/day.

# CONTRAINDICATIONS

History of hypersensitivity to halcinonide or other corticosteroids; viral, fungal, or tubercular skin lesions.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Occasional

Itching, redness, irritation, burning at site of application, dryness, folliculitis, acneiform eruptions, hypopigmentation. **Rare** 

Allergic contact dermatitis, maceration of the skin, secondary infection, skin atrophy.

# SERIOUS REACTIONS

• The serious reactions of longterm therapy and the addition of occlusive dressings are reversible hypothalamic-pituitary-adrenal (HPA) axis suppression, manifestations of Cushing's syndrome, hyperglycemia, and glucosuria.

# PRECAUTIONS & CONSIDERATIONS

Caution should be used over large surface areas and with prolonged use. It is unknown whether halcinonide is excreted in breast milk. Drugs of this class should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Notify physician if irritation occurs. Absorption is more likely with occlusive dressings or extensive application in young children. **Storage** 

Store at room temperature and away from excessive heat. Do not freeze.

# Administration

Gently cleanse area before application preferably after bath or shower for best absorption. Use occlusive dressings only as directed. Apply sparingly. Rub into area gently and thoroughly. Avoid contact with eyes.

# Halobetasol

hal-oh-be'ta-sol

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

*Classification:* Corticosteroids, topical, dermatologics

# **MECHANISM OF ACTION**

A very-high-potency corticosteroid that inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release, and synthesis or release of mediators of inflammation. *Therapeutic Effect:* Decreases or prevents tissue response to inflammatory process.

#### PHARMACOKINETICS

Variation in absorption among individuals and sites: scrotum 36%, forehead 7%, scalp 4%, forearm 1%.

#### AVAILABILITY

Cream: 0.05% (Ultravate). Ointment: 0.05% (Ultravate).

#### INDICATIONS AND DOSAGES

#### Dermatoses, corticosteroid-responsive Topical

Adults, Elderly, Children 12 yr and older. Apply 1-2 times/day. Maximum: 50 g/wk for no more than 2 wks.

#### CONTRAINDICATIONS

Hypersensitivity to halobetasol or other corticosteroids; viral, fungal, or tubercular skin lesions.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

Frequent

Burning, stinging, pruritus. **Rare** 

Cushing's syndrome, hyperglycemia, glucosuria, HPA axis suppression.

# SERIOUS REACTIONS

 Overdosage can occur from topically applied halobetasol absorbed in sufficient amounts to produce systemic effects producing reversible HPA axis suppression, manifestations of Cushing's syndrome, hyperglycemia, and glucosuria in some patients.

# PRECAUTIONS & CONSIDERATIONS

Occlusive dressings should be avoided. It is unknown whether halobetasol crosses the placenta or is distributed in the breast milk. Drugs of this class should not be used extensively on pregnant patients, in large amounts, or for prolonged periods of time. Safety and efficacy have not been established in children less than 12 yr of age. No age-related precautions have been noted in elderly patients.

#### Storage

Store at room temperature and away from excessive heat.

#### Administration

Avoid the use of occlusive dressings unless otherwise directed by a physician. Apply sparingly to the skin or scalp and rub into area thoroughly. Administer for no longer than 2 wks. Only small areas should be treated at one time. Discontinue treatment when control is achieved. Do not apply on face, groin, or axillae. Avoid contact with eyes.

H

# Haloperidol

ha-loe-per'idole ★ Haldol, Haldol Decanoate ★ Apo-Haloperidol Do not confuse Haldol with Halcion, Halog, or Stadol.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

regnancy reisk category. c

**Classification:** Antipsychotics, butyrophenone

### MECHANISM OF ACTION

An antipsychotic, antiemetic, and antidyskinetic agent that competitively blocks postsynaptic dopamine receptors, interrupts nerve impulse movement, and increases turnover of dopamine in the brain. Has strong extrapyramidal and antiemetic effects, weak anticholinergic and sedative effects. *Therapeutic Effect:* Produces tranguilizing effect.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 92%. Extensively metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 12-37 h PO; 10-19 h IV; 17-25 h IM.

# AVAILABILITY

Oral Concentrate: 2 mg/mL. Tablets: 0.5 mg, 1 mg, 2 mg, 5 mg, 10 mg, 20 mg. Injection (Lactate): 5 mg/mL. Injection (Decanoate): 50 mg/mL, 100 mg/mL.

# INDICATIONS AND DOSAGES

#### Treatment of psychotic disorders PO

Adults, Children 12 vr and older. Initially, 0.5-5 mg 2-3 times/day. Dosage gradually adjusted as needed. Elderly. 0.5-2 mg 2-3 times/day. Dosage gradually adjusted as needed. Children 3-12 vr or weighing 15-40 kg. Initially, 0.05 mg/kg/day in 2-3 divided doses. May increase by 0.5-mg increments at 5- to 7-day intervals. Maximum: 0.15 mg/kg/day in divided doses. IM (LACTATE) Adults, Elderly, Children 12 vr and older. Initially, 2-5 mg. May repeat at 1-h intervals as needed. Convert to oral treatment as soon as possible.

#### ÎM (DECANOATE)

Adults, Elderly, Children 12 yr and older: Initially, 10-15 times previous daily oral dose up to maximum initial dose of 100 mg. Injections are given once every 28 days. Maximum: 300 mg/mo.

#### Treatment of nonpsychotic disorders, Tourette's syndrome PO

*Children 3-12 yr or weighing 15-40 kg.* Initially, 0.05 mg/kg/day in 2-3 divided doses. May increase by 0.5 mg at 5- to 7-day intervals. Maximum: 0.075 mg/kg/day.

# **OFF-LABEL USES**

Treatment of nausea or vomiting associated with cancer chemotherapy; used IV off-label for agitation in hospitalized patients.

Haloperidol (Generic Name)

# CONTRAINDICATIONS

Angle-closure glaucoma, severe central nervous system (CNS) depression, Parkinson's disease, coma, hypersensitivity.

#### **INTERACTIONS**

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Amphetamines, selected β-blockers, dextromethorphan, fluoxetine, lidocaine, mirtazapine, nefazodone, paroxetine, risperidone, ritonavir, thioridazine, tricyclic antidepressants, venlafaxine, and other CYP2D6 substrates: May increase the levels of haloperidol. Antihypertensives: May cause additive hypotension. Azole antifungals, clarithromycin, diclofenac, doxycycline, erythromycin, imatinib, isoniazid, nefazodone, nicardipine, propofol, protease inhibitors, quinidine, telithromycin, verapamil, and other CYP3A4 inhibitors: May increase the effects of haloperidol. Carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin, rifamycins, and other CYP3A4 inducers: May decrease the effects of haloperidol. Chlorpromazine, delavirdine, fluoxetine, miconazole, paroxetine, pergolide, quinidine, quinine, ritonavir, ropinirole, and other CYP2D6 inhibitors: May increase the levels of haloperidol. Epinephrine: May block α-adrenergic effects. Extrapyramidal symptomproducing medications: May

increase extrapyramidal symptoms. Lithium: May increase neurologic toxicity.

**QT-prolonging medications:** May increase the risk of QT prolongation.

SSRIs: May increase the risk of extrapyramidal symptoms. Tricyclic antidepressants: May cause increased toxicity. Herbal Valerian, St. John's wort, kava kava, gotu kola: May increase CNS depression. Food Alcohol: May increase CNS depression.

# **DIAGNOSTIC TEST EFFECTS**

May decrease WBC or increase LFTs. Therapeutic serum drug level is 0.2-1 mcg/mL; toxic serum drug level is > 1 mcg/mL.

# IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), calcium chloride, most cephalosporins, clindamycin (Cleocin), diazepam (Valium), digoxin (Lanoxin), diphenhydramine (Benadryl), epoetin alfa (Epogen, Procrit), fluconazole (Diflucan), foscarnet (Foscavir), furosemide, heparin, hydroxyzine (Vistaril), imipenem-cilastatin (Primaxin), ketorolac (Toradol), lansoprazole (Prevacid), magnesium sulfate, methylprednisolone (Solu-Medrol), nitroprusside (Nipride), pantoprazole (Protonix), phenobarbital, phenytoin, piperacillin and tazobactam (Zosyn), potassium chloride, sodium bicarbonate, vancomycin.

# **IV COMPATIBILITIES**

Amifostine (Ethyol), amsacrine (Amsa), aztreonam (Azactam), cimetidine (Tagamet), cisatracurium (Nimbex), cladribine (Leustatin), dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Rubex), etoposide (VePesid), famotidine (Pepcid),

fentanyl (Sublimaze), filgrastim (Neupogen), fludarabine (Fludara), gatifloxacin (Tequin), gemcitabine (Gemzar), granisetron (Kytril), hydromorphone (Dilaudid), lidocaine, linezolid (Zyvox), lorazepam (Ativan), midazolam (Versed), morphine, nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), paclitaxel (Taxol), phenylephrine, propofol (Diprivan), remifentanil (Ultiva), sufentanil (Sufenta), tacrolimus (Prograf), teniposide (Vumon), theophylline (Theodur), thiotepa (Thioplex), vinorelbine (Navelbine).

#### SIDE EFFECTS

#### Frequent

Blurred vision, constipation, orthostatic hypotension, dry mouth, swelling or soreness of female breasts, peripheral edema.

#### Occasional

Allergic reaction, difficulty urinating, decreased thirst, dizziness, decreased sexual function, drowsiness, nausea, vomiting, photosensitivity, lethargy, agitation, akathisia, alopecia, confusion.

#### SERIOUS REACTIONS

• Extrapyramidal symptoms appear to be dose related and typically occur in the first few days of therapy. Marked drowsiness and lethargy, excessive salivation, and fixed stare occur frequently. Less common reactions include severe akathisia (motor restlessness) and acute dystonias (such as torticollis, opisthotonos, and oculogyric crisis).

 Tardive dyskinesia (tongue protrusion, puffing of the cheeks, chewing or puckering of the mouth) may occur during long-term therapy or after discontinuing the drug and may be irreversible. Elderly women have a greater risk of developing this reaction.

 Rare reports of agranulocytosis or liver dysfunction with jaundice.

 Rare QT prolongation and torsades de pointes; high doses and IV use may result in higher risk. Use of medications that increase haloperidol concentrations also increases QT risk.

• May lower the seizure threshold.

• Neuroleptic malignant syndrome (NMS)–like events are rare.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disease, hepatic or renal dysfunction, a history of seizures, and with concurrent use with medications that may prolong the QT interval. Haloperidol crosses the placenta and is distributed in breast milk. Children are more susceptible to dystonias. Haloperidol use is not recommended for children younger than 3 yr. A decreased dosage is recommended for elderly patients, who are more susceptible to extrapyramidal and anticholinergic effects, orthostatic hypotension, and sedation. Elderly patients with dementia-related psychosis have a significantly higher incidence of cerebrovascular adverse events (e.g., stroke, TIA) and increased risk of mortality. Exposure to sunlight and any conditions that may cause dehydration or overheating should be avoided because they may increase the risk of heatstroke.

Drowsiness may occur but generally subsides with continued therapy. Alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician if muscle stiffness occurs. Fine tongue movement, mask-like facial expression, rigidity, and tremor should be assessed if they occur.

#### Storage

Store vials, tablets, and oral solution at room temperature. Protect them from freezing and light. Discard the solution if it becomes discolored or contains precipitate. Do not refrigerate the decanoate injection. Administration

I Only haloperidol lactate is given IV. Widely accepted practice but not FDA approved: Off-label, haloperidol may be given undiluted by IV push. Flush with at least 2 mL 0.9% NaCl before and after administration. To dilute, add the drug to 30-50 mL of most solutions; D5W is preferred. Give IV push at 5 mg/min. Infuse IV piggyback over 30 min. For IV infusion, administer up to 25 mg/h, titrating dosage to patient response.

Prepare haloperidol decanoate IM injection using a 21-gauge needle. Do not exceed 3 mL per IM injection site. Slowly inject the drug deep into the upper outer quadrant of the gluteus maximus. Keep recumbent (head low and legs raised) for 30-60 min after administration to minimize hypotensive effects.

Take oral haloperidol without regard to food. Crush scored tablets as needed. Full therapeutic effect may take up to 6 wks to appear. Do not abruptly discontinue the drug after long-term use.

# Heparin

hep'a-rin

★ Hep-Lock, Hep-Lock U/P 🐏 Hepalean, Hepalean-Lok Do not confuse heparin with Hespan.

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

Classification: Anticoagulants

#### MECHANISM OF ACTION

A blood modifier that interferes with blood coagulation by blocking the conversion of prothrombin to thrombin and fibrinogen to fibrin. Therapeutic Effect: Prevents further extension of existing thrombi or new clot formation. Has no effect on existing clots.

#### PHARMACOKINETICS

Well absorbed following subcutaneous administration. Protein binding: Very high. Metabolized in the liver. Removed from the circulation via uptake by the reticuloendothelial system. Primarily excreted in urine. Not removed by hemodialysis. Half-life: 1-6 h.

# **AVAILABILITY**

Injection: 10 units/mL, 100 units/mL, 1000 units/mL, 2500 units/mL, 5000 units/mL, 7500 units/mL, 10,000 units/mL, 20,000 units/mL. Pre-mixed IV infusion: 25,000 units/500 mL infusion.

# INDICATIONS AND DOSAGES Line flushing

IV

Adults, Elderly, Children. 100 units q6-8h.

Infants weighing < 10 kg. 10 units q6-8h. CAUTION: Always verify strength of solution before giving heparin flush to infants.

#### Treatment of venous thrombosis, pulmonary embolism, peripheral arterial embolism, atrial fibrillation with embolism

INTERMITTENT IV

Adults, Elderly. Initially, 10,000 units, then 50-70 units/kg (5000-10,000 units) q4-6h, adjust to aPTT. Children 1 yr and older. Initially, 50-100 units/kg, then 50-100 units q4h, adjust to aPTT. IV INFUSION

*Adults, Elderly.* Loading dose: 80 units/kg, then 18 units/kg/h, with adjustments based on aPTT. Range: 10-30 units/kg/h.

*Children 1 yr and older.* Loading dose: 75 units/kg, then 20 units/ kg/h with adjustments based on aPTT.

*Children younger than 1 yr*: Loading dose: 75 units/kg, then 28 units/kg/h, adjust to aPTT.

#### Prevention of venous thrombosis, pulmonary embolism, peripheral arterial embolism, atrial fibrillation with embolism

SUBCUTANEOUS *Adult, Elderly.* 5000 units q8-12h.

# CONTRAINDICATIONS

Intracranial hemorrhage, severe hypotension, severe thrombocytopenia, subacute bacterial endocarditis, uncontrolled bleeding, history of heparin-induced thrombocytopenia (HIT).

NOTE: Injections preserved with benzyl alcohol are contraindicated in neonates and infants, and also in pregnant or nursing women.

# INTERACTIONS

#### Drug

Antithyroid medications, cefoperazone, cefotetan, valproic acid: May cause hypoprothrombinemia. Other anticoagulants, platelet aggregation inhibitors, thrombolytics: May increase the risk of bleeding. Probenecid: May increase the effects of heparin. Herbal Cat's claw, dong quai, evening

primrose, feverfew, red clover, horse chestnut, garlic, green tea, ginseng, ginkgo: May have an additive effect.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels. May decrease serum cholesterol and triglyceride levels. Increases aPTT, may decrease platelets.

# IV INCOMPATIBILITIES

Alatrofloxacin (Trovan), alteplase (Activase), amikacin (Amikin), amiodarone (Cordarone), amphotericin B complex (Abelcet, AmBisome, Amphotec), amsacrine (Amsa), atracurium (Tracrium), chlorpromazine (Thorazine). ciprofloxacin (Cipro), clarithromycin (Biaxin), cytarabine (Cytosar), dacarbazine (DTIC), daunorubicin (Cerubidine), diazepam (Valium), dobutamine (Dobutrex), doxorubicin (Adriamycin), doxycycline (Vibramycin), droperidol (Inapsine), erythromycin (Erythrocin), filgrastim (Neupogen), gatifloxacin (Tequin), gentamicin (Garamycin), haloperidol (Haldol), idarubicin (Idamycin), isosorbide dinitrate, kanamycin (Kantrex), labetalol (Trandate), levofloxacin (Levaquin), levorphanol (Levo-Dromoran), meperidine (Demerol), morphine (Avinza, Kadian, Roxanol), nicardipine (Cardene), phenytoin (Dilantin), promethazine (Phenergan), quinidine, tobramycin (Nebcin), vancomycin (Vancocin), warfarin (Coumadin).

# **IV COMPATIBILITIES**

Acyclovir (Zovirax), aldesleukin (Proleukin), allopurinol (Alloprim), amifostine (Ethyol), aminophylline, ampicillin (Polycillin), ampicillin/ sulbactam (Unasyn), ascorbic acid, atropine, aztreonam (Azactam), betamethasone sodium phosphate (Celestone), bleomycin (Blenoxane), calcium gluconate, cefamandole (Mandol), cefazolin (Ancef), cefepime (Maxipime), cefoperazone (Cefobid), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefixitin), ceftazidime (Fortaz), ceftriaxone (Rocephin), chloramphenicol (Chloromycetin), chlordiazepoxide (Librium), cimetidine (Tagamet), cisplatin (Platinol-AQ), cladribine (Leustatin), clindamycin (Cleocin), cyanocobalamin, cyclophosphamide (Cytoxan), cytarabine (Cytosar), dexamethasone sodium phosphate (Decadron), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Rubex), edrophonium (Tensilon), enalapril (Vasotec), epinephrine, erythromycin lactobionate (Erythrocin), esmolol (BreviBloc), estrogens (conjugated), ethacrynate (Edecrin), etoposide (VePesid), famotidine (Pepcid), fentanyl (Sublimaze), fluconazole (Diflucan), fludarabine (Fludara), fluorouracil (Efurix), foscarnet (Foscavir), furosemide (Lasix), gemcitabine (Gemzar), granisetron (Kytril), hydralazine (Apresoline), hydrocortisone sodium succinate (Solu-Cortef), hydromorphone (Dilaudid), insulin, isoproterenol (Isuprel), leucovorin, lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, methotrexate, methylprednisolone (Solu-Medrol), metoclopramide (Reglan), metronidazole (Flagyl), midazolam (Versed), milrinone (Primacor), minocycline (Minocin), mitomycin (Mutamycin), nafcillin (Unipen), neostigmine, nitroglycerin, norepinephrine (Levophed), ondansetron (Zofran), oxacillin (Bactocil), oxytocin (Pitocin), paclitaxel (Taxol), pancuronium (Pavulon), penicillin G potassium (Pfizerpen), pentazocine (Talwin),

phytonadione, piperacillin (Piperacil), piperacillin/tazobactam (Zosyn), potassium chloride, procainamide (Pronestyl), propofol (Diprivan), propranolol (Inderal), pyridostigmine (Mestinon), ranitidine (Zantac), remifentanil (Ultiva), sargramostim (Leukine), scopolamine, sodium bicarbonate, sodium nitroprusside (Nitropress), streptokinase (Streptase), succinylcholine (Anectine), tacrolimus (Prograf), theophylline (Theodur), thiopental (Pentothal), thiotepa (Thioplex), ticarcillin (Ticar), ticarcillin/clavulanate potassium (Timentin), tirofiban (Aggrastat), trimethaphan camsylate (Arfonad), trimethobenzamide (Tigan), trimethoprim/sulfamethoxazole (Bactrim), vecuronium (Norcuron), vinblastine (Velban), vincristine (Oncovin), zidovudine (Retrovir).

# SIDE EFFECTS

# Occasional

Itching, burning (particularly on soles of feet) caused by vasospastic reaction, bruising.

#### Rare

Pain, cyanosis of extremity 6-10 days after initial therapy lasting 4-6 h; hypersensitivity reaction, including chills, fever, pruritus, urticaria, asthma, rhinitis, lacrimation, and headache; alopecia.

#### SERIOUS REACTIONS

 Bleeding complications ranging from local ecchymoses to major hemorrhage occur more frequently in high-dose therapy, in intermittent IV infusion, and in women 60 yr of age and older. Antidote: Protamine sulfate
 1-1.5 mg, IV, for every 100 units heparin subcutaneous within 30 min of overdose, 0.5-0.75 mg for every
 100 units heparin subcutaneous if within 30-60 min of overdose, 0.25-0.375 mg for every 100 units heparin subcutaneous if 2 h have
elapsed since overdose, 25-50 mg if
heparin was given by IV infusion.
Immune-mediated heparin-induced
thrombocytopenia (HIT) and
resulting risk of thrombosis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used during menstruation in persons receiving IM injections and in those with peptic ulcer disease, recent invasive or surgical procedures, and severe hepatic or renal disease. Heparin should be used with caution in pregnant women, particularly during the last trimester and immediately postpartum, because it increases the risk of maternal hemorrhage. Heparin does not cross the placenta and is not distributed in breast milk. The benzyl alcohol preservative may cause gasping syndrome in infants; be sure to use benzyl alcohol-free solutions in neonates, infants, and in pregnant or nursing women. NOTE: Extreme caution should be used during the preparation, dispensing, and administration of heparin flushes, heparin-containing fluids, and therapeutic doses of heparin for children and infants. Fatal hemorrhages have occurred in pediatric patients (including neonates) due to medication errors. Elderly patients are more susceptible to hemorrhage, and age-related decreased renal function may increase the risk of bleeding. Other medications, including OTC drugs, should be avoided. An electric razor and soft toothbrush should be used to prevent bleeding during therapy.

Notify the physician of bleeding from surgical site, chest pain, dyspnea, severe or sudden headache, swelling in the feet or hands, unusual back pain, bruising, weakness, black or red stool, coffee-ground vomitus, dark or red urine, or red-speckled mucus from cough. CBC, BUN and creatinine levels, BP, pulse, potassium, and stool for occult blood should be monitored. Be aware of signs of bleeding, including bleeding at injection or surgical sites or from gums, blood in stool, bruising, hematuria, and petechiae.

#### Storage

Store at room temperature. Administration

! Do not give by IM injection because it may cause pain, hematoma, ulceration, and erythema. The subcutaneous route is used for low-dose therapy.

! Always confirm the choice of correct heparin vial or solution before administration. Fatal medication errors may occur with incorrect selections.

For subcutaneous use, after withdrawing heparin from the vial, change the needle before injection to prevent leakage along the needle track. Inject the heparin dose above the iliac crest or in the abdominal fat layer. Do not inject within 2 inches of umbilicus or scar tissue.

For IV use, dilute IV infusion in isotonic sterile saline, D5W, or lactated Ringer's solution. Invert IV bag at least 6 times to ensure mixing and to prevent pooling of the medication. Use constant-rate IV infusion pump.

#### Hepatitis B Immune Globulin (Human) hep-ah-tie'tis B ih-mewn'

glah'byew-lin HepaGam B, HyperHEP B, Nabi-HB

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Classification: Immune globulins

#### MECHANISM OF ACTION

An immune globulin of inactivated hepatitis B virus that provides passive immunity against hepatitis B virus.

# AVAILABILITY

Injection: 1-mL, 5-mL vials.

#### INDICATIONS AND DOSAGES

 Prevention of hepatitis B infection IM

*Adults, Elderly.* Usual 0.06 mL/kg. Repeat 28-30 days after exposure.

#### Perinatal exposure of infants born to HBsAg-positive mothers

*Infants.* 0.5 mL IM after stable at birth, preferably within 12 h of birth.

#### For prevention of hepatitis B infection recurrence after liver transplantation in HBsAg-positive liver transplant patients:

IV INFUSION (HEPAGAM B ONLY) Adults. 20,000 IU concurrent with grafting of the transplanted liver, then 20,000 IU/day on days 1 to 7 postoperatively, then 20,000 IU q2wk starting on day 14 postoperatively, then 20,000 IU every month starting at month 4 postoperatively. The target serum antiHBs concentration is > 500 IU/L. Regularly monitor the serum antiHBs and HBsAg. If the serum antiHBs concentration is < 500 IU/L the first week, increase the dose to 10,000 IU q6h until target antiHBs concentration attained.

#### CONTRAINDICATIONS

Allergies to gamma globulin or thimerosal, IgA deficiency, IM injection in patients with coagulation disorders or thrombocytopenia.

#### INTERACTIONS

#### Drug

Live-virus vaccines: May decrease immune response.

# Herbal and Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

# Frequent

Headache (26%), injection site pain (12%).

### Occasional (5%)

Malaise, nausea, myalgia, dizziness, vomiting.

#### SERIOUS REACTIONS

 Agents derived from human plasma carry a very rare risk of transmission of certain infectious agents.

• Infusion-related reactions; angioedema or serious reactions rare.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with coagulation disorders; thrombocytopenia; IgA deficiency; and allergies to gamma globulin, eggs, chicken, or thimerosal. Notify the physician of any side effects, including headache or injection site pain. Baseline and periodic liver function studies and hepatitis B antibody levels should be obtained. Live vaccine administration should be deferred for 3 mo after immune globulin. **Storage** 

Refrigerate this drug; do not freeze it. Use within 6 h of opening.

#### Administration

HyperHEP B and Nabi-HB are for IM use only. In adults, administer by IM injection only in the gluteal or deltoid area. Complete full course of immunization.

For infants, administer IM in the anterolateral muscles of the thigh.

HepaGam B (ONLY) may be administered via IV infusion for prophylaxis following liver transplant. Calculate the volume needed for each 20,000 IU or 10,000 IU dose by using the measured potency of the HepaGam B lot. The potency is stamped on the vial label. Aseptically prepare the dose. Administer at 2 mL/min through a separate IV line using an IV infusion pump. Decrease the infusion rate to 1 mL/min or less if the patient has infusion-related discomfort.

# Hetastarch

het'ah-starch ★ Hespan, Hextend, Voluven ★ Hextend

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Plasma expanders

# **MECHANISM OF ACTION**

A plasma volume expander that exerts osmotic pull on tissue fluids. *Therapeutic Effect:* Reduces hemoconcentration and blood viscosity; increases circulating blood volume.

# PHARMACOKINETICS

Smaller molecules: < 50,000 molecular weight, rapidly excreted by kidneys; larger molecules: 50,000 molecular weight and greater, slowly degraded to smallersized molecules, then excreted. Not removed by hemodialysis. *Half-life:* 17 days.

# AVAILABILITY

Injection: 6 g/100 mL 0.9% NaCl (500-mL infusion container).

#### INDICATIONS AND DOSAGES Plasma volume expansion IV

Adults, Elderly. 500-1000 mL/day up to 1500 mL/day (20 mg/kg) at a rate up to 20 mL/kg/h in hemorrhagic shock and at a slower rate in burns and septic shock.

*Children.* Limited clinical data for the Voluven product are available. A mean dose of  $16 \pm 9$  mL/kg was given. Adapt dose to the individual patient colloid needs, taking into account the disease state, as well as the hemodynamic and hydration status. Use in newborns should be carefully evaluated, given the limited numbers of infants studied.

#### Leukapheresis IV

*Adults, Elderly.* 250-700 mL infused at a constant rate, usually 1:8 to venous whole blood.

# CONTRAINDICATIONS

Known hypersensitivity to hydroxyethyl cellulose, preexisting coagulation or bleeding disorders, CHF or pulmonary edema where volume overload is a potential problem; do not use in renal disease with oliguria or anuria not related to hypovolemia.

# INTERACTIONS

Drug None significant. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May prolong bleeding, and clotting times, PTT, and PT. May decrease Hct concentration. May elevate indirect bilirubin levels and serum amylase.

# IV INCOMPATIBILITIES

Amikacin (Amikin), amphotericin B (Fungizone), ampicillin (Polycillin), cefamandole (Mandol), cefazolin (Ancef, Kefzol), cefoperazone (Cefobid), cefotaxime (Claforan), cefoxitin (Mefoxin), diazepam (Valium), gentamicin (Garamycin), ranitidine (Zantac), sodium bicarbonate, theophylline (Theodur), tobramycin (Nebcin).

#### **IV COMPATIBILITIES**

Alatrofloxacin (Trovan), alfentanil (Alfenta), aminophylline, amiodarone (Cordarone), ampicillin (Polycillin), ampicillinsulbactam (Unasyn), atracurium (Tracrium), azithromycin (Zithromax), bumetanide (Bumex), butorphanol (Stadol), calcium gluconate, cefepime (Maxipime), cefotaxime (Claforan), cefotetan (Cefotan), ceftazidime (Fortaz), ceftizoxime (Cefizox), ceftriaxone (Rocephin), cefuroxime (Zinacef), chlorpromazine (Thorazine), cimetidine (Tagamet), ciprofloxacin (Cipro), cisatracurium (Nimbex), clindamycin (Cleocin), dexamethasone (Decadron), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), dobutamine (Dobutrex), dolasetron (Anzemet), dopamine (Intropin), doxycycline (Vibramycin), droperidol (Inapsine), enalaprilat (Vasotec), ephedrine, epinephrine, erythromycin (Erythrocin), esmolol (BreviBloc), famotidine (Pepcid), fentanyl (Sublimaze), fluconazole (Diflucan), furosemide (Lasix), granisetron (Kytril), haloperidol (Haldol), heparin, hydrocortisone (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine (Vistaril), inamrinone (Inocor), isoproterenol (Isuprel), ketorolac (Toradol), labetalol (Normodyne, Trandate), levofloxacin (Levaquin), lidocaine (Xylocaine), lorazepam (Ativan), magnesium, mannitol, meperidine (Demerol), methylprednisolone (Solu-Medrol), metoclopramide (Reglan), metronidazole (Flagyl), midazolam (Versed), milrinone (Primacor), mivacurium (Mivacron), morphine (Avinza, Kadian, Roxanol),

nalbuphine (Nubain), nitroglycerin (Nitrobid), norepinephrine (Levophed), ofloxacin (Floxin), ondansetron (Zofran), pancuronium (Pavulon), phenylephrine, piperacillin (Piperacil), piperacillintazobactam (Zosyn), potassium chloride, procainamide (Pronestyl), prochlorperazine (Compazine), promethazine (Phenergan), rocuronium (Zemuron), sodium nitroprusside (Nitropress), succinvlcholine (Anectine), sufentanil (Sufenta), thiopental (Pentothal), ticarcillin (Ticar), ticarcillin-clavulanate (Timentin), tobramycin (Nebcin), trimethoprimsulfamethoxazole (Bactrim), vancomycin (Vancocin), vecuronium (Norcuron), verapamil (Calan).

#### SIDE EFFECTS Rare

Allergic reaction resulting in vomiting, mild temperature elevation, chills, itching, submaxillary and parotid gland enlargement, peripheral edema of lower extremities, mild flu-like symptoms, headache, muscle aches.

#### SERIOUS REACTIONS

 Fluid overload may occur marked by increased BP and distended neck veins. Neurologic changes that may occur include headache, weakness, blurred vision, behavioral changes, incoordination, and isolated muscle twitching. Pulmonary edema may also occur, manifested by rapid breathing, crackles, wheezing, and coughing.

• Anaphylactic reaction, including periorbital edema, urticaria, and wheezing, may occur.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in those with corn hypersensitivity as they may also

be allergic to hetastarch. Caution is warranted with congestive heart failure, hepatic disease, pulmonary edema, sodium-restricted diets, thrombocytopenia, and in elderly patients or children. An electric razor and soft toothbrush should be used to prevent bleeding during therapy.

Notify the physician of bleeding, wheezing, itching, rash, black or red stool, coffee-ground emesis. Urine output, vital signs, and laboratory tests, including coagulation studies and CBC, should be monitored. Central venous pressure (CVP) should also be monitored to detect blood volume overexpansion. Be aware of signs and symptoms of fluid overload, such as peripheral or pulmonary edema, and impending congestive heart failure.

#### Storage

Store solution at room temperature. Solution normally appears clear, pale yellow to amber. Do not use if discolored a deep turbid brown or if precipitate forms.

#### Administration

Administer only by IV infusion. Do not add drugs to the IV infusion. If administration is by pressure infusion, all air should be withdrawn or expelled from the bag through the medication port prior to infusion. Additionally, take care to turn off infusion pump before the bag runs dry to avoid air embolism. In acute hemorrhagic shock, administer at a rate approaching 1.2 g/kg/h (20 mL/kg/h), as prescribed. Expect to use slower rates in burns and septic shock. Monitor CVP when giving by rapid infusion. If CVP rises precipitously, immediately discontinue the drug, as prescribed, to prevent blood volume overexpansion.

# **Hydralazine**

hye-dral'a-zeen Apresoline, Nu-Hydral, Novo-Hylazin Do not confuse hydralazine with hydroxyzine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Vasodilators, antihypertensive

#### **MECHANISM OF ACTION**

An antihypertensive with direct vasodilating effects on arterioles. *Therapeutic Effect:* Decreases BP and systemic resistance.

# PHARMACOKINETICS

Route	Onset (min)	Peak	Duration
PO	20-30	N/A	2-4 h
IV	5-20	N/A	2-6 h

Well absorbed from the GI tract. Widely distributed. Protein binding: 85%-90%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 3-7 h (increased with impaired renal function).

#### AVAILABILITY

*Tablets:* 10 mg, 25 mg, 50 mg, 100 mg. *Injection:* 20 mg/mL.

# INDICATIONS AND DOSAGES Moderate to severe hypertension PO

*Adults*. Initially, 10 mg 4 times a day. May increase by 10-25 mg/dose q2-5 days. Maximum: 300 mg/day. *Children*. Initially, 0.75-1 mg/kg/day in 2-4 divided doses, not to exceed 25 mg/dose. May increase over

Hydralazine (Generic Name)

# Hyaluronan

hye-al-yer'a-nan ★ Euflexxa, Hyalgan, Orthovisc, Supartz, Synvisc Injection

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: NR

**Classification:** Hyaluronic acid derivatives

H

# **MECHANISM OF ACTION**

A natural complex sugar of the glycosaminoglycan family that enhances viscoelastic properties of synovial fluid. *Therapeutic Effect:* Produces lubrication for knee joint and relieves pain and increases mobility.

# PHARMACOKINETICS

Not known.

# AVAILABILITY

Prefilled Syringe: 8 mg/1 mL (Synvisc), 10 mg/1 mL (Euflexxa, Hyalgan, Supartz), 15 mg/1 mL (Orthovisc).

# INDICATIONS AND DOSAGES Knee osteoarthritis

PO

Adults, Elderly. Euflexxa: inject 20 mg into one knee weekly for 3 wks; Hyalgan: inject 20 mg into one knee weekly for 3-5 wks; Orthovisc: inject 30 mg into one knee weekly for 3 or 4 wks; Supartz: inject 25 mg into one knee weekly for 5 wks; Synvisc: inject 16 mg into one knee weekly for 3 wks.

# **OFF-LABEL USES**

Treatment of psoriatic arthritis.

# CONTRAINDICATIONS

Allergies to avian or avian-derived products (including eggs, feathers, or poultry), skin disease or infection in area of injection site, hypersensitivity to hyaluronate preparations or any one of its components, including preservatives.

# INTERACTIONS

#### Drug

Anticoagulants or antiplatelet agents: May increase the risk of

injection site bleeding.

None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Arthralgia, back pain, pain at injection site.

# Rare

Joint stiffness, swelling, erythema, firmness, or bruising at injection site.

# SERIOUS REACTIONS

• Transient increases in inflammation in the injected knee following hyaluronan injection have been reported in some patients with OA.

Rare allergic reactions.

# PRECAUTIONS & CONSIDERATIONS

Be aware that the safety and effectiveness of hyaluronan have not been established in joints other than the knee. Be aware that use of disinfectants containing quartenary ammonium salts for skin preparation as hyaluronic acid can precipitate in their presence. Safety and efficacy of this drug have not been tested in pregnant, nursing women, or children. No age-related precautions have been noted in elderly patients. Strenuous activity or weight-bearing activities should be avoided within 48 h following injection.

#### Storage

Store syringes at room temperature. Do not freeze.

#### Administration

Be aware that the prefilled syringe is for single use only. Discard syringe after administering. Remove the protective rubber cap on the tip of the syringe, and attach smallgauge needle (18-21 gauge) to the tip. Inject full contents of syringe into one knee. If treatment is bilateral, use a separate syringe for each knee.

# **PRECAUTIONS & CONSIDERATIONS**

Consider discontinuing the drug if apparent allergic reactions occur. Caution is warranted in patients with conditions aggravated by fluid retention, such as epilepsy, hypertension, renal impairment, preeclampsia, cardiac disease, or those with hepatic impairment. Use with caution in patients with diabetes mellitus or if there is a history of depression. There are inadequate data regarding use of this drug in the first trimester of pregnancy. Hydroxyprogesterone is likely distributed in breast milk, but may not pose serious concern to a nursing infant. Safety and efficacy have not been established in children under 16 yr of age. Use is not expected in the elderly. Avoid smoking because of the increased risk of blood clot formation.

Hydroxyprogesterone may increase the risk of some complications of pregnancy, such as gestational diabetes, hospitalization, low amniotic fluid levels. Use is carefully monitored. Some patients experience drowsiness; do not drive or perform other tasks requiring mental alertness. Notify the physician of chest pain, migraine headache, peripheral paresthesia, sudden decrease in vision, sudden shortness of breath, pain, redness, swelling, warmth in the calf, abnormal vaginal bleeding, or other symptoms. BP and weight should be monitored, as well as pelvic ultrasound and signs or symptoms of impending delivery.

#### Storage

Store vials at room temperature. Avoid exposure to heat and protect from light. Once entered, discard any unused injection after 5 weeks of first opening.

#### Administration

! Never give intravenously. For intramuscular (IM) use only. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. Hydroxyprogesterone in castor oil is a clear, yellow solution that is viscous and oily. Do not use if solid particles appear or if the solution is cloudy.

Clean the vial top with an alcohol swab before use. Draw up 1 mL (250 mg) of drug into a 3-mL syringe with an 18-gauge needle. Change the needle to a 21-gauge 1½-inch needle. After preparing the skin, inject IM in the upper outer quadrant of the gluteus maximus. Slow IM injection (over 1 min or longer) is recommended. Applying pressure to the injection site may minimize bruising and swelling. Rotate injection sides each week. 3-4 wks. Maximum: 7.5 mg/kg/day (5 mg/kg/day in infants). IV, IM

*Adults, Elderly.* Initially, 10-20 mg/ dose q4-6h. Maximum: 20 mg per dose IV, 50 mg IM.

*Children.* Initially, 0.1-0.2 mg/kg/ dose (maximum 20 mg) q4-6h, as needed, up to 1.7-3.5 mg/kg/day in divided doses q4-6h.

Dosage in renal impairment

Dosage interval is based on creatinine clearance.

CrCl (mL/min)	Dosage Interval	
10-50	q8h	
< 10	q8-24h	

# **OFF-LABEL USES**

Treatment of congestive heart failure, hypertension secondary to eclampsia and preeclampsia, primary pulmonary hypertension.

#### CONTRAINDICATIONS

Hypersensitivity to hydralazine; coronary artery disease; mitral valvular rheumatic heart disease.

#### INTERACTIONS

#### Drug

**Diuretics, other antihypertensives:** May increase hypotensive effect. **Herbal** 

Licorice, ma huang, yohimbine: May decrease the effectiveness of hydralazine.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May produce positive direct Coombs' test.

# IV INCOMPATIBILITIES

Do not add hydralazine to any IV solutions. Aminophylline, ampicillin (Polycillin), chlorothiazide (Diuril), edetate calcium disodium, ethacrynate (Edecrin), furosemide (Lasix), hydrocortisone sodium succinate (Solu-Cortef), methohexital (Brevital), nitroglycerin (Nitrobid), phenobarbital, verapamil (Calan).

# SIDE EFFECTS

#### Frequent

Headache, palpitations, tachycardia (generally disappears in 7-10 days).

#### Occasional

GI disturbance (nausea, vomiting, diarrhea), paresthesia, fluid retention, peripheral edema, dizziness, flushed face, nasal congestion.

# SERIOUS REACTIONS

 High dosage may produce lupus erythematosus–like reaction, including fever, facial rash, muscle and joint aches, and splenomegaly.

• Severe orthostatic hypotension, skin flushing, severe headache, myocardial ischemia, and cardiac arrhythmias may develop.

 Peripheral neuritis (paresthesia, numbness, and tingling). Published evidence suggests an antipyridoxine effect. Pyridoxine should be added to regimen if symptoms develop.

• Profound shock may occur with severe overdosage.

# PRECAUTIONS & CONSIDERATIONS

Hydralazine may produce a clinical picture simulating systemic lupus erythematosus, including glomerulonephritis. In such patients hydralazine should usually be discontinued. Caution is warranted with cerebrovascular disease, pulmonary hypertension, and impaired renal function. Hydralazine crosses the placenta; it is unknown whether

#### 772 Hydrochlorothiazide

it is distributed in breast milk. Hematomas, leukopenia, petechial bleeding, and thrombocytopenia have occurred in newborns; these conditions resolve within 1-3 wks. No age-related precautions have been noted in children. Elderly patients are more sensitive to the drug's hypotensive effects. In elderly patients, age-related renal impairment may require dosage adjustment.

Dizziness and light-headedness may occur. Rise slowly from a lying to a sitting position, and permit legs to dangle from the bed momentarily before standing to reduce the hypotensive effect of hydralazine. Those receiving high doses of hydralazine should notify the physician if fever (lupus-like reaction) or joint and muscle aches occur. Also, notify the physician if headache, palpitations, tachycardia, or peripheral edema of the hands and feet occurs. BP and pulse should be obtained immediately before each hydralazine dose, in addition to regular BP monitoring. Be alert for BP fluctuations. Daily bowel activity and stool consistency should also be monitored.

#### Storage

Store drug at room temperature. Use injection immediately after the vial is opened. Injection may discolor upon contact with metal; discolored solutions should be discarded.

#### Administration

Hydralazine is best given with food or regularly spaced meals. Crush tablets if necessary.

For IV use, give undiluted. Do not add to infusion solutions. Give single dose IV at a rate not to exceed 10 mg/min. Hydralazine injection may also be given IM if needed.

#### Hydrochlorothiazide

hye-droe-klor-oh-thye'a-zide ★ Ezide, Microzide ★ Apo-Hydro, Nu-Hydro, Novo-Hydrazide, Urozide

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in pregnancy-induced hypertension)

**Classification:** Diuretics, thiazide and derivatives

#### **MECHANISM OF ACTION**

A sulfonamide derivative that acts as a thiazide diuretic, and antihypertensive. As a diuretic, blocks reabsorption of water, sodium, and potassium at the cortical diluting segment of the distal tubule. As an antihypertensive, reduces plasma, extracellular fluid volume, and peripheral vascular resistance by direct effect on blood vessels. *Therapeutic Effect:* Promotes diuresis; reduces BP.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (diuretic)	2 h	4-6 h	6-12 h

Variably absorbed from the GI tract. Primarily excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* 5.6-14.8 h.

#### AVAILABILITY

Capsules (Microzide):12.5 mg. Oral Solution: 50 mg/5 mL. Tablets: 12.5 mg, 25 mg, 50 mg,

Hydrochlorothiazide (Generic Name)

### INDICATIONS AND DOSAGES • Edema, hypertension

#### PO

Adults. 12.5-100 mg/day, given in 1-2 divided doses. Maximum: 200 mg/day.

#### Usual pediatric dosage PO

*Children 6 mo to 12 yr*: 1-2 mg/kg/ day once daily or in 2 divided doses. Maximum for aged 2-12 yr: 100 mg/day. Maximum for up to 2 yr: 12.5-37.5 mg/day. *Infants younger than 6 mo.* 2-3 mg/ kg/day in 2 divided doses.

# **OFF-LABEL USES**

Treatment of diabetes insipidus, prevention of calcium-containing renal calculi.

# CONTRAINDICATIONS

Anuria, history of hypersensitivity to thiazide diuretics or other sulfonamide derivatives.

# INTERACTIONS

#### Drug

**β-Blockers:** May increase hyperglycemic effects in type 2 diabetics.

**Cholestyramine, colestipol:** May decrease the absorption and effects of hydrochlorothiazide.

**Cyclosporine:** Concurrent use with hydrochlorothiazide may increase the risk of gout or renal toxicity.

**Digoxin:** May increase the risk of digoxin toxicity associated with hydrochlorothiazide-induced hypokalemia.

**Lithium:** May increase the risk of lithium toxicity.

Neuromuscular blocking agents: May prolong blockade. Herbal

Ephedra, ginseng, ginkgo biloba, ma huang, yohimbine: May increase BP. Garlic: May have additive hypotensive effects. Licorice: May increase risk of hypokalemia and reduce the effectiveness of hydrochlorothiazide. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose and serum cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, and triglyceride levels. May decrease urinary calcium levels and serum magnesium, potassium, and sodium levels.

# SIDE EFFECTS

#### Expected

Increase in urinary frequency and urine volume.

#### Frequent

Potassium depletion.

#### Occasional

Orthostatic hypotension, headache, GI disturbances, photosensitivity.

# SERIOUS REACTIONS

• Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, and dehydration.

• Acute hypotensive episodes may occur.

• Hyperglycemia may occur during prolonged therapy.

• Pancreatitis, blood dyscrasias, pulmonary edema, allergic pneumonitis, and dermatologic reactions occur rarely.

• Overdose can lead to lethargy and coma without changes in electrolytes or hydration.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes mellitus, gout, thyroid disorders, hepatic impairment,

severe renal disease, and in elderly patients and debilitated patients. Hydrochlorothiazide crosses the placenta, and a small amount is distributed in breast milk. Breastfeeding is not recommended. No age-related precautions have been noted in children, except that jaundiced infants may be at risk for hyperbilirubinemia. Elderly patients may be more sensitive to the drug's electrolyte and hypotensive effects. Age-related renal impairment may require cautious use in elderly patients. Consuming foods high in potassium such as apricots, bananas, legumes, meat, orange juice, raisins, whole grains, including cereals, and white and sweet potatoes, is encouraged. Avoid prolonged exposure to sunlight and ultraviolet rays because a photosensitivity reaction may occur.

Dizziness or light-headedness may occur, so change positions slowly and let legs dangle momentarily before standing. An increase in the frequency and volume of urination may also occur. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Hyponatremia may result in cold and clammy skin, confusion, and thirst. Storage

Store at room temperature and protect from light, moisture, and do not freeze.

#### Administration

Take hydrochlorothiazide with food or milk if GI upset occurs, preferably with breakfast to help prevent nocturia. Tablets may be crushed and mixed with fluid, if necessary.

#### Hydrocodone

hye-droe-koe'done Hydrocodone and acetaminophen: Co-Gesic, Dolorex Forte, Duocet, Hycet, Hydrocet, Hydrogesic, Lorcet, Lorcet Plus, Lortab, Margesic H, Maxidone, Norco, Polygesic, Stagesic, Vicodin, Vicodin ES, Vicodin HP, Xodol, Zydone. Hydrocodone and

chlorpheniramine (Tussionex, Tussicaps).

Hydrocodone and guaifenesin (Codiclear DH, Kwelcof, Vitussin, Xpect-HC). Hydrocodone and homatropine (Hydromet, Mycodone, Tussigon). Hydrocodone and ibuprofen (Reprexain, Vicoprofen). Hydrocodone and pseudoephedrine (P-V Tussin). **Do not confuse hydrocodone with oxycodone.** 

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used for prolonged periods, high dosages at term) Controlled Substance Schedule: III

*Classification:* Antitussive, narcotic analgesic, opiate derivative, phenathrene derivative

#### MECHANISM OF ACTION

Hydrocodone blocks pain perception in the cerebral cortex by binding to specific opiate receptors ( $\mu$  and  $\kappa$ ). This binding results in a decreased synaptic chemical transmission throughout the central nervous system (CNS), thus inhibiting the flow of pain sensations into the higher centers. *Therapeutic Effect:* Alters perception of pain and produces analgesic effect. Reduces coughing.

### PHARMACOKINETICS

Well absorbed. Metabolized in liver. Excreted in urine. *Half-life:* 3.3-3.4 h.

# AVAILABILITY

NOTE: Other products may exist on the market; the following list includes the more common brands available.

#### Hydrocodone and Acetaminophen

Acetaminophen/Hydrocodone Capsule (5/500): Dolorex Forte, Hydrogesic Polygesic, Margesic H, Stagesic.

Acetaminophen/Hydrocodone Tablet (5/300): Xodol 5/300. Acetaminophen/Hydrocodone Tablet (5/325): Norco 5/325. Acetaminophen/Hydrocodone Tablet (5/400): Zydone 5/400. Acetaminophen/Hydrocodone Tablet (5/500): Vicodin, Lortab 5/500, Co-Gesic, Duocet. Acetaminophen/Hydrocodone Tablet (7.5/300): Xodol 7.5/300. Acetaminophen/Hydrocodone Tablet (7.5/325): Norco 7.5/325. Acetaminophen/Hydrocodone Tablet (7.5/400): Zydone 7.5/400. Acetaminophen/Hydrocodone Tablet (7.5/500): Lortab 7.5/500. Acetaminophen/Hydrocodone Tablet (7.5/650): Lorcet Plus. Acetaminophen/Hydrocodone Tablet (7.5/750): Vicodin ES. Acetaminophen/Hydrocodone Tablet (10/300): Xodol 10/300. Acetaminophen/Hydrocodone Tablet (10/325): Norco 10/325. Acetaminophen/Hydrocodone Tablet (10/400): Zydone 10/400. Acetaminophen/Hydrocodone Tablet (10/500): Lortab 10/500. Acetaminophen/Hydrocodone Tablet (10/650): Lorcet. Acetaminophen/Hydrocodone Tablet (10/660): Vicodin HP. Acetaminophen/Hydrocodone Tablet (10/750): Maxidone.

#### Hydrocodone and Chlorpheniramine

Oral Suspension, Extended Release: Hydrocodone polistirex 10 mg and chlorpheniramine polistirex 8 mg/5 mL (Tussionex). Capsules, Extended Release: Hydrocodone polistirex 10 mg and chlorpheniramine polistirex 8 mg per capsule OR hydrocodone polistirex 5 mg and chlorpheniramine polistirex 4 mg per capsule (Tussicaps).

# Hydrocodone and Guaifenesin

*Liquid:* Hydrocodone bitartrate 5 mg and guaifenesin 100 mg/5 mL (Codiclear DH, Kwelcof, Vitussin). *Tablets:* Hydrocodone bitartrate 5 mg and guaifenesin 600 mg (Xpect-HC).

#### Hydrocodone and Homatropine

Syrup: Hydrocodone bitartrate 5 mg and homatropine methylbromide 1.5 mg/5 mL (Hydromet, Mycodone). *Tablets:* Hydrocodone bitartrate 5 mg and homatropine methylbromide 1.5 mg (Tussigon).

#### Hydrocodone and Ibuprofen

*Tablets:* Hydrocodone bitartrate 5 mg and ibuprofen 200 mg (Reprexain), hydrocodone bitartrate 7.5 mg and ibuprofen 200 mg (Vicoprofen).

#### Hydrocodone and Pseudoephedrine

*Tablets:* Hydrocodone bitartrate 5 mg and pseudoephedrine 60 mg (P-V Tussin).

# INDICATIONS AND DOSAGES

NOTE: Due to the many available product combinations and dosage forms, dose recommendations may vary from product to product. The most common dosages are listed here. Check prescribing information for the specific product chosen.

# Hydrocodone and acetaminophen Analgesia

PO (DOSAGE GIVEN AS HYDROCODONE) Adults, Children older than 13 yr or > 50 kg. 2.5-10 mg q4-6h. Maximum: 60 mg/day hydrocodone. Maximum dose of acetaminophen: 4 g/day.

*Elderly.* 2.5-5 mg hydrocodone q4-6h. Titrate dose to appropriate analgesic effect. Maximum: 4 g/day acetaminophen.

Children 2-13 yr or < 50 kg. 0.135 mg/kg/dose hydrocodone q4-6h. Maximum: 6 doses/day of hydrocodone or maximum recommended dose of acetaminophen. See weight-based dosage chart in manufacturer's prescribing information for liquid dosage forms.

#### Hydrocodone and chlorpheniramine

*Adults, Elderly, Children 12 yr and older.* 5 mL q12h. Maximum: 10 mL/24h.

*Children 6-12 yr.* 2.5 mL q12h. Maximum: 5 mL/24h.

Hydrocodone and guaifenesin

Adults, Elderly, Children 12 yr and older: 5 mL q4h. Maximum: 30 mL/24h.

*Children 2-12 yr.* 2.5 mL q4h. *Children < 2 yr.* 0.3 mg/kg/day (hydrocodone) in 4 divided doses.

#### Hydrocodone and homatropine

Adults, Elderly. 10 mg (hydrocodone) q4-6h. A single dose should not exceed 15 mg and not more frequently than q4h. *Children.* 0.6 mg/kg/day (hydrocodone)

in 3-4 divided doses. Do not administer more frequently than q4h.

# Hydrocodone and ibuprofen

*Adults.* 7.5-15 mg (hydrocodone) q4-6h as needed for pain. Maximum: 5 tablets/day.

#### Hydrocodone and pseudoephedrine

*Adults, Elderly.* 1 tablet q4-6h as needed, up to 4 doses/day.

# CONTRAINDICATIONS

Central nervous system (CNS) depression, severe respiratory depression, hypersensitivity to hydrocodone or to any component of the formulation.

# INTERACTIONS

#### Drug

Alcohol, CNS depressants: May increase hypotension and CNS or respiratory depression.

**CYP2D6 inhibitors (e.g., chlorpromazine):** May decrease the effects of hydrocodone.

Hepatotoxic medications (e.g., phenytoin), liver enzyme inducers (e.g., cimetidine): May increase the risk of hepatotoxicity associated with acetaminophen with prolonged high dose or single toxic dose.

**MAOIs, tricyclic antidepressants:** May increase effects of MAOIs and TCAs and hydrocodone.

**Warfarin:** May increase the risk of bleeding with regular use.

#### Herbal

Valerian, St. John's wort, SAMe, kava kava: May increase sedative effects. Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Dizziness, sedation, drowsiness, bradycardia.

#### Occasional

Anxiety, dysphoria, euphoria, lethargy, light-headedness, malaise, mental clouding, mental impairment, mood changes, physiologic dependence, sedation, somnolence, constipation, bradycardia, heartburn, nausea, vomiting, pruritus.

#### Rare

Hypersensitivity reaction, rash.

#### SERIOUS REACTIONS

 Cardiac arrest, circulatory collapse, coma, hypotension, hypoglycemic coma, ureteral spasm, urinary retention, vesical sphincter spasm, agranulocytosis, bleeding time prolonged, hemolytic anemia, iron deficiency anemia, occult blood loss thrombocytopenia, hepatic necrosis, hepatits, skeletal muscle rigidity, renal toxicity, and renal tubular necrosis have been reported.

• Combinations with acetaminophen may cause severe hepatotoxicity and hepatic necrosis in overdose.

• Hearing impairment or loss has been reported with chronic overdose.

 Acute airway obstruction, apnea, dyspnea, and respiratory depression occur rarely and are usually dose related.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypersensitivity reactions to other phenanthrene derivative opioid agonists (morphine, hydrocodone, hydromorphone, levorphanol, oxycodone, oxymorphone). Be aware that tablets with metabisulfite may cause allergic reactions. Information is not available for hydrocodone during pregnancy. The manufacturers recommend discontinuing the medication or to discontinue nursing during therapy. Be aware that hydrocodone should be used cautiously in children and elderly patients.

Drug dependence or tolerance may occur with prolonged use of high dosages. Avoid alcohol and tasks that require mental alertness or motor skills. Change positions slowly to avoid orthostatic hypotension. Be aware that ambulatory persons and those not in severe pain may experience dizziness, hypotension, nausea, and vomiting more frequently than patients in the supine position or with severe pain. Be aware to expect to reduce the initial dosage in those with concurrent central nervous system (CNS) depressants, elderly, and debilitated. **Storage** 

Store at room temperature. Administration

Take without regard to meals. Shake any oral liquid or suspension well before use to avoid improper dosing.

Extended-release products should not be crushed or chewed. Do not exceed maximum dosages for any given product or combination. NOTE: Maximum acetaminophen PO dosage 4000 mg/day in adults and 75 mg/kg/day in children.

#### Hydrocortisone

hye-dro-kor'ti-sone A-HydroCort, Anusol-HC, Caldecort, Cortaid, Cortef, Cortizone-5, Cortizone-10, Hytone, Locoid, Nupercainal Hydrocortisone Cream, Preparation-H, Hydrocortisone, Protocort, Solu-Cortef, Westcort A-HydroCort, Anusol-HC, Cortef, Solu-Cortef

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in first trimester) OTC (hydrocortisone 0.5% and 1% cream, gel, and ointment)

**Classification:** Corticosteroids, topical, dermatologics, anti-inflammatory

Hydrocortisone (Generic Name)

# **MECHANISM OF ACTION**

An adrenocortical steroid that inhibits the accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release, and synthesis and release of mediators of inflammation. *Therapeutic Effect:* Prevents or suppresses cell-mediated immune reactions. Decreases or prevents tissue response to inflammatory process.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	N/A	4-6 h	8-12 h

Well absorbed after IM administration. Widely distributed. Metabolized in the liver. *Half-life:* Plasma, 1.5-2 h; biologic, 8-12 h.

# AVAILABILITY

Tablet (Cortef): 5 mg, 10 mg, 20 mg. Cream (Rectal [Nupercainal Hydrocortisone Cream, Cortizone-10, Preparation-H Hydrocortisone]): 1%. Cream (Topical [Cortizone-5]): 0.5%. Cream (Topical [Caldecort, Cortizone-10]): 1%. Cream (Topical [Hytone]): 2.5%. Ointment (Topical [Locoid]): 0.1%. Ointment (Topical [Westcort]): 0.2%. Ointment (Topical [Cortizone-5]): 0.5%. Ointment (Topical [Anusol-HC, Cortaid, Cortizone-10]): 1%. Ointment (Topical [Hytone]): 2.5%. Suppositories (Anusol-HC): 25 mg. Suppositories (Emcort, Protocort): 30 mg. Injection (A-HydroCort, Solu-Cortef): 100 mg, 250 mg, 500 mg, 1 g.

# INDICATIONS AND DOSAGES

• Acute adrenal insufficiency IV

*Adults, Elderly.* 100 mg IV bolus; then 300 mg/day in divided doses q8h. *Children.* 1-2 mg/kg IV bolus; then 150-250 mg/day in divided doses q6-8h.

*Infants.* 1-2 mg/kg/dose IV bolus; then 25-150 mg/day in divided doses q6-8h.

#### Anti-inflammation, immunosuppression

IV, IM

Adults, Elderly. 15-240 mg q12h. Children. 1-5 mg/kg/day in divided doses q12h.

#### Physiologic replacement PO

Children. 0.5-0.75 mg/kg/day in divided doses q8h.

IM

*Children*. 0.25-0.35 mg/kg/day as a single dose.

# Corticosteroid responsive dermatoses

TOPICAL

*Adults, Children.* Apply topical product of choice to the affected area as a thin film 2 or 3 times daily depending on the severity of the condition.

#### Status asthmaticus IV

Adults, Elderly. 100-500 mg q6h. Children. 2 mg/kg/dose q6h.

# Shock

IV

Adults, Elderly, Children 12 yr and older. 100-500 mg q6h.

#### Adjunctive treatment of ulcerative colitis

RECTAL (RETENTION ENEMA) Adults, Elderly. 100 mg at bedtime for 21 nights or until clinical and proctologic remission occurs (may require 2-3 mo of therapy). RECTAL SUPPOSITORIES

Adults. Suppository 2-3 times/day. Usually for 2 wks. RECTAL (CORTIFOAM) *Adults, Elderly.* 1 applicator 1-2 times a day for 2-3 wks, then every second day until therapy ends.

# Hemorrhoidal irritation

TOPICAL *Adults, Elderly.* Apply sparingly 2-4 times a day.

# CONTRAINDICATIONS

Fungal, tuberculosis, or viral skin lesions; serious infections.

# INTERACTIONS

#### Drug

Amphotericin: May increase hypokalemia.

**Cyclosporine:** May increase the effects of cyclosporine. **Digoxin:** May increase the risk of digoxin toxicity caused by hypokalemia.

Diuretics, insulin, oral hypoglycemics, potassium supplements: May decrease the effects of these drugs.

Hepatic enzyme inducers: May decrease the effects of hydrocortisone.

Live-virus vaccines: May decrease the patient's antibody response to vaccine, increase vaccine side effects, and potentiate virus replication. Herbal

**Cat's claw, echinacea:** Avoid use because of its immunostimulant properties.

St. John's wort: May decrease hydrocortisone levels.

**Calcium:** May interfere with calcium absorption.

# **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose and serum lipid, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

# IV INCOMPATIBILITIES

Bleomycin (Blenoxane), ciprofloxacin (Cipro), diazepam (Valium), doxapram (Dopram), ephedrine, hydralazine (Apresoline), idarubicin (Idamycin), midazolam (Versed), nafcillin (Unipen), pentobarbital (Nembutal), phenobarbital, phenytoin (Dilantin), prochlorperazine (Compazine), promethazine (Phenergan), sargramostim (Leukine).

# 🗏 IV COMPATIBILITIES

Acyclovir (Zovirax), allopurinol (Alloprim), amikacin (Amikin), amifostine (Ethyol), aminophylline, amphotericin, ampicillin (Polycillin), amsacrine (Amsa), atracurium (Tracrium), atropine, aztreonam (Azactam), betamethasone sodium phosphate (Celestone), calcium gluconate, cefepime (Maxipime), chloramphenicol (Chloromycetin), chlordiazepoxide (Librium), chlorpromazine (Thorazine), cisatracurium (Nimbex), cladribine (Leustatin), clindamycin (Cleocin), corticotropin, cyanocobalamin, cytarabine (Cytosar), daunorubicin (Cerubidine), dexamethasone sodium phosphate (Decadron), digoxin (Lanoxin), diltiazem (Cardizem), diphenhydramine (Benadryl), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Rubex), droperidol (Inapsine), edrophonium (Tensilon), enalaprilat (Vasotec), epinephrine, erythromycin (Erythrocin), esmolol (BreviBloc), estrogens (conjugated), ethacrynate sodium (edecrin), etoposide (VePesid), famotidine (Pepcid), fentanyl (Sublimaze), filgrastim (Neupogen), fludarabine (Fludara), fluorouracil (Efurix), foscarnet (Foscavir), furosemide (Lasix), gatifloxacin (Tequin), gemcitabine (Gemzar),

granisetron (Kytril), heparin, inamrinone (Inocor), insulin, isoproterenol (Isuprel), kanamycin (Kantrex), lidocaine, linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, meperidine (Demerol), metronidazole (Flagyl), metoclopramide (Reglan), methoxamine (Vasoxyl), methylergonovine (Methergine), minocycline (Minocin), mitomycin (Mutamycin), mitoxantrone (Novantrone), morphine, neostigmine, norepinephrine (Levophed), ondansetron (Zofran), oxacillin (Floxin), oxytocin (Pitocin), paclitaxel (Taxol), pancuronium (Pavulon), penicillin G potassium (Pfizerpen), pentazocine (Talwin), phytonadione, piperacillin/ tazobactam (Zosyn), potassium chloride, procainamide (Pronestyl), propofol (Diprivan), propranolol (Inderal), pyridostigmine, remifentanil (Ultiva), scopolamine, sodium bicarbonate, succinylcholine (Anectine), tacrolimus (Prograf), teniposide (Vumon), theophylline (Theodur), thiopental (Pentothal), thiotepa (Thioplex), trimethaphan camsylate (Arfonad), trimethobenzamide (Tigan), vancomycin (Vancocin), vecuronium (Norcuron), verapamil (Calan), vinorelbine (Navelbine).

# SIDE EFFECTS

#### Frequent

Insomnia, heartburn, nervousness, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea, or constipation.

#### Occasional

Headache, edema, change in skin color, frequent urination. Topical: Itching, redness, irritation.

#### Rare

Tachycardia, allergic reaction (such as rash and hives), psychologic changes, hallucinations, depression. Topical: Allergic contact dermatitis, purpura.

Systemic: Absorption more likely with use of occlusive dressings or extensive application in young children.

# SERIOUS REACTIONS

 Long-term therapy may cause hypocalcemia, hypokalemia, muscle wasting (especially in arms and legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, and congestive heart failure.

 Abruptly withdrawing the drug after long-term therapy may cause anorexia, nausea, fever, headache, sudden severe joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

• Chronic corticosteroids raise risk of immunosuppression and resultant increased risk for infection.

• Long-term use may increase intraocular pressure or produce cataracts.

• Signs and symptoms of hypercorticism, Cushing's syndrome, HPA suppression.

 An acute hypersensitivity reaction marked by urticaria, angioedema occurs rarely.

· Rare psychosis with high doses.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cirrhosis, congestive heart failure, diabetes mellitus, hypertension, hyperthyroidism, osteoporosis, peptic ulcer disease, seizure disorders, thromboembolic tendencies, thrombophlebitis, and ulcerative colitis. Hydrocortisone crosses the placenta and is distributed in breast milk. Persons taking hydrocortisone should not breastfeed. Prolonged hydrocortisone use during the first trimester of pregnancy may produce cleft palate in the neonate. Prolonged treatment or high dosages may decrease the cortisol secretion and short-term growth rate in children. Elderly patients may be more susceptible to developing hypertension or osteoporosis. Dentist and other physicians should be informed of hydrocortisone therapy if taken within the past 12 mo. Consult with the physician before taking aspirin or other medications. Avoid alcohol, and limit caffeine intake. Hydrocortisone should not be overused for symptomatic relief.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. Blood glucose level, intake and output, BP, serum electrolyte levels, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms. In long-term therapy, signs and symptoms of hypocalcemia or hypokalemia (such as ECG changes, weakness and muscle cramps, and numbness or tingling, especially in the lower extremities) should be assessed. Storage

Store at room temperature. After reconstitution, store hydrocortisone sodium succinate solution at room temperature and use within 72 h.

#### Administration

For IV administration, use immediately if further diluted with D5W, 0.9% NaCl, or other compatible diluent. For

hydrocortisone sodium succinate IV push, dilute to 50 mg/mL; for intermittent infusion, dilute to 1 mg/mL. Administer hydrocortisone sodium succinate solution IV push over 3-5 min. Give intermittent infusion over 20-30 min.

For topical use, gently cleanse area before applying drug; apply topical hydrocortisone valerate after bath or shower for best absorption. Apply sparingly, and rub into area thoroughly. Use occlusive dressings only as ordered.

For rectal use of suppository, moisten the suppository with cold water before inserting it well into the rectum.

For rectal enema use, shake homogeneous suspension well. Lie on the left side with left leg extended and right leg flexed. Gently insert applicator tip into rectum, pointed slightly toward umbilicus, and slowly instill medication.

Hydrocortisone therapy should not be abruptly discontinued. Taper slowly to avoid disease flare or withdrawal symptoms.

# **Hvdromorphone**

hve-droe-mor'fone 🛃 Dilaudid, Dilaudid HP, Exalgo Dilaudid, Dilaudid XP. Hydromorph Contin, Jurnista Do not confuse with morphine or Dilantin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

Classification: Analgesics, narcotic

Hydromorphone (Generic Name)

## **MECHANISM OF ACTION**

An opioid agonist that binds to opioid receptors in the CNS, reducing the intensity of pain stimuli from sensory nerve endings. *Therapeutic Effect:* Alters the perception of and emotional response to pain; suppresses cough reflex.

## PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration (h)
P0	30	90-120	4
IV	10-15	15-30	2-3
IM	15	30-60	4-5
Subcutaneous	15	30-90	4
Rectal	15-30	N/A	N/A

Well absorbed from the GI tract after IM administration. Widely distributed. Metabolized in the liver. Excreted in urine. *Half-life*: 1-3 h.

## AVAILABILITY

Liquid (Dilaudid): 5 mg/5 mL. Tablets (Dilaudid): 2 mg, 4 mg, 8 mg. Injection (Dilaudid): 1 mg/mL, 2 mg/mL, 4 mg/mL. Injection (Dilaudid HP): 10 mg/mL. Suppository (Dilaudid): 3 mg. Extended-Release Tablets (Exalgo): 8 mg, 12 mg, 16 mg.

## INDICATIONS AND DOSAGES Analgesia

PO (IMMEDIATE RELEASE) Adults, Elderly, Children weighing 50 kg and more. 2-4 mg q3-4h. Usual single dose range: 2-8 mg/dose. Children older than 6 mo and weighing < 50 kg. 0.03-0.08 mg/kg/ dose q3-4h. IV

Adults, Elderly, Children weighing more than 50 kg. 0.2-0.6 mg q2-3h. Children weighing 50 kg or less. 0.015 mg/kg/dose q3-6h as needed.

### RECTAL

Adults, Elderly. 3 mg q6-8h.

#### Patient-controlled analgesia (PCA) IV

*Adults, Elderly.* 0.05-0.5 mg at 5-15 min lockout. Maximum (4-h): 4-6 mg.

EPIDURAL

*Adults, Elderly.* Bolus dose of 1-1.5 mg at rate of 0.04-0.4 mg/h. Demand dose of 0.15 mg at 30-min lockout.

#### For moderate to severe pain in opioid-tolerant patients:

PO (conversion from immediate release hydromorphone to extendedrelease tablets—EXALGO) Adults. May be converted to Exalgo by giving the total daily immediaterelease oral hydromorphone dose once daily. If necessary, titrate q3-4days until adequate pain relief with tolerable side effects has been achieved.

PO (conversion from other oral opioid analgesics to EXALGO) Adults. For conversion from other opioids to Exalgo, utilize relative potency information, understanding that conversion ratios are approximate. In general, initiate hydromorphone extended-release tablets at 50% of the calculated total daily equivalent; give the dose q24h. Titrate not more often than q3-4 days.

PO (conversion from transdermal fentanyl patch to EXALGO) Adults. Initiate Exalgo 18 h after removal of a transdermal fentanyl patch. For each 25-mcg/h dose of transdermal fentanyl, the equianalgesic dose of Exalgo is roughly 12 mg q24h. An appropriate starting dose is 50% of the calculated Exalgo dose; give every 24h. Titrate patients to adequate pain relief with dose increases not more often than q3-4days.

#### CONTRAINDICATIONS

Respiratory depression in the absence of resuscitative equipment, status asthmatics, depressed ventilatory function, obstetric anesthesia, severe CNS depression, pregnancy.

## INTERACTIONS

Drug

Alcohol, other CNS depressants: May increase CNS or respiratory depression and hypotension. **MAOIs:** May produce a severe, sometimes fatal, reaction; plan to administer one quarter of the usual hydromorphone dose. When possible, MAOI therapy should generally be discontinued 14 days prior to use. **Selective serotonin reuptake inhibitors (SSRIs):** May cause additive serotonergic symptoms leading to serotonin syndrome. **Herbal** 

Gotu kola, kava kava, St. John's wort, valerian: May cause additive sedative effects.

Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase concentrations.

#### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), cefazolin (Ancef, Kefzol), diazepam (Valium), hyaluronidase (Wydase), minocycline (Minocin), phenobarbital, phenytoin (Dilantin), sargramostim (Leukine), sodium bicarbonate, tetracycline (Sumycin), thiopental (Pentothal).

## **IV COMPATIBILITIES**

Acyclovir (Zovirax), albuterol (Ventolin), allopurinol (Alloprim), amifostine (Ethyol), amikacin

(Amikin), amsacrine (Amsa), atropine, aztreonam (Azactam), bupivacaine (Marcaine), cefamandole (Mandol), cefepime (Maxipime), cefoperazone (Cefobid), cefotaxime (Claforan), cefoxitin (Mefixitin), ceftazidime (Fortaz), ceftizoxime (Cefizox), cefuroxime (Zinacef), chloramphenicol (Chloromycetin), chlorpromazine (Thorazine), cimetidine (Tagamet), cisatracurium (Nimbex), cisplatin (Platinol-AQ), cladribine (Leustatin), clindamycin (Cleocin), cyclophosphamide (Cytoxan), cytarabine (Cytosar), diltiazem (Cardizem), dimenhydrinate (Dramamine), diphenhydramine (Benadryl), dobutamine (Dobutrex), docetaxel (Taxotere), dopamine (Intropin), doxorubicin (Rubex), doxycycline (Vibramycin), epinephrine, erythromycin lactobionate (Erythrocin), etoposide (VePesid), famotidine (Pepcid), fentanyl (Sublimaze), filgrastim (Neupogen), fludarabine (Fludara), fluorouracil (Efurix), foscarnet (Foscavir), furosemide (Lasix), gatifloxacin (Tequin), gemcitabine (Gemzar), gentamicin (Garamycin), glycopyrrolate (Robinul), granisetron (Kytril), haloperidol (Haldol), heparin, hydroxyzine (Vistaril), kanamycin (Kantrex), labetalol (Normodyne, Trandate), linezolid (Zyvox), lorazepam (Ativan), magnesium sulfate, melphalan (Alkeran), methotrexate, metoclopramide (Reglan), metronidazole (Flagyl), midazolam (Versed), milrinone (Primacor), morphine, nafcillin (Unipen), nicardipine (Cardene), nitroglycerin (Nitrobid), norepinephrine (Levophed), ondansetron (Zofran), oxacillin (Bactocil), paclitaxel (Taxol), penicillin G potassium (Pfizerpen), pentazocine (Talwin), pentobarbital

(Nembutal), piperacillin (Piperacil), piperacillin/tazobactam (Zosyn), prochlorperazine (Compazine), promethazine (Phenergan), propofol (Diprivan), ranitidine (Zantac), remifentanil (Ultiva), tacrolimus (Prograf), teniposide (Vumon), thiotepa (Thioplex), ticarcillin (Ticar), tobramycin (Nebcin), trimethobenzamide (Tigan), trimethobenzamide (Tigan), trimethoprim/sulfamethoxazole (Bactrim), vancomycin (Vancocin), vecuronium (Norcuron), verapamil (Calan), vinorelbine (Navelbine).

## SIDE EFFECTS

#### Frequent

Somnolence, dizziness, hypotension (including orthostatic hypotension), decreased appetite.

#### Occasional

Confusion, diaphoresis, facial flushing, urine retention, constipation, pruritus, sweating, bradycardia, dysuria, dry mouth, nausea, vomiting, headache, pain at injection site. **Rare** 

#### Kare

Allergic reaction, depression.

## SERIOUS REACTIONS

• Overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

• The patient who uses hydromorphone repeatedly may develop a tolerance to the drug's analgesic effect as well as physical dependence.

• This drug may have a prolonged duration of action and cumulative effect in patients with hepatic or renal impairment.

#### **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used in patients with acute alcoholism, anoxia, CNS depression, hypercapnia, respiratory depression or dysfunction, seizures, shock, and untreated myxedema. Caution is also warranted in patients with acute abdominal conditions, Addison's disease, COPD, hypotension, hypothyroidism, hepatic impairment, increased intracranial pressure, benign prostatic hyperplasia, and urethral stricture. Hydromorphone readily crosses the placenta; it is unknown whether it is distributed in breast milk. Regular use of opioids during pregnancy may produce withdrawal symptoms in the neonate, including diarrhea, excessive crying, fever, hyperactive reflexes, irritability, seizures, sneezing, tremors, vomiting, and yawning. Hydromorphone use may prolong labor if administered in the latent phase of the first stage of labor or before cervical dilation of 4-5 cm. The neonate may develop respiratory depression if the mother receives hydromorphone during labor. Children younger than 2 yr may be more susceptible to respiratory depression. Elderly patients may be more susceptible to respiratory depression and paradoxical excitement. In elderly patients, agerelated benign prostatic hyperplasia, obstruction, or renal impairment may increase the risk of urine retention; a dosage adjustment is recommended.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. Vital signs, pattern of daily bowel activity and stool consistency, and clinical improvement of pain should be monitored. The drug should be held and the physician should be notified if the respiratory rate is 12 breaths/min or less in a achild.

#### Storage

Store tablets, oral solution, vials at room temperature; protect from light. A slight yellow discoloration of the parenteral form does not indicate a loss of potency. Refrigerate suppositories.

#### Administration

! Ambulatory patients and those not in severe pain may be more prone to dizziness, hypotension, nausea, and vomiting than patients in the supine position and those in severe pain.

Take oral hydromorphone without regard to food. Crush immediaterelease tablets as needed. Measure oral liquid carefully using calibrated oral syringe.

For extended-release product (e.g., Exalgo), discontinue all other extended-release opioids when beginning. Administer only once every 24 h with or without food. Do not crush, break, dissolve, or chew the tablets. If the tablets are not swallowed intact, a fatal dose of hydromorphone may be delivered.

Be aware that a high concentration injection (10 mg/mL) should be used only in patients currently receiving high doses of another opioid agonist for severe, chronic pain caused by cancer or those who have developed a tolerance to high doses of other opioids.

CAUTION: Take care to not confuse highly concentrated injection with more dilute injection solutions. For IV use, hydromorphone may be given undiluted as IV push over 2-5 min, or it may be further diluted with 5 mL sterile water for injection or 0.9% NaCl. Be aware that rapid IV administration increases the risk of a severe anaphylactic reaction, marked by apnea, cardiac arrest, and circulatory collapse. For IM and subcutaneous administration, use a short 25- to 30-gauge needle for subcutaneous injection. Administer the drug slowly; rotate injection sites. Know that those with circulatory impairment are at increased risk for overdose because of delayed absorption of repeated injections.

For rectal use, unwrap, then moisten the suppository with cold water before inserting it well into the rectum.

#### Hydroquinone

hye-droe-kwin'one ▲ Alphaquin HP, Alustra, Claripel, Eldopaque, Eldopaque Forte, Eldoquin, EpiQuin Micro, Esoterica Regular, Glyquin, Lustra, Lustra-AF, Melanex, Melpaque HP, Melquin-3, Melquin HP, NeoStrata AHA, Nuquin HP, NeoStrata HQ, Palmer's Skin Success Fade Cream, Solaquin, Solaquin Forte ■ Esoterica, Lustra, NeoStrata HQ, Palmer's Skin Success Fade Cream

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Depigmenting agents, dermatologics

#### MECHANISM OF ACTION

A depigmenting agent that suppresses melanocyte metabolic processes of the skin. Inhibits the enzymatic oxidation of tyrosine to DOPA (3,4-dihydroxyphenylalanine). Sun exposure reverses this effect and causes repigmentation. *Therapeutic Effect*: Lightens hyperpigmented areas.

## PHARMACOKINETICS

Onset and duration of depigmentation vary among individuals. About 35% is absorbed.

## AVAILABILITY

Cream: 2% (Eldopaque, Esoterica Regular, Palmer's Skin Success Fade Cream), 4% (Alphaquin HP, Alustra, EpiQuin Micro, Lustra, Melquin HP, Nuquin HP). Cream with Sunscream: 2%

(Solaquin), 4% (Claripel, Glyquin, Solaquin), 4% (Claripel, Glyquin, Solaquin, Solaquin, Solaquin Forte, Lustra-AF, Melpaque HP).
Gel: 2% (NeoStrata AHA).
Gel, with Sunscreen: 4% (Nuquin HP, Solaquin Forte).
Solution, Topical: 3% (Melanex, Melquin-3).

## INDICATIONS AND DOSAGES

## Hyperpigmentation, melanin

TOPICAL Adults, Elderly, Children 12 yr and older. Apply twice daily.

## **OFF-LABEL USES**

None known.

## CONTRAINDICATIONS

Hypersensitivity to hydroquinone, sulfites, or any other component of its formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Occasional

Burning, itching, stinging, erythema, such as localized contact dermatitis.

## Rare

Conjunctival changes, fingernail staining.

## SERIOUS REACTIONS

• Gradual blue-black darkening of skin has been reported.

Occasional cutaneous

hypersensitivity (localized contact dermatitis) may occur.

## **PRECAUTIONS & CONSIDERATIONS**

Some products contain sulfites that may cause sensitivity in sensitive individuals. It is unknown whether hydroquinone crosses the placenta or is distributed in breast milk. Caution should be used in pregnant women. Therapeutic effect may take several weeks. Be aware that safety and efficacy of hydroquinone have not been established in children younger than 12 yr. No age-related precautions have been noted in elderly patients. Sun exposure should be avoided. Protective sunscreen or clothing to cover the skin should be used if sun is unavoidable

#### Storage

Store at room temperature. Keep tightly closed.

## Administration

Hydroquinone is for external use only. It is recommended to try a test response in a small area of skin and monitor for irritation or blistering over 24 h before using on a larger skin surface. Gently cleanse the area before application. Limit to small areas of the body at one time. Apply sparingly on skin spots and rub into area thoroughly. Avoid contact with eyes. In general, limit application to no more surface area than face and neck or hands and arms.

## **Hydroxychloroquine**

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiprotozoals, disease-modifying antirheumatic drugs, antimalarial

#### **MECHANISM OF ACTION**

An antimalarial and antirheumatic that concentrates in parasite acid vesicles, increasing the pH of the vesicles and interfering with parasite protein synthesis. Antirheumatic action may involve suppressing formation of antigens responsible for hypersensitivity reactions. *Therapeutic Effect:* Inhibits parasite growth antiinflammatory actions.

#### PHARMACOKINETICS

PO: Peak 1-2 h. *Half-life:* 3-5 days; metabolized in liver; excreted in urine, feces, breast milk; crosses placenta.

#### AVAILABILITY

Tablets: 200 mg (155 mg base).

#### INDICATIONS AND DOSAGES

 Treatment of acute attack of malaria (dosage in mg base)
 PO

Dose	Times	Adults (mg)	Children (mg/kg)
Initial	Day 1	620	10
Second	6 h later	310	5
Third	Day 2	310	5
Fourth	Day 3	310	5

## Suppression of malaria PO

*Adults.* 400 mg (310 mg base) weekly on same day each week, beginning 2 wks before entering an endemic area and continuing for 4-6 wks after leaving the area. If therapy is not begun before exposure, administer a loading dose of 800 mg (620 mg base), then begin the usual suppressive dose.

*Children.* 5 mg base/kg/wk, beginning 2 wks before entering an endemic area and continuing for 4-6 wks after leaving the area. If therapy is not begun before exposure, administer a loading dose of 10 mg base/kg in 2 equally divided doses 6 h apart, followed by the usual dosage regimen.

#### Rheumatoid arthritis PO

*Adults*. Initially, 400-600 mg (310-465 mg base) daily for 5-10 days; gradually increased to optimum response level. Maintenance (usually within 4-12 wks): Dosage decreased by 50% and then continued at maintenance dose of 200-400 mg/day. Maximum effect may not be seen for several months. If symptoms not improved in 6 months, discontinue.

#### Lupus erythematosus PO

*Adults.* Initially, 400 mg once or twice a day for several weeks or months. Maintenance: 200-400 mg/day.

Hydroxychloroquine (Generic Name)

## **OFF-LABEL USES**

Sarcoidosis.

## CONTRAINDICATIONS

Long-term therapy for children, hypersensitivity to 4-aminoquinolines, retinal or visual field changes attributable to 4-aminoquinolines.

#### INTERACTIONS

#### Drug

Aurothioglucose: May increase the risk of blood dyscrasias.

**Cimetidine:** May increase levels of hydroxychloroquine.

**Digoxin:** May increase serum digoxin concentrations.

**Penicillamine:** May increase blood penicillamine concentration and the risk of hematologic, renal, or severe skin reactions.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Mild, transient headache; anorexia; nausea; vomiting.

#### Occasional

Visual disturbances, nervousness, fatigue, pruritus (especially of palms, soles, and scalp), irritability, personality changes, diarrhea, skin and mucosal pigmentation, alopecia.

## Rare

Stomatitis, dermatitis, impaired hearing.

## SERIOUS REACTIONS

 Ocular toxicity, especially retinopathy, may occur and may progress even after drug is discontinued.  Prolonged therapy may result in peripheral neuritis, neuromyopathy, hypotension, ECG changes, agranulocytosis, aplastic anemia, thrombocytopenia, seizures, and psychosis.

 Overdosage may result in headache, vomiting, visual disturbances, drowsiness, seizures, and hypokalemia followed by cardiovascular collapse and death.

• Cardiomyopathy with high daily doses.

 Photosensitivity or severe skin eruptions.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with glucose-6-phosphate dehydrogenase deficiency, hepatic disease, and alcoholism. May precipitate attacks of porphyria. Use of hydroxychloroquine for psoriasis may precipitate a severe attack of psoriasis. Children are especially susceptible to hydroxychloroquine's effects.

Avoid in pregnancy unless essential for malaria treatment; the drug may affect the fetal retina. Use caution with use during breastfeeding.

Report decreased hearing, tinnitus, visual difficulties, muscle weakness, or any other new symptoms. Visual disturbances, impaired hearing, and GI distress should be monitored. Liver function should be assessed. The skin should be checked for pruritus.

#### Storage

Store at room temperature. Administration

! Be aware that 200 mg hydroxychloroquine equals 155 mg of base. Take with food or milk to limit GI effects.

## **Hydroxyprogesterone**

hye-drox-ee-proe-jes'ter-one

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B (used in select pregnancies)

**Classification**: Hormones, progestins, fertility agents

## **MECHANISM OF ACTION**

A synthetic steroid hormone that promotes mammary gland development and relaxes uterine smooth muscle. *Therapeutic Effect:* Supports pregnancy and reduces preterm birth in patients at risk.

### PHARMACOKINETICS

IM: Duration 7 days; metabolized in liver; excreted in urine, feces. *Half-life:* 7.8 days.

## AVAILABILITY

Injection in Castor Oil: 250 mg/mL, in a multidose 5 mL vial.

#### INDICATIONS AND DOSAGES

#### Prevention of preterm delivery in singleton pregnancies: IM

Adults and Adolescent pregnant females 16 years or older. 250 mg (1 mL) IM once weekly. Begin between 16 weeks of pregnancy up to 20 weeks and 6 days of pregnancy. Continue once weekly until week 37 (through 36 weeks, 6 days) of gestation or delivery, whichever occurs first.

## CONTRAINDICATIONS

Current or history of thrombosis or thromboembolic disorders, breast cancer or hormone-sensitive cancer, undiagnosed abnormal vaginal bleeding unrelated to pregnancy, cholestatic jaundice of pregnancy, liver tumors (e.g., hepatocellular cancer) or active liver disease, uncontrolled hypertension. Product contains benzyl alcohol, so use caution in those with a hypersensitivity to it.

#### INTERACTIONS Drug

#### Theophylline, tizanidine, clozapine, acetaminophen, halothane, nicotine, efavirenz, methadone, bupropion:

Hydroxyprogesterone may increase metabolism of these drugs; monitor for clinical efficacy as it may be reduced.

#### Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase glucose concentrations. May elevate liver function tests (rare).

## SIDE EFFECTS

Frequent (> 10%) Injection site reactions (pain, swelling, local urticaria), headache, fluid retention.

#### Occasional (2%-10%)

Pruritus, injection site nodule, nausea, diarrhea.

Depression or other mood swings, facial hair growth or change in acne, hyperglycemia.

## SERIOUS REACTIONS

 Arterial or venous thromboembolism, cerebrovascular disorders, retinal thrombosis, and pulmonary embolism occur rarely. Discontinue if thromboembolism occurs.

• Rare reports of hypersensitivity causing angioedema or widespread urticaria.

#### **PRECAUTIONS & CONSIDERATIONS**

Consider discontinuing the drug if apparent allergic reactions occur. Caution is warranted in patients with conditions aggravated by fluid retention, such as epilepsy, hypertension, renal impairment, preeclampsia, cardiac disease, or those with hepatic impairment. Use with caution in patients with diabetes mellitus or if there is a history of depression. There are inadequate data regarding use of this drug in the first trimester of pregnancy. Hydroxyprogesterone is likely distributed in breast milk, but may not pose serious concern to a nursing infant. Safety and efficacy have not been established in children under 16 yr of age. Use is not expected in the elderly. Avoid smoking because of the increased risk of blood clot formation.

Hydroxyprogesterone may increase the risk of some complications of pregnancy, such as gestational diabetes, hospitalization, low amniotic fluid levels. Use is carefully monitored. Some patients experience drowsiness; do not drive or perform other tasks requiring mental alertness. Notify the physician of chest pain, migraine headache, peripheral paresthesia, sudden decrease in vision, sudden shortness of breath, pain, redness, swelling, warmth in the calf, abnormal vaginal bleeding, or other symptoms. BP and weight should be monitored, as well as pelvic ultrasound and signs or symptoms of impending delivery.

#### Storage

Store vials at room temperature. Avoid exposure to heat and protect from light. Once entered, discard any unused injection after 5 weeks of first opening.

#### Administration

! Never give intravenously. For intramuscular (IM) use only. Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. Hydroxyprogesterone in castor oil is a clear, yellow solution that is viscous and oily. Do not use if solid particles appear or if the solution is cloudy.

Clean the vial top with an alcohol swab before use. Draw up 1 mL (250 mg) of drug into a 3-mL syringe with an 18-gauge needle. Change the needle to a 21-gauge 1½-inch needle. After preparing the skin, inject IM in the upper outer quadrant of the gluteus maximus. Slow IM injection (over 1 min or longer) is recommended. Applying pressure to the injection site may minimize bruising and swelling. Rotate injection sides each week.

#### Hydroxyzine

hye-drox'i-zeen Vistaril Apo-Hydroxyzin, Atarax, Novo-Hydroxyzin Do not confuse hydroxyzine with hydralazine or hydroxyurea.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X, first trimester

*Classification:* Antihistamines, H<sub>1</sub> antagonists, anxiolytics, sedatives/hypnotics, antivertigo

Hydroxyzine (Generic Name)

## **MECHANISM OF ACTION**

A piperazine derivative that competes with histamine for receptor sites in the GI tract, blood vessels, and respiratory tract. May exert CNS depressant activity in subcortical areas. Diminishes vestibular stimulation and depresses labyrinthine function. *Therapeutic Effect:* Produces anxiolytic, anticholinergic, antihistaminic, and analgesic effects; relaxes skeletal muscle; controls nausea and vomiting.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15-30 min	N/A	4-6 h

Well absorbed from the GI tract and after parenteral administration. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 20-25 h (increased in elderly patients).

## AVAILABILITY

Capsules (Vistaril): 25 mg, 50 mg, 100 mg. Oral Suspension: 25 mg/5 mL. Syrup: 10 mg/5 mL. Tablets (ANX): 10 mg, 25 mg, 50 mg. Injection (Vistaril): 25 mg/mL, 50 mg/mL.

## INDICATIONS AND DOSAGES

#### Anxiety PO

*Adults, Elderly.* 25-100 mg 4 times a day. Maximum: 400 mg/day.

## Nausea and vomiting

IM Adults, Elderly. 25-100 mg/dose a4-6h.

#### Pruritus

PO

Adults, Elderly. 25 mg 3-4 times a day.

## Preoperative sedation

PO Adults, Elderly. 50-100 mg. IM Adults, Elderly. 25-100 mg. > Usual pediatric dosage PO Children. 2 mg/kg/day in divided doses q6-8h. IM Children. 0.5-1 mg/kg/dose q4-6h.

## CONTRAINDICATIONS

Early pregnancy, hypersensitivity to hydroxyzine or certirizine, intravenous administration.

#### INTERACTIONS Drug

Alcohol, other CNS depressants: May increase CNS depressant effects. MAOIs: May increase anticholinergic and CNS depressant effects. Herbal

Gotu kola, kava kava, St. John's wort, valerian: May cause additive CNS depressant effects. Food None known.

## DIAGNOSTIC TEST EFFECTS

May cause false-positive urine 17-hydroxycorticosteroid determinations.

## SIDE EFFECTS

Side effects are generally mild and transient.

#### Frequent

Somnolence, dry mouth, marked discomfort with IM injection.

#### Occasional

Dizziness, ataxia, asthenia, slurred speech, headache, agitation, increased anxiety.

#### Rare

Paradoxical CNS reactions, such as hyperactivity or nervousness

in children and excitement or restlessness in elderly or debilitated patients (generally noted during first 2 wks of therapy, particularly in presence of uncontrolled pain).

#### SERIOUS REACTIONS

• A hypersensitivity reaction, including wheezing, dyspnea, and chest tightness, may occur.

• Inadvertent IV administration can cause hemolysis, hypotension, cardiac or respiratory instability, or severe localized injection reactions.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with asthma, bladder neck obstruction. COPD, angle-closure glaucoma, and benign prostatic hyperplasia. It is unknown whether hydroxyzine crosses the placenta or is distributed in breast milk. Hydroxyzine use is not recommended for neonates or premature infants because they are at increased risk for anticholinergic effects. Children may experience paradoxical excitement. Elderly patients are at increased risk for confusion, dizziness, sedation, hypotension, and hyperexcitability. Be aware of dehydration, which can occur with severe vomiting.

Drowsiness and dizziness may occur. Change positions slowly from recumbent to sitting before standing to prevent dizziness. Alcohol, caffeine, and tasks that require mental alertness or motor skills should also be avoided. Autonomic responses, such as cold, clammy hands and diaphoresis, and motor responses, such as agitation, trembling, and tension, should be assessed. CBC and blood chemistry tests should be performed periodically in long-term therapy. Breath sounds, electrolyte levels, and CNS reactions should also be assessed.

#### Storage

Store at room temperature; protect from light.

#### Administration

Crush scored tablets as needed, but do not crush or break capsules. Shake the oral suspension well before each use.

! Do not give hydroxyzine by the subcutaneous, intra-arterial, or IV route because doing so can cause significant tissue damage, thrombosis, and gangrene; IV administration may cause hemolysis.

The IM form may be given undiluted. Inject the drug deep into the gluteus maximus or midlateral thigh in adults and the midlateral thigh in children. Use the Z-track technique of injection to prevent subcutaneous infiltration. IM injection may cause marked discomfort.

#### Hyoscyamine

hye-oh-sye'a-meen ▲ Anaspaz, Colytrol Pediatric Drops, Colidrops Pediatric Drops, Cystospaz, Cystospaz-M, HyoMax, HyoMax-DT, HyoMax, FT, HyoMax-SL, HyoMax SR, Hyosyne, Levbid, Levsin, Levsin SL, Medispaz, NuLev, Spacol, Spacol T/S, Spasdel, Symax FasTabs, Symax DuoTabs, Symax SL Do not confuse Anaspaz with Anaprox.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Anticholinergics, gastrointestinals, urinary antispasmodic

Hyoscyamine (Generic Name)

## **MECHANISM OF ACTION**

A GI antispasmodic and anticholinergic agent that inhibits the action of acetylcholine at postganglionic (muscarinic) receptor sites. *Therapeutic Effect:* Decreases secretions (bronchial, salivary, sweat gland) and gastric juices and reduces motility of GI and urinary tract.

## AVAILABILITY

Tablets (Anaspaz, HyoMax, Levsin, Medispaz, Spasdel): 0.125 mg, 0.15 mg. Tablets (Oral Disintegrating [HyoMax-FT, NuLev, Symax FasTabs]): 0.125 mg. Tablets (Sublingual [HyoMax-SL, Levsin SL, Symax SL]): 0.125 mg. Tablets (Extended Release [HvoMax-SR, Levbid, Symax SR]): 0.375 mg. Capsules (Extended Release [Cystospaz-M]): 0.375 mg. Elixir (Hyosyne, Spasdel, Spacol): 0.125 mg/5 mL. Oral Solution Drops (Hyosyne, Colidrops): 0.125 mg/5 mL. Oral Solution Drops (Colytrol): 0.03 mg/mL. Injection (Levsin): 0.5 mg/mL.

## INDICATIONS AND DOSAGES Gl tract disorders

PO or SL Adults, Elderly, Children 12 yr and older. 0.125-0.25 mg q4h as needed. Extended release: 0.375-0.75 mg PO q12h. Maximum: 1.5 mg/day. Children 2-11 yr. 0.0625-0.125 mg q4h as needed. Maximum: 0.75 mg/day. IM, IV Adults, Elderly, Children 12 yr and

*older*: 0.25-0.5 mg q4h for 1-4 doses. **Hypermotility of lower urinary tract** PO, SUBLINGUAL

*Adults, Elderly.* 0.15-0.3 mg 4 times a day; or extended release 0.375 mg PO q12h.

## Infant colic

PO

*Infants*. Individualized drops dosed q4h as needed. See manufacturer-provided weight-based dosing.

## CONTRAINDICATIONS

GI or genitourinary obstruction, myasthenia gravis, narrow-angle glaucoma, paralytic ileus, severe ulcerative colitis, intestinal atony of elderly or debilitated patients, toxic megacolon complicating ulcerative colitis, unstable cardiovascular status in acute hemorrhage, myocardial ischemia.

## INTERACTIONS

Drug Antacids, antidiarrheals:

May decrease the absorption of hyoscyamine.

Haloperidol, phenothiazines, tricyclic antidepressants: May have additive adverse effects. Ketoconazole: May decrease the absorption of this drug. Other anticholinergics: May increase the effects of hyoscyamine. Potassium chloride: May increase the

severity of GI lesions with the matrix formulation of potassium chloride.

## None known.

Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent

Dry mouth (sometimes severe), decreased sweating, constipation. Occasional

Blurred vision, bloated feeling, urinary hesitancy, somnolence (with high dosage), headache, intolerance to light, loss of taste, nervousness, flushing, insomnia, impotence, mental confusion or excitement (particularly in elderly patients and children), temporary light-headedness (with parenteral form), local irritation (with parenteral form).

#### Rare

Dizziness, faintness.

#### SERIOUS REACTIONS

 Overdose may produce temporary paralysis of ciliary muscle; pupillary dilation; tachycardia; palpitations; hot, dry, or flushed skin; absence of bowel sounds; hyperthermia; increased respiratory rate; ECG abnormalities; nausea; vomiting; rash over face or upper trunk; CNS stimulation; and psychosis (marked by agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, and delusions, followed by depression).

#### **PRECAUTIONS & CONSIDERATIONS**

Carefully evaluate GI symptoms prior to use. For example, diarrhea may be an early sign of incomplete intestinal obstruction. Caution is warranted with cardiac arrhythmias, congestive heart failure, chronic lung disease, hyperthyroidism, neuropathy, and prostatic hyperplasia. Avoid hot baths, saunas, and becoming overheated while exercising in hot weather. Tasks that require mental alertness or motor skills should also be avoided until response to the drug has been established.

Dry mouth may occur, so good oral hygiene should be maintained. Notify the physician of constipation, difficulty urinating, eye pain, or rash. Pattern of daily bowel activity, stool consistency, and urine output should be monitored. The patient should void before receiving the drug to reduce the risk of urine retention.

## Storage

Store at room temperature. Protect from moisture. Keep orally disintegrating tablet (ODT) forms in package until time of use.

#### Administration

Give oral hyoscyamine without regard to meals. The sublingual tablets may be taken sublingually, orally, or chewed. Extended-release capsule should be swallowed whole. ODTs may be placed on tongue; dissolve. May be taken with or without water.

For parenteral use, hyoscyamine may be given undiluted. May be administered IM, intravenously, or subcutaneously. If given IV, inject slowly.

## Ibandronate

eye-band'droh-nate 🗙 Boniva

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Bisphosphonates

## **MECHANISM OF ACTION**

A bisphosphonate that binds to bone hydroxyapatite (part of the mineral matrix of bone) and inhibits osteoclast activity. *Therapeutic Effect:* Reduces rate of bone turnover and bone resorption, resulting in a net gain in bone mass.

## PHARMACOKINETICS

Absorbed in the upper GI tract. Extent of absorption impaired by food or beverages (other than plain water). Rapidly binds to bone. Unabsorbed portion is eliminated in urine. Protein binding: 90%. *Halflife:* 10-60 h.

## AVAILABILITY

*Tablets:* 2.5 mg, 150 mg. *Injection:* 3 mg/3 mL.

## INDICATIONS AND DOSAGES Osteoporosis

PO Adults, Elderly. 2.5 mg daily or 150 mg once a month. IV Adults, Elderly. 3 mg every 3 mo.

## CONTRAINDICATIONS

Known hypersensitivity to ibandronate or product components (cross-sensitivity may occur with other bisphosphonates), abnormalities of the esophagus such as stricture or achalasia (oral use), inability to stand or sit upright for at least 60 min (for oral use), uncorrected hypocalcemia, severe renal impairment (e.g., SCr > 2.3 mg/dL or CrCl < 30 ml/min).

## INTERACTIONS

#### Drug

Antacids containing aluminum, calcium, magnesium; vitamin D: Decrease the absorption of

ibandronate.

## Herbal

None known.

Food

Beverages other than plain water, dietary supplements, food: Interfere with the absorption of ibandronate.

## **DIAGNOSTIC TEST EFFECTS**

May decrease serum alkaline phosphatase level. May increase blood cholesterol level. May cause transient decrease in serum calcium (IV).

## SIDE EFFECTS

### Frequent (6%-13%)

Back pain; dyspepsia, including epigastric distress and heartburn; peripheral discomfort; diarrhea; headache; myalgia.

Occasional (3%-4%)

Dizziness, arthralgia, asthenia. Rare (≤ 2%)

Vomiting, hypersensitivity reaction.

## SERIOUS REACTIONS

• Upper respiratory tract infection occurs occasionally.

• Overdose causes hypocalcemia, hypophosphatemia, and significant GI disturbances.

- · Osteonecrosis of the jaw.
- Infrequent reports of severe and occasionally incapacitating bone,

joint, and/or muscle pain.

• Increased risk of fractures in femur (rare).

Ibandronate (Generic Name)

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with GI diseases, including duodenitis, dysphagia, esophagitis, gastritis, ulcers, and mild to moderate renal impairment. Bone, joint, and muscle pain have been reported with ibandronate therapy. Osteonecrosis of the jaw has also been reported with ibandronate therapy and has been associated more commonly in cancer patients and in those with preexisting dental disease. Ibandronate may have teratogenic effects. It is unknown whether ibandronate is excreted in breast milk. Breastfeeding is not recommended for women taking ibandronate. The safety and efficacy of ibandronate have not been established in children. No age-related precautions have been noted in elderly patients. Consider beginning weight-bearing exercises, reduce alcohol consumption, and stop cigarette smoking.

Hypocalcemia and vitamin D deficiencies, if present, should be corrected before beginning ibandronate therapy. BUN, creatinine levels, and serum electrolytes, especially calcium and serum alkaline phosphatase levels, should be monitored during therapy. **Storage** 

Store tablets at room temperature. Store unopened injection at room temperature in carton until time of use.

#### Administration

Expect patients to receive calcium and vitamin D during bisphosphonate treatment. Take ibandronate on an empty stomach with 6-8 oz of plain water 60 min before the first food or beverage of the day; give with plain water only. Avoid taking ibandronate with coffee, mineral water, and orange juice because they significantly reduce the absorption of the drug. Stay in an upright position while standing or sitting; do not lie down for 60 min after drug administration. Do not chew or suck the tablet because of the potential for oropharyngeal ulceration. Give once-monthly dose on the same date of the month.

Give injection IV only over 15-30 seconds. Do not mix with calcium-containing solutions or any other drugs. Do not administer paravenously or intra-arterially because this may cause tissue damage. Do not give injection more often than every 3 mo.

### Ibuprofen

eye-byoo'pro-fen Advil, Advil Children's, Advil Infants' Drops, Advil Junior Strength, Advil Liquigels, Advil Migraine, Midol Cramps and Body Aches, Motrin, Motrin IB, Motrin Infants' Drops, Motrin Junior Strength

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B (D if used in third trimester or near delivery) Many products are OTC; tablets > 200 mg/tablet are Rx only.

**Classification:** Analgesics, antipyretics, nonsteroidal antiinflammatory drugs (NSAIDs)

#### MECHANISM OF ACTION

An NSAID that inhibits prostaglandin synthesis. Also produces vasodilation by acting centrally on the heat-regulating center of the hypothalamus. *Therapeutic Effect:* Produces analgesic and anti-inflammatory effects and decreases fever.

Ibuprofen (Generic Name)

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (analgesic)	0.5 h	N/A	4-6 h
PO (antirheu- matic)	2 days	1-2 wks	NA

Rapidly absorbed from the GI tract. Protein binding: > 90%. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2-4 h.

## AVAILABILITY

Caplets (Advil, Motrin IB): 100 mg, 200 mg.

*Capsules (Advil, Advil Migraine):* 200 mg.

*Gelcaps (Advil, Motrin IB):* 200 mg. *Tablets (Advil, Motrin IB):* 200 mg. *Tablets (Rx only):* 400 mg, 600 mg, 800 mg.

Tablets (Chewable [Children's Advil, Children's Motrin]): 50 mg. Tablets (Chewable [Junior Advil, Junior Strength Motrin]): 100 mg. Oral Suspension (Children's Advil, Children's Motrin): 100 mg/5 mL. Oral Drops (Infant Advil, Infant Motrin): 40 mg/mL.

## INDICATIONS AND DOSAGES

 Acute or chronic rheumatoid arthritis, osteoarthritis, migraine pain, gouty arthritis
 PO

Adults, Elderly. 300-800 mg 3-4 times a day. Maximum: 3.2 g/day. Mild to moderate pain, primary dysmenorrhea

PO

*Adults, Elderly.* 200-400 mg q4-6h as needed. Maximum: 1.6 g/day.

## • Fever, minor aches or pain PO

*Adults, Elderly.* 200-400 mg q4-6h. Maximum: 1.6 g/day. Children, Infants 6 mo and older: 5-10 mg/kg/dose q6-8h. Maximum: 40 mg/kg/day. OTC: 7.5 mg/kg/dose q6-8h. Maximum: 30 mg/kg/day.

#### Juvenile arthritis PO

*Children.* 30-40 mg/kg/day in 3-4 divided doses. Maximum: 400 mg/day in children weighing < 20 kg, 600 mg/day in children weighing 20-30 kg, 800 mg/day in children weighing > 30-40 kg.

## **OFF-LABEL USES**

Treatment of psoriatic arthritis, vascular headaches.

## CONTRAINDICATIONS

Active peptic ulcer, chronic inflammation of GI tract, GI bleeding disorders or ulceration, history of hypersensitivity to aspirin or NSAIDs, use within 14 days of coronary artery bypass graft surgery.

## INTERACTIONS

#### Drug

Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, other salicylates: May increase the risk of GI side effects such as bleeding. NSAID use may negate cardioprotective effect of ASA.

**Bile acid sequestrants:** May decrease the absorption of NSAIDs. Separate administration by at least 2 h. **Corticosteroids:** May increase risk of GI ulceration.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of these drugs.

**Lithium:** May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Probenecid:** May increase the ibuprofen blood concentration.

**SSRIs, SNRIs:** Increased risk of GI bleeding.

#### Herbal

**Feverfew:** May decrease the effects of feverfew.

Alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAM-e (S-adenosylmethionine), sweet clover, turmeric, white willow: May increase the risk of bleeding. Food

Alcohol: May cause dizziness and may increase the risk of GI bleeding.

#### DIAGNOSTIC TEST EFFECTS

May prolong bleeding time. May alter blood glucose level. May increase BUN level, and serum creatinine, potassium, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin and hematocrit.

## SIDE EFFECTS

#### Occasional (3%-9%)

Nausea with or without vomiting, dyspepsia, dizziness, rash. **Rare (< 3%)** 

Diarrhea or constipation, flatulence, abdominal cramps or pain, pruritus.

#### SERIOUS REACTIONS

 Acute overdose may result in metabolic acidosis.

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, a severe hepatic reaction (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), and a severe hypersensitivity reaction (particularly in patients with systemic lupus erythematosus or other collagen diseases).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with dehydration, GI disease (such as GI bleeding or ulcers), hepatic or renal impairment, and concurrent anticoagulant use. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. The lowest effective dose should be used for the shortest duration of time possible. It is unknown whether ibuprofen crosses the placenta or is distributed in breast milk. Ibuprofen should not be used during the third trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. The safety and efficacy of this drug have not been established in children younger than 6 mo. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may increase the risk of hepatotoxicity or renal toxicity; a reduced dosage is recommended. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures. Increases the risk of GI bleeding. Because the drug may cause dizziness, do not perform tasks requiring mental concentration until the effects of the drug are known.

Monitor CBC and blood chemistries to assess hepatic and renal function with chronic therapeutic use. Be alert for skin rash or dark stools, or other signs of potential bleeding. Therapeutic

response, such as decreased pain, stiffness, swelling, and tenderness, improved grip strength, and increased joint mobility, should be evaluated. Storage

Store at room temperature; protect liquid-filled capsules and chewable tablets from high humidity/moisture. Administration

Do not crush or break entericcoated tablets. Take ibuprofen with food, milk, or antacids. Chewable tablets should be chewed well and swallowed with water or liquid.

Shake suspensions well before each use, including infant drops. Take care to measure accurate dosage.

### Ibuprofen; Oxycodone

eye-byoo'pro-fen; ox-ee-koe'done ★ 🍁 Combunox

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used for prolonged periods, within third trimester, or near term) Controlled Substance Schedule: II

Classification: Analgesics, nonsteroidal anti-inflammatory drug (NSAID), synthetic opiate agonist

## MECHANISM OF ACTION

An NSAID that inhibits prostaglandin synthesis, combined with a potent semisynthetic opioid that binds to opiate receptors in the central nervous system. Therapeutic Effect: Ibuprofen produces analgesic and antiinflammatory effects and decreases fever. Oxycodone also produces analgesia, but may also produce sedation and respiratory depression.

#### PHARMACOKINETICS

See individual drug monographs. Rapidly absorbed from the GI tract. Protein binding: > 90%. Onset of analgesic activity in 1-2 hours. Metabolized in the liver. Oxycodone metabolites have lowered analgesic activity. Metabolites excreted in urine. Unknown whether removed by hemodialysis. Analgesic activity of the combination ranges up to 6 hours. Not removed by hemodialysis. Half-life: 1.8-2.6 h (ibuprofen); 3.1-3.7 h (oxycodone).

#### AVAILABILITY

Tablets: Each tablet contains oxycodone 5 mg and ibuprofen 400 mg.

#### INDICATIONS AND DOSAGES

#### Acute moderate to severe pain: PO

Adults, Elderly. 1 tablet every 4-6 h with interval determined by patient response. Do not exceed 4 tablets in a 24-h period and use should not exceed 7 days.

#### CONTRAINDICATIONS

Hypersensitivity to ibuprofen or oxycodone; severe hypersensitivity to related opioids, aspirin, or other NSAIDs; significant respiratory depression (in unmonitored settings or the absence of resuscitative equipment); acute or severe bronchial asthma or hypercarbia; paralytic ileus; active peptic ulcer or GI bleeding. Not for use within 14 days of coronary artery bypass graft (CABG) surgery.

#### INTERACTIONS Drug

Alcohol, other CNS depressants, other narcotics, sedative-hypnotics, skeletal muscle relaxants, phenothiazines, benzodiazepines: May increase CNS or respiratory depression and hypotension.

#### Antihypertensives, diuretics:

NSAIDs may decrease the effects of these drugs.

Aspirin, other salicylates: May increase the risk of GI side effects such as bleeding. NSAID use may negate cardioprotective effect of aspirin.

**Bile acid sequestrants:** May decrease the absorption of NSAIDs. Separate administration by at least 2 h. **Corticosteroids:** May increase risk of GI ulceration.

Heparin, oral anticoagulants (warfarin), thrombolytics: May increase the effects of these drugs; increased risk GI bleed.

**Lithium:** May increase the blood concentration and risk of lithium toxicity.

Methotrexate: May increase the risk of methotrexate toxicity.

Potent CYP2D6 inhibitors: May increase oxycodone exposure. Probenecid: May increase the ibuprofen blood concentration. Ritonavir: May cause a significant increase in oxycodone plasma concentrations.

**SSRIs, SNRIs:** Increased risk of GI bleeding. Some may increase oxycodone exposure.

#### Herbal

**Feverfew:** May decrease the effects of feverfew.

Alfalfa, anise, bilberry, bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAM-e (S-adenosylmethionine), sweet clover, turmeric, white willow: May increase the risk of bleeding.

#### Food

Alcohol: May cause dizziness, CNS depression, and may increase the risk of GI bleeding.

#### **Diagnostic Test Effects**

May prolong bleeding time. May alter blood glucose level. May increase BUN level, and serum creatinine, potassium, AST (SGOT), and ALT (SGPT) levels. May increase serum amylase and lipase levels. May decrease blood hemoglobin and hematocrit. Side Effects

#### Occasional (5%-10%)

Nausea with or without vomiting, dizziness, somnolence, rash.

#### Occasional (< 3%)

Sweating, flatulence, abdominal cramps or pain, rash, pruritus. **Rare** 

Allergic reaction, confusion, depression, paradoxical excitement and restlessness in elderly or debilitated patients.

#### SERIOUS REACTIONS

• Acute NSAID overdose may result in metabolic acidosis.

 Opiate overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

• The patient who uses oxycodone repeatedly may develop physical dependence and a tolerance to the drug's analgesic effect.

 Rare reactions with long-term NSAID use include peptic ulcer disease, GI bleeding, gastritis, a severe hepatic reaction (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), and a severe hypersensitivity reaction (particularly in patients with systemic lupus erythematosus or other collagen diseases).

#### **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used in patients with acute alcoholism, anoxia, CNS depression, hypercapnia, respiratory depression or dysfunction, seizures, shock, or untreated myxedema. Caution is also warranted with acute abdominal conditions. Addison's disease, chronic obstructive pulmonary disease (COPD), hypothyroidism, hepatic impairment, increased intracranial pressure, prostatic hypertrophy, and urethral stricture. Caution is warranted with NSAID use in patients with dehydration, GI disease (such as GI bleeding or ulcers), hepatic or renal impairment, and concurrent anticoagulant use. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. The lowest effective dose should be used for the shortest duration of time possible. Ibuprofen/oxycodone should not be used during late pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. Oxycodone is excreted in breast milk, while ibuprofen alone is considered compatible. The safety and efficacy of this drug product have not been established in children. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may increase the risk. Do not administer within 4-6 half-lives before surgical procedures.

Monitor CBC and blood chemistries to assess hepatic and renal function with chronic therapeutic use. Therapeutic response, such as decreased pain, should be monitored. Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. BP, respiratory rate, mental status, pattern of daily bowel activity, and clinical improvement should be monitored. Be alert for GI bleeding. The drug should be withheld and the physician should be notified if the respiratory rate is 12 breaths/min or less in an adult. Signs of overdose need to be reported immediately. Some predisposed patients may develop a tolerance to the drug's analgesic effect and physical dependence. Abrupt discontinuation of the drug may result in withdrawal effects.

## Storage

Store at room temperature. Administration

! Ambulatory patients may be more likely to experience dizziness, hypotension, nausea, and vomiting than those in the supine position. It is advisable to take ibuprofen/ oxycodone with food or milk. Do not use for longer than advised.

lbutilide eye-byoo'ti-lide ★ ♥ Corvert

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiarrhythmics, class III

### **MECHANISM OF ACTION**

An antiarrhythmic that prolongs both atrial and ventricular action potential duration and increases the atrial and ventricular refractory period. Activates slow, inward current (mostly of sodium); produces mild slowing of sinus node rate and AV conduction; and causes dose-related prolongation of QT interval. *Therapeutic Effect:* Converts atrial arrhythmias to sinus rhythm.

## PHARMACOKINETICS

After IV administration, highly distributed, rapidly cleared. Protein binding: 40%. Primarily excreted in urine as metabolite. *Half-life:* 2-12 h (average: 6 h).

## AVAILABILITY

Injection: 0.1 mg/mL solution.

#### INDICATIONS AND DOSAGES > Rapid conversion of atrial fibrillation or flutter of recent onset to normal sinus rhythm IV INFUSION

Adults, Elderly weighing 60 kg or more. One vial (1 mg) given over 10 min. If arrhythmia does not stop within 10 min after the end of initial infusion, a second 1-mg/10-min infusion may be given. Adults, elderly weighing < 60 kg. 0.01 mg/kg given over 10 min. If arrhythmia does not stop within 10 min after end of initial infusion, a second 0.01-mg/kg, 10-min infusion may be given.

## CONTRAINDICATIONS

QTc interval > 440 msec, hypersensitivity.

## INTERACTIONS

#### Drug

Class IA antiarrhythmics (disopyramide, moricizine, procainamide, quinidine), class III antiarrhythmics (amiodarone, bretylium, sotalol): Do not give ibutilide with these drugs or give these drugs within 4 h after infusing ibutilide.

**Digoxin:** Signs of digoxin toxicity may be masked with coadministration.

H<sub>1</sub> receptor antagonists, phenothiazines, tricyclic and tetracyclic antidepressants: May prolong QT interval. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## IV INCOMPATIBILITIES

No information is available for Y-site administration.

## SIDE EFFECTS

Ibutilide is generally well tolerated. **Occasional** 

Ventricular extrasystoles (5.1%), ventricular tachycardia (4.9%), headache (3.6%), hypotension, orthostatic hypotension (2%). **Rare** 

Bundle-branch block, AV block, bradycardia, hypertension.

## SERIOUS REACTIONS

• Sustained polymorphic ventricular tachycardia, occasionally with QT prolongation (torsades de pointes) occurs rarely.

 Overdose results in central nervous system (CNS) toxicity, including CNS depression, rapid gasping breathing, and seizures.

• Expect prolongation of repolarization.

• Existing arrhythmias may worsen or new arrhythmias may develop.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with abnormal hepatic function or heart block. Patients with chronic atrial fibrillation are not strong candidates for ibutilide. Avoid coadministration with other medications that may prolong the QT interval. Because ibutilide is embryocidal and teratogenic in animals, breastfeeding is not recommended during ibutilide therapy. Safety and efficacy of ibutilide have not been established in children. No age-related precautions have been noted in elderly patients.

Notify the physician if palpitations or other adverse reactions occur. BP and ECG should be continuously monitored during therapy. Serum electrolyte levels, especially magnesium and potassium, should be monitored, and arthythmias requiring overdrive cardiac pacing, electrical cardioversion, or defibrillation should be surveyed. Patients with atrial fibrillation lasting more than 3 days should be given an anticoagulant for at least 2 wks before ibutilide therapy is started. Proarrhythmias may develop. **Storage** 

Store unopened vials at room temperature in carton. Diluted IV infusions are stable at room temperature for up to 24 h or up to 48 h if refrigerated.

#### Administration

Have advanced cardiac life-support equipment, medications, and trained personnel on hand during and after ibutilide administration. Ibutilide is compatible with D5W and 0.9% NaCl. It is also compatible with polyvinyl chloride plastic and polyolefin bag. Give undiluted or may dilute in 50 mL 0.9% NaCl or dextrose 5%. Give IV over 10 min.

Icatibant eye-kat'i-bant Tirazyr

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Bradykinin antagonist

#### MECHANISM OF ACTION

Icatibant is a bradykinin  $\beta_2$  receptor antagonist that inhibits bradykinin from binding to the  $\beta_2$  receptor. Hereditary angioedema is caused by an absence or dysfunction of C<sub>1</sub>esterase-inhibitor, a key regulator of bradykinin production. Bradykinin is thought to be responsible for the characteristic symptoms. *Therapeutic Effect*: Reduces attacks of hereditary angioedema (HAE), including swelling, inflammation, and pain.

#### AVAILABILITY

Injection solution: 30 mg/3 mL.

#### INDICATIONS AND DOSAGES

Acute attacks of hereditary angioedema (HAE): SC Adults, Elderly. 30-mg single injection. If response is inadequate or symptoms recur, may give 30 mg again at intervals of at least 6 h. Maximum of 3 injections per each 24 h.

### CONTRAINDICATIONS

None.

#### INTERACTIONS

Drug ACE inhibitors: Icatibant may reduce the effects of ACE inhibitors. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Infrequent and benign increases in liver transaminases.

#### SIDE EFFECTS

Frequent (≥ 90%) Injection site reactions. Rare (< 1%) Pyrexia, liver transaminase increase, dizziness, tiredness, and rash.

#### SERIOUS REACTIONS

 None known; hypersensitivity and immunogenicity have not been reported.

## **PRECAUTIONS & CONSIDERATIONS**

Patients experiencing a laryngeal attack are at risk of airway obstruction and thus should seek immediate medical assistance, even when they use this drug. There are no data in pregnancy and lactation. Safety and effectiveness are not established in children.

Tiredness, drowsiness, and dizziness have been reported following the use of icatibant. Patients should be advised not to drive or use machinery if they feel tired or dizzy.

#### Storage

Store unopened drug in temperature range of 36-77° F (2-25° C). Do not freeze. Keep in original carton until time of use. The solution normally appears clear and colorless; discard the solution if particulate matter is present.

#### Administration

Patients may be trained to selfadminister the drug. However, following treatment of any laryngeal attacks, advise patients to seek immediate medical attention.

To use, remove prefilled syringe and needle from the carton. Attach the provided 25-gauge needle to the syringe hub and screw on securely. Do not use a different needle. Disinfect the injection site and administer icatibant by subcutaneous injection over at least 30 sec. The injection site should be a fold of abdominal skin, about 2 to 4 inches (5 to 10 cm) below the navel on either side. The site should be at least 2 inches (5 cm) away from any scars. Do not choose an area that is bruised, swollen, or painful.

#### lloperidone

eye'low-per'i-done Fanapt Do not confuse iloperidone with risperidone or ixabepilone, or Fanapt with Fansidar, Fanatrex, or Xanax.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

### MECHANISM OF ACTION

A benzisoxazole derivative that antagonizes dopamine and serotonin receptors; also has  $\alpha$ -adrenergic blocking properties. *Therapeutic Effect:* Suppresses psychotic behavior.

### PHARMACOKINETICS

Oral form is well absorbed from the GI tract; unaffected by food. Protein binding: 95%. Steadystate levels attained in 3-4 days. Extensively metabolized in the liver to 2 metabolites (P88 and P95) by CYP2D6 (predominantly) and CYP3A4. Poor metabolizers of CYP2D6 or administration with potent CYP2D6 inhibitors greatly increases iloperidone exposure. Drug and metabolites excreted primarily in urine and feces. Halflife: For iloperidone, P88, and P95 are 18, 26, and 23 h, respectively (increased in poor metabolizers).

#### AVAILABILITY

*Tablets (Fanapt):* 1 mg, 2 mg, 4 mg, 6 mg, 8 mg, 10 mg, 12 mg.

# INDICATIONS AND DOSAGES Schizophrenia PO

Adults. Must be titrated slowly to avoid orthostatic hypotension. Initially, give 1 mg twice daily. May increase to 2 mg twice daily, 4 mg twice daily, 6 mg twice daily, 8 mg twice daily, 10 mg twice daily, and 12 mg twice daily on days 2, 3, 4, 5, 6, and 7, respectively. Effective range is 6-12 mg twice daily. Control of symptoms may be delayed during the first 1-2 wks of treatment due to the titration schedule needed. Maximum: 12 mg twice daily (24 mg/day). NOTE: Whenever treatment is interrupted for more than 3 days, return to the titration schedule.

#### Dosage adjustment if a poor metabolizer of CYP2D6

Reduce dose by 50%.

#### Dosage adjustment with CYP2D6 inhibitors

Reduce dose by 50% when given with strong CYP2D6 inhibitors such as fluoxetine or paroxetine. When the CYP2D6 inhibitor is withdrawn, increase dose.

#### Dosage adjustment with CYP3A4 inhibitors

Reduce dose by 50% when given with strong CYP3A4 inhibitors such as ketoconazole or clarithromycin. When the CYP3A4 inhibitor is withdrawn, increase dose.

#### Hepatic impairment of any degree

Use of this drug is not recommended.

#### CONTRAINDICATIONS

Hypersensitivity to the drug.

#### INTERACTIONS

#### Drug

### Alcohol, other CNS depressants: May increase central nervous system

(CNS) depression. Drugs that prolong the

#### Drugs that prolong the

QT interval: Do not use in combination with such drugs

including class 1A (e.g., quinidine, procainamide) or class III (e.g., amiodarone, sotalol) antiarrhythmics, chlorpromazine, thioridazine, gatifloxacin, moxifloxacin, pentamidine, levomethadyl, methadone.

**Strong CYP2D6 inhibitors** (e.g., fluoxetine, paroxetine): May increase the levels/effects of

Nay increase the reverse rever

**Dopamine agonists, levodopa:** May antagonize the effects of these drugs.

#### Herbal

Kava kava, valerian: May increase CNS depression.

Food

Alcohol: Avoid; may increase CNS depression.

## DIAGNOSTIC TEST EFFECTS

Elevates prolactin levels. Infrequently causes hyperglycemia, decreased hemoglobin or hematocrit, decreased potassium. May rarely cause changes in neutrophil counts. May rarely cause ECG changes.

## SIDE EFFECTS

#### Frequent (>10%)

Dizziness, somnolence, tachycardia, dry mouth, nausea, extrapyramidal symptoms.

#### Occasional (5%-10%)

Fatigue, nasal congestion, orthostatic hypotension, diarrhea, and weight increase. Hyperprolactinemia may affect fertility.

#### Less Frequent (< 5%)

Blurry vision, abdominal pain, arthralgia, muscle stiffness, nasopharyngitis, cough, upper respiratory infection, hypotension, dyspnea, rash, ejaculation disturbance, extrapyramidal symptoms, tremor, lethargy.

#### SERIOUS REACTIONS

• Hypersensitivity may include pruritus and urticaria, or more serious reactions.

Esophageal dysmotility and risk of aspiration.

• Tardive dyskinesia (characterized by tongue protrusion and chewing, puffing, or puckering of the mouth) and neuroleptic malignant syndrome (marked by hyperpyrexia, muscle rigidity, change in mental status, irregular pulse or BP, tachycardia, diaphoresis, cardiac arrhythmias, rhabdomyolysis, and acute renal failure).

• Potential for QTc prolongation and resultant arrhythmia (rare).

Priapism.

• Seizures, especially in those with altered seizure thresholds.

#### **PRECAUTIONS & CONSIDERATIONS**

Avoid use in patients with congenital/hereditary or preexisting QT prolongation or in those with hepatic impairment. Caution is warranted with cardiovascular (hypotension, heart failure, recent MI) or cerebrovascular diseases (because it may induce hypotension or QTc prolongation); correct any electrolyte imbalances prior to administration and do not give with other medications known to cause OT prolongation. Also use with caution in patients with history of seizures or conditions that may lower the seizure threshold (such as Alzheimer's disease), and Parkinson's disease (because of potential for exacerbation of movement disorders). Use with caution in patients with diabetes

or with risk factors for diabetes due to risk for hyperglycemia or weight gain. It is unknown whether iloperidone crosses the placenta; there are no adequate data during pregnancy and use should generally be avoided. Because this drug is likely to be distributed in breast milk, females should avoid breastfeeding. Elderly patients are more susceptible to orthostatic hypotension and may require lower dosages. Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death; iloperidone has not been approved for dementia-related psychosis. Most deaths appear to be either CV (e.g., heart failure, sudden death) or infectious (e.g., pneumonia) in nature. The safety and efficacy of iloperidone have not been established in children or adolescents.

Drowsiness and dizziness may occur but generally improve with continued therapy. CNS depressants and alcohol should be avoided. Disruption of temperature regulation may occur and patients should use caution with exercise, exposure to extreme heat, or dehydration. Monitor for extrapyramidal symptoms and tardive dyskinesia. BP, pulse rate, weight, CBC, and therapeutic response should also be monitored. Dehydration and hypovolemia should be corrected before beginning therapy.

#### Storage

Store at room temperature. Protect from light and moisture.

#### Administration

Take iloperidone without regard to food. Expect to follow the initial titration schedule whenever patients have been off iloperidone for >3 days.

## lloprost

eye'low-prost

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Respiratory agents, pulmonary antihypertensive, prostaglandins

## **MECHANISM OF ACTION**

A prostaglandin that dilates systemic and pulmonary arterial vascular beds, alters pulmonary vascular resistance, and suppresses vascular smooth muscle proliferation. *Therapeutic Effect*: Improves symptoms and exercise tolerance in patients with pulmonary hypertension; delays deterioration of condition.

## AVAILABILITY

Solution for Oral Inhalation: 10 mcg/mL or 20 mcg/mL ampules.

#### INDICATIONS AND DOSAGES

 Pulmonary hypertension in patients with New York Heart Association (NYHA) class III or IV symptoms

ORAL INHALATION Adults. Initially, 2.5 mcg/dose; if tolerated, increased to 5 mcg/ dose. Administer 6-9 times a day at intervals of 2 h or longer while patient is awake. Maintenance: 5 mcg/dose. Maximum daily dose: 45 mcg (5 mcg given 9 times/day).

## CONTRAINDICATIONS

None known. Do not initiate if systolic BP < 85 mm Hg.

## INTERACTIONS

#### Drug

Antihypertensives, other vasodilators: May increase the

hypotensive effects of iloprost.

#### Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum alkaline phosphatase and GGT levels.

## SIDE EFFECTS

**Frequent (27%-39%)** Increased cough, headache, flushing.

## Occasional (11%-13%)

Flu-like symptoms, nausea, lockjaw, jaw pain, hypotension.

#### Rare (2%-8%)

Insomnia, syncope, palpitations, vomiting, back pain, muscle cramps.

### SERIOUS REACTIONS

• Hemoptysis and pneumonia occur occasionally.

• Congestive heart failure, renal failure, dyspnea, and chest pain occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with renal and hepatic impairment and in those who are concurrently taking medications that may increase the risk of syncope. Discontinue therapy immediately if pulmonary edema occurs.

#### Storage

Store at room temperature up to 86° F or store in refrigerator; do not freeze.

## Administration

Iloprost is administered by inhalation only, using the Prodose ADD or the I-neb AAD systems. Transfer the entire contents of the ampule into the medication chamber. Ampule size used (e.g., 1 or 2 mL) is system dependent. After use, discard any unused portion from the system's medication chamber.

! Do not give doses more frequently than every 2 h, even though the clinical effect of the medication may not last the full 2 h.

## Imatinib

im′a-tin-ib ★ ∳ Gleevec

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, signal transduction inhibitors

### **MECHANISM OF ACTION**

Inhibits Bcr-Abl tyrosine kinase, an enzyme created by the Philadelphia chromosome abnormality found in patients with chronic myeloid leukemia (CML). *Therapeutic Effect:* Suppresses tumor growth during the three stages of CML: blast crisis, accelerated phase, and chronic phase.

### PHARMACOKINETICS

Well absorbed after PO administration. Binds to plasma proteins, particularly albumin. Metabolized in the liver. Eliminated mainly in the feces as metabolites. *Half-life*: 18 h.

## AVAILABILITY

Tablets: 100 mg, 400 mg.

## INDICATIONS AND DOSAGES

 Philadelphia chromosome positive (Ph+) CML

PO

Adults, Elderly. 400 mg/day for patients in chronic-phase CML; 600 mg/day for patients in accelerated phase or blast crisis. May increase dosage from 400 to 600 mg/day for patients in chronic phase or from 600 to 800 mg (given as 400 mg twice a day) for patients in accelerated phase or blast crisis in the absence of a severe drug reaction or severe neutropenia or thrombocytopenia in the following circumstances: progression of the disease, failure to achieve a satisfactory hematologic response after 3 mo or more of treatment, or loss of a previously achieved hematologic response. *Children 2 yr and older*. Newly diagnosed CML: 340 mg/m<sup>2</sup>/day (maximum: 600 mg). Chronic phase: 260 mg/m<sup>2</sup>/day as a single daily dose or in 2 divided doses. **PP+ acute lymphocytic leukemia** 

(ALL)

PO Adults. 600 mg once daily.

Kit (CD117) positive unresectable or metastatic gastrointestinal stromal tumors (GIST) PO

*Adults.* 400-600 mg once daily. Up to 400 mg twice daily may be considered in patients with disease progression at a lower dose.

## Kit-positive GIST after complete gross resection

Adults. 400 mg once daily.

Myelodysplastic syndrome (MDS)/ myeloproliferative disease (MPD) with PDGFR (platelet-derived growth factor receptor) gene rearrangement PO

Adults. 400 mg once daily.

 Hypereosinophilic syndrome (HES) or chronic eosinophilic leukemia (CEL) positive for FIPL1L1-PDGFR α fusion kinase OR for HES or CEL that are negative or unknown PO

Adults. 400 mg PO once daily (if negative for marker). If positive for FIP1L1-PDGFR  $\alpha$  fusion kinase, initially 100 mg/day and increase up to 400 mg if inadequate response.

 Aggressive systemic mastocytosis (ASM) without D816V c-Kit mutation or status unknown

Adults. 400 mg once daily.

Imatinib (Generic Name)

## Unresectable, recurrent, and/or metastatic dermatofibrosarcoma protuberans (DFSP)

PO

Adults. 400 mg twice daily.

#### Dosage modifications (all indications) if taking strong CYP3A inducer

Increase imatinib dose by at least 50% and monitor clinical response closely.

#### Dosage adjustments

Dosage adjustments are recommended for hepatic dysfunction and hematologic toxicity. See manufacturer's information.

## CONTRAINDICATIONS

Known hypersensitivity to imatinib.

## INTERACTIONS

#### Drug

Carbamazepine, dexamethasone, phenobarbital, phenytoin,

rifampin: Decrease imatinib concentration. Increase imatinib dose as directed.

**Clarithromycin, erythromycin, itraconazole, ketoconazole:** Increase imatinib plasma concentration.

**Cyclosporine, pimozide:** May alter the therapeutic effects of these drugs.

**Digoxin:** Imatinib may decrease the absorption of digoxin.

Dihydropyridine calcium channel blockers, simvastatin, triazolo-

**benzodiazepines:** May increase the blood concentration of these drugs. **HMG-CoA reductase** 

inhibitors: Imatinib may inhibit the metabolism of HMG-CoA

reductase inhibitors. Lansoprazole: May increase dermatological side effects of imatinib.

Live-virus vaccines: May potentiate viral replication, and decrease the patient's antibody response to the vaccine. **Warfarin:** Reduces the effect of warfarin. Use heparin or low-molecular-weight heparin instead during treatment.

### Herbal

St. John's wort: Decreases imatinib concentration. Avoid.

**Grapefruit juice:** Increases imatinib concentration. Avoid.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels. May decrease platelet count, WBC count, and serum potassium level.

## SIDE EFFECTS

## Frequent (24%-68%)

Nausea, diarrhea, vomiting, headache, fluid retention (periorbital, lower extremities), rash, musculoskeletal pain, muscle cramps, arthralgia.

#### Occasional (10%-23%)

Abdominal pain, cough, myalgia, fatigue, fever, anorexia, dyspepsia, constipation, night sweats, pruritus. **Rare** (< 10%)

Nasopharyngitis, petechiae, asthenia, epistaxis, infection.

## SERIOUS REACTIONS

 Severe fluid retention (manifested as pleural effusion, pericardial effusion, pulmonary edema, and ascites) and hepatotoxicity occur rarely.

 Neutropenia and thrombocytopenia are expected responses to the drug; bleeding may occur.

• Respiratory toxicity, manifested as dyspnea and pneumonia, may occur.

• Stevens-Johnson syndrome and other bullous skin reactions.

 In HES and cardiac involvement, cases of cardiogenic shock/left ventricular dysfunction have been reported.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic and renal impairment and in patients with congestive heart failure or pulmonary disease. Because imatinib may cause severe teratogenic effects, women should avoid becoming pregnant and avoid breastfeeding while taking this drug. The safety and efficacy of imatinib have not been established in children. Elderly patients are at increased risk for fluid retention. Vaccinations without the physician's approval, crowds, and contact with people with known infections should be avoided.

Notify the physician of rapid weight gain, fluid retention, nausea, and vomiting. Antiemetics should be ordered to control nausea and vomiting. Pattern of daily bowel activity and stool consistency should be monitored. CBC for evidence of neutropenia and thrombocytopenia and liver function test results for evidence of hepatotoxicity should be assessed. Neutropenia and thrombocytopenia usually last 2-4 wks.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Give oral imatinib with a meal and a large glass of water. Do not crush or chew. For patients unable to swallow the tablets, the tablets may be dispersed in a glass of water or apple juice. Use approximately 50 mL of liquid for the 100-mg tablet and 200 mL for a 400-mg tablet. Place tablets in the appropriate volume and stir. The suspension should be administered immediately after complete disintegration.

## Imipenem-Cilastatin

i-me-pen'em sye'la-stat'in ★ ♥ Primaxin, Primaxin IM

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antibiotics, carbapenems

### **MECHANISM OF ACTION**

A fixed-combination carbapenem. Imipenem penetrates the bacterial cell membrane and binds to penicillin-binding proteins, inhibiting cell wall synthesis. Cilastatin competitively inhibits the enzyme dehydropeptidase, preventing renal metabolism of imipenem. *Therapeutic Effect:* Produces bacterial cell death.

#### PHARMACOKINETICS

Readily absorbed after IM administration. Protein binding: 13%-21%. Widely distributed. Metabolized in the kidneys. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 1 h (increased in impaired renal function).

#### AVAILABILITY

*IV Injection:* 250 mg, 500 mg. *IM Injection:* 500 mg, powder for suspension.

## INDICATIONS AND DOSAGES

NOTE: For all indications, doses are based on the imipenem component and are determined considering weight and renal function. The adult doses given represent average dose ranges. > Serious respiratory tract, skin and skin-structure, gynecologic, bone, joint, intra-abdominal, nosocomial, and polymicrobic infections; UTIs; endocarditis; septicemia IV
## Imiglucerase

im-i-gloo'ser-ase Cerezyme Do not confuse Cerezyme with Cerebyx or Ceredase.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Enzymes, metabolic, recombinant DNA origin

## **MECHANISM OF ACTION**

An enzyme analog of the enzyme  $\beta$ -glucocerebrosidase, which catalyzes hydrolysis of the glycolipid glucocerebroside to glucose and ceramide. *Therapeutic Effect:* Minimizes conditions associated with Gaucher's disease, such as anemia and bone disease.

## AVAILABILITY

*Powder for Injection:* 212 units (equivalent to a reconstituted withdrawal dose of 200 units), 424 units (equivalent to a reconstituted withdrawal dose of 400 units).

## INDICATIONS AND DOSAGES

## Gaucher's disease

IV

*Adults, Elderly, Children.* Initially, 2.5 units/kg infused over 1-2 h 3 times a week up to 60 units/kg/wk. Maintenance: Progressive reduction in dosage while monitoring patient response.

## CONTRAINDICATIONS

None known. If serious hypersensitivity occurs, reevaluate continued treatment.

## INTERACTIONS

None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## IV INCOMPATIBILITIES

Do not mix imiglucerase with any solution other than 0.9% NaCl.

## SIDE EFFECTS

Frequent (3%)

Headache. IgG antibody formation in up to 15%.

## Occasional (< 3% to 1%)

Nausea, abdominal discomfort, dizziness, pruritus, rash, small decrease in BP, urinary frequency.

## SERIOUS REACTIONS

• Serious hypersensitivity, such as anaphylaxis, is rare.

## PRECAUTIONS & CONSIDERATIONS

CBC, platelet count, and liver function test results should be monitored. Notify the physician of headache.

## Storage

Refrigerate vials. The reconstituted solution is stable for 24 h if refrigerated or 12 h at room temperature.

#### Administration

For IV use, reconstitute the 200-unit vial with 5.1 mL sterile water (or the 400-unit vial with 10.2 mL) to provide a concentration of 40 units/ mL. Further dilute with 100-200 mL 0.9% NaCl. Infuse the solution over 1-2 h.

Adults, Elderly. 2-4 g/day in divided doses q6h.

 Mild to moderate respiratory tract, skin and skin-structure, gynecologic, bone, joint, intra-abdominal, and polymicrobic infections; UTIs; endocarditis; septicemia IV

Adults, Elderly. 1-2 g/day in divided doses q6-8h. Children 4 mo to 12 yr. 60-100 mg/kg/day in divided doses q6h. Maximum: 4 g/day. Children 1-3 mo. 100 mg/kg/day in divided doses q6h. Children younger than 1 mo. 20-25 mg/kg/dose q8-24h.

IM (ONLY FOR SKIN, LOWER RESPIRATORY SYSTEM, OR ABDOMINAL INFECTIONS) *Adults, Elderly.* 500-750 mg q12h.

Dosage in renal impairment

Dosage and frequency must be based on creatinine clearance, patient weight, and the severity of the infection. The manufacturer provides detailed and specific tables for dosage adjustments. See prescribing information. Do not give to children with impaired renal function.

## CONTRAINDICATIONS

All dosage forms: Hypersensitivity to primaxin or serious previous hypersensitivity with other  $\beta$ -lactams, such as penicillins or cephalosporins. For IM dosage form (since diluted with lidocaine): Hypersensitivity to amide anesthetics or severe shock or heart block.

## INTERACTIONS

## Drug

**Cyclosporine:** May increase neurotoxicity of imipenem; may cause increased levels of cyclosporine.

Ganciclovir: May increase risk of seizures.

Valproic acid: May decrease levels of valproic acid. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May decrease blood hematocrit and hemoglobin levels.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), azithromycin (Zithromax), ceftriazone (Rocephin), diazepam, drotrecogin alfa (Xigris), etoposide (VesPesid), fluconazole (Diflucan), gemcitabine (Gemzar), haloperidol, inamrinone, lansoprazole (Prevacid), lorazepam (Ativan), mannitol, meperidine (Demerol), methyldopate, midazolam (Versed), phenytoin, quinupristindalfopristin (Synercid), sagramostim (Leukine), sodium bicarbonate.

## **IV COMPATIBILITIES**

Acyclovir (Valtrex), amifostine (Ethyol), aztreonam (Azactam), cefepime (Maxipime), cisatracurium (Nimbex), diltiazem (Cardizem), docetaxel (Taxotere), famotidine (Pepcid), fludarabine (Fludara), foscarnet (Foscavir), granisetron (Kytril), idarubicin (Idamycin), insulin, linezolid (Zyvox), melphalan (Alkeran), methotrexate, ondansetron (Zofran), propofol (Diprivan), remifentanil (Ultiva), tacrolimus (Prograf), teniposide (Vumon), thiotepa (Thioplex), vinorelbine (Navelbine), zidovudine (Retrovir).

## SIDE EFFECTS

## Occasional (2%-3%)

Diarrhea, nausea, vomiting, pruritus, urticaria.

#### Rare (1%-2%)

Rash.

#### SERIOUS REACTIONS

Antibiotic-associated colitis and other superinfections may occur.
Anaphylactic reactions have been reported, serious skin reactions.
Seizures, especially with high doses in presence of renal insufficiency.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with a history of seizures, renal impairment, and sensitivity to penicillins. Superinfection may occur with prolonged use. Be aware that imipenem crosses the placenta and is distributed in amniotic fluid, breast milk, and cord blood. This drug may be used safely in children younger than 12 yr, but the IM form should not be used. Do not give to children with renal impairment. In elderly patients, age-related renal function impairment may require dosage adjustment. Notify the physician if severe diarrhea occurs, but avoid taking antidiarrheals.

Notify the physician of the onset of troublesome or serious adverse reactions, including infusion site pain, redness, or swelling, nausea or vomiting, or skin rash or itching. History of allergies, particularly to  $\beta$ -lactams, cephalosporins, and penicillins, should be determined before beginning drug therapy. **Storage** 

IM suspension will be light tan once reconstituted. IV solution normally appears colorless to yellow; discard if solution turns brown. IV infusion (piggyback) is stable for 4 h at room temperature, 24 h if refrigerated. Discard if precipitate forms.

#### Administration

For IM use, prepare primaxin IM with 1% lidocaine without epinephrine, as prescribed; 500-mg vial with 2 mL, 750-mg vial with 3 mL lidocaine HCl. Administer suspension within 1 h of preparation. Do not mix the suspension with any other medications. Give deep IM injections slowly into a large muscle to minimize patient discomfort. To further minimize discomfort, administer IM injections into the gluteus maximus instead of the lateral aspect of the thigh. Be sure to aspirate with the syringe before injecting the drug to decrease risk of injection into a blood vessel.

For IV use, dilute each 250- or 500-mg vial with 100 mL D5W or 0.9% NaCl. Give by intermittent IV infusion (piggyback). Do not give IV push. Infuse over 20-30 min (1-g dose longer than 40-60 min). Observe the patient during the first 30 min of the infusion for possible hypersensitivity reaction. Infusions can be slowed if patient complains of nausea. Doses > 500 mg in children should be given over 40-60 min.

## Imipramine

ih-mih'prah-meen
★ Tofranil, Tofranil-PM
◆ Apo-Imipramine, Impril **Do not confuse imipramine with desipramine.**

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: D

Classification: Antidepressants, tricyclic

Imipramine (Generic Name)

## **MECHANISM OF ACTION**

A tricyclic antidepressant agent that blocks the reuptake of neurotransmitters, such as norepinephrine and serotonin, at presynaptic membranes, increasing their concentration at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression and controls nocturnal enuresis.

## AVAILABILITY

*Tablets:* 10 mg, 25 mg, 50 mg. *Capsules:* 75 mg, 100 mg, 125 mg, 150 mg.

## INDICATIONS AND DOSAGES Depression

PO

Adults. Initially, 75-100 mg/day. May gradually increase to 300 mg/day for hospitalized patients, or 200 mg/day for outpatients; then reduce dosage to effective maintenance level, 50-150 mg/day.

*Elderly, Adolescents.* Initially, 30-40 mg/day at bedtime. May increase by 10-25 mg every 3-7 days. Range: 50-100 mg/day.

*Children older than 6 yr.* 1.5 mg/kg/ day. May increase by 1 mg/kg every 3-4 days. Maximum: 2.5 mg/kg/day.

## Enuresis

PO

*Children older than 6 yr.* Initially, 10-25 mg at bedtime. May increase by 25 mg/day. Maximum: 50 mg if under 12 yr, 75 mg if over 12 yr; do not exceed 2.5 mg/kg/day.

## **OFF-LABEL USES**

Treatment of attention deficit hyperactivity disorder, cataplexy associated with narcolepsy, neurogenic pain, panic disorder.

## CONTRAINDICATIONS

Acute recovery period after myocardial infarction, use within 14 days of

MAOIs, pregnancy, hypersensitivity. Do not use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

## INTERACTIONS

#### Drug

Alcohol, other central nervous system (CNS) depressants: May increase the hypotensive effects and CNS and respiratory depression caused by imipramine.

Anticholinergic agents: May have additive adverse effects.

**β-Agonists:** May increase risk of arrhythmias.

**Bile acid sequestrants:** May bind to and decrease levels of tricyclic antidepressants.

**Carbamazepine:** May increase carbamazepine levels.

**CYPZD6 inhibitors (e.g., SSRIs, quinidine, and cimetidine):** May increase imipramine blood

concentration and risk of toxicity.

**Clonidine, guanadrel:** May decrease the effects of these drugs.

Linezolid: Serotonin syndrome may occur. Avoid this combination. MAOIs: May increase the risk of neuroleptic malignant syndrome, hyperpyrexia, hypertensive crisis, and seizures. Contraindicated.

**Methylphenidate:** May inhibit imipramine metabolism.

**Phenothiazines:** May increase the anticholinergic and sedative effects of imipramine.

**Phenytoin:** May decrease the imipramine blood concentration. **Sympathomimetics:** May increase the risk of cardiac effects.

Valproic acid: May increase adverse effects.

## Herbal

**Ginkgo biloba:** May decrease seizure threshold.

Kava kava, SAM-e, valerian: May increase risk of serotonin syndrome and excessive sedation.

**St. John's wort:** May increase imipramine's pharmacologic effects and risk of toxicity.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May alter blood glucose levels and ECG readings. Therapeutic serum drug level is 225-300 ng/mL; toxic serum drug level is > 500 ng/mL.

## SIDE EFFECTS

#### Frequent

Somnolence, fatigue, dry mouth, blurred vision, constipation, delayed micturition, orthostatic hypotension, diaphoresis, impaired concentration, increased appetite, urine retention, photosensitivity.

#### Occasional

GI disturbances (nausea, metallic taste). Rare

Paradoxical reactions (agitation, restlessness, nightmares, insomnia), extrapyramidal symptoms (particularly fine hand tremor).

#### SERIOUS REACTIONS

 Overdose may produce seizures; cardiovascular effects, such as severe orthostatic hypotension, dizziness, tachycardia, palpitations, and arrhythmias; and altered temperature regulation, including hyperpyrexia or hypothermia.

 Abrupt discontinuation after prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiac disease, diabetes mellitus, glaucoma, hiatal hernia, history of seizures, history of urinary obstruction or retention, hyperthyroidism, increased intraocular pressure, benign prostatic hyperplasia, renal or hepatic disease, and schizophrenia. Imipramine is minimally distributed in breast milk. Imipramine use is not recommended for children younger than 6 yr. Antidepressants have been associated with an increased risk of suicidality in adolescents and young adults. Patients should be monitored closely for behavioral changes, such as emotional lability, suicidal thoughts, or other unusual behaviors during treatment. Expect to administer a lower dosage to elderly patients because they are at increased risk for drug toxicity.

Anticholinergic, sedative, and hypotensive effects may occur during early therapy, but tolerance to these effects usually develops. Because dizziness may occur, change positions slowly and avoid alcohol and tasks that require mental alertness or motor skills. Assess pattern of daily bowel activity, bladder for urine retention, BP and pulse rate to detect hypotension and arrhythmias, CBC and blood serum chemistry tests to monitor blood glucose level, and liver and renal function tests.

#### Storage

Store at room temperature. Administration

! Make sure at least 14 days elapse between the use of MAOIs and imipramine.

Take imipramine with food or milk if GI distress occurs. Do not crush or break film-coated tablets. To reduce daytime sedation and improve sleep, can administer entire daily dose at bedtime in most patients. Improvement may occur 2-5 days after starting therapy but the full therapeutic effect will likely occur within 2-3 wks. Do not abruptly discontinue imipramine. Imiquimod im-ick'wih-mod

🖈 🐏 Aldara, Zyclara

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Dermatologics, immunomodulators

## **MECHANISM OF ACTION**

An immune response modifier whose mechanism of action is unknown. Induces cytokines such as interferon- $\alpha$ ; tumor necrosis factor- $\alpha$ ; and interleukins 1, 6, and 8, which may result in antiviral actions. Dermatologic antitumor effects may be via upregulation of local  $\alpha$  interferon levels and that recruitment of natural killer cells may produce therapeutic response. *Therapeutic Effect:* Reduces genital and perianal warts.

## PHARMACOKINETICS

Minimal absorption after topical administration. Minimal excretion in urine and feces.

## AVAILABILITY

Cream (Aldara): 5%. Cream (Zydara): 2.5%, 3.75%.

## INDICATIONS AND DOSAGES

## Condyloma acuminata/genital and perianal warts

TOPICAL

Adults, Elderly, Children 12 yr and older. Apply 5% cream 3 times/wk before normal sleeping hours; leave on skin 6-10 h. Remove following treatment period. Continue therapy for maximum of 16 wks.

Adults, Elderly, Children 12 yr and older. Apply 3.75% cream once daily before bedtime; leave on 8 h. Remove following treatment period. Continue therapy for maximum of 8 wks.

#### Actinic keratosis

#### TOPICAL

*Adults.* Apply 5% cream to defined treatment area of face or scalp 2 times/wk (e.g., Monday and Thursday) for 16 wks at bedtime. Leave on skin approximately 8 h before washing.

Adults. Apply 2.5% or 3.75% cream once daily at bedtime to the affected area for two 2-week cycles separated by a 2-week no-treatment period. Up to 2 packets may be applied each time. Leave on skin for approximately 8 h before washing.

## Superficial basal cell carcinoma TOPICAL

*Adults*. Apply 5% cream 5 times/wk before bedtime for a full 6 wks. Leave on skin 8 h, then wash.

## CONTRAINDICATIONS

History of hypersensitivity to imiquimod.

## INTERACTIONS

None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent

Local skin reactions: erythema, itching, burning, erosion, excoriation/ flaking, fungal infections (women).

#### Occasional

Pain, induration, ulceration, scabbing, soreness, headache, flu-like symptoms, photosensitivity.

## SERIOUS REACTIONS

• If local reactions are intense, continue rest periods from treatment.

• In females, severe vulvar swelling can lead to urinary retention.

Interrupt or discontinue if this occurs.

• Skin color change (hyperpigmentation or

hypopigmentation) may occur. Some changes may be permanent.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used with inflammatory conditions of the skin. Safety and efficacy have not been established for basal cell nevus syndrome or xeroderma pigmentosum. It is unknown whether imiquimod crosses the placenta or is distributed in breast milk. Safety and efficacy of imiquimod have not been established in children younger than 12 yr. No age-related precautions have been noted in elderly patients.

If severe local skin reaction occurs, the cream should be removed by washing the treatment area and may be resumed after the reaction has subsided. Avoid exposure to sunlight and sunlamps and follow UV protection guidelines.

#### Storage

Store at room temperature.

#### Administration

Wash application site with soap and water 6-10 h after applying. Follow specific product directions. Apply a thin layer to affected area. Avoid contact with eyes, lips, and nostrils. Wash hands after application. Discard any partially used packets.

#### Immune Globulin IV (IGIV)

im-myoon'glob'yoo-lin ▲ Baygam, Carimune NF, Flebogamma, Flebogamma DIF, Gamimune N, Gammagard S/D, Gammar-P-IV, Gamunex, Iveegam EN, Octagam, Polygam S/D, Privigen ▲ IGIVnex, Gammagard S/D,

Gamunex, Privigen

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Immune globulins

#### MECHANISM OF ACTION

An immune serum that increases antibody titer and antigen-antibody reaction. *Therapeutic Effect:* Provides passive immunity against infection; induces rapid increase in platelet count; produces antiinflammatory effect.

#### PHARMACOKINETICS

Evenly distributed between intravascular and extravascular space. *Half-life:* 21-23 days.

#### AVAILABILITY

Injection Solution (Flebogamma DIF, Gamimune N, Gamunex, Privigen): 10%. Injection Solution (Flebogamma): 5%. Injection Solution (Octagam): 5%. Injection Powder for Reconstitution (Carimune):1 g, 3 g, 6 g, 12 g. Injection Powder for Reconstitution (Gammagard S/D, Polygam S/D): 2.5 g, 5 g, 10 g. Injection Powder for Reconstitution (Gammar-P-IV): 5 g, 10 g. Injection Powder for Reconstitution (Iveegam EN): 0.5 g, 1 g, 2.5 g, 5 g.

## INDICATIONS AND DOSAGES

 Primary immunodeficiency syndrome IV

Adults, Elderly, Children. 200-800 mg/kg once monthly.

 Idiopathic thrombocytopenic purpura (ITP)

IV

Adults, Elderly, Children. 400-1000 mg/kg/day for 2-5 days.

Kawasaki disease IV

*Adults, Elderly, Children.* 2 g/kg as a single dose; 400 mg/kg/day for 4 days has also been used.

 Chronic lymphocytic leukemia IV

Adults, Elderly, Children. 400 mg/kg q3-4wk.

#### Bone marrow transplant IV

Adults, Elderly, Children. 400-500 mg/kg/dose every week for 12 wks, then every month.

## **OFF-LABEL USES**

Control and prevention of infections in infants and children with immunosuppression from AIDS or AIDS-related complex; prevention of acute infections in immunosuppressed patients; prevention and treatment of infections in high-risk, preterm, low-birth-weight neonates; treatment of chronic inflammatory demyelinating polyneuropathies and multiple sclerosis, HIV-associated thrombocytopenia, and refractory pemphigus vulgaris. Used also for rare immune-related seizure disorders.

## CONTRAINDICATIONS

Allergies to γ-globulin, thimerosal, or anti-IgA antibodies; isolated IgA deficiency; hyperprolinemia.

## INTERACTIONS

#### Drug

#### Live-virus vaccines: IVIG

contains antibodies that may interfere with proper response to the vaccine.

## Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Administer IGIV by infusion only through separate tubing (dedicated line). Avoid mixing IGIV with other medications or IV infusion fluids.

## SIDE EFFECTS

#### Frequent

Tachycardia, backache, headache, arthralgia, myalgia.

## Occasional

Fatigue, wheezing, injection site rash or pain, leg cramps, urticaria, bluish lips and nailbeds, light-headedness.

## SERIOUS REACTIONS

 Anaphylactic reactions are rare, but the incidence increases with repeated injections of IGIV. Keep epinephrine readily available.

 Renal dysfunction/failure (especially with sucrose-containing products) as a result of osmotic nephrosis.

• Overdose may produce chest tightness, chills, diaphoresis, dizziness, facial flushing, nausea, vomiting, fever, and hypotension.

• Severe reactions can include chest pain, tachycardia, hypotension, vasovagal syncope and rarely thromboembolism.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cardiovascular disease, diabetes mellitus, a history of thrombosis, impaired renal function, sepsis, or volume depletion and concurrent use of nephrotoxic drugs. It is unknown whether IGIV crosses the placenta or is distributed in breast milk. No agerelated precautions have been noted in children or elderly patients.

Adequate hydration should be maintained before giving IGIV. Notify the physician if dyspnea, decreased urine output, fluid retention, edema, or sudden weight gain occurs. Vital signs and platelet count should be monitored. **Storage** 

Refer to individual IV preparations for storage requirements and information about stability after reconstitution.

#### Administration

Reconstitute IGIV only as directed by the manufacturer. Discard partially used or turbid preparations. Administer IGIV by infusion only through separate tubing. Avoid mixing IGIV with other medications or IV infusion fluids. The infusion rate varies among products. In general, the initial IV rate should begin slowly. Each rate increase thereafter should be at 15-30 min intervals. Because of the risk of acute renal failure. the FDA recommends a maximum infusion rate of 3 mg sucrose/kg/ min (2 mg immune globulin/kg/ min). Filtering is not necessary. Control the infusion rate carefully. A too-rapid infusion increases the risk of a precipitous drop in BP and an anaphylactic reaction, marked by chest tightness, chills, diaphoresis, facial flushing, fever, nausea, and vomiting. Monitor BP and vital signs diligently during and immediately after IV administration. Stop the infusion immediately if a suspected anaphylactic reaction occurs or with signs of infusion reaction (fever, chills, nausea, vomiting, shock). Keep epinephrine readily available. A rapid response occurs to therapy lasting 1-3 mo.

Inamrinone Lactate

Do not confuse with Amiodarone.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Inotropes, vasodilators

#### **MECHANISM OF ACTION**

A positive inotropic agent that inhibits myocardial cyclic adenosine monophosphate (cAMP) phosphodiesterase activity and directly stimulates cardiac contractility. Peripheral vasodilation reduces both preload and afterload. *Therapeutic Effect:* Reduces preload and afterload; increases cardiac output.

## PHARMACOKINETICS

After IV administration, rapidly absorbed from the GI tract. Protein binding: 10%-49%. Partially metabolized in liver. Excreted in urine as both inamrinone and its metabolites. *Half-life*: 3-6 h (half-life increased with congestive heart failure).

#### AVAILABILITY

Injection: 5 mg/mL.

#### INDICATIONS AND DOSAGES > Short-term management of intractable heart failure

IV INFUSION (CONTINUOUS) Adults. Initially, 0.75 mg/kg loading dose over 2-3 min followed by a maintenance infusion of 5-10 mcg/kg/min. A repeat bolus dose of 0.75 mg/kg may be given 30 min after the initiation of therapy. Maximum: 10 mg/kg/day.

#### Dosage for severe renal impairment

CrCl < 10 mL/min: Reduce dosage to 50%-75% of the usual dosage.

#### CONTRAINDICATIONS

Severe aortic or pulmonic valvular disease; hypersensitivity to inamrinone or bisulfites.

#### INTERACTIONS

#### Drug

Anagrelide: Additive cAMP effects. Digitalis: May increase the inotropic effects.

**Diuretics:** May cause hypovolemia and decrease filling pressure.

**Dysopyramide:** May cause hypotension.

#### **Herbal and Food**

None known.

## DIAGNOSTIC TEST EFFECTS

Elevated AST or ALT, decreased platelets.

## IV INCOMPATIBILITIES

Furosemide (Lasix), sodium bicarbonate, amphotericin B, ampicillin, aztreonam, calcium gluconate, all cephalosporins, clindamycin, esmolol, imipenemcilastatin, insulin, levofloxacin, many penicillins, vancomycin.

## 🗏 IV COMPATIBILITIES

Atropine, calcium chloride, cisatracurium (Nimbex), digoxin (Lanoxin), labetalol, lidocaine (Xylocaine), metaraminol (Aramine), nitroprusside (Nitropress), propafenone (Rhythmol), propofol (Diprivan), propranolol (Inderal), remifentanil (Ultiva), verapamil (Calan).

#### SIDE EFFECTS

#### Occasional

Arrhythmia, nausea, hypotension, thrombocytopenia.

#### Rare

Fever, vomiting, abdominal pain, anorexia, chest pain, decreased tear production, hepatotoxicity, burning at the site of injection, hypersensitivity to inamrinone.

#### SERIOUS REACTIONS

• Overdose may cause severe hypotension.

• Improved diuresis may cause fluid or electrolyte imbalance.

• If thrombocytopenia is persistent, may require discontinuation of drug.

#### PRECAUTIONS & CONSIDERATIONS

BP and pulse should be obtained immediately before each inamrinone dose, in addition to regular BP monitoring. Be alert for BP fluctuations. Elderly patients are more sensitive to the drug's hypotensive effects, and age-related renal impairment may require dosage adjustment. Caution should be used in children and elderly patients. Cardiac index, stroke volume, systemic vascular resistance, and pulmonary vascular resistance, BP, heart rate, platelet count, fluid status, and liver and renal function should be monitored.

#### Storage

Store unopened vial at room temperature. Do not freeze. Protect from light.

## Administration

Give IV bolus dose undiluted over 2-3 min. Reconstituted solutions should be used within 24 h. Dosage is based on clinical response. Do not dilute with solutions containing dextrose. Do not administer furosemide in intravenous lines containing inamrinone. Inamrinone is for short-term therapy; use infusions within 24 h of preparation. To make recommended 2.5 mg/mL concentration for infusion, mix inamrinone solution with an equal volume of 0.9% or 0.45% NaCl.

## Incobotulinumtoxin A

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Miscellaneous skeletal muscle relaxants

## MECHANISM OF ACTION

A neurotoxin that blocks neuromuscular conduction

## 820 Incobotulinumtoxin A

by binding to receptor sites on motor nerve endings and inhibiting the release of acetylcholine, resulting in muscle denervation. *Therapeutic Effect:* Reduces muscle activity.

## AVAILABILITY

Injection: 50 units or 100 units per vial.

## INDICATIONS AND DOSAGES

 Cervical dystonia in patients who have previously tolerated botulinum toxin type A:

#### IM

I

Adults, Elderly. 120 units total dose per treatment session, divided among the affected muscles, based on patient's head and neck position, localization of pain, muscle hypertrophy, patient response, and adverse reaction history.

#### ▶ Blepharospasm: IM

*Adults*. Initially, 1.25-2.5 international units (IU) per injection site. In clinical trials, the mean dose per injection site was 5.6 IU, the mean number of injections per eye was 6, and the mean dose per eye was 33.5 IU.

## Improvement of brow furrow/ glabellar lines:

IM

Adults 65 yr and younger: 20 IU total dose, divided into 4-unit increments and injected over 5 sites. Re-treat no more frequently than every 3 mos.

## CONTRAINDICATIONS

Infection at proposed injection sites; hypersensitivity to albumin, botulinum toxin, or any component of the formulation.

## INTERACTIONS

#### Drug

Aminoglycoside antibiotics, other drugs that interfere with

#### **neuromuscular transmission (such as curare-like compounds):** May potentiate the effects of botulinum toxin type A.

Herbal None known. Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

None known. Side Effects Frequent (≥ 7%)

Localized pain, tenderness, or bruising at injection site; localized weakness in injected muscle; upper respiratory tract infection; neck pain; musculoskeletal pain; dry eyes; headache.

## Occasional (2%-6%)

Increased cough, flu-like symptoms, rhinitis, dizziness, hypertonia, asthenia, dry mouth, nausea, somnolence, blurred vision.

## Rare (< 2%)

Stiffness, numbness, diplopia, ptosis, dyspnea.

#### Serious Reactions

• Mild to moderate dysphagia occurs in approximately 15% of patients.

• Severe dysphagia (manifested as aspiration, pneumonia, and dyspnea) occurs rarely but may be life-threatening. Immediate medical attention may be required in cases of respiratory, speech, or swallowing difficulties.

· Arrhythmias.

• Overdose produces systemic weakness and muscle paralysis, respiratory failure, death.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with neuromuscular junctional disorders, such as amyotrophic lateral sclerosis, Lambert-Eaton syndrome, motor neuropathy, and myasthenia gravis, because they may experience significant systemic effects, including respiratory compromise, and severe dysphagia. Be aware of signs of dysphagia and aspiration pneumonia, including fever, sputum production, and adventitious breath sounds after treatment. Safety and effectiveness are not established in children. Clinical improvement should begin within 2 wks of the injection, but the drug's maximum benefit will appear approximately 6 wks after the injection. Resume normal activity slowly and carefully. Seek medical attention immediately if respiratory, speech, or swallowing difficulties occur.

#### Storage

Store unopened drug vials in the refrigerator. Do not freeze. The reconstituted solution may be refrigerated for up to 24 h. Administer the drug within 24 h after reconstitution. The solution normally appears as clear and colorless; discard the solution if particulate matter is present.

#### Administration

! The potency units of Xeomin are not interchangeable with other preparations of botulinum toxin products

! Plan to have a physician inject the drug into the affected muscle. Expect to administer the drug at the lowest effective dosage and at the longest effective dosing interval to avoid formation of neutralizing antibodies.

Dilute drug with preservative-free 0.9% NaCl. See manufacturer's diluent table for amount of diluent to be used for each strength vial to provide the concentration desired by the physician for administration, dependent on indication for use. Slowly and gently inject the diluent into the vial to avoid producing bubbles. Then rotate the vial gently to mix the drug. If a vacuum does not pull the diluent into the vial, discard it. For IM use, assist the physician, as necessary, while he or she injects the drug into the affected muscles using a 25-, 27-, or 30-gauge needle for superficial muscles and a 22-gauge needle for deeper muscles. Do not inject through pen marks to avoid permanent tattoo-like effect.

## Indacaterol

in-da-kat′er-ol ★ 🙅 Arcapta Neohaler

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Respiratory agents, adrenergic agonists, bronchodilators, long acting  $\beta_2$ -agonist (LABA)

## MECHANISM OF ACTION

A long-acting bronchodilator that stimulates  $\beta_2$ -adrenergic receptors in the lungs, resulting in relaxation of bronchial smooth muscle. Also inhibits release of mediators from various cells in the lungs, including mast cells, with little effect on heart rate. *Therapeutic Effect:* Reduces airway resistance. Improves bronchodilation and peak flow rates.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	5 min	0.25 h	up to 24 h

Some drug absorbed from bronchi after inhalation. Less than 2% of the dose appears excreted in urine. *Halflife*: 40-56 h.

## AVAILABILITY

Inhalation Powder in Capsules: 75 mcg.

## INDICATIONS AND DOSAGES • Chronic obstructive pulmonary disease (COPD):

INHALATION

Adults, Elderly. 75 mcg once daily. GOLD guidelines recommend as high as 300 mg/day, but this is not included in current manufacturer labels, and GOLD guidelines may take into account dosage forms not yet available in the United States.

## CONTRAINDICATIONS

Status asthmaticus. Indacaterol is *not* indicated for the treatment of asthma. All LABA are contraindicated in patients with asthma without use of a long-term asthma-control medication.

## INTERACTIONS

#### Drug

**β-Blockers:** May antagonize indacaterol's bronchodilating effects. **Diuretics, steroids, xanthine derivatives:** May increase the risk of hypokalemia.

Drugs that can prolong QT interval (including erythromycin, quinidine, and thioridazine), MAOIs, tricyclic antidepressants: May potentiate cardiovascular effects.

## Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level. May increase blood glucose level.

## SIDE EFFECTS

#### Common (≥ 2%)

Cough, oropharyngeal pain, nasopharyngitis, headache and nausea.

#### Occasional (< 2%)

Tremor, muscle cramps, tachycardia, insomnia, irritability, irritation of mouth or throat, increased blood glucose.

## SERIOUS REACTIONS

• Excessive sympathomimetic stimulation may produce palpitations, extrasystole, and chest pain.

• Life-threatening paradoxical bronchospasm can occur. Discontinue if it does.

## **PRECAUTIONS & CONSIDERATIONS**

Monotherapy with indacaterol may increase risk of asthma-related events, such as hospitalization or mortality, and the drug has not been proven safe or effective for asthma. Caution is warranted in patients with cardiovascular disease, hypertension, a seizure disorder, diabetes, and thyrotoxicosis. It is unknown whether indacaterol crosses the placenta or is distributed in breast milk. The safety and efficacy of indacaterol have not been established in children. Elderly patients may be more prone to tachycardia and tremor because of increased sensitivity to sympathomimetics.

Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Pulse rate and quality; ECG; respiratory rate, depth, rhythm, and type; ABG; and serum potassium levels should be monitored. Keep a log of measurements of peak flow readings.

#### Storage

Indacaterol capsules for inhalation should be kept at room temperature, protected from heat and moisture, in original packaging blisters until time of use.

#### Administration

Keep capsules in individual blister packs until immediately before use. Do not swallow the capsules. Do not use with a spacer. Pull off the aerohaler inhaler cover. Place the capsule in the chamber and close. Press both buttons on the side of the aerohaler only once. This action punctures the capsule. Exhale completely, then place mouth on the mouthpiece and close the lips. Inhale quickly and deeply through the mouth, which causes the capsule to spin and dispense the drug. Hold breath for as long as possible before exhaling slowly. Check the capsule to make sure all the powder is gone. If not, inhale again to receive the rest of the dose. Empty the chamber to discard empty capsule shell. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness. Never swallow capsules orally. Never wash the inhaler.

## Indapamide

in-dap'a-mide Lozide Do not confuse indapamide with iodamide or iopamidol.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B (D if used in pregnancy-induced hypertension)

**Classification:** Diuretics, thiazide and derivatives

## **MECHANISM OF ACTION**

A thiazide-like diuretic that blocks the reabsorption of water, sodium, and potassium at the cortical diluting segment of the distal tubule; also reduces plasma and extracellular fluid volume and peripheral vascular resistance by direct effect on blood vessels. *Therapeutic Effect:* Promotes diuresis and reduces BP.

#### AVAILABILITY

Tablets: 1.25 mg, 2.5 mg.

## INDICATIONS AND DOSAGES

#### Edema PO

Adults. Initially, 2.5 mg/day, may increase to 5 mg/day after 1 wk.

## Hypertension

## PO

*Adults, Elderly.* Initially, 1.25 mg/day, may increase to 2.5 mg/day after 4 wks or 5 mg/day after additional 4 wks.

## CONTRAINDICATIONS

Hypersensitivity to sulfonamidederived drugs; anuria; renal decompensation; pregnancy.

## INTERACTIONS

#### Drug

**β-Blockers:** May increase hyperglycemic effects in type 2 diabetic patients. **Cyclosporine:** May increase risk of gout or renal toxicity. **Digoxin:** May increase the risk of digoxin toxicity associated with indapamide-induced hypokalemia. **Lithium:** May increase the risk of lithium toxicity. **Herbal** 

Ephedra, ginseng, yohimbe: May cause hypertension. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase plasma renin activity. May decrease protein-bound iodine and serum potassium and sodium levels. May increase serum calcium or uric acid.

## SIDE EFFECTS

#### Frequent ( $\geq 5\%$ )

Fatigue, numbness of extremities, tension, irritability, agitation,

Indapamide (Generic Name)

headache, dizziness, lightheadedness, insomnia, muscle cramps.

#### Occasional (< 5%)

Tingling of extremities, urinary frequency, urticaria, rhinorrhea, flushing, weight loss, orthostatic hypotension, depression, blurred vision, nausea, vomiting, diarrhea or constipation, dry mouth, impotence, rash, pruritus.

#### SERIOUS REACTIONS

- Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, and dehydration.
- Acute hypotensive episodes may occur.

• Hyperglycemia may occur during prolonged therapy.

• Pancreatitis, blood dyscrasias, pulmonary edema, allergic pneumonitis, and dermatologic reactions occur rarely.

 Overdose can lead to lethargy and coma without changes in electrolytes or hydration.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with anuria, diabetes mellitus, a history of hypersensitivity to sulfonamides or thiazide diuretics, hepatic impairment, severe renal disease, thyroid disorders, gout, and in elderly or debilitated patients. Consuming foods high in potassium, such as apricots, bananas, legumes, meat, orange juice, raisins, whole grains, including cereals, and white and sweet potatoes, is encouraged.

Dizziness or light-headedness may occur, so change positions slowly and let legs dangle momentarily before standing. An increase in the frequency and volume of urination may occur. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Hyponatremia may result in cold and clammy skin, confusion, and thirst.

#### Storage

Store at room temperature; avoid excessive heat.

#### Administration

Take indapamide with food or milk if GI upset occurs, preferably with breakfast to help prevent nocturia. Do not crush or break tablets.

#### Indinavir

in-din'ah-veer ★ Crixivan Do not confuse indinavir with Denavir.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiretrovirals, protease inhibitors

## MECHANISM OF ACTION

A protease inhibitor that suppresses HIV protease, an enzyme necessary for splitting viral polyprotein precursors into mature and infectious viral particles. *Therapeutic Effect:* Interrupts HIV replication, slowing the progression of HIV infection.

## PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 60%. Metabolized in the liver.

Indinavir (Generic Name)

Primarily excreted in urine. Unknown if removed by hemodialysis. *Half-life:* 1.8 h (increased in impaired hepatic function).

## AVAILABILITY

Capsules: 100 mg, 200 mg, 400 mg.

## INDICATIONS AND DOSAGES

# HIV infection (in combination with other antiretrovirals)

PO

Adults. 800 mg (two 400-mg capsules) q8h; 400 mg twice daily when used with ritonavir 400 mg twice daily or 800 mg twice daily when used with ritonavir 100-200 mg twice daily.

## HIV infection in patients with hepatic insufficiency

*Adults*. 600 mg q8h (when used without ritonavir).

## **OFF-LABEL USES**

Prophylaxis following occupational exposure to HIV.

## CONTRAINDICATIONS

Hypersensitivity to indinavir; concurrent use of alprazolam, amiodarone, cisapride, triazolam, midazolam, pimozide, ergot alkaloids, atazanavir, alfuzosin, sildenafil, conivaptan, dronedarone, ranolazine, colchicine.

## INTERACTIONS

NOTE: Please see detailed manufacturer's information for management of drug interactions. In some cases, dosage adjustment or an alternate agent is recommended. Drug

Amiodarone: May increase amiodarone levels. Contraindicated. Antacids: May decrease absorption of indinavir. Anticonvulsants, venlafaxine: May decrease levels of indinavir. Antifungal agents, delavirdine, NNRTIs: May increase levels of indinavir. Atazanavir: Increases blood bilirubin. Contraindicated. Calcium channel blockers: Indinavir may increase concentrations of calcium channel blockers. Conivaptan, dronedarone: Indinavir increases concentrations of these drugs significantly.

Contraindicated. Clarithromycin: May increase

levels of clarithromycin.

Cyclosporine, other

immunosuppressants: Indinavir may increase concentrations; use with caution and monitor closely. **CYP3A4 inducers:** May decrease

effects of indinavir.

**CYP3A4 inhibitors:** May increase effects of indinavir.

**CYP3A4 substrates:** Levels of CYP3A4 substrates may be increased by indinavir. Contraindicated with cisapride and pimozide.

**Didanosine:** Separate administration by at least 1 h.

**Érgot alkaloids:** Effects of ergot alkaloids may be increased. Contraindicated.

**Fentanyl:** Effects of fentanyl may be increased.

HMG-CoA reductase inhibitors, lidocaine: Indinavir may increase effects. Use not recommended with lovastatin, simvastatin, and rosuvastatin.

Phosphodiesterase-5 inhibitors (e.g., sildenafil, vardenafil, tadalafil): Increases PDE-5 inhibitor levels and risk of hypotension. Contraindicated for use with sildenafil for pulmonary HTN. Alprazolam, midazolam,

Alprazolam, midazolam,

triazolam: Increases the risk of

arrhythmias and prolonged sedation. Contraindicated.

## Ranolazine, cisapride, pimozide:

Increases levels of these drugs and risk of QT prolongation. Contraindicated.

**Rifamycins:** Decrease indinavir concentrations. Avoid.

#### Herbal

**St. John's wort:** May decrease indinavir concentration and effect. Avoid.

## Food

**Grapefruit juice:** May decrease indinavir concentration and effect. Avoid.

**High-fat, high-calorie, and high-protein meals:** May decrease indinavir concentration.

## DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin (in 10% of patients), AST (SGOT), and ALT (SGPT) levels, blood glucose, lipids.

## SIDE EFFECTS

## Frequent

Nausea (12%), abdominal pain (9%), headache (6%), diarrhea (5%), hyperbilirubinemia (10%).

## Occasional

Vomiting, asthenia, fatigue (4%); insomnia; accumulation of fat in waist, abdomen, or back of neck, buffalo hump.

## Rare

Abnormal taste sensation, heartburn, symptomatic urinary tract disease, transient renal dysfunction, hyperglycemia.

## SERIOUS REACTIONS

• Nephrolithiasis (flank pain with or without hematuria) occurs in 4% of patients, 24% in children.

• Indinavir should be discontinued if hemolytic anemia develops.

Tubulointerstitial nephritis.

- Immune reconstitution syndrome.
- Hepatitis/liver failure or pancreatitis.

• Serious hypersensitivity reactions have included erythema multiforme or Stevens-Johnson syndrome or anaphylactoid reactions.

• Spontaneous bleeding in patients with hemophilia.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with renal or liver function impairment. Also use with caution in patients with diabetes mellitus, kidney stones, hemophilia. Be aware that it is unknown whether indinavir is excreted in breast milk. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Be aware that the safety and efficacy of this drug have not been established in children; children have increased risk of nephrolithiasis. No information on the effects of this drug's use in elderly patients is available.

Monitor for signs and symptoms of nephrolithiasis as evidenced by flank pain and hematuria, and notify the physician if symptoms occur. If nephrolithiasis occurs, expect therapy to be interrupted for 1-3 days. Establish baseline lab values and monitor renal function before and during therapy; in particular, evaluate the results of the serum creatinine and urinalysis tests. Maintain adequate hydration and drink 48 oz (1.5 L) of liquid over each 24-h period during therapy. Assess the pattern of daily bowel activity and stool consistency. Evaluate for abdominal discomfort or headache. Storage

Store drug at room temperature, keep it in the original bottle, and protect it from moisture. Keep in mind that indinavir capsules are sensitive to moisture. Leave the desiccant in the bottle.

#### Administration

For optimal drug absorption, take indinavir with water only and without food 1 h before or 2 h after a meal. May take indinavir with coffee, juice, skim milk, tea, or water and with a light meal (e.g., dry toast with jelly). Do not take indinavir with meals high in fat, calories, and protein. If indinavir and didanosine are given concurrently, give the drugs at least 1 h apart on an empty stomach.

## Indomethacin

in-doe-meth'a-sin ↓ Indocin, Indocin IV, Indocin-SR ↓ Apo-Indomethacin, Indocid, Novomethacin Do not confuse Indocin with Imodium or Vicodin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used after 34 wks' gestation, close to delivery, or for longer than 48 h)

#### Classification: Analgesics,

nonnarcotic, nonsteroidal antiinflammatory drugs (NSAIDs), antipyretics

#### **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. Also increases the sensitivity of the premature ductus to the dilating effects of prostaglandins. *Therapeutic Effect:* Reduces the inflammatory response and intensity of pain. Closure of the patent ductus arteriosus.

## PHARMACOKINETICS

PO: Onset 1-2 h, peak 3 h, duration 4-6 h; 99% plasma-protein binding; metabolized in liver, kidneys; excreted in urine, bile, feces, breast milk; crosses placenta.

#### AVAILABILITY

Capsules (Indocin): 25 mg, 50 mg. Capsules (Sustained Release [Indocin-SR]): 75 mg. Oral Suspension (Indocin): 25 mg/5 mL. Powder for Injection (Indocin IV): 1 mg. Suppository: 50 mg.

#### INDICATIONS AND DOSAGES Moderate to severe rheumatoid arthritis, osteoarthritis, ankylosing spondylitis

PO

Adults, Elderly. Initially, 25 mg 2-3 times a day; increased by 25-50 mg/wk up to 150-200 mg/day. Or 75 mg/day (extended release) up to 75 mg twice a day. Children. 1-2 mg/kg/day.

Maximum: 3 mg/kg/day (or 150-200 mg/day). Do not use extended release.

## Acute gouty arthritis PO

*Adults, Elderly.* 50 mg 3 times a day until pain decreases. For short-term use.

## Acute shoulder pain, bursitis, tendinitis

PO

*Adults, Elderly.* 75-150 mg/day in 3-4 divided doses. Usually no more than 7-14 days.

## Usual rectal dosage

*Adults, Elderly.* 50 mg 4 times a day. Maximum: 200 mg/day.

Indomethacin (Generic Name)

*Children*. Initially, 1.5-2.5 mg/kg/ day, increased up to 4 mg/kg/day. Maximum: 150-200 mg/day.

#### Patent ductus arteriosus IV

Neonates. Initially, 0.2 mg/kg. Subsequent doses are based on age, as follows, and are given at 12-24 h intervals. Neonates older than 7 days. 0.25 mg/

kg for second and third doses. *Neonates 2-7 days.* 0.2 mg/kg for second and third doses.

*Neonates* < 48 *h*. 0.1 mg/kg for second and third doses. If ductus arteriosus reopens, a second course may be given (not necessary if ductus closes or significantly reduces within 48 h of first course).

## **OFF-LABEL USES**

Treatment of fever from malignancy, pericarditis, psoriatic arthritis, rheumatic complications associated with Paget's disease of bone, vascular headache.

## CONTRAINDICATIONS

Active GI bleeding or ulcerations; history of proctitis or recent rectal bleeding, hypersensitivity to aspirin, indomethacin, or other NSAIDs; renal impairment, thrombocytopenia; perioperative pain in the setting of coronary artery bypass graft surgery (use within 14 days of surgery). For IV in neonates: active bleeding, thrombocytopenia, coagulation problems, necrotizing enterocolitis, severe renal dysfunction, if patency ductus arteriosis necessary for blood flow.

## INTERACTIONS

#### Drug

**Aminoglycosides:** May increase the blood concentration of these drugs in neonates.

#### Antihypertensives, diuretics:

May decrease the effects of these drugs.

**Aspirin, other salicylates:** May increase the risk of GI side effects such as bleeding.

**Bile acid sequestrants:** May decrease absorption of NSAIDs. **Bone marrow depressants:** May increase the risk of hematologic reactions.

**Corticosteroids:** May increase risk of GI ulceration.

**Heparin, oral anticoagulants, thrombolytics:** May increase the effects of these drugs.

Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Probenecid:** May increase the indomethacin blood concentration.

**Quinolone antibiotics:** May increase seizure potential.

SSRIs, SNRIs: Increased risk of GI bleeding.

Triamterene: May potentiate acute renal failure. Do not give concurrently. Herbal

Alfalfa, anise, bilberry,

bladderwrack, bromelain, cat's claw, celery, chamomile, coleus, cordyceps, dong quai, evening primrose, fenugreek, feverfew, garlic, ginger, ginkgo biloba, ginseng (American, Panax, Siberian), grapeseed, green tea, guggul, horse chestnut seed, horseradish, licorice, prickly ash, red clover, reishi, SAM-e (S-adenosylmethionine), sweet clover, turmeric, white willow: May increase the risk of bleeding. Feverfew: May decrease the effects of feverfew. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May prolong bleeding time. May alter blood glucose level. May increase BUN level, and serum creatinine, potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium level and platelet count.

## IV INCOMPATIBILITIES

Amino acid injection, calcium gluconate, cimetidine (Tagamet), dobutamine (Dobutrex), dopamine (Intropin), gentamicin (Garamycin), levofloxacin (Levaquin), tobramycin (Nebcin).

## 🗏 IV COMPATIBILITIES

Furosemide (Lasix), insulin, potassium, sodium bicarbonate, sodium nitroprusside (Nitropress).

#### SIDE EFFECTS

#### Frequent (3%-11%)

Headache, nausea, vomiting, dyspepsia, dizziness.

#### Occasional (< 3%)

Depression, tinnitus, diaphoresis, somnolence, constipation, diarrhea, bleeding disturbances in patent ductus arteriosus.

#### Rare

Hypertension, confusion, urticaria, pruritus, rash, blurred vision.

## SERIOUS REACTIONS

• Paralytic ileus and ulceration of the esophagus, stomach, duodenum, or small intestine may occur.

• Patients with impaired renal function may develop hyperkalemia and worsening of renal impairment.

 Indomethacin use may aggravate epilepsy, parkinsonism, and depression or other psychiatric disturbances.

 Nephrotoxicity, including dysuria, hematuria, proteinuria, and nephrotic syndrome, occurs rarely.  Metabolic acidosis or alkalosis, apnea, and bradycardia occur rarely in patients with patent ductus arteriosus.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac dysfunction, hypertension, epilepsy, hepatic or renal impairment, and in those receiving anticoagulant therapy concurrently. Use of the lowest effective dose for the shortest duration is recommended. Avoid alcohol and aspirin during therapy because these substances increase the risk of GI bleeding. Tasks that require mental alertness or motor skills should be avoided.

BUN, serum alkaline phosphatase, bilirubin, creatinine, potassium, AST (SGOT), ALT (SGPT) levels, BP, ECG, heart rate, platelet count, serum sodium, blood glucose levels, and urine output should be monitored. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness, improved grip strength, and increased joint mobility, should be evaluated.

#### Storage

Store at room temperature below 86° F. Do not freeze. Protect injection from light.

#### Administration

Take oral indomethacin after meals or with food or antacids. Don't crush extended-release capsules. Shake oral suspension well before each use.

! IV injection is the preferred route for neonates with patent ductus arteriosus. The drug may also be given orally, by nasogastric tube, or rectally. Administer no more than 3 doses at 12- to 24-h intervals.

For IV use, reconstitute by adding only 1 or 2 mL preservativefree sterile water for injection or 0.9% NaCl to the 1-mg vial to provide a concentration of 1 mg or 0.5 mg/mL, respectively. Do not dilute the solution any further. Administer the IV immediately after reconstitution. The solution normally appears clear; discard if it becomes cloudy or contains precipitate; discard any unused portion. Administer the drug over 20-30 min. Restrict fluid intake, as ordered. Take care to avoid extravasation.

For rectal use, if suppository is too soft, refrigerate it for 30 min or run cold water over the foil wrapper. Unwrap. Moisten the suppository with cold water before inserting it into the rectum.

#### Infliximab

in-flicks'ih-mab Remicade Do not confuse Remicade with Reminyl or infliximab with rituximab.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Disease-modifying antirheumatic drugs (DMARDs), gastrointestinals, immunomodulators, monoclonal antibodies, tumor necrosis factor modulators

#### **MECHANISM OF ACTION**

A monoclonal antibody that binds to tumor necrosis factor (TNF), inhibiting functional activity of TNF. Reduces infiltration of inflammatory cells. *Therapeutic Effect:* Decreases inflamed areas of the intestine, decreases synovitis and joint erosion.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-2 wks	N/A	8-48 wks (Crohn's disease)
IV	3-7 days	N/A	6-12 wks (rheumatoid arthritis [RA])

Absorbed into the GI tissue; primarily distributed in the vascular compartment. *Half-life*: 9.5 days.

#### AVAILABILITY

Powder for Injection: 100 mg.

#### INDICATIONS AND DOSAGES Moderate to severe Crohn's disease and fistulizing Crohn's disease IV INFUSION

Adults, Elderly, Children 6 yr and older. Initially, 5 mg/kg followed by additional 5-mg/kg doses at 2 and 6 wks after first infusion. Maintenance: 5 mg/kg q8wk. In adults only, may increase dose to 10 mg/kg if needed. **BA** 

IV INFUSION

*Adults, Elderly.* 3 mg/kg; followed by additional doses at 2 and 6 wks after first infusion. Maintenance: 3 mg/kg q8wk. Some receive up to 10 mg/kg per dose.

#### Ankylosing spondylitis, prosiatic arthritis, plaque psoriasis, and moderate to severe ulcerative colitis

IV INFUSION Adults, Elderly. Initially, 5 mg/kg at wks 0, 2 and 6. Maintenance: 5 mg/kg q6-8wk.

#### CONTRAINDICATIONS

Sensitivity to infliximab or murine proteins, sepsis, serious active infection, doses > 5 mg/kg in patients with moderate or severe congestive heart failure.

## INTERACTIONS

## Drug

#### Abatacept, rilonacept, anakinra:

May increase adverse effects such as infection risk.

**Immunosuppressants:** May reduce frequency of infusion reactions and antibodies to infliximab. May increase risk of serious infection.

Live vaccines: May decrease immune response to vaccine. Herbal

Echinacea: May decrease effect of infliximab.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Do not infuse infliximab in the same IV line with other agents.

## SIDE EFFECTS

#### Frequent (10%-22%)

Headache, nausea, fatigue, fever. Occasional (5%-9%)

Fever or chills during infusion, upper respiratory infection, cough, pharyngitis, bronchitis, rhinitis, sinusitis, vomiting, pain, dizziness, rash, pruritus, sinusitis, myalgia, back pain.

## Rare (1%-4%)

Hypotension or hypertension, paresthesia, anxiety, depression, insomnia, diarrhea, urinary tract infection.

## SERIOUS REACTIONS

 Hypersensitivity reaction, infusion-related reactions, and anaphylaxis might occur at any time. Also, serum-sickness–like illness, and lupus-like syndrome may occur. Most occur within 2 h of infusion. • Severe hepatic reactions and reactivation of hepatitis B have been reported with therapy.

• Hepatosplenic T-cell lymphoma has been reported in adolescents and young adults with Crohn's disease.

· New or worsening heart failure.

 Reactivation of latent tuberculosis has occurred; other serious infections.

• Rare: Systemic vasculitis, seizure CNS disorders (e.g., multible sclerosis, optic neuritis), or Guillain. Barrè syndrome.

## **PRECAUTIONS & CONSIDERATIONS**

Patients switching biologic DMARD treatments may be at increased risk of infection, due to overlapping biologic activity. Use with caution in patients with risk factors for or who currently have mild heart failure, as treatment may make condition worse. Use cautiously in patients with known neurologic disorders, such as multiple sclerosis.

Caution is warranted in patients with a history of recurrent infections and in patients on concomitant immunosuppressant agents. It is unknown whether infliximab is distributed in breast milk. Safety and efficacy of infliximab have not been established in children for JRA; trials failed to establish effectiveness. Use infliximab cautiously in elderly patients because of a higher rate of infection in this population.

Follow-up tests, such as ESR, C-reactive protein measurement, and urinalysis, should be obtained. Notify the physician of signs of infection, such as fever. Persons with rheumatoid arthritis should report increase in pain, stiffness, or swelling of joints. Persons with Crohn's disease should report changes in stool color, consistency, or elimination pattern. Hydration status should be assessed before and during therapy. **Storage** 

#### Refrigerate vials.

#### Administration

Reconstitute each vial with 10 mL sterile water for injection, using 21-gauge or smaller needle. Direct the stream of sterile water to the glass wall of the vial. Swirl the vial gently to dissolve the contents. Do not shake. Allow the solution to stand for 5 min. Because infliximab is a protein, the solution may develop a few translucent particles; do not use if particles are opaque or foreign particles are present. The solution normally appears colorless to light vellow and opalescent; do not use if discolored. Withdraw and waste a volume of 0.9% NaCl from a 250-mL bag that is equal to the volume of reconstituted solution to be injected into the 250-mL bag (approximately 10 mL). Total dose to be infused should equal 250 mL. Slowly add the reconstituted infliximab solution to the 250-mL infusion bag. Gently mix. Infusion concentration should range between 0.4 and 4 mg/mL. Begin infusion within 3 h of reconstitution. Administer IV infusion over 2 h, using set with a low-protein-binding filter.

Monitor for infusion-related reactions like flu-like symptoms, headache, dyspnea, hypotension, transient fever, chills, and skin rashes. Prior to infusion, may consider premedication such as acetaminophen, antihistamines, and/ or corticosteroids. if reaction occurs, may improve by slowing or temporary suspension of the infusion and reinitiation at a lower infusion rate. Discontinue the drug in any patient that dose not tolerate the infusion following these interventions.

Anaphylaxis might occur at any time. Appropriate personnel and

medication should be available to treat anaphylaxis if it occurs.

## Insulin

in'sull-in

*Rapid Acting:* ★ ➡ Humulin R, Novolin R, Novolog, Humalog, Apidra

• Intermediate Acting: 🖈 🍟 Humulin N, Novolin N

 Long Acting: ★ ↓ Lantus, Levemir

 Combinations: X NovoLog Mix 70/30, Humalog Mix 50/50, Humalog Mix 75/25, Humulin 70/30, Novolin 70/30

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B OTC; some forms are Rx-only, such as insulin analogs.

**Classification:** Antidiabetic agents, insulins and insulin analogs

## MECHANISM OF ACTION

Exogenous human insulins facilitate passage of glucose, potassium, and magnesium across the cellular membranes of skeletal and cardiac muscle and adipose tissue. Controls storage and metabolism of carbohydrates, protein, and fats. Promotes conversion of glucose to glycogen in the liver. *Therapeutic Effect*: Controls glucose levels in patients with diabetes or hyperglycemia.

## PHARMACOKINETICS

Drug Form/	Onset	Peak	Duration
Analog	(h)	(h)	(h) <sup>*</sup>
Regular Insulin	0.5-1	2-5	5-12

Insulin	833
---------	-----

Drug Form/ Analog	Onset (h)	Peak (h)	Duration (h)*
Insulin Aspart (Novolog)	0.16- 0.33	1-3	3-5
Insulin Glulisine (Apidra)	0.25- 0.5	0.75-1	4-5
Insulin Lispro (Humalog)	0.25	0.5-1.5	3-6
Insulin NPH	1-2	6-14	10-24
Insulin Detemir (Levemir)	1.1-2	6-8 (not pronoun- ced)	6-24
Insulin Glargine (Lantus)	1.1	No pro- nounced peak	11-24 (most 18-24)

\*Duration of action may vary from individual to individual.

## AVAILABILITY

NOTE: All insulins are available as 100 units/mL concentrations. *Rapid Acting:* Humulin R, Novolin R, Novolog, Humalog, Apidra. *Intermediate Acting:* Humulin N, Novolin N.

*Combinations:* NovoLog Mix 70/30, Humalog Mix 50/50, Humalog Mix 75/25, Humulin 70/30, Novolin 70/30.

Long Acting: Lantus, Levemir.

#### INDICATIONS AND DOSAGES > Treatment of type 1 (insulindependent) or type 2 diabetes mellitus

SUBCUTANEOUS

Adults, Elderly, Children. Usually 0.5-1 unit/kg/day in divided doses (usual range 0.1-2.5 units/ kg/day). Adjust doses to desired target blood sugar for the patient's individualized goals (NOTE: normal blood sugar is generally 80-110 mg/dL). Note that the dosage range given is quite general; patients with diabetes mellitus type 2 usually receive lower initial doses during initial treatment or if taking oral hypoglycemics. Basal insulins (e.g., insulin glargine, insulin detemir) will have different parameters for daily administration, and are usually initiated at 10 units/day or roughly 0.1-0.2 units/kg/day. Consult individual analog product literature for details of correct dosage, titration, and administration times.

Adolescents (during growth spurt). In general, 0.5-1 unit/kg/day, but may be adjusted to individual patient needs. • Emergency treatment of diabetic

ketoacidosis (DKA) *or* hyperosmolar hyperglycemic state of type 2 diabetes mellitus (regular insulin) IV INFUSION (REGULAR

INSULIN ONLY) Adults. Initially, 0.15 unit/kg IV bolus, then 0.1 unit/kg/h continuous infusion. Additionally, adequate fluid therapy must be initiated; fluid type and hourly requirements based on estimated patient need and serum osmolality. Blood glucose levels are checked hourly, and the insulin infusion rate is adjusted accordingly. The insulin infusion should cause blood glucose to fall at a rate of about 50 to 75 mg/ dL/h; faster blood glucose lowering may cause adverse reactions, like cerebral edema. When blood glucose is 250 mg/dL or less, the insulin infusion rate is usually decreased to 0.05-0.1 unit/kg/h IV and fluid therapy is changed to a dextrose-containing infusion; rates are adjusted to maintain a blood glucose of 150-250 mg/dL until the acidosis is corrected.

#### **OFF-LABEL USES**

Widely accepted for use to control blood glucose during hyperalimentation (regular insulin); also for emergency treatment of severe hyperkalemia (regular insulin).

## CONTRAINDICATIONS

Hypersensitivity or insulin resistance may require change of type or species' source of insulin.

## INTERACTIONS

#### Drug

β-Adrenergic blockers: May

increase the risk of hyperglycemia or hypoglycemia; may mask signs and prolong periods of hypoglycemia.

Glucocorticoids, thiazide diuretics: May increase blood glucose level. Herbal

Chromium, garlic, gymnema: May increase hypoglycemic effects. Food

Alcohol: May increase risk of hypoglycemia.

## **DIAGNOSTIC TEST EFFECTS**

Expected to decrease blood glucose levels and also HbA1C over time. May decrease serum potassium concentrations. Rarely causes decrease in serum magnesium and phosphate concentrations.

## IV INCOMPATIBILITIES

Regular insulin (*only*) and the analogs Insulin Lispro and Insulin Glulisine (*only*) are the only insulins that may be given IV: Consult specialized resources for Y-site and other compatibility.

## SIDE EFFECTS

## Occasional

Localized redness, swelling, and itching caused by improper injection technique or allergy to cleansing solution or insulin, hypoglycemia. Infrequent

Hypokalemia; Somogyi effect, including rebound hyperglycemia with chronically excessive insulin dosages: systemic allergic reaction, marked by rash, angioedema, and anaphylaxis; lipoatrophy or depression at injection site from breakdown of adipose tissue (can avoid by using adequate injection site rotation).

## Rare

Insulin resistance.

## SERIOUS REACTIONS

 Severe hypoglycemia caused by hyperinsulinism may occur with insulin overdose, decrease or delay of food intake, or excessive exercise and in those with unstable diabetes.
 Diabetic ketoacidosis may result

from stress, illness, omission of insulin dose, or long-term poor insulin control, even despite insulin therapy.

Rarely, serious allergic reactions
 occur.

## **PRECAUTIONS & CONSIDERATIONS**

Dose adjustments may be necessary in renal and hepatic dysfunction. Insulin is the drug of choice for treating diabetes mellitus during pregnancy, but close medical supervision is needed. Insulin needs may change in the postpartum period, so monitor closely after delivery. Insulin is not secreted in breast milk. Breastfeeding may alter maternal insulin requirements. No age-related precautions have been noted in children; the most commonly used insulins in children are regular insulin and insulin lispro. Decreased vision and shakiness in elderly patients may lead to inaccurate insulin self-dosing. Be alert to conditions that alter blood glucose requirements, such as fever, increased activity, stress, or a surgical procedure. Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store extra unopened vials or unopened prefilled pens/cartridges in refrigerator; do not freeze.

Store currently used insulin vials at room temperature or refrigerated; avoid extreme temperatures and direct sunlight. Discard open vials after 28 days.

Prefilled pens or pens with cartridges should be stored in the vertical or oblique position to avoid plugging. Once in use and at room temperature, refer to the manufacturer advice for how long the pens/cartridges may be kept in use; recommendations vary depending on the device and insulin brand.

#### Administration

Know that insulin dosages are highly individualized and monitored. Adjust dosage, as prescribed, to achieve blood glucose goals and HbA1C targets.

! Most insulins and insulin analogs are given subcutaneously only; some may be used in subcutaneous external infusion pumps; consult specific product literature. For subcutaneous use; warm the drug to room temperature; do not give cold insulin. Roll the drug vial gently between hands; do not shake. Regular insulin normally appears clear. No insulin should have discoloration. Suspensions should be uniform in appearance. Gently roll/rock prefilled pens before use to mix the suspensions/solutions. Be sure to always use an insulin syringe (e.g., U-30, U-50, or U-100) for administration.

Use glucometer to check blood glucose before administration. In health care systems, have a second person double-check the insulin type and dose to be administered.

Administer most insulins approximately 30-60 min before a meal. Insulin lispro should be given 15 min before meals or immediately after a meal. Insulin aspart is given 5-10 min before starting a meal. Insulin glulisine is given 15 min before a meal or within 20 min of starting a meal. Insulin aspart is given immediately before a meal. Oncedaily basal insulins, such as Lantus and Levemir, are given at any time of day but are usually initiated once daily at the evening meal or at bedtime.

Always draw either regular insulin, Novolog, Humalog, or Apidra first into the syringe when mixed with NPH. Mixtures must be administered immediately after preparation. *Never* give insulin mixtures intravenously. Lantus and Levemir should *not* be mixed with other insulins.

Give subcutaneous injections in the abdomen, buttocks, thigh, or upper arm. Maintain a careful record of rotated injection sites. ! Only regular insulin may be given IV. Novolog or Apidra have also been used in this manner, but use of these analogs is more rare; use of IV insulin should be limited to monitored clinical settings. May give bolus undiluted. An infusion of regular insulin is prepared by adding 100 units of regular insulin (only) to 100 mL of 0.9% NaCl. *Only* regular insulin may be added to hyperalimentation solutions. Administration rate must be individualized (see dosage). Use with controlled infusion device.

## Interferon Alfa-2b

inn-ter-fear'on ★ ● Intron-A Do not confuse interferon alfa-2b with interferon alfa-2a.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Immunologic agents, interferons

## MECHANISM OF ACTION

A biological response modifier that inhibits viral replication in virus-infected cells, suppresses cell proliferation, increases phagocytic action of macrophages, and augments specific cytotoxicity of lymphocytes for target cells. *Therapeutic Effect:* Prevents rapid growth of malignant cells; inhibits hepatitis virus.

## PHARMACOKINETICS

Well absorbed after IM and SC administration. Undergoes proteolytic degradation during reabsorption in kidneys. *Half-life:* 2-3 h.

## AVAILABILITY

*Injection (Multidose Vial):* 6 million units/mL, 10 million units/mL. *Injection (Single-Dose Vial):* 10 million units/mL. Injection (Prefilled Solution): 3 million units/0.2 mL, 5 million units/0.2 mL, 10 million units/0.2 mL. Injection (Powder for Reconstitution): 10 million units, 18 million units, 50 million units.

## INDICATIONS AND DOSAGES Hairy cell leukemia

IM, SC

Adults. 2 million units/m<sup>2</sup> 3 times a week. If severe adverse reactions occur, modify dose or temporarily discontinue drug.

#### Condyloma acuminatum INTRALESIONAL

*Adults.* 1 million units/lesion 3 times a week for 3 wks. Use only 10-million-unit vial, and reconstitute with no more than 1 mL diluent.

#### AIDS-related Kaposi's sarcoma IM, SC

*Adults.* 30 million units/m<sup>2</sup> 3 times a week. Use only 50-million-unit vials. If severe adverse reactions occur, modify dose or temporarily discontinue drug.

#### Chronic hepatitis C IM. SC

*Adults.* 3 million units 3 times a week for up to 6 mo. For patients who tolerate therapy and whose ALT (SGPT) level normalizes within 16 wks, therapy may be extended for up to 18-24 mo.

#### Chronic hepatitis B IM, SC

M, SC

*Adults.* 30-35 million units weekly, either as 5 million units/day or 10 million units 3 times a week.

#### Malignant melanoma IV

*Adults.* Initially, 20 million units/m<sup>2</sup> 5 times a week for 4 wks. Maintenance: 10 million units IM or subcutaneously 3 times a week for 48 wks.

Follicular lymphoma

SC

*Adults*. 5 million units 3 times a week for up to 18 mo.

## **OFF-LABEL USES**

Treatment of bladder, cervical, or renal carcinoma; chronic myelocytic leukemia; laryngeal papillomatosis; multiple myeloma; mycosis fungoides.

## CONTRAINDICATIONS

Decompensated liver disease; autoimmune hepatitis interactions, hypersensitivity to interferon alfa-2b, *E. coli* proteins, albumin.

#### Drug

Bone marrow depressants: May increase myelosuppression. Ribavirin: May increase risk of hemolytic anemia.

**Theophylline:** May increase levels of theophylline.

**Zidovudine:** May increase levels of zidovudine.

Herbal and Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase PT, aPTT, and serum LDH, alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin level, hematocrit, and leukocyte and platelet counts.

## IV INCOMPATIBILITIES

No information available. Do not mix with other medications for Y-site administration.

#### SIDE EFFECTS

#### Frequent

Flu-like symptoms, rash, headache, chills, fatique, somnolence, chest pain, alopecia, depression, dyspepsia, dry mouth, thirst.

#### Occasional

Dizziness, pruritus, dry skin, dermatitis, altered taste.

#### Rare

Confusion, leg cramps, back pain, gingivitis, flushing, tremor, nervousness, eye pain.

## SERIOUS REACTIONS

• Hypersensitivity reactions occur rarely.

 May cause severe psychiatric adverse events in patients with or without previous psychiatric symptoms.

• Severe and even life-threatening side effects occur in 0.1% or greater of patients; these include thyroid, visual, auditory, renal, and cardiac impairment, pulmonary interstitial fibrosis, autoimmune disorders, or serious infection.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac diseases or abnormalities. compromised CNS function. hepatic or renal impairment, myelosuppression, and seizure disorders. Interferon alfa-2b should not be used by pregnant or breastfeeding women. Effective contraceptive measures should be used during therapy, and the physician should be notified if the woman is or might be pregnant. The safety and efficacy of interferon alfa-2b have not been established in children. Elderly patients are more prone to cardiotoxicity and neurotoxicity. Agerelated renal impairment may require cautious use of interferon alfa-2b in elderly patients. Avoid receiving immunizations without the physician's approval and coming in contact with people who have recently received a live-virus vaccine because interferon alfa-2b lowers the body's resistance. Also, avoid tasks that require mental alertness or motor skills until response to the drug has been established.

Flu-like symptoms may occur but may be minimized by taking the drug at bedtime and tend to diminish with continued therapy. Urinalysis, CBC, platelet count, BUN level, serum alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels should be obtained before and routinely during therapy.

#### Storage

Refrigerate unopened vials and multidose pens; however, the drug remains stable for 7 days at room temperature.

#### Administration

! Dosage is individualized based on clinical response and tolerance of the drug's adverse effects. When used in combination therapy, consult specific protocols for optimum dosage and sequence of drug administration, as prescribed. Remember that side effects are dose related. The drug's therapeutic effect may take 1-3 mo to appear.

! For most uses, give the drug in the evening with acetaminophen, which alleviates side effects.

For IV use, prepare the solution immediately before use. Reconstitute with the diluent provided by the manufacturer. Withdraw the desired dose and further dilute with 100 mL 0.9% NaCl to provide final concentration at least 10 million units/100 mL. Administer the drug over 20 min.

Do not administer interferon alfa-2b by IM injection if platelet count is  $< 50,000/m^3$ ; instead give it subcutaneously.

For hairy cell leukemia, reconstitute as follows: Add 1 mL bacteriostatic water for injection to each 3-million-unit vial to provide a concentration of 3 million units/mL, or add 1 mL to each 5-million-unit vial, 2 mL to each 10-million-unit vial, or 5 mL to each 25-million-unit vial to provide a concentration of 5 million units/mL.

For condylomata acuminata, (intralesional use), reconstitute each 10-million-unit vial with 1 mL bacteriostatic water for injection to provide a concentration of 10 million units/mL. Use a tuberculin syringe with a 25- or 26-gauge needle.

For AIDS-related Kaposi's sarcoma, reconstitute each 50-millionunit vial with 1 mL bacteriostatic water for injection to provide a concentration of 50 million units/mL. Agitate the vial gently and withdraw the solution with a sterile syringe.

For hepatitis indications, multidose pens are available for ease of chronic treatment. See specialized literature for appropriate use.

## Interferon Alfacon-1 in-ter-fear'on

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Immunologic agents, biological response modifiers, interferons

## **MECHANISM OF ACTION**

A biological response modifier that stimulates the immune system. *Therapeutic Effect:* Inhibits hepatitis C virus.

#### AVAILABILITY

*Injection:* 15 mcg/0.5 mL, 9 mcg/ 0.3 mL.

#### INDICATIONS AND DOSAGES • Chronic hepatitis C SC

*Adults.* 9 mcg 3 times a week for 24 wks. May increase to 15 mcg 3 times a week in patients who tolerate

**Interferon Alfa-n3** 

in-ter-fear'on ★ Alferon N

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Immunologic agents, interferons

## **MECHANISM OF ACTION**

A biological response modifier that inhibits viral replication in virus-infected cells, suppresses cell proliferation, increases phagocytic action of macrophages, and augments the specific cytotoxicity of lymphocytes for target cells. *Therapeutic Effect:* Inhibits viral growth in condylomata acuminatum.

## PHARMACOKINETICS

Plasma levels below detectable limits.

## AVAILABILITY

*Injection:* 5 million international units/mL.

## INDICATIONS AND DOSAGES

▶ Condyloma acuminatum INTRALESIONAL Adults. 0.05 mL (250,000 international units) per wart twice a week up to 8 wks. Maximum dose/ treatment session: 0.5 mL (2.5 million international units). Do not repeat for 3 mo after initial 8-wk course unless warts enlarge or new warts appear.

## CONTRAINDICATIONS

Previous history of anaphylactic reaction to egg protein, murine proteins, or neomycin (trace).

## INTERACTIONS

#### Drug

ACE inhibitors: May increase risk of granulocytopenia. Bone marrow depressants: May increase myelosuppression. Prednisone: May decrease effects of interferon. Theophylline: May increase levels of theophylline. Warfarin: May increase anticoagulant effects. Zidovudine: May increase levels of zidovudine. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum LDH, alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin level, hematocrit, and leukocyte and platelet counts.

## SIDE EFFECTS

Frequent

Flu-like symptoms.

## Occasional

Dizziness, pruritus, dry skin, dermatitis, altered taste.

## Rare

Confusion, leg cramps, back pain, gingivitis, flushing, tremor, nervousness, eye pain.

## SERIOUS REACTIONS

• Hypersensitivity reaction occurs rarely.

• Severe and even life-threatening side effects occur in 0.1% or greater of patients; these include thyroid, visual, auditory, renal, psychatric, and cardiac impairment, and pulmonary interstitial fibrosis or serious infection.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes mellitus and

#### 838.e2 Interferon Alfa-n3

ketoacidosis, hemophilia, pulmonary embolism, seizure disorders, severe myelosuppression, severe pulmonary disease, thrombophlebitis, uncontrolled congestive heart failure, and unstable angina.

Flu-like symptoms may occur but may be minimized by taking the drug at bedtime and tend to diminish with continued therapy. Diagnostic tests, such as CBC, should be obtained before and routinely during therapy.

#### Storage

Refrigerate vials. Do not freeze or shake them.

#### Administration

Using a 30-gauge needle, inject 0.05 mL into the base of each wart. Used intralesionally only.

but fail to respond to 9-mcg dose, for up to 48 wks.

## When used in combination with ribavirin

#### SC

Adults. 15 mcg SC daily; use in combination with weight-based ribavirin (1000 mg/day PO for patients < 75 kg and 1200 mg/day PO for patients ≥ 75 kg) in 2 divided doses each day. Give for up to 48 weeks.

## CONTRAINDICATIONS

History of autoimmune hepatitis or hepatic decompensation, hypersensitivity to any drug or component of the product.

## SIDE EFFECTS

## Frequent (> 50%)

Headache, fatigue, fever, depression.

## SERIOUS REACTIONS

• Bone marrow suppression (rare).

- · Cardiac effects, hypertension.
- · Hypersensitivity.
- · Psychiatric disturbances.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of autoimmune disease, cardiac disease, depression, endocrine disorders, hepatic disorders, myelosuppression, and renal dysfunction. May cause severe psychiatric adverse events in patients with or without previous psychiatric symptoms. Notify the physician of side effects, including headache or injection site pain, as soon as possible. Serum alkaline phosphatase, AST (SGOT), ALT (SGPT), hepatitis C virus (HCV) antibody, and HCV-RNA levels should be obtained before and during therapy.

#### Storage

Refrigerate unopened vials; do not freeze. Warm to room temperature before administration.

#### Administration

! Make sure at least 48 h elapse between doses of interferon alfacon-1.

Administer as SC injection. Sometimes, doses are reduced in 1.5 or 3 mcg increments to help tolerance. The lowest effective dose is 7.5 mcg (0.25 mL).

## **Interferon Beta-1a**

in-ter-fear'on Avonex, Rebif Do not confuse interferon beta-1a with interferon beta-1b or Avonex with Avelox.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Immunologic agents, biological response modifiers, interferons

## **MECHANISM OF ACTION**

A biological response modifier that interacts with specific cell receptors found on the surface of human cells. *Therapeutic Effect:* Produces antiviral and immunoregulatory effects.

## PHARMACOKINETICS

Peak serum levels attained 3-15 h after IM administration. Biological markers increase within 12 h and remain elevated for 4 days. *Half-life:* 10 h (Avonex); 69 h (Rebif).

#### AVAILABILITY

Injection Solution (Prefilled Syringe [Avonex]): 30 mcg/0.5 mL. Injection Solution (Prefilled Syringe [Rebif]): 22 mcg/0.5 mL, 44 mcg/ 0.5 mL.
*Rebif Titration Pack (Prefilled Syringes):* 8.8 mcg/0.2 mL and 22 mcg/0.5 mL.

# INDICATIONS AND DOSAGES Relapsing-remitting multiple sclerosis

IM (AVONEX) Adults. 30 mcg once weekly. SC (REBIF) Adults. Initially 8.8 mcg 3 times a week; may increase to 44 mcg 3 times a week over 4-6 wks.

# **OFF-LABEL USES**

Treatment of AIDS, AIDS-related Kaposi's sarcoma, malignant melanoma, renal cell carcinoma.

# CONTRAINDICATIONS

Hypersensitivity to albumin or interferon.

# INTERACTIONS

#### Drug

Hepatotoxic agents: May increase risk of hepatotoxicity. Telbivudine: May increase neuropathy. Theophylline: May increase levels of theophylline. Warfarin: May increase anticoagulant effects. Zidovudine: May increase effects of zidovudine. Herbal

None known.

# Food

Alcohol: Limit or avoid because may increase risk of hepatic adverse effects.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose and BUN levels and serum alkaline phosphatase, bilirubin, calcium, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin level and neutrophil, platelet, and WBC counts.

# SIDE EFFECTS

# Frequent

Headache (67%), flu-like symptoms (61%), myalgia (34%), upper respiratory tract infection (31%), generalized pain (24%), asthenia, chills (21%), sinusitis (18%), infection (11%).

# Occasional

Abdominal pain, arthralgia (9%), chest pain, dyspnea (6%), malaise, syncope (4%).

# Rare

Injection site reaction, hypersensitivity reaction (3%).

# SERIOUS REACTIONS

- Anemia occurs in 8% of patients.
- Severe and even life-threatening

side effects occur in 0.1% or greater of patients; these include thyroid, visual, auditory, renal, psychiatric, and cardiac impairment, and pulmonary interstitial fibrosis or serious infection.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with chronic, progressive multiple sclerosis and in children younger than 18 yr. May cause severe psychiatric adverse events in patients with or without previous psychiatric symptoms. Interferon beta-1a may cause spontaneous abortion. It is unknown whether interferon beta-1a is distributed in breast milk. Interferon beta-1a should be used cautiously in children because its safety and efficacy have not been established in this age group. No information is available on the use of interferon beta-1a in elderly patients.

Notify the physician of flu-like symptoms, headache, or muscle pain or weakness. CBC and serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels should be obtained before and during therapy.

#### Storage

Refrigerate Avonex prefilled syringes; warm to room temperature before use. Use Avonex prefilled syringe within 12 h after removal from refrigerator. Refrigerate Rebif prefilled syringes; if refrigeration is unavailable, the drug may be stored at room temperature, away from heat and light up to 30 days.

# Administration

For IM use (Avonex powder for injection), reconstitute 30 mcg MicroPin (6.6-million-unit) vial with 1.1 mL of the diluent provided by the manufacturer. Discard it if it becomes discolored or contains a precipitate. I Gently swirl, do not shake the vial, to dissolve the drug.

For IM use (Avonex prefilled syringes), allow the drug to warm to room temperature prior to use. Administer on the same day each week.

For subcutaneous use (Rebif prefilled syringes), administer the drug at the same time of day 3 days each week. Separate doses by at least 48 h.

# **Interferon Beta-1b**

in-ter-fear'on ★ ● Betaseron, Extavia Do not confuse interferon beta-1b with interferon beta-1a.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Immunologic agents, biological response modifiers, interferons

#### MECHANISM OF ACTION

A biological response modifier that interacts with specific cell receptors

found on the surface of human cells. *Therapeutic Effect:* Produces antiviral and immunoregulatory effects.

#### PHARMACOKINETICS

Half-life: 8 min-4.3 h.

#### AVAILABILITY

*Powder for Injection:* 0.3 mg (9.6 million units).

# INDICATIONS AND DOSAGES Relapsing-remitting multiple

# sclerosis

*Adults.* Target dose is 0.25 mg (8 million units) every other day. Start with 62.5 mcg SC every other day and increase to 125 mcg every other day after 2 wks, etc.

# CONTRAINDICATIONS

Hypersensitivity to albumin or interferon.

# INTERACTIONS

#### Drug

Theophylline: May increase levels of theophylline. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose and BUN levels and serum alkaline phosphatase, bilirubin, calcium, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin level and neutrophil, platelet, and WBC counts.

# SIDE EFFECTS

# Frequent

Injection site reaction (85%), headache (84%), flu-like symptoms (76%), fever (59%), asthenia (49%), myalgia (44%), sinusitis (36%), diarrhea, dizziness (35%), mental status changes (29%), constipation (24%), diaphoresis (23%), vomiting (21%).

#### Occasional

Malaise (15%), somnolence (6%), alopecia (4%).

# SERIOUS REACTIONS

· Seizures occur rarely.

 May cause severe psychiatric adverse events in patients with or without previous psychiatric symptoms.

- Injection site necrosis.
- · Rare serious hypersensitivity.

• Severe and even life-threatening side effects occur in 0.1% or greater of patients; these include thyroid, visual, auditory, renal, and cardiac impairment, and pulmonary interstitial fibrosis or serious infection.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with chronic, progressive multiple sclerosis and in children younger than 18 yr. Pregnancy should be avoided. It is unknown whether interferon beta-1b is distributed in breast milk. The safety and efficacy of interferon beta-1b have not been established in children. No information is available on the use of interferon beta-1b in elderly patients. Sunscreen and protective clothing should be worn when exposed to sunlight or ultraviolet light until the extent of photosensitivity has been determined.

Notify the physician of flu-like symptoms, headache, or muscle pain or weakness. CBC and serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels should be obtained before and during therapy. Pattern of daily bowel activity and stool consistency and food intake should be monitored.

# Storage

Store vials at room temperature. After reconstitution, the solution is stable for 3 h if refrigerated. Use the solution within 3 h of reconstitution.

#### Administration

! Gently swirl; do not shake the vial to dissolve the drug.

For subcutaneous injection, reconstitute the 0.3-mg (9.6-millionunit) vial with 1.2 mL of the diluent supplied by the manufacturer to provide a concentration of 0.25 mg/mL (8 million units/mL). Using a 27-gauge needle, inject the appropriate dose of the solution subcutaneously into the abdomen, arms, hips, or thighs. Discard the solution if it becomes discolored or contains a precipitate. Discard any unused portion because the solution contains no preservative.

#### Interleukin-2 (Aldesleukin)

in'ter-lu'kin-2 (al-des-loo'kin) IL-2, Proleukin Do not confuse interleukin-2 with interferons.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antineoplastics, biological response modifiers, interleukins

# **MECHANISM OF ACTION**

A biological response modifier that acts like human recombinant interleukin-2, promoting proliferation, differentiation, and recruitment of T and B cells, lymphokine-activated and natural cells, and thymocytes. *Therapeutic Effect*: Enhances cytolytic activity in lymphocytes.

# PHARMACOKINETICS

Primarily distributed into plasma, lymphocytes, lungs, liver, kidney, and spleen. Metabolized to amino

# Interferon Gamma-1b

in-ter-fear'on

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Immunologic agents, biological response modifiers, interferons

# **MECHANISM OF ACTION**

A biological response modifier that induces the activation of macrophages in blood monocytes to phagocytes, which is necessary in the body's cellular immune response to intracellular and extracellular pathogens. Enhances phagocytic function and antimicrobial activity of monocytes. *Therapeutic Effect:* Decreases signs and symptoms of serious infections in chronic granulomatous disease.

# PHARMACOKINETICS

Slowly absorbed after subcutaneous administration.

# AVAILABILITY

Injection: 100 mcg (2 million units).

# INDICATIONS AND DOSAGES

#### Chronic granulomatous disease; severe, malignant osteopetrosis SC

Adults, Children older than 1 yr: 50 mcg/m<sup>2</sup> (1.5 million units/m<sup>2</sup>) in patients with body surface area (BSA) > 0.5 m<sup>2</sup>; 1.5 mcg/kg/dose in patients with BSA 0.5 m<sup>2</sup> or less. Give 3 times a week.

# CONTRAINDICATIONS

Hypersensitivity to *Escherichia coli*derived products, mannitol, ortho drug.

## INTERACTIONS

#### Drug

Bone marrow depressants: May increase myelosuppression. Theophylline: May increase levels of theophylline. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May elevate AST or ALT.

# SIDE EFFECTS

Frequent

Fever (52%); headache (33%); rash (17%); chills, fatigue, diarrhea (14%). **Occasional (10%-13%)** 

Vomiting, nausea.

Rare (3%-6%) Weight loss, myalgia, anorexia.

# SERIOUS REACTIONS

• Interferon gamma-1b may exacerbate preexisting central nervous system (CNS) disturbances, including decreased mental status, seizures, gait disturbance, and dizziness.

· Neutropenia or thrombocytopenia.

• Severe and even life-threatening side effects occur in 0.1% or greater of patients; these include thyroid, visual, auditory, renal, and cardiac impairment, and pulmonary interstitial fibrosis or serious infection.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with compromised CNS function, myelosuppression, preexisting cardiac disorders (including arrhythmias, congestive heart failure, and myocardial ischemia), and seizure disorders. It is unknown whether interferon gamma-1b crosses the placenta or is distributed in breast milk. The safety and efficacy of interferon gamma-1b have not been established in children younger than 1 yr. Children are more likely

#### 842.e2 Interferon Gamma-1b

to experience flu-like symptoms. No information is available on the use of interferon gamma-1b in elderly patients. Avoid performing tasks that require mental alertness or motor skills until response to the drug has been established.

Notify the physician of flu-like symptoms or rash. CBC, urinalysis, BUN level and serum alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels should be obtained before and every 3 mo during therapy.

#### Storage

Refrigerate unopened vials; do not freeze them. Discard vials kept at room temperature for longer than 12 h. Administration

! Avoid excessive agitation of the vial; do not shake it.

Vials come in single doses; discard any unused portion. The solution normally appears clear and colorless. Do not use it if it becomes discolored or contains a precipitate. Administer the drug subcutaneously 3 times a week. Rotate injection sites. acids in the cells lining the kidneys. Half-life: 85 min.

# AVAILABILITY

*Powder for Injection:* 22 million units (1.3 mg).

# INDICATIONS AND DOSAGES

# Metastatic melanoma, metastatic renal cell carcinoma IV

*Adults.* 600,000 units/kg q8h for 14 doses, followed by 9 days of rest, then another 14 doses for a total of 28 doses per course. Course may be repeated after rest period of at least 7 wks from date of hospital discharge.

# **OFF-LABEL USES**

Treatment of non-Hodgkin's lymphoma, acute myelogenous leukemia.

# CONTRAINDICATIONS

Hypersensitivity to the drug or mannitol, abnormal pulmonary function or thallium stress test results, bowel ischemia or perforation, coma or toxic psychosis lasting longer than 48 h, GI bleeding requiring surgery, intubation lasting more than 72 h, organ allografts, pericardial tamponade, renal dysfunction requiring dialysis for longer than 72 h. repetitive or difficult-to-control seizures. Retreatment in those who experience any of the following toxicities: angina, MI, recurrent chest pain with ECG changes, sustained ventricular tachycardia, uncontrolled or unresponsive cardiac rhythm disturbances.

# INTERACTIONS

#### Drug

Antihypertensives: May increase hypotensive effect. Cardiotoxic, hepatotoxic, myelotoxic, or nephrotoxic medications: May increase the risk of toxicity. Glucocorticoids: May decrease the effects of interleukin. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase BUN and serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May decrease serum calcium, magnesium, phosphorus, potassium, and sodium levels.

# IV INCOMPATIBILITIES

Ganciclovir (Cytovene), lorazepam (Ativan), pentamidine (Pentam), prochlorperazine (Compazine), promethazine (Phenergan).

# **IV COMPATIBILITIES**

Amikacin (Amikin), amphotericin B (Abelcet, AmBisome, Amphotec), calcium gluconate, co-trimoxazole (Bactrim), diphenhydramine (Benadryl), dopamine (Intropin), fat emulsion 10%, fluconazole (Diflucan), foscarnet (Foscavir), gentamicin (Garamycin), heparin, lorazepam (Ativan), magnesium, metoclopramide (Reglan), morphine (Avinza, Kadian, Roxanol), ondansetron (Zofran), piperacillin (Piperacil), potassium, ranitidine (Zantac), thiethylperazine, ticarcillin (Ticar), tobramycin (Nebcin).

# SIDE EFFECTS

Side effects are generally selflimiting and reversible within 2-3 days after discontinuing therapy. **Frequent (48%-89%)** 

Fever, chills, nausea, vomiting, hypotension, diarrhea, oliguria or anuria, mental status changes, irritability, confusion, depression,

#### 844 Interleukin-2 (Aldesleukin)

sinus tachycardia, pain (abdominal, chest, back), fatigue, dyspnea, pruritus. **Occasional (17%-47%)** 

Edema, erythema, rash, stomatitis, anorexia, weight gain, infection (urinary tract, injection site, catheter tip), dizziness.

#### Rare (4%-15%)

Dry skin, sensory disorders (vision, speech, taste), dermatitis, headache, arthralgia, myalgia, weight loss, hematuria, conjunctivitis, proteinuria.

#### SERIOUS REACTIONS

• Anemia, thrombocytopenia, and leukopenia occur commonly.

• GI bleeding and pulmonary edema occur occasionally.

 Capillary leak syndrome results in hypotension (systolic pressure < 90 mm Hg or a 20 mm Hg drop from baseline systolic pressure), extravasation of plasma proteins and fluid into extravascular space, and loss of vascular tone. It may result in cardiac arrhythmias, angina, myocardial infarction, and respiratory insufficiency.

• Other rare reactions include fatal malignant hyperthermia, cardiac arrest, cerebrovascular accident, pulmonary emboli, bowel perforation, gangrene, and severe depression leading to suicide.

# **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used with a history of cardiac or pulmonary disease, even if they have normal thallium stress and pulmonary function test results. Also use the drug cautiously with fixed requirements for large volumes of fluid (such as those with hypercalcemia) or a history of seizures. Interleukin use should be avoided in patients of either sex who do not practice effective contraception. The safety and efficacy of interleukin have not been established in children. Elderly patients may require cautious use of the drug because of age-related renal impairment. They are also less able to tolerate drug-related toxicities.

Notify the physician of difficulty urinating, black tarry stools, pinpoint red spots on the skin, bruising, fever, signs of local infection, sore throat, or unusual bleeding from any site. Treat persons with bacterial infection with antibiotic therapy before beginning interleukin therapy. Patients with indwelling central lines have a higher risk of infection. A negative CT scan must be obtained before beginning therapy. Immediately report any symptoms of depression or suicidal ideation. CBC, electrolytes, liver and renal function, amylase concentration, BP, mental status, intake and output, extravascular fluid accumulation, platelet count, pulse oximetry values, and weight should be assessed.

#### Storage

Refrigerate unopened vials; do not freeze. The reconstituted solution is stable for 48 h at room temperature or refrigerated (refrigerated is preferred).

#### Administration

! Withhold the drug in patients who exhibit moderate to severe lethargy or somnolence because continued administration may result in coma. Restrict interleukin therapy to patients with normal cardiac and pulmonary function as determined by thallium stress testing and pulmonary function testing. Dosage is individualized based on clinical response and tolerance of the drug's adverse effects.

For IV use, reconstitute the 22-million-unit vial with 1.2 mL sterile water for injection to provide a concentration of 18 million units/ mL. Do not use bacteriostatic water for injection or 0.9% NaCl. During reconstitution, direct the diluent at the side of the vial. Swirl the contents gently to avoid foaming; do not shake. Further dilute the appropriate dose in 50 mL D5W and infuse over 15 min. Do not use an in-line filter. Warm the solution to room temperature before infusion. Closely monitor the patient for a drop in mean arterial BP, a sign of capillary leak syndrome. Continued treatment may result in edema, pleural effusion, mental status changes, and significant hypotension (systolic pressure < 90 mm Hg or a 20 mm Hg drop from baseline systolic pressure).

# lodoquinol

eye-oh-do-kwin'ole Xodoxin 酔 Diodoquin

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antiprotozoals, amebicide

# **MECHANISM OF ACTION**

An antibacterial, antifungal, and antitrichomonal agent that works in the intestinal lumen by an unknown mechanism. *Therapeutic Effect:* Amebicidal.

# PHARMACOKINETICS

Partially and irregularly absorbed from the GI tract. Metabolized in liver. Primarily excreted in feces.

# AVAILABILITY

Tablets: 210 mg, 650 mg (Yodoxin).

# INDICATIONS AND DOSAGES Intestinal amebiasis

#### PO

*Adults, Elderly.* 630 mg OR 650 mg 3 times a day for 20 days.

*Children.* 30-40 mg/kg in 3 divided doses for 20 days. Maximum: 650 mg/dose.

# **OFF-LABEL USES**

Active treatment of infectious diarrhea due to travel, pulmonary aspergillosis.

# CONTRAINDICATIONS

Hepatic impairment, hypersensitivity to iodine and 8-hydroxyquinolones.

#### INTERACTIONS

Drug, Herbal, and Food None known.

# DIAGNOSTIC TEST EFFECTS

May result in false-positive ferric chloride test for phenylketonuria. May increase protein-bound serum iodine concentrations reflecting a decrease in I<sup>131</sup> uptake.

# SIDE EFFECTS

#### Occasional

Fever, chills, headache, nausea, vomiting, diarrhea, cramps, urticaria, pruritus, stomach pain, rash, pruritus ani.

#### SERIOUS REACTIONS

• Optic neuritis, atrophy, and peripheral neuropathy have been reported with high dosages and longterm use.

Thyroid dysfunction, goiter.

# PRECAUTIONS & CONSIDERATIONS

This drug is not intended for long-term use. Caution should be used in patients with thyroid disease and neurologic disorders. It is unknown whether iodoquinol is distributed in breast milk. No age-related precautions have been noted in children. Age-related renal impairment may limit the use of iodoquinol in elderly patients.

Be aware that iodoquinol may temporarily stain skin, hair, and

clothing a yellow-brown color. Pattern of daily bowel activity and stool consistency should be accessed. Monitor for resolution of infection. Thyroid tests may be needed in individuals with possible thyroid complaints. Investigate any complaints of visual impairment promptly, due to the potential seriousness of optic effects.

#### Storage

Store at room temperature.

# Administration

Give after meals. May crush tablets and mix with applesauce. Avoid long-term use.

# Ipratropium

eye-pra-troep'ee-um Atrovent HFA, Atrovent Nasal Apo-Ipravent, Gen-Ipratropium, Novo-Impramide, Ratio-Ipratropium Do not confuse Atrovent with Alupent.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anticholinergics, bronchodilators

# **MECHANISM OF ACTION**

An anticholinergic that blocks the action of acetylcholine at parasympathetic sites in bronchial smooth muscle. *Therapeutic Effect:* Causes bronchodilation and inhibits nasal secretions.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	1-3 min	1-2 h	4-6 h

Minimal systemic absorption after inhalation. Metabolized in the liver

(systemic absorption). Primarily eliminated in feces. *Half-life:* 1.5-4 h.

# AVAILABILITY

Oral Inhalation: 17 mcg/actuation. Nebulizer Solution for Inhalation: 0.02%. Nasal Spray: 0.03%, 0.06%.

#### INDICATIONS AND DOSAGES • Bronchospasm, acute treatment,

adjunctive INHALATION Adults, Elderly, Children. 2 puffs q6h initially. NEBULIZATION Adults, Elderly, Children 12 yr and older. 500 mcg q30min for 3 doses, then q2-4h as needed. Children younger than 12 yr. 250 mcg q20min for 3 doses, then q2-4h as needed.

 Bronchospasm, maintenance treatment, associated with COPD INHALATION

Adults, Elderly. 2 puffs q6h. NEBULIZATION Adults, Elderly. 500 mcg q6-8h.

Rhinorrhea, common cold
 INTRANASAL

Adults, Children older than 12 yr. 2 sprays per nostril of (0.06%) solution 3-4 times a day for up to 4 days.

# Rhinorrhea, allergic or nonallergic perennial

INTRANASAL Adults, Children 6 yr and older. 2 sprays per nostril of (0.03%) solution 2-3 times a day. Usually used for up to 4 days.

# CONTRAINDICATIONS

Hypersensitivity to ipratropium bromide or other product components; hypersensitivity to atropine or its derivatives.

# INTERACTIONS

#### Drug

Anticholinergic agents: May increase risk of adverse events.

#### Cromolyn inhalation solution:

Avoid mixing these drugs because they form a precipitate.

Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Inhalation (3%-6%): Cough, dry mouth, headache, nausea. Nasal: Dry nose and mouth, headache, nasal irritation.

#### Occasional

Inhalation (2%): Dizziness, transient increased bronchospasm.

Rare (<1%)

Inhalation: Hypotension, insomnia, metallic or unpleasant taste, palpitations, urine retention. Nasal: Diarrhea or constipation, dry throat, abdominal pain, stuffy nose.

# SERIOUS REACTIONS

• Worsening of angle-closure glaucoma, acute eye pain, and hypotension occur rarely.

• Paradoxical acute bronchospasm that can be life threatening; usually reported with first use of a new canister.

 Rare reports of serious hypersensitivity reactions, including anaphylaxis.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bladder neck obstruction, angle-closure glaucoma, and benign prostatic hyperplasia. It is unknown whether ipratropium is distributed in breast milk. No age-related precautions have been noted in children or elderly patients. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea.

Pulse rate and quality, respiratory rate, depth, rhythm and type, ABG levels, and serum potassium levels should be monitored. Lips and fingernails should be examined for hypoxemia. Clinical improvement should also be evaluated.

#### Storage

Store products at room temperature. Keep nebulizer solution protected from light in packet until time of use. Do not expose HFA to high temperatures or flame, as the contents are under pressure and may burst.

#### Administration

Shake the HFA container well. If a new canister, first do 3 "test sprays" away from the face and others before first use. Exhale completely through mouth; then place the mouthpiece into the mouth and close lips, holding the inhaler upright. Inhale deeply through the mouth while fully depressing the top of the canister. Hold breath for as long as possible before exhaling slowly. Wait 2 min before inhaling the second dose to allow for deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness. Do not take more than 2 inhalations at a time because excessive use decreases the drug's effectiveness or may produce paradoxical bronchoconstriction.

Nebulizer solution: Use in nebulizer as directed; may mix with albuterol if will be used within 1 h. Do not mix with cromolyn sodium as the two are not compatible. Nasal spray: Before using first time, prime unit with 7 sprays; if unit not used for 24 h, prime with 2 sprays, away from body. Blow nose gently to clear before use. Close one nostril, bend head slightly forward, insert nasal tip into open nostril. Point to back and outer wall of nose. Spray and sniff deeply. Repeat then repeat with other nostril (2 sprays per nostril).

# Irbesartan

erb'ba-sar-tan

CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antihypertensives, angiotensin II receptor antagonists

# **MECHANISM OF ACTION**

An angiotensin II receptor, type AT<sub>1</sub>, antagonist that blocks the vasoconstrictor and aldosteronesecreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT<sub>1</sub> receptors. *Therapeutic Effect:* Causes vasodilation, decreases peripheral resistance, and decreases BP.

# PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Protein binding: 90%. Undergoes hepatic metabolism to inactive metabolite. Recovered primarily in feces and, to a lesser extent, in urine. Not removed by hemodialysis. *Half-life*: 11-15 h.

# AVAILABILITY

Tablets: 75 mg, 150 mg, 300 mg.

# INDICATIONS AND DOSAGES

# Hypertension (alone or in combination with other antihypertensives)

Adults, Elderly. Initially, 150 mg/day. May increase to 300 mg/day.

Use lower (75 mg/day) initial dose if volume-depleted.

#### Diabetic nephropathy PO

Adults, Elderly. Titrate to target dose of 300 mg/day.

# **OFF-LABEL USES**

Treatment of heart failure.

# CONTRAINDICATIONS

Hypersensitivity to irbesartan.

# INTERACTIONS

Drug

CYP2C9 substrates: May increase levels of CYP2C9 substrates. Hydrochlorothiazide: Further reduces BP. NSAIDs: May decrease efficacy of irbesartan. Salt substitutes, drospirenone, eplerenone, and potassium-sparing diuretics: May increase risk of hyperkalemia. Herbal

Ephedra, ginseng, yohimbe: May increase blood pressure. Food None known.

# DIAGNOSTIC TEST EFFECTS

May slightly increase BUN and serum creatinine levels. May decrease blood hemoglobin level. Rarely increases serum potassium or decreases platelet counts.

# SIDE EFFECTS

#### Occasional (3%-9%)

Upper respiratory tract infection, fatigue, diarrhea, cough.

Irbesartan (Generic Name)

#### Rare (1%-2%)

Heartburn, dizziness, headache, nausea, rash, hyperkalemia.

#### SERIOUS REACTIONS

· Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often.

 Rare serious hypersensitivity reactions.

· Rarely cases of hepatitis, hyperkalemia, and thrombocytopenia, renal failure. Increased CPK and rhabdomyolysis rarely reported.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with congestive heart failure, coronary artery disease, mild to moderate hepatic dysfunction, sodium and water depletion, renal dysfunction and unilateral renal artery stenosis. It is unknown whether irbesartan is distributed in breast milk. Irbesartan may cause fetal or neonatal morbidity or mortality. Discontinue as soon as pregnancy is detected. Safety and efficacy of irbesartan have not been established in children. In clinical studies, irbesartan did not effectively lower blood pressure in hypertensive children. No age-related precautions have been noted in elderly patients.

Apical pulse and BP should be assessed immediately before each irbesartan dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the person in the supine position with feet slightly elevated, and notify the physician. Tasks that require mental alertness or motor skills should be avoided until the drug's effects are known. BUN, serum electrolytes, serum creatinine levels, heart rate for tachycardia, and

urinalysis results should be obtained before and during therapy. Maintain adequate hydration; exercising outside during hot weather should be avoided to decrease the risk of dehydration and hypotension. Storage

#### Store at room temperature. Administration

Irbesartan may be given concurrently with other antihypertensives; if BP is not controlled by irbesartan alone, a diuretic may also be prescribed.

Take irbesartan without regard to meals.

# Iron Dextran

eye'ern dex'tran ★ Dexferrum, Infed 🐏 Dexiron, Infufer

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Hematinics, minerals

# MECHANISM OF ACTION

A trace element and essential component in the formation of hemoglobin. Necessary for effective erythropoiesis and transport and utilization of oxygen. Serves as cofactor of several essential enzymes. Therapeutic Effect: Replenishes hemoglobin and depleted iron stores.

# PHARMACOKINETICS

Readily absorbed after IM administration. Most absorption occurs within 72 h; remainder within 3-4 wks. Bound to protein to form hemosiderin, ferritin, or transferrin. No physiologic system of elimination. Small

Irinotecan

eye-ri-noe-tee'kan

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastics, topoisomerase inhibitors

# **MECHANISM OF ACTION**

A DNA topoisomerase inhibitor that inhibits the action of topoisomerase I, an enzyme that allows DNA replication by producing reversible single-strand breaks in DNA that relieve torsional strain. Irinotecan prevents religation of the DNA strand, resulting in damage to double-strand DNA and cell death. *Therapeutic Effect:* Kills cancer cells.

# PHARMACOKINETICS

Metabolized to active metabolite in the liver after IV administration. Protein binding: 95% (metabolite). Excreted in urine and eliminated by biliary route. *Half-life*: 6 h; metabolite 10 h.

# AVAILABILITY

Injection: 20 mg/mL.

# INDICATIONS AND DOSAGES Advanced colorectal cancer

First-line in combination with 5-FU and leucovorin:

IV INFUSION (WITH BOLUS 5-FU/LEUCOVORIN) Adults. 125 mg/m<sup>2</sup> IV over 90 min, then leucovorin (20 mg/m<sup>2</sup> IV), and then 5-FU (500 mg/m<sup>2</sup> IV) on days 1, 8, 15, and 22. The next course begins on day 43 or when toxicity has recovered. IV INFUSION (WITH INFUSIONAL 5-FU/ LEUCOVORIN) *Adults.* 180 mg/m<sup>2</sup> IV over 90 mins, then leucovorin (200 mg/m<sup>2</sup> IV), then 5-FU (400 mg/m<sup>2</sup> IV bolus, then 600 mg/m<sup>2</sup> IV infusion for 22 hours). Irinotecan is given days 1, 15, and 29, while leucovorin and 5-FU are given days 1, 2, 15, 16, 29, and 30. The next course begins on day 43 or when toxicity has recovered. *Single-agent for metastatic colorectal cancer:* IV INFUSION (WEEKLY DOSAGE)

Adults. 125 mg/m<sup>2</sup> IV over 90 min once weekly for 4 wks, then 2 wks of rest; subsequent cycles given every 6 wks.

IV INFUSION (ONCE-EVERY-3-WK DOSAGE)

Adults. 350 mg/m<sup>2</sup> by IV infusion over 90 min, administered once every 3 wks.

Dosage adjustments

NOTE: A reduction in the starting dose of irinotecan by at least 1 dose level should be considered for patients known to be homozygous for the UGT1A1\*28 allele. Expect to adjust dosage based on disease type, concomitant treatments, and worst presenting grade of hematologic or nonhematologic toxicity. Dosage is adjusted in 25-50 mg/m2 increments to as low as 50 mg/m<sup>2</sup> (see prescribing information). Prior to each course, the granulocyte count should be  $\geq$  1500, the platelet count  $\geq$  100,000, and treatment-related diarrhea should be fully resolved.

# **OFF-LABEL USES**

Small cell lung cancer, non-small cell lung cancer, malignant gliomas, breast and gynecologic cancers; pancreatic and GI cancers.

# CONTRAINDICATIONS

Known hypersensitivity to irinotecan; do not use ketoconazole, St. John's wort, or atazanavir with irinotecan.

# INTERACTIONS

# Drug

Anticonvulsants: May decrease effects of irinotecan.

Atazanavir: May increase levels of irinotecan. Contraindicated.

Bevacizumab: May increase adverse effects of irinotecan.

**CYP2B6 inducers:** May decrease levels of irinotecan.

**CYP2B6 inhibitors:** May increase levels of irinotecan.

**CYP3A4 inducers:** May decrease levels of irinotecan.

**CYP3A4 inhibitors:** May increase levels of irinotecan.

**Diuretics:** May increase the risk of dehydration from vomiting and diarrhea.

**Ketoconazole:** Increases levels of irinotecan and the active metabolite. Contraindicated.

**Laxatives:** May increase the severity of diarrhea.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

**Other bone marrow depressants:** May increase the risk of myelosuppression.

**Prochlorperazine:** May increase akathisia.

Herbal

**St. John's wort:** Decreases therapeutic effect of irinotecan. Contraindicated.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase and AST (SGOT) levels.

# IV INCOMPATIBILITIES

Acyclovir, allopurinol, amphotericin B (all formulas), cefepime (Maxipime), cefotaxime, ceftriaxone (Rocephin), diazepam, epirubicin, 5-fluorouracil, fosphenytoin, furosemide, gemcitabine (Gemzar), methylprednisolone sodium succinate (Solu-Medrol), nafcillin, nitroprusside, pemetrexed, phenytoin, piperacillin-tazobactam (Zosyn), trastuzumab.

# SIDE EFFECTS

#### Expected

Nausea (64%), alopecia (49%), vomiting (45%), diarrhea (32%). Frequent

Constipation, fatigue (29%); fever (28%); asthenia (25%); skeletal pain (23%); abdominal pain, dyspnea (22%), flushing, insomnia.

## Occasional

Anorexia (19%); headache, stomatitis (18%); rash (16%).

# SERIOUS REACTIONS

• Myelosuppression characterized as neutropenia occurs in 97% of patients; severe neutropenia, a neutrophil count < 50/mm<sup>3</sup>, occurs in 78% of patients. Can be prolonged, life-threatening. Start treatment with loperamide at the first sign of diarrhea.

• Thrombocytopenia, anemia, and sepsis are common reactions.

• Severe diarrhea may occur early or late in therapy. Can be prolonged, life-threatening. Start treatment with loperamide at the first sign of diarrhea.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in those who have previously received abdominal or pelvic irradiation, patients with renal dysfunction, and elderly patients. Because of the risk of fetal harm, pregnant women should not take irinotecan, especially in the first trimester. Breastfeeding is not recommended for patients taking this drug. The safety and efficacy of irinotecan have not been established in children. Elderly patients are at increased risk for diarrhea. Use the drug cautiously in patients older than 65 yr. Vaccinations and coming in contact with crowds, people with known infections, and anyone who has recently received a live-virus vaccine should be avoided.

Notify the physician if diarrhea, rash, or inflammation at the infusion site occurs. Hemoglobin levels, CBC, serum electrolytes, and hydration status should be monitored. Hair loss may occur and is reversible, but new hair may have a different color or texture.

#### Storage

Store vials at room temperature, and protect them from light. If the solution is reconstituted in D5W, it remains stable for up to 24 h at room temperature or 48 h if refrigerated. However, because the drug contains no preservative, it should be used within 6 h if kept at room temperature or within 24 h if refrigerated. Do not refrigerate the solution if it is diluted with 0.9% NaCl.

#### Administration

CAUTION: Observe and exercise usual cautions for handling, administering, and preparing solutions of cytotoxic drugs.

Premedication with antiemetic agents is recommended, including dexamethasone plus a serotonin 5-HT<sub>3</sub> blocker, given at least 30 min before administration.

Dilute the drug in D5W (the preferred diluent) or 0.9% NaCl to a concentration of 0.12-2.8 mg/mL. Infusion volume is usually 250-500 mL. Administer all doses by IV infusion over 90 min. Assess the patient for signs and symptoms of extravasation. If extravasation occurs, flush the site with sterile water and apply ice. amounts lost daily in shedding of skin, hair, and nails and in feces, urine, and perspiration. *Half-life:* 5-20 h.

# AVAILABILITY

Injection: 50 mg/mL.

# INDICATIONS AND DOSAGES • Iron deficiency anemia (no blood loss)

IV, IM Adults, Elderly. DOSE (mL) = 0.0442 (desired Hb - observed Hb) × LBW + (0.26 × LBW) (Lean body weight for males = 50 kg + 2.3 kg for each inch over 5 ft. Lean body weight for females = 45.5 kg + 2.3 kg for each inch over 5 ft). Maximum: 100 mg/day.
Iron replacement secondary to

# Iron replacement secondary to blood loss IM. IV

*Adults, Elderly.* Replacement iron (mg) = blood loss (mL) times hematocrit.

# Maximum daily dosage

Adults weighing more than 50 kg. 100 mg.

*Children weighing 10-50 kg.* 100 mg. *Children weighing 5-9 kg.* 50 mg. *Infants weighing < 5 kg.* 25 mg.

# CONTRAINDICATIONS

Hypersensitivity to the product. All anemias except iron deficiency anemia, including pernicious, aplastic, normocytic, and refractory; hemochromatosis; hemolytic anemia.

# INTERACTIONS

#### Drug

**Chloramphenicol:** May decrease effect of iron dextran. **Herbal and Food** None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# IV INCOMPATIBILITIES

No information is available regarding administration with other medications via Y-site. Do not dilute with dextrose injection or mix with parenteral nutrition for infusion.

## SIDE EFFECTS Frequent

Allergic reaction (such as rash and itching), backache, myalgia, chills, dizziness, headache, fever, nausea, vomiting, flushed skin, pain or redness at injection site, brown discoloration of skin, metallic taste.

# SERIOUS REACTIONS

 Anaphylaxis has occurred during the first few minutes after injection, causing arrhythmia, chest pain, and rarely cardiac arrest or death. Use test dose prior to therapeutic dosage.

• Leukocytosis and lymphadenopathy occur rarely.

# PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used in patients with serious hepatic impairment. Caution is warranted with bronchial asthma, a history of allergies, and rheumatoid arthritis. Iron dextran may cross the placenta in some form, and trace amounts of the drug are distributed in breast milk. No age-related precautions have been noted in children and elderly patients. Avoid taking oral iron while receiving iron injections.

Stools may become black during iron therapy, but this side effect is harmless unless accompanied by abdominal cramping, pain, or red streaking or sticky consistency of stool. Notify the physician of abdominal cramping or pain, back pain, fever, headache, or red streaking or sticky consistency of stool. Be alert for acute exacerbation of joint pain and swelling in persons with rheumatoid arthritis and iron deficiency anemia.

#### Storage

Store at room temperature. Administration

! Plan to discontinue oral iron before administering iron dextran because excessive iron intake may produce excessive iron storage (hemosiderosis). Know that a test dose is generally given before the full dose; stay with the patient for several minutes after injection of the test dose because of the potential for anaphylactic reaction.

! Before giving a therapeutic dose, it is customary to give a test dose of 25 mg (adults). The patient is usually observed for 1 h before commencing therapeutic treatment.

For IV use, may give undiluted or dilute in 0.9% NaCl for infusion. Do not exceed an administration rate of 50 mg/min (1 mL/min). A too-rapid IV rate may produce flushing, chest pain, shock, hypotension, and tachycardia. The patient should stay recumbent for 30-45 min after IV administration to minimize orthostatic hypotension.

For IM use, draw up medication with one needle; use new needle for injection to minimize skin staining. Use Z-tract technique by displacing subcutaneous tissue lateral to injection site before inserting needle to minimize skin staining. Administer deep into upper outer quadrant of buttock only. **Iron Sucrose** 

eye'ern su'crose

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Hematinics, minerals

# **MECHANISM OF ACTION**

A trace element that is an essential component in the formation of hemoglobin. It is necessary for effective erythropoiesis and oxygen transport capacity of blood, and transport and utilization of oxygen, and it serves as cofactor of several essential enzymes. *Therapeutic Effect:* Replenishes body iron stores in patients on long-term hemodialysis who have iron deficiency anemia and are receiving erythropoietin.

#### AVAILABILITY

Injection: 20 mg/mL or 100 mg elemental iron in 5-mL single-dose vial.

#### INDICATIONS AND DOSAGES Iron deficiency anemia in patients on chronic hemodialysis

Dosage is expressed in terms of milligrams of elemental iron. IV

*Adults, Elderly.* 100 mg elemental iron, delivered during dialysis; administer 1-3 times a wk to total dose of 1000 mg (10 doses). Give no more than 3 times weekly.

NOTE: Other dose regimens are approved for patients receiving peritoneal dialysis and who are nondialysis dependent. See manufacturer's literature.

# CONTRAINDICATIONS

Hypersensitivity to iron sucrose; all anemias except iron deficiency anemia, including pernicious, aplastic, normocytic, and refractory anemia; evidence of iron overload.

# INTERACTIONS

#### Drug

**Dimercaprol:** May increase nephrotoxicity.

**Oral iron preparations:** Iron sucrose may decrease absorption of oral agents.

Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

Increases hemoglobin and hematocrit, serum ferritin level, and serum transferrin saturation.

# IV INCOMPATIBILITIES

Do not mix with other medications or add to parenteral nutrition solution for IV infusion.

# SIDE EFFECTS

#### Frequent

Hypotension, leg cramps, diarrhea, headache, peripheral edema.

# SERIOUS REACTIONS

 Too-rapid IV administration may produce severe hypotension, headache, vomiting, nausea, dizziness, paresthesia, abdominal and muscle pain, edema, and cardiovascular collapse.

 Hypersensitivity reaction occurs rarely but may include anaphylaxis during or soon after infusion completes.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac dysfunction, bronchial asthma, history of allergies, and hepatic or renal impairment. Notify the physician of leg cramps or diarrhea. Initially, hematocrit, hemoglobin, serum ferritin, and serum transferrin levels should be obtained monthly, then every 2-3 mo as determined by the physician. Iron levels should be obtained 48 h after iron sucrose administration. Monitor closely for hypotension.

#### Storage

Store unopened vials at room temperature.

#### Administration

! Administer directly into dialysis line during hemodialysis, as prescribed.

Can be given as undiluted, slow IV injection. However, IV infusion is preferred to avoid hypotension. For IV infusion, dilute each vial in maximum of 100 mL 0.9% NaCl immediately before infusion. For IV injection, administer into the dialysis line at a rate of 1 mL, or 20 mg iron, undiluted solution per minute. Allow 5 min per vial; do not exceed 1 vial per injection. For IV infusion, administer into dialysis line at a rate of 100 mg iron over at least 15 min. Expect to monitor the results of treatment.

If hypersensitivity reactions or signs of intolerance occur, stop infusion immedietly. Monitor patients for signs and symptoms of hypersensitivity during and for at least 30 minutes after infusion and ensure patient is clinically stable following administration. Keep personnel and therapies immedietely available for the treatment of serious hypersensitivity reactions. Most reactions occur with 30 min of the completion of the infusion.

# Isocarboxazid

eye-soe-kar-box′a-zid ★ Marplan

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidepressants, monoamine oxidase inhibitors (MAOIs)

# **MECHANISM OF ACTION**

An antidepressant that inhibits the MAO enzyme system at central nervous system (CNS) storage sites. The reduced MAO activity causes an increased concentration in epinephrine, norepinephrine, serotonin, and dopamine at neuron receptor sites. *Therapeutic Effect:* Produces antidepressant effect.

# PHARMACOKINETICS

PO: Good absorption; maximum MAO inhibition 5-10 days, duration up to 2 wks; metabolized by liver; excreted by kidneys.

# AVAILABILITY

Tablets: 10 mg (Marplan).

# INDICATIONS AND DOSAGES

 Depression refractory to other antidepressants or electroconvulsive therapy

PO Adults, Elderly. Initially, 10 mg 3 times/day. May increase to 60 mg/day.

**OFF-LABEL USES** Treatment of panic disorder.

# CONTRAINDICATIONS

Cardiovascular disease (CVD), cerebrovascular disease, liver

impairment, pheochromocytoma. NOTE: Many drugs are contraindicated for use within 14 days of MAOI use.

#### INTERACTIONS Drug

Alcohol, CNS depressants: May increase CNS depressant effects. **Bupropion:** May increase neurotoxic effects.

**Buspirone:** May increase BP. **Caffeine-containing medications:** May increase cardiac arrhythmias and hypertension.

Carbamazepine, cyclobenzaprine, maprotiline, other MAOIs: May precipitate hypertensive crises. CNS depressants: May increase adverse effects.

**CNS stimulants:** Isocarboxazid may increase hypertensive effects.

Catechol-O-methyltransferase (COMT) inhibitors: May increase adverse effects of isocarboxacid.

Dextromethorphan, trazodone, SSRIs, tricyclic antidepressants: May cause serotonin syndrome. Contraindicated.

**Insulin, oral hypoglycemics:** May increase effects of insulin and oral hypoglycemics.

**Linezolid:** Additive MAOI actions. Contraindicated.

Lithium: May increase adverse effects of lithium.

#### Meperidine, other opioid analgesics: May produce coma,

convulsions, death, diaphoresis, immediate excitation, rigidity, severe hypertension or hypotension, severe respiratory distress, or vascular collapse. Meperidine is contraindicated.

Methylphenidate: May increase the CNS stimulant effects of methylphenidate.

Sympathomimetics: May increase the cardiac stimulant and

vasopressor effects of isocarboxazid. Contraindicated.

Tramadol: May increase risk of seizures.

**Tyramine:** May cause severe, sudden hypertension.

#### Herbal

None known.

#### Food

**Foods high in tyramine:** May cause hypertensive crisis.

#### DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent (>10%)

Postural hypotension, drowsiness, decreased sexual ability, weakness, trembling, visual disturbances.

#### Occasional (1%-10%)

Tachycardia, peripheral edema, nervousness, chills, diarrhea, anorexia, constipation, xerostomia. Rare (< 1%)

Hepatitis, leukopenia, parkinsonian syndrome.

#### SERIOUS REACTIONS

 Hypertensive crisis, marked by severe hypertension, occipital headache radiating frontally, neck stiffness or soreness, nausea, vomiting, sweating, fever or chilliness, clammy skin, dilated pupils, palpitations, tachycardia or bradycardia, and constricting chest pain.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with asthma, bronchitis, bipolar disorder, cardiac arrhythmias, cardiovascular disease, diabetes mellitus, epilepsy, headaches, hepatic function impairment, hypertension, hyperthyroidism, Parkinson's disease, renal function impairment, schizophrenia, and those with suicidal tendencies. Foods that require bacteria or molds for their preparation or preservation or containing tyramine, including avocados, bananas, beer, broad beans, cheese, figs, meat tenderizers, papaya, raisins, sour cream, soy sauce, wine, yeast extracts, yogurt, or excessive amounts of caffeine, such as chocolate, coffee, and tea, should be avoided. It is unknown whether isocarboxazid crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children or elderly patients.

Blurred vision, drowsiness, increased sweating, decreased sexual ability, and dizziness may be experienced while taking isocarboxazid. Headache, neck soreness or stiffness should be reported.

#### Storage

Store at room temperature. Administration

Use the lowest effective dose. Take with or without meals.

! Food and drug interactions with isocarboxazid can be serious (see Interactions). Consider patient's intake of foods/beverages containing large amounts of tyramine, tryptophan, and/or caffeine.

# Isoniazid (INH)

eye-soe-nye'a-zid 📩 INH, Nydrazid 🙅 Isotamine

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antimycobacterials; antitubercular

# **MECHANISM OF ACTION**

An isonicotinic acid derivative that inhibits mycolic acid synthesis

Isoniazid (INH) (Generic Name)

and causes disruption of the bacterial cell wall and loss of acid-fast properties in susceptible mycobacteria. Active only during bacterial cell division. *Therapeutic Effect*: Bactericidal against actively growing intracellular and extracellular susceptible mycobacteria.

# PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 10%-15%. Widely distributed (including to the cerebrospinal fluid). Metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 0.5-5 h.

# AVAILABILITY

*Tablets:* 100 mg, 300 mg. *Syrup:* 50 mg/5 mL. *Injection:* 100 mg/mL.

# INDICATIONS AND DOSAGES

 Tuberculosis (in combination with one or more antituberculars)
 PO, IM

Adults, Elderly. 5 mg/kg/day as a single dose. Maximum: 300 mg/day. Children. 10-15 mg/kg/day as a single dose. Maximum: 300 mg/day. > Prevention of tuberculosis

# PO, IM

Adults, Elderly. 300 mg/day as a single dose.

*Children.* 10 mg/kg/day as a single dose. Maximum: 300 mg/day.

# CONTRAINDICATIONS

Acute hepatic disease, history of hypersensitivity reactions or hepatic injury with previous isoniazid therapy.

# INTERACTIONS

#### Drug

Acetaminophen: May potentiate adverse effects of acetaminophen.

Alcohol: May increase isoniazid metabolism and the risk of hepatotoxicity. Antacids: May decrease absorption of isoniazid. Benzodiazepines: May decrease metabolism of benzodiazepines. Carbamazepine, phenytoin, valproic acid: May increase the concentrations of these drugs. Corticosteroids: May decrease concentrations of isoniazid. CYP2C19 substrates: May increase levels of CYP2C19 substrates. CYP2E1 substrates: May decrease levels of CYP2E1 substrates. CYP3A4 substrates: May increase levels of CYP3A4 substrates. Disulfiram: May increase central nervous system (CNS) effects. Dronedarone, ranolazine: INH significantly increases levels of these drugs; avoid. Hepatotoxic medications: May increase the risk of hepatotoxicity. MAOIs: INH has some MAOinhibiting activity; actions may be additive. Avoid co-use. Theophylline: May increase theophylline levels. Herbal None known. Food All foods: Significantly reduce INH bioavailability. Tyramine-containing foods: May cause a hypertensive crisis.

# DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

Frequent

Nausea, vomiting, diarrhea, abdominal pain.

# Occasional

Flushing, palpitations, rash, elevated blood pressure, sinus tachycardia.

#### Rare

Pain at injection site, hypersensitivity reaction.

### SERIOUS REACTIONS

 Rare reactions include neurotoxicity (as evidenced by ataxia and paresthesia), optic neuritis, and hepatotoxicity.

# PRECAUTIONS & CONSIDERATIONS

Because there is a higher frequency of isoniazid-associated hepatitis among certain patient groups, including those over 35 yr, daily users of alcohol, those with chronic hepatic disease, injectable drug abusers, and women belonging to minority groups, particularly in the postpartum period, LFTs should be obtained prior to and monthly during therapy, or more frequently as needed. If any of the values exceed 3 times the upper limit of normal (ULN), temporarily discontinue.

Be aware that prophylactic use of isoniazid is usually postponed until after childbirth. Be aware that isoniazid crosses the placenta. The small concentrations of isoniazid in breast milk do not produce toxicity in the nursing neonate; therefore, breastfeeding should not be discouraged. Pyridoxine supplementation in the nursing infant may be advised. No age-related precautions have been noted in children. Elderly patients are more susceptible to developing hepatitis.

Avoid consuming alcohol during treatment and taking any other medications without first notifying the physician, including antacids. Avoid foods containing tyramine, including aged cheeses, sauerkraut, smoked fish, and tuna, because these foods may cause a reaction such as headache, a hot or clammy feeling, light-headedness, pounding heartbeat, and red or itching skin.

Determine whether the patient has any history of hypersensitivity reactions or liver injury from isoniazid as well as sensitivity to nicotinic acid before starting drug therapy. Monitor the patient's liver function test results, and assess the patient for signs and symptoms of hepatitis as evidenced by anorexia, dark urine, fatigue, jaundice, nausea, vomiting, and weakness. If hepatitis is suspected, withhold the drug and notify the physician promptly. In addition, assess for burning, numbness, and tingling of the extremities. People at risk for neuropathy, such as alcoholics, those with chronic liver disease, diabetics, elderly patients, and malnourished individuals, may receive pyridoxine prophylactically.

#### Storage

Store vials and tablets at room temperature; protect from light. Injection may crystallize at low temperatures. Warm the vial to room temperature before use to redissolve the crystals.

#### Administration

Give 1 h before or 2 h after meals. Do not give with food. Administer at least 1 h before antacids, especially those containing aluminum. Do not skip doses and continue taking isoniazid for the full length of therapy (6-24 mo).

INH injection is for intramuscular (IM) use only and is used in those unable to take oral therapy.

# **Isoproterenol** eye-soe-proe-ter'e-nole

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Adrenergic agonists, β-agonists, bronchodilators, inotropes

# **MECHANISM OF ACTION**

A sympathomimetic (adrenergic agonist) that stimulates  $\beta_1$ -adrenergic receptors. *Therapeutic Effect:* Increases myocardial contractility, stroke volume, cardiac output.

# PHARMACOKINETICS

Readily absorbed. Metabolized in liver. Primarily excreted in urine. *Half-life:* 2.5-5 min.

# AVAILABILITY

*Injection:* 0.02 mg/mL, 0.2 mg/mL (Isuprel).

# INDICATIONS AND DOSAGES Arrhythmias

IV BOLUS

*Adults, Elderly.* Initially, 0.02-0.06 mg (1-3 mL of diluted solution). Subsequent dose range: 0.01-0.2 mg (0.5-10 mL of diluted solution). IV INFUSION

Adults, Elderly. Initially, 5 mcg/min (1.25 mL/min of diluted solution). Subsequent dose range: 2-20 mcg/min.

# Shock and hypoperfusion IV INFUSION

Adults, Elderly. Rate of 0.5-5 mcg/ min (0.25-2.5 mL of 1:500,000 dilution); rate of infusion based on clinical response (heart rate, central venous pressure, systemic BP, urine flow measurements).

# **OFF-LABEL USES**

Treatment of children for emergency uses similar to adults.

# CONTRAINDICATIONS

Tachycardia resulting from digitalis toxicity, preexisting arrhythmias, angina, precordial distress, hypersensitivity to isoproterenol, other sympathomimetic amines, or any component of the formulation.

# INTERACTIONS

### Drug

β-Blockers: May antagonize the effects of isoproterenol.
 Digoxin: May increase the risk of arrhythmias.
 General anesthetics: May increase risk of arrhythmias.
 Tricyclic antidepressants: May increase cardiovascular effects.
 Sympathomimetic agents: May increase adverse effects.
 Herbal
 Ephedra, ma huang, yohimbe: May increase CNS stimulation.
 Food

None known.

# DIAGNOSTIC TEST EFFECTS

Decreases serum potassium levels.

# IV INCOMPATIBILITIES

Aminophylline, furosemide (Lasix), sodium bicarbonate.

# **IV COMPATIBILITIES**

Amiodarone (Cordarone), atracurium (Tracrium), bretylium (Bretylol), calcium chloride, cimetidine (Tagamet), cisatracurium (Nimbex), dobutamine (Dobutrex), famotidine (Pepcid), heparin, hydrocortisone sodium succinate (Solu-Cortef), inamrinone (Inocor), levofloxacin (Levaquin), magnesium sulfate, milrinone (Primacor), pancuronium (Panvulon), potassium chloride, propofol (Diprivan), ranitidine (Zantac), remifentanil (Ultiva), succinylcholine (Anectine), tacrolimus (Prograf), vecuronium (Norcuron), verapamil (Calan), vitamin B complex with C.

#### SIDE EFFECTS Frequent

Palpitations, tachycardia, restlessness, nervousness, tremor, insomnia, anxiety.

#### Occasional

Increased sweating, headache, nausea, flushed skin, dizziness, coughing.

# SERIOUS REACTIONS

• Excessive sympathomimetic stimulation may cause palpitations, extrasystoles, tachycardia, chest pain, slight increase in BP followed by a substantial decrease, chills, sweating, and blanching of skin.

• Ventricular arrhythmias may occur if heart rate is above 130 beats/min.

 Parotid gland swelling may occur with prolonged use.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hypersensitivity to sulfite, elderly or debilitated, hypertension, cardiovascular disease, impaired renal function, hyperthyroidism, diabetes mellitus, prostatic hypertrophy, seizure disorder, glaucoma. It is unknown whether isoproterenol crosses the placenta or is distributed in breast milk, so it is not administered to pregnant women. Safety and efficacy have not been established in children. Be aware that elderly patients may exhibit decreased therapeutic response (decreased heart rate, peripheral vascular response).

If chest pain or palpitations occur, notify the physician.

#### Storage

Store solution at room temperature. Do not use if the solution is pink to brown, contains a precipitate, or appears cloudy. Stability of parenteral admixture at room temperature or at refrigeration is 24 h.

#### Administration

Reconstitutite for IV push by diluting 0.2 mg (1 mL) of 1:5000 solution to a volume of 10 mL 0.9% NaCl or D5W. Give IV push at rate of 1 mL/min.

For IV infusion, dilute 0.2-2 mg (1-10 mL) of 1:5000 solution in 500 mL D5W to provide a solution of 0.4-4 mcg/mL. Rate of IV infusion determined by the person's heart rate, central venous pressure, systemic BP, and urine flow measurements. Use microdrip (60 drops/mL) or infusion pump to administer drug.

Regulate by ECG monitoring. If ECG changes occur, heart rate exceeds 110 beats/min, or premature beats occur, consider reducing rate of infusion or temporarily stopping infusion.

# Isosorbide Dinitrate/ Mononitrate

eye-soe-sor'bide die-nye'trate mon-oh-nye'trate ★ Dilatrate SR, Isordil Titradose, IsoChron, IsoDitrate, Imdur, Monoket ▲ Apo-ISMN, Imdur, ISDN, Novo-Sorbide, PMS-ISMN, Pro-ISMN

Do not confuse Isordil with Isuprel or Plendil, or Imdur with Inderal or K-Dur.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Vasodilators; nitrate antianginal

# **MECHANISM OF ACTION**

A nitrate that stimulates intracellular cyclic guanosine monophosphate. *Therapeutic Effect:* Relaxes vascular smooth muscle of both arterial and venous vasculature. Decreases preload and afterload.

# PHARMACOKINETICS

Dinitrate poorly absorbed and metabolized in the liver to its active metabolite isosorbide mononitrate.

Isosorbide Dinitrate/Mononitrate (Generic Name)

Mononitrate well absorbed after PO administration. Excreted in urine and feces. *Half-life:* Dinitrate, 1-4 h; mononitrate, 4 h.

# AVAILABILITY

Isosorbide Dinitrate (ISDN) Capsules, Sustained Release (Dilatrate SR): 40 mg. Tablets (Isordil Titradose): 5 mg, 10 mg, 20 mg, 30 mg, 40 mg. Tablets, Extended Release (IsoChron, IsoDitrate): 40 mg. Tablets, Sublingual: 2.5 mg, 5 mg. Isosorbide Mononitrate Tablets (Monoket): 10 mg, 20 mg. Tablets, Extended Release (Imdur): 30 mg, 60 mg, 120 mg.

# INDICATIONS AND DOSAGES Angina

PO (ISOSORBIDE DINITRATE) Adults, Elderly. 5-40 mg 4 times a day. Sustained release: 40 mg q8-12h.

PO (ISOSORBIDE MONONITRATE) Adults, Elderly. 5-10 mg twice a day given 7 h apart. Sustained release: Initially, 30-60 mg/day in morning as a single dose. May increase dose at 3-day intervals. Usually up to 120 mg/day. Maximum: 240 mg/day.

#### **OFF-LABEL USES**

Congestive heart failure, dysphagia, relief of esophageal spasm with gastroesophageal reflux.

#### CONTRAINDICATIONS

Closed-angle glaucoma, GI hypermotility or malabsorption (extended-release tablets), head trauma, hypersensitivity to nitrates, increased intracranial pressure, orthostatic hypotension, severe anemia (extended-release tablets).

#### INTERACTIONS Drug

Antihypertensives, vasodilators: May increase risk of orthostatic hypotension. **CYP3A4 inducers:** May decrease levels of isosorbide.

**CYP3A4 inhibitors:** May increase levels of isosorbide.

#### Sildenafil, tadalafil, vardenafil: May significantly decrease blood

pressure. Concurrent use is contraindicated.

## Herbal

None known.

### Food

Alcohol: May increase risk of orthostatic hypotension.

### DIAGNOSTIC TEST EFFECTS

May increase urine catecholamine and urine vanillylmandelic acid levels.

# SIDE EFFECTS

Frequent

Burning and tingling at the oral point of dissolution (sublingual), headache (possibly severe) occurs mostly in early therapy, diminishes rapidly in intensity, and usually disappears during continued treatment, transient flushing of face and neck, dizziness (especially if the patient is standing immobile or is in a warm environment), weakness, orthostatic hypotension, nausea, vomiting, restlessness.

#### Occasional

GI upset, blurred vision, dry mouth.

#### SERIOUS REACTIONS

 Blurred vision or dry mouth may occur (drug should be discontinued).

• Isosorbide administration may cause severe orthostatic hypotension manifested by fainting, pulselessness, cold or clammy skin, and diaphoresis.

 Tolerance may occur with repeated, prolonged therapy but may not occur with the extended-release form. Minor tolerance may be seen with intermittent use of sublingual tablets. • High dosage tends to produce severe headache.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with acute MI, blood volume depletion from therapy, glaucoma (contraindicated in closed-angle glaucoma), hepatic or renal disease, and systolic BP < 90 mm Hg. It is unknown if isosorbide crosses the placenta or is distributed in breast milk. The safety and efficacy of isosorbide have not been established in children. Elderly patients may be more sensitive to the drug's hypotensive effects. In elderly patients, age-related decreased renal function may require cautious use. Alcohol should be avoided because it intensifies the drug's hypotensive effect. If alcohol is ingested soon after taking nitrates, an acute hypotensive episode marked by pallor, vertigo, and a drop in BP may occur.

Dizziness, light-headedness, and headache may occur. Notify the physician of facial or neck flushing. The onset, type (sharp, dull, or squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, such as exertion and emotional stress, should be recorded before therapy begins. **Storage** 

Store at room temperature. Protect from moisture and light.

#### Administration

Best if taken on an empty stomach; however, take oral isosorbide with meals if the headache occurs. Oral tablets, except the extended-release form, may be crushed. Do not crush or break the extended-release form. Do not crush the chewable form before administering. For sublingual use, do not crush or chew tablets. Dissolve tablets under tongue without swallowing. Isosorbide should be taken at the first sign or symptom of angina. If angina is not relieved within 5 min, dissolve a second tablet under the tongue and then repeat the dosage 5 min later if there is no relief. Do not take more than 3 tablets within 15-30 min.

#### Isotretinoin

eye-soe-tret'i-noyn Amnesteem, Claravis, Myorisan, Sotret Accutane, Clarus

CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Retinoids, dermatologic agents, acne therapies

# **MECHANISM OF ACTION**

Reduces the size of sebaceous glands and inhibits their activity. *Therapeutic Effect:* Decreases sebum production; produces antikeratinizing and antiinflammatory effects.

#### PHARMACOKINETICS

Metabolized in the liver; major metabolite active. Eliminated in urine and feces. *Half-life:* 21 h; metabolite, 21-24 h.

#### AVAILABILITY

*Capsules:* 10 mg, 20 mg, 30 mg, 40 mg.

# INDICATIONS AND DOSAGES

 Recalcitrant cystic acne that is unresponsive to conventional acne therapies

Isotretinoin (Generic Name)

Adults, Children 12 yr of age and older: Initially, 0.5-1 mg/kg/day, divided into 2 doses for 15-20 wks. May repeat after at least 2 mo off therapy. Severe acne may require 2 mg/kg/day.

# **OFF-LABEL USES**

Treatment of gram-negative folliculitis, severe keratinization disorders, certain cancers.

#### CONTRAINDICATIONS

Hypersensitivity to isotretinoin or parabens (component of capsules); pregnancy.

#### INTERACTIONS

#### Drug

**Carbamazepine:** May decrease levels of carbamazepine. **Etretinate, tretinoin, vitamin A:** 

May increase toxic effects.

Methotrexate: May increase risk of hepatotoxicity. Avoid.

**Oral contraceptives:** May decrease efficacy of oral contraceptives.

**Tetracycline:** May increase the risk of pseudotumor cerebri.

Tigecycline: May cause

pseudotumor cerebri.

**Warfarin:** Retinoids may decrease effect; monitor INR.

#### Herbal

**Dong quai, St. John's wort:** May cause photosensitization. **Food** 

**Milk:** May increase bioavailability of isotretinoin.

# DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, total cholesterol, LDH, triglyceride, ALT (SGPT), and AST (SGOT) levels; urine uric acid level; erythrocyte sedimentation rate; and fasting blood glucose level. May decrease HDL level. May decrease hemoglobin and hematocrit.

#### SIDE EFFECTS

#### Frequent (20%-90%)

Cheilitis (inflammation of lips), dry skin and mucous membranes, skin fragility, pruritus, epistaxis, dry nose and mouth, conjunctivitis, hypertriglyceridemia, nausea, vomiting, abdominal pain.

### Occasional (5%-16%)

Musculoskeletal symptoms (including bone pain, arthralgia, generalized myalgia), photosensitivity.

# Rare

Decreased night vision, depression.

#### SERIOUS REACTIONS

 Inflammatory bowel disease and pseudotumor cerebri (benign intracranial hypertension) have been associated with isotretinoin therapy.

 Hearing impairment may occur and may continue after isotretinoin is discontinued.

Teratogen.

#### **PRECAUTIONS & CONSIDERATIONS**

Patients, prescribers, wholesalers, and dispensing pharmacists must register with the iPledge program.

Caution should be used in patients with renal or hepatic dysfunction. Depression, psychosis, aggressive behavior, and suicide have been reported with this medication. Be aware that isotretinoin is contraindicated in pregnancy. There is an extremely high risk of major deformities in infants if pregnancy occurs while taking any amount of isotretinoin, even for short periods. The person must be capable of understanding and carrying out instructions and of complying with mandatory contraception (2 forms). Be aware that excretion in breast milk is unknown; due to potential for serious adverse effects, it is not recommended during nursing. No

age-related precautions have been noted in children or elderly patients.

Women must have 2 negative serum pregnancy tests within 2 wks before starting therapy; therapy will begin on the second or third day of the next normal menstrual period. Effective contraception (using 2 reliable forms of contraception simultaneously) must be used for at least 1 mo before, during, and for at least 1 mo after therapy. Give both oral and written warnings, with the patient acknowledging in writing that she understands the warnings and consents to treatment. Prescriptions may be written for only 30 days and pregnancy testing and counseling should be repeated monthly. Med Guides are given with each refill. Blood donation must be avoided during treatment and for 1 mo following completion because the donated blood might be given to a pregnant woman and expose a fetus.

Patients may have decreased tolerance to contact lenses during and after therapy. Patients should be cautioned about driving at night due to potential decreases in night vision and should use caution with UV exposure due to photosensitivity. Notify the physician immediately if abdominal pain, severe diarrhea, rectal bleeding (possible inflammatory bowel disease), or headache, nausea and vomiting, visual disturbances (possible pseudotumor cerebri) occur.

#### Storage

Store at room temperature and protect from light.

# Administration

Give isotretinoin with food and a full glass of liquid to reduce esophogeal irritation. Failure to take with food will significantly decrease absorption. Do not crush or open capsules. Patients not responding to treatment should be asked about adherence to administration with meals prior to increasing dosage.

# Isradipine

is-rad'ih-peen ★ DynaCirc CR Do not confuse DynaCirc with Dynabac or Dynacin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Calcium channel blockers

# **MECHANISM OF ACTION**

An antihypertensive that inhibits calcium movement across cardiac and vascular smooth-muscle cell membranes. Potent peripheral vasodilator that does not depress SA or AV nodes. *Therapeutic Effect:* Produces relaxation of coronary vascular smooth muscle and coronary vasodilation. Increases myocardial oxygen delivery to those with vasospastic angina.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2-3 h	2-4 wks (with multiple doses)	NA
		8-16 h (with single dose)	
PO (con- trolled release)	2 h	8-10 h	NA

Isradipine (Generic Name)

Well absorbed from the GI tract. Protein binding: 95%. Metabolized in the liver (undergoes first-pass effect). Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 8 h.

# AVAILABILITY

Capsules: 2.5 mg, 5 mg. Tablets (Controlled Release [DynaCirc CR]): 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Hypertension

PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 2.5 mg twice a day. May increase by 2.5 mg at 2- to 4-wk intervals. Range: 5-20 mg/day in divided doses twice daily. PO (EXTENDED RELEASE) Initially, 5 mg once daily. Usual dose 5-10 mg/day. May increase at 2- to 4-wk intervals Maximum: 20 mg/ day.

# **OFF-LABEL USES**

Treatment of chronic angina pectoris, Raynaud's phenomenon, and treatment of hypertension in children.

# CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

Drug

**β-Blockers:** May have additive effect.

Strong CYP3A inhibitors: May increase isradipine levels.

Fentanyl anesthesia: Severe hypotension has been reported; may have additive effects.

#### Herbal

**Melatonin:** Reported to reduce hypotensive effects of some calcium channel blockers.

**St. John's wort:** May reduce isradipine concentrations.

#### Food

**Grapefruit, grapefruit juice:** May increase the absorption of isradipine. Avoid.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent (4%-7%)

Peripheral edema, palpitations, headache, dizziness (higher frequency in female patients). Occasional (3%) Facial flushing, cough. Rare (1%-2%)

Angina, tachycardia, rash, pruritus.

# SERIOUS REACTIONS

• Overdose produces nausea, drowsiness, confusion, and slurred speech, dizziness, syncope.

- Angina exacerbation may rarely lead to unstable angina, coronary steal, or myocardial infarction.
- · Congestive heart failure occurs rarely.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with edema, hepatic disease, severe left ventricular dysfunction, sick sinus syndrome, and in those concurrently receiving β-blockers or digoxin. It is unknown whether isradipine crosses the placenta or is distributed in breast milk. The safety and efficacy of isradipine have not been established in children. In elderly patients, agerelated renal impairment may require cautious use. Grapefruit juice, which may increase isradipine blood concentration, should be avoided. Tasks that require alertness and motor skills should also be avoided.

Avoid using sodium-containing products, such as IV saline fluids, for patients with a dietary salt restriction. Patients should be assessed for stress-induced angina episodes, which may occur during isradipine therapy.

Notify the physician if irregular heartbeat, nausea, pronounced dizziness, or shortness of breath occurs. Rise slowly from a lying to a sitting position and wait momentarily before standing to avoid isradipine's hypotensive effect. Apical pulse and BP should be assessed immediately before beginning isradipine administration. If the systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Liver function tests should also be performed before and during therapy. Skin should be assessed for flushing and peripheral edema, especially behind the medial malleolus and the sacral area. Blood dyscrasias may occur in patients on chronic isradipine therapy, which may include signs of infection, bleeding, and poor healing.

#### Storage

Store at controlled room temperature. Protect from moisture and light.

# Administration

Do not crush, open, or break extended-release tablets. Do not abruptly discontinue isradipine. Compliance is essential to control hypertension. May take without regard to food. Do not administer with grapefruit juice.

# Itraconazole

it-ra-con'a-zol Sporanox Do not confuse Sporanox with Suprax.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antifungals, azole antifungals

# **MECHANISM OF ACTION**

A fungistatic antifungal that inhibits the synthesis of ergosterol, a vital component of fungal cell formation. *Therapeutic Effect:* Damages the fungal cell membrane, altering its function.

# PHARMACOKINETICS

Moderately absorbed from the GI tract. Absorption is increased if the drug is taken with food. Protein binding: 99%. Widely distributed, primarily in the fatty tissue, liver, and kidneys. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 21 h; metabolite, 12 h.

# AVAILABILITY

*Capsules:* 100 mg. *Oral Solution:* 10 mg/mL. *Injection:* 10 mg/mL (25-mL ampule).

#### INDICATIONS AND DOSAGES • Blastomycosis, histoplasmosis, and aspergillosis

# PO

*Adults, Elderly.* Initially, 200 mg once a day. Maximum: 400 mg/day in 2 divided doses. IV INFUSION *Adults, Elderly.* 200 mg twice a day for 4 doses, then 200 mg once a day.

#### Life-threatening fungal infections PO

Adults, Elderly. 600 mg/day in 3 divided doses for 3-4 days, then 200-400 mg/day in 2 divided doses. IV

Adults, Elderly. 200 mg twice a day for 4 doses, then 200 mg once a day. • Esophageal candidiasis

# PO (ORAL SOLUTION ONLY) Adults, Elderly. Swish 10 mL in mouth for several seconds, then swallow. Maximum: 200 mg/day.

Itraconazole (Generic Name)
#### Oropharyngeal candidiasis

PO (ORAL SOLUTION ONLY) Adults, Elderly. Vigorously swish 10 mL in the mouth for several seconds and then swallow (20 mL total daily dose) once a day. Usually given 1-2 wks.

### Onychomycosis of toenails PO

Adults. 200 mg once daily for 12 wks.

Onychomycosis of fingernails
 PO

*Adults.* Give 200 mg twice daily for 1 wk; rest for 3 wks; then give 200 mg twice daily for 1 wk.

## Dosage in renal impairment Do not use itraconazole IV if CrCl 30 mL/min.

#### **OFF-LABEL USES**

Suppression of histoplasmosis; treatment of disseminated sporotrichosis, fungal pneumonia and septicemia, or ringworm of the hand.

#### CONTRAINDICATIONS

Hypersensitivity to itraconazole, fluconazole, ketoconazole, or miconazole. Do not use itraconazole for treatment of onychomycosis if patient has CHF.

Coadministration with cisapride, pimozide, quinidine, dofetilide, levomethadyl, lovastatin, simvastatin, and ergot alkaloids is contraindicated.

#### INTERACTIONS

#### Drug

Antacids, didanosine,  $H_2$ antagonists: May decrease itraconazole absorption; take itraconazole 2 h before taking antacids, didanosine, or  $H_2$  antagonists. **Buspirone, cyclosporine, digoxin, midazolam, triazolam, allopurinol, felodipine:** May increase blood concentration of these drugs. **Carbamazepine, phenobarbital:** May increase metabolism of

itraconazole. **Cyclosporine, protease inhibitors, nisoldipine, haloperidol, carbamazepine, erythromycin, clarithromycin, azithromycin, alfentanil, corticosteroids, zolpidem:** May increase plasma level of these drugs.

HMG-CoA reductase inhibitors (statins): May increase side effects and plasma levels of statins; either avoid using itraconazole with statins or lower their dosages when using itraconazole to limit the risk of rhabdomyolysis. Lovastatin and simvastatin are contraindicated.

**Oral anticoagulants, warfarin:** May inhibit warfarin metabolism; may increase the effect of oral anticoagulants generally.

**Oral antidiabetic agents:** May increase the risk of hypoglycemia. **Phenytoin, rifampin:** May decrease itraconazole blood concentration.

#### Herbal

None known. Food

**Cola products:** May increase plasma levels of itraconazole.

**Grapefruit juice:** May decrease itraconazole absorption. Avoid.

#### DIAGNOSTIC TEST EFFECTS

May increase serum LDH, serum alkaline phosphatase, serum bilirubin, SGOT (AST), and SGPT (ALT) levels. May decrease serum potassium level.

#### IV INCOMPATIBILITIES

! Dilution compatibilities of itraconazole with any solution other than 0.9% NaCl are unknown. Don't mix with D5W or lactated Ringer's solution. Do not administer any medication in same bag or through same IV line as itraconazole.

#### SIDE EFFECTS

Frequent (9%-11%) Nausea, rash.

Occasional (3%-5%)

Vomiting, headache, diarrhea, hypertension, peripheral edema, fatigue, fever.

#### Rare (≤ 2%)

Abdominal pain, dizziness, anorexia, pruritus.

#### SERIOUS REACTIONS

• Hepatitis (as evidenced by anorexia, abdominal pain, unusual fatigue or weakness, jaundiced skin or sclera, and dark urine) occurs rarely.

 May cause new or worsened heart failure. More common with IV formulation. Consider discontinuing if heart failure occurs.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with achlorhydria, hepatitis, HIV infection, hypochlorhydria, or impaired liver function, or patients with heart failure or risk factors for cardiac compromise. Be aware that itraconazole is distributed in breast milk. Be aware that the safety and efficacy of itraconazole have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment. Carefully assess potential serious drug interactions.

Obtain the baseline temperature, check the liver function test results, as appropriate, and determine whether there is a history of allergies before giving the drug. Assess for signs and symptoms of liver dysfunction. Report any anorexia, dark urine, nausea, pale stool, unusual fatigue, yellow skin, or vomiting to the physician. Development of hepatic problems may require drug discontinuation. Therapy will continue for at least 3 mo and until lab tests and overall condition indicate that the infection is controlled. Be aware that itraconazole has a tendency to create GI side effects; telling the patient to remain in semisupine position while reclining will reduce these effects.

#### Storage

Store oral formulations and solutions for injection at room temperature. Do not freeze.

#### Administration

! Doses larger than 200 mg should be given in 2 divided doses. Give capsules with food to increase absorption. Give solution on an empty stomach. Do not give either with grapefruit juice.

For IV administration, use only components provided by the manufacturer. Do not dilute with any other diluent. Add full contents of amp (250 mg/10 mL) to infusion bag provided (50 mL 0.9% NaCl) and mix gently.

! Then withdraw 15 mL of the solution from the bag before administering to patient; otherwise, patient will receive overdosage. Do not give as an IV bolus; slowly infuse over 60 min using the extension line and infusion set provided. After administration, flush infusion set with 15-20 mL 0.9% NaCl and discard entire infusion line.

#### lvermectin (Systemic)

eye-ver-mek'tin

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

**Classification:** Antihelmintics, systemic

#### **MECHANISM OF ACTION**

Selectively binds to chloride ion channels in invertebrate nerve/muscle cells, increasing permeability to chloride ions. In general, the following organisms are susceptible to ivermectin: Onchocerca volvulus, pediculosis capitis, Strongyloides stercoralis, Sarcoptes scabiei, and Wuchereria bancrofti. Therapeutic Effects: Causes paralysis/death of parasites.

#### PHARMACOKINETICS

Does not readily cross the bloodbrain barrier. Metabolized in the liver. Excreted in the feces. *Half-life:* 4 h. Well absorbed with plasma concentrations proportional to the dose.

#### AVAILABILITY

Tablets: 3 mg.

### INDICATIONS AND DOSAGES Strongyloidiasis

PO

Adults, Elderly, Children weighing < 3 lb. 200 mcg/kg as a single dose.

Onchocerciasis (river blindness)
 PO

Adults, Elderly, Children weighing more than 33 lb. 150 mcg/kg as a single dose at 3-12-mo intervals (12 mo is most common).

#### Scabies (off-label)

PO

*Adults.* 200 mcg/kg as a single dose and repeat 2 wks later.

#### Norwegian scabies (crusted scabies infection), superinfected scabies, or resistant scabies (off-label)

PO

*Adults.* 200 mcg/kg with repeated treatments or combined with a topical scabicide.

#### Pediculosis (resistant cases) (off-label)

PO

*Adults.* A regimen of 2 doses of 200 mcg/kg with each dose separated by 10 days.

#### **OFF-LABEL USES**

Cutaneous larva migrans, filariasis, pediculosis, scabies, *Wuchereria* bancrofti (Bancroft's filariasis).

#### CONTRAINDICATIONS

Hypersensitivity to ivermectin or to any one of its components. Should not be used in women who are pregnant, in infants or children under 33 lb.

#### INTERACTIONS

#### Drug

Carbamazepine: May decrease the concentration of ivermectin. Corticosteroids: May have a synergistic effect with ivermectin reducing inflammation caused by river blindness infestation. CYP3A4 inducers: Decrease the levels of ivermectin. CYP3A4 inhibitors: Increase the levels of ivermectin. Warfarin: Reports of increased INR. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase SGOT (AST), SGPT (ALT), alkaline phosphatase, BUN, eosinophil count. May decrease WBC.

#### SIDE EFFECTS Occasional

#### Abdominal pain, anorexia, arthralgia, constipation, diarrhea, dizziness, drowsiness, edema, fatigue, fever, lymphadenopathy, maculopapular or

unspecified rash, nausea, vomiting, orthostatic hypotension, pruritus, Stevens-Johnson syndrome, toxic epidermal necrolysis, tremor, urticaria, vertigo, visual impairment, weakness.

#### Less Common

Eye or eyelid irritation, pain, redness, swelling, headache, swelling of the face, arms, feet, or legs.

#### Rare

Orthostatic hypotension, loss of appetite, shaking or trembling, sleepiness.

#### SERIOUS REACTIONS

• Worsening of Mazzotti reactions (e.g., arthralgia, synovitis, lymph node enlargement and tenderness, pruritus, edema, papular and pustular urticarial rash, and fever.

· Seizures (rare).

• Severe allergic reactions are possible, including anaphylaxis or serious skin rashes.

· Hepatitis (rare).

 Cardiovascular reactions, such as orthostatic hypotension and ECG changes (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bronchial asthma. Treating *Loa loa* infection with ivermectin may result in encephalopathy. It is unknown whether ivermectin crosses the placenta and should be avoided during pregnancy. Ivermectin is distributed into breast milk; however, it is not reported to cause problems in nursing babies. Safety and efficacy have not been established in children under 33 lb or in elderly patients.

Light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided. Joint or muscle pain; fever; pain and tender glands in neck, armpits, or groin; skin rash; or rapid heartbeat may also occur (primarily during onchocerciasis therapy).

Follow-up medical examination schedules should be adhered to; additional treatment may be required in intervals of 3-12 mo.

#### Storage

Store at room temperature below 86° F. Administration

Take as a single dose with a full glass of water on an empty stomach 1 h before breakfast.

#### Ixabepilone

ix′ab-ep′i-lone ★ ♥ Ixempra

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastics, epothilones

#### **MECHANISM OF ACTION**

Ixabepilone is unique chemical class agent, an epothilone, and a microtubule stabilizing agent with activity similar to taxanes. Ixabepilone directly binds to β-tubulin subunits on microtubules and promotes tubulin polymerization and microtubule stabilization via inhibition of depolymerization. The action leads to microtubule bundles. The damage to spindle formation causes G2/M phase cell-cycle arrest, which results in cell death. In addition to direct antitumor activity, ixabepilone inhibits angiogenesis. Therapeutic Effect: Arrests cell cycle, promotes apoptosis.

#### PHARMACOKINETICS

After IV infusion, ixabepilone exhibits linear kinetics. Protein binding: 67%-77%. Extensively distributes to extravascular spaces. Metabolized in the liver by CYP3A4. Over 30 metabolites identified. Excreted in feces (65%) and urine over a period of 7 days. *Half-life*: 52 h.

#### AVAILABILITY

*Powder for Injection:* 15 mg, 45 mg; supplied with diluent that includes polyoxyethylated castor oil and dehydrated alcohol.

### INDICATIONS AND DOSAGES

Metastatic breast cancer

NOTE: Ixabepilone doses for patients with BSA >  $2.2 \text{ m}^2$  should be calculated based on  $2.2 \text{ m}^2$ .

#### With capecitabine IV INFUSION

Adults. 40 mg/m<sup>2</sup> IV over 3 h, given q3wk in combination with capecitabine (2000 mg/m<sup>2</sup>/day PO in divided doses on days 1-14 of 21-day cycle).

#### Breast cancer resistant to, intolerant of, or progressing despite anthracycline, taxane, or capecitabine

IV INFUSION *Adults.* 40 mg/m<sup>2</sup> IV over 3 h, given q3wk.

## Dosage with a strong CYP3A4 inhibitor

Reduce to 20 mg/m<sup>2</sup> IV over 3 h, given q3wk. If the strong inhibitor is discontinued, allow a washout period of approximately 1 wk before adjusting to the normal dosage.

#### Dosage adjustments for neuropathy, neutropenia, or hepatic dysfunction

! Expect reductions dependent on degree of toxicity and the use of other agents (see manufacturer information). In combination with capecitabine do *not* give if AST or ALT > 2.5 times the upper limit of normal (ULN) or bilirubin > 1 times ULN due to an increased risk of toxicity and neutropenia-related death.

#### CONTRAINDICATIONS

Hypersensitivity to ixabepilone or to any drugs formulated with Cremophor® EL (e.g., polyoxyethylated castor oil); baseline neutrophil count < 1500 cells/mm<sup>3</sup> or a platelet count < 100,000 cells/mm<sup>3</sup>. Patients with AST or ALT > 2.5 times the upper limit of normal (ULN) or bilirubin > 1 times ULN must *not* be treated with ixabepilone in combination with capecitabine due to the risk of toxicity and neutropenia-related mortality.

#### INTERACTIONS Drug

#### Potent CYP3A4 inhibitors (e.g.,

**ketoconazole):** Increases ixabepilone levels. Try to avoid if possible. If alternative treatment cannot be chosen, a lower dose should be considered; monitor closely. Use caution when using mild or moderate inhibitors (e.g., erythromycin,

fluconazole, or verapamil). Potent CYP3A4 inducers (e.g., rifampin, phenytoin, carbamazepine, rifabutin, phenobarbital): Decreases

ixabepilone levels significantly. Avoid. Choose alternate agent if possible. If must be given a strong CYP3A4 inducer, a gradual dose adjustment to 60 mg/m<sup>2</sup> over 4 h may be considered with caution.

#### Live-virus vaccines:

Contraindicated due to viral replication, adverse reactions to the virus, and the immunocompromised status of the patient. May also decrease the patient's antibody response to the vaccine.

#### Herbal

**St. John's wort:** May decrease ixabepilone plasma concentrations unpredictably. Avoid.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase bilirubin, AST (SGOT), and ALT (SGPT) levels. May decrease WBC, RBC, platelet count, and hemoglobin levels.

#### IV INCOMPATIBILITIES

Do not infuse or mix with any other medications. Only dilute for infusion in the solutions indicated.

#### SIDE EFFECTS Frequent (> 20%)

Peripheral sensory neuropathy, fatigue/asthenia, myalgia/ arthralgia, alopecia, nausea, vomiting, stomatitis/mucositis, diarrhea, and musculoskeletal pain. More than 40% experience neutropenia, leukopenia, anemia, and thrombocytopenia. In combination with capecitabine: also hand-foot syndrome, anorexia, abdominal pain, nail disorders, and constipation.

#### Occasional (< 20%)

Headache, dizziness, insomnia, edema, myalgia, hot flushes, pruritus.

#### SERIOUS REACTIONS

 Severe hypersensitivity reactions related to infusion occur in 1% of patients. To help reduce the risk, must premedicate all patients before treatment (see Administration).

 Dose-limiting reactions include myelosuppression (evidenced mostly by neutropenia) and peripheral neuropathy (burning sensation, hyperesthesia, hypoesthesia, paresthesia, discomfort, or neuropathic pain).

• Risk for serious and opportunistic infections.

Radiation recall reactions reported post-marketing.

#### PRECAUTIONS & CONSIDERATIONS

Must adjust dose in liver dysfunction; do not give to patients in combination with capecitabine if liver dysfunction meets stated parameters. Use with caution in patients with significant renal impairment, anemia, cardiac disease, angina, or arrhythmia. Avoid use in pregnant women due to the risk of fetal harm; screen for pregnancy prior to use. Women should avoid becoming pregnant during treatment. It is unknown whether ixabepilone is distributed in breast milk. Safety and efficacy have not been established in children.

Must premedicate all patients before treatment. Closely monitor for signs of infusion reaction and hypersensitivity. Monitor CBC. Monitor for signs of infection. Monitor for symptoms of neuropathy, primarily sensory.

#### Storage

Store unopened vials and diluent in the original kit under refrigeration and protected from light; do not freeze. Once reconstituted, may be stored in the vial (not a syringe) for a maximum of 1 h at room temperature and light prior to dilution for infusion. Once diluted for infusion, the final solution must be used within 6 h of preparation.

#### Administration

CAUTION: Observe and exercise usual cautions for handling, administering, and preparing solutions of cytotoxic drugs.

! Hypersensitivity reactions are common. Must premedicate *all* patients with an H<sub>1</sub> antagonist (e.g., diphenhydramine 50 mg PO or equivalent) and an H<sub>2</sub> antagonist (e.g., ranitidine 150-300 mg PO or equivalent) 1 h before each treatment. Patients who experience a hypersensitivity reaction will also require premedication with corticosteroids (e.g., dexamethasone 20 mg IV 30 min or orally 60 min before infusion).

Ixabepilone is for intravenous (IV) infusion only. Remove the

kit from the refrigerator and allow to stand at room temperature for approximately 30 min. When first removed from the refrigerator, a white precipitate may be observed in the diluent, but this will dissolve as it warms.

To allow for withdrawal losses, the vial labeled as 15 mg for injection contains 16 mg of ixabepilone and the vial labeled as 45 mg contains 47 mg of ixabepilone. The vial must be constituted with supplied diluent. The 15-mg vial is constituted with 8 mL of diluent and for the 45-mg vial use 23.5 mL of diluent. Gently swirl and invert the vial until the powder in the drug is completely dissolved. The vial concentration will be 2 mg/mL.

Before infusion, the drug *must* be further diluted to a final ixabepilone concentration of 0.2-0.6 mg/mL. For most doses, a 250-mL bag of fluid is sufficient. The infusion must be prepared in a DEHP [di-(2-ethylhexyl) phthalate] free bag.

The following infusion fluids are compatible: lactated Ringer's injection; or 0.9% NaCl; or PLASMA-LYTE A Injection pH 7.4®. (NOTE: When using 250 mL or 500 mL 0.9% NaCl to prepare, the pH must be adjusted to a pH between 6 and 9 by adding 2 mEq of sodium bicarbonate injection, prior to the addition of the ixabepilone dose.) Thoroughly mix the infusion bag by manual rotation.

The IV infusion solution must be administered over 3 h through an appropriate in-line filter (0.2 to 1.2 micron). DEHP-free infusion containers and administration sets must be used.

#### Ketoconazole

kee-toe-koe'na-zole ★ Extina, Kuric, Nizoral, Nizoral A-D, Xolegal 🙅 Ketoderm, Nizoral, Nu-Ketocon Do not confuse Nizoral with Nasarel.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC (1% shampoo only)

Classification: Antifungals, azole antifungals

#### MECHANISM OF ACTION

A fungistatic antifungal that inhibits the synthesis of ergosterol, a vital component of fungal cell formation. Therapeutic Effect: Damages the fungal cell membrane, altering its function.

#### **PHARMACOKINETICS**

PO: Peak serum concentrations achieved in 1-2 h; highly protein bound. Metabolized in liver, excreted in bile, feces. Requires acidic pH for absorption; distributed poorly to cerebrospinal fluid (CSF). Half-life: 2 h; terminal half-life: 8 h.

#### **AVAILABILITY**

Tablets (Nizoral): 200 mg. Cream (Kuric): 2%. Shampoo (Nizoral AD): 1%. Topical Foam (Extina): 2%. Shampoo (Nizoral): 2%. Topical Gel (Xolegel): 2%.

#### INDICATIONS AND DOSAGES

Systemic fungal infections such as histoplasmosis, blastomycosis, candididasis, chronic mucocutaneous candidiasis, coccidioidomycosis,

#### paracoccidioidomycosis, chromomycosis, onychomycosis, oral thrush, candiduria PO

Adults, Elderly. 200-400 mg/day. Maximum: 800 mg/day in 2 divided doses.

Children over 2 yr. 3.3-6.6 mg/kg/ day.

#### Dermatologic conditions such as seborrheic dermatitis, tinea corporsis, tinea capitis, tinea manus, tinea cruris, tinea pedis

TOPICAL

Adults, Elderly. Apply to affected area 1-2 times a day for 2-4 wks. SHAMPOO

Adults, Elderly, Children  $\geq 12$  vr. Use twice weekly for 4 wks, allowing at least 3 days between shampooing. Use intermittently to maintain control.

#### **OFF-LABEL USES**

Systemic: Treatment of fungal pneumonia.

#### CONTRAINDICATIONS

Hypersensitivity, lactation, fungal meningitis.

Systemic coadministration with cisapride, pimozide, quinidine, dofetilide, lovastatin, simvastatin, ergot alkaloids, terfenadine, astemizole, and triazolam is contraindicated.

#### INTERACTIONS

NOTE: Ketoconazole (oral) is a potent inhibitor of CYP3A4 and is contraindicated with a variety of medications. Review manufacturer contraindications carefully for drug interactions.

#### Drug

Alcohol, acetaminophen (high-dose, long-term use); carbamazepine, sulfonamides, and other hepatotoxic medications:

Ketoconazole (Generic Name)

#### Ketamine Hydrochloride

kee<sup>7</sup>ta-meen high-droh-klor'ide ★ ➡ Ketalar **Do not confuse Ketalar with** ketorolac.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B Controlled Substance Schedule: III

**Classification:** Anesthetics, general

K

#### **MECHANISM OF ACTION**

A rapidly acting general anesthetic that selectively blocks afferent impulses and interacts with central nervous system (CNS) transmitter systems. *Therapeutic Effect:* Produces an anesthetic state characterized by profound analgesia and normal pharyngeal-laryngeal reflexes.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
IM	3-4 min	N/A	12-25 min
(anesthetic)			
IM	30 min	N/A	15-30 min
(analgesic)			
IV	30 sec-	N/A	5-10 min
(anesthetic)	onds		
IV	10-15	N/A	NA
(analgesic)	min		

Rapidly distributed. Metabolized in the liver. Primarily excreted in urine. *Half-life:* Distribution: 10-15 min, elimination: 2-3 h.

#### AVAILABILITY

Injection: 10 mg/mL, 50 mg/mL, 100 mg/mL.

# INDICATIONS AND DOSAGES Sole anesthetic for short diagnostic and surgical procedures

#### that do not require skeletal muscle relaxation, induction of anesthesia before administering other general anesthetics, supplement to lowpotency agents

IM Adults, Elderly. 3-8 mg/kg. Children. 3-7 mg/kg. IV Adults, Elderly. 1-4.5 mg/kg. Children. 0.5-2 mg/kg.

#### CONTRAINDICATIONS

Known hypersensitivity, aneurysms, angina, congestive heart failure, elevated intracranial pressure, hypertension, thyrotoxicosis.

#### INTERACTIONS

#### Drug

All CNS depressants and nondepolarizing muscle relaxants: May increase the risk of hypotension and prolonged respiratory depression.

Herbal and Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase intraocular pressure.

#### IV INCOMPATIBILITIES

No information available for Y-site administration.

#### IV COMPATIBILITIES

Bupivacaine (Marcaine), fentanyl (Sublimaze), lidocaine, morphine, propofol (Diprivan).

#### SIDE EFFECTS Frequent

Increased BP and pulse rate; emergence reaction (marked by dream-like state, delirium, hallucinations, and vivid imagery; and occasionally accompanied by confusion, excitement, and irrational behavior; lasts from few hours to 24 h after ketamine administration).

#### Occasional

Pain at injection site.

Rash. Hypotension and bradycardia have been observed.

#### SERIOUS REACTIONS

• Continuous or repeated intermittent infusion may result in extreme CNS depression and circulatory or respiratory depression.

• Too-rapid IV administration of ketamine may produce severe hypotension, respiratory depression, and irregular muscle movements.

• Psychiatric effects: hallucinations, emergence delirium.

• Abuse of ketamine can lead to dependence.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with intoxication, chronic alcoholism, a full stomach, gastroesophageal reflux disease, and hepatic impairment. Ketamine is not recommended for pregnant or breastfeeding women. No age-related precautions have been noted in children or in elderly patients. Avoid tasks requiring mental alertness or motor skills until 24 h after anesthesia has been discontinued.

Patients must be continuously monitored and facilities for maintenance of patent airway, ventilatory support, oxygen supplementation, and circulatory resuscitation should be immediately available. Strict aseptic techniques must be followed in handling ketamine HCl.

Vital signs should be monitored before and every 3-5 min during and after ketamine administration until the patient has recovered. A barbiturate or hypnotic should be administered in an emergence reaction. Verbal, tactile, and visual stimulation should be minimized during the recovery period. Advise the patient to avoid performing tasks requiring mental alertness or motor skills for 24 h after anesthesia has been discontinued. A responsible person must drive patient home after recovery.

#### Storage

Store unopened vials at room temperature. Protect from light. Administration

#### Administration

Give ketamine by IV push over 60 seconds when it is used to induce anesthesia. Dilute the 100 mg/mL vial of ketamine with an equal volume of sterile water for injection, D5W, or 0.9% NaCl. For a maintenance IV infusion, dilute the 50-mg/mL vial (10 mL) or 100-mg/ mL vial (5 mL) of ketamine with 250-500 mL D5W or 0.9% NaCl to provide a concentration of 1-2 mg/mL. Administer maintenance dose by IV push slowly at a rate of 0.5 mg/kg/min over 60 seconds. A too-rapid IV administration may result in severe hypotension and respiratory depression.

For IM administration, use the 10-mg/mL vial of ketamine. Do not dilute the 10-mg/mL vial.

May increase hepatotoxicity of ketoconazole.

Antacids, anticholinergics, didanosine, H<sub>2</sub> antagonists, protonpump inhibitors (omeprazole): May decrease ketoconazole absorption; take 2 h after ketoconazole dose.

Benzodiazepines (midazolam, triazolam), warfarin: May inhibit metabolism of these drugs. Cyclosporine, HMG-CoA reductase inhibitors (statins): May increase blood concentration and risk of hepatotoxicity of these drugs. Contraindicated with lovastatin and simvastatin.

Buspirone, carbamazepine, corticosteroids, haloperidol, indinavir, nisoldipine, ritonavir, saquinavir, tricyclic antidepressants, zolpidem: May increase levels of these drugs. Isoniazid, rifampin: May decrease blood concentration of ketoconazole. Tacrolimus: May cause leukocytic disorders.

Systemic coadministration with cisapride, pimozide, quinidine, dofetilide, lovastatin, simvastatin, ergot alkaloids, terfenadine, astemizole, and triazolam: Contraindicated; do not use.

#### Herbal

**Echinacea:** May have additive hepatotoxic effects.

Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, serum bilirubin, SGOT (AST), and SGPT (ALT) levels. May decrease serum corticosteroid and testosterone concentrations.

#### SIDE EFFECTS

#### Occasional (3%-10%)

Nausea, vomiting.

#### Rare (< 2%)

Abdominal pain, diarrhea, headache, dizziness, photophobia, pruritus. Topical: Itching, burning, irritation.

#### SERIOUS REACTIONS

 Hematologic toxicity (as evidenced by thrombocytopenia, hemolytic anemia, and leukopenia) occurs occasionally.

 Hepatotoxicity may occur within 1 wk to several months after starting therapy.

Anaphylaxis occurs rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with liver impairment. Use with care during lactation and pregnancy, and in children, and elderly with renal impairment.

Confirm that a culture or histologic test was done for accurate diagnosis; therapy may begin before results are known.

Expect to monitor liver function test results. Be alert for signs and symptoms of hepatotoxicity, including anorexia, dark urine, fatigue, nausea, pale stools, and vomiting, that are unrelieved by giving the medication with food. Monitor complete blood count (CBC) for evidence of hematologic toxicity. Assess the daily pattern of bowel activity and stool consistency. Assess for dizziness, provide assistance as needed, and institute safety precautions. Evaluate skin for itching, rash, and urticaria.

Prolonged therapy over weeks or months is usually necessary. Do not miss a dose, and continue therapy for as long as directed. Avoid alcohol to avoid potential liver toxicity. Avoid tasks that require mental alertness or motor skills until response to the drug is established.

If dark urine, increased irritation in topical use, onset of other new

symptoms, pale stool, or yellow skin or eyes develop, notify the physician.

In dermatologic treatment, separate personal items that come in direct contact with the affected area. **Storage** 

Store products at room temperature. Foam and gels are flammable; keep away from excessive heat and away from flame. Do not freeze.

#### Administration

Give oral ketoconazole with food to minimize GI irritation. Tablets may be crushed. Ketoconazole requires acidity for absorption in the GI tract; give didanosine, antacids, anticholinergics, H<sub>2</sub> blockers, and proton-pump inhibitors (all) at least 2 h after dosing.

Apply ketoconazole shampoo to wet hair, massage for 1 min, rinse thoroughly, reapply for 3 min, then rinse. Use initially twice weekly for 4 wks with at least 3 days between shampooing. Further shampooing will be based on the response to the initial treatment.

Apply topical ketoconazole sparingly and rub gently into the affected and surrounding area. Avoid drug contact with the eyes, keep the skin clean and dry, and wear light clothing for ventilation.

#### Ketoprofen

kee-toe-proe'fen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAIDs)

#### **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces the inflammatory response and intensity of pain.

#### PHARMACOKINETICS

PO: Peak levels achieved in 2 h. 99% plasma protein binding. Metabolized in liver, excreted in urine and breast milk as metabolites. *Half-life:* 3-3.5 h.

#### AVAILABILITY

Capsules: 50 mg, 75 mg. Capsules (Extended Release): 200 mg.

### INDICATIONS AND DOSAGES Acute or chronic rheumatoid

#### Acute or chronic meumatoid arthritis and osteoarthritis

PO (IMMEDIATE RELEASE) Adults. Initially, 75 mg 3 times a day or 50 mg 4 times a day. Elderly. Initially, 25-50 mg 3-4 times a day. Maintenance: 150-300 mg/day in 3-4 divided doses. PO (EXTENDED RELEASE) Adults, Elderly. 200 mg once a day.

 Mild to moderate pain, dysmenorrhea

Adults, Elderly. 25-50 mg q6-8h. Maximum: 300 mg/day.

• **Dosage in renal impairment** Mild: 150 mg/day maximum.

Severe: 100 mg/day maximum.

#### OFF-LABEL USES

Treatment of acute gouty arthritis, psoriatic arthritis, ankylosing spondylitis, vascular headache.

#### CONTRAINDICATIONS

Previous hypersensitivity to ketoprofen; those who have experienced asthma, urticaria, or serious reactions after taking aspirin or other NSAIDs; use within 14 days of CABG surgery.

Ketoprofen (Generic Name)

#### INTERACTIONS

#### Drug

Acetaminophen (long-term or chronic use): Increased risk of nephrotoxicity, hepatotoxicity. Antihypertensives, diuretics: May decrease the effects of these drugs.

Aspirin, other NSAIDs, corticosteroids, alcohol, or other salicylates: May increase the risk of GI side effects such as bleeding. NSAIDs may negate cardioprotective effect of ASA.

**Bone marrow depressants:** May increase the risk of hematologic reactions.

**Cyclosporine:** Possible decreased renal function.

**Diuretics:** May decrease diuretic effect.

Heparin, oral anticoagulants, thrombolytics, oral antidiabetic agents: May increase the effects of

these drugs. Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Probenecid:** May increase the ketoprofen blood concentration.

**SSRIs, SNRIs:** Increased risk of GI bleeding.

**Tetracycline:** Possible increased photosensitivity.

#### Herbal

**Feverfew:** May decrease the effects of feverfew.

**Ginkgo biloba:** May increase the risk of bleeding.

#### Food

Alcohol: May increase dizziness; may increase risk of GI bleeding.

#### **DIAGNOSTIC TEST EFFECTS**

May prolong bleeding time. May increase serum alkaline phosphatase levels and liver function test results. May decrease hematocrit, blood hemoglobin, and serum sodium levels.

#### SIDE EFFECTS

Frequent (11%) Dyspepsia. Occasional (> 3%)

Nausea, diarrhea or constipation, flatulence, abdominal cramps, headache.

Rare (< 2%)

Anorexia, vomiting, visual disturbances, fluid retention.

#### SERIOUS REACTIONS

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, and severe hepatic reactions (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), and severe hypersensitivity reaction (bronchospasm, angioedema).

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with hepatic or renal impairment, and a predisposition to fluid retention. Caution is warranted in patients with a history of GI tract disease such as active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding or ulceration. Use the lowest effective dose for the shortest duration of time. Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Drug is excreted in breast milk as metabolite; caution is warranted in lactation. It is not known whether drug

crosses placenta; use with caution in pregnancy. No age-related precautions are noted except in cases of impaired renal function where dose adjustment may be required or in individuals age 75 or older.

CBC, blood chemistry, and renal and liver function tests should be obtained at the beginning and throughout therapy. Therapeutic response, such as improved grip strength, increased mobility, improved range of motion, and decreased pain, tenderness, stiffness, and swelling, should be assessed.

Because of possible increased photosensitivity attributed to NSAIDs, patients should be advised to wear a sunscreen with SPF 15 during UV exposure.

#### Storage

Store at room temperature. Protect from light and moisture.

#### Administration

Take ketoprofen with food, a full glass (8 oz) of water, or milk to minimize GI distress. Do not break, open, or chew extended-release capsules.

#### Ketorolac Tromethamine

kee-tor'oh-lak tro-meth'ay-meen Acular, Acular LS, Acuvail, Sprix Acular, Acular-LS, Toradol Do not confuse Acular with Acthar or Ocular. Do not confuse ketorolac with Ketalar.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used in third trimester)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAIDs), ophthalmics

#### **MECHANISM OF ACTION**

An NSAID that inhibits prostaglandin synthesis and reduces prostaglandin levels in the aqueous humor and body. *Therapeutic Effect:* Relieves pain stimulus and reduces intraocular inflammation.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30-60 min	1.5-4 h	4-6 h
IV/IM	30 min	1-2 h	4-6 h

Readily absorbed from the GI tract, after IM administration. Protein binding: 99%. Largely metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Halflife:* 3.8-6.3 h (increased with impaired renal function and in elderly patients).

#### AVAILABILITY

Tablets: 10 mg. Injection: 15 mg/mL, 30 mg/mL. Nasal (Sprix): 15.75 mg/spray. Ophthalmic Solution (Acular): 0.5%. Ophthalmic Solution (Acular LS): 0.4%. Ophthalmic Solution (Acuvail): 0.45% preservative-free.

### INDICATIONS AND DOSAGES Short-term relief of moderate pain (multiple doses)

! The combined use of ketorolac injection and tablets, or use of the nasal form, is not to exceed 5 days.

PO

*Adults, Elderly.* 10 mg q4-6h. Maximum: 40 mg/24 h. NOTE: Oral route is only used as continuation following IV or IM dosing, if necessary. IV/IM

Adults younger than 65 yr. 30 mg q6h. Maximum: 120 mg/24 h.

Ketorolac Tromethamine (Generic Name)

Elderly 65 vr and older, Adults with renal impairment or weighing < 50 kg. 15 mg q6h. Maximum: 60 mg/24 h. NASAL (SPRIX) Adults < 65 yrs and  $\geq$  50 kg: 1 spray (15.75 mg/spray) in each nostril q6-8h. Maximum 126 mg/day. Elderly or renally impaired adults, or adults < 50 kg: 1 spray (15.75 mg) in only one nostril q 6-8 h. Maximum 63 mg/day. Short-term relief of moderate pain (single dose) IV Adults vounger than 65 vr. Adolescents 17 vr and older weighing more than 50 kg: 30 mg. Elderly 65 vr and older, Adults with renal impairment or weighing < 50 kg. 15 mg. Children 2-16 yr. 0.5 mg/kg. Maximum: 15 mg. IM Adults younger than 65 vr, Adolescents 17 yr and older, weighing more than 50 kg. 60 mg. Elderly 65 vr and older, Adults with renal impairment or weighing < 50 kg. 30 mg. Children 2-16 vr. 1 mg/kg. Maximum: 30 mg. Allergic conjunctivitis OPHTHALMIC (ACULAR) Adults, Elderly, Children 3 yr and older. 1 drop 4 times a day. Cataract extraction **OPHTHALMIC (ACULAR)** Adults, Elderly. 1 drop 4 times a day. Begin 24 h after surgery and continue for 2 wks. **OPHTHALMIC (ACUVAIL)** Adults, Elderly, 1 drop to affected eye(s) twice per day beginning 1 day prior to surgery. Continue on the day of surgery and then for 2 weeks. Refractive surgery OPHTHALMIC (ACULAR LS) Adults, Elderly, 1 drop 4 times a day for 4 days.

#### CONTRAINDICATIONS

Active peptic ulcer disease, chronic inflammation of the GI tract, GI bleeding or ulceration, history of hypersensitivity to aspirin or NSAIDs, use within 14 days of CABG surgery, advanced renal failure, labor and delivery, breastfeeding, cerebrovascular bleeding and other serious bleeding or risk for such bleeding, use with probenecid or pentoxifylline, use with aspirin or other NSAIDs.

#### INTERACTIONS

#### Drug

Alcohol, corticosteroids: May increase the risk of GI side effects such as bleeding.

Aspirin, other salicylates, other NSAIDs: May increase the risk of GI side effects such as bleeding. NSAIDs may negate cardioprotective effect of ASA. Contraindicated for concurrent use.

#### **β-Blockers, ACE inhibitors, diuretics:** May decrease the antihypertensive effects of these.

**Bone marrow depressants:** May increase the risk of hematologic reactions.

**Cyclosporine:** Possible decreased renal function.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of these drugs.

Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Pentoxifylline:** Contraindicated for concurrent use.

**Probenecid:** May increase ketorolac blood concentration to dangerous levels; contraindicated; do not use. **SSRIs, SNRIs:** Increased risk of GI bleeding.

#### Herbal

**Feverfew:** May decrease the effects of feverfew.

**Ginkgo biloba:** May increase the risk of bleeding.

#### Food

Alcohol: Increases dizziness; may increase risk of GI bleeding.

#### **DIAGNOSTIC TEST EFFECTS**

May prolong bleeding time. May increase liver function test results.

#### IV INCOMPATIBILITIES

Promethazine (Phenergan).

#### IV COMPATIBILITIES

Fentanyl (Sublimaze), hydromorphone (Dilaudid), morphine, nalbuphine (Nubain).

#### SIDE EFFECTS

#### Frequent (12%-17%)

Gastric pain, headache, nausea, abdominal cramps, dyspepsia.

#### Occasional (3%-9%)

Diarrhea. Ophthalmic: Transient stinging and burning.

#### Rare (1%-3%)

Constipation, vomiting, flatulence, stomatitis, dizziness. Ophthalmic: Ocular irritation, allergic reactions, superficial ocular infection, keratitis.

#### SERIOUS REACTIONS

 Rare reactions with long-term use include peptic ulcer disease,
 GI bleeding, gastritis, severe hepatic reactions (cholestasis, jaundice), nephrotoxicity (glomerular nephritis, interstitial nephritis, nephrotic syndrome), and an acute hypersensitivity reaction (including fever, chills, and joint pain).

- Hemorrhage.
- Hypersensitivity.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of GI tract disease such as chronic inflammation of GI tract. Use the lowest effective dose for the shortest duration of time. Anaphylactoid reactions have occurred in patients with aspirin triad hypersensitivity. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not use for post-op pain in CABG patients

Caution is warranted in patients with hepatic or renal impairment. It is unknown whether ketorolac is excreted in breast milk. Ketorolac should not be used during the third trimester of pregnancy because it can cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. Notify the physician if pregnant. The safety and efficacy of ketorolac have not been established in children, for continued use; a singledose regimen should be adhered to.

GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may increase the risk of hepatotoxicity or renal toxicity; a decreased dosage is recommended. Tasks that require mental alertness or motor skills should also be avoided.

CBC, liver and renal function tests, urine output, BUN level, and creatinine levels should be assessed. Be alert for signs of bleeding, which may also occur with ophthalmic use. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness; improved grip strength; and increased joint mobility, should be evaluated. Storage

Store all products at room temperature. Protect from light. Nasal spray should be discarded within 24 h of opening, even if the bottle still contains some medication.

#### Administration

! Ketorolac should not be administered by any route or combination of routes for more than 5 days. This drug may be given as a single dose, on a schedule, or on an as-needed basis, as prescribed.

Take oral ketorolac with food, milk, or antacids if GI distress occurs. Oral dosing is preceded by parenteral use. Duration total not to exceed 5 consecutive days.

For IV use, administer ketorolac undiluted by IV push over at least 15 seconds.

For IM use, slowly inject the drug deeply into a large muscle mass.

For ophthalmic use, place a finger on lower eyelid, and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket, and place the prescribed number of drops in the pocket. Gently close eye and apply digital pressure to the lacrimal sac for 1-2 min to minimize the risk of systemic effects. Remove excess solution with a tissue.

For nasal use, prime the nasal spray before first use; remove the cap cover and press pump down evenly and release 5 times. Blow nose gently to clear nostrils. Gently insert the tip into one nostril and point tip away from the center of the nose. Press down evenly on both sides of pump and spray. For patients needing 2 sprays per dose, repeat the nasal spray in the other nostril. Wipe tip and replace cap.

#### Ketotifen

kee-toe-teh'fen ★ Claritin Eye, Zaditor, Zyrtec Itchy Eye ▲ Claritin Eye, Zaditen, Zaditor, Zyrtec Itchy Eye

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC

#### Classification:

Antihistamines, ophthalmics

#### MECHANISM OF ACTION

An antihistamine that competes with histamine for histamine receptor sites, and stabilizes mast cells. *Therapeutic Effect:* Relieves symptoms associated with allergic conjunctivitis, such as redness, itching, and excessive tearing.

#### PHARMACOKINETICS

Minimal systemic absorption via application of eyedrops, especially with lacrimal occlusion. Duration of relief approximately 8-12 h.

#### AVAILABILITY

Ophthalmic Solution: 0.025%.

#### SIDE EFFECTS

#### Frequent

Conjunctival hyperemia, headache, rhinitis.

#### Occasional

Burning or stinging on application, dry eyes, tearing, ocular pain, eyelid disorder, itching.

#### Rare

Keratitis, conjunctivitis, temporary photophobia, rash, pharyngitis.

#### SERIOUS REACTIONS

• Allergic reactions are rare.

#### **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether ketotifen crosses the placenta or is distributed in breast milk. The safety and efficacy of this drug have not been established in children younger than 3 yr. No age-related precautions have been noted in elderly patients.

#### Storage

Store at room temperature. Do not freeze. Keep tightly closed when not in use.

#### Administration

For ophthalmic use only. To prevent contamination, care should be taken not to touch the dropper tip to any surface. Tilt head back and instill the drops in the conjunctival sac of the affected eye. Close the eye gently; then press gently on the lacrimal sac for 1 min. Wait at least 10 min before inserting contact lenses.

#### Labetalol Hydrochloride

la-bet'a-lole high-droh-klor'ide ★ Normodyne, Trandate Trandate Do not confuse Trandate with tramadol or Trental.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antihypertensives, mixed  $\beta$ - and  $\alpha$ -blocker

#### **MECHANISM OF ACTION**

An antihypertensive that blocks  $\alpha_1$ -,  $\beta_1$ -, and  $\beta_2$ - (large doses) adrenergic receptor sites. Large doses increase airway resistance. *Therapeutic Effect:* Slows sinus heart rate; decreases peripheral vascular resistance, cardiac output, and BP.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration (h)
PO	0.5-2 h	2-4 h	8-12 h
IV	2-5 min	5-15 min	2-4 h

Completely absorbed from the GI tract. Protein binding: 50%. Undergoes first-pass metabolism. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* PO, 6-8 h; IV, 5.5 h.

#### AVAILABILITY

Tablets (Normodyne, Trandate): 100 mg, 200 mg, 300 mg. Injection: 5 mg/mL.

## INDICATIONS AND DOSAGES Hypertension PO

*Adults*. Initially, 100 mg twice a day adjusted in increments of 100 mg

twice a day q2-3 days. Maintenance: 200-400 mg twice a day. Maximum: 2.4 g/day.

*Elderly*. Initially, 100 mg 1-2 times a day. May increase as needed.

#### Severe hypertension, hypertensive emergency

#### IV

*Adults*. Initially, 20 mg. Additional doses of 20-80 mg may be given at 10-min intervals, up to total dose of 300 mg.

IV INFUSION

*Adults*. Initially, 2 mg/min up to total dose of 300 mg.

PO (AFTER IV THERAPY) Adults. Initially, 200 mg; then, 200-400 mg in 6-12 h. Increase dose at 1-day intervals to desired level.

#### **OFF-LABEL USES**

Control of hypotension during surgery, treatment of chronic angina pectoris, treatment of HTN in children.

#### CONTRAINDICATIONS

Bronchial asthma, cardiogenic shock, second- or third-degree heart block, severe bradycardia, uncontrolled congestive heart failure, hypersensitivity.

#### INTERACTIONS

Drug

**Cimetidine:** May increase plasma level.

**Diuretics, other antihypertensives:** May increase hypotensive effect. **Hydrocarbon inhalation** 

**anesthetics:** May increase risk of hypotension or myocardial depression.

**Indomethacin**, **NSAIDs:** May decrease hypotensive effect.

**Insulin, oral hypoglycemics:** May mask symptoms of hypoglycemia and prolong hypoglycemic effect of these drugs.

Labetalol Hydrochloride (Generic Name)

**Lidocaine:** May result in decreased metabolism of labetalol.

**MAOIs:** May produce hypertension. **Sympathomimetics, xanthines:** 

May reduce effects of labetalol. Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum antinuclear antibody titer and BUN, serum LDH, lipoprotein, alkaline phosphatase, bilirubin, creatinine, potassium, triglyceride, uric acid, AST (SGOT), and ALT (SGPT) levels.

#### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), ceftriaxone (Rocephin), furosemide (Lasix), heparin, nafcillin (Nafcil), thiopental, sodium bicarbonate solutions.

#### 🗏 IV COMPATIBILITIES

Aminophylline, amiodarone (Cordarone), calcium gluconate, diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), enalapril (Vasotec), fentanyl (Sublimaze), hydromorphone (Dilaudid), lidocaine, lorazepam (Ativan), magnesium sulfate, midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, propofol (Diprivan).

#### SIDE EFFECTS

#### Frequent

Drowsiness, difficulty sleeping, unusual fatigue or weakness, diminished sexual ability, transient scalp tingling. Postural hypotension with IV use.

#### Occasional

Dizziness, dyspnea, peripheral edema, depression, anxiety,

constipation, diarrhea, nasal congestion, nausea, vomiting, abdominal discomfort.

#### Rare

Altered taste, dry eyes, increased urination, paresthesia.

#### SERIOUS REACTIONS

• Labetolol administration may precipitate or aggravate congestive heart failure (CHF) because of decreased myocardial stimulation.

 Abrupt withdrawal may precipitate ischemic heart disease, producing sweating, palpitations, headache, and tremor.

• May mask signs and symptoms of acute hypoglycemia (tachycardia, BP changes) in patients with diabetes.

• Hepatic injury, necrosis (rare).

• Intraoperative floppy iris syndrome (IFIS) has been observed in some patients during cataract surgery.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, medicationcontrolled CHF, impaired cardiac or hepatic function, nonallergic bronchospastic disease, including chronic bronchitis and emphysema. Patients with pheochromocytoma may require higher doses or closer monitoring to avoid paradoxical hypertension. Labetalol crosses the placenta and is distributed in small amounts in breast milk. The safety and efficacy of labetalol have not been established in children. In elderly patients, age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval.

Notify the physician of excessive fatigue, headache, prolonged dizziness, shortness of breath, or weight gain. BP for hypotension, respiratory status for shortness of breath, pattern of daily bowel activity and stool consistency, ECG for arrhythmias, and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 60 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed.

#### Storage

Store at room temperature. After dilution, IV solution is stable for 24 h.

#### Administration

Labetalol may be taken without regard to meals. Crush tablets if necessary. Do not abruptly discontinue the drug.

! Place the patient in a supine position for IV administration and for 3 h after receiving the medication. Expect a substantial drop in BP if the patient stands within 3 h following drug administration.

The solution for injection normally appears clear and colorless to light yellow; discard the solution if precipitate forms or discoloration occurs. For IV infusion, dilute 200 mg in 160 mL dextrose 5% in water, 0.9% NaCl, lactated Ringer's solution, or any combination of these solutions to provide a concentration of 1 mg/mL. For IV push, give slowly over 2 min at 10-min intervals. For IV infusion, administer at a rate of 2 mg/min (2 mL/min) initially. Adjust the rate according to the patient's BP. Monitor the patient's BP immediately before and every 5-10 min during IV administration. Maximum effect occurs within 5 min of any IV push injection.

#### Lacosamide

la-koe'sah-mide ★ ♥ Vimpat

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C Controlled Substance Schedule: V

Classification: Anticonvulsant

#### MECHANISM OF ACTION

An antiepileptic medication whose precise mechanism remains to be fully elucidated. Selectively enhances slow inactivation of voltage-gated sodium channels, resulting in stabilization of hyperexcitable neuronal membranes and inhibition of repetitive neuronal firing. Drug binds to collapsin response mediator protein-2 (CRMP-2), a phosphoprotein that is mainly expressed in the nervous system and is involved in neuronal differentiation and control of axonal outgrowth. The role of CRMP-2 binding in seizure control is unknown. Therapeutic Effect: Reduces seizure activity.

#### PHARMACOKINETICS

Well absorbed after PO administration; oral bioequivalent to injection (100%). Protein binding is low (15%). Lacosamide is a CYP2C19 substrate; the primary metabolite has no anticonvulsant activity. Parent drug and metabolite primarily excreted in urine. Removed by hemodialysis. *Half-life:* 13 h.

#### AVAILABILITY

Tablets: 50 mg, 100 mg, 150 mg, 200 mg. Oral Solution: 10 mg/mL. Injection Solution: 200 mg/20 mL.

## INDICATIONS AND DOSAGES Partial seizures (adjunctive treatment)

### PO OR IV INFUSION

Adults, Elderly, Children 17 yr and older. Initially, give 50 mg twice daily (100 mg/day). The dose may be increased, based on clinical response and tolerability, at weekly intervals by 100 mg/day given as 2 divided doses up to a total of 200-400 mg/day.

#### SWITCHING FROM PO TO IV INFUSION

The initial total daily IV dose should be equivalent to the total PO daily dosage and frequency. At the end of IV treatment, may switch to PO at the equivalent daily dosage and frequency of IV administration.

#### Dosage adjustment for renal impairment

No dose adjustment is necessary in patients with mild to moderate renal impairment. Maximum of 300 mg/ day is recommended if CrCl  $\leq$  30mL/ min and with end-stage renal disease. Following a 4-h hemodialysis treatment, dosage supplementation of up to 50% of a dose should be considered.

#### Dosage adjustment for hepatic impairment

The dose titration should be performed with caution. Maximum of 300 mg/day is recommended for mild or moderate hepatic impairment. Not recommended in patients with severe hepatic impairment.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

Drug

Potent inhibitors of CYP2C19 (e.g., fluconazole, isoniazid, fenofibric acid): In theory may increase

#### lacosamide levels.

Potent inducers of CYP2C19 (e.g., rifampin, barbiturates): In theory may decrease lacosamide levels. Drugs that prolong PR interval (e.g., atazanavir, digoxin, dronedarone, β-blockers, diltiazem, verapamil): May have additive effects on ECG with lacosamide. Herbal and Food None known.

#### DIAGNOSTIC TEST EFFECTS

May prolong PR interval of ECG. May increase serum AST (SGOT) and ALT (SGPT) levels.

#### IV INCOMPATIBILITIES

No information regarding Y-site administration is available.

#### SIDE EFFECTS

#### Frequent

Diplopia, headache, dizziness, nausea.

#### Occasional

Somnolence, ataxia, impaired memory or concentration, vertigo, gait disturbance, nystagmus. IV administration: injection site pain or discomfort, irritation, erythema, vomiting.

#### Rare

Pruritus, tinnitus, irritability, paresthesia, confusion, atrial arrhythmia, syncope.

#### SERIOUS REACTIONS

• Overdose is characterized by bradycardia, hypotension, respiratory depression, and coma.

 Multiorgan hypersensitivity reactions (also known as drug reaction with eosinophilia and systemic symptoms, or DRESS) have been reported with other anticonvulsants and typically present with fever and rash associated with other organ system involvement, which may include eosinophilia, hepatitis, nephritis, lymphadenopathy, and/or myocarditis.

#### PRECAUTIONS & CONSIDERATIONS

Antiepileptic drugs (AEDs) increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, or unusual changes in behavior or mood. Hepatic or renal dysfunction may require dosage adjustment. Use with caution in patients with known conduction problems (e.g., marked first-degree AV block, second-degree or higher AV block, and sick sinus syndrome without pacemaker) or with severe cardiac disease such as myocardial ischemia or heart failure. Obtaining an ECG prior to initiation is recommended in such patients; repeat tests are recommended during treatment. The drug may cause fetal harm; women of childbearing age must use reliable and adequate contraception. Use with caution during lactation. Safety and efficacy not established in children < 17 yr. The oral solution contains a source of phenylalanine and should be used with caution in phenylketonuria.

May cause dizziness or drowsiness; patients should not drive or operate machinery or do other hazardous tasks until effects of drug are known. Monitor hepatic function and for improvements in seizure control. **Storage** 

Store at all products at controlled room temperature. Do not freeze injection or oral solution. Discard any unused oral solution remaining after 7 wks of first opening the bottle. If mixed as an IV infusion, the solutions are stable for 24 h at room temperature.

#### Administration

Oral forms may be taken with or without food. A calibrated oral medicine syringe or spoon should be used to measure oral solution.

The injection is for IV infusion only. The injection can be administered IV without further dilution or may be diluted. May dilute in either 0.9% NaCl or D5W, or lactated Ringer's injection. Infuse IV over 30-60 min.

As with many antiepileptic medications, do not abruptly discontinue treatment; slow tapering is recommended to minimize increasing seizure potential.

#### Lactulose

lak'tyoo-lose ★ Acilac, Constulose, Enulose, Generlac, Kristalose ▲ Euro-LAC Do not confuse lactulose with lactose.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Laxatives, osmotic

#### **MECHANISM OF ACTION**

A lactose derivative that retains ammonia in the colon and decreases serum ammonia concentration; also produces an osmotic effect. *Therapeutic Effect:* Promotes increased peristalsis and bowel evacuation; expels ammonia from the colon.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	24-48 h	NA	NA
Rectal	30-60 min	NA	NA

Poorly absorbed from the GI tract. Acts in the colon. Primarily excreted in feces.

#### AVAILABILITY

*Syrup:* 10 g/15 mL. *Packets:* 10 g, 20 g.

## INDICATIONS AND DOSAGES Constipation

#### PO

Adults, Elderly. 15-30 mL (10-20 g lactulose)/day, up to 60 mL (40 g)/day.

#### Portal-systemic encephalopathy PO

Adults, Elderly. 30-45 mL (20-30 g) 3-4 times a day. Adjust dose q1-2 days to produce 2-3 soft stools a day. Hourly doses of 30-45 mL may be used for rapid laxation initially; then it may be reduced to recommended daily dose levels.

*Children.* 40-90 mL/day in divided doses to produce 2-3 soft stools/day. *Infants.* 2.5-10 mL/day in divided doses to produce 2-3 soft stools/day. RECTAL (AS RETENTION ENEMA)

Adults, Elderly. 300 mL with 700 mL water or saline solution; patient should retain 30-60 min. Repeat q4-6h. If evacuation occurs too promptly, repeat immediately.

#### CONTRAINDICATIONS

Lactulose contains galactose (< 0.3 g/10 g), so contraindicated in those who require a low galactose diet.

#### INTERACTIONS

#### Drug

**Neomycin, other anti-infectives:** May interfere with degradation of

lactulose and prevent acidification of colonic contents.

Nonabsorbable antacids: May inhibit colonic acidification. Oral medication: May decrease transit time of concurrently administered oral medications, decreasing lactulose absorption.

#### Herbal and Food

None known.

#### **DIAGNOSTIC TEST EFFECTS**

Lowers serum ammonia.

#### SIDE EFFECTS

#### Occasional

Abdominal cramping, flatulence, increased thirst, abdominal discomfort. Rare

Nausea, vomiting, dehydration, electrolyte disturbances.

#### SERIOUS REACTIONS

• Diarrhea indicates overdose; adjust dosage downward.

• Long-term use may result in laxative dependence, chronic constipation, and loss of normal bowel function.

• Excessive dosage can lead to diarrhea with potential complications, such as loss of fluids, hypokalemia, and hypernatremia.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes mellitus. It is unknown whether lactulose crosses the placenta or is distributed in breast milk. Lactulose for constipation should generally be avoided in children younger than 6 yr of age as the child may develop hyponatremia and dehydration. No age-related precautions have been noted in elderly patients, but extended use (> 6 mo) may increase risk of dehydration and electrolyte imbalance.

Maintain adequate fluid intake. Electrolyte levels and pattern of daily bowel activity and stool consistency should be monitored. Periodic serum ammonia levels should be obtained. Storage

Store solution at room temperature. Administration

Oral solution normally appears pale yellow to yellow and viscous in consistency. However, cloudy, darkened solution does not indicate potency loss. Evacuation occurs in 24-48 h of the initial drug dose. To promote defecation, increase fluid intake, exercise, and eat a high-fiber diet. Some patients find liquid more palatable when mixed with fruit juice, water, or milk.

The powder for oral solution (10or 20-g packet) should be dissolved in at least 4 oz of water.

To prepare retention enema, mix 300 mL lactulose with 700 mL of water or 0.9% NaCl irrigation. Administer solution rectally using a rectal balloon catheter. Enema should be retained for 30-60 min. May be readministered if inadvertently expelled.

L

#### Lamivudine (3TC)

la-miv'yoo-deen ★ Epivir, Epivir-HBV ★ Heptovir Do not confuse lamivudine with lamotrigine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiretrovirals, nucleoside reverse transcriptase inhibitors

#### **MECHANISM OF ACTION**

An antiviral that inhibits HIV reverse transcriptase by viral DNA chain termination. Also inhibits RNA- and DNA-dependent DNA polymerase, an enzyme necessary for HIV replication. *Therapeutic Effect:* Interrupts HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Protein binding: 36%. Widely distributed (crosses the blood-brain barrier). Primarily excreted unchanged in urine. Not removed by hemodialysis or peritoneal dialysis. *Half-life*: 11-15 h (intracellular), 2-11 h (serum, adults), 1.7-2 h (serum, children) (increased in impaired renal function).

#### AVAILABILITY

*Oral Solution:* (Epivir): 10 mg/mL; (Epivir-HBV): 5 mg/mL. *Tablets:* (Epivir): 150 mg, 300 mg; (Epivir-HBV): 100 mg.

#### INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals) PO

Adults, Children >16 yr weighing more than 50 kg (100 lb). 150 mg twice a day or 300 mg once a day. Children 3 mo to  $\leq$  16 yr. 4 mg/kg twice a day (up to 150 mg/dose).

 Chronic hepatitis B PO

Adults, Children 17 yr and older. 100 mg/day.

*Children younger than 17 yr.* 3 mg/kg/day. Maximum: 100 mg/day.

 Dosage in renal impairment (adult and adolescent ≥ 30 kg)

Dosage and frequency are modified based on creatinine clearance.

CrCl (mL/min)	HIV Dosage	Hepatitis B Dosage
≥ 50	150 mg twice a day	100 mg once a day
30-49	150 mg once a day	100 mg first dose, then 50 mg once a day
15-29	150 mg first dose, then 100 mg once a day	100 mg first dose, then 25 mg once a day

Lamivudine (3TC) (Generic Name), Epivir (Brand Name)

CrCl (mL/min)	HIV Dosage	Hepatitis B Dosage
5-14	150 mg first dose, then 50 mg once a day	35 mg first dose, then 15 mg once a day
< 5	50 mg first dose, then 25 mg once a day	35 mg first dose, then 10 mg once a day

#### **OFF-LABEL USES**

Prophylaxis in health care workers at risk of acquiring HIV after occupational exposure.

#### CONTRAINDICATIONS

Hypersensitivity, history of pancreatitis as a child.

#### INTERACTIONS

#### Drug

**Co-trimoxazole:** Increases lamivudine blood concentration. **Emtricitabine:** Due to similarities between the drugs and therapeutic duplication/toxic effects, do not use.

Interferon alfa: Hepatic decompensation may occur; monitor; consider dose reductions of agents.

**Ribavirin:** Increased risk of hepatotoxicity; monitor closely. **Zalcitabine:** May inhibit intracellular phosphorylation when

used concomitantly. Avoid co-use since the action cancels effectiveness of both drugs.

#### Herbal

**St. John's wort:** May decrease lamivudine blood concentration and effect. Avoid.

#### Food

None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase serum amylase, AST (SGOT), and ALT (SGPT) levels. May rarely lower platelet, WBC, or RBC counts.

#### SIDE EFFECTS

#### Frequent

Headache (35%), nausea (33%), malaise and fatigue (27%), nasal disturbances (20%), diarrhea, cough (18%), musculoskeletal pain, neuropathy (12%), insomnia (11%), anorexia, dizziness, fever, or chills (10%).

#### Occasional

Depression (9%), myalgia (8%), abdominal cramps (6%), dyspepsia, arthralgia (5%). Alopecia occurs rarely.

#### SERIOUS REACTIONS

• Pancreatitis occurs in 13% of pediatric patients.

• Anemia, neutropenia, and

- thrombocytopenia occur rarely.
- Lactic acidosis.
- Severe hepatomegaly with steatosis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired renal function, a history of pancreatitis, and a history of peripheral neuropathy and in young children. Be aware that lamivudine crosses the placenta, and it is unknown whether lamivudine is distributed in breast milk. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Be aware that the safety and efficacy of this drug have not been established in children younger than 3 mo. In elderly patients, age-related renal impairment may require dosage adjustment. Lamivudine is not a cure for HIV, and the patient may continue to experience illnesses, including opportunistic infections.

m M if cł m hy at ba

the baseline lab values, especially renal function. Expect to monitor the serum amylase, BUN, and serum creatinine levels. Assess for altered sleep patterns, cough, dizziness, headache, nausea, and pattern of daily bowel activity and stool consistency. Avoid activities that require mental acuity if dizziness occurs. Modify diet or administer a laxative, if ordered, as needed. Closely monitor children for symptoms of pancreatitis, manifested as clammy skin, hypotension, nausea, severe and steady abdominal pain often radiating to the back, and vomiting accompanying abdominal pain. If pancreatitis occurs in a child, help the child to sit up or flex at the waist to relieve abdominal pain aggravated by movement. Patients with hepatitis B should be advised not to stop taking the drug suddenly, as this can cause a worsening of hepatitis that may be sudden. Treatment dose not reduce the risk of transmission of HIV or HBV to other through sexual contact or blood contamination.

Before starting drug therapy, check

#### Storage

Store all products at room temperature, tightly closed. Administration

Give without regard to meals. Take lamivudine for the full length of treatment and evenly space drug doses around the clock.

#### Lamotrigine

la-moe-trih'jeen

Lamictal, Lamictal CD, Lamictal ODT, Lamictal XR Do not confuse lamotrigine with lamivudine or Lamictal with Lamisil.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

Classification: Anticonvulsant

#### MECHANISM OF ACTION

An anticonvulsant whose exact mechanism is unknown. May block voltage-sensitive sodium channels, thus stabilizing neuronal membranes and regulating presynaptic transmitter release of excitatory amino acids. *Therapeutic Effect:* Reduces seizure activity.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 55%. Metabolized primarily by glucuronic acid conjugation. Excreted in the urine. *Half-life:* 13-30 h.

#### AVAILABILITY

Chewable Tablets (Lamictal CD): 2 mg, 5 mg, 25 mg. Tablets: 25 mg, 100 mg, 150 mg, 200 mg. Tablets, Orally Disintegrating (Lamictal ODT): 25 mg, 50 mg, 100 mg, 200 mg. Extended-Release Tablets (Lamictal XR): 25 mg, 50 mg, 100 mg, 200 mg.

#### INDICATIONS AND DOSAGES

 Seizure control in patients receiving enzyme-inducing antiepileptic drug (EIAED) but not valproic acid

Adults, Elderly, Children 12 yr and older. Recommended as add-on therapy: 50 mg once a day for 2 wks, followed by 100 mg/day in 2 divided doses for 2 wks. Maintenance: Dosage may be increased by 100 mg/day every week, up to 300-500 mg/day in 2 divided doses. *Children aged 2-12 yr.* 0.6 mg/kg/day in 2 divided doses for 2 wks, then 1.2 mg/kg/day in 2 divided doses for wks 3 and 4. Maintenance: 5-15 mg/kg/ day. Maximum: 400 mg/day.

Lamotrigine (Generic Name)

#### Seizure control in patients receiving combination therapy of EIAED and valproic acid PO

Adults, Elderly, Children 12 yr and older. 25 mg every other day for 2 wks, followed by 25 mg once a day for 2 wks. Maintenance: Dosage may be increased by 25-50 mg/day q1-2wk, up to 150 mg/day in 2 divided doses. *Children aged 2-12 yr*. 0.15 mg/kg/ day in 2 divided doses for 2 wks, then 0.3 mg/kg/day in 2 divided doses for wks 3 and 4. Maintenance: 1-5 mg/kg/day in 2 divided doses. Maximum: 200 mg/day.

### Conversion to monotherapy in patients receiving EIAED

Adults, Elderly, Children 16 yr and older. Add lamotrigine 50 mg/day in divided doses for 2 wks; then titrate to the desired dose while maintaining EIAED at a fixed level until maintenance dosage is achieved. Gradually discontinue other EIAEDs by 20% each week over 4 wks once maintenance dose is achieved.

#### Conversion to monotherapy in patients receiving valproic acid PO

Adults, Elderly, Children 16 yr. and older. Titrate lamotrigine to 200 kg/day, maintaining valproic acid dose. Maintain lamotrigine dose and decrease valproic acid to 500 mg/day not to exceed 500 mg/day/ wk, then maintain 500 mg/day for 1 wk. Increase lamotrigine to 300 mg/ day, and decrease valproic acid to 250 mg/day and maintain for 1 wk. Then discontinue valproic acid and increase lamotrigine by 100 mg/day each week until maintenance dose of 500 mg/day is reached.

#### Usual dosage extended release for seizure control

PO (EXTENDED RELEASE) Adults, Elderly, Children 13 yr and older. NOTE: Lamictal XR is given once daily. When converting from immediate release the initial dose of Lamictal XR should match the total daily dose of immediate-release lamotrigine. Some patients may have lower plasma levels with Lamictal XR and should be monitored.

#### Treatment initiation if not currently on lamotrigine

Adults and Children > 12 yr receiving EIAEDs (e.g., carbamazepine, phenobarbital, phenytoin, primidone), without valproic acid: 50 mg PO daily during wks 1-2, then 100 mg daily during wks 3-4, then 200 mg daily during wk 5, then 300 mg daily during wk 6, then 400 mg daily during wk 7. After wk 7, the maintenance range is 400-600 mg daily. Dosage increases after wk 7 should not exceed 100 mg/day at weekly intervals.

Adults and Children > 12 yr receiving nonenzyme-inducing AEDs and without valproic acid. 25 mg PO daily during wks 1-2, then 50 mg daily during wks 3-4, then 100 mg daily during wk 5, then 150 mg daily during wk 6, then 200 mg daily during wk 7. After wk 7, the maintenance range is 300-400 mg daily. Dosage increases after wk 7 should not exceed 100 mg/ day at weekly intervals.

Adults and Children > 12 yr receiving valproic acid: 25 mg PO every other day during wks 1-2, then 25 mg daily during wks 3-4, then 50 mg daily during wk 5, then 100 mg daily during wk 6, then 150 mg daily during wk 7. After wk 7, the maintenance range is 200-250 mg every day. Dosage increases after wk 7 should not exceed 100 mg/day at weekly intervals.

#### Bipolar disorder in patients receiving EIAED without valproic acid

PO

Adults, Elderly. 50 mg/day for 2 wks, then 100 mg/day for 2 wks, then 200 mg/day for 1 wk, then 300 mg/ day for 1 wk. Then increase to usual maintenance dose of 400 mg/day in divided doses.

#### Bipolar disorder in patients receiving valproic acid PO

*Adults, Elderly.* 25 mg/day every other day for 2 wks, then 25 mg/day for 2 wks, then 50 mg/day for 1 wk, then 100 mg/day. Usual maintenance dose with valproic acid: 100 mg/day.

• Discontinuation of therapy Adults, Children older than 16 yr. A dosage reduction of approximately 50% per week over at least 2 wks is recommended.

General recommendations for patients with hepatic impairment For initial dosing, decrease normal initial dose by 25% for moderate to severe impairment; up to 50% if residue impairment; Careba de discussion of the severe patient impairment.

## ascites is present. Escalate and adjust to clinical response.

#### CONTRAINDICATIONS

Previous hypersensitivity or druginduced rash from lamotrigine.

#### INTERACTIONS

#### Drug

Acetaminophen (long-term, high dose): Possible increased excretion of lamotrigine.

Carbamazepine, phenobarbital, phenytoin, primidone: Decrease lamotrigine blood concentration. Valproic acid: Doubles lamotrigine concentration.

Oral hormonal contraceptives: May increase CNS side effects; may decrease effectiveness of lamotrigine or oral contraceptive. Adjustment of lamotrigine dose will be required in most patients taking estrogencontaining contraceptives.

#### Herbal and Food

None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase serum AST or ALT. The value of monitoring plasma levels of lamotrigine has not been established.

#### SIDE EFFECTS

#### Frequent

Dizziness (38%), diplopia (28%), headache (29%), ataxia (22%), nausea (19%), blurred vision (16%), somnolence, rhinitis (14%).

#### Occasional (5%-10%)

Rash, pharyngitis, vomiting, cough, flu-like symptoms, diarrhea, dysmenorrhea, fever, insomnia, dyspepsia.

#### Rare

Constipation, tremor, anxiety, pruritus, vaginitis, hypersensitivity reaction.

#### SERIOUS REACTIONS

• Abrupt withdrawal may increase seizure frequency.

 Serious rashes, including Stevens-Johnson syndrome, requiring hospitalization and discontinuation of treatment, have been reported; can be life threatening.

- Rarely, multisystem organ dysfunction, including liver failure.
- Rarely, neutropenia, leukopenia, anemia, thrombocytopenia, pancytopenia, and, rarely, aplastic anemia and pure red cell aplasia.

• Unknown potential for eye effects due to melanin-binding activity.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac, hepatic, and renal impairment. AEDs increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, or unusual behavior or moods. Safety and efficacy not established in children < 2 yr of age; do not use extended release in children under 13 yr. The effects of lamotrigine on pregnancy are not known. The drug is excreted in breast milk and breastfeeding is not recommended. Exposure to sunlight and artificial light should be avoided.

Drowsiness and dizziness may occur, so alcohol and tasks requiring mental alertness or motor skills should be avoided. Notify the physician if fever, rash, or swollen glands occur. If rash suspected to be drug-related, discontinuation of lamotrigine is recommended. Seizure disorder, including the onset, duration, frequency, intensity, and type of seizures, should be assessed before and during treatment. Changes in frequency or characterization of seizures should be reported to the health care provider immediately. Storage

Store all dosage forms at room temperature; protect chewable tablets and ODT from moisture; keep ODT in foil blister until time of use. Administration

If the patient is currently taking valproic acid, expect to reduce the lamotrigine dosage to less than half the normal dosage.

Take lamotrigine without regard to food. Do not discontinue the drug abruptly after long-term therapy. Strict maintenance of drug therapy is essential for seizure control.

Lamotrigine regular tablets should be swallowed whole because of their bitter taste. The chewable-dispersible tablets may be chewed or dissolved in a small amount of liquid (5 mL) in a spoon, then swallowed.

Lamotrigine ODT should be placed on tongue and moved around in the mouth to facilitate disintegration. The tablet may be swallowed with or without water.

Swallow the extended-release tablets whole. Do not chew, crush, or divide.

#### Lansoprazole

lan-soe'pray-zole ★ Prevacid, Prevacid IV, Prevacid SoluTab 🙅 Previcid FasTab, Prevacid-SRC Do not confuse Prevacid with Pepcid, Pravachol, or Prevpac.

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Gastrointestinals, antiulcer agents, proton-pump inhibitors (PPI)

#### MECHANISM OF ACTION

A proton-pump inhibitor that selectively inhibits the parietal cell membrane enzyme system (hydrogen-potassium adenosine triphosphatase) or proton-pump. Therapeutic Effect: Suppresses gastric acid secretion.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (15 mg)	2-3 h	NA	8-24 h
PO (30 mg)	1-2 h	NA	longer than 24 h

Rapid and complete absorption (food may decrease absorption) once the drug has left the stomach. Protein binding: 97%. Distributed primarily to gastric parietal cells and converted

Lansoprazole (Generic Name), Prevacid (Brand Name)

to two active metabolites. Extensively metabolized in the liver. Eliminated in bile and urine. Not removed by hemodialysis. *Half-life:* 1.5 h (increased in elderly patients and in those with hepatic impairment).

## AVAILABILITY

Capsules (Delayed-Release [Prevacid]): 15 mg, 30 mg. Injection Powder for Reconstitution (Prevacid IV): 30 mg. Oral Disintegrating Tablets (Prevacid SoluTab): 15 mg, 30 mg.

## INDICATIONS AND DOSAGES

Duodenal ulcer

PO

L

*Adults, Elderly.* 15 mg/day, before eating, preferably in the morning, for up to 4 wks.

## Healed duodenal ulcer, gastroesophageal reflux disease (GERD)

Adults. 15 mg/day.

## Erosive esophagitis

Adults, Elderly. 30 mg/day, before eating, for up to 8 wks. If healing does not occur within 8 wks (in 5%-10% of cases), may give for additional 8 wks. Maintenance: 15 mg/day.

IV

*Adults, Elderly.* 30 mg once a day for up to 7 days. Switch to oral lansoprazole therapy as soon as the patient can tolerate the oral route.

## Gastric ulcer

PO

Adults. 30 mg/day for up to 8 wks. NSAID gastric ulcer

#### PO

*Adults, Elderly.* (Healing): 30 mg/day for up to 8 wks. (Prevention): 15 mg/ day for up to 12 wks.

## Usual pediatric dosage

Children 1-11 yr, weighing more than 30 kg. 30 mg once daily for up

to 12 weeks for GERD or erosive esophagitis, active treatment. See adult dosages for children 12 yr and older. *Children 1-11 yr, weighing*  $\leq$  30 kg. 15 mg once daily for up to 12 weeks for GERD or erosive esophagitis active treatment.

#### Helicobacter pylori infection PO

*Adults.* 30 mg twice a day for 10 days (with amoxicillin and clarithromycin).

## Pathologic hypersecretory conditions (including Zollinger-Ellison syndrome)

Adults, Elderly. 60 mg/day. Individualize dosage according to patient needs and for as long as clinically indicated. Doses up to 90 mg twice daily have been used.

## Severe hepatic disease

Consider dosage reduction.

## **OFF-LABEL USES**

stress gastritis/ulcer prophylaxis.

## CONTRAINDICATIONS

Hypersensitivity to lansoprazole or any of its components.

## INTERACTIONS

Drug

Ampicillin, digoxin, iron salts, ketoconazole: May interfere with the absorption of ampicillin, digoxin, iron salts, and ketoconazole.

Atazanavir: Do not give PPI with atazanavir because effectiveness against HIV will be diminished.

**Clopidogrel:** PPIs with CYP2C19 inhibiting activity reduce conversion of clopidogrel to active metabolite; may result in cardiovascular events due to decreased efficacy. Avoid PPI use when possible.

Methotrexate: May increase risk of methotrexate toxicity.

**Rifampin:** May decrease the levels of lansoprazole.

**Sucralfate:** May delay the absorption of lansoprazole.

## Herbal

St John's wort: May decrease the levels of lansoprazole. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase LDH, serum alkaline phosphatase, bilirubin, cholesterol, creatinine, AST (SGOT), ALT (SGPT), triglyceride, and uric acid levels. May produce abnormal albumin/globulin ratio, electrolyte balance, and platelet, RBC, and WBC counts. May increase hemoglobin and hematocrit levels. May decrease serum magnesium in chronic use.

## IV INCOMPATIBILITIES

Do not administer with other drugs via Y-site.

#### SIDE EFFECTS

#### Occasional (2%-3%)

Diarrhea, abdominal pain, rash, pruritus, altered appetite. **Rare (1%)** Nausea, headache, constipation.

#### SERIOUS REATIONS

• Bilirubinemia, eosinophilia, and hyperlipemia occur rarely.

- Serious hypersensitivitydermatologic reactions (rare).
- In chronic use, may cause hypomagnesemia.
- In chronic use, may increase risk of bone fracture.

 Possible alteration of GI microflora which increases risk of *Clostridium dificile*-associated diarrhea (CDAD).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired hepatic function.

It is unknown whether lansoprazole is distributed in breast milk; caution is warranted in pregancy and lactation. Safety and efficacy of lansoprazole have not been established in infants. No age-related precautions have been noted in elderly patients. Laboratory values, including CBC and blood chemistry, should be obtained before and periodically during therapy. Some gastric disruption, such as loose stool or flatulence, is common, especially early in therapy.

#### Storage

Store the drug at room temperature. Keep SoluTab in package until time of administration. Use within 15 min of addition to liquid. IV infusion is stable for up to 24 h at room temperature once prepared with NS (12 h in D5W).

#### Administration

Take lansoprazole capsules while fasting or before meals. Do not chew or crush delayed-release capsules. May open capsules and sprinkle granules on 1 tbsp of applesauce; swallow immediately. May also sprinkle in 2 oz of apple, orange, or tomato juice. Take lansoprazole 30 min before sucralfate because sucralfate may delay lansoprazole absorption.

SoluTab may be placed on tongue and allowed to dissolve without water. May give SoluTab with oral syringe or NG tube (≥ 8 French). May dissolve in 4 mL water (15 mg) or 10 mL water (30 mg). Shake gently. Administer within 15 minutes. After giving the dose, add a small amount (e.g., 2 mL) of water to rinse cup or syringe and administer to ensure entire dose given.

For IV use, infuse over 30 min. The IV vial must only be reconstituted with 5 mL of sterile water for injection. Mix gently. Then

#### 892 Lanthanum Carbonate

add dose to either 50 mL of 0.9%NaCl or dextrose 5% injection. Must use provided in-line filter (1.2  $\mu$ m) to deliver. Flush administration port before and after administration.

### Lanthanum Carbonate

lan-than'um car'bo-nate Fosrenol Do not confuse lanthanum carbonate with lithium carbonate.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Phosphatebinding agents

#### **MECHANISM OF ACTION**

A phosphate regulator that dissociates in the acidic environment of the upper GI tract to lanthanum ions, which bind to dietary phosphate released from food during digestion, forming highly insoluble lanthanum phosphate complexes. *Therapeutic Effect:* Reduces phosphate absorption.

#### PHARMACOKINETICS

Phosphate complexes are eliminated in urine.

#### AVAILABILITY

Tablets (Chewable): 500 mg, 750 mg, 1000 mg.

#### INDICATIONS AND DOSAGES

## Reduce serum phosphate in endstage renal disease

*Adults, Elderly.* 1500 mg/day initially in divided doses, taken with or immediately after a meal. Dosage may be titrated q2-3wk based on serum phosphate levels. Most patients require 1500-3000 mg/day. Typical increase of 750 mg/day every 2-3 weeks. Doses up to 4500 mg/day have been used.

### CONTRAINDICATIONS

Contraindicated in patents with GI obstruction, ileus, or fecal impaction.

## INTERACTIONS

Drug

Antacids: Interact with lanthanum; separate administration by 2 h. Herbal and Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

During abdominal x-ray studies, drug may show up similar to a radiopaque imaging agent.

### SIDE EFFECTS

Frequent

Nausea (11%), vomiting (9%), dialysis graft occlusion (8%), abdominal pain (5%).

#### SERIOUS REACTIONS

· GI obstruction has been reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute peptic ulcer disease, bowel obstruction, Crohn's disease, and ulcerative colitis. Side effects of nausea and vomiting should decrease over time. Use not recommended in pregnancy due to lack of data. Use with caution in lactation although lanthanum carbonate is not likely to pass to breast milk. Not approved for use in children.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Chew the tablets thoroughly before swallowing. Take the drug with

Lanthanum Carbonate (Generic Name), Fosrenol (Brand Name)

or immediately after a meal. Take lanthanum 2 h before or after antacids.

#### Latanoprost

la-tan'oh-prost ★ ➡ Xalatan

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Ophthalmic agents, prostaglandin analogs, antiglaucoma agents

## **MECHANISM OF ACTION**

A synthetic analog of prostaglandin with ocular hypotensive activity. *Therapeutic Effect:* Reduces intraocular pressure (IOP) by increasing the outflow of aqueous humor.

### PHARMACOKINETICS

Absorbed through the cornea and hydrolyzed to the active free acid form. Peak aqueous humor concentrations occur roughly 2 h after administration. Reduction IOP starts approximately 3 h after administration and peaks after 8-12 h. Plasma levels detectable only in first hour of administration. Any absorbed drug metabolized by liver and metabolites excreted primarily by the kidney. *Half-life*: 17 min.

## AVAILABILITY

Ophthalmic Solution: 0.005%.

#### INDICATIONS AND DOSAGES • Open-angle glaucoma, ocular hypertension

OPHTHALMIC *Adults, Elderly.* 1 drop in affected eye(s) once daily, in the evening.

### CONTRAINDICATIONS

Hypersensitivity to latanoprost or any component of the formulation.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

## Frequent

Conjunctival hyperemia, growth of eyelashes, temporary blurring of vision after application, increased iris pigmentation, and ocular pruritus.

#### Occasional

Ocular dryness, visual disturbance, foreign body sensation, eye pain, pigmentation of the periocular skin, blepharitis, cataract, superficial punctate keratitis, eyelid erythema, ocular irritation, and eyelash darkening. **Rare** 

Intraocular inflammation (iritis).

## SERIOUS REACTIONS

• Systemic adverse events, including infections (colds and upper respiratory tract infections), headaches, skin rash/allergic reactions, have been reported.

· Macular retinal edema may occur.

## PRECAUTIONS & CONSIDERATIONS

May permanently increase pigmentation in iris and eyelid and produce changes in eye color and changes in eyelashes (color, length, shape). Use with caution in patients with uveitis or risk factors for macular edema. While caution is recommended, data suggest little exposure to the fetus during pregnancy or to a breastfeeding infant. Safety and effectiveness have not been established in children. Remove contact lenses to apply; wait 15 min after administration to reinsert.

#### Storage

Protect from light. Store unopened bottle under refrigeration. Once a bottle is opened for use, it may be stored at room temperature for up to 6 wks.

#### Administration

If more than 1 topical ophthalmic agent is being used, wait at least 5 min between administration of each. Remove contact lenses prior to use, and wait 15 min after administration before reinsertion.

Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Instill drop(s) and gently close the eyes for 1-2 min. Do not blink. Do not touch the tip of the dropper to any surface to avoid contamination.

### Leflunomide

le-flu′na-mide ★ 🙅 Arava

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: X

**Classification:** Diseasemodifying antirheumatic drugs, immunosuppressives

## **MECHANISM OF ACTION**

An immunomodulatory agent that inhibits dihydroorotate dehydrogenase, the enzyme involved in autoimmune process that leads to rheumatoid arthritis. *Therapeutic Effect*: Reduces signs and symptoms of rheumatoid arthritis and slows structural damage.

## PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: > 99%. Metabolized to active metabolite in the GI wall and liver. Excreted through both renal and biliary systems. Not removed by hemodialysis. *Half-life:* 16 days.

### AVAILABILITY

Tablets: 10 mg, 20 mg.

# INDICATIONS AND DOSAGES Rheumatoid arthritis PO

Adults, Elderly. Initially, 100 mg/ day for 3 days, then 10-20 mg/day. May eliminate loading dose if patient is at risk for hematologic or hepatic toxicity, such as receiving concurrent methotrexate.

## CONTRAINDICATIONS

Pregnancy or plans to become pregnant, *or* women of childbearing potential who are not using reliable contraception; known hypersensitivity to the drug. Do not use if preexisting acute or chronic liver disease, or serum ALT > 2 times upper limit of normal (ULN) is present.

## INTERACTIONS

Activated charcoal and cholestyramine: Rapidly decrease concentration of leflunomide's active metabolite.

Hepatotoxic medications: May increase risk of liver toxicity. **Rifampin:** Increases the blood concentration of leflunomide's active metabolite; use is generally contraindicated.

**Tolbutamide:** May increase tolbutamide free fraction; monitor blood glucose.

Vaccines, live: Due to potential immunosuppression, avoid vaccination during treatment. Warfarin: May increase the effects

of warfarin. Herbal and Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase hepatic enzyme levels, especially AST (SGOT) and ALT (SGPT). Monitor ALT levels at least monthly for 6 mo, and thereafter

Leflunomide (Generic Name)

q6-8wk. May decrease WBC and platelet counts.

#### SIDE EFFECTS

#### Frequent (10%-20%)

Diarrhea, respiratory tract infection, alopecia, rash, nausea.

### SERIOUS REACTIONS

! NOTE: If any serious toxicity occurs, a drug elimination procedure, using cholestyramine or activated charcoal, must be given because of the long half-life of the drug.

• Transient thrombocytopenia and leukopenia occur rarely.

 Hypersensitivity, including rare cases of Stevens-Johnson syndrome and toxic epidermal necrolysis (TEN).

• Severe liver injury, including fatal liver failure.

· Risk of malignancy

(lymphoproliferative) is increased with some immunosuppressants.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with immunodeficiency, bone marrow dysplasia, impaired hepatic or renal function. Severe liver injury has been reported. Use caution when the drug is given with other potentially hepatotoxic, or immunosuppressant drugs. Not recommended for patients with severe immunodeficiency; bone marrow suppression; or severe, uncontrolled infections. If infection occurs, may need to hold therapy. Leflunomide may cause fetal harm. Pregnancy must be excluded before the start of treatment. Pregnancy must be avoided during treatment or prior to the completion of the drug elimination procedure. Although it is not known whether leflunomide is excreted in breast milk, the drug is not recommended for breastfeeding women. The safety and efficacy of

leflunomide have not been established in children younger than 18 yr. No age-related precautions have been noted in elderly patients, although decreased renal function or hepatic disease may require decreased dosage or total discontinuation of drug.

Liver function test results should be monitored. Symptomatic relief of rheumatoid arthritis, including relief of pain and improved range of motion, grip strength, and mobility, should be assessed.

#### Storage

Store at room temperature and protect from light.

#### Administration

Take leflunomide without regard to food. Therapeutic effect may take longer than 8 wks to appear.

### Lenalidomide

lin-e-lid′oh-mide ★ ➡ Revlimid Do not confuse lenalidomide with leflunomide.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

#### Classification:

Antineoplastics, immunomodulators, tumor necrosis factor modulators

#### MECHANISM OF ACTION

An analog of thalidomide, lenalidomide is an immunomodulator whose exact mechanism is unknown. Has anti-inflammatory, antineoplastic, and antiangiogenic activity. Lenalidomide inhibits the secretion of pro-inflammatory cytokines and increases the secretion of anti-inflammatory cytokines from peripheral blood mononuclear cells. Lenalidomide inhibits cell proliferation in some but not all cell lines. Effective in inhibiting Namalwa cells (a human B cell lymphoma cell) and multiple myeloma cells, by inducing cell-cycle arrest and apoptosis. Also inhibits cyclooxygenase-2 (COX-2) but not COX-1. Therapeutic Effect: Reduces need for RBC transfusion in myelodysplastic syndromes (MDS); induces apoptosis (cell death) of myeloma cells.

### PHARMACOKINETICS

Well absorbed orally. Extent of absorption not affected by food, but a higher maximum concentration attained if taken on an empty stomach. Plasma concentrations are proportional to the dose given. Protein binding: 30%. Unknown if drug passes into semen. Roughly two-thirds of the drug eliminated unchanged through the urine. Partially actively secreted; drug clearance exceeds GFR. Removed by hemodialysis. Half-life: 3 h (prolonged in moderate to severe renal impairment).

## **AVAILABILITY**

Capsules: 5 mg, 10 mg, 15 mg, 25 mg.

# INDICATIONS AND DOSAGES

Multiple myeloma PO Adults. Initially, 25 mg once per day on days 1-21 of each 28-day cycle. (With dexamethasone -e.g., 40 mg/day PO on days 1-4, 9-12, and 17-20 of each 28-day cycle for the first 4 cycles, and then 40 mg/day PO on days 1-4 every 28 days. NOTE: Other dexamethasone dosing options are available, this is a representative regimen.) Dosing is continued or modified based upon clinical and laboratory findings.

Myelodysplastic syndromes (MDS) PO

Adults. Initially 10 mg once per day. Dosing is continued or modified based upon clinical and laboratory findings.

#### Adjustment for renal function PO

Adjust starting doses. Continue or modify dosing based upon clinical and laboratory findings.

CrCl 30-59 ml/min: 5 mg q24h (MDS); 10 mg q24h (multiple myeloma).

CrCl < 30 ml/min (no dialysis): 5 mg q48h (MDS); 15 mg q48h (multiple myeloma).

ESRD (requiring hemodialysis): 5 mg given 3 times per week after each dialysis (MDS); 5 mg once per day, given after dialysis on dialysis days (multiple myeloma).

#### Adjustment for neutropenia or thrombocytopenia

Expect to adjust dosing based on WBC and platelet counts; see manufacturer's prescribing information for adjustments.

## CONTRAINDICATIONS

Hypersensitivity to lenalidomide; pregnancy (known teratogen).

#### INTERACTIONS Drug

Digoxin: May increase digoxin levels. Monitor digoxin clinically and via levels as indicated.

Medications decreasing efficacy of hormonal contraception: Be alert for medications that might interfere with contraceptive efficacy (e.g., antibiotics, anticonvulsants).

Live-virus vaccines: Due to potential immunosuppression, avoid vaccination during treatment.

## Herbal

None known.

Food

All food: Decreases peak levels; best taken with water only.

### **DIAGNOSTIC TEST EFFECTS**

Reduces WBC and platelet counts frequently.

#### SIDE EFFECTS

#### Frequent

Diarrhea, itching/pruritus, rash, fatigue, reductions in blood counts, peripheral edema, arthralgia, fever, constipation.

#### Occasional

Nausea, sore throat, headache, dizziness, weakness, dry skin, epistaxis, cough, infection, poor appetite, sleep disturbance, paresthesias, swelling, sedation. Weight loss, constipation, taste alterations, muscle cramps, back pain, blurred vision also reported

#### SERIOUS REACTIONS

- · Known teratogen.
- Thromboembolic events are common (DVT and PE).
- Neutropenia and thrombocytopenia.
- Serious hypersensitivity, such as Stevens-Johnson syndrome or TEN, have been reported.

• Portential increase in risk of secondary malignancies.

#### PRECAUTIONS & CONSIDERATIONS

! Lenalidomide is an analog of thalidomide. All prescribers, pharmacists, and patients must be registered in RevAssist<sup>™</sup> to prescribe, dispense, or receive lenalidomide. As a known tetratogen, 2 forms of contraception must be used 4 wks before, during, and 4 wks following discontinuation of lenalidomide. Lenalidomide is contraindicated in pregnant women. Women of childbearing age must receive a pregnancy test within 10-14 days and again 24 h before starting treatment and then testing will occur every 2-4 wks; the 2 negative tests results are required prior to use. Males must always use a latex condom during any sexual contact with females of childbearing potential even if they have undergone a successful vasectomy, as the drug may be present in the semen.

Breastfeeding is contraindicated. The drug is not approved for use in children. Patients with renal impairment or the elderly with renal dysfunction may require dosage adjustment (see Indications and Dosages). The elderly may be more at risk for side effects such as embolism and syncope. Caution is warranted with history of thromboembolic events. Prophylactic anticoagulation may be considered. Risk may be greater with concomitant dexamethasone use.

Patients should be instructed to seek medical care if they develop clot symptoms such as shortness of breath, chest pain, or arm or leg swelling. Patients should drink plenty of fluids. Notify the physician if symptoms of clotting, unusual bruising or bleeding, fever, infection, or extreme fatigue limiting daily activities occur. Monitor CBC frequently and monitor for signs of bone marrow suppression.

#### Storage

Store capsules at room temperature.

#### Administration

Administer lenalidomide with water only. Do not break, open, crush, or chew the capsules. Bedtime administration may minimize intolerance to neurologic side effects.

#### Letrozole

le'tro-zole ★ ➡ Femara **Do not confuse Femara with FemHRT.** 

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Hormones and hormone modifiers, aromatase inhibitors

#### **MECHANISM OF ACTION**

Decreases the level of circulating estrogen by inhibiting aromatase, an enzyme that catalyzes the final step in estrogen production. *Therapeutic Effect:* Inhibits the growth of breast cancers that are stimulated by estrogens.

### PHARMACOKINETICS

Rapidly and completely absorbed. Metabolized in the liver. Primarily eliminated by the kidneys. Unknown if removed by hemodialysis. *Half-life:* Approximately 2 days.

#### AVAILABILITY

Tablets: 2.5 mg.

#### INDICATIONS AND DOSAGES

## Breast cancer, hormone replacement

PO Adults, Elderly. 2.5 mg/day. Continue until tumor progression is evident.

#### Dosage in severe hepatic impairment

Give 2.5 mg every other day.

## CONTRAINDICATIONS

Hypersensitivity to letrozole or any of its components, pregnancy, premenopausal women.

#### **INTERACTIONS**

Drug Estrogens: Oppose actions of letrozole. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum calcium, cholesterol, GGT, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

#### Frequent (9%-21%)

Musculoskeletal pain (back, arm, leg), nausea, headache, hot flashes. Occasional (5%-8%)

Constipation, arthralgia, fatigue, vomiting, diarrhea, abdominal pain, cough, rash, anorexia, hypertension, peripheral edema.

#### Rare (1%-4%)

Asthenia, somnolence, dyspepsia, weight gain, pruritus.

### SERIOUS REACTIONS

• May decrease bone mineral density with long-term use.

· Peripheral thrombotic events.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and severe renal impairment. Women who are or may be pregnant should not use this drug. Pregnancy should be determined before beginning therapy. It is unknown whether letrozole is distributed in breast milk. The safety and efficacy of letrozole have not been established in children. No agerelated precautions have been noted in elderly patients.

Notify the physician if weakness, hot flashes, or nausea becomes unmanageable. Vital signs, especially BP, should be assessed before

Letrozole (Generic Name), Femara (Brand Name)

therapy begins because letrozole may cause hypertension. CBC, serum electrolyte levels, thyroid function, and liver and renal function tests should be monitored during therapy. Signs of infection or blood dyscrasias should be reported to health care provider immediately. **Storage** 

Store at a controlled room temperature. Administration

Take oral letrozole without regard to food.

#### Leucovorin Calcium (Folinic Acid, Citrovorum Factor)

loo-koe-vor'in kal'see-um 🔀 Wellcovorin

Do not confuse Wellcovorin with Wellbutrin or Wellferon. Do not confuse folinic acid with folic acid. Do not confuse leucovorin with levoleucovorin; the two drugs have different dosages.

It is recommended always to use leucovorin as the drug name to avoid drug errors.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antineoplastic adjunct; antidotes, folate analog

#### **MECHANISM OF ACTION**

An antidote to folic acid antagonists that may limit the antagonists' action on normal cells by competing with them for the same transport processes into the cells. Actively and passively transported across cell membranes and converted to 5-methyltetrahydrofolic acid (5-methyl-THF), the primary circulating form of active reduced folate. Leucovorin and 5-methyl-THF are polyglutamated intracellularly by the enzyme folylpolyglutamate synthetase. Folypolyglutamates are active and participate in biochemical pathways that require reduced folate. *Therapeutic Effect:* Counteracts toxic effects of folic acid antagonists, such as bone marrow toxicities; has little effect on acute renal toxicity of methotrexate.

### PHARMACOKINETICS

Readily absorbed from the GI tract. Widely distributed. Small quantities pass into the CSF. Metabolized in the liver and intestinal mucosa to active metabolite. Primarily excreted in urine. *Half-life:* 5.7 h (terminal).

### AVAILABILITY

*Tablets:* 5 mg, 10 mg, 15 mg, 25 mg. *Injection:* 10 mg/mL. *Powder for Injection:* 50 mg, 100 mg, 200 mg, 350 mg, 500 mg.

#### INDICATIONS AND DOSAGES • Rescue dosage following highdose methotrexate therapy

IV INFUSION OR PO Adults, Elderly, Children, 10 mg/ m<sup>2</sup> IV q6h for 10 doses start 24 h after the beginning of the methotrexate infusion. Serum creatinine and methotrexate levels are determined at least once daily. Rescue administration, hydration, and urinary alkalinization (pH of 7.0 or more) should be continued until the methotrexate level is < 5times 10<sup>-8</sup> M (0.05 micromolar). If there is delayed early elimination of methotrexate or evidence of acute renal injury, doses of 100 mg/m<sup>2</sup> IV q3h may be given until methotrexate level < 1 micromolar; then give 10 mg/m<sup>2</sup> IV q3h until methotrexate level is < 0.05 micromolar.

#### Inadvertent folic acid antagonist overdose

IV INFUSION/IM/PO Adults, Elderly, Children. Begin as soon as possible after an inadvertent overdosage, preferably within 24 h. As the time interval between overdose and rescue increases, the effectiveness in counteracting toxicity may decrease. Give 10 mg/m2 IV q6h until the serum methotrexate level is < 10<sup>-8</sup> M. Serum creatinine and methotrexate levels should be determined daily. If the 24-h serum creatinine has increased 50% over baseline or if the 24-h methotrexate level is > 5 times 10<sup>-6</sup> M or the 48-h level is > 9 times  $10^{-7}$  M, the dose should be increased to 100 mg/m<sup>2</sup> IV q3h until the methotrexate level is  $< 10^{-8}$  M. Hydration (3 L/day) and urinary alkalinization with NaHCO3 should be employed concomitantly to maintain the urine pH at 7.0 or greater.

## Megaloblastic anemia secondary to folate deficiency

IM/IV

Adults, Elderly, Children. 1 mg/day. Prevention of hematologic

#### toxicity (for toxoplasmosis) with sulfadiazine PO. IV

Adults, Elderly, Children. 10 mg/day.

#### Prevention of hematologic toxicity with pyrimethamine PO, IV

Adults, Children. 25 mg once weekly.

Regimens may vary depending on other medications used.

### **OTHER USES**

Used with 5-FU in standard approved regimens for colorectal cancer. The following options have been used historically in adults: Leucovorin at 200 mg/m<sup>2</sup> by slow IV over a minimum of 3 min, followed by 5-FU (370 mg/m<sup>2</sup> by IV).

OR Leucovorin 20 mg/m<sup>2</sup> by IV injuection followed by 5-FU (425 mg/m<sup>2</sup> IV).

The drugs are administered separately to avoid precipitate formation. The regimen is repeated daily for 5 days. The 5-day treatment course is given at 4 week (28-day) intervals for 2 courses and then at 4- to 5- week (28- to 35-day) intervals based on tolerance.

In subsequent courses, the dosage of 5-FU is adjusted to patient response and tolerance.

## CONTRAINDICATIONS

Previous allergic reactions attributed to folic acid or leucovorin calcium (folinic acid). NOTE: Not approved for pernicious anemia and megaloblastic anemias secondary to the lack of vitamin B<sub>12</sub>. Improper use may cause a hematologic remission while neurologic manifestations continue to progress.

## INTERACTIONS

#### Drug

Anticonvulsants: May decrease the effects of anticonvulsants.

**Chemotherapeutic agents:** May increase the effects and toxicity of these drugs when taken in combination.

Sulfamethoxazole-trimethoprim (SMZ-TMP): Concomitant use for the acute treatment of PCP in patients with HIV infection is associated with treatment failure and morbidity.

Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

#### IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), droperidol (Inapsine), foscarnet (Foscavir).

#### 🗏 IV COMPATIBILITIES

Cisplatin (Platinol AQ), cyclophosphamide (Cytoxan), doxorubicin (Adriamycin), etoposide (VePesid), filgrastim (Neupogen), 5-fluorouracil, gemcitabine (Gemzar), granisetron (Kytril), heparin, methotrexate, metoclopramide (Reglan), mitomycin (Mutamycin), piperacillin and tazobactam (Zosyn), vinblastine (Velban), vincristine (Oncovin).

#### SIDE EFFECTS

#### Frequent

When combined with chemotherapeutic agents: Diarrhea, stomatitis, nausea, vomiting, lethargy or malaise or fatigue, alopecia, anorexia.

#### Occasional

Urticaria, dermatitis.

#### SERIOUS REACTIONS

• Excessive dosage may negate chemotherapeutic effects of folic acid antagonists.

Anaphylaxis occurs rarely.

• Diarrhea may cause rapid clinical deterioration.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bronchial asthma and a history of allergies. Caution should also be used with 5-fluorouracil in persons with GI toxicities. It is unknown whether leucovorin crosses the placenta or is distributed in breast milk. Leucovorin use in epileptic children may increase the risk of seizures by counteracting the anticonvulsant effects of barbiturates and hydantoins. Age-related renal impairment may require a dosage adjustment for elderly patients receiving drug for rescue from effects of high-dose methotrexate therapy. Consuming foods with folic acid, including dried beans, meat proteins, and green leafy vegetables, is encouraged in those with folic acid deficiency.

Caution in individuals with severe anemia or those receiving cancer chemotherapy. Report development of infection immediately.

CBC, BUN, and serum creatinine levels (important in leucovorin rescue) should be monitored. Electrolyte levels and liver function test results in those receiving chemotherapeutic agents in combination with leucovorin should be assessed. For treatment of accidental overdosage of folic acid antagonists, leucovorin should be given as soon as possible (preferably within 1 h), as prescribed.

#### Storage

Store vials for parenteral use at room temperature. Protect from light. Use the solution immediately if reconstituted with sterile water for injection and within 7 days if reconstituted with bacteriostatic water for injection.

#### Administration

Scored tablets may be crushed.

The injection solution normally appears clear and yellowish. Reconstitute each 50-mg vial with 5 mL sterile water for injection or bacteriostatic water for injection (containing benzyl alcohol) to provide a concentration of 10 mg/ mL. Reconstitute doses >10 mg/m<sup>2</sup> with sterile water for injection. Further dilute with D5W or 0.9% NaCl. Do not exceed an infusion rate of 160 mg/min (because of the drug's calcium content).

I Never administer intrathecally. Do not mix in same infusion as 5-FU.

## **Leuprolide Acetate**

loo'proe-lide ass'eh-tayte
★ Eligard, Lupron, Lupron Depot, Lupron Depot-Ped, Viadur
↓ Eligard, Lupron, Lupron Depot, Lupron Depot-Ped
Do not confuse leuprolide or Lupron with Lopurin or Nuprin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Antineoplastics, hormones, gonadotropin-releasing hormone (GnRH) analog

## **MECHANISM OF ACTION**

A gonadotropin-releasing hormone analog and antineoplastic agent that stimulates the release of luteinizing hormone (LH) and follicle-stimulating hormone (FSH) from the anterior pituitary gland. *Therapeutic Effect:* Produces pharmacologic castration and decreases the growth of abnormal prostate tissue in males, causes endometrial tissue to become inactive and atrophic in females, and decreases the rate of pubertal development in children with central precocious puberty.

## PHARMACOKINETICS

Rapidly and well absorbed after SC administration. Absorbed slowly after IM administration. Protein binding: 43%-49%. *Half-life:* 3-4 h.

## AVAILABILITY

Implant (Viadur): 65 mg. Injection Depot Formulation (Eligard): 7.5 mg, 22.5 mg, 30 mg. Injection Depot Formulation (Lupron Depot): 3.75 mg, 7.5 mg, 11.25 mg, 22.5 mg, 30 mg, 45 mg. Injection Solution (Lupron): 5 mg/mL. Pediatric 1-Month Injection Depot Formulation (Lupron Depot-PED 1 month): 7.5 mg, 11.25 mg, 15 mg. Pediatric 3-Month Injection Depot Formulation (Lupron Depot-PED 3 month): 11.25 mg, 30 mg.

#### INDICATIONS AND DOSAGES • Advanced prostatic carcinoma IM

Adults, Elderly. Lupron Depot: 7.5 mg/mo or 22.5 mg every 3 mo or 30 mg every 4 mo, or 45 mg every 6 mo. SC

Adults, Elderly. Eligard: 7.5 mg every month or 22.5 mg every 3 mo or 30 mg every 4 mo. Lupron: 1 mg/day. Viadur: 65 mg implanted every 12 mo.

#### Endometriosis

#### IM

*Adults, Elderly.* Lupron Depot: 3.75 mg/mo for up to 6 mo or 11.25 mg every 3 mo for up to 2 doses.

## Uterine leiomyomata

IM

*Adults, Elderly.* Lupron Depot: 3.75 mg/mo for up to 3 mo or 11.25 mg as a single injection.

#### Precocious puberty IM

*Children.* Lupron Depot-Ped: 0.3 mg/kg/dose every 28 days. Minimum: 7.5 mg. If downregulation is not achieved, titrate upward in 3.75-mg increments q4wk. *Children.* Lupron Depot-Ped 3-month injection: 11.25 mg or 30 mg every 3 mos. If suppression inadequate, choose other therapies. SC *Children.* Lupron: 20-45 mcg/kg/day

*Children.* Lupron: 20-45 mcg/kg/day. Titrate upward by 10 mcg/kg/day if downregulation is not achieved.

#### CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to drug or GnRH analogs.

#### INTERACTIONS

Drug, Herbal, and Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum prostatic acid phosphatase (PAP) levels. Initially increases, then decreases, serum testosterone concentration.

#### SIDE EFFECTS

#### Frequent

Hot flashes (ranging from mild flushing to diaphoresis). Females: Amenorrhea, spotting. Occasional

#### Arrhythmiager

Arrhythmias; palpitations; blurred vision; dizziness; edema; headache; burning, itching, or swelling at injection site; nausea; insomnia; weight gain. Females: Deepening voice, hirsutism, decreased libido, increased breast tenderness, vaginitis, altered mood. Males: Constipation, decreased testicle size, gynecomastia, impotence, decreased appetite, angina.

#### Rare

Males: Thrombophlebitis.

#### SERIOUS REACTIONS

 Signs and symptoms of metastatic prostatic carcinoma (such as bone pain, dysuria or hematuria, and weakness or paresthesia of the lower extremities) occasionally worsen
 1-2 wks after the initial dose but then subside with continued therapy.

Pulmonary embolism and MI occur rarely.

Decreased bone density may lead to osteoporosis.

 Rare reports of hepatic injury with depot formulation use.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted when administered to children receiving long-term therapy. Leuprolide use is contraindicated in pregnancy because the drug may cause spontaneous abortion. Pregnancy should be determined before therapy. Nonhormonal contraceptives should be used during leuprolide use. No agerelated precautions have been noted in elderly patients.

Females should notify the physician if regular menstruation persists or pregnancy occurs. The patient should be assessed for peripheral edema, arrhythmias and palpitations, sleep-pattern changes, and visual difficulties. Serum testosterone and PAP levels should be obtained periodically during leuprolide therapy in men. Be aware that serum testosterone and PAP levels should increase during the first week of therapy. The testosterone level should decrease to baseline level or less within 2 wks, and the PAP level should decrease within 4 wks.

#### Storage

Refrigerate Lupron vials. Store Lupron Depot at room temperature; do not freeze and protect from light and heat. Store Eligard in the refrigerator.

#### Administration

! Because leuprolide may be carcinogenic, mutagenic, or teratogenic, handle it with extreme care during preparation and administration.

! Due to the ease of product mixups, always check the product against the order, the age of the patient, and the indication for use.

For SC (Lupron) use, the injection should appear clear and colorless. Discard the solution if

it appears discolored or contains precipitate. Administer the drug undiluted into the abdomen, anterior thigh, or deltoid muscle.

For IM (Lupron Depot) use, reconstitute only with the diluent provided. Follow mixing instructions provided by the manufacturer. Use the reconstituted solution immediately. Do not use needles smaller than 22 gauge; use syringes provided by the manufacturer (0.5mL low-dose insulin syringes may be used as an alternative).

For IM (Eligard) use, allow drug to warm to room temperature before reconstitution. Follow mixing instructions provided by the manufacturer. Administer the drug within 30 min after reconstitution.

Viadur implant: Implanted SC in inner aspect of upper arm. Removed after 12 mo.

### Levalbuterol

lee-val-byoo'ter-ole ★ ★ Xopenex, Xopenex HFA Do not confuse Xopenex with Xanax.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Respiratory agents, adrenergic agonists, bronchodilators, short-acting  $\beta_2$ -agonist

#### **MECHANISM OF ACTION**

A sympathomimetic that stimulates  $\beta_2$ -adrenergic receptors in the lungs resulting in relaxation of bronchial smooth muscle. *Therapeutic Effect:* Relieves bronchospasm and reduces airway resistance.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	10-17 min	1.5 h	5-6 h

Metabolized in the liver to inactive metabolite. *Half-life:* 3.3-4 h.

### AVAILABILITY

Solution for Nebulization: 0.31 mg in 3-mL vials, 0.63 mg in 3-mL vials, 1.25 mg in 3-mL vials. Also available as 1.25 mg/0.5 mL nebulizer solution. Inhalation (Aerosol [Xopenex HFA]): 45 mcg/actuation.

# INDICATIONS AND DOSAGES Treatment and prevention of bronchospasm

NEBULIZATION Adults, Elderly, Children 12 yr and older. Initially, 0.63 mg 3 times a day 6-8 h apart. May increase to 1.25 mg 3 times a day with dose monitoring. Children aged 6-11 yr. Initially 0.31 mg 3 times a day. Maximum: 0.63 mg 3 times a day. HFA INHALER Adults, Elderly, Children 12 vr and older. 90 mcg (2 inhalations) q4-6h; in some, 45 mcg (1 inhalation) q4h may be sufficient. Children aged 4-11 yr. 90 mcg (2 inhalations) q4-6h; in some, 45 mcg (1 inhalation) q4h may be sufficient.

#### CONTRAINDICATIONS

History of hypersensitivity to sympathomimetics, particularly albuterol or levalbuterol.

#### INTERACTIONS

#### Drug

**β-Blockers:** Antagonize effects of levalbuterol.

**Digoxin:** May increase the risk of arrhythmias.

**Diuretics:** Hypokalemia associated with diuretic may worsen with levalbuterol. Monitor potassium levels. **MAOIs, tricyclic antidepressants:** 

## May potentiate cardiovascular

effects. MAOIs may cause hypertensive crisis.

#### Herbal

None known.

#### Food

**Caffeine:** Limit use of caffeine, increased CNS stimulation.

### DIAGNOSTIC TEST EFFECTS

May increase blood glucose level. May decrease serum potassium level.

#### SIDE EFFECTS

#### Frequent

Tremor, nervousness, headache, throat dryness and irritation.

#### Occasional

Cough, bronchial irritation, diarrhea, rash.

#### Rare

Somnolence, dry mouth, flushing, diaphoresis, anorexia.

#### SERIOUS REACTIONS

 Excessive sympathomimetic stimulation may produce palpitations, extrasystoles, tachycardia, chest pain, a slight increase in BP followed by a substantial decrease, chills, diaphoresis, and blanching of skin.
 Too-frequent or excessive use may lead to decreased bronchodilating effectiveness and severe, paradoxical bronchoconstriction.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiovascular disorders (such as arrhythmias), diabetes mellitus, hypertension, and seizures. Levalbuterol crosses the placenta. It is unknown whether the drug is distributed in breast milk. The safety and efficacy of levalbuterol have not been established in children younger than 4 yr. A lower initial dosage is recommended for elderly patients. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea.

Pulse rate and quality; respiratory rate, depth, rhythm, and type; ECG; ABG levels; and serum potassium levels should be monitored.

#### Storage

Store at room temperature. For nebulization, use the solution immediately upon opening the foil. Do not freeze; protect from light. The solution is normally clear and colorless; discard if discolored. Store inhaler with the actuator (or mouthpiece) down. Contents under pressure; exposure to heat or flame will cause bursting.

#### Administration

For nebulization, discard the solution if it is not colorless. The concentrated (1.25 mg/0.5 mL) solution is diluted with 0.9% NaCl before administration; the less concentrated solution does not need dilution. Do not mix levalbuterol with other medications. Administer levalbuterol over 5-15 min.

For HFA inhalation, shake the container well before inhalation. Prime before first use or if inhaler has not been used for 3 days. Wait 2 min before inhaling the second dose to allow for deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness. Excessive use may produce paradoxical bronchoconstriction.

## Levetiracetam

leva-tir-ass'eh-tam ★ ★ Keppra, Keppra XR Do not confuse Keppra with Kaletra or Keflex.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anticonvulsants

## **MECHANISM OF ACTION**

An anticonvulsant that inhibits burst firing without affecting normal neuronal excitability. *Therapeutic Effect:* Prevents seizure activity.

## PHARMACOKINETICS

Oral bioavailability is 100%. Onset 1 h, peak plasma levels attained in 20 min to 2 h. < 10% plasma protein bound; limited hepatic metabolism and renal excretion (66%). *Half-life:* 6-8 h.

## AVAILABILITY

Extended-Release Tablets: 500 mg, 750 mg. Liquid: 100 mg/mL. Tablets: 250 mg, 500 mg, 750 mg, 1000 mg. Injection: 100 mg/mL.

## INDICATIONS AND DOSAGES

#### Partial-onset seizures, juvenile myoclonic epilepsy, primary generalized tonic-clonic seizures PO OR IV

Adults, Elderly, children  $\geq 16$  yr. Initially, 500 mg q12h. May increase by 1000 mg/day q2wk. Maximum: 3000 mg/day. For extended-release tablets, give usual total daily dose once daily. *Children aged 4-16 yr.* 10 mg/kg/ day in 2 divided doses. May increase at weekly intervals by 10-20 mg/kg. Maximum: 60 mg/kg.

#### Replacement therapy (switching from PO to IV)

The initial total daily IV dosage is equivalent to the total daily dosage and frequency of immediate-release PO regimen. At the end of the IV treatment period, may switch to immediate-release PO at the equivalent daily dosage and frequency of the IV.

## Dosage in renal impairment

Dosage is modified based on creatinine clearance. *Immediate-release dose:* 

Creatinine Clearance (mL/min)	Adult Dosage (mg q12h)
> 80	500-1500
50-80	500-1000
30-50	250-750
< 30 mL/min	250-500
End-stage renal disease using dialysis	500-1000 every 24 h
After dialysis, supplemental dose is recommended	250-500

*Extended-release renal-impairment dose:* If extended-release, may give total daily dose q24h, as long as dosage 1000 mg/day, or above. If lower doses/day, require the use of immediate-release dose forms.

## CONTRAINDICATIONS

Hypersensitivity reaction.

## INTERACTIONS

Drug Probenecid: Competes with metabolite for tubular renal clearance. Herbal None known. Food None significant.

## DIAGNOSTIC TEST EFFECTS

Infrequent decreases in blood hemoglobin level, hematocrit, and RBC and WBC counts.

Levetiracetam (Generic Name)

## **IV COMPATIBILITIES**

Lorazepam, diazepam, valproate sodium. There are no data to support compatibility with any other drugs.

#### SIDE EFFECTS

#### Frequent (10%-15%)

Somnolence, asthenia, headache, infection.

#### Occasional (4%-9%)

Dizziness, pharyngitis, pain, depression, nervousness, vertigo, rhinitis, anorexia.

#### Rare (< 3%)

Amnesia, anxiety, emotional lability, cough, weakness, behavior changes, vomiting, sinusitis, anorexia, diplopia, neutropenia (mild).

#### SERIOUS REACTIONS

· Psychotic reactions (rare).

• Abnormal liver function, hepatic failure, hepatitis (rare).

• Blood dyscrasias or bone marrow suppression (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment. Drowsiness and dizziness may occur, so alcohol and tasks requiring mental alertness or motor skills should be avoided. AEDs may increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, or unusual behavior or moods. Safety and efficacy not established in children < 4 yr of age; do not use extended-release in children under 16 yr. The effects of this drug on pregnancy are not known. Levetiracetam is excreted in breast milk, and breastfeeding is not recommended. Seizure disorder, including the onset, duration, frequency, intensity, and type of

seizures, should be assessed before and during treatment.

Report symptoms of blood dyscrasias or infection immediately to health care provider.

#### Storage

Store all oral products and unopened vials at room temperature. Only prepare infusion immediately prior to use; discard any unused portion.

#### Administration

Take levetiracetam without regard to food. Because of bitter taste, do not cut tablets; administer whole. Do not crush, cut, or chew extended-release tablets.

IV must be diluted before use with 100 mL of 0.9% NaCl or dextrose 5% injection up to 1500 mg/100 mL. Infuse over 15 min.

Do not discontinue the drug abruptly after long-term therapy. Strict maintenance of drug therapy is essential for seizure control.

## Levocetirizine

lee'vo-si-tear'a-zeen
Xyzal
Do not confuse levocetirizine with cetirizine, or Xyzal with Xyrem.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antihistamines, H<sub>1</sub>, low sedating

#### **MECHANISM OF ACTION**

The active enantiomer of cetirizine, levocetirizine is a second-generation piperazine that competes with histamine for  $H_1$  receptor sites on effector cells in the GI tract, blood vessels, and respiratory tract.

Levocetirizine (Generic Name)

*Therapeutic Effect:* Prevents allergic response, reduces itching.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	< 4-8 h	0.5-1 h	24 h

Rapidly and almost completely absorbed from the GI tract (absorption not affected by food). Protein binding: 92%. Not extensively metabolized by the liver. Drug and metabolites primarily excreted in urine (more than 85%). Levocetirizine is excreted both by glomerular filtration and active tubular secretion. *Half-life:* 8-9 h.

## AVAILABILITY

Oral Solution: 2.5 mg/5 mL. Tablets: 5 mg.

## INDICATIONS AND DOSAGES

## Allergic rhinitis, chronic idiopathic urticaria

Adults, Elderly, Children 12 yr and older. 5 mg once daily.

*Children 6-11 yr.* 2.5 mg once daily. *Children 6 mo to 5 yr.* 1.25 mg once daily.

## ▶ Dosage in renal impairment (adults and children $\ge$ 12 yr)

CrCl 50-80 mL/min: 2.5 mg once daily.

CrCl 30-50 mL/min: 2.5 mg once every other day.

CrCl 10-30 mL/min): 2.5 mg twice weekly (give once every 3-4 days).

CrCl < 10 mL/min, ESRD and patients undergoing dialysis: Do not use.

### CONTRAINDICATIONS

Hypersensitivity to levocetirizine, cetirizine, or hydroxyzine; CrCl < 10 mL/min or end-stage renal disease; any degree of renal impairment in children 11 yr of age and younger.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Ritonavir: May increase cetirizine concentrations. Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May suppress wheal and flare reactions to antigen skin testing, unless drug is discontinued 4 days before testing.

## SIDE EFFECTS

#### Occasional (2%-10%)

Mild sedation, pharyngitis, fatigue, dry mouth. Additionally, pyrexia, cough, and epistaxis in children 6-12 yr of age. In children < 6 yr, pyrexia, diarrhea, vomiting, otitis media, and constipation were reported.

## SERIOUS REACTIONS

 Children may experience paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremor.

• Dizziness, sedation, asthenia, and confusion are more likely to occur in elderly patients.

• Rare hypersensitivity and anaphylaxis, angioedema, fixed drug eruption, pruritus, rash, and urticaria.

• Rare covulsions, paresthesias, dizziness, aggression, hallucinations, visual disturbances, cardiac events, hepatitis reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment or in patients with hepatic impairment when renal impairment is also likely. Levocetirizine use is not recommended during the early months of pregnancy. Levocetirizine is likely to be excreted in breast milk. Breastfeeding is not recommended. Elderly patients are more likely to experience dry mouth and urine retention, as well as dizziness, sedation, and confusion.

Avoid drinking alcoholic beverages, and tasks that require alertness or motor skills until response to the drug is established. Drowsiness may occur at dosages > 5 mg/day. Do not exceed recommended doses, especially in children, whose exposure to the drug increases greatly with increasing dose. Therapeutic response should be monitored.

#### Storage

Store at room temperature.

#### Administration

Take levocetirizine without regard to food. Administer in the evening.

## Levofloxacin

levo-flox'a-sin
Iquix, Levaquin, Quixin
Levaquin
Do not confuse Levaquin with
Lariam or levofloxacin with
levetiracetam.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anti-infectives, fluoroquinolones

#### **MECHANISM OF ACTION**

A fluoroquinolone that inhibits the enzyme DNA gyrase in susceptible microorganisms, interfering with bacterial cell replication and repair. *Therapeutic Effect:* Bactericidal.

#### PHARMACOKINETICS

Well absorbed after both PO and IV administration. Protein binding: 8%-24%. Penetrates rapidly and extensively into leukocytes, epithelial cells, and macrophages. Lung concentrations are 2-5 times higher than those of plasma. Eliminated unchanged in the urine. Partially removed by hemodialysis. *Half-life*: 8 h.

#### AVAILABILITY

Tablets (Levaquin): 250 mg, 500 mg, 750 mg. Oral Solution: 25 mg/mL. Injection (Levaquin): 500-mg/20-mL. Premixed IV Solution (Levaquin): 250 mg/50 mL, 500 mg/100 mL, 750 mg/150 mL. Ophthalmic Solution (Quixin): 1.5%.

## INDICATIONS AND DOSAGES Bronchitis

PO, IV

*Adults, Elderly.* 500 mg q24h for 7 days.

## Community-acquired pneumonia PO, IV

*Adults, Elderly.* 750 mg/day for 5 days or use 500 mg/day for 7-14 days.

Pneumonia nosocomial

PO, IV

*Adults, Elderly.* 750 mg q24h for 7-14 days.

## Acute maxillary sinusitis PO, IV

*Adults, Elderly.* 500 mg q24h for 10-14 days or use 750 mg/day for 5 days.

#### Skin and skin-structure infections PO, IV

*Adults, Elderly.* 500 mg q24h for 7-10 days or if complicated, 750 mg/day for 7-14 days.

Levofloxacin (Generic Name), Levaquin (Brand Name)

## Urinary tract infection, acute pyelonephritis

PO, IV

*Adults, Elderly.* 250 mg q24h for 10 days or use 750 mg/day for 5 days.

## Bacterial conjunctivitis

OPHTHALMIC Adults, Elderly, Children 1 yr and older: 1-2 drops q2h for 2 days (up to 8 times a day), then 1-2 drops q4h for 5 days.

## Corneal ulcer

OPHTHALMIC Adults, Elderly, Children older than

*5 yr*: Days 1-3: Instill 1-2 drops q30min to 2 h while awake and 4-6 h after retiring. Days 4 through completion: 1-2 drops q1-4h while awake.

#### Dosage in renal impairment

For bronchitis, pneumonia, sinusitis, and skin and skin-structure infections, dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Based on 500 mg/ day* Adult Dosage
50-80	No change
20-49	500 mg initially, then 250 mg q24h
10-19	500 mg initially, then 250 mg q48h
Dialysis	500 mg initially, then 250 mg q48h

\*See prescribing information for adjustment for higher 750 mg/day dose.

Creatinine Clearance (mL/min)	Based on 250 mg/ day Adult Dosage
20	No change
10-19	250 mg initially, then 250 mg q48h

## CONTRAINDICATIONS

Hypersensitivity to levofloxacin, other fluoroquinolones, or nalidixic acid.

#### INTERACTIONS Drug

Antacids, didanosine, iron preparations, sucralfate, zinc: Decrease levofloxacin absorption. Separate times of administration by at least 2 h.

Antipsychotics, class 1A and class III antiarrhythmics, erythromycin, tricyclic antidepressants: May

increase the risk of prolonged QTc interval.

**Corticosteroids:** May increase risk of tendon rupture, especially in elderly patients.

Cyclosporine: May increase cyclosporine levels; monitor. NSAIDs: May increase the risk of central nervous system (CNS) stimulation or seizures.

Warfarin: May increase risk of bleeding.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May alter blood glucose levels.

## IV INCOMPATIBILITIES

Cefazolin, diazepam, furosemide (Lasix), heparin, insulin, nitroglycerin, phenytoin, propofol (Diprivan).

## **IV COMPATIBILITIES**

Aminophylline, dobutamine, dopamine, fentanyl (Sublimaze), lidocaine, lorazepam (Ativan), morphine.

## SIDE EFFECTS

Occasional (1%-3%)

Diarrhea, nausea, abdominal pain, dizziness, drowsiness, headache, light-headedness. Ophthalmic: Local burning or discomfort, margin crusting, crystals or scales, foreign body sensation, ocular itching, altered taste.

#### Rare (<1%)

Flatulence; altered taste; pain; inflammation or swelling in calves, hands, or shoulder; chest pain; difficulty breathing; palpitations; edema; tendon pain; hypoglycemia. Ophthalmic: Corneal staining, keratitis, allergic reaction, eyelid swelling, tearing, reduced visual acuity.

#### SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may occur from altered bacterial balance.

 Hypersensitivity reactions, including photosensitivity (as evidenced by rash, pruritus, blisters, edema, and burning skin) have occurred in patients receiving fluoroquinolones.

- Tendon rupture.
- · Peripheral neuropathy.
- Seizures (rare).

• Hepatitis or other liver dysfunction (rare).

• QTc prolongation and potential for arrhythmia (rare).

• Benign intracranial hypertension (pseudotumor cerebri), rare.

• Exacerbation of myasthenia, may be severe and lead to weakness of respiratory muscles.

#### **PRECAUTIONS & CONSIDERATIONS**

History of hypersensitivity to levofloxacin and other quinolones should be determined before therapy. Caution is warranted in patients with bradycardia, cardiomyopathy, hypokalemia, hypomagnesemia, impaired renal function, seizure disorders, or suspected CNS disorder. May exacerbate myasthenia gravis or other neuromuscular conditions. Use with caution in patients with cardiac arrhythmias; should not be used unmonitored in patients with known QT prolongation. Conditions that might increase the risk of proarrythmia include electrolyte imbalances and use of drugs that prolong the QT interval. Fluoroquinolones increase the risk of tendinitis and tendon rupture and may be seen more often in the elderly, in those taking corticosteroids, and in patients with organ transplants. There are no adequate data regarding the use of levofloxacin in pregnancy. The drug is likely excreted in breast milk. The safety and efficacy of levofloxacin have not been established in children younger than 18 yr. Age-related renal impairment may require a dosage adjustment in elderly patients.

Chest pain, difficulty breathing, palpitations, edema, tendon pain, as well as hypersensitivity reactions, including photosensitivity, pruritus, skin rash, and urticaria, should be reported immediately. Be alert for signs and symptoms of superinfection, such as moderate to severe diarrhea, new or increased fever, and ulceration or changes in the oral mucosa. Symptomatic relief should be provided for nausea. Blood glucose levels, liver and renal function, and white blood cell (WBC) count should be monitored.

Discontinue treatment if patient experiences pain or inflammation of a tendon; seek medical consultation, rest and refrain from exercise. **Storage** 

Store at room temperature; protect injection and premixed infusions from light and freezing. Infusions prepared from vials are stable for 72 h at room temperature or for 14 days if refrigerated. Do not remove overwrap from premixed bags until time of use. Administration

Take levofloxacin tablets without regard to food. Oral solution should

be given 1 h before or 2 h after food. Do not take antacids (containing aluminum or magnesium), sucralfate, iron preparations, or multivitamins containing zinc within 2 h of levofloxacin because these drugs significantly reduce levofloxacin absorption.

Injection is for further dilution as an IV infusion only. For infusion using the single-dose vial, withdraw the desired amount (10 mL for 250 mg, 20 mL for 500 mg). Dilute each 10 mL (250 mg) with at least 40 mL 0.9% NaCl or D5W. Give 250-mg or 500-mg IV infusions over 60 min and 750-mg infusions over 90 min.

For ophthalmic use, place a gloved finger on the lower eyelid, and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket, and place the correct number of drops into the pocket. Close the eye gently. Apply digital pressure to the lacrimal sac for 1-2 min to minimize drainage of the medication into the patient's nose and throat, reducing the risk of systemic effects.

#### Levoleucovorin Calcium

lee'vo-loo'koe-vor'in kal'see-um

Do not confuse Fusilev with Fuzeon. Do not confuse levoleucovorin calcium with leucovorin calcium; the two drugs have different dosages.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antineoplastic adjunct; antidotes, folate analog

#### MECHANISM OF ACTION

Levoleucovorin is the pharmacologically active isomer of leucovorin. An antidote to folic acid antagonists that may limit the antagonist's action on normal cells by competing with them for the same transport processes into the cells. Does not require reduction by the enzyme dihydrofolate reductase. Levoleucovorin is actively and passively transported across cell membranes and converted to 5-methyltetrahydrofolic acid (5-methyl-THF), the primary circulating form of active reduced folate. Levoleucovorin and 5-methyl-THF are polyglutamated intracellularly by the enzyme folylpolyglutamate synthetase. Folylpolyglutamates are active and participate in biochemical pathways that require reduced folate. Therapeutic Effect: Counteracts toxic effects of folic acid antagonists, such as bone marrow toxicities; has little effect on acute renal toxicity of methotrexate.

#### PHARMACOKINETICS

After rapid IV administration, serum total tetrahydrofolate (total-THF) concentrations reached a mean peak of 1722 ng/mL. Mean peak serum (6S)-5-methyl-5,6,7,8tetrahydrofolate concentration was 275 ng/mL and the mean time to peak was 0.9 h. Small quantities of the drug penetrate into the CSF. Metabolized in intestinal mucosa and by the liver. Primarily excreted in urine as active folate metabolites. *Half-life:* 5.1-6.8 h.

#### AVAILABILITY

*Powder for Injection:* 50 mg (contains mannitol).

### INDICATIONS AND DOSAGES

NOTE: Levoleucovorin dosage is 50% of the normal leucovorin dosage in various rescue dosage regimens.

## Rescue dosage following highdose methotrexate therapy

IV INFUSION

Adults, Elderly, Children > 6 yrs. 5 mg/m2 IV q6h for 10 doses; treatment starts 24 h after the beginning of the methotrexate infusion. Serum creatinine and methotrexate levels are determined at least once daily. Rescue administration, hydration, and urinary alkalinization (pH of 7.0 or more) should be continued until the methotrexate level is < 5times 10-8 M (0.05 micromolar). If there is delayed early elimination of methotrexate or evidence of acute renal injury, doses of 50 mg/m2 IV q3h may be given until methotrexate level < 1 micromolar; then give 5 mg/ m<sup>2</sup> IV q3h until methotrexate level is < 0.05 micromolar.

#### Inadvertent folic acid antagonist overdose

IV INFUSION

Adults, Elderly, Children > 6 yrs. Begin as soon as possible after an inadvertent overdosage, preferably within 24 h. As the time interval between overdose and rescue increases, the effectiveness in counteracting toxicity may decrease. Give 5 mg/m<sup>2</sup> IV q6h until the serum methotrexate level is < 10-8 M. Serum creatinine and methotrexate levels should be determined daily. If the 24-h serum creatinine has increased 50% over baseline or if the 24-h methotrexate level is > 5 times 10-6 M or the 48-h level is > 9 times  $10^{-7}$  M, the dose should be increased to 50 mg/ m<sup>2</sup> IV q3h until the methotrexate level is < 10<sup>-8</sup> M. Hydration (3 L/day) and urinary alkalinization with NaHCO3 should be employed concomitantly to maintain the urine pH at 7.0 or greater.

#### Other Uses

*Adults.* Used with 5-FU in standard approved regimens for colorectal cancer in adults, the dosage used is in place of leucovorin (at 50% the leucovorin dosage).

#### **OFF-LABEL USES**

May also be used for overdosage or toxicity of various other folate antagonists (e.g., trimethoprim, pyrimethamine).

## CONTRAINDICATIONS

Previous allergic reactions attributed to folic acid or leucovorin calcium (folinic acid). NOTE: Not approved for pernicious anemia and megaloblastic anemias secondary to the lack of vitamin B<sub>12</sub>. Improper use may cause a hematologic remission while neurologic manifestations continue to progress.

## INTERACTIONS

#### Drug

Anticonvulsants: May decrease the anticonvulsant activity.

**Chemotherapeutic agents:** May increase the effects and toxicity of these drugs when taken in combination. Occurs especially with 5-FU; watch for dehydration, diarrhea.

Sulfamethoxazole-trimethoprim (SMZ-TMP): Concomitant use for the acute treatment of PCP in patients with HIV infection is associated with treatment failure and morbidity.

Herbal and Food None known.

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Due to the risk of precipitation, do not coadminister with other agents in the same admixture.

## SIDE EFFECTS

#### Frequent

Vomiting (38%), stomatitis (38%), and nausea (19%) were most common.

### Occasional

Diarrhea, taste perversion, urticaria, dermatitis, dyspnea.

## SERIOUS REACTIONS

• Excessive dosage may negate chemotherapeutic effects of folic acid antagonists.

- · Anaphylaxis occurs rarely.
- Diarrhea may cause rapid clinical deterioration.

#### PRECAUTIONS & CONSIDERATIONS

Monitor patients with renal dysfunction or dehydration closely. It is unknown whether levoleucovorin crosses the placenta or is distributed in breast milk. Consuming foods with folic acid, including dried beans, meat proteins, and green leafy vegetables, is encouraged in those with folic acid deficiency. Caution in individuals with severe anemia or those receiving cancer chemotherapy. Report development of infection immediately. Monitor CBC, BUN, and serum creatinine (important in methotrexate rescue). Electrolyte levels and liver function test results in those receiving chemotherapeutic agents should be assessed. For treatment of accidental overdosage of folic acid antagonists, levoleucovorin should be given as soon as possible. Storage

Store vials at room temperature; protect from light. Initial reconstitution or infusions using 0.9% NaCl may be held at room temperature for not more than 12 h. Infusions in D5W may be held at room temperature for not more than 4 h.

#### Administration

For intravenous (IV) infusion use only. *Never* administer intrathecally.

Prior to IV use, the 50-mg vial is reconstituted with 5.3 mL of 0.9% NaCl (unpreserved) to yield a concentration of 10 mg/mL. Further dilute to a concentration between 0.5 mg/mL and 5 mg/mL in 0.9% NaCl or D5W. Because of the calcium content, no more than 16 mL (160 mg of levoleucovorin) should be infused IV per minute.

### Levorphanol

lee-vor'fa-nole

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Analgesics, narcotic

## **MECHANISM OF ACTION**

An opioid agonist that binds at opiate receptor sites in central nervous system (CNS). *Therapeutic Effect*: Reduced intensity of pain stimuli incoming from sensory nerve endings, altering pain perception and emotional response to pain.

### PHARMACOKINETICS

Rapidly absorbed after oral administration; onset of effect within 15-30 min after IM administration. Protein binding: 40%-50%. Extensively distributed. Metabolized in liver. Excreted in urine. Steady-state plasma levels attained by third day of dosing. *Half-life:* 11 h.

## AVAILABILITY

Tablets: 2 mg. Injection: 2 mg/mL (Levo-Dromoran).

# INDICATIONS AND DOSAGES Pain

PO

Adults, Elderly. 2 mg. May be increased to 3 mg if needed and may increase dose to 3 mg every 6-8 h. Not to exceed 6-12 mg/day. Patients with cancer or with chronic opioid therapy needs will require individualized dosage that may exceed these recommendations for acute pain. IM/SC

Adults, Elderly. 1-2 mg as a single dose. May repeat in 6-8 h as needed. Maximum: 3-8 mg/day. IV

*Adults.* Up to 1 mg injection in divided doses by slow injection. May repeat in 3-6 h as needed. Maximum: 4-8 mg/day.

## Preoperative

#### IM/SC

*Adults, Elderly.* 1-2 mg as a single dose 60-90 min before surgery. Adjustment may be needed in elderly patients.

### Perioperative

#### IM/SC

*Adults, Elderly.* Dosing based on age, weight, physical status, underlying pathology, and other anesthetic being used during procedure.

## CONTRAINDICATIONS

Hypersensitivity to levorphanol or any component of the formulation.

## INTERACTIONS

#### Drug

Alcohol, barbiturates, general anesthetics, hypnotics, other opioids, phenothiazines, sedatives, skeletal muscle relaxants, tranquilizers, tricyclic antidepressants and other central nervous system (CNS) depressants: May increase CNS or respiratory depression, profound sedation and coma, hypotension. MAOIs: May produce severe, fatal reaction. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum amylase and lipase levels.

## IV INCOMPATIBILITIES

Do not mix with aminophylline, ammonium dichloride, amobarbital, chlorothiazide, dietholamine, heparin, methicillin, nitrofurantoin, novobiocin, pentobarbital, perphenazine, phenobarbital, phenytoin, secobarbital, sodium bicarbonate, sodium iodide, sulfadiazine, sulfisoxazole, thiopental.

## SIDE EFFECTS

Effects are dependent on dosage amount, route of administration. Ambulatory patients and those not in severe pain may experience dizziness, nausea, vomiting, or hypotension more frequently than those in supine position or having severe pain.

#### Frequent

Dizziness, drowsiness, hypotension, nausea, vomiting.

#### Occasional

Shortness of breath, confusion, decreased urination, stomach cramps, altered vision, constipation, dry mouth, headache, difficult or painful urination.

### Rare

Allergic reaction (rash, itching), histamine reaction (decreased BP, increased sweating, flushed face, wheezing).

## SERIOUS REACTIONS

• Overdosage results in respiratory depression, skeletal muscle flaccidity, cold clammy skin,

cyanosis, extreme somnolence progressing to convulsions, stupor, coma, hypotension, respiratory depression, and death.

• Tolerance to analgesic effect, physical dependence may occur with repeated use.

 Paralytic ileus may occur with prolonged use.

#### PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used in patients with acute alcoholism, anoxia, CNS depression, hypercapnia, respiratory depression, respiratory dysfunction, seizures, shock, and untreated myxedema. Caution is also warranted with acute abdominal conditions, biliary surgery, Addison's disease, chronic obstructive pulmonary disease (COPD), hypothyroidism, impaired renal or liver function, increased intracranial pressure, benign prostatic hypertrophy, and urethral stricture; expect to reduce the initial dosage in these conditions. biliary surgery, Safety and efficacy in children are not established. Unknown if excreted in breast milk; caution warranted in pregnancy and lactation.

Vital signs should be taken before giving medication. If respirations are 12/min or lower (20/min or lower in children), withhold medication and contact the physician. Vital signs should be monitored after administration as well.

Be aware that ambulatory persons and those not in severe pain may experience dizziness, hypotension, nausea, and vomiting more frequently than persons in the supine position or with severe pain. Avoid alcohol and tasks that require mental alertness or motor skills. Change positions slowly to avoid orthostatic hypotension. Drug has abuse potential. Caution warranted in patients with addictive disorders.

May cause serious or potentially fatal respiratory depression if given in excessive dose, given too frequently, or given in full dose to compromised patients. Discontinuing after chronic use may result in withdrawal syndrome.

Any of the follwing symptoms should be reported immediately to health care providers: dizziness, light-headedness, sleepiness, drowsiness, difficulty urinating, fainting, shallow breathing, excessive sleepiness.

## Storage

Store at room temperature. Administration

Dosage should be individualized based on degree of pain and physical condition of the person. Administration may be IV, IM, or SC. Give by slow IV injection.

#### Levothyroxine

 lee-voe-thye-rox'een
 ▲ Levothroid, Levoxyl, Synthroid, Tirosint, Unithroid ▲ Eltroxin, Euthyrox, Synthroid
 Do not confuse levothyroxine with liothyronine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A

Classification: Thyroid hormone

#### **MECHANISM OF ACTION**

A synthetic isomer of thyroxine (T4) involved in normal metabolism, growth, and development, especially of the CNS in infants. Possesses catabolic and anabolic effects. *Therapeutic Effect*: Increases basal metabolic

Levothyroxine (Generic Name)

rate, enhances gluconeogenesis, and stimulates protein synthesis.

### PHARMACOKINETICS

Variable, incomplete absorption from the GI tract. Protein binding: 99%. Widely distributed. Deiodinated in peripheral tissues, minimal metabolism in the liver. Eliminated by biliary excretion. *Half-life:* 6-7 days.

## AVAILABILITY

*Tablets (Levothroid, Levoxyl, Synthroid, Unithroid):* 0.025 mg, 0.05 mg, 0.075 mg, 0.088 mg, 0.1 mg, 0.112 mg, 0.125 mg, 0.137 mg, 0.15 mg, 0.175 mg, 0.2 mg, 0.3 mg. *Capsules (Tirosint):* 0.013 mg, 0.025 mg, 0.05 mg, 0.075 mg, 0.125 mg, 0.137 mg, 0.150 mg. *Powder for Injection:* 500 mcg.

# INDICATIONS AND DOSAGES Hypothyroidism (non-emergent) PO

*Adults, Elderly.* Initially, 12.5-50 mcg. May increase by 25-50 mcg/day q2-4wk. Maintenance: 100-200 mcg/day.

#### Usual pediatric dose

NOTE: Dosing is highly individualized and based on body weight and age (see manufacturer dosing). The information below represents common ranges seen at each age.

*Children 13 yr and older*. 150 mcg/ day.

Children aged 6-12 yr: 100-125 mcg/ day.

Children aged 1-5 yr: 75-100 mcg/day. Children 7-11 mo. 50-75 mcg/day.

Children 3-6 mo. 25-50 mcg/day. Children 3 mo and younger. 10-15 mcg/day.

#### Myxedema (usual dose) IV

*Adults, Elderly.* Initially, 300-500 mcg/day for 1 dose, then 100-300 mcg

on second day if needed. Then, 75-100 mcg/day until stabilized and PO therapy feasible.

 Thyroid-stimulating hormone suppression in thyroid cancer, nodules, euthyroid

Adults, Elderly. 2-6 mcg/kg/day for 7-10 days.

#### Usual IV maintenance dosage IV

*Adults, Elderly, Children.* Initial dosage approximately half the previously established oral dosage.

## CONTRAINDICATIONS

Hypersensitivity to tablet components, such as tartrazine; uncorrected adrenal insufficiency (may cause acute adrenal crisis); myocardial infarction and thyrotoxicosis uncomplicated by hypothyroidism; treatment of obesity.

## INTERACTIONS

#### Drug

Antidiabetic drugs: As thyroid replacement ensues, antidiabetic requirements may change; monitor. Cholestyramine, colestipol, enteral feedings, antacids, calcium and iron supplements: May decrease the absorption of levothyroxine. Separate times of administration.

**Digoxin:** May alter digoxin dose requirements as thyroid function corrected due to increased metabolic rate; monitor.

**Oral anticoagulants:** May alter the effects of oral anticoagulants.

Sympathomimetics: May increase the risk of coronary insufficiency. Herbal

#### Herbar Mana 1.

None known. Food

Coffee, dairy foods, soybean flour (infant formula), cotton seed meal, walnuts, and dietary fiber: May decrease absorption.
## DIAGNOSTIC TEST EFFECTS

None known. Dose is adjusted based on monitoring of TSH response. Changes in TBG levels must be considered when interpreting T4 and T3 values.

## IV INCOMPATIBILITIES

Do not use or mix with other IV solutions.

## SIDE EFFECTS

#### Occasional

Reversible hair loss at the start of therapy (in children).

#### Rare

Dry skin, GI intolerance, rash, hives, pseudotumor cerebri, or severe headache in children.

## SERIOUS REACTIONS

 Excessive dosage produces signs and symptoms of hyperthyroidism, including weight loss, palpitations, increased appetite, tremors, nervousness, tachycardia, hypertension, headache, insomnia, and menstrual irregularities.

Cardiac arrhythmias occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Due to potential adverse effects, levothyroxine is not indicated for weight reduction in euthyroid individuals. Caution is warranted in patients with angina pectoris, hypertension, other cardiovascular disease, and in elderly patients. Levothyroxine does not cross the placenta and is minimally excreted in breast milk. Thyroid euthymia promotes fetal development and proper lactation, so there are usually no particular precautions for pregnancy or lactation. No age-related precautions have been noted in children. Use caution in interpreting thyroid function tests in neonates. Elderly

patients may be more sensitive to thyroid effects. Individualized dosages are recommended for this population. Increased nervousness, excitability, sweating, or tachycardia indicates possible uncontrolled hyperthyroidism or overdosage.

Reversible hair loss or increased aggressiveness may occur during the first few months of therapy. Notify the physician of chest pain, edema of feet or ankles, insomnia, nervousness, tremors, weight loss, or a pulse rate of 100 beats/min or more. Weight and vital signs, especially pulse rate and rhythm, should be monitored. Keep in mind that levothyroxine may intensify the signs and symptoms of adrenal insufficiency, diabetes insipidus, diabetes mellitus, and hypopituitarism. Also, know that adrenocortical steroids should be prescribed before thyroid therapy in persons with coexisting hypoadrenalism and hypothyroidism.

#### Storage

Store tablets and vials at room temperature. Protect tablets from moisture.

#### Administration

! Do not use different brands of levothyroxine interchangeably, although problems with bioequivalence among manufacturers are minimized with today's manufacturing process; it is better for patients to use same product throughout treatment or be carefully monitored during product switches. Begin therapy with small doses and increase the dosage gradually, as prescribed.

Take oral levothyroxine at same time each day to maintain hormone levels. Take before breakfast or at bedtime on empty stomach and without other medications or foods. Take with plenty of water. Full therapeutic effect of the drug may take 4-6 wks to appear. Crush tablets as needed. Do not crush or cut capsules. Do not discontinue this drug; replacement therapy for hypothyroidism is lifelong.

For IV use, reconstitute 500-mcg vial with 5 mL 0.9% NaCl to provide a concentration of 100 mcg/mL; shake until clear. Use immediately, and discard unused portion. Give each 100 mcg or less over 1 min.

## Lidocaine Hydrochloride

lye'doe-kane high-droh-klor'ide ★ Lidoderm Patch, Lidamantle, Lidomar, Solarcaine, Xylocaine, Xylocaine MPF, Xylocaine Jelly, Xylocaine Topical Solution ★ Lidodan, Lidodan Jelly, Xylocard

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Antiarrythmics, class IB; local anesthetics, amide local anesthetics

## **MECHANISM OF ACTION**

An amide anesthetic that inhibits the conduction of nerve impulses. *Therapeutic Effect:* Causes temporary loss of feeling and sensation. Also an antiarrhythmic that decreases depolarization, automaticity, excitability of the ventricle during diastole by direct action.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	30-90 seconds	NA	10-20 min
Local	2.5 min	NA	30-60 min anesthetic

Completely absorbed after IM

administration. Protein binding: 60%-80%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 1-2 h.

## AVAILABILITY

IV Syringes, Prefilled, 10 mL: 10 mg/mL, 20 mg/mL. IV Infusion: 4 mg/mL, 8 mg/mL. Injection (Anesthesia): 0.5%, 1%, 1.5%, 2%, 4%. Ointment: 2.5%, 5%. Cream: 0.5%. Gel: 0.5%, 2.5%. Topical Spray: 0.5%. Topical Solution: 2%, 4%. Topical Jelly: 2%. Dermal Patch (Lidoderm): 5%.

## INDICATIONS AND DOSAGES

 Rapid control of acute ventricular arrhythmias after myocardial infarction, cardiac catheterization, cardiac surgery, or digitalis-induced ventricular arrhythmias IV

*Adults, Elderly.* Initially, 50-100 mg (1 mg/kg) IV bolus at rate of 25-50 mg/min. May repeat in 5 min. Give no more than 200-300 mg in 1 h. Maintenance: 20-50 mcg/kg/min (1-4 mg/min) as IV infusion. *Children, Infants.* Initially, 0.5-1 mg/kg IV bolus; may repeat but total dose not to exceed 3-5 mg/kg. Maintenance: 10-50 mcg/kg/min as IV infusion.

## Dental or surgical procedures, childbirth

## INFILTRATION OR NERVE BLOCK

*Adults*. Local anesthetic dosage varies with the procedure, degree of anesthesia, vascularity, duration. Maximum dose: 4.5 mg/kg. Do not repeat within 2 h.

 Local skin disorders (minor burns, insect bites, prickly heat, skin manifestations of chickenpox, abrasions) and local anesthesia of nasal and laryngeal mucous membranes; relief of discomfort of pruritus ani, hemorrhoids, pruritus vulvae

## TOPICAL

*Adults, Elderly.* Apply to affected areas as needed. Refer to specific directions of product chosen.

#### Postherpetic neuralgia

TOPICAL (DERMAL PATCH) *Adults, Elderly.* Apply to intact skin over most painful area (up to 3 patches once for up to 12 h in a 24-h period).

#### Oral pain relief

ORAL MUCOSAL APPLICATION (VISCOUS ORAL SOLUTIONS) *Adults.* 15 mL no more than q3h undiluted as needed. For use in the mouth, swish around in the mouth and spit out. For use in the pharynx, gargle and may be swallowed.

Maximum: 8 doses/24 h. Children > 3 yr. Care must be taken to ensure correct dosage based on age and weight. For example, in a child of 5 yr weighing 50 lb, the dose should not exceed 75-100 mg (3.75-5 mL); do not give more often than q3h. Maximum: 8 doses/24 h. Infants and Children < 3 vr. 1.25 mL of the solution should be accurately measured and applied to the immediate area with a cottontipped applicator. Give no sooner than at 3-h intervals. Not more than 4 doses should be given in a 12-h period.

#### Typical dosage for urethral anesthesia

#### TOPICAL (JELLY)

*Adults.* Instill 15 mL (male) or 3-5 mL (female) of 2% jelly or solution into the urethra.

## CONTRAINDICATIONS

Adams-Stokes syndrome, hypersensitivity to amide-type local anesthetics, septicemia (spinal anesthesia), supraventricular arrhythmias, Wolff-Parkinson-White syndrome.

## INTERACTIONS

#### Drug

 Anticonvulsants: May increase cardiac depressant effects.
 β-Adrenergic blockers: May increase risk of toxicity.

 Other antiarrhythmics: May increase cardiac effects.
 Herbal

 None known.
 Food

 None known.
 Horbal

## DIAGNOSTIC TEST EFFECTS

Therapeutic blood level is 1.5-6 mcg/mL; mL; toxic blood level is > 6 mcg/mL. Monitor ECG.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), caspofungin (Cancidas), diazepam, haloperidol, lansoprazole (Prevacid), milrinone, nesiritide (Natrecor), pantoprazole (Protonix), phenobarbital, phenytoin, thiopental.

## **IV COMPATIBILITIES**

Aminophylline, amiodarone (Cordarone), calcium gluconate, digoxin (Lanoxin), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), enalapril (Vasotec), furosemide (Lasix), heparin, insulin, nitroglycerin, potassium chloride.

## SIDE EFFECTS

Central nervous system (CNS) effects are generally dose-related and of short duration.

#### Occasional

IM: Pain at injection site. Topical: Burning, stinging, tenderness at application site.

#### Rare

Generally with high dose: Drowsiness; dizziness; disorientation; light-headedness; tremors; apprehension; euphoria; sensation of heat, cold, or numbness; blurred or double vision; ringing or roaring in ears (tinnitus); nausea.

#### SERIOUS REACTIONS

 Although serious adverse reactions to lidocaine are uncommon, high dosage by any route may produce cardiovascular depression, bradycardia, hypotension, arrhythmias, heart block, cardiovascular collapse, and cardiac arrest.

 Potential for malignant hyperthermia.

· CNS toxicity may occur, especially with regional anesthesia use, progressing rapidly from mild side effects to tremors, somnolence, seizures, vomiting, and respiratory depression.

 Methemoglobinemia (evidenced by cyanosis) has occurred following topical application of lidocaine for teething discomfort and laryngeal anesthetic spray.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with atrial fibrillation, bradycardia, heart block, hypovolemia, liver disease, marked hypoxia, and severe respiratory depression. Be aware that lidocaine crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in children. Elderly patients are more sensitive to the adverse effects of lidocaine. Lidocaine dose and rate of infusion should be reduced in elderly patients. In

elderly patients, age-related renal impairment may require dosage adjustment. Chewing gum, drinking, or eating for 1 h after oral mucous membrane lidocaine application should be avoided; the swallowing reflex may be impaired, increasing risk of aspiration, and numbness of tongue or buccal mucosa may lead to trauma.

A loss of feeling or sensation will occur, and patients will need protection from trauma until anesthetic wears off. Hypersensitivity to amide anesthetics and lidocaine should be determined before beginning drug therapy. BP, pulse, respirations, ECG, and serum electrolytes should be obtained at baseline and periodically thereafter.

#### Storage

Store at room temperature. Administration

Keep resuscitative equipment and drugs, including O2, readily available when administering lidocaine by any injectable route.

For IM administration, use 10% (100 mg/mL) and clearly identify the lidocaine preparation. Give injection in deltoid muscle because the blood level will be significantly higher than if the injection is given in gluteus muscle or lateral thigh. For transdermal use, may cut patch to size before removing adhesive backing. Use only lidocaine without preservative, clearly marked for IV use.

For IV infusion, prepare solution by adding 1 g to 1 L D5W to provide concentration of 1 mg/mL (0.1%). Know that commercially available preparations of 0.2%, 0.4%, and 0.8% may be used for IV infusion. Be aware that the maximum concentration is 4 g/250 mL. For IV push, use 1% (10 mg/mL) or 2% (20 mg/mL). Administer IV push at rate of 25-50 mg/min. Administer for IV infusion at rate of 1-4 mg/min (1-4 mL) and use a volume control IV set.

For topical use, be aware that this form is not for ophthalmic use. For skin disorders, apply directly to affected area or put on a gauze or bandage, which is then applied to the skin. For mucous membrane use, apply to desired area as per manufacturer's insert. Administer the lowest dosage possible that still provides anesthesia. Dermal patches may be cut to fit area. Do not apply external heat to the site of the dermal patch, as this could cause anesthetic toxicity.

## Linagliptin

lin'a-glip'-tin

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: B

**Classification:** Antidiabetic agents, dipeptidyl peptidase-4 (DPP-4) inhibitor

## **MECHANISM OF ACTION**

A "gliptin," or dipeptidyl peptidase-4 inhibitor (DPP-4), that decreases the breakdown of glucagon-like peptide-1 (GLP-1), resulting in more prompt and appropriate secretion of insulin and suppression of glucagon in response to blood sugar increases following meals or snacks, improving glucose tolerance. *Therapeutic Effect:* Lowers blood glucose concentration and also HbA1C over time.

## PHARMACOKINETICS

May administer with or without food; oral absorption about 30%. Protein binding is dose dependent and can approach 99%. Maximal plasma concentration occurs 1.5 h after dosing. Minimal metabolism. Mostly excreted unchanged in enterohepatic system (> 80%) and the rest in urine. Not removed by hemodialysis. *Halflife:* > 100 h (terminal).

## AVAILABILITY

Tablets: 5 mg.

## INDICATIONS AND DOSAGES • Type 2 diabetes mellitus:

PO

*Adults, Elderly.* 5 mg once daily. May be given with sulfonylureas or metformin.

## CONTRAINDICATIONS

Hypersensitivity to linagliptin. Not for type 1 diabetes mellitus or diabetic ketoacidosis. Not studied with insulin.

## INTERACTIONS

#### Drug

**β-Blockers:** May mask signs of hypoglycemia.

**Rifampin, other strong CYP3A4 inducers:** May render linagliptin ineffective; avoid co-use where possible.

Corticosteroids: May increase blood sugar.

**Sulfonylureas:** May increase risk of hypoglycemia; lower sulfonylurea dose may be needed.

## Herbal

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle: May enhance hypoglycemic effects.

**St. John's wort:** May reduce linagliptin levels and negate efficacy; avoid use.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

Lowers blood sugar. May increase uric acid.

#### SIDE EFFECTS

#### Frequent

Nasopharyngitis, hypoglycemia. Occasional

Headache, decreased appetite, nausea, abdominal pain, arthralgia, back pain, cough.

#### Rare

Peripheral edema when used with a thiazolidinedione.

#### SERIOUS REACTIONS

 Overdose may produce severe hypoglycemia.

• Rare reports of serious allergic reactions, including angioedema and exfoliative skin rashes, such as Stevens-Johnson syndrome.

• Rare reports of pancreatitis with this class of drugs.

#### PRECAUTIONS & CONSIDERATIONS

There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with linagliptin. Caution is warranted in patients who are taking potentially interacting medications. Be alert to conditions that alter blood glucose requirements or dietary intake, such as fever, increased activity, stress, or a surgical procedure. There are no data regarding linagliptin use during pregnancy. It is unknown whether the drug is distributed in breast milk; caution is recommended. Safety and efficacy of linagliptin have not been established in children.

Hypoglycemia may be difficult to recognize in elderly patients. Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store tablets at room temperature. Administration

May take orally without regard to food or the timing of meals or snacks, at roughly the same time daily.

## Lindane (Gamma Benzene Hexachloride)

lin'dane Hexit Do not confuse lindane with lidocaine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anti-infectives, topical; dermatologics; scabicides/ pediculicides

#### **MECHANISM OF ACTION**

A scabicidal agent that is directly absorbed by parasites and ova through the exoskeleton. *Therapeutic Effect:* Stimulates the nervous system resulting in seizures and death of parasitic arthropods.

## PHARMACOKINETICS

May be absorbed systemically. Metabolized in liver. Excreted in the urine and feces. *Half-life:* 17-22 h.

## AVAILABILITY

Lotion: 1%. Shampoo: 1%.

## INDICATIONS AND DOSAGES

NOTE: Only to be used in patients who cannot tolerate or have failed first-line treatment with safer medications.

## Treatment of scabies

TOPICAL

Adults, Elderly, Children weighing 110 lb (50 kg) or more. Apply thin layer. Massage on skin from neck to the toes. Bathe and remove drug after 8-12 h.

## Head lice

TOPICAL

Adults, Elderly, Children weighing 110 lb (50 kg) or more. Apply about 30 mL of shampoo to dry hair and massage into hair for 4 min. Add small amounts of water to hair until lather forms, then rinse hair thoroughly and comb with a fine-tooth comb to remove nits. Maximum: 60 mL of shampoo.

## CONTRAINDICATIONS

Hypersensitivity to lindane or any component of the formulation, uncontrolled seizure disorders, crusted (Norwegian) scabies, acutely inflamed skin or raw, weeping surfaces, or other skin conditions that might increase systemic absorption.

## INTERACTIONS

#### Drug

Drugs known to decrease seizure threshold (antipsychotics, etc.): Use caution due to neurotoxicity of lindane.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Rare (<1%)

Burning, stinging, cardiac arrhythmia, ataxia, dizziness, headache, restlessness, seizures, pain, alopecia, contact dermatitis, skin and adipose tissue may act as repositories, eczematous eruptions, pruritus, urticaria, nausea, vomiting, aplastic anemia, hepatitis, paresthesias, hematuria, pulmonary edema.

## SERIOUS REACTIONS

• Seizures and death or serious reactions due to neurotoxicity; may occur even with proper, single-dose use.

## PRECAUTIONS & CONSIDERATIONS

Lindane is second-line choice because of the potential for systemic absorption and CNS side effects, especially in children. Do not use in children < 50 kg. Caution should be used in people taking medications for seizures. Avoid use during pregnancy and when breastfeeding. Avoid using on infants. No age-related precautions have been noted in elderly patients. Clothing and bedding should be washed in hot water or by dry cleaning to remove infestation.

#### Administration

! Never apply more than 2 oz of lotion. Wait at least 1 h after bathing or showering to apply. Skin should be clean and free of any lotions, creams, or oils before lindane application. Apply a thin layer and massage onto clean, dry skin from the neck to the toes. Wait 8-12 h, then bathe or shower. Avoid contact with eyes or face.

Apply shampoo to clean, dry hair. Wait at least 1 h after washing hair before applying lindane shampoo. Hair should be washed with a shampoo that does not contain conditioner. Hair should be free of any lotions, oils, or creams before lindane application.

Because of the drug's toxicity, no more than 1 treatment should be applied.

## Linezolid

li-nee'zoh-lid ★ Zyvox ➡ Zyvoxam Do not confuse Zyvox with Zovirax or Vioxx.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antibiotics, oxazolidinone derivative

#### **MECHANISM OF ACTION**

An oxazolidinone anti-infective that binds to a site on bacterial 23S ribosomal RNA, preventing the formation of a complex that is essential for bacterial translation. *Therapeutic Effect:* Bacteriostatic against enterococci and staphylococci; bactericidal against streptococci.

#### PHARMACOKINETICS

Rapidly and extensively absorbed after PO administration. Protein binding: 31%. Metabolized in the liver by oxidation. Excreted in urine. Removed by dialysis. *Half-life:* 4-5.4 h.

#### AVAILABILITY

Powder for Oral Suspension: 100 mg/5 mL. Tablets: 400 mg, 600 mg. Premixed IV Infusion: 2 mg/mL in 100-mL, 200-mL, 300-mL bags.

## INDICATIONS AND DOSAGES

 Vancomycin-resistant infections (VRE, VR-MSRA)

PO, IV Adults, Elderly, Children  $\ge 12$  yr: 600 mg q12h for 14-28 days.

#### Pneumonia, complicated skin and skin-structure infections

PO, IV

Adults, Elderly, Children  $\geq 12$  yr. 600 mg q12h for 10-14 days.

## Uncomplicated skin and skinstructure infections

PO

*Adults, Elderly.* 400 mg q12h for 10-14 days.

#### Usual pediatric dosage

Children  $\geq 12$  yr: 600 mg q12h. Children aged 5-11 yr: 10 mg/kg/ dose q8-12h.

## Usual neonate dosage

PO, IV Neonates. 10 mg/kg/dose q8-12h.

#### CONTRAINDICATIONS

Hypersensitivity to oxazolidinones or any of their components. Use within 14 days of an MAOI, uncontrolled hypertension. Unless patients are carefully observed for serotonin syndrome, linezolid should not be administered to patients with carcinoid syndrome or to patients taking any of the following medications: SSRIs or SNRIs, tricyclic antidepressants, serotonin 5-HT<sub>1</sub> receptor agonists (triptans) for migraine, meperidine or buspirone.

Linezolid (Generic Name), Zyvox (Brand Name)

## INTERACTIONS

## Drug

Adrenergic agents (indirectacting sympathomimetics) and vasopressors (dopaminergic drugs, phenylephrine, pseudoephedrine, epinephrine): May increase pressor effects.

**MAOIs:** Additive side effects. Contraindicated.

SSRIs or SNRIs; tricyclic antidepressants; serotonin agonists (triptans) for migraine; meperidine or buspirone: Reports of serotonin syndrome. Avoid use.

## Herbal

None known.

#### Food

#### Tyramine-containing foods and

**beverages:** Excessive amounts may cause hypertension.

#### DIAGNOSTIC TEST EFFECTS

May decrease blood hemoglobin, platelet count, WBC count, and ALT (SGPT) levels; monitor platelet counts and CBC in patients at risk for bleeding.

## IV INCOMPATIBILITIES

Do not mix with other drugs while infusing.

Amphotericin B complex (Abelcet, AmBisome, Amphotec), chlorpromazine (Thorazine), co-trimoxazole (Bactrim), diazepam (Valium), erythromycin (Erythrocin), pantoprazole (Protonix), pentamidine (Pentam IV), phenytoin (Dilantin), thiopental.

#### SIDE EFFECTS

#### Occasional (2%-5%)

Diarrhea, nausea, headache. Rare (< 2%)

Altered taste, vaginal candidiasis, fungal infection, dizziness, tongue discoloration, insomnia, fever.

## SERIOUS REACTIONS

Thrombocytopenia and myelosuppression occur rarely.
Antibiotic-associated colitis and other superinfections may result from

altered bacterial balance.

· Serotonin syndrome or

hypertension with serotonergic or pressor agents.

• Lactic acidosis (rare) with prolonged therapy.

· Peripheral neuropathy.

• Optic neuropathy with rare vision loss with prolonged therapy.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with carcinoid syndrome, pheochromocytoma, severe renal or hepatic impairment, uncontrolled hypertension, or untreated hyperthyroidism. It is unknown whether linezolid is distributed in breast milk. The safety and efficacy of linezolid have not been established in children. No agerelated precautions have been noted in elderly patients. Avoid excessive amounts of tyramine-containing foods (such as aged cheese and red wine) because these foods may cause severe reactions and increased hypertension, including diaphoresis, neck stiffness, palpitations, and severe headache. May promote overgrowth of nonsusceptible bacterial strains; monitor platelet counts in patients at risk for bleeding.

Mild GI effects may be tolerable, but severe symptoms may indicate the onset of antibiotic-associated colitis. Pattern of daily bowel activity and stool consistency should be monitored. Be alert for signs and symptoms of superinfection, including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, fever or fatigue, and severe mouth soreness. CBC should be monitored weekly.

## Storage

Use the oral suspension within 21 days of reconstitution. Store the drug at room temperature and protect it from light. A yellow color does not affect potency. Keep infusion bags in overwrap until ready to use. Protect from freezing.

#### Administration

Take oral linezolid without regard to food. May take with food or milk if GI upset occurs. Space drug doses evenly around the clock, and continue linezolid therapy for the full course of treatment.

! Do not mix linezolid for IV use with other medications. If the same line is used to administer another drug, flush it with a compatible fluid (D5W, 0.9% NaCl, lactated Ringer's). Infuse the drug over 30-120 min.

## Liothyronine T<sub>3</sub>

lye-oh-thye'roe-neen ↓ Cytomel, Triostat ↓ Cytomel Do not confuse liothyronine with levothyroxine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: A

Classification: Thyroid hormone

## **MECHANISM OF ACTION**

A synthetic form of triiodothyronine  $(T_3)$ , a thyroid hormone involved in normal metabolism, growth, and development, especially of the central nervous system in infants. Possesses catabolic and anabolic effects. *Therapeutic Effect:* Increases basal metabolic rate, enhances gluconeogenesis, and stimulates protein synthesis.

#### PHARMACOKINETICS

PO: Peak 12-48 h. *Half-life:* 0.6-1.4 days.

## AVAILABILITY

Tablets (Cytomel): 5 mcg, 25 mcg, 50 mcg. Injection (Triostat): 10 mcg/mL.

## INDICATIONS AND DOSAGES Hypothyroidism

PO

Adults, Elderly. Initially, 25 mcg/ day. May increase in increments of 12.5-25 mcg/day q1-2wk. Maximum: 100 mcg/day.

*Children.* Initially, 5 mcg/day. May increase by 5 mcg/day q3-4wk. Maintenance: 100 mcg/day (children older than 3 yr); 50 mcg/day (children 1-3 yr); 20 mcg/day (infants).

#### Myxedema PO

*Adults, Elderly.* Initially, 5 mcg/day. Increase by 5-10 mcg q1-2wk (after 25 mcg/day has been reached, may increase in 12.5-mcg increments). Maintenance: 50-100 mcg/day.

#### Nontoxic goiter PO

Adults, Elderly: Initially, 5 mcg/day. Increase by 5-10 mcg/day q1-2wk. When 25 mcg/day has been reached, may increase by 12.5-25 mcg/day q1-2wk. Maintenance: 75 mcg/day. *Children*. 5 mcg/day. May increase by 5 mcg q1-2wk. Maintenance: 15-20 mcg/day.

#### Congenital hypothyroidism PO

*Children.* Initially, 5 mcg/day. Increase by 5 mcg/day q3-4 days. Maintenance: Full adult dosage (children older than 3 yr); 50 mcg/day (children 1-3 yr); 20 mcg/day (infants).

## T<sub>3</sub> suppression test

PO

*Adults, Elderly.* 75-100 mcg/day for 7 days; then repeat <sup>131</sup>I thyroid uptake test.

Liothyronine T<sub>3</sub> (Generic Name)

#### Myxedema coma, precoma IV

*Adults, Elderly.* Initially, 25-50 mcg (10-20 mcg in patients with cardiovascular disease). Total dose at least 65 mcg/day.

## CONTRAINDICATIONS

Hypersensitivity to tablet components; myocardial infarction; thyrotoxicosis uncomplicated by hypothyroidism; uncorrected adrenal insufficiency (may cause acute adrenal crisis); treatment of obesity.

## INTERACTIONS

#### Drug

Antidiabetic drugs: As thyroid replacement ensues, antidiabetic requirements may change; monitor. Cholestyramine, colestipol, enteral feedings, antacids, calcium and iron supplements: May decrease the absorption of liothyronine.

**Digoxin:** May alter digoxin dose requirements as thyroid function corrected due to increased metabolic rate; monitor.

**Ketamine:** May cause tachycardia or hypertension.

**Oral anticoagulants:** May alter the effects of these drugs.

**Sympathomimetics:** May increase the risk of coronary insufficiency and the effects of liothyronine.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional

Reversible hair loss at start of therapy (in children).

## Rare

Dry skin, GI intolerance, rash, hives, pseudotumor cerebri or severe headache in children.

## SERIOUS REACTIONS

• Excessive dosage produces signs and symptoms of hyperthyroidism, including weight loss, palpitations, increased appetite, tremors, nervousness, tachycardia, hypertension, headache, insomnia, and menstrual irregularities.

· Cardiac arrhythmias occur rarely.

## **PRECAUTIONS & CONSIDERATIONS**

Due to potential adverse effects, liothyronine is not indicated for weight reduction in euthyroid individuals.

Caution is warranted in patients with adrenal insufficiency, cardiovascular disease, coronary artery disease, diabetes insipidus, and diabetes mellitus. Liothyronine does not cross the placenta and is minimally excreted in breast milk. Maternal thyroid health is important to pregnancy and to proper lactation. No age-related precautions have been noted in children. Use caution in interpreting thyroid function test results in neonates. Elderly patients may be more sensitive to thyroid effects. Individualized dosages are recommended.

Reversible hair loss or increased aggressiveness may occur during the first few months of therapy. Notify the physician of chest pain, edema of feet or ankles, insomnia, nervousness, tremors, weight loss, or a pulse rate of 100 beats/ min or more. Weight and vital signs, especially pulse rate and rhythm, should be monitored. Keep in mind that liothyronine may intensify the signs and symptoms of adrenal insufficiency, diabetes insipidus, diabetes mellitus, and hypopituitarism.

Also, know that adrenocortical steroids should be prescribed before thyroid therapy in persons with coexisting hypoadrenalism and hypothyroidism.

#### Storage

Store tablets and unopened vials at room temperature.

#### Administration

! Initial and subsequent dosages are based on the clinical status and response. Do not use different brands of liothyronine interchangeably because of problems with bioequivalence among manufacturers.

Take at the same time each day, preferably in the morning. Do not abruptly discontinue the drug; replacement therapy for hypothyroidism is lifelong.

Administer IV dose over 4 h but no longer than 12 h apart. For intravenous use only; may give without further dilution.

## Liraglutide lir'a-gloo'tide

🗙 🗳 Victoza

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, incretin mimetics

#### MECHANISM OF ACTION

A synthetic peptide similar to exenatide; 97% of the peptide sequence of liraglutide overlaps with human glucagon-like peptide-1 (GLP-1). Incretins, such as GLP-1, enhance glucose-dependent insulin secretion and exhibit other antihyperglycemic actions following their release into the circulation from the gut. Liraglutide is a GLP-1 receptor agonist that enhances glucose-dependent insulin secretion by the pancreatic  $\beta$ -cell, suppresses inappropriately elevated glucagon secretion, and slows gastric emptying. *Therapeutic Effect:* Lowers blood glucose concentration and also HbA1C over time.

#### PHARMACOKINETICS

Native GLP-1 has a very short halflife (< 1 min) and is not clinically useful; liraglutide has an extended therapeutic profile in comparison. Bioavailability following subcutaneous administration is roughly 55%. Maximum plasma concentration occurs 8-12 h after subcutaneous injection. There is no one organ responsible for liraglutide elimination. *Half-life*: 13 h.

#### AVAILABILITY

*Injection (6 mg/mL):* Available in prefilled pens that deliver doses of either 0.6 mg, 1.2 mg or 1.8 mg; each containing 60 doses.

# INDICATIONS AND DOSAGES Type 2 diabetes mellitus SC

Adults, Elderly. Initially, 0.6 mg once per day for 1 wk. The dose can be given at any time of day and without regard to meals. The initial dose is for titration to limit GI side effects and is not effective for glycemic control. After 1 wk, increase the dose to 1.2 mg once per day. Can then increase to 1.8 mg once per day if needed for glycemic control.

 Dosage in renal or hepatic impairment Use usual dose, but use with caution due to lack of clinical data.

## CONTRAINDICATIONS

Hypersensitivity to liraglutide or product components. Do not use in patients with a personal or family history of medullary thyroid carcinoma (MTC) or in patients with multiple endocrine neoplasia syndrome type 2 (MEN 2). Not for type 1 diabetes mellitus or diabetic ketoacidosis. Not studied in combination with insulin.

## INTERACTIONS

#### Drug

**β-Blockers:** May mask signs of hypoglycemia.

## Oral medications (e.g., oral contraceptives, antibiotics):

Liraglutide may slow GI transit time. For oral medications dependent on normal transit times efficacy, such as contraceptives and antibiotics, it may be best to take those drugs at least 1 h before liraglutide, or at a meal or snack when liraglutide is not administered. **Corticosteroids:** May increase blood sugar.

**Digoxin:** Liraglutide may reduce digoxin concentrations; monitor for clinical effect, etc.

**Sulfonylureas:** May increase risk of hypoglycemia; lower sulfonylurea dose may be needed.

Warfarin: May increase the effects of warfarin, resulting in increased INR. Monitor INR closely. Herbal

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle: May enhance hypoglycemic effects. Food

Alcohol: Hypoglycemia is more likely to occur if alcohol is ingested. High and chronic alcohol use may increase risk for pancreatitis.

## DIAGNOSTIC TEST EFFECTS

Lowers blood sugar. May increase serum creatinine, amylase, or lipase.

## SIDE EFFECTS

#### Frequent

Headache, nausea, diarrhea and antiliraglutide antibody formation. Nausea subsides with time.

#### Occasional

Gastroesophageal reflux (GERD), vomiting, constipation, hypoglycemia, nervousness, dizziness, dyspepsia, decreased appetite, asthenia, hyperhidrosis. **Rare** 

Injection site reaction, abdominal pain, eructation, flatulence, abdominal distention, taste disturbance, pruritus, urticaria, maculopapular rash.

## SERIOUS REACTIONS

• Overdose may produce severe hypoglycemia, along with severe GI symptoms and vomiting.

• Pancreatitis, including nonfatal hemorrhagic and necrotizing pancreatitis.

• Rare reports of serious allergic reactions, including angioedema and serious rashes.

· Potential risk of thyroid tumor.

## **PRECAUTIONS & CONSIDERATIONS**

For patients with a history of pancreatitis, selection of other antidiabetic medications is suggested (see Serious Reactions). Caution is warranted in patients with potential risk factors for pancreatitis (hypertriglyceridemia, alcoholism, other) and patients with significant GI disease (e.g., gastroparesis) where slowing of GI transit time may aggravate the condition. Also use with caution in patients with thyroid disease. Liraglutide may cause dose-dependent and treatment-duration-dependent thyroid C-cell tumors (adenomas and/or carcinomas). Be alert to conditions that alter blood glucose requirements or dietary intake, such as fever, increased activity, stress, or a surgical procedure. There are limited data in patients with organ dysfunction. There are no data regarding liraglutide use during pregnancy. It is unknown whether the drug is distributed in breast milk; discontinuation of breastfeeding is recommended due to the potential tumorigenicity of the drug. Safety and efficacy of liraglutide have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients. With time, development of antibodies to the drug may present as treatment failure.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Prior to first use, store pens in a refrigerator. Do not freeze. After

initial use, the pen can be stored for 30 days at controlled room temperature or in a refrigerator. Keep the pen cap on when not in use. Protect from heat and sunlight. Always store the pen without an injection needle attached. This will reduce the potential for contamination, infection, and leakage. Administration

For subcutaneous injection only. Doses are given any time of day and may be given without regard to meals.

If using a new pen, make sure you have prepared the pen for routine use. For routine use, wash hands. Pull off pen cap. The cartridge liquid should be clear, colorless, and free of particles. Attach the needle and dial in the pen dose as the manufacturer directs. Inject the dose SC as directed in the thigh, abdomen, or upper arm; rotate injection sites with each use. After injection, reset the pen, remove and dispose of the used needle properly, and store the pen for next use by replacing the pen cap.

## Lisdexamfetamine

lis-dex-am-fet'a-meen Vyvanse Do not confuse Vyvanse with Glucovance.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Adrenergic agonists, amphetamines, stimulants

#### MECHANISM OF ACTION

Lisdexafetamine is a prodrug of dextroamphetamine, an amphetamine that enhances the action of dopamine

Lisdexamfetamine (Generic Name), Vyvanse (Brand Name)

and norepinephrine by blocking their reuptake from synapses; also inhibits monoamine oxidase. May also modulate serotonergic pathways. Alters motor activity, mental alertness; decreases drowsiness, fatigue. *Therapeutic Effect*: Improves attention span, decreases distractibility, and decreases impulsivity.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Converted to dextroamphetamine and L-lysine, which is believed to occur by first-pass intestinal and/or hepatic metabolism. Not metabolized by CYP450. Plasma concentrations of unconverted lisdexamfetamine dimesylate are low and are nonquantifiable roughly 8 h after a dose. There is minor inhibition of CYP2D6 by dextroamphetamine. Dextroamphetamine metabolized in liver, and metabolites and drug excreted in urine; a small amount of lisdexamfetamine appears in feces. Half-life: Parent drug: < 1 h; dextroamphetamine: roughly 10 h in adults and 6-8 h in children.

## AVAILABILITY

*Capsules (Vyvanse):* 20 mg, 30 mg, 40 mg, 50 mg, 60 mg, 70 mg.

#### INDICATIONS AND DOSAGES Attention-deficit hyperactivity disorder (ADHD) PO

Adults, Children 6 yr and older. Initially, 30 mg once daily in the morning. Titrate at weekly intervals in increments of 10-20 mg if needed. Maximum: 70 mg/day given once daily in the morning.

## CONTRAINDICATIONS

Advanced arteriosclerosis, agitated states, glaucoma, history of drug abuse, hypersensitivity to sympathomimetic amines, hyperthyroidism, moderate to severe hypertension, symptomatic cardiovascular disease, use during or within 14 days of MAOIs.

## INTERACTIONS

#### Drug

Antihypertensives: May decrease efficacy of antihypertensives. Antipsychotics: Efficacy of antipsychotics may be decreased.  $\beta$ -Blockers: May increase the risk of bradycardia, heart block, and hypertension.

GI antacids, sodium bicarbonate, and urinary alkalinizers: Increase amphetamine absorption and decrease urinary elimination, respectively. Avoid concurrent use.

Lithium and neuroleptic medications: Antagonize effect of amphetamines; concurrent use not recommended.

MAOIs, linezolid: May prolong and intensify the effects of amphetamines, including severe hypertensive episodes. Contraindicated with MAOIs.

**Meperidine:** May increase the risk of hypotension, respiratory depression, seizures, and vascular collapse.

Methenamine and urinary acidifiers: Increase amphetamine elimination.

Other CNS stimulants: May increase the effects of amphetamines. Concurrent use not recommended. SSRIs: May increase risk of serotonin syndrome.

**Thyroid hormones:** May increase the effects of either drug.

Tricyclic antidepressants: May increase cardiovascular effects of TCAs. Dietary Supplements

Melatonin: Potential for additive neurologic and cardiac effects. Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase plasma corticosteroid concentrations.

#### SIDE EFFECTS

#### Frequent ( $\geq 5\%$ )

Adults: Upper abdominal pain, diarrhea, nausea, fatigue, feeling jittery, irritability, anorexia, decreased appetite, headaches, anxiety, and insomnia. Children: Decreased appetite, dizziness, dry mouth, irritability, insomnia, upper abdominal pain, nausea, vomiting, and decreased weight.

#### Occasional

Tachycardia, palpitations, emotional lability, blurred vision.

#### Rare

Change in libido, allergic reactions, elevated blood pressure, chest pain, hallucinations or psychosis at normal doses.

#### SERIOUS REACTIONS

 CNS stimulant use associated with serious cardiovascular events and sudden death in patients with cardiac abnormalities or serious heart problems.

 Hypersensitivity reactions, including angioedema and anaphylaxis. Serious skin reactions, including Stevens-Johnson syndrome and toxic epidermal necrolysis, have been reported.

 Overdose may produce skin pallor or flushing, arrhythmias, seizures, and psychosis.

 Abrupt withdrawal after prolonged use of high doses may produce lethargy.

 Prolonged administration to children with ADHD may inhibit growth. Patients who are not growing or gaining weight as expected may need to have their treatment interrupted.

## PRECAUTIONS & CONSIDERATIONS

Amphetamines have a high potential for abuse; prolonged administration may lead to dependence. Misuse of amphetamines may cause sudden death and serious cardiovascular adverse events. Even normal prescription use may cause events in susceptible individuals. Stimulant products generally should not be used in those with known serious structural cardiac abnormalities, cardiomyopathy, serious heart rhythm abnormalities, or other serious cardiac problems that may place them at increased vulnerability to the sympathomimetic effects. Caution is warranted in debilitated and elderly patients and in those with hypertension, psychiatric disorders, seizure disorder, and Tourette's syndrome (may exacerbate tics), or with a history of substance abuse. Safety and efficacy have not been established in children less than 6 yr of age; children under 3 yr should not receive amphetamine treatment. Avoid in pregnancy; amphetamines may cause premature delivery, low birth weight, or withdrawal symptoms in the neonate. Distributed in breast milk; breastfeeding should be avoided.

Mental status, BP, and weight should be assessed. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established. Monitor weight and growth status in children during treatment. Notify the physician if decreased appetite, dizziness, dry mouth, or pronounced nervousness occurs, or if there are unusual changes in behavior or moods. Patients who develop symptoms such as exertional chest pain, unexplained syncope, or other symptoms suggestive of cardiac disease during stimulant treatment should undergo a prompt cardiac evaluation.

#### Storage

Store capsules at room temperature in a tightly closed container.

#### Administration

Lisdexafetamine should be taken in the morning; giving the daily dose in the afternoon may cause insomnia.

The capsules may be taken with or without food. Take whole, or the capsule may be opened and the entire contents dissolved in a glass of water. The entire dose of solution should be consumed immediately. The dose of a single capsule should not be divided. Where possible, treatment should be interrupted occasionally to determine if there is a recurrence of behavioral symptoms sufficient to require continued treatment.

## Lisinopril

ly-sin'oh-pril

Prinivil, Zestril Prinivil, Zestril, Apo-Lisinopril Do not confuse Prinivil with Desyrel, fosinopril, or Plendil; or Zestril with Zostrix.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensives, angiotensin-converting enzyme (ACE) inhibitors

## **MECHANISM OF ACTION**

This ACE inhibitor suppresses the renin-angiotensin-aldosterone system and prevents the conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. Decreases plasma angiotensin II, increases plasma renin activity, and decreases aldosterone secretion. *Therapeutic Effect:* Reduces peripheral arterial resistance, BP, afterload, pulmonary capillary wedge pressure (preload), pulmonary vascular resistance. In those with heart failure, also decreases heart size, increases cardiac output, and increases exercise tolerance time.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	6 h	24 h

Incompletely absorbed from the GI tract. Protein binding: 25%. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life*: 12 h (half-life is prolonged in those with impaired renal function).

## AVAILABILITY

*Tablets (Prinivil, Zestril):* 2.5 mg, 5 mg, 10 mg, 20 mg, 30 mg, 40 mg.

## INDICATIONS AND DOSAGES Hypertension (used alone)

PO

Adults. Initially, 10 mg/day. May increase by 5-10 mg/day at 1- to 2-wk intervals. Maximum: 40 mg/day. *Elderly*. Initially, 2.5-5 mg/day. May increase by 2.5-5 mg/day at 1- to 2-wk intervals. Maximum: 40 mg/day. *Children 6 yr of age or older*. Initially, 0.07 mg/kg once daily

(up to 5 mg total). Adjust according to BP response. Doses above

Lisinopril (Generic Name)

0.61 mg/kg (or 40 mg/day) have not been studied.

## Hypertension (used in combination with other hypertensives)

*Adults*. Initially, 2.5-5 mg/day titrated to clinical response.

#### Adjunctive therapy for management of heart failure PO

Adults, Elderly. Initially, 2.5-5 mg/ day. May increase by no more than 10 mg/day at intervals of at least 2 wks. Maintenance: 5-40 mg/day.

## Improve survival in patients after myocardial infarction (MI)

*Adults, Elderly.* Initially, 5 mg, then 5 mg after 24 h, 10 mg after 48 h, then 10 mg/day for 6 wks. For patients with low systolic BP, give 2.5 mg/day for 3 days, then 2.5-5 mg/day.

#### Dosage in renal impairment (adults)

Titrate to patient's response/tolerance after giving the following initial dose:

## CrCl (mL/min) | Initial Dosage

> 30	10 mg once daily
10-30	5 mg once daily
< 10	2.5 mg once daily

## **OFF-LABEL USES**

Treatment of hypertension or renal crises with scleroderma.

## CONTRAINDICATIONS

Hypersensitivity, history of angioedema related to ACE inhibitors, hereditary or idiopathic angioedema.

## INTERACTIONS

Drug

Alcohol, phenothiazines, diuretics, hypotensive agents: May increase hypotensive effects. Gold compounds: May cause facial flushing, hypotension. Lithium: May increase lithium blood concentration and risk of toxicity. NSAIDs, indomethacin, sympathomimetics: May decrease hypotensive effects. Potassium-sparing diuretics, drospirenone, eplerenone, potassium supplements: May cause hyperkalemia. Herbal None known. Food

**Salt substitutes:** Rich in potassium, these should be avoided during treatment.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, SGOT (AST), and SGPT (ALT) levels. May decrease serum sodium levels. May cause positive ANA titer.

## SIDE EFFECTS

**Frequent (5%-12%)** Headache, dizziness, postural hypotension.

Occasional (2%-4%)

Hyperkalemia, chest discomfort, fatigue, rash, abdominal pain, nausea, diarrhea, upper respiratory infection.

#### Rare (≤ 1%)

Palpitations, tachycardia, peripheral edema, insomnia, paresthesia, confusion, constipation, dry mouth, muscle cramps.

## SERIOUS REACTIONS

• Excessive hypotension ("first-dose syncope") may occur in patients with congestive heart failure (CHF) and severe salt and volume depletion.

#### 936 Lithium Carbonate/Lithium Citrate

• Angioedema (swelling of face and lips) occurs rarely.

 Agranulocytosis and neutropenia may be noted in patients with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in patients with history of renal disease.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cerebrovascular and coronary insufficiency, hypovolemia, renal impairment, sodium depletion, and those on dialysis or receiving diuretics. Be aware that lisinopril crosses the placenta and that it is unknown whether lisinopril is distributed in breast milk; caution is warranted in lactation. Lisinopril has caused fetal or neonatal morbidity or mortality. Discontinue use as soon as possible after pregnancy is detected. Be aware that the safety and efficacy of lisinopril have not been established in children less than 6 yr of age. Elderly patients may be more sensitive to the hypotensive effects of lisinopril.

First-dose syncope may occur in patients with congestive heart failure and severe salt and fluid depletion.

Dizziness may occur. BP should be obtained immediately before giving each lisinopril dose, in addition to regular monitoring. Be alert to fluctuations in BP since orthostatic hypotension may occur; avoid rapid postural changes.

CBC and blood chemistry should be obtained before beginning lisinopril therapy, then every 2 wks for the next 3 mo, and periodically thereafter. Lungs should be ausculated for rales. Pattern of daily bowel activity and stool consistency should be assessed.

#### Storage

Store tablets at room temperature. Compounded suspension stored at or below 77 °F is stable for up to 4 wks; do not freeze.

#### Administration

Take lisinopril without regard to food. Crush tablets if necessary.

For pediatric patients, the manufacturer allows for the compounding of an oral suspension. Shake well before each use.

### Lithium Carbonate/ Lithium Citrate

lith'ee-um kahr' buh-neyt/sit'rayte ▲ Lithobid ▲ Carbolith, Duralith, Lithane, Lithmax Do not confuse Lithobid with Levbid, Lithostat, or Lithotabs. Do not confuse lithium carbonate with lanthanum carbonate.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Psychiatric agents; mood stabilizers

#### **MECHANISM OF ACTION**

A psychotherapeutic agent that affects the storage, release, and reuptake of neurotransmitters. Antimanic effect may result from increased norepinephrine reuptake and serotonin receptor sensitivity. *Therapeutic Effect:* Produces antimanic and antidepressant effects.

#### PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Primarily excreted unchanged in urine. Removed by

Lithium Carbonate/Lithium Citrate (Generic Name)

hemodialysis. *Half-life:* 18-24 h (increased in elderly).

## AVAILABILITY

Capsules: 150 mg, 300 mg, 600 mg. Oral Solution: 300 mg/5 mL. Tablets: 300 mg. Tablets (Extended Release): 300 mg, 450 mg.

## INDICATIONS AND DOSAGES

NOTE: During acute phase, a therapeutic serum lithium concentration of 1-1.4 mEq/L is required. For long-term control, the desired level is 0.5-1.3 mEq/L. Monitor serum drug concentration and clinical response to determine proper dosage.

#### Prevention or treatment of acute mania, manic phase of bipolar disorder (manic-depressive illness) PO

*Adults.* 300 mg 3-4 times a day or 450-900 mg slow-release form twice a day. Maximum: 2.4 g/day. *Elderly.* 300 mg twice a day. May increase by 300 mg/day q1wk. Maintenance: 900-1200 mg/day. *Children 12 yr and older.* 600-1800 mg/day in 3-4 divided doses (2 doses/day for slow release). *Children 6-12 yr.* 15-60 mg/kg/day in 3-4 divided doses.

## **OFF-LABEL USES**

Treatment of depression, treatment of SIADH.

## CONTRAINDICATIONS

Debilitated patients, severe cardiovascular disease, severe dehydration, severe renal disease, severe sodium depletion, first trimester of pregnancy.

## INTERACTIONS

Drug Aspirin, indomethacin, other NSAIDs, metronidazole, carbamazepine: May increase risk of toxicity developing.

Antithyroid medications, iodinated glycerol, potassium iodide: May increase the effects of these drugs. β-Blockers: May mask lithiuminduced tremors.

**Diuretics, NSAIDs:** May increase lithium serum concentration and risk of toxicity.

Haloperidol: May increase extrapyramidal symptoms and the risk of neurologic toxicity.

**Molindone:** May increase the risk of neurotoxicity.

Neuromuscular blocking agents: May increase effects of these drugs. Phenothiazines: May decrease the absorption of phenothiazines, increase the intracellular concentration and renal excretion of lithium, and increase delirium and extrapyramidal symptoms. Antiemetic effect of some phenothiazines may mask early signs of lithium toxicity.

Herbal

None known.

Food

**Caffeine:** Excessive caffeine intake may alter lithium concentrations. **Enteral feedings:** Physically incompatible; do not mix together.

## **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose, immunoreactive parathyroid hormone, and serum calcium levels. Therapeutic lithium serum level is 0.6-1.2 mEq/L; toxic serum level is > 1.5 mEq/L.

## SIDE EFFECTS

! Side effects are dose related and seldom occur at lithium serum levels < 1.5 mEq/L.

#### Occasional

Fine hand tremor, polydipsia, polyuria, mild nausea.

#### Rare

Weight gain, bradycardia or tachycardia, acne, rash, muscle

twitching, cold and cyanotic extremities, pseudotumor cerebri (eye pain, headache, tinnitus, vision disturbances).

## SERIOUS REACTIONS

 A lithium serum concentration of 1.5-2.0 mEq/L may produce vomiting, diarrhea, drowsiness, confusion, incoordination, coarse hand tremor, muscle twitching, and T-wave depression on ECG.
 A lithium serum concentration of

 A lithium serum concentration of 2.0-2.5 mEq/L may result in ataxia, giddiness, tinnitus, blurred vision, clonic movements, and severe hypotension.

 Acute toxicity may be characterized by seizures, oliguria, circulatory failure, cardiac arrhythmias, coma, and death.

#### **PRECAUTIONS & CONSIDERATIONS**

Use may unmask a congenital heart problem called Brugada's syndrome; a cardiology consult is recommended in patients with family history or risk factors for this disease.

Caution is warranted in patients with thyroid disease, renal impairment, or cardiovascular disease as well as those receiving medications that alter sodium such as diuretics, ACE inhibitors, and NSAIDs. Caution should also be used if there is a risk of suicide. Lithium crosses the placenta and is excreted in breast milk. Children and elderly are more sensitive to an increased drug dosage and have a higher risk for toxicity. Steady salt and fluid intake should be maintained, especially during summer months.

Lithium toxicity is closely related to serum levels and the drug has a narrow therapeutic range. Ensure prompt and accurate serum lithium determinations are available during treatment. Serum lithium should be monitored every 4-5 days during initial therapy, then every 1-3 mo when stable. Draw lithium serum concentrations 8-12 h after dose. Closely supervise patients during early therapy. Patients with renal impairment need close monitoring and careful dosing. A cardiac evaluation is indicated in any patient who has syncope or palpitations while on the drug.

## Storage

Store at room temperature; protect from moisture.

#### Administration

Take with food or milk if GI distress occurs. Extended-release tablets must be swallowed whole. Do not crush or chew. Drink 2-3 L of water daily.

Lithium solution may be diluted with fruit juice or other flavored beverage. However, do not mix with other liquid medications or with enteral feedings as incompatibilities may form.

## Lodoxamide Tromethamine

loe-dox'a-mide troh-meth'aye-meen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Mast cell stabilizers, ophthalmics

## **MECHANISM OF ACTION**

A mast cell stabilizer that prevents an increase in cutaneous vascular permeability and antigen-stimulated histamine release and that may prevent calcium influx into mast cells. *Therapeutic Effect:* Inhibits sensitivity reaction.

## PHARMACOKINETICS

Nondetectable absorption. *Half-life:* 8.5 h.

## AVAILABILITY

Ophthalmic Solution: 0.1% (Alomide).

## INDICATIONS AND DOSAGES

#### Treatment of vernal keratoconjunctivitis, conjunctivitis, keratitis

OPHTHALMIC Adults, Elderly, Children 2 yr or older: 1-2 drops 4 times/day, for up to 3 mo.

## CONTRAINDICATIONS

Wearing soft contact lenses (product contains benzalkonium chloride) or hypersensitivity to lodoxamide tromethamine or any component of the formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Transient stinging, burning, instillation discomfort.

#### Occasional

Ocular itching, blurred vision, dry eye, tearing/discharge/foreign body sensation, headache.

#### Rare

Scales on lid or lash, ocular swelling, sticky sensation, dizziness, somnolence, nausea, sneezing, dry nose, rash.

## SERIOUS REACTIONS

None reported.

## **PRECAUTIONS & CONSIDERATIONS**

Be aware that lodoxamide tromethamine is for ophthalmic use only. Not for injection. It is unknown whether lodoxamide tromethamine crosses the placenta or is distributed in breast milk. Be aware that the safety and efficacy of lodoxamide tromethamine have not been established in children younger than 2 yr. No age-related precautions have been noted in elderly patients. Continuous use for longer than 2 wks could result in dry mouth.

#### Storage

Store at room temperature.

## Administration

Tilt the patient's head back; place solution in conjunctival sac. Close eyes, then press gently on the lacrimal sac for 1 min. Do not wear soft contact lenses during therapy. Therapy may last up to 3 mo.

## Loperamide

loe-per'a-mide M Imodium A-D, Imodium A-D EZ Chews ♥ Diarr-Eze, Imodium Do not confuse Imodium with Indocin or Ionamin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC liquid, tablets

**Classification:** Antidiarrheals, opioids

## **MECHANISM OF ACTION**

An antidiarrheal that directly affects the intestinal wall muscles. *Therapeutic Effect:* Slows intestinal motility and prolongs transit time of intestinal contents by reducing fecal volume, diminishing loss of fluid and electrolytes, and increasing viscosity and bulk of stool.

Loperamide (Generic Name)

## PHARMACOKINETICS

Poorly absorbed from the GI tract. Protein binding: 97%. Metabolized in the liver. Eliminated in feces and excreted in urine. Not removed by hemodialysis. *Half-life*: 9.1-14.4 h.

## AVAILABILITY

Capsules: 2 mg. Liquid: 1 mg/5 mL or 1 mg/7.5 mL, both OTC. Tablets: 2 mg (OTC). Chewable Tablets: 2 mg (OTC).

## INDICATIONS AND DOSAGES

## Acute diarrhea

PO (CAPSULES) Adults, Elderly. Initially, 4 mg; then 2 mg after each unformed stool. Maximum: 16 mg/day. Children aged 9-12 yr, weighing more than 30 kg. Initially, 2 mg 3 times a day for 24 h. Maintenance: 0.1 mg/kg given only after loose stool. Maximum: 6 mg/day. Children aged 6-8 yr, weighing 20-30 kg. Initially, 2 mg twice a day for 24 h. Maintenance: 0.1 mg/kg given only after loose stool. Maximum: 4 mg/day. Children aged 2-5 yr, weighing 13-20 kg. Initially, 1 mg 3 times/day for 24 h. Maintenance:

0.1 mg/kg only after loose stool.

## Chronic diarrhea

## PO

*Adults, Elderly.* Initially, 4 mg; then 2 mg after each unformed stool until diarrhea is controlled.

*Children*. 0.08-0.24 mg/kg/day in 2-3 divided doses. Maximum: 2 mg/dose.

## Traveler's diarrhea (to reduce bowel movement frequency and enable travel while awaiting antibiotics)

*Adults, Elderly.* Initially, 4 mg; then 2 mg after each loose bowel movement (LBM). Maximum: 8 mg/day for 2 days. *Children 9-11 yr*: Initially, 2 mg; then 1 mg after each LBM. Maximum: 6 mg/day for 2 days. *Children 6-8 yr*: Initially, 1 mg; then 1 mg after each LBM. Maximum: 4 mg/day for 2 days.

## CONTRAINDICATIONS

Hypersensitivity, acute ulcerative colitis (may produce toxic megacolon), diarrhea associated with pseudomembranous enterocolitis from broad-spectrum antibiotics or with organisms that invade intestinal mucosa (such as *Escherichia coli*, shigella, and salmonella), patients who must avoid constipation, patients with undiagnosed abdominal pain in absence of diarrhea, those with dysentery.

#### INTERACTIONS Drug

Opioid (narcotic) analgesics: May increase the risk of constipation. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

## Rare

Dry mouth, somnolence, abdominal discomfort, allergic reaction (such as rash and itching). Constipation, dizziness, nausea rarely reported.

## SERIOUS REACTIONS

• Toxicity results in constipation, GI irritation, including nausea and vomiting, and central nervous system (CNS) depression. Activated charcoal is used to treat loperamide toxicity.

· Severe constipation, ileus.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with fluid and electrolyte depletion and hepatic impairment. It is unknown whether loperamide crosses the placenta or is distributed in breast milk. Loperamide use is not recommended in children younger than 6 yr. Infants younger than 3 mo are more susceptible to CNS effects. Loperamide use in elderly patients may mask dehydration and electrolyte depletion. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established. Alcohol should also be avoided during drug therapy.

Dry mouth may occur. Notify the physician if abdominal distention and pain, diarrhea that does not stop within 3 days, or fever occurs. Pattern of daily bowel activity and stool consistency and hydration status should be monitored.

#### Storage

Store at room temperature. Administration

Do not give if bloody diarrhea is present or temperature is  $> 101^{\circ}$  F. When administering the oral liquid to children, use the accompanying plastic dropper to measure the liquid.

## Lopinavir/Ritonavir

lop-in'a-veer/rit-on'a-veer ★ ▲ Kaletra Do not confuse Kaletra with Keppra.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antiretrovirals, protease inhibitors

## **MECHANISM OF ACTION**

A protease inhibitor combination drug in which lopinavir inhibits the activity of the enzyme protease late in the HIV replication process and ritonavir increases plasma levels of lopinavir. *Therapeutic Effect*: Formation of immature, noninfectious viral particles.

#### PHARMACOKINETICS

Readily absorbed after PO administration (absorption increased when taken with food). Protein binding: 98%-99%. Metabolized in the liver. Eliminated primarily in feces. Not removed by hemodialysis. *Half-life:* 5-6 h.

## AVAILABILITY

Oral Solution: 80 mg/mL lopinavir/20 mg/mL ritonavir. Tablets: 100 mg lopinavir/25 mg ritonavir; 200 mg lopinavir/50 mg ritonavir.

#### INDICATIONS AND DOSAGES • HIV infection (monotherapy) PO

Adults. 400 mg lopinavir/100 mg ritonavir or 5 mL twice a day. Increase to (500 mg lopinavir/125 mg ritonavir) 6.5 mL when taken with efavirenz or nevirapine. Children aged 6 mo to 12 yr. General: Dose based on lopinavir component of combination. Children weighing more than 40 kg who are not taking amprenavir, efavirenz, or nevirapine. PO adult dose. Children weighing 15-40 kg who are not taking efavirenz or nevirapine. 10 mg/kg twice a day.

Children weighing 7-14 kg who are not taking amprenavir; efavirenz, nelfinavir; or nevirapine. 12 mg/kg twice a day.

 HIV infection concomitant therapy with amprenavir, efavirenz, nelfinavir, or nevirapine

Lopinavir/Ritonavir (Generic Name), Kaletra (Brand Name)

Adults. 400 mg lopinavir/100 mg ritonavir or 5 mL twice a day. Increase to (500 mg lopinavir/125 mg ritonavir) 6.5 mL when taken with efavirenz or nevirapine. *Children aged 6 mo to 12 yr.* General: Dose based on lopinavir component of combination. *Children weighing 15-40 kg who are taking efavirenz or nevirapine.* 11 mg/kg twice a day.

Children weighing 7-14 kg who are taking amprenavir, efavirenz, or nevirapine. 13 mg/kg twice a day. Children weighing more than 45 kg who are taking amprenavir, efavirenz, or nevirapine. PO adult dose.

#### Usual infant dose up to 6 mos of age

PO (ORAL SOLUTION) Dose is based on body weight *or* BSA. Give lopinavir/ ritonavir 16/4 mg/kg *or* 300/75 mg/m<sup>2</sup> twice daily. No data exists for coadministering with efavirenz, nevirapine, amprenavir, or nelfinavir; do not administer in combination with these drugs in patients < 6 mos of age.

#### HIV infection in therapy-naïve patients

#### PO

*Adults.* 400/100 mg twice daily or 800/200 mg once daily. Once daily only for those without resistance mutations.

#### HIV infection in therapyexperienced patients PO

Adults. 400/100 mg twice daily.

## HIV infection concomitant therapy with amprenavir, efavirenz, nelfinavir, nevirapine PO

*Adults.* A dose increase in lopinavir/ ritonavir to 500/125 mg 2 times a day with food is recommended when combined.

## CONTRAINDICATIONS

Coadministration with drugs that are highly dependent on CYP3A4 for clearance and for which elevated plasma levels are associated with serious and or life-threatening reactions (astemizole, cisapride, conivaptan, dihydroergotamine, ergonovine, ergotamine, methylergonovine, midazolam, pimozide, ranolazine, sulfasalazine, terfenadine, triazolam).

Hypersensitivity to lopinavir or ritonavir or any of its components; breastfeeding.

#### **INTERACTIONS**

! NOTE: Many medications are contraindicated with, or must be used cautiously with, protease inhibitors like ritonavir. Check manufacturer's recommendations for drug interaction management.

#### Drug

Abacavir, amprenavir, atovaquone, lamotrigine, methadone, oral contraceptives, phenytoin, zidovudine: May reduce serum levels of these drugs, decreasing efficacy.

Antiarrhythmic agents (amiodarone, bepridil, lidocaine systemic, quinidine), antifungal agents (itraconazole, ketoconazole), atorvastatin, buspirone, calcium channel blockers (amiodipine, diltiazem, felodipine, nicardipine, nifedepine), cetirizine, clarithromycin, cyclosporine, dihydropyridine, fexofenadine, fluticasone, phosphodiesterase type 5 inhibitors (sildenafil, tadalafil, vardenafil), protease inhibitors (amprenavir, indinavir, nelfinavir, saquinavir), rifabutin, tacrolimus, tenofovir, trazodone: May increase levels of these drugs, increasing adverse pharmacologic and adverse reactions

Astemizole, cisapride, conivaptan ergot derivatives (dihydroergotamine, ergonovine, ergotamine, methylergonovine), HMG-CoA reductase inhibitors (lovastatin, simvastatin), midazolam, pimozide, ranolazine, rifampin, sulfasalazine, terfenadine, triazolam: Contraindicated due to potentially life-threatening reactions.

Carbamazepine, dexamethasone, NNRTIs (efavirenz, nevirapine), phenobarbital, pheytoin, protease inhibitors (amprenavir, fosamprenavir, nelfinavir), rifampin: May reduce lopinavir concentrations, decreasing efficacy.

**Delavirdine, ritonavir:** May elevate lopinavir concentrations, increasing efficacy and adverse effects.

**Didanosine:** Must be given 1 h before or 2 h after lopinavir/ritonavir capsules or oral solution.

**Disulfiram, metronidazole:** May produce a disulfiram-like reaction when administered with the oral solution, which contains alcohol.

Oral contraceptives: May decrease efficacy; advise patient to use alternative nonhormonal contraception during therapy. Warfarin: May affect efficacy; monitor INR levels.

#### monitor INI

Herbal

**St. John's wort:** May decrease blood concentration and effects of lopinavir and ritonavir. Avoid.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase blood glucose, GGT, total cholesterol, total bilirubin, total cholesterol, and serum uric acid (at least 2%), AST (SGOT), ALT (SGPT), and triglyceride levels, INR.

#### SIDE EFFECTS

Frequent (14%)

Mild to moderate diarrhea. Occasional (2%-6%)

Nausea, asthenia, abdominal pain, headache, vomiting.

#### Rare (< 2%)

Insomnia, rash. Redistribution/ accumulation of body fat including buffalo hump, hypercholesterolemia, hyperglycemia with insulin resistance or new-onset diabetes mellitus.

#### SERIOUS REACTIONS

 Anemia, leukopenia, lymphadenopathy, deep vein thrombosis, Cushing's syndrome, and hemorrhagic colitis occur rarely.

• Pancreatitis and hepatotoxicity occur rarely.

Immune reconstitution syndrome.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with hepatitis B or C or impaired liver function and pancreatitis where fatalities have been reported. Be aware that it is unknown whether lopinavir/ritonavir is excreted in breast milk. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. In elderly patients, age-related cardiac function, renal, or liver impairment requires caution. Lopinavir/ritonavir is not a cure for HIV infection, nor does it reduce risk of transmission to others.

Alcohol-related toxicity may occur because of the 42.5% alcohol content of the oral solution; caution warranted in using this product or any other alcohol-containing product or beverage. Women should be advised to use another nonhormonal-based contraceptive while taking this medication.

Expect to establish baseline values for CBC, renal and liver function tests, and weight. Assess for nausea and vomiting, pattern of daily bowel activity and stool consistency, and signs and symptoms of pancreatitis as evidenced by abdominal pain, nausea, and vomiting. Eat small, frequent meals to offset nausea or vomiting. Evaluate for signs and symptoms of opportunistic infections as evidenced by cough, onset of fever, oral mucosal changes, or other respiratory symptoms. Check the weight at least twice a week.

#### Storage

Refrigerate until dispensed, and avoid exposure to excessive heat. If stored at room temperature, use within 2 mo.

#### Administration

Tablets may be taken without regard to food. Oral solution should be given with food to improve absorption. The oral solution is highly concentrated and the dosage ordered should be double-checked to the weight and age of the patient to avoid overdosage. Do not administer lopinavir/ritonavir as a oncedaily regimen in combination with amprenavir, efavirenz, nelfinavir, or nevirapine; oncedaily administration of lopinavir/ ritonavir is not recommended in therapy-experienced patients.

#### Loratadine

loer-at'ah-deen ★ Alavert, Claritin, Claritin Children's, Claritin Liqui-Gels, Claritin RediTabs, Dimetapp, Tavist ND ♥ Claritin, Claritin Kids

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B OTC

*Classification:* Antihistamines, H<sub>1</sub> histamine antagonist, nonsedating

#### **MECHANISM OF ACTION**

A long-acting antihistamine that competes with histamine for  $H_1$ receptor sites on effector cells. *Therapeutic Effect:* Prevents allergic responses mediated by histamine, such as rhinitis, urticaria, and pruritus.

#### PHARMACOKINETICS

#### Route | Onset | Peak | Duration

P0	1-3 h	8-12 h	Longer than 24 h

Rapidly and almost completely absorbed from the GI tract. Protein binding, 97%; metabolite, 73%-77%. Distributed mainly to the liver, lungs, GI tract, and bile. Metabolized in the liver to active metabolite; undergoes extensive first-pass metabolism. Eliminated in urine and feces. Not removed by hemodialysis. *Half-life:* 8.4 h; metabolite, 28 h (increased in elderly and hepatic impairment).

#### AVAILABILITY

*Syrup (Claritin):* 5 mg/5 mL. *Tablets (Alavert, Claritin, Tavist ND):* 10 mg.

Loratadine (Generic Name)

Tablets (Rapid Disintegrating [Alavert, Claritin RediTabs]): 10 mg. Chewable Tablets (Claritin Children's): 5 mg Liquid-Filled Capsule (Claritin Liqui-Gels): 10 mg.

# INDICATIONS AND DOSAGES Allergic rhinitis, urticaria PO

Adults, Elderly, Children 6 yr and older. 10 mg once a day.

Children 2-5 yr. 5 mg once a day.

Dosage in hepatic impairment For adults, elderly, and children 6 yr and older, dosage is reduced to 10 mg every other day. Children 2-5 yr, reduce to 5 mg every other day.

## CONTRAINDICATIONS

Hypersensitivity to loratadine or its ingredients.

## INTERACTIONS

#### Drug

All central nervous system (CNS) depressants, alcohol: May increase CNS depressive effects.

Anticholinergics, antihistamines, antiparkinsonian drugs: May increase anticholinergic effects.

Clarithromycin, erythromycin, fluconazole, ketoconazole: May increase the loratadine blood concentration.

Conscious sedation drugs: May cause synergistic sedative activity. Herbal

#### None known.

#### Food

All foods: Delay the absorption of loratadine.

## DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing

unless the drug is discontinued 4 days before testing.

## SIDE EFFECTS

Frequent (8%-12%) Headache, fatigue, somnolence. Occasional (3%) Dry mouth, nose, or throat. Rare Photosensitivity.

## SERIOUS REACTIONS

· None known.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in breastfeeding women, children, and those with hepatic impairment. Loratadine is excreted in breast milk. Children and elderly patients are more sensitive to the drug's anticholinergic effects, such as dry mouth, nose, and throat. Avoid exposure to sunlight, drinking alcoholic beverages, and tasks that require alertness or motor skills until response to the drug is established.

Drowsiness and dry mouth may occur. Respiratory rate, depth, and rhythm; pulse rate and quality; BP; and therapeutic response should be monitored.

#### Storage

Store at room temperature. Protect RediTabs or ODT form from moisture; keep in foil until time of use. Once package open, use within 6 mo.

#### Administration

May take oral forms without regard to food. For ODT or RediTabs: Place on tongue; allow to dissolve and then swallow. May be administered with or without water. Chewable tablets are chewed thoroughly then swallowed with water.
### Lorazepam

lor-a'ze-pam
★ Ativan, Lorazepam Intensol
◆ Apo-Lorazepam, Ativan, Novolorazepam, Nu-Loraz
Do not confuse lorazepam with alprazolam.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

**Classification:** Anxiolytics, benzodiazepines

## **MECHANISM OF ACTION**

A benzodiazepine that enhances the action of the inhibitory neurotransmitter  $\gamma$ -aminobutyric acid in the CNS, affecting memory, as well as motor, sensory, and cognitive function. *Therapeutic Effect:* Produces anxiolytic, anticonvulsant, sedative, muscle relaxant, and antiemetic effects.

## PHARMACOKINETICS

Route	Onset (min)	Peak	Duration (h)
PO	60	NA	8-12
IV	15-30	NA	8-12
IM	30-60	NA	8-12

Well absorbed after PO and IM administration. Protein binding: 85%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 10-20 h.

## AVAILABILITY

Tablets (Ativan): 0.5 mg, 1 mg, 2 mg. Injection (Ativan): 2 mg/mL, 4 mg/mL. Oral Solution (Lorazepam Intensol): 2 mg/mL.

# INDICATIONS AND DOSAGES Anxiety PO

Adults. 1-10 mg/day in 2-3 divided doses. Average: 2-6 mg/day. Elderly. Initially, 1-2 mg/day. May increase gradually. Range: 0.5-4 mg. IV

*Adults, Elderly.* 0.044 mg/kg or 2 mg single dose, whichever is smaller. Repeat doses may be given every 6-8 h as needed.

IV INFUSION

Adults, Elderly. 0.01-0.1 mg/kg/h. PO, IV

*Children.* 0.05 mg/kg/dose q4-8h. Range: 0.02-0.1 mg/kg. Maximum: 2 mg/dose.

## Insomnia due to anxiety

PO

*Adults.* 2-4 mg at bedtime. *Elderly.* 0.5-1 mg at bedtime.

#### Preoperative sedation IV

Adults, Elderly. 0.044 mg/kg 15-20 min before surgery. Maximum total dose: 2 mg. IM

*Adults, Elderly.* 0.05 mg/kg 2 h before procedure. Maximum total dose: 4 mg.

#### Status epilepticus IV

*Adults, Elderly.* 4 mg over 2-5 min. May repeat in 10-15 min. Maximum: 8 mg in 12-h period.

*Children.* 0.1 mg/kg over 2-5 min. May give second dose of 0.05 mg/kg in 15-20 min. Maximum: 4 mg. *Neonates.* 0.05 mg/kg. May repeat in 10-15 min.

## **OFF-LABEL USES**

Treatment of alcohol withdrawal, panic disorders, skeletal muscle spasms, chemotherapy-induced nausea or vomiting, tension headache, tremors; adjunctive treatment before

Lorazepam (Generic Name)

endoscopic procedures (diminishes patient recall).

#### CONTRAINDICATIONS

Angle-closure glaucoma; preexisting CNS depression. Known sensitivity to benzodiazepines or injection vehicle (polyethylene glycol, propylene glycol, and benzyl alcohol), patients with sleep apnea or other severe respiratory insufficiency, except in those mechanically ventilated. The use of the injection intra-arterially is contraindicated because it may produce arteriospasm resulting in gangrene, which may require amputation.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants, probenecid: May increase CNS depression.

**Opioid analgesics:** Increases CNS effects; reduce dosage by a third in elderly patients.

**Scopolamine:** Possible increased sedation, hallucination.

#### Herbal

Kava kava, valerian: May increase CNS depression.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known. Therapeutic serum drug level is 50-240 mg/mL; toxic serum drug level is unknown.

## IV INCOMPATIBILITIES

Aldesleukin (Proleukin), ampicillin, aztreonam (Azactam), idarubicin (Idamycin), ondansetron (Zofran), pantoprazole, sufentanil (Sufenta).

## **IV COMPATIBILITIES**

Bumetanide (Bumex), cefepime (Maxipime), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), heparin, labetalol (Normodyne, Trandate), milrinone (Primacor), norepinephrine (Levophed), piperacillin and tazobactam (Zosyn), potassium, propofol (Diprivan).

## SIDE EFFECTS

#### Frequent

Somnolence (initially in the morning), ataxia, confusion.

## Occasional

Blurred vision, slurred speech, hypotension, headache.

#### kare

Paradoxical CNS restlessness or excitement in elderly or debilitated.

## SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal or muscle cramps, diaphoresis, vomiting, and seizures.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with pulmonary, hepatic, and renal impairment and in those using other CNS depressants concurrently. Lorazepam may cross the placenta and be distributed in breast milk. Lorazepam may increase the risk of fetal abnormalities if administered during the first trimester of pregnancy. Women on long-term therapy should use effective contraception during therapy and notify the physician immediately if they become or might be pregnant. Chronic lorazepam use during pregnancy may produce withdrawal symptoms in the patient and CNS depression in the neonate. The safety and efficacy of this drug have not been established in children

younger than 12 yr. In elderly patients, expect to give small doses initially and to increase dosage gradually to avoid ataxia and excessive sedation.

Lorazepam may be abused by those with addictive propensities; psychologic and physical dependence may occur with chronic administration.

Elderly persons are more prone to orthostatic hypotension and anticholinergic and sedative effects; it may be advisable to reduce their dosages.

Drowsiness and dizziness may occur. Change positions slowly from recumbent, to sitting, before standing to prevent dizziness or orthostatic hypotension from developing. Alcohol, caffeine, and tasks that require mental alertness or motor skills should also be avoided. BP, heart rate, respiratory rate, CBC with differential, and hepatic and renal function should be monitored. **Storage** 

Oral forms should be stored at room temperature; protect oral solution from light. Refrigerate—do not freeze—parenteral form.

## Administration

Take oral lorazepam with food. Crush tablets as needed.

Do not use the solution for injection if it appears discolored or contains a precipitate. Dilute with an equal volume of sterile water for injection, 0.9% NaCl, or D5W. To dilute a prefilled syringe, remove air from a half-filled syringe, aspirate an equal volume of diluent, pull the plunger back slightly to allow for mixing, and gently invert the syringe several times-do not shake vigorously. Give by IV push into the tubing of a free-flowing IV infusion of 0.9% NaCl or D5W at a rate not exceeding 2 mg/min. Keep recumbent after parenteral administration to reduce the drug's hypotensive effect.

For IM use, inject the drug deep into a large muscle mass, such as the gluteus maximus.

## Lorcaserin

lor-ca-ser`in

CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Obesity agents, serotonin agonists

## **MECHANISM OF ACTION**

Selectively activates 5-HT2C serotonin receptors on anorexigenic pro-opiomelanocortin neurons located in the hypothalamus. The exact mechanism of action is not known. *Therapeutic Effect:* Promotes satiety, assisting weight loss.

#### PHARMACOKINETICS

Well absorbed, distributed to CNS. Protein binding: 70%. Metabolized in liver with primarily renal elimination of parent drug and metabolites. *Half-life:* 11 h (prolonged in renal impairment or severe hepatic disease).

#### AVAILABILITY

Tablets (Belviq): 10 mg.

#### INDICATIONS AND DOSAGES

➤ Weight reduction if BMI of ≥ 30 kg/m<sup>2</sup> or in those with BMI > 27 kg/m<sup>2</sup> with secondary health risk factors: PO

Adults, Elderly. 10 mg PO twice daily. Do not exceed. Evaluate response to therapy by week 12. If patient has not lost at least 5% of baseline body weight at that time, discontinue as not likely drug will help with meaningful weight loss.

 Dosage adjustment in renal impairment: CrCl 30 to 50 ml/min: Use with caution.

CrCl < 30 ml/min, including endstage renal disease or dialysis: Not recommended.

Dosage adjustment in hepatic impairment: No dosage adjustment needed if mild or moderate impairment; use extreme caution in those with severe impairment since not studied.

## CONTRAINDICATIONS

Hypersensitivity, pregnancy.

## INTERACTIONS

#### Drug

Other anorexiant agents: Avoid co-use; not studied; may increase serotonergic, cardiac, or vascular risks. Includes prescription drugs (e.g., phentermine, fenfluramine, dexfenfluramine, orlistat, phendimetrazine, amphetamines), OTC (e.g., orlistat, phenylpropanolamine, ephedrine), and herbal preparations (ephedra, ma huang). Co-use with sibutramine is contraindicated.

Antidiabetic medications, insulin: Lorcaserin increases risk for hypoglycemia. Doses may require adjustment as glycemic control improves with weight loss.

**Dextromethorphan:** May increase risk of serotonin syndrome. Use with extreme caution.

**Drugs for erectile dysfunction:** Co-use not studied; use with caution.

Cabergoline, ergotaminecontaining medications: May increase risk of serotonin syndrome or valvulopathy. Avoid co-use. MAOIs: May increase risk of serotonin syndrome. Avoid co-use. Serotonin agonists (triptans for migraine), SSRI, or SNRI antidepressants, bupropion, tramadol, methylene blue: May increase risk of serotonin syndrome.

Avoid co-use.

## Herbal

St. John's wort, tryptophan: May increase serotonergic effects. Avoid. Ephedra, ma huang: Avoid co-use due to anorectic effects and additive effects on vascular system.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease WBC or RBC counts. May elevate prolactin concentration. May lower heart rate.

## SIDE EFFECTS

#### Frequent (> 5%)

Headache, dizziness, fatigue, nausea, dry mouth, and constipation. Additionally in patients with diabetes may see hypoglycemia, back pain, cough, hypertension.

## Occasional (1%-5%)

Vomiting, musculoskeletal pain, oropharyngeal pain, sinus congestion, rash, toothache, decreased appetite, muscle spasm, insomnia, stress, depression.

#### Rare (<1%)

Bradycardia, anemia, neutropenia, leukopenia, euphoria, hallucination, anxiety, symptoms of hyperprolactinemia such as galactorrhea, menstrual changes.

#### SERIOUS REACTIONS

• Potenial for pulmonary hypertension

- · Potential for cardiac valvulopathy.
- Potential for cognitive impairment or psychiatric disorders.
- Severe hypoglycemia in diabetic patients.
- · Priapism.

• Serotonin syndrome or malignant hyperthermia theoretically possible.

#### PRECAUTIONS & CONSIDERATIONS

Use particularly with caution in patients with bradycardia, history of AV block, sick sinus syndrome, heart failure, due to the potential cardiac and vascular effects of the drug. Not recommended for patients with existing valvular heart disease. Use with caution in patients with other cardiac disease. Use in patients with severe renal impairment or with severe hepatic disease is not recommended. Use with caution in those with a history of psychiatric or mood disorders, memory problems, or history of blood disorders like anemia or leukopenia. Use with caution in patients with poorly controlled diabetes or those predisposed to hypoglycemia. Use with caution in men who have conditions that might predispose them to priapism (e.g., sickle cell disease, multiple myeloma, or leukemia), or in men with anatomical deformation of the penis (e.g., angulation, cavernosal fibrosis, or Peyronie's disease). Contraindicated in pregnancy and not recommended for use during lactation due to lack of data. Not for use in children. Since lorcaserin has the potential to impair cognitive function, patients should be cautioned about driving or operating machinery or performing other potentially hazardous tasks, until they are aware of how this medication affects them.

Monitor CBC, heart rate, blood pressure routinely. Weight should be regularly monitored. Monitor patients who are severely obese for diabetes or cardiovascular disease before beginning therapy. Diabetic patients must closely watch blood sugar control. Patients who develop signs or symptoms of valvular heart disease, including dyspnea, dependent edema, congestive heart failure, or a new cardiac murmur while being treated with lorcaserin should be evaluated and consider discontinuation. Discontinue if valvulopathy, pulmonary hypertension, serontonin syndrome, or other serious effects occur. Prolonged erection in a male requires immediate emergency evaluation. Patients treated with lorcaserin should be monitored for the emergence or worsening of depression, suicidal thoughts or behavior, and/or any unusual changes in mood or behavior. Discontinue use in patients who experience suicidal thoughts or behaviors.

#### Storage

Store at room temperature.

## Administration

May administer lorcaserin with or without food.

#### Losartan

lo-sar'tan Cozaar Do not confuse Cozaar with Zocor.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antihypertensives, angiotensin II receptor antagonists

#### MECHANISM OF ACTION

An angiotensin II receptor, type AT<sub>1</sub>, antagonist that blocks vasoconstrictor and aldosteronesecreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT<sub>1</sub> receptors. *Therapeutic Effect:* Causes vasodilation, decreases peripheral resistance, and decreases BP.

Losartan (Generic Name)

## PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	N/A	6 h	24 h

Well absorbed after PO administration. Protein binding: 98%. Undergoes first-pass metabolism in the liver to active metabolites. Excreted in urine and via the biliary system. Not removed by hemodialysis. *Half-life*: 2 h, metabolite: 6-9 h.

## AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg.

## INDICATIONS AND DOSAGES Hypertension

РО

Adults, Elderly. Initially, 50 mg once a day. Maximum: May be given once or twice a day, with total daily doses ranging from 25 to 100 mg. *Children 6 yr of age and older*: Initially, 0.7 mg/kg once daily (up to 50 mg total). Adjust according to BP response. Doses > 1.4 mg/kg (or > 100 mg) daily have not been studied.

## Diabetic nephropathy

#### PO

*Adults, Elderly.* Initially, 50 mg/day. May increase to 100 mg/day based on BP response.

#### Stroke prophylaxis

PO

Adults, Elderly. 50 mg/day. Maximum: 100 mg/day.

#### Hypertension in patients with impaired hepatic function PO

Adults, Elderly. Initially, 25 mg/day.

## CONTRAINDICATIONS

Hypersensitivity, second or third trimester of pregnancy.

## INTERACTIONS

Drug

**Cimetidine:** May increase the effects of losartan.

Fluconazole, ketoconazole, troleandomycin: Suspected increase in antihypertensive effects; monitor BP if used concurrently. General anesthetics: May increase risk of hypotensive episode. Lithium: May increase lithium blood concentration and risk of lithium toxicity. Other hypotensive drugs and sedatives: May increase hypotensive effects. Phenobarbital, rifampin: May decrease hypotensive effects of losartan. Herbal None known. Food

**Grapefruit juice:** May alter the absorption of losartan.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease blood hemoglobin and hematocrit levels.

## SIDE EFFECTS

Frequent (8%)

Upper respiratory tract infection. Occasional (2%-4%)

Dizziness, diarrhea, cough, hyperkalemia.

## Rare (≤ 1%)

Insomnia, dyspepsia, heartburn, back and leg pain, muscle cramps, myalgia, nasal congestion, sinusitis, chest pain, fatigue, changes in blood sugar, weakness, anemia.

## SERIOUS REACTIONS

• Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often.

· Angioedema (rare).

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and renal impairment and renal arterial stenosis. Losartan has caused fetal or neonatal morbidity or mortality; discontinue as soon as possible after pregnancy is detected. Patients should not breastfeed while taking losartan. Safety and efficacy of losartan have not been established in children. No age-related precautions have been noted in elderly patients.

Apical pulse and BP should be assessed immediately before each losartan dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the person in the supine position with feet slightly elevated and notify the physician. BUN, serum electrolytes, serum creatinine levels, heart rate, urinalysis, and pattern of daily bowel activity and stool consistency should be assessed. Maintain adequate hydration; exercising outside during hot weather should be avoided to decrease the risk of dehydration and hypotension.

#### Storage

Store tablets at room temperature. Compounded suspension is stable under refrigeration for up to 4 wks.

#### Administration

Take losartan without regard to food. Do not crush or break tablets.

For pediatric patients, the manufacturer allows for the compounding of an oral suspension. Shake well before each use.

#### Lovastatin

lo'va-sta-tin ★ ▲ Altoprev, Mevacor Do not confuse with Leustatin, Livostin, or Mivacron.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

#### Classification:

Antihyperlipidemics, HMG-CoA reductase inhibitors

#### **MECHANISM OF ACTION**

An antihyperlipidemic that inhibits HMG-CoA reductase, the enzyme that catalyzes the early step in cholesterol synthesis. *Therapeutic Effect:* Decreases LDL cholesterol, VLDL cholesterol, plasma triglycerides; increases HDL cholesterol.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	3 days	4-6 wks	NA

Incompletely absorbed from the GI tract (increased on empty stomach). Protein binding: 95%. Hydrolyzed in the liver to active metabolite. Primarily eliminated in feces. Not removed by hemodialysis. *Half-life:* 1.1-1.7 h.

#### AVAILABILITY

Tablets (Mevacor): 10 mg, 20 mg, 40 mg. Tablets (Extended Release [Altoprev]): 20 mg, 40 mg, 60 mg.

#### INDICATIONS AND DOSAGES

 Hyperlipoproteinemia, primary prevention of coronary artery disease
 PO

Lovastatin (Generic Name)

Adults, Elderly. Initially, 20 mg/day with evening meal. Increase at 4-wk intervals up to maximum of 80 mg/ day. Maintenance: 20-80 mg/day in single or divided doses.

*Children 10-17 yr*: 10-40 mg/day with evening meal.

PO (EXTENDED RELEASE) Adults, Elderly. Initially, 20 mg/day. May increase at 4-wk intervals up to 60 mg/day.

## Heterozygous familial hypercholesterolemia

*Children aged 10-17 yr.* Initially, 10 mg/day. May increase to 20 mg/day after 8 wks and 40 mg/day after 16 wks if needed.

## CONTRAINDICATIONS

Hypersensitivity, active liver disease, pregnancy, unexplained elevated liver function tests, lactation, rhabdomyolysis. See Drug Interactions for contraindicated drugs.

## INTERACTIONS

#### Drug

Amiodarone, verapamil: Do not exceed lovastatin 40 mg/day. Cyclosporine, gemfibrozil, other fibrates, danazol, niacin: Increases the risk of acute renal failure, myalgia, and rhabdomyolysis. Do not exceed lovastatin 20 mg/day.

Erythromycin, itraconazole, clarithromycin, HIV protease inhibitors, ergot alkaloids, nefazodone, ketoconazole: Contraindicated.

#### Contraindicat

## Herbal

None known.

#### Food

**Grapefruit juice:** Large amounts of grapefruit juice may increase risk of side effects, such as myalgia and weakness. Avoid.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum creatinine kinase and serum transaminase concentrations.

## SIDE EFFECTS

Generally well tolerated. Side effects usually mild and transient.

## Frequent (5%-9%)

Headache, flatulence, diarrhea, abdominal pain or cramps, rash and pruritus.

Occasional (3%-4%)

Nausea, vomiting, constipation, dyspepsia.

### Rare (1%-2%)

Dizziness, heartburn, myalgia, blurred vision, eye irritation. Reversible cognitive impairment or depression, hair loss, may worsen glucose tolerance and increase HbA1C.

## SERIOUS REACTIONS

• There is a potential for cataract development.

- · Hepatotoxicity or rhabdomyolysis.
- Hypersensitivity, such as bullous
- rash or anaphylaxis, reported rarely.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with history of heavy or chronic alcohol use, renal impairment, and those who use cyclosporine, fibrates, and niacin. Be aware that lovastatin use is contraindicated in pregnancy because the suppression of cholesterol biosynthesis may cause fetal toxicity and in lactation because it is unknown whether lovastatin is distributed in breast milk. Be aware that the safety and efficacy of lovastatin have not been established in children younger than 10 yr. No age-related precautions have been noted in elderly patients.

Notify the physician of changes in the color of stool or urine, muscle weakness, myalgia, severe gastric upset, rash, unusual bruising, vision changes, or yellowing of eyes or skin. Pattern of daily bowel activity and stool consistency should be assessed. Serum cholesterol and triglyceride levels and hepatic function should be checked at baseline and periodically during treatment.

Be aware that diet is an important part of treatment.

#### Storage

Lovastatin should be kept at room temperature in a container with low light exposure.

#### Administration

Take lovastatin immediate-release tablets with the evening meal for best effectiveness. Administer extendedrelease tablets in the evening at bedtime, preferably without food (to increase absorption); do not crush or chew. Do not administer lovastatin with grapefruit juice.

Loxapine

lox'a-peen ★ Loxitane ▲ Apo-Loxapine, Loxapac, Xylac

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antipsychotics

#### **MECHANISM OF ACTION**

A dibenzodiazepine derivative that interferes with the binding of dopamine at postsynaptic receptor sites in the brain. Strong anticholinergic effects. *Therapeutic Effect:* Suppresses locomotor activity, produces tranquilization.

#### PHARMACOKINETICS

Onset of action occurs within 1 h. Metabolized to active metabolites 8-hydroxyloxapine, 7-hydroxyloxapine, and 8-hydroxyamoxapine. Excreted in urine. *Half-life:* 4 h.

## AVAILABILITY

*Capsules:* 5 mg, 10 mg, 25 mg, 50 mg (Loxitane).

## INDICATIONS AND DOSAGES Psychotic disorders

#### PO

*Adults.* 10 mg 2 times/day. Increase dosage rapidly during first week to 50 mg, if needed. Usual therapeutic, maintenance range: 60-100 mg daily in 2-4 divided doses. Maximum: 250 mg/day.

#### CONTRAINDICATIONS

Severe central nervous system (CNS) depression, comatose states, hypersensitivity to loxapine or any component of the formulation.

#### INTERACTIONS

Drug

Alcohol, all CNS depressants: May increase CNS depressant effects. Antacids, antidiarrheals: May decrease absorption of loxapine. Anticholinergics: May increase effects of both drugs. Extrapyramidal symptom (EPS)producing medications: May increase risk of EPS. Sympathomimetics, carbamazepine: May decrease effect of these drugs. Herbal None known. Food None known.

DIAGNOSTIC TEST EFFECTS

None known.

Loxapine (Generic Name)

#### SIDE EFFECTS

#### Frequent

Blurred vision, confusion, drowsiness, dry mouth, dizziness, light-headedness.

#### Occasional

Allergic reaction (rash, itching), decreased urination, constipation, decreased sexual ability, enlarged breasts, headache, photosensitivity, nausea, vomiting, insomnia, weight gain.

## SERIOUS REACTIONS

 Extrapyramidal symptoms frequently noted are akathisia (motor restlessness, anxiety). Less frequently noted are akinesia (rigidity, tremor, salivation, masklike facial expression, reduced voluntary movements). Infrequently noted dystonias: torticollis (neck muscle spasm), opisthotonos (rigidity of back muscles), and oculogyric crisis (rolling back of eyes). Tardive dyskinesia (protrusion of tongue, puffing of cheeks, chewing/puckering of mouth) occurs rarely but may be irreversible. Risk is greater in elderly women.

Seizures.

#### **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used in patients with a history of seizures. Caution is also warranted with cardiovascular disease, glaucoma, prostatic hypertrophy, and urinary retention. It is unknown whether loxapine crosses the placenta or is distributed in breast milk. Safety and efficacy of loxapine have not been established in children under the age of 16 yr. Elderly patients are more susceptible to anticholinergic effects and sedation, increased risk for extrapyramidal effects, and orthostatic hypotension. An increased incidence of cerebrovascular adverse events (e.g., stroke, TIA) has been seen in elderly patients with dementiarelated psychoses. A decreased dosage is recommended in elderly patients. Avoid alcohol and tasks that require mental alertness or motor skills.

Assess for presence of extrapyramidal motor symptoms, such as tardive dyskinesia and akathisia.

#### Storage

Store at room temperature. Administration

Give loxapine with food or a full glass of water or milk to decrease GI irritation. The full therapeutic effect may take up to 6 wks. Do not abruptly discontinue loxapine.

## Lubiprostone loo-bee-pros'tone

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Gastrointestinal agents, GI regulators, laxatives

#### MECHANISM OF ACTION

A bicyclic fatty acid, prostaglandin E1 (PGE 1) derivative. Increases intestinal fluid secretion by activating specific ClC-2 chloride channels in the luminal cells of the intestinal epithelium. *Therapeutic Effect:* Alters stool consistency and promotes regular bowel movements, without altering serum electrolyte concentrations or producing tolerance.

Lubiprostone (Generic Name)

## PHARMACOKINETICS

Minimal absorption following oral administration. Plasma concentrations below the level of quantification, and pharmacokinetic parameters cannot be calculated. Plasma levels of the only known active metabolite are also very low. Minimal distribution occurs beyond the GI tissues.

## AVAILABILITY

Capsules, Gelatin (Amitiza): 8 mcg, 24 mcg.

#### INDICATIONS AND DOSAGES > Treatment of idiopathic chronic constipation PO

*Adults, Elderly.* 24 mcg twice per day. If intolerance occurs, may reduce to 24 mcg once daily.

## Treatment of irritable bowel syndrome (IBS), constipationpredominant

PO

*Adult, Elderly females.* 8 mcg twice per day. If intolerance occurs, may reduce to once daily. Not proved effective in males.

#### Dosage adjustment for hepatic impairment

Chronic constipation: For moderate hepatic impairment give 16 mcg PO twice daily. For severe hepatic impairment begin with 8 mcg twice daily. If tolerated, may titrate upward to usual dosages.

IBS: For severe hepatic impairment begin with 8 mcg PO once daily. If tolerated, may titrate upward.

## CONTRAINDICATIONS

Hypersensitivity, known or suspected mechanical GI obstruction.

## INTERACTIONS

Drug None known.

## **Herbal and Food**

None.

## **DIAGNOSTIC TEST EFFECTS**

Rare reports of increased AST or ALT.

## SIDE EFFECTS

#### Frequent

Nausea, mild abdominal discomfort, flatulence, loose stools.

#### Occasional

Diarrhea, headache, dizziness, dyspepsia, dry mouth.

#### Rare

Fecal incontinence, mild cramps, defecation urgency, frequent bowel movements, hyperhidrosis, anxiety, cold sweat, constipation, cough, dysgeusia, eructation, decreased appetite, myalgia.

## SERIOUS REACTIONS

- · Chest tightness and dyspnea.
- Severe watery diarrhea (stop drug).
- Allergic-type reactions (including
- rash, swelling, and throat tightness).

## PRECAUTIONS & CONSIDERATIONS

If severe diarrhea occurs, it can lead to fluid and electrolyte imbalance. Do not use in patients with diarrheapredominant IBS. There are no adequate data in human pregnancy, and there are no data for use during breastfeeding. Lubiprostone is a prostaglandin derivative and is generally not recommended for use in pregnancy due to its chemical classification. Not approved for use in children.

Increasing fluid intake, exercising, and eating a high-fiber diet should be instituted to promote defecation. Notify the physician if dyspnea within an hour of the dosage, unrelieved constipation, dizziness, severe diarrhea, or rectal bleeding weakness occurs. Hydration status, daily bowel activity, and stool consistency should be assessed. **Storage** 

Store at room temperature; protect from excessive heat.

#### Administration

Swallow capsules whole with water. Do not cut, crush, or chew. Administer doses in the morning and evening as prescribed. May give with food to reduce nausea. If excessive loose stools occur, a reduction in dose to once daily may alleviate their occurrence.

## Lurasidone

loo-ras'i-done

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antipsychotic, atypical

## **MECHANISM OF ACTION**

A benzoisothiazol derivative that antagonizes dopamine, and serotonin receptors. *Therapeutic Effect*: Diminishes symptoms of schizophrenia.

## AVAILABILITY

Tablets: 20 mg, 40 mg, 80 mg.

## PHARMACOKINETICS

Well absorbed after PO administration if given with food. Food increases bioavailability. Protein binding: 99%. Extensively metabolized in the liver by CYP3A4; there are 2 active metabolites and 2 inactive metabolites. Not removed by hemodialysis. *Half-life*: 18 h.

# INDICATIONS AND DOSAGES Schizophrenia: PO

*Adults, Elderly.* Initially, 40 mg once daily with food (at least 350 calories). If needed for efficacy, may titrate. Maximum: 160 mg once daily.

Moderate to severe renal or hepatic impairment or dosing with moderate CYP3A4 inhibitors (e.g., diltiazem): Do not exceed 80 mg/day. Do not give with strong CYP3A4 inhibitors.

## CONTRAINDICATIONS

Known hypersensitivity to lurasidone; use with known potent CYP3A4 inhibitors (e.g., ketoconazole) or inducers (e.g., rifampin).

#### INTERACTIONS Drug

Central nervous system (CNS) depressants: Increased risk of CNS depressant effects; use caution. Drugs that lower blood pressure: Increased risk of hypotension. Drugs that prolong the QT interval: Avoid use of these drugs. Ketoconazole and other strong inhibitors of CYP3A4: Increased plasma levels of lurasidone; contraindicated.

Levodopa, dopamine agonists: Lurasidone may antagonize effects of these drugs.

**Moderate inhibitors of CYP3A4:** Increased plasma levels of lurasidone; dose adjustments needed. Do not exceed 80 mg/day of lurasidone.

**Rifampin and other strong inducers of CYP3A4:** Decreased plasma levels of lurasidone; contraindicated.

Phenothiazines and related drugs (haloperidol, droperidol),

**metoclopramide:** Increased risk of extrapyramidal effects.

#### Herbal

**St John's wort:** Decreased plasma levels of lurasidone; contraindicated. **Food** 

Take with food; do not take on empty stomach.

## DIAGNOSTIC TEST EFFECTS

May increase blood sugar and cholesterol or triglycerides. May elevate prolactin. May rarely decrease WBC or other blood cell counts.

## SIDE EFFECTS

#### Frequent (> 5%)

Somnolence, akathisia, nausea, parkinsonism and agitation.

## Occasional

Headache, weight gain, restlessness, anxiety, insomnia, dystonia, dizziness, dyspepsia, hyperglycemia, onset of diabetes mellitus.

#### Rare

Syncope, tachycardia or bradycardia, rash, orthostatic hypotension.

## SERIOUS REACTIONS

Leukopenia, neutropenia, and agranulocytosis are rare.

• Neuroleptic malignant syndrome is rare (discontinue if occurs).

• Tardive dyskinesia (discontinue if appropriate) is rare.

• Seizures; severe mood changes or suicide are also rare events.

## **PRECAUTIONS & CONSIDERATIONS**

An increased incidence of cerebrovascular adverse events (e.g., stroke, TIA) and mortality has been seen in elderly patients with dementia-related psychoses. Metabolic changes may increase cardiovascular/ cerebrovascular risk and these include hyperglycemia, dyslipidemia, and weight gain. Use cautiously in those with liver disease, hyperprolactinemia, cardiac disease or risk factors, hypotension, seizure disorders, or suicidal ideation history. Use in pregnancy only if clearly needed; use in lactation not recommended. Safety and efficacy not established in children. Monitor glucose regularly in patients with diabetes or at risk for diabetes. Monitor weight, CBC, serum lipid profiles.

Use caution when operating machinery until effects of drug are known. Closely supervise high-risk patients for unusual changes in mood or behavior that may lead to suicide attempt or other irrational behavior. **Storage** 

Store tablets at room temperature. Administration

Administer tablets with food (at least 350 calories) at a consistent time daily.

## Mafenide

ma'fe-nide 🗙 Sulfamylon

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anti-infectives, topical, dermatologics, sulfonamides

## **MECHANISM OF ACTION**

A topical anti-infective that decreases number of bacteria in avascular tissue of second- and thirddegree burns. *Therapeutic Effect:* Bacteriostatic. Promotes spontaneous healing of deep partial-thickness burns.

## PHARMACOKINETICS

Absorbed through devascularized areas into systemic circulation following topical administration. Excreted in the form of its metabolite rho-carboxybenzenesulfonamide.

## AVAILABILITY

*Cream:* 85 mg base/g (Sulfamylon). *Powder for Topical Solution:* 5%.

## INDICATIONS AND DOSAGES Burns

TOPICAL (CREAM) *Adults, Elderly, Children.* Apply 1-2 times/day.

## CONTRAINDICATIONS

Hypersensitivity to mafenide or sulfonamides or any other component of the formulation.

## INTERACTIONS

Drug None known. Herbal None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Difficult to distinguish side effects and effects of severe burn.

## Frequent

Pain, burning upon application. Occasional

Allergic reaction (usually 10-14 days after initiation): itching, rash, edema, swelling; unexplained syndrome of marked hyperventilation with respiratory alkalosis.

## Rare

Delay in eschar separation, excoriation of new skin.

## SERIOUS REACTIONS

• Hemolytic anemia, porphyria, bone marrow depression, superinfections (especially with fungi), metabolic acidosis occur rarely.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired renal function because of the risk of metabolic acidosis. Be aware that cross-sensitivity to sulfonamides is not certain. It is unknown whether mafenide crosses the placenta or is distributed in breast milk. Be aware that mafenide is not recommended in newborn infants because sulfonamides may cause kernicterus. No age-related precautions have been noted in elderly patients.

Signs and symptoms of metabolic acidosis should be monitored. Storage

Store cream at room temperature. Administration

Mafenide is for external use only. Apply cream with gloved hands. Burned area should be kept covered with mafenide at all times. Apply to thickness of around 16 mm. For details of preparation and use of topical solution for burns, see manufacturer literature. Dressings may be moistened every 6-8 h as necessary.

## Magnesium Hydroxide, Aluminum Hydroxide, Simethicone

mag-nee'zee-um hi-drox'ide, ah-loo'mih-num hi-drox'ide, sye-meth'i-cone ★ Almacone, Maalox, Maalox Max, Maalox Multi-Symptom Suspension, Mag-Al Plus, Mintox Plus, Mylanta, Mylanta Maximum Strength, Rulox

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Gastrointestinal agents, antacid-antigas combination

#### **MECHANISM OF ACTION**

An antacid combination that reduces gastric acid. Simethicone disperses gas pockets within the GI tract. *Therapeutic Effect:* Neutralizes acid and increases gastric pH; alleviates GI symptoms and eliminates gas.

## PHARMACOKINETICS

In GI tract, antacids react with hydrochloric acid to form chloride salts and water, neutralizing the acid. Roughly 15%-30% of the magnesium chloride formed is available for oral absorption. Most aluminum chloride formed combines with dietary elements in the intestine and is excreted primarily via the feces. Any magnesium systemically absorbed is utilized in the body or excreted by the kidneys. Simethicone is not systemically absorbed. Magnesium may accumulate with chronic use in severe renal impairment.

#### AVAILABILITY

*Chewable Tablets:* 200 mg aluminum hydroxide, 200 mg magnesium hydroxide, and 25 mg simethicone per tablet.

Suspension, Regular Strength: 200 mg aluminum hydroxide, 200 mg magnesium hydroxide, and 20 mg simethicone/5 mL.

Suspension, Maximum Strength: 400 mg aluminum hydroxide, 400 mg magnesium hydroxide, and 40 mg simethicone/5 mL.

## INDICATIONS AND DOSAGES Antacid (with flatulence)

PO

*Adults, Elderly, Children 12 yr of age or older.* 10-20 mL or 2-4 chewable tablets 4-6 times/day.

#### CONTRAINDICATIONS

Not recommended for those with severe renal impairment; hypermagnesemia.

#### INTERACTIONS

#### Drug

Bisphosphonates, ketoconazole, quinolones, tetracyclines: Antacids may decrease absorption of these medications; separate times of administration. Methenamine: May decrease effects of methenamine. Herbal None known.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum gastrin levels and gastric pH.

## SIDE EFFECTS

#### Frequent

Chalky taste, mild constipation, stomach cramps, diarrhea.

#### Occasional

Nausea, vomiting.

Rare Hypermagnesemia, hypophosphatemia, osteomalacia.

### SERIOUS REACTIONS

• Prolonged constipation may result in intestinal obstruction.

• Excessive or chronic use may produce hypophosphatemia.

• Prolonged use may produce urinary calculi.

#### PRECAUTIONS & CONSIDERATIONS

Use caution in using magnesiumand aluminum-containing antacids in patients with mild to moderate renal impairment. Caution is warranted with Alzheimer's disease, chronic diarrhea, cirrhosis, constipation, dehydration, edema, fecal impaction, fluid restrictions, gastric outlet obstruction, undiagnosed GI or rectal bleeding, heart failure, low sodium diets, symptoms of appendicitis, and in elderly patients. Do not use in children 6 yr or younger without physician approval. Elderly patients may be at increased risk of constipation and fecal impaction. Storage

Store at room temperature. Administration

Administer 1-3 h after meals for best antacid effect. Expect the dosage to be individualized based on the neutralizing capacity of the antacid. For chewable tablets, thoroughly chew before swallowing and then drink a glass of water or milk. If administering a suspension, shake well before use.

## **Magnesium Salts**

mag-nee'zee-um salts Magnesium Citrate Magnesium Hydroxide Phillips Milk of Magnesia, Phillips' Concentrated Milk of Magnesia, Ex-Lax Milk of Magnesia ★ Magnesium Chloride Mag-64, Slow-Mag ★ Magnesium Gluconate Mag-G, Magtrate, Magonate ★ Magnesium Oxide Uro-Mag, MagOx 400, Phillips' Cramp Free Caplets Magnesium Sulfate Do not confuse magnesium sulfate with manganese sulfate or morphine sulfate. To avoid prescription confusion, never abbreviate formulas chemically.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A (parenteral use) Magnesium citrate, hydroxide, and oxide (OTC). Most other forms are Rx only.

**Classification:** Nutritional supplements, electrolytes, minerals, laxatives, antacids

## **MECHANISM OF ACTION**

Magnesium citrate: A hyperosmotic saline laxative that acts by osmotically drawing water into the intestinal lumen; the intestine responds with increased peristalsis and release of cholecystokinin. Therapeutic Effect: Produces bowel evacuation and laxative effect.

#### 962 Magnesium Salts

Magnesium hydroxide: Also known as milk of magnesia, is used PO primarily as a laxative. As a relatively nonabsorbable cation, magnesium hydroxide is considered a saline laxative. It is also used as an antacid, primarily in combination products with aluminum hydroxide (see separate monograph).

Magnesium sulfate, oxide, gluconate, and chloride: Primarily used as electrolyte and mineral replacement. This electrolyte is found primarily in intracellular fluids and is essential for enzyme activity, nerve conduction, and muscle contraction. Stabilizes cardiac muscle and conduction. Magnesium sulfate can act as an anticonvulsant; it blocks neuromuscular transmission and the amount of acetylcholine released at the motor endplate. Therapeutic Effect: Maintains and restores magnesium levels. Stabilizes nerve conduction and electronic activity.

#### PHARMACOKINETICS

Oral dosage forms have roughly 15%-30% absorption. IM injection onsets within about an hour; IV effect is immediate. Widely distributed. Approximately one-half of the total body magnesium is in soft tissue; most of the remaining is in bone. Less than 1% of the total body magnesium is present the blood. Crosses the placenta and is excreted into breast milk. Not metabolized. Elimination occurs renally. Approximately 12 mEq of magnesium is excreted in the urine daily and some is reabsorbed in the thick ascending limb of the loop of Henle.

## AVAILABILITY

#### Magnesium citrate

*Oral Solution (Citrate of Magnesia):* 291 mg/5 mL (also available in low-sodium formula).

#### Magnesium hydroxide

Oral Liquid (Milk of Magnesia, various): 400 mg/5 mL, 800 mg/5 mL. Chewable Tablets (Phillips' Milk of Magnesia): 311 mg. Magnesium chloride

Delayed-Release Tablets (Mag-64): 64 mg. Enteric-Coated Tablets with added

calcium (Slow-Mag): 143 mg.

#### Magnesium gluconate

Oral Solution (Magonate): 100 mg/5 mL. Tablets (Mag-G, Magtrate): 500 mg. Magnesium oxide

Tablets (MagOx 400): 400 mg. Capsules (Uro-Mag): 140 mg. Caplets for Constipation (Phillips' Cramp Free Laxative Caplets): 500 mg.

#### Magnesium sulfate

Premix IVPB Infusion Solution: 1 g/100 mL, 2 g/100 mL. Injection: 50% (4 mEq/mL or 5 g/10 mL). Topical Powder for Soaks (Epsom Salts)

#### INDICATIONS AND DOSAGES

## Dietary supplement (magnesium oxide)

Adults, Elderly. 400-800 mg PO per day in 1-2 divided doses, dose adjusted depending on patient status. Doses may be given up to 3 times per day for short-term use if deficiency is present.

### Dietary supplement (magnesium chloride)

#### PO

*Adults, Elderly.* 64-429 mg/day in 1-4 divided doses; dose adjusted depending on patient status.

## Dietary supplement (magnesium gluconate)

## PO

*Adults, Elderly.* 500 mg given 1-3 times per day; dose adjusted depending on patient status.

## Acute hypomagnesemia (usual dosages, magnesium sulfate) IV, IM

*Adults, Elderly.* 1 g IM q6h for up to 4 doses; or, 1-2 g IVPB for one dose. Recheck magnesium levels to determine need for additional treatment.

*Children*. 25-50 mg/kg/dose q4-6h for 3-4 doses. Maximum: 2 g/dose.

## Preeclampsia/eclampsia (magnesium sulfate)

#### IV INFUSION

Adult females. Initially, 4-5 g bolus, diluted, then 1-2 g/h given by IV continuous infusion; rate adjustments guided by magnesium levels, urine output, patellar reflexes, contractions, and patient status. Alternatively, up to 10-14 g may be needed in severe cases initially; the dose may be given as two 4- or 5-g injections IM into each buttock if needed.

## Hyperalimentation (magnesium sulfate)

NOTE: Exact daily requirements must be determined individually. TPN

Adults, Elderly. Maintenance dose 8-24 mEq (1-3 g) daily. Infants. 2-10 mEq (0.25-1.25 mEq) daily.

## ACLS protocol use (magnesium sulfate)

#### IV

Adults, Elderly. For pulseless cardiac arrest, 1-2 g (diluted in 10 mL D5W or NS) IV over 5-20 min. Alternatively, if a pulse is present, 1-2 g (in 50-100 mL compatible solution), infused slowly over 5-60 min.

## Cathartic or bowel preparation (magnesium citrate)

Adults, Elderly, Children 12 yr and older. 120-300 mL. Children 6-11 yr. 100-200 mL.

*Children* < 6 yr. 0.5 mL/kg up to maximum of 200 mL.

## Constipation

PO (MOM suspension or concentrate)

*Adults, Elderly, Children older than 11 yr.* 30-60 mL/day (or 10-20 mL concentrated MOM) once daily as needed.

*Children 6-11 yr*: 7.5-15 mL/day (or 3.75-7.5 mL concentrated MOM) once daily as needed.

*Children 2-5 yr.* 2.5-7.5 mL/day (or 1.25-3.75 mL concentrated MOM) once daily as needed.

### Constipation

PO (magnesium hydroxide chewable tablets)

Adults, Elderly, Children older than 11 yr: 8 tablets at bedtime or given in divided doses throughout the day.

*Children 6-11 yr.* 4 tablets at bedtime or given in divided doses throughout the day.

*Children 3-5 yr.* 2 tablets at bedtime or given in divided doses throughout the day.

#### Constipation

PO (magnesium oxide caplets) Adults, Elderly, Children older than 11 yr: 2-4 caplets daily at bedtime or individually taken throughout the day.

## CONTRAINDICATIONS

Antacid/laxative: Appendicitis, ileus or intestinal obstruction, severe renal impairment, undiagnosed rectal bleeding.

Systemic: Renal failure, toxemia of pregnancy during 2 h preceding delivery.

#### INTERACTIONS Drug

#### Antacid/Laxative

Ketoconazole, bisphosphonates, fluoroquinolones, tetracyclines:

May decrease the absorption of these drugs; separate times of oral administration. Methenamine: May decrease the effects of methenamine.

**Nitrofurantoin:** May decrease absorption.

#### Systemic (Electrolyte Replacement)

**Calcium:** May reverse the effects of magnesium (used to treat magnesium toxicity).

**Digoxin:** May cause changes in cardiac conduction if magnesium is excessive or depleted.

## Fluoroquinolones, tetracyclines:

May form nonabsorbable complex; separate times of oral administration.

**Cisplatin, aminoglycosides, amphotericin B, loop diuretics:** May deplete magnesium.

#### Herbal

None known.

#### Food

Alcohol: Excessive use may deplete magnesium.

## DIAGNOSTIC TEST EFFECTS

Antacid: Increases gastric pH. Systemic: Normal magnesium serum concentrations are 1.4-2 mEq/L in adults and children, and 1.5-2.3 mEq/L in infants. As an anticonvulsant for eclampsia, effective concentrations reported to be 2.5-7.5 mEq/L.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), anidulafungin (Eraxis), cefepime (Maxipime), ceftriaxone (Rocephin), cefuroxime, ciprofloxacin (Cipro), dexamethasone sodium phosphate, diazepam, doxorubicin, drotrecogin alfa (Xigris), epirubicin, haloperidol, inamrinone, lansoprazole (Prevacid), levofloxacin (Levaquin), methylprednisolone sodium succinate, phenytoin, phytonadione.

## SIDE EFFECTS

#### Frequent

Antacid: Chalky taste, laxative effect.

#### Occasional

Antacid/laxative: Nausea, cramping, diarrhea, increased thirst, flatulence. Systemic (dietary supplement, electrolyte replacement): Reduced respiratory rate, decreased reflexes, flushing, hypotension, decreased heart rate.

## SERIOUS REACTIONS

 Magnesium as an antacid or laxative has no known serious reactions with routine recommended use, as long as renal function is normal.

• Systemic use of magnesium may produce prolonged PR interval and widening of QRS interval.

 Magnesium toxicity may cause loss of deep tendon reflexes, heart block, respiratory paralysis, and cardiac arrest. Hypocalcemia with tetany may occur with large doses. The antidote for toxicity is 10-20 mL 10% calcium chloride or gluconate (5-10 mEq of calcium).

## **PRECAUTIONS & CONSIDERATIONS**

Magnesium antacids/laxatives should be used cautiously in those with renal impairment and in those with chronic diarrhea, GI disease, and undiagnosed GI and rectal bleeding. Use cautiously in those with diabetes mellitus and in those on a low-salt diet because some magnesium supplements contain sugar or sodium. Due to sodium content, use magnesium citrate with caution if congestive heart failure is present. Occasional use of magnesium hydroxide for constipation is generally considered compatible for pregnancy and lactation.

When magnesium is given for systemic use, it should be used cautiously in severe renal impairment. Parenteral magnesium readily crosses the placenta and is distributed in breast milk. Continuous IV infusion of magnesium increases the risk of magnesium toxicity in the neonate and should not be administered IV during the 2 h preceding delivery. Magnesium should be used cautiously in children younger than 6 yr. Elderly patients are at increased risk for developing magnesium deficiency because of decreased magnesium absorption, other medications they may be taking, and poor diet.

Adequate hydration should be maintained. Notify the physician if signs and symptoms of hypermagnesemia occur, including confusion, hypotension, cramping, dizziness, irregular heartbeat, light-headedness, or unusual fatigue or weakness. ECG, BUN, serum creatinine, and magnesium levels should be monitored in those receiving parenteral or chronic oral therapy. Patellar reflexes monitored to assess for CNS depression. Know that suppressed reflexes may indicate impending respiratory arrest. Patellar reflexes should be present, and respiratory rate should be > 16breaths/min before each parenteral dose. Report any unrelieved constipation, rectal bleeding, symptoms of electrolyte imbalance, particularly muscle cramps, pain, weakness, and dizziness, immediately.

#### Storage

May refrigerate magnesium citrate prior to use; do not freeze. Store oral supplements at room temperature protected from moisture. If oral suspension appears nonmiscible, discard. Store parenteral injection vials at room temperature. Once diluted, IVPB and infusions are stable for 24 h at room temperature. Premixed bags should be kept in overwraps until time of use. Do not freeze injection or premixed bags.

#### Administration

When using magnesium hydroxide suspension, shake well before use. Chew the chewable tablets thoroughly before swallowing. Follow oral laxative with a full glass of water. Take at least 2 h before or 2 h after other medications. Do not take for longer than 1-2 wks, unless directed by the physician.

Magnesium citrate liquid may be chilled before serving for palatability. Follow with clear liquids as physician instructs, especially for bowel preparation. A lower sodium formula is available for those patients who should have lower sodium intake.

For IV use, magnesium sulfate injection solution must be diluted. Dilute for IVPB in an appropriate volume of D5W or 0.9% NaCl. Normally, a 1-2 g IVPB is diluted in 100 mL of fluid and is infused over 1 h. For emergency use, do not exceed infusion rate of 150 mg/ min and the concentration should not exceed 20% (200 mg/mL). Do not mix with other IV drugs unless compatibility is established.

For IM use in children, dilute to a maximum of 20% concentration. Adults may receive the 50% solution undiluted for IM use. Inject deep into a large muscle mass, as prescribed. Malathion mal-uh-thahy'on

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anti-infectives, topical, pediculicides

## **MECHANISM OF ACTION**

An organophosphate agent that acts as a pediculicide by inhibiting cholinesterase activity in the organism. Acts quickly. *Therapeutic Effect:* Pediculocidal; product is also ovocidal.

### PHARMACOKINETICS

In most patients with limited use as directed, there is minimal absorption after topical application. No changes in plasma cholinesterase activity were noted with use. Topical absorption may be increased over areas of damaged skin.

#### AVAILABILITY

Lotion: 0.5% (Ovide).

## INDICATIONS AND DOSAGES Head lice

TOPICAL

Adults, Children 6 yrs and older. Apply sufficient lotion to dry hair and leave on for at least 8 h before shampooing and rinsing off. May repeat application in 7 days after initial treatment if live lice or eggs still present.

#### CONTRAINDICATIONS

Do not use in infants younger than 6 months or neonates as their scalps are more permeable and there is potential for malathion toxicity. Hypersensitivity to any component of the formulation.

#### **INTERACTIONS**

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

**Frequent to Occasional** 

Skin irritation, eye stinging or irritation, contact sensitization (itching, redness). Rare (< 1%) Application site dryness, skin exfoliation, rash.

### SERIOUS REACTIONS

Chemical burns, including seconddegree burns, have been reported.
Organophosphate toxicity usually only occurs after significant oral ingestions. The lethal dose is approximately 1 g/kg.

#### PRECAUTIONS & CONSIDERATIONS

No age-related precautions have been noted for suspension or topical use in children over 6 yrs of age. Do not use in infants, especially in neonates, who are susceptible to malathion toxicity. Other agents are preferred during pregnancy and lactation.

Keep out of reach of children; children receiving treatment should be in supervision of an adult during each treatment application period. Use care to avoid eye exposure during use. If the eyes come in contact with the lotion, flush the eyes immediately for several minutes with water. If irritation persists, contact physician. Watch for signs of contact/ allergy and severe irritation during applications.

Because lice are contagious, use caution to avoid infecting others. To help prevent the spread of lice from one patient to another: Avoid head-to-head contact at school (e.g., playground, in physical education or sports activities, and any play with other children). Avoid sleepovers. Do not share combs, brushes, hats, towels, pillows, bedding, helmets, or other hair-related personal items with anyone else, whether they have lice or not. After finishing treatment, check everyone in the family for lice after 1 wk. Family members or close contacts may also require treatment. Machine wash any bedding and clothing used by anyone having lice or thought to have been exposed to lice; machine wash at high temperatures (150° F) and tumble in a hot dryer for 20 min.

#### Storage

Store in a dry place at room temperature; do not freeze. The lotion is flammable. Keep away from heat and flame of any type. Do not smoke around a person to whom the lotion has been applied. Do not use hair dryers.

#### Administration

For external use only. Shake well before use. Caregivers may wish to wear gloves for application.

Patient should cover face and eyes with a towel and keep eyes tightly closed during application. Apply to dry hair using just enough lotion to thoroughly wet hair and scalp. Use care to avoid contact with eyes and mucous membranes. Pay particular attention to the back of the head and neck. Wash hands immediately after the application process is complete.

Allow hair to dry naturally and to remain uncovered. Leave on for 8 h. Shampoo hair after 8 to 12 h; rinse thoroughly. Use a fine-tooth (nit) comb to remove dead lice and eggs. If lice are still present after 7 to 9 days, repeat with a second application. Further treatment is generally not necessary. Other family members should be evaluated by a physician to determine if infested, and if so, receive treatment.

## Mannitol

man'i-tall

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Diuretics, osmotic

#### MECHANISM OF ACTION

An osmotic diuretic, antiglaucoma, and antihemolytic agent that elevates osmotic pressure of the glomerular filtrate, inhibiting tubular reabsorption of water and electrolytes, resulting in increased flow of water into interstitial fluid and plasma. *Therapeutic Effect:* Produces diuresis; reduces intraocular pressure (ICP); reduces intracranial pressure (ICP) and cerebral edema. When inhaled, acts as an irritant and bronchoconstrictor and causes bronchospasm for diagnostic effects.

#### PHARMACOKINETICS

Route	Onset (min)	Peak	Duration (h)
IV (diuresis)	1-3h	N/A	2-8
IV (reduced ICP)	15-30	N/A	3-8
IV (reduced IOP)	N/A	30-60 min	4-8

Remains in extracellular fluid. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 45-100 min.

## AVAILABILITY

Injection: 5%, 10%, 15%, 20%, 25%.

*Inhalation powder and inhaler* (*Aridol*): 5 mg, 10 mg, 20 mg, and 40 mg inhalation powder capsules packaged with inhaler.

## INDICATIONS AND DOSAGES

Prevention and treatment of oliguric phase of acute renal failure, to promote urinary excretion of toxic substances (such as aspirin, barbiturates, bromides, and imipramine); to reduce increased ICP due to cerebral edema or edema of injured spinal cord; to reduce increased IOP due to acute glaucoma IV

Adults, Elderly, Children. Initially, 0.2-1 g/kg, then 0.25-0.5 g/kg q4-6h.

To rest for bronchial hyper-reactivity

INHALATION (ARIDOL) Adults, Elderly, Children 6 yrs of age or older. See complete product information for diagnostic testing procedures and requirements for monitoring.

## CONTRAINDICATIONS

Hypersensitivity to mannitol. Severe dehydration, active intracranial bleeding (except during craniotomy), severe pulmonary edema and congestion, severe renal disease (well established anuria), progressive renal damage or dysfunction after receiving mannitol, including increasing oliguria and azotemia, progressive heart failure.

Do not use Aridol in those who may be compromised by repeated/induced bronchospasm or spirometry maneuvers (e.g., aortic or cerebral aneurysm, uncontrolled hypertension, recent myocardial infarction or stroke).

## INTERACTIONS

#### Drug

**Digoxin:** May increase the risk of digoxin toxicity associated with mannitol-induced hypokalemia. **Lithium:** Increases urinary excretion of lithium.

#### Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum phosphate, potassium, and sodium levels.

## IV INCOMPATIBILITIES

Cefepime (Maxipime), diazepam, doxorubicin liposomal (Doxil), filgrastim (Neupogen), imipenemcilastatin (Primaxin), meropenem (Merrem), phenytoin, whole blood for transfusion.

## **IV COMPATIBILITIES**

Cisplatin (Platinol), ondansetron (Zofran), propofol (Diprivan).

#### SIDE EFFECTS Frequent

Dry mouth, thirst. Aridol commonly causes cough, headache.

Blurred vision, increased urinary frequency and urine volume, headache, arm pain, backache, nausea, vomiting, urticaria, dizziness, hypotension or hypertension, tachycardia, fever, angina-like chest pain.

## SERIOUS REACTIONS

• Fluid and electrolyte imbalance may occur from rapid administration of large doses or inadequate urine output resulting in overexpansion of extracellular fluid. • Circulatory overload may produce pulmonary edema and congestive heart failure.

• Excessive diuresis may produce hypokalemia and hyponatremia.

Fluid loss in excess of electrolyte excretion may produce hypernatremia and hyperkalemia.
Aridol may cause severe bronchospasm that may require

rescue treatments.

#### **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether mannitol crosses the placenta or is distributed in breast milk. The safety and efficacy of mannitol have not been established in children younger than 12 yr. Age-related renal impairment may require cautious use in elderly patients.

Dry mouth and an increase in the frequency and volume of urination may occur. BP, BUN, liver function test results, electrolytes, and urine output should be assessed before and during treatment. Weight should be monitored daily. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Hyponatremia may result in cold and clammy skin, confusion, and thirst.

May increase cerebral blood flow and worsen intracranial hypertension in chldren who develop generalized cerebral hyperemia 24-48 h post injury.

Aridol may cause severe bronchospasm. The test should only be conducted by trained professionals familiar with all aspects of the bronchial challenge test.

#### Storage

Store the drug at room temperature. Do not use if container is damaged or solution is not clear. Do not use if crystals are visible; brief storage in a warmer ( $< 104^{\circ}$  F [40° C]) may help redispense crystals.

Store Aridol inhaler at room temperature. Do not freeze or refrigerate. Do not remove inhalant capsules from blister until immediately before use.

#### Administration

! Assess the IV site for patency before administering each dose. Pain and thrombosis are noted with extravasation. With suspected renal insufficiency or marked oliguria, a test dose should be given. The test dose is 12.5 g for adults (200 mg/kg for children) over 3-5 min to produce a urine flow of at least 30-50 mL/h (1 mL/kg/h for children) over 2-3 h.

If the solution crystallizes, warm the bottle in hot water and shake it vigorously at intervals. Do not use the solution if crystals remain after the warming procedure. Cool the solution to body temperature before administration. Use an in-line filter (< 5  $\mu$ m) for drug concentrations > 20%. The test dose for oliguria is IV push over 3-5 min. The test dose for cerebral edema or elevated ICP is IV over 20-30 min. Maximum concentration is 25%. Do not add potassium chloride or sodium chloride to mannitol with a concentration of 20% or greater. Do not add mannitol to whole blood for transfusion conjointly. If it is necessary to coadminister whole blood, use at least 20 mEq NaCl added to each liter of mannitol solution to prevent pseudoagglutination. Do not put into PVC bags for administration.

See the Aridol bronchial challenge test instructions for complete dosing and spirometry procedures. Patients should not be left unattended during the test. Medications and equipment to treat severe bronchospasm must be present in the testing area. Insert the capsule, as indicated in testing order, into the device. (The first test capsule will not contain mannitol.) Puncture by depressing buttons (only once) on side of device slowly. Have patient exhale deeply and completely through the mouth, before inhaling from the device in a controlled rapid deep inspiration through the mouth. Hold breath for 5 seconds and exhale. At the end of 60 seconds, measure the FEV1. Repeat and follow the provided dose chart until a positive response or 635 mg of mannitol has been administered (negative test).

## Maraviroc

mah-rav'i-rock 🛃 Selzentry 🍟 Celsentri

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiretrovirals, fusion inhibitors

## **MECHANISM OF ACTION**

A fusion inhibitor that is a CCR5 coreceptor antagonist that interferes with the entry of HIV-1 into CD4+ cells by inhibiting the fusion of viral and cellular membranes. Maraviroc is only effective at reducing viral load in patients with CCR5-tropic HIV strains. *Therapeutic Effect:* Impairs HIV replication, slowing the progression of HIV infection.

## PHARMACOKINETICS

Efficacy not affected by food. The drug is a substrate for the efflux transporter P-glycoprotein (Pgp). Protein binding: 76% with moderate affinity for albumin and a-1 acid glycoprotein. Metabolized in liver to inactive metabolites; CYP3A is the major enzyme for metabolism. Maraviroc was the major component present in urine (8% dose) and feces (25% dose); the remainder was excreted as metabolites. *Half-life*: 14-18 h.

### AVAILABILITY

*Tablets (Selzentry):* 150 mg, 300 mg.

## INDICATIONS AND DOSAGES

 CCR5-tropic HIV infection (in combination with other antiretrovirals)

With CYP3A inhibitors with or without a CYP3A inducer (e.g., most protease inhibitors, delavirdine, and other strong CYP3A inhibitors) PO

Adults, Elderly, Children 16 yr and older. 150 mg twice daily.

 With CYP3A inducers (e.g., efavirenz, rifampin, etravirine, others) with *no* strong CYP3A inhibitor

#### PO

Adults, Elderly, Children 16 yr and older: 600 mg twice daily.

If regimen does *not* include *any* CYP3A inducers or inhibitors (e.g., regimens with tipranavir/ritonavir, nevirapine, raltegravir, NRTIs, and enfuvirtide) PO

Adults, Elderly, Children 16 yr and older. 300 mg twice daily.

Dosage in renal impairment

Renal Function Based on CrCl	Potent CYP3A4 Inhibitor (or in Combination with Inducers)	Other Interacting Meds That Decrease Elimination	Potent CYP3A4 Inducer (Alone)
> 30 mL/min	Normal dose	Normal dose	Increase to 600 mg PO BID
≤ 30 mL/min ESRD on dialysis	Not recommended Do not use	300 mg PO BID* 300 mg PO BID*	Not recommended Do not use

## Recommended Dosing Based on Renal Function and Drug Interactions

ESRD, end-stage renal disease.

\* If postural hypotension occurs, reduce to 150 mg PO twice daily.

## CONTRAINDICATIONS

Hypersensitivity to maraviroc. Do not use in severe renal impairment or ESRD (i.e., CrCl < 30 mL/min) if taking potent CYP3A inhibitors or inducers

#### INTERACTIONS

#### Drug

**CYP3A** inhibitors (including most protease inhibitors [except tipranavir/ritonavir] and delavirdine, ketoconazole, itraconazole, clarithromycin, nefazodone): Increases the concentration of maraviroc. Decrease maraviroc dosage.

CYP3A inducers (e.g., efavirenz, rifampin, etravirine, carbamazepine, phenobarbital, and phenytoin):

Decreases the concentration of maraviroc. Increase maraviroc dosage. Herbal

St. John's wort: Decreases the concentration of maraviroc Avoid Food

None known. High-fat food decreases absorption some but does not affect final efficacy.

#### DIAGNOSTIC TEST EFFECTS

May elevate AST (SGOT) and ALT (SGPT) levels. May decrease blood hemoglobin levels and WBC count

## SIDE EFFECTS

#### Frequent (> 8%)

Upper respiratory tract infections, cough, pyrexia, rash, and dizziness. Occasional (3%-7%)

Asthenia, arthralgia, insomnia, anxiety, constipation, myalgia, paresthesias, peripheral neuropathy, cold sores, sinus and other infections. Rare (≤ 2%)

Change in appetite, conjunctivitis, urinary symptoms, flu-like syndrome. Lowered blood counts, altered fat distribution. Postural hypotension with increased levels of maraviroc

## SERIOUS REACTIONS

· Hepatotoxicity has been reported, which may be preceded by evidence of a systemic allergic reaction (e.g., fever with pruritic rash, eosinophilia, or elevated IgE). Stevens-Johnson syndrome has been reported: discontinue and do not rechallenge if this occurs.

 More cardiovascular events. including myocardial ischemia and/or infarction, were observed in treatment-experienced subjects who received this drug, but more data are needed to assess any risk. Because of effects on immune cells, potential risk for infection or increased rate of malignancy. Immune reconstitution syndrome

has been reported. Risk currently not proven or known.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with liver function impairment and in those coinfected with hepatitis B. In patients with renal impairment, carefully screen for drug interactions. Use with caution in patients at increased risk of cardiovascular events or diabetes or at risk of postural hypotension. There are no adequate data in human pregnancy. Breastfeeding is not recommended in this patient population because of the possibility of HIV transmission. Be aware that the safety and efficacy of maraviroc have not been established in children younger than 16 yr of age. No age-related precautions have been noted in elderly patients.

Maraviroc is not a cure for HIV infection, nor does it reduce risk of transmission to others. Expect to obtain baseline laboratory testing, especially CBC, liver function, and renal function, before beginning maraviroc therapy and at periodic intervals. Assess for hypersensitivity reaction, fatigue or nausea, myalgia, paresthesia or neuropathy, and insomnia.

#### Storage

Store at room temperature. Shelf life is only 1 yr.

#### Administration

Maraviroc may be taken without regard to food or meals.

#### **Mebendazole**

meh-ben'dah-zole

#### **CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Pregnancy Risk Category: C

*Classification:* Antihelmintics, carbamate

### **MECHANISM OF ACTION**

A synthetic benzimidazole derivative that degrades parasite cytoplasmic microtubules and irreversibly blocks glucose uptake in helminthes and larvae. *Therapeutic Effect:* Vermicidal. Depletes glycogen, decreases ATP, causes helminth death.

## PHARMACOKINETICS

Poorly absorbed from GI tract (absorption increases with food). Metabolized in liver. Primarily eliminated in feces. *Half-life:* 2.5-9 h (half life increased with impaired renal function).

#### AVAILABILITY

Tablets, Chewable: 100 mg.

#### INDICATIONS AND DOSAGES • Trichuriasis, ascariasis, hookworm PO

Adults, Elderly, Children older than 2 yr. 1 tablet in morning and at bedtime for 3 days. For resistant infections (i.e., helminth ova continuing to appear in feces 3-4 wks after initial course), a 2nd course is recommended.

## Enterobiasis (pinworm) PO

*Adults, Elderly, Children older than* 2 yr. 1 tablet one time.

## **OFF-LABEL USES**

Ancylostoma duodenale or Necator americanus, trichinosis, visceral larva migrans.

## CONTRAINDICATIONS

Hypersensitivity to mebendazole or any component of the formulation.

#### INTERACTIONS

#### Drug Carbamazepine: May decrease concentrations of mebendazole.

Mebendazole (Generic Name)

Cimetidine: May increase

mebendazole levels.

Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase SGOT (AST), SGPT (ALT), alkaline phosphatase, BUN. May decrease hemoglobin.

## SIDE EFFECTS

#### Occasional

Nausea, vomiting, headache, dizziness, transient abdominal pain, diarrhea with massive infection and expulsion of helminthes.

## Rare

Fever.

## SERIOUS REACTIONS

• High dosage may produce reversible myelosuppression (granulocytopenia, leukopenia, neutropenia).

• Higher-than-recommended dosages may produce hepatitis.

### **PRECAUTIONS & CONSIDERATIONS**

Be aware that mebendazole is ineffective in hydatid disease. Use with caution in known liver dysfunction and monitor closely. It is unknown whether mebendazole crosses the placenta or is distributed in breast milk; caution is warranted in lactation. Safety and efficacy have not been established in children 2 yr and younger. No age-related precautions have been noted in elderly patients.

Avoid walking barefoot (larval entry into system). Change and launder underclothing, pajamas, bedding, towels, and washcloths daily. Because of the high transmission of pinworm infections, all family members should be treated simultaneously; the infected person should sleep alone and shower frequently.

## Storage

Store at room temperature protected from light and moisture.

#### Administration

For high dosages, take with food. Tablets may be crushed, swallowed, or mixed with food. Take and continue iron supplements as long as ordered (may be 6 mo after treatment) for anemia associated with whipworm and hookworm.

## Meclizine Hydrochloride

mek'li-zeen high-droh-klor'ide ★ Antivert, Bonine, Dramamine Less Drowsy ➡ Bonamine Do not confuse Antivert with Axert.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC, Rx

**Classification:** Antihistamines, sedating, H<sub>1</sub> antagonists, antivertigo agents

## **MECHANISM OF ACTION**

An anticholinergic that reduces labyrinthine excitability and diminishes vestibular stimulation of the labyrinth, affecting the chemoreceptor trigger zone. *Therapeutic Effect:* Reduces nausea, vomiting, and vertigo.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30-60 min	N/A	12-24 h

Well absorbed from the GI tract. Widely distributed. Metabolized in the liver. Primarily excreted in urine. *Half-life*: 6 h.

Meclizine Hydrochloride (Generic Name)

## AVAILABILITY

Tablets (Antivert): 12.5 mg, 25 mg, 50 mg.

Tablets, Chewable (Bonine): 25 mg. Tablets (Dramamine Less Drowsy): 25 mg.

## INDICATIONS AND DOSAGES

#### Motion sickness

PO

*Adults, Elderly, Children 12 yr and older.* 25-50 mg 1 h before travel. May repeat every 24 h.

Vertigo

#### PO

Adults, Elderly, Children 12 yr and older. 25-100 mg/day in divided doses, as needed.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

Drug Alcohol, CNS depressants: May increase CNS depressant effect. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May produce false-negative results in antigen skin testing unless meclizine is discontinued 4 days before testing.

## SIDE EFFECTS

#### Frequent

Drowsiness.

## Occasional

Blurred vision; dry mouth, nose, or throat.

## SERIOUS REACTIONS

 A hypersensitivity reaction, marked by eczema, pruritus, rash, cardiac disturbances, and photosensitivity may occur. • Overdose may produce CNS depression (manifested as sedation, apnea, cardiovascular collapse, or death) or severe paradoxical reactions (such as hallucinations, tremor, and seizures).

 Children may experience paradoxical reactions, including restlessness, insomnia, euphoria, nervousness, and tremors.

• Elderly patients (older than 60 yr) may have increased risk for agitation, disorientation, dizziness, sedation, hypotension, confusion.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with asthma, prostate enlargement, angle-closure glaucoma, and obstructive diseases of the GI or genitourinary tract. It is unknown whether meclizine crosses the placenta or is distributed in breast milk. Meclizine use may produce irritability in breastfeeding infants. Safety and efficacy in children under age 12 are not established. Children and elderly patients may be more sensitive to the drug's anticholinergic effects, such as dry mouth. Alcohol and tasks that require mental alertness or motor skills should be avoided until the effects of the drug are known.

Dizziness, drowsiness, and dry mouth may occur. BP, electrolytes, and skin should be assessed. Storage

Store at room temperature. keep tightly closed and protect from light.

#### Administration

Take meclizine orally without regard to food. Crush scored tablets if needed. Chewable tablets may be administered with or without water.
# Medroxyprogesterone Acetate

me-drox'ee-proe-jess'te-rone ass'e-tayte Depo-Provera, Depo-Provera Contraceptive, Depo-SubQ Provera 104, Provera Medroxy, Provera Do not confuse medroxyprogesterone with hydroxyprogesterone, methylprednisolone, or methyltestosterone.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

Classification: Progestogen

# **MECHANISM OF ACTION**

A hormone that transforms endometrium from proliferative to secretory in an estrogen-primed endometrium. Inhibits secretion of pituitary gonadotropins. *Therapeutic Effect:* Prevents follicular maturation and ovulation. Stimulates the growth of mammary alveolar tissue and relaxes uterine smooth muscle. Corrects hormonal imbalance.

## PHARMACOKINETICS

Slowly absorbed after IM administration. Protein binding: 90%. Metabolized in the liver. Excreted primarily in urine. *Half-life:* 16 h (oral tablet); 16-43 days (mean, injection suspension).

# AVAILABILITY

Tablets (Provera): 2.5 mg, 5 mg, 10 mg. Injection (Depo-Provera Contraceptive): 150 mg/mL. Injection (Depo-Provera): 400 mg/mL. Subcutaneous Injection (Depo-SubQ Provera 104 Contraceptive): 104 mg/0.65 mL.

#### INDICATIONS AND DOSAGES • Endometrial hyperplasia PO

Adults. 2.5-10 mg/day for 14 days.

# Secondary amenorrhea PO

*Adults.* 5-10 mg/day for 5-10 days, beginning at any time during menstrual cycle or 2.5 mg/day.

### Abnormal uterine bleeding PO

*Adults.* 5-10 mg/day for 5-10 days, beginning on calculated day 16 or day 21 of menstrual cycle.

## Endometrial, renal carcinoma IM

*Adults, Elderly.* Initially, 400-1000 mg; repeat at 1-wk intervals. If improvement occurs and disease is stabilized, begin maintenance with as little as 400 mg/mo.

Contraception

IM (DEPO-PROVERA) *Adults.* 150 mg q3mo. Do not use for > 2 yr unless necessary.

Contraception or endometriosis SUBCUTANEOUS (DEPO-SUBQ PROVERA 104) Adults. 104 mg q12-14 wk. Do not use for > 2 yr unless necessary.

# CONTRAINDICATIONS

Carcinoma of breast; hormonedependent neoplasm; history of or active thrombotic disorders, such as cerebral apoplexy, thrombophlebitis, or thromboembolic disorders; hypersensitivity to progestins; known or suspected pregnancy; missed abortion; severe hepatic dysfunction; undiagnosed abnormal genital bleeding; use as pregnancy test.

#### INTERACTIONS Drug

**Bromocriptine:** May interfere with the effects of bromocriptine.

Medroxyprogesterone Acetate (Generic Name)

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May alter results for serum thyroid and liver function tests, prothrombin time, and metapyrone test.

## SIDE EFFECTS

#### Frequent

Transient menstrual abnormalities (including spotting, change in menstrual flow or cervical secretions, and amenorrhea) at initiation of therapy.

#### Occasional

Edema, weight change, breast tenderness, nervousness, insomnia, fatigue, dizziness, hot flashes, decreased libido or anorgasmia, acne, rash.

#### Rare

Alopecia, depression, dermatologic changes, headache, fever, nausea.

### SERIOUS REACTIONS

• Thrombophlebitis, pulmonary or cerebral embolism, and retinal thrombosis occur rarely.

• Lowered bone mineral density with injectable use > 2 yr; may be nonreversible. Recovery of bone density is usually seen in adolescent females following discontinuation.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with conditions aggravated by fluid retention, including asthma, seizures, migraine, cardiac or renal dysfunction, and in those with diabetes mellitus, osteopenia, or history of depression. Medroxyprogesterone should be avoided during pregnancy, especially in the first 4 mo because the drug may cause congenital heart and limb-reduction defects in the neonate. Medroxyprogesterone contraception is compatible with breastfeeding. Safety and efficacy of medroxyprogesterone have not been established in children under the age of 12 yr. No age-related precautions have been noted in elderly patients. Avoid smoking because of the increased risk of blood clot formation and myocardial infarction.

Notify the physician of chest pain, blood-tinged expectorants, hemoptysis, numbness in the arm or leg, severe headache, severe pain or swelling in the calf, severe abdominal pain or tenderness, sudden loss of vision, or unusually heavy vaginal bleeding. BP, weight, blood glucose, hepatic enzyme, and serum calcium levels should be monitored.

#### Storage

Store all products at room temperature; do not freeze the injection.

#### Administration

Take oral medroxyprogesterone without regard to meals.

For IM use, shake vial immediately before administering to ensure complete suspension. Inject IM only in upper arm or upper outer aspect of buttock. Rarely, a residual lump, change in skin color, or sterile abscess occurs at injection site.

For use of the subcutaneous injection, shake well immediately before use to ensure complete suspension. Preferred sites of administration are the upper thigh and abdomen.

#### Mefloquine me'flow-quine Lariam

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Classification: Antimalarial

Mefloquine (Generic Name)

## **MECHANISM OF ACTION**

A quinolone-methanol compound structurally similar to quinine that destroys the asexual blood forms of malarial pathogens *Plasmodium falciparum*, *P. vivax. Therapeutic Effect:* Inhibits parasite growth.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 98%. Widely distributed, including cerebrospinal fluid (CSF). Metabolized in liver. Primarily excreted in urine. *Half-life:* 21-22 days.

### AVAILABILITY

Tablets: 250 mg.

# INDICATIONS AND DOSAGES

#### Suppression of malaria PO

Adults. 250 mg base weekly starting 1-2 wk before travel, continuing weekly during travel and for 4 wks after leaving endemic area. Children weighing more than 45 kg. 250 mg weekly starting 1-2 wk before travel, continuing weekly during travel and for 4 wks after leaving the endemic area. Children weighing 31-45 kg. 187.5 mg (3/4 tablet) weekly starting 1-2 wks before travel, continuing weekly during travel, and for 4 wks after leaving the endemic area. Children weighing 20-30 kg. 125 mg (1/2 tablet) weekly starting 1-2 wk before travel, continuing weekly during travel, and for 4 wks after leaving the endemic area. Children weighing 15-19 kg. 62.5 mg (1/4 tablet) weekly starting 1 wk before travel, continuing weekly during travel, and for 4 wks after leaving the endemic area.

# Treatment of malaria (if strain not resistant)

PO

Adults. 1250 mg as a single dose.

*Children.* 20-25 mg/kg single dose (not to exceed 1250 mg). Splitting the dose into 2 doses taken 6-8 h apart may reduce side effects. Experience in children < 20 kg is limited.

## CONTRAINDICATIONS

Cardiac abnormalities; severe psychiatric disorders; epilepsy; history of hypersensitivity to mefloquine; quinine, or quinidine; use with halofantrine.

# INTERACTIONS

#### Drug

Anticonvulsants: May decrease the effect of anticonvulsants. β-Blockers: May increase bradycardia with β-blockers. Chloroquine, quinine, quinidine: May increase the risk of toxicity with these drugs (seizures or ECG changes). Dronedarone: Risk of fatal OT prolongation; do not use. Halofantrine: Risk of fatal QT prolongation; do not use. Ketoconazole: Do not use within 15 days of mefloquine as may cause toxicity and QT prolongation. Medications prolonging the QT interval and/or potently inhibiting CYP3A4: May increase risk of mefloquine toxicity and QT prolongation. Rifampin: Induces mefloquine metabolism and may cause treatment failure. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Mild transient headache, difficulty concentrating, insomnia,

light-headedness, vertigo, diarrhea, nausea, vomiting, visual disturbances, tinnitus, chills, fatigue, myalgia. **Rare** 

Aggressive behavior, anxiety, bradycardia, depression, hallucinations, hypotension, panic attacks, paranoia, psychosis, syncope, tremor.

## SERIOUS REACTIONS

 Prolonged therapy may result in peripheral neuritis, neuromyopathy, hypotension, ECG changes (e.g., QT prolongation), agranulocytosis, aplastic anemia, thrombocytopenia, seizures, and psychosis.

• Overdosage may result in headache, vomiting, visual disturbance, drowsiness, and seizures.

· Acute hypersensitivity.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with history of depression, epilepsy, liver disease, heart disease, and people who pilot airplanes and operate machines because dizziness and disturbed sense of balance are side effects. It is unknown whether mefloquine crosses the placenta or is excreted in breast milk. Advise female patients to use adequate contraception during the period of prophylaxis or treatment. No age-related precautions have been noted in children or elderly patients.

Any new symptoms of anxiety, confusion, depression, restlessness, tinnitus, and visual difficulties should be reported.

#### Storage

Store at controlled room temperature in original package until time of use. Administration

Begin therapy before and continue after trip. Take mefloquine with food and at least 8 oz of water. Tablets may be crushed and mixed with water or sugar water for oral administration. Continue taking mefloquine for the full length of treatment. ! NOTE: Patients with acute *P. vivax* malaria are at high risk of relapse because mefloquine does not eliminate hepatic phase parasites. To avoid relapse after mefloquine treatment, patients should subsequently be treated with an 8-aminoquinoline derivative (e.g., primaquine).

## **Megestrol Acetate**

me-jess'trole ass'ee-tayte ★ Megace, Megace ES ★ Apo-Megestrol, Megace OS, Nu-Megestrol

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X (for suspension), D (for tablets)

Classification: Progestin derivative

# **MECHANISM OF ACTION**

A hormone and antineoplastic agent that suppresses the release of luteinizing hormone from the anterior pituitary gland by inhibiting pituitary function. *Therapeutic Effect:* Shrinks tumors. Also increases appetite by an unknown mechanism.

## PHARMACOKINETICS

Well absorbed from the GI tract. Metabolized in the liver; excreted in urine.

## AVAILABILITY

Tablets: 20 mg, 40 mg. Suspension: 40 mg/mL, 125 mg/mL.

# INDICATIONS AND DOSAGES

 Palliative treatment of advanced breast cancer

*Adults, Elderly.* 160 mg/day in 4 equally divided doses.

Megestrol Acetate (Generic Name)

# Palliative treatment of advanced endometrial carcinoma

Adults, Elderly. 40-320 mg/day in divided doses. Maximum: 800 mg/day in 1-4 divided doses.

#### Anorexia, cachexia, weight loss PO (MEGACE)

Adults, Elderly. 400-800 mg/day (equal to 10-20 mL/day). PO (MEGACE ES) Adults, Elderly: 625 mg (5 mL) once daily.

# **OFF-LABEL USES**

Appetite stimulant, treatment of hormone-dependent or advanced prostate carcinoma (palliative).

# CONTRAINDICATIONS

Hypersensitivity to megestrol acetate or any of its components.

## INTERACTIONS

#### Drug

Antidiabetic agents: Megestrol may alter glucose tolerance. Monitor.

**Dofetilide:** Megestrol inhibits renal cationic transport and clearance; co-use contraindicated.

Entecavir: Competes with megestrol for renal tubular secretion; monitor.

**Warfarin:** Megestrol may increase response to warfarin; monitor INR.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose level.

# SIDE EFFECTS

### Frequent

Weight gain secondary to increased appetite, hot flashes, sweating, rash, increased blood pressure.

## Occasional

Nausea, breakthrough vaginal bleeding, backache, headache, breast tenderness, carpal tunnel syndrome. **Rare** 

Feeling of coldness.

# SERIOUS REACTIONS

• Thrombophlebitis and pulmonary embolism occur rarely.

• New or exacerbation of diabetes mellitus, overt Cushing's syndrome.

• Adrenal insufficiency with megestrol withdrawal after chronic use.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of thrombophlebitis. Megestrol use should be avoided during pregnancy, if possible, especially in the first 4 mo. Pregnancy should be determined before initiating megestrol therapy. Megestrol has a pregnancy risk category of X in suspension form and D in tablet form. Contraception is imperative during therapy. Breastfeeding is not recommended for patients taking this drug. The safety and efficacy of megestrol have not been established in children. No age-related precautions have been noted in elderly patients.

Notify the physician if calf pain, difficulty breathing, or vaginal bleeding develops.

Patients receiving chemotherapy may require palliative treatment for stomatitis.

#### Storage

Store suspension and tablets at room temperature; avoid exposure to excessive heat. Do not freeze.

#### Administration

Tablets and suspensions may be taken without regard to meals. Shake suspension well before using. Note difference in dosage of Megace and Megace ES suspensions.

# Meloxicam

mel-oks'i-kam ★ Mobic 🍁 Mobicox

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAIDs)

## **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces the inflammatory response and intensity of pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (anal- gesic)	30 min	4-5 h	NA

Well absorbed after PO administration. Protein binding: 99%. Metabolized in the liver. Eliminated in urine and feces as inactive metabolites. Not removed by hemodialysis. *Half-life*: 15-20 h.

# AVAILABILITY

Tablets: 7.5 mg, 15 mg. Oral Suspension: 7.5 mg/5 mL.

# INDICATIONS AND DOSAGES

# Osteoarthritis, rheumatoid arthritis PO

*Adults*. Initially, 7.5 mg/day. Maximum: 15 mg/day.

#### Juvenile rheumatoid arthritis PO

Children  $\ge 2$  yr. 0.125 mg/kg (not to exceed 7.5 mg) once daily.

# CONTRAINDICATIONS

Hypersensitivity to meloxicam, other NSAIDs, or aspirin. Use within 14 days of CABG.

# INTERACTIONS

#### Drug

Antihypertensives, diuretics:

May decrease the effects of antihypertensives and diuretics.

Aspirin, salicylates,

corticosteroids: May increase the risk of GI bleeding and side effects. NSAIDs may negate the cardioprotective effect of ASA. Cyclosporine: May increase risk of

nephrotoxicity.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of heparin, oral anticoagulants, and thrombolytics. Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of toxicity with methotrexate.

**SSRIs, SNRIs:** Increased risk of GI bleeding.

# Herbal

**Feverfew:** May increase the risk of bleeding.

**Ginkgo biloba:** May increase the risk of bleeding.

#### Food

Alcohol: May increase risk of dizziness, GI bleeding.

# DIAGNOSTIC TEST EFFECTS

May increase serum creatinine, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

### Frequent (7%-9%)

Dyspepsia, headache, diarrhea, nausea.

### Occasional (3%-4%)

Dizziness, insomnia, rash, pruritus, flatulence, constipation, vomiting.

Meloxicam (Generic Name)

#### Rare (< 2%)

Somnolence, urticaria, photosensitivity, tinnitus.

## SERIOUS REACTIONS

 Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, severe hepatic reaction (jaundice), nephrotoxicity (hematuria, dysuria, proteinuria).
 Severe hypersensitivity reaction (bronchospasm, angioedema).

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with asthma, dehydration, hepatic or renal impairment, a history of GI disorders (such as ulcers), and concurrent anticoagulant use. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures. Meloxicam should not be used during pregnancy because it can cause fetal harm. Meloxicam is excreted in breast milk; caution is advisable in lactation. Elderly patients may require dose adjustments due to age-related renal impairment and increased susceptibility to GI toxicity.

Notify the physician if chest pain, difficulty breathing, palpitations, peripheral edema, persistent abdominal cramps or pain, rash, ringing in the ears, severe nausea or vomiting, or unusual bleeding or ecchymosis occurs. CBC, BUN level, and serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels should be assessed during therapy. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness, improved grip strength, and increased joint mobility, should be evaluated. Report any indications of infection, bleeding, or poor healing to the health care provider.

#### Storage

Store at room temperature, tightly closed and protected from moisture. Administration

Take meloxicam without regard to food.

## Memantine Hydrochloride

meh-man'teen high-droh-klor'ide ★ Namenda, Namenda XR ◆ Ebixa

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Alzheimer's disease agents, NMDA receptor antagonists

## MECHANISM OF ACTION

An NMDA receptor antagonist that decreases the effects of glutamate, the principal excitatory neurotransmitter in the brain. Persistent central nervous system (CNS) excitation by glutamate is thought to contribute to the symptoms of Alzheimer's disease. *Therapeutic Effect:* May reduce clinical deterioration in moderate to severe Alzheimer's disease.

## PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Protein binding: 45%. Undergoes little metabolism; most of the dose is excreted unchanged in urine. *Half-life:* 60-80 h.

## AVAILABILITY

Tablets: 5 mg, 10 mg.

Memantine Hydrochloride (Generic Name)

## 982 Memantine Hydrochloride

*Oral Solution:* 2 mg/mL. *Capsules, Extended Release:* 7 mg, 14 mg, 21 mg, 28 mg.

# INDICATIONS AND DOSAGES Alzheimer's disease

PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 5 mg once a day. May increase dosage at intervals of at least 1 wk in 5-mg increments to 10 mg/day (5 mg twice a day), then 15 mg/day (5 mg and 10 mg as separate doses), and finally 20 mg/day (10 mg twice a day). Target dose: 20 mg/day.

PO (EXTENDED RELEASE) Adults, Elderly. Initially, 7 mg once a day. May increase dosage at intervals of at least 1 wk in 7-mg increments.

Target dose: 28 mg/day.

#### Dosage in renal impairment (CrCl < 30 mL/min)</li>

Initially, 5 mg once daily. Target dose is 5 mg twice daily.

For extended release, initially 7 mg once daily; target dose should not exceed 14 mg/day.

## CONTRAINDICATIONS

Hypersensitivity to the drug, administration with dofetilide.

### INTERACTIONS

#### Drug

#### Carbonic anhydrase inhibitors, sodium bicarbonate: May decrease the renal elimination of memantine. Dofetilide: Competes for renal tubular excretion; contraindicated.

**Metformin:** Competes for renal tubular excretion and may increase risk of lactic acidosis.

Use with other NDMA antagonists (e.g., dextromethorphan, ketamine, amantadine): Not well studied; use together with caution; may increase risk of side effects.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

Increased alkaline phosphatase. Rarely, increased liver function tests. Decreased hemoglobin/ hematocrit or decreased WBC noted infrequently.

# SIDE EFFECTS

Occasional (4%-7%)

Dizziness, headache, confusion, constipation, hypertension, cough. **Rare (2%-3%)** 

Back pain, nausea, fatigue, anxiety, peripheral edema, arthralgia, insomnia.

## SERIOUS REACTIONS

- · Atrioventricular block.
- Serious CNS reactions may include aggressive behavior, emotional lability, psychosis or delirium, hallucinations, seizures.
- Rare serious allergic reactions.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with moderate renal impairment or advanced liver disease. Use with caution in patients with seizure disorders, since not well studied. It is unknown whether memantine crosses the placenta or is distributed in breast milk. Memantine is not used in children. No age-related precautions have been noted in elderly patients. Be aware that memantine is not a cure for Alzheimer's disease but may slow the progression of its symptoms.

Adequate fluid intake should be maintained. Renal function and urine pH should be monitored; alkaline urine may lead to an accumulation of the drug and a possible increase in side effects.

#### Storage

Store all dose forms at room temperature.

#### Administration

Take memantine without regard to food. Carefully measure the dose using the supplied dosing device. Do not mix the oral solution with any other liquids. Do not abruptly discontinue or adjust the drug dosage. If therapy is interrupted for several days, restart the drug at the lowest dose and increase the dosage at intervals of at least 1 wk to the most recent dose, as prescribed.

The extended-release capsules should be swallowed whole and not be divided, chewed, or crushed. If needed to aide swallowing, the capsules may be opened and the entire contents sprinkled on cool applesauce.

# Meperidine Hydrochloride

me-per'i-deen high-droh-klor'ide Demerol Demetrol, Pethidine Do not confuse Demerol with Demulen or Dymelor.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

**Classification:** Analgesics, narcotic, opiate agonist, synthetic

### **MECHANISM OF ACTION**

An opioid agonist that binds to opioid receptors in the central nervous system (CNS). *Therapeutic Effect:* Alters the perception of, and emotional response, to pain.

## PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration (h)
P0	15	60	2-4
IV	< 5	5-7	2-3
IM	10-15	30-50	2-4
Subcuta- neous	10-15	30-50	2-4

Variably absorbed from the GI tract; well absorbed after IM administration. Protein binding: 60%-80%. Widely distributed. Metabolized in the liver to active metabolite. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 2.4-4 h; metabolite 8-16 h (increased in hepatic impairment and disease).

## AVAILABILITY

*Syrup:* 50 mg/5 mL. *Tablets:* 50 mg, 100 mg. *Injection:* 10 mg/mL, 25 mg/mL, 50 mg/mL, 75 mg/mL, 100 mg/mL.

# INDICATIONS AND DOSAGES

▶ Acute, moderate to severe pain PO, IM, SC, IV Adults. 25-150 mg q3-4h. Elderly. Use lower end of adult dosage range and use care in titration. Children. 1.1-1.5 mg/kg q3-4h. Do

not exceed single dose of 100 mg.

 Patient-controlled analgesia (PCA) IV

*Adults.* Loading dose: 50-100 mg. Intermittent bolus: 5-30 mg. Lockout interval: 10-20 min. Continuous infusion: 5-40 mg/h. Maximum (4-h): 200-300 mg.

*Elderly.* Use lower end of adult dosage range and use care in titration.

#### Dosage in renal impairment Desage is based on greatining

Dosage is based on creatinine clearance.

Meperidine Hydrochloride (Generic Name)

Creatinine Clearance	
(mL/min)	Dosage
10-50	75% of usual dose
< 10	50% of usual dose

## CONTRAINDICATIONS

Hypersensitivity to meperidine; use within 14 days of MAOIs; any condition of severe respiratioy insufficiency.

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants, alcohol, neuromuscular blocking agents: May increase CNS or respiratory depression and hypotension. Anticholinergics: Increased anticholinergic effects. Antihypertensive drugs: May increase risk of hypotension. MAOIs: May produce a severe, sometimes fatal reaction. Meperidine use is contraindicated. Ritonavir: Suspected increase in meperidine levels. Sibutramine: Meperidine use is contraindicated. Herbal Valerian: May increase CNS depression. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase levels. Therapeutic serum level is 100-550 ng/mL; toxic serum level is > 1000 ng/mL.

# IV INCOMPATIBILITIES

Acyclovir, allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), all barbiturates, cefepime (Maxipime), cefoperazone (Cefobid), diazepam, doxorubicin liposomal (Doxil), fospropofol (Lusedra), furosemide (Lasix), heparin, idarubicin (Idamycin), lansoprazole (Prevacid), lorazepam, micafungin (Mycamine), nafcillin (Nafcil), pantoprazole (Protonix), phenytoin, sodium bicarbonate.

# **IV COMPATIBILITIES**

Bumetanide (Bumex), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), insulin, lidocaine, magnesium, oxytocin (Pitocin), potassium, propofol (Diprivan).

# SIDE EFFECTS

#### Frequent

Sedation, hypotension (including orthostatic hypotension), diaphoresis, facial flushing, dizziness, nausea, vomiting, constipation.

#### Occasional

Confusion, arrhythmias, tremors, urine retention, abdominal pain, dry mouth, headache, irritation at injection site, euphoria, dysphoria. **Rare** 

Allergic reaction (rash, pruritus), insomnia.

# SERIOUS REACTIONS

• Overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma. The antidote is 0.4 mg naloxone.

• CNS toxicity due to accumulation of neurotoxic metabolite; risk of seizures. Many experts do not recommended meperidine use for pain due to potential toxicity.

 The patient who uses meperidine repeatedly may develop a tolerance to the drug's analgesic effect and physical dependence.

#### PRECAUTIONS & CONSIDERATIONS

NOTE: Meperidine is not an appropriate choice for the treatment of chronic pain.

Caution is warranted in patients with acute abdominal conditions, cor pulmonale, history of seizures, increased intracranial pressure, hepatic or renal impairment, respiratory abnormalities, supraventricular tachycardia, and in debilitated or elderly patients. Be aware that with renal impairment, meperidine's metabolite may increase and cause seizures, tremors, and twitching. Meperidine crosses the placenta and is distributed in breast milk. Regular use of opiates during pregnancy may produce withdrawal symptoms in the neonate, such as diarrhea, excessive crying, fever, hyperactive reflexes, irritability, seizures, sneezing, tremors, vomiting, and yawning. The neonate may develop respiratory depression if the mother receives meperidine during labor. Children are more prone to develop paradoxical excitement. Children younger than 2 yr and elderly patients are more susceptible to the drug's respiratory depressant effects. In elderly patients, age-related renal impairment may increase the risk of urine retention. Also, elderly patients require care in dose selection and titration, and based on renal function and other parameters should be dosed conservatively initially.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. Vital signs, pattern of daily bowel activity and stool consistency, and clinical improvement of pain should be monitored. The drug should be withheld and the physician should be notified if the respiratory rate is 12 breaths/min or less in an adult, or 20 breaths/min or less in a child. Be alert for decreased BP as well as a change in quality and rate of pulse. Psychological and physical dependence may occur with chronic administration; drug has an abuse potential in predisposed individuals.

#### Storage

Store injection and oral products at room temperature.

#### Administration

! Be aware that meperidine's side effects are dependent on the dosage and route of administration. Know that ambulatory patients and those not in severe pain may be more prone to dizziness than those in the supine position and those in severe pain.

Take oral meperidine without regard to food. Dilute the syrup in a halfglass of water to prevent an anesthetic effect on mucous membranes. ! Give meperidine injection by slow IV push or IV infusion.

Meperidine may be given undiluted or may be diluted in D5W, Ringer's solution, lactated Ringer's solution, a dextrosesaline combination (such as 2.5%, 5%, or 10% dextrose and 0.45% or 0.9% NaCl), or molar (M/6) sodium lactate injection for IV injection or infusion. Place the patient in a recumbent position before administering parenteral meperidine. Administer IV push very slowly, over 2-3 min. Rapid IV administration increases the risk of a severe anaphylactic reaction, marked by apnea, cardiac arrest, and circulatory collapse.

! The IM route is preferred over the SC route because the SC route can produce induration, local irritation, and pain. For IM use, inject the drug slowly.

# **Meprobamate**

📩 me-proe'ba-mate

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

*Classification:* Anxiolytics, sedative-hypnotic

# **MECHANISM OF ACTION**

A carbamate derivative that affects the thalamus and limbic system. Appears to inhibit multineuronal spinal reflexes. *Therapeutic Effect:* Anxiolytic and sedative activity.

# PHARMACOKINETICS

Slowly absorbed from the GI tract. Protein binding: 0%-30%. Metabolized in liver. Excreted in urine and feces. Moderately dialyzable. *Half-life:* 10 h.

# AVAILABILITY

Tablets: 200 mg, 400 mg.

# INDICATIONS AND DOSAGES Anxiety disorders

PO

Adults, Children 12 yr and older. 400 mg 3-4 times/day. Maximum: 2400 mg/day.

*Children aged 6-12 yr:* 100-200 mg 2-3 times/day. Maximum: 600 mg/day. *Elderly*. Use lowest effective dose. Maximum: 200 mg 2-3 times/day.

## Dosage in renal impairment

Creatinine Clearance (mL/min)	Dosage Interval (h)
10-50	Every 9-12 h
< 10	Every 12-18 h

# CONTRAINDICATIONS

Acute intermittent porphyria, hypersensitivity to meprobamate

or related compounds, such as carisoprodol.

# INTERACTIONS

### Drug

Alcohol, all central nervous system (CNS) depressants: May increase CNS depression.

Warfarin: Meprobamate has been associated with a decreased anticoagulation response; monitor INR.

#### Herbal

Gotu kola, kava kava, St. John's wort: May increase CNS depression. Food

None known.

# DIAGNOSTIC TEST EFFECTS

Therapeutic levels range between 6 and 12 mg/mL. Rarely causes decreased WBC, platelets, or changes in LFTs.

## SIDE EFFECTS

Frequent Drowsiness, dizziness.

## Occasional

Tachycardia, palpitations, headache, light-headedness, dermatitis, diarrhea, nausea, vomiting, dyspnea, rash, weakness, blurred vision, wheezing.

# SERIOUS REACTIONS

 Agranulocytosis, aplastic anemia, leukopenia, anaphylaxis, cardiac arrhythmias, hypotensive crisis, syncope, Stevens-Johnson syndrome, and bullous dermatitis have been reported.

• Overdose may cause CNS depression, ataxia, coma, shock, hypotension, and death.

 Rarely causes seizures in predisposed patients.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with elderly patients as well as those with liver or renal impairment, those with a history of seizures, and those who

Meprobamate (Generic Name)

use alcohol, psychotropic drugs, or other CNS depressants. Prolonged use of meprobamate may produce dependence. Meprobamate crosses the placenta and is distributed in breast milk. Be aware that the safety and efficacy of meprobamate have not been established in children younger than 6 yr. In elderly patients, there is an increased risk of CNS toxicity, manifested as confusion, hallucinations, mental depression, and sedation. Agerelated renal impairment may require a decreased dosage in elderly patients. This drug can be highly sedating in the elderly.

Complete blood count (CBC), renal function tests, BUN, serum creatinine, liver function tests should be monitored.

Dizziness and drowsiness are expected side effects with meprobamate. Avoid alcohol and sudden changes in posture to help prevent hypotensive effects. Evaluate the patient's tolerance to stress while on therapy. Psychologic and physical dependence may occur with chronic administration.

#### Storage

Store at room temperature. Administration

May give without regard to meals. Give last dose at bedtime. Avoid abrupt discontinuation after prolonged use of meprobamate, as dependence with long term use is common.

Meropenem mear-ro-pen'em

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Anti-infective, carbapenem

#### MECHANISM OF ACTION

A carbapenem that binds to penicillin-binding proteins and inhibits bacterial cell wall synthesis. Active against most gram-positive and gram-negative bacteria, including *E. coli*, *P. aeruginosa*, and methicillinsensitive *S. aureus. Therapeutic Effect:* Produces bacterial cell death in most susceptible organisms.

### PHARMACOKINETICS

After IV administration, widely distributed into tissues and body fluids, including cerebrospinal fluid (CSF). Protein binding: 2%. Primarily excreted unchanged in urine. High urinary concentrations maintained for up to 5 h after a dose. Removed by hemodialysis. *Half-life*: 1 h.

## AVAILABILITY

Powder for Injection: 500 mg, 1 g.

#### INDICATIONS AND DOSAGES > Skin, skin-structure, and intraabdominal infections IV

Adults, Elderly. 0.5-1 g q8h. Children 3 mo and older: 10-20 mg/ kg/dose q8h. Children younger than 3 mo. 10-20 mg/kg/dose q8-12h. Manimits and concurrent

#### Meningitis and concurrent bacteremia IV

Adults, Elderly. Children weighing 50 kg or more. 2 g q8h. Children 3 mo and older weighing < 50 kg. 40 mg/kg q8h. Maximum: 2 g/dose.

Dosage in renal impairment
 Dosage and frequency are
 modified based on creatinine
 clearance.

Creatinine Clearance (mL/min)	Dosage Interval
26-49	Recommended dose q12h
10-25	½ of recommended dose q12h
< 10	½ of recommended dose q24h

# **OFF-LABEL USES**

Lower respiratory tract infections (pneumonia), febrile neutropenia, gynecologic and obstetric infections, sepsis.

# CONTRAINDICATIONS

Hypersensitivity to the drug or other carbapenems; use caution in patients with immediate hypersensitivity to other  $\beta$ -lactams.

## INTERACTIONS

#### Drug

**Probenecid:** Reduces renal excretion of meropenem.

## Valproic acid or divalproex:

Carbapenems reported to lower valproic acid levels; monitor.

#### Herbal

None known.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels. May decrease blood hematocrit and hemoglobin levels and serum potassium levels.

# IV INCOMPATIBILITIES

According to manufacturer, do not mix with or add to solutions containing other drugs. Acyclovir (Zovirax), amphotericin B (Fungizone), diazepam (Valium), doxycycline (Vibramycin), metronidazole (Flagyl), ondansetron (Zofran), quinupristin-dalfopristin (Synercid).

# **IV COMPATIBILITIES**

Dobutamine (Dobutrex), dopamine (Intropin), heparin, magnesium.

# SIDE EFFECTS

Frequent (3%-5%)

Diarrhea, nausea, vomiting, headache, inflammation at injection site.

### Occasional (2%)

Oral candidiasis, rash, pruritus. Rare (< 2%) Constipation, glossitis.

# SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may occur.

• Anaphylactic reactions have been reported.

• Seizures may occur in those with CNS disorders (including brain lesions and a history of seizures), bacterial meningitis, or impaired renal function.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with CNS disorders (particularly a history of seizures); hypersensitivity to cephalosporins, penicillins, or other  $\beta$ -lactams; and renal function impairment. Assess penicillin and cephalosporin sensitivity before dosing. Be aware that it is unknown whether meropenem is distributed in breast milk; caution is warranted in lactation. Be aware that the safety and efficacy of meropenem have not been established in children younger than 3 mo. In elderly patients, age-related renal impairment may require dosage adjustment. Notify the physician if severe diarrhea occurs, but avoid taking antidiarrheals.

Notify the physician of the onset of troublesome or serious adverse reactions, including infusionsite pain, redness, or swelling, nausea or vomiting, or skin rash or itching. Electrolytes (especially potassium), intake and output, and renal function test results should be monitored. BP, temperature, and mental status should be monitored. Examine the patient periodically for opportunistic secondary infection. Report any oral soreness, lesions, or bleeding. Drug is to be administered only in a hospital or outpatient institutional setting.

#### Storage

Store vials at room temperature. After reconstitution with 0.9% NaCl, infusion is stable for 4 h at room temperature, 24 h if refrigerated (with D5W, stable for 1 h at room temperature, 4 h if refrigerated).

## Administration

Space drug doses evenly around the clock.

For IV use, reconstitute each 500 mg with 10 mL sterile water for injection to provide a concentration of 50 mg/mL. Shake to dissolve until clear. May further dilute with 100 mL 0.9% NaCl or D5W. Doses of 500 mg or 1 g may be given by intermittent IV bolus over 3-5 min. If diluted for IV infusion, final concentrations are usually 1-20 mg/mL. Give IV intermittent infusion (piggyback) over 15-30 min.

## Mesalamine/5 Aminosalicylic Acid (5-ASA)

mez-al'a-meen ▲ Apriso, Asacol, Asacol HD, Canasa, Lialda, Pentasa, Rowasa ▲ Asacol 800, Mesasal, Mezavant, Pentasa, Salofalk Do not confuse Asacol with Os-Cal.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Gastrointestinal anti-inflammatory, 5-amino-salicylate

### MECHANISM OF ACTION

A salicylic acid derivative that locally inhibits arachidonic acid metabolite production, which is increased in patients with chronic inflammatory bowel disease. *Therapeutic Effect:* Blocks prostaglandin production and diminishes inflammation in the colon.

### PHARMACOKINETICS

Poorly absorbed from the colon. Moderately absorbed from the GI tract. Metabolized in the liver to active metabolite. Unabsorbed portion eliminated in feces; absorbed portion excreted in urine. Unknown whether removed by hemodialysis. *Half-life*: 0.5-1.5 h; metabolite, 5-10 h.

#### AVAILABILITY

Tablets (Delayed Release [Asacol]): 400 mg. Tablets (Delayed Release [Asacol HD]): 800 mg. Tablets (Delayed Release [Lialda]): 1.2 g. Capsules (Controlled Release [Pentasa]): 250 mg, 500 mg. Rectal Suspension (Rowasa): 4 g/60 mL. Suppositories (Canasa): 1000 mg. Capsules (Extended Release [Apriso]): 0.375 g.

# INDICATIONS AND DOSAGES Ulcerative colitis,

proctosigmoiditis, proctitis PO (ASACOL) Adults, Elderly. 800 mg (2 times 400 mg tablets) 3 times a day for 6 wks. PO (ASACOL HD) Adults, Elderly. 1600 mg (2 times 800 mg) 3 times a day for 6 wks. PO (LIALDA) Adults, Elderly. 1.2 g OR 2.4 g once daily for up to 8 wks. PO (PENTASA) Adults, Elderly. 1 g 4 times a day for 8 wks. RECTAL (RETENTION ENEMA) Adults, Elderly. 60 mL (4 g) at bedtime; retain overnight (about 8 h); treat for 3-6 wks. RECTAL (SUPPOSITORY) Adults, Elderly. 1 suppository (500 mg) twice a day, retain 1-3 h; treat for 3-6 wks. Alternatively, 1 suppository (1000 mg) at bedtime. Maintenance of remission in ulcerative colitis PO (ASACOL)

Adults, Elderly. 800 mg (2 times 400 mg) twice daily or 400 mg 4 times a day. PO (PENTASA) Adults, Elderly. 1 g 4 times a day. PO (APRISO) Adults. 1.5 g PO once daily. PO (LIALDA) Adults, Elderly. 2.4 g once daily with meal.

# CONTRAINDICATIONS

Hypersensitivity to drug or other 5-aminosalicylates or salicylates.

#### INTERACTIONS Drug

Antacids: Do not administer Apriso capsules with antacids. Azathioprine, mercaptopurine:

May increase side effects of these antineoplastics. **Herbal** 

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

Mesalamine is generally well tolerated, with only mild and transient effects.

### Frequent (> 6%)

PO: Abdominal cramps or pain, diarrhea, dizziness, headache, nausea, vomiting, rhinitis, unusual fatigue. Rectal: Abdominal or stomach cramps, flatulence, headache, nausea.

# Occasional (2%-6%)

PO: Hair loss, decreased appetite, back or joint pain, flatulence, acne. Rectal: Hair loss.

Rare (< 2%)

Rectal: Anal irritation.

# SERIOUS REACTIONS

 Acute intolerance syndrome may occur in susceptible patients, manifested by cramping, headache, diarrhea, fever, rash, hives, itching, and wheezing. Discontinue drug immediately.

Hepatitis, pancreatitis, and pericarditis occur rarely with oral use.
Interstitial nephritis (rare).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with preexisting renal disease

and sulfasalazine sensitivity. It is unknown whether mesalamine crosses the placenta or is distributed in breast milk; caution is warranted in lactation. The Asacol HD product contains dibutyl phthalate, which may be harmful to a developing male fetus. The dibutyl phthalate is also excreted in human milk. Safety and efficacy of mesalamine have not been established in children. In elderly patients, age-related renal impairment may require cautious use. Avoid tasks that require mental alertness or motor skills until response to the drug has been established.

Be aware that mesalamine use may discolor urine yellow-brown; mesalamine suppositories stain fabrics. Adequate fluid intake should be maintained. Daily bowel activity and stool consistency and skin for rash should be assessed. Mesalamine should be discontinued if cramping, diarrhea, fever, or rash occurs. To avoid the possibility of pseudomembranous colitis developing, medical consultation is warranted before selecting an antibiotic for infection.

#### Storage

Store rectal suspension, suppositories, and oral forms at room temperature.

#### Administration

For tablet use, do not break; swallow whole. Take mesalamine without regard to food, with the exception of Lialdo, which is recommended to be taken with a meal. Extended- and delayed-release capsules should be swallowed whole.

For rectal use, shake bottle well. Lie on the left side with the lower leg extended, upper leg flexed forward, or assume the knee-chest position. Insert applicator tip into rectum, pointing toward umbilicus. Squeeze bottle steadily until contents are emptied. Retain the enema for as long as tolerable, preferably for a minimum of 8 h.

# Metaxalone

me-tax'a-lone 🗙 🐏 Skelaxin

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Muscle relaxant

## **MECHANISM OF ACTION**

A central depressant whose exact mechanism is unknown. Many effects due to its central depressant actions. Has no direct effect on muscle contractions, the motor end plate, or the nerve fiber. *Therapeutic Effect:* Relieves pain or muscle spasms.

### PHARMACOKINETICS

PO route onset 1 h, peak 3 h, duration 4-6 h. Well absorbed from the GI tract. Metabolized in the liver. Excreted primarily in urine. *Half-life:* 9 h.

#### AVAILABILITY

Tablets: 400 mg, 800 mg (Skelaxin).

# INDICATIONS AND DOSAGES Muscle relaxant

PO

Adults, Elderly, Children older than 12 yr. 800 mg 3-4 times/day.

#### CONTRAINDICATIONS

Significantly impaired renal or hepatic function, history of druginduced hemolytic anemias or other anemias, history of hypersensitivity to metaxalone.

# INTERACTIONS

## Drug

Alcohol, central nervous system (CNS) depressionproducing medications, tricyclic antidepressants: May increase CNS depression. Herbal None known.

Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May give false-positive Benedict test.

# SIDE EFFECTS

#### Occasional

Drowsiness, headache, lightheadedness, dermatitis, nausea, vomiting, stomach cramps, dyspnea.

# SERIOUS REACTIONS

• Overdose may cause CNS depression, coma, shock, and respiratory depression.

- Hemolytic anemia (rare).
- · Jaundice.
- · Rare reports of anaphylaxis.

### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patient with impaired liver or renal function. It is unknown whether metaxalone crosses the placenta or is distributed in breast milk. Safety and efficacy of metaxalone have not been established in children younger than 12 yr. In elderly patients, there is an increased risk of CNS toxicity, manifested as confusion, hallucinations, mental depression, and sedation. Age-related renal impairment may require a decreased dosage in elderly patients. Alcohol as well as tasks that require mental alertness or motor skills should be avoided during therapy. Storage

Store at room temperature.

## Administration

Take metaxalone without regard to food.

# Metformin Hydrochloride

met-for'min high-droh-klor'ide
▲ Fortamet, Glucophage,
Glucophage XL, Glumetza, Riomet
▲ Glucophage, Glucophage XR,
Glycon, Glumetza
Do not confuse metformin with metronidazole.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antidiabetic agents, biguanide derivative, oral hypoglycemic

# **MECHANISM OF ACTION**

An antihyperglycemic that decreases hepatic production of glucose. Decreases absorption of glucose and improves insulin sensitivity. *Therapeutic Effect:* Improves glycemic control, stabilizes or decreases body weight, and improves lipid profile.

# PHARMACOKINETICS

Slowly, incompletely absorbed after oral administration. Food delays or decreases the extent of absorption. Protein binding: Negligible. Distributed primarily to intestinal mucosa and salivary glands. Primarily excreted unchanged in urine. Removed by hemodialysis. *Half-life*: 3-6 h.

# AVAILABILITY

Oral Solution (Riomet): 100 mg/mL. Tablets (Glucophage): 500 mg, 850 mg, 1000 mg.

Metformin Hydrochloride (Generic Name)

Tablets (Extended Release [Glucophage XL]): 500 mg, 750 mg. Tablets (Extended Release [Fortamet]): 500 mg, 1000 mg.

# INDICATIONS AND DOSAGES Diabetes mellitus type 2

PO (500-MG, 1000-MG TABLET) Adults, Elderly. Initially, 500 mg twice a day, with morning and evening meals. May increase in 500-mg increments every week in divided doses. May give twice a day up to 2000 mg/day (for example, 1000 mg twice a day [with morning and evening meals]). If 2500 mg/day is required, divide dose and give 3 times a day with meals. Maximum: 2500 mg/day. Children 10-16 yr. Initially, 500 mg twice a day. May increase by 500 mg/day at weekly intervals. Maximum: 2000 mg/day. PO (850-MG TABLET) Adults, Elderly. Initially, 850 mg/day, with morning meal. May increase dosage in 850-mg increments every other week, in divided doses. Maintenance: 850 mg twice a day, with morning and evening meals. Maximum: 2550 mg/day (850 mg 3 times a day). PO (EXTENDED-RELEASE TABLETS)

Adults, Elderly. Initially, 500 mg once a day. May increase by 500 mg/day at weekly intervals. Maximum: 2000 mg once a day.

## Conversion to once-daily extended-release formulation in patients currently taking conventional metformin

PO (EXTENDED RELEASE) Adults. May switch to same total daily dose, but give extended release once daily with evening meal. Increase in increments of 500 mg weekly if needed. Maximum for Glucophage XR and Glumetza is 2000 mg/day. Maximum Fortamet is 2500 mg/day. *Elderly, Debilitated Adults:* Avoid use if  $\geq$  80 yr unless normal renal function. Use lower maximum dose.

#### Adjunct to insulin therapy PO

*Adults, Elderly.* Initially, 500 mg/day. May increase by 500 mg at 7-day intervals. Maximum: 2500 mg/day (2000 mg/day for extended-release form).

## **OFF-LABEL USES**

Treatment of metabolic complications of AIDS, prediabetes, polycystic ovary syndrome.

# CONTRAINDICATIONS

Known hypersensitivity to metformin; renal dysfunction (e.g., as suggested by serum creatinine levels  $\geq 1.5 \text{ mg/mL}$ [males],  $\geq 1.4 \text{ mg/mL}$  [females] or abnormal CrCl < 60 mL/ min), which may also result from conditions such as cardiovascular collapse (shock), acute MI, and septicemia; acute or chronic metabolic acidosis; diabetic ketoacidosis, with or without coma. Diabetic ketoacidosis should be treated with insulin.

Temporarily discontinue in patients undergoing radiologic studies involving IV iodinated contrast because use may result in acute renal failure.

Contraindicated in use with dofetilide.

### INTERACTIONS Drug

Alcohol, amiloride, cimetidine, digoxin, furosemide, morphine, nifedipine, procainamide, quinidine, quinine, ranitidine,

#### 994 Metformin Hydrochloride

triamterene, trimethoprim, vancomycin: May increase metformin blood concentration. Dofetilide: Decreases excretion of dofetilide. Contraindicated. Furosemide, hypoglycemia-causing medications: May require a decrease in metformin dosage. Iodinated contrast studies: May cause acute renal failure and increased risk of lactic acidosis. Discontinue metformin before such tests and for 48 h after the procedure.

## Drugs eliminated by renal tubular secretion (e.g., adefovir, amiloride, cimetidine,

entecavir): May decrease metformin excretion.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Rarely causes vitamin  $B_{12}$  deficiency and resultant indices of megaloblastic anemia.

### SIDE EFFECTS

#### Occasional (> 3%)

GI disturbances (including diarrhea, nausea, vomiting, abdominal bloating, flatulence, and anorexia) that are transient and resolve spontaneously during therapy. Others include headache, weakness.

#### Rare (1%-3%)

Unpleasant or metallic taste that resolves spontaneously during therapy.

## SERIOUS REACTIONS

 Lactic acidosis occurs rarely but is a fatal complication in 50% of cases. Lactic acidosis is characterized by an increase in blood lactate levels (> 5 mmol/L), a decrease in blood pH, and electrolyte disturbances. Signs and symptoms of lactic acidosis include unexplained hyperventilation, myalgia, malaise, and somnolence, which may advance to cardiovascular collapse (shock), acute CHF, acute MI, and prerenal azotemia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with CHF, chronic respiratory difficulty, and uncontrolled hyperthyroidism or hypothyroidism, concurrent use of drugs that affect renal function, conditions that cause hyperglycemia or hypoglycemia or delay food absorption (such as diarrhea, high fever, malnutrition, gastroparesis, and vomiting), and in elderly patients, debilitated, or malnourished with renal impairment. Caution should also be used in those who consume excessive amounts of alcohol; alcohol should be avoided during therapy. Insulin is the drug of choice during pregnancy. Metformin is distributed in breast milk in animals. Safety and efficacy of metformin have not been established in children. In elderly patients, age-related renal impairment or peripheral vascular disease may require dosage adjustment or discontinuation of drug; in general, do not titrate up to adult maximum doses.

Notify the physician of diarrhea, easy bleeding or bruising, change in color of stool or urine, headache, nausea, persistent rash, and vomiting. Hemoglobin and hematocrit, RBC count, and serum creatinine level should be obtained before beginning metformin therapy and annually thereafter. Food intake, blood glucose level, glycosylated hemoglobin, folic acid level, and renal function should also be monitored. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting), especially in persons also taking oral sulfonylureas; carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

Notify the physician immediately if any of the following symptoms occur, evidencing lactic acidosis: myalgia, respiratory distress, weakness, diarrhea, malaise, muscle cramps, somnolence. Surgical procedures may warrant stopping metformin therapy or adjustment in dose.

#### Storage

Store at room temperature. Administration

! Expect to withhold metformin in patients with conditions that may predispose to lactic acidosis, such as dehydration, hypoperfusion, hypoxemia, and sepsis, radiographic tests using contrast.

Take metformin orally with meals. Do not crush film-coated tablets or extended-release tablets. Once-daily extended-release tablets usually given with evening meal and with a full glass of water. Shake oral suspension well before each use.

## Methadone Hydrochloride

meth'a-done high-droh-klor'ide ★ Diskets, Dolophine, Methadone Intensol, Methadose ▲ Metadol

Do not confuse methadone with Metadate, methylphenidate, or Mephyton.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II For opiate dependence, must comply with Narcotic Addict Treatment Act (NATA) [21USC 823(g)].

*Classification:* Analgesics, narcotic, opiate agonist, synthetic

### MECHANISM OF ACTION

An opioid agonist that binds with opioid receptors in the central nervous system (CNS). *Therapeutic Effect:* Alters the perception of and emotional response to pain; reduces withdrawal symptoms from other opioid drugs.

# PHARMACOKINETICS

Route	Peak
Oral	6-8 h
IM	4-5 h
IV	15-30 min

Well absorbed after IM injection. Protein binding: 80%-85%. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 8-59 h.

### AVAILABILITY

Oral Concentrate (Methadone Intensol, Methadose): 10 mg/mL.

Methadone Hydrochloride (Generic Name)

#### 996 Methadone Hydrochloride

Oral Solution: 5 mg/5 mL, 10 mg/5 mL. Tablets (Dolophine, Methadose): 5 mg, 10 mg. Tablets (Dispersible [Diskets, Methadose]): 40 mg. Injection (Dolophine): 10 mg/mL.

# INDICATIONS AND DOSAGES

Analgesia

PO, IV, IM, SC *Adults.* 2.5-10 mg q3-8h as needed up to 5-20 mg q6-8h. *Elderly.* 2.5 mg q8-12h. **Detoxification** 

#### Detoxification

PO

Adults, Elderly. 15-40 mg/day. For patients preferring a brief course of stabilization followed by medically supervised withdrawal, it is generally recommended that the patient be titrated to a total daily dose of about 40 mg in divided doses to achieve an adequate stabilizing level. Continue stabilization for 2-3 days, after which the dose of methadone should be gradually decreased. The rate at which methadone is decreased is chosen individually. Can decrease daily or at 2-day intervals, but the intake should remain sufficient to keep withdrawal symptoms tolerable. In hospitalized patients, a daily reduction of 20% of the total daily dose may be tolerated. In ambulatory patients, a slower schedule may be needed (e.g., 10% reduction every 10-14 days).

## Maintenance treatment of opiate dependence in opiate-tolerant patients

PO Adults, Elderly. 20-120 mg/day. Dosed initially at 20-40 mg/day if opiate tolerant; reduce initial dose by 50% if little or no tolerance. Additional doses of 10 mg given as needed for distressing symptoms related to abstinence. Daily doses > 120 mg need to be justified in the medical record. Continue maintenance as long as benefit is derived.

#### CONTRAINDICATIONS

Hypersensitivity to methadone, respiratory depression in absence of monitored setting, acute bronchial asthma, hypercarbia, paralytic ileus.

#### INTERACTIONS

#### Drug

Alcohol, narcotics, sedativehypnotics, skeletal muscle relaxants, benzodiazepines, other CNS depressants: May increase CNS or respiratory depression and hypotension.

Anticholinergics: Increased effects of anticholinergics.

**CYP3A4 or CYP2D6 inducers:** May decrease methadone effect or precipitate withdrawal.

**CYP3A4 or CYP2D6 inhibitors:** May increase methadone concentrations.

**MAOIs:** May produce a severe, sometimes fatal reaction; expect to begin methadone at smaller incremental doses.

**Nevirapine, efavirenz, ritonavir:** May decrease methadone concentrations.

Medications proloning the QT intervals (e.g., class I and class III antiarrhythmics, others): Possible additive effect on QT interval. Herbal

Valerian: May increase CNS depression.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase levels.

#### SIDE EFFECTS

#### Frequent

Sedation, decreased BP (including orthostatic hypotension), diaphoresis, facial flushing, constipation, dizziness, nausea, vomiting.

## Occasional

Confusion, urine retention, palpitations, abdominal cramps, visual changes, dry mouth, headache, decreased appetite, anxiety, insomnia.

## Rare

Allergic reaction (rash, pruritus).

#### SERIOUS REACTIONS

 Overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma. The antidote is naloxone.

• The patient who uses methadone long-term may develop a tolerance to the drug's analgesic effect and physical dependence.

• Potential for QT prolongation and ECG changes.

### **PRECAUTIONS & CONSIDERATIONS**

! Methadone may only be dispensed by registered opioid treatment programs or their agents when used for narcotic addiction. Documentation of proper enrollment must be maintained.

! Methadone will accumulate over time. Peak respiratory depressant effects typically occur later, and persist longer, than peak analgesic effects. These characteristics can contribute to cases of iatrogenic overdose, particularly during initial dose titration. Dose adjustments should be made cautiously.

Caution is warranted with acute abdominal conditions, cor

pulmonale, history of seizures, impaired hepatic or renal function, increased intracranial pressure, respiratory abnormalities, supraventricular tachycardia, and in debilitated or elderly patients. Methadone crosses the placenta and is distributed in breast milk. Regular use of opioids during pregnancy may produce withdrawal symptoms in the neonate, such as diarrhea, excessive crying, fever, hyperactive reflexes, irritability, seizures, sneezing, tremors, vomiting, and yawning. The neonate may develop respiratory depression if the mother receives methadone during labor. Children are more prone to experience paradoxical excitement. Children younger than 2 yr and elderly patients are more susceptible to the drug's respiratory depressant effects. Age-related renal impairment may increase the risk of urine retention in elderly patients.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. Vital signs should be monitored for 15-30 min after an IM or SC dose and for 5-10 min after an IV dose. Clinical improvement should be monitored. The drug should be withheld and the physician should be notified if the respiratory rate is 12 breaths/min or less in an adult or 20 breaths/min or less in a child. Psychologic and physical dependence may occur with chronic administration.

Patients in the methadone maintenance program should not receive additional opioids or other controlled substances without a consultation.

#### Storage

Store all dosage forms at room temperature. Keep dispersible tablets tightly closed.

#### Administration

Know that oral methadone is one-half as potent as parenteral methadone. Take methadone without regard to food. Dilute the concentrate in 3-4 oz of water or citrus fruit juice to prevent an anesthetic effect on mucous membranes.

Dispersible tablets are placed in 3-4 oz of water, orange juice, citrus Tang, or citrus-flavored Kool-Aid and allowed to disperse (1 min). Drink entire dose after stirring well.

! Be aware that the IM route is preferred over the subcutaneous route because the subcutaneous route may produce induration, local irritation, and pain. Do not use the solution if it appears cloudy or contains a precipitate. Place the patient in the recumbent position before giving parenteral methadone. Inject the drug slowly.

# **Methazolamide**

meth-ah-zole'ah-mide ★ Neptazane **Do not confuse Neptazane with** nefazodone.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Diuretics, antiglaucoma agents, carbonic anhydrase inhibitors

## **MECHANISM OF ACTION**

A noncompetitive inhibitor of carbonic anhydrase that inhibits the enzyme at the luminal border of cells of the proximal tubule. Increases urine volume and changes to an alkaline pH with subsequent decreases in the excretion of titratable acid and ammonia. *Therapeutic Effect:* Produces a diuretic and antiglaucoma effect.

## PHARMACOKINETICS

PO route onset 2-4 h, peak 6-8 h, duration 10-18 h. Well absorbed slowly from the GI tract. Protein binding: 55%. Distributed into the tissues (including CSF). Metabolized slowly from the GI tract. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 14 h.

#### AVAILABILITY

Tablets: 25 mg, 50 mg.

# INDICATIONS AND DOSAGES Glaucoma

PO Adults, Elderly. 50-100 mg/day 2-3 times/day.

### **OFF-LABEL USES**

Prevention of altitude sickness, treatment of essential tremor.

## CONTRAINDICATIONS

Hypersensitivity to methazolamide, severe kidney or liver disease, failure of adrenal glands, hyperchloremic acidosis.

## INTERACTIONS

#### Drug

Amphetamines, quinidine, procainamide, methenamine, phenobarbital, salicylates (high doses): May increase the excretion of these drugs.

Methazolamide (Generic Name)

#### Aspirin and other salicylates

(high doses): May increase the risk for anorexia, tachypnea, lethargy, coma, and death (reported with high dose aspirin treatment).

**Corticosteroids (systemic use), diuretics:** May cause hypokalemia. **Lithium:** May increase the excretion

of lithium.

**Memantine:** May decrease the clearance of memantine.

**Steroids:** May increase the risk of hypokalemia.

**Topiramate:** May increase the risk of nephrolithiasis.

## Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Monitor complete blood count for blood dyscrasias. May cause decreased serum potassium.

### SIDE EFFECTS

#### Occasional

Paresthesias, hearing dysfunction or tinnitus, fatigue, malaise, loss of appetite, taste alteration, nausea, vomiting, diarrhea, polyuria, drowsiness, confusion, hypokalemia.

#### Rare

Metabolic acidosis, electrolyte imbalance, transient myopia, urticaria, melena, hematuria, glycosuria, hepatic insufficiency, flaccid paralysis, photosensitivity, convulsions, and rarely crystalluria, renal calculi.

### SERIOUS REACTIONS

 Malaise and complaints of tiredness and myalgia are signs of excessive dosing and acidosis in elderly patients.  Stevens-Johnson syndrome, toxic epidermal necrolysis, fulminant hepatic necrosis, agranulocytosis, aplastic anemia, and other blood dyscrasias have been reported and have caused fatalities.

· Nephrolithiasis.

# **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with allergies to sulfonamides, sulfonylureas, carbonic anhydrase inhibitors, thiazides, and loop diuretics (except ethacrynic acid) because of a risk of cross-reaction. Anorexia, tachypnea, lethargy, coma, and death have been reported with concomitant use of high-dose aspirin and methazolamide. Caution is also warranted with COPD, respiratory acidosis, diabetes mellitus, a history of nephrolithiasis, or mental impairment. It is unknown whether methazolamide crosses the placenta and is excreted in breast milk. Safety and efficacy of this drug have not been established in children. Elderly patients may be at an increased risk for developing hypokalemia.

Hypokalemia may result in cardiac arrhythmias, changes in mental status and muscle strength, muscle cramps, and tremor. In patients with cirrhosis or serious hepatic insufficiency, hepatic coma may be precipitated. Potassium should be assessed before and during treatment. Frequency and volume of urination are expected to increase.

#### Storage

Store tablets at room temperature. Administration

Take methazolamide with food to avoid GI upset. Maintain adequate hydration.

# **Methenamine**

★ Hiprex, Urex 🌺 Mandelamine

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anti-infectives, urinary

## **MECHANISM OF ACTION**

A hippuric acid salt that hydrolyzes to formaldehyde and ammonia in acidic urine. *Therapeutic Effect:* Formaldehyde has antibacterial action. Bactericidal.

# PHARMACOKINETICS

Readily absorbed from the GI tract. Partially metabolized by hydrolysis (unless protected by enteric coating) and partially by the liver. Primarily excreted in urine. *Half-life:* 3-6 h.

# AVAILABILITY

Tablets, as Hippurate: 1 g (Urex, Hiprex). Tablets, as Mandelate: 500 mg, 1 g.

# INDICATIONS AND DOSAGES

#### Suppressive therapy for frequently recurring urinary tract infection (UTI) PO

*Adults, Elderly.* 1 g 2 times/day (as hippurate). *Children 6-12 yr.* 25-50 mg/kg/day q12h (as hippurate).

# **OFF-LABEL USES**

Hyperhidrosis.

# CONTRAINDICATIONS

Moderate to severe renal impairment, hepatic impairment (hippurate salt), tartrazine sensitivity (Hiprex contains tartrazine), hypersensitivity to methenamine or any of its components.

# INTERACTIONS

#### Drug

Acetazolamide, antacids, methazolamide, sodium

**bicarbonate:** May decrease effect secondary to alkalinization of urine. **Dichlorphenamide:** May inhibit the action of methenamine to alkalinize the urine.

**Sulfonamides:** May increase the risk of crystalluria. Avoid.

Herbal None known. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

Formaldehyde, the active form of methenamine, interferes with fluorometric procedures for the determination of urinary catecholamines and vanillylmandelic acid (VMA), causing false high results.

## SIDE EFFECTS

#### Occasional

Rash, nausea, dyspepsia, difficulty urinating.

Rare

Bladder irritation, increased liver enzymes.

## SERIOUS REACTIONS

• Crystalluria can occur when there is low urinary output.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with hepatic impairment. It is unknown whether methenamine crosses the placenta or is excreted in breast milk; caution is warranted in lactation. No age-related precautions have been noted in children older than 6 yr of age. Avoid using in elderly patients with age-related renal impairment. Antacids should be avoided. Sun and ultraviolet

Methenamine (Generic Name)

light should be avoided. If it is not avoidable, sunscreens and protective clothing should be worn. Urine pH should be monitored.

#### Storage

Store at room temperature. Administration

Take methenamine with food or milk to reduce GI upset. Usually taken with cranberry juice or ascorbic acid to acidify urine. Maintain adequate hydration. Not to be used as primary treatment of UTI.

# **Methimazole**

meth-im'a-zole Tapazole Do not confuse methimazole with metolazone.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Thyroid hormone antagonist

# **MECHANISM OF ACTION**

A thiomidazole derivative that inhibits synthesis of thyroid hormone by interfering with the incorporation of iodine into tyrosyl residues. *Therapeutic Effect:* Effectively treats hyperthyroidism by decreasing thyroid hormone levels.

# PHARMACOKINETICS

High bioavailability in oral administration (80%-95%). Excreted in breast milk. High transplacental passage. Not bound to plasma proteins. Rapidly metabolized; < 10% eliminated in urine. *Half-life:* 6-13 h.

# AVAILABILITY

Tablets: 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Hyperthyroidism PO

Adults, Elderly. Initially, 15-60 mg/day in 3 divided doses. Maintenance: 5-15 mg/day in 3 divided doses. Generally avoid doses > 40 mg/day because of increased risk of blood dyscrasias. *Children*. Initially, 0.4 mg/kg/day in 3 divided doses. Maintenance: Half the initial dose, or alternately: 0.5-0.7 mg/kg/day in 3 divided doses initially and half the initial dose for maintenance.

# CONTRAINDICATIONS

Hypersensitivity to the drug (including drug-induced agranulocytosis); breastfeeding.

#### INTERACTIONS Drug

Anticholinergics and sympathomimetics: May increase cardiovascular side effects in uncontrolled patients.

Amiodarone, iodinated glycerol, iodine, potassium iodide: May decrease response to methimazole.  $\beta$ -Blockers: May increase effect and toxicity as patient becomes euthyroid.

**Central nervous system (CNS) depressants:** May have increased response to these drugs in uncontrolled patients.

**Digoxin:** May increase the blood concentration of digoxin as patient becomes euthyroid.

 $I^{131}$ : May decrease thyroid uptake of  $I^{131}$ .

**Oral anticoagulants:** May decrease the effects of oral anticoagulants.

**Theophylline:** May alter theophylline clearance in hyperthyroid or hypothyroid patients.

Methimazole (Generic Name)

#### 1002 Methocarbamol

Vasoconstrictors: Uncontrolled hypothyroid patients are at higher risk when using methimazole. Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase LDH, serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels and prothrombin time. May decrease prothrombin level and WBC count.

# SIDE EFFECTS

#### Frequent (4%-5%)

Fever, rash, pruritus. Occasional (1%-3%)

Dizziness, loss of taste, nausea, vomiting, stomach pain, peripheral neuropathy or numbness in fingers, toes, face.

#### Rare (<1%)

Swollen lymph nodes or salivary glands.

# SERIOUS REACTIONS

 Agranulocytosis as long as 4 mo after therapy, pancytopenia, aplastic anemia, and hepatitis have occurred.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with concurrent use of other agranulocytosis-inducing drugs, impaired hepatic function, and in persons older than 40 yr. Methimazole is excreted in breast milk and should be avoided during breastfeeding. Methimazole is not the agent of choice in pregnancy because it crosses the placenta. Uncontrolled hyperthyroid patients should not engage in any surgical procedures until blood levels are established.

Notify the physician of illness, unusual bleeding or bruising, sore throat, burning, fever, infection, jaundice, or rash. Weight, pulse, CBC, prothrombin time, thyroid function, and serum hepatic enzymes should be monitored. Overdose is evidenced by nausea, vomiting, epigastric distress, headache, fever, arthralgia, pruritis, edema, pancytopenia, agranulocytosis, exfoliative dermatitis, hepatitis, neuropathies, CNS stimulation, or depression. Drug may cause drowsiness; driving or performing tasks requiring mental alertness should be avoided until the effects of the drug are known.

#### Storage

Store at room temperature in a lightresistant container.

#### Administration

Take with food if GI symptoms occur. Space doses evenly around the clock.

# Methocarbamol

meth-oh-kar'ba-mole

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Skeletal muscle relaxant

# **MECHANISM OF ACTION**

A carbamate derivative of guaifenesin that causes skeletal muscle relaxation by general central nervous system (CNS) depression. *Therapeutic Effect:* Relieves muscle spasticity.

#### PHARMACOKINETICS

Rapidly and almost completely absorbed from the GI tract. Protein binding: 46%-50%. Metabolized in liver by dealkylation and hydroxylation. Primarily excreted in urine as metabolites. *Half-life*: 1-2 h.

Methocarbamol (Generic Name)

# AVAILABILITY

Injection: 100 mg/mL (Robaxin). Tablets: 325 mg, 500 mg (Robaxin), 750 mg.

# INDICATIONS AND DOSAGES Musculoskeletal spasm

IM/IV

*Adults, Children 16 yr and older.* 1 g q8h for no more than 3 consecutive days. May repeat course of therapy after a drug-free interval of 48 h.

#### PO

Adults, Children 16 yr and older. 1.5 g 4 times/day for 2-3 days (up to 8 g/day may be given in severe conditions). Decrease to 4 g/day in 3-6 divided doses.

*Elderly.* Initially, 500 mg 4 times a day. May gradually increase dosage.

#### Tetanus spasm

IV, FOLLOWED BY NASOGASTRIC ADMINISTRATION OF ORAL TABLETS

*Adults.* 1-3 g q6h until oral dosing is possible. Injection should be used no more than 3 consecutive days. Oral dosage in tetanus can require up to 24 g/day in divided doses q6h.

*Children.* 15 mg/kg/dose or 500 mg/m<sup>2</sup>/dose q6h as needed. Maximum: 1.8 g/m<sup>2</sup>/day for 3 days only.

# CONTRAINDICATIONS

Hypersensitivity to methocarbamol or any component of the formulation, renal impairment (injection formulation).

#### INTERACTIONS

#### Drug

CNS depressants, including alcohol, narcotics, sedativehypnotics: May potentiate effects when used with other CNS depressants, including alcohol. Herbal Gotu kola, kava kava, St. John's wort: May increase CNS depression. Food

F000

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Transient drowsiness, weakness, dizziness, light-headedness, nausea, vomiting.

#### Occasional

Headache, constipation, anorexia, hypotension, confusion, blurred vision, vertigo, facial flushing, rash.

#### Rare

Paradoxical CNS excitement and restlessness, slurred speech, tremor, dry mouth, diarrhea, nocturia, impotence, bradycardia, hypotension, syncope.

# SERIOUS REACTIONS

• Anaphylactoid reactions, leukopenia, and seizures (IV form) have been reported.

• Methocarbamol overdosage results in cardiac arrhythmias, nausea, vomiting, drowsiness, and coma.

#### PRECAUTIONS & CONSIDERATIONS

Caution is necessary in patients with oral formulation with renal or hepatic impairment. Due to polyethylene glycol 300, NF in injection, do not use injection in renal impairment. Use injectable formulation cautiously in patients with a history of seizures or hepatic impairment. It is unknown whether methocarbamol crosses the

#### 1004 Methotrexate Sodium

placenta or is distributed in breast milk. Be aware that the safety and efficacy of methocarbamol have not been established in children younger than 16 yr. In elderly patients, there is an increased risk of CNS toxicity, manifested as confusion, hallucinations, mental depression, and sedation.

Age-related renal impairment may necessitate a decreased dosage in elderly patients. Symptoms of overdosage indicated as arrhythmia, nausea, vomiting, drowsiness, and coma should be reported immediately.

#### Storage

Store tablets and unopened vials at room temperature.

#### Administration

Maximum of 5 mL can be administered into each gluteal region with IM injection.

! Take care with IV use because pain and sloughing may occur.

IV injection may be administered undiluted as a direct IV bolus at a maximum rate of 3 mL/min. Solution is hypertonic. May dilute 1 g of methocarbamol to no more than 250 mL with 0.9% NaCl or dextrose 5% injection. Do not use for more than 3 consecutive days. Except in tetanus, total parenteral dosage will not exceed 3 vials (30 mL) a day by any route. Administer IV while in recumbent position. Maintain position for 15-30 min following infusion. Give oral formulation without regard to meals. Tablets may be

crushed and mixed with food or liquid if needed. May crush tablets and give by nasogastric (NG) tube if necessary (often necessary in tetanus treatment).

#### Methotrexate Sodium

meth-oh-trex'ate soe'dee-um
Rheumatrex, Trexall,
Apo-Methotrexate, Metoject
Do not confuse Trexall with
Trexan.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Antineoplastic, disease-modifying antirheumatic drug (DMARD), folic acid antagonist

#### MECHANISM OF ACTION

An antimetabolite that competes with enzymes necessary to reduce folic acid to tetrahydrofolic acid, a component essential to DNA, RNA, and protein synthesis. This action inhibits DNA, RNA, and protein synthesis. The drug can inhibit replication and function of T and B lymphocytes and can suppress the secretion of interleukin-1, interferon-gamma, and tumor necrosis factor; increase the secretion of interleukin-4; impair the release of histamine from basophils; and decrease chemotaxis of neutrophils. Therapeutic Effect: Causes death of cancer cells. In psoriasis, reduces plaque and improves joint symptoms. In inflammatory arthritis, slows progression of joint destruction.

#### PHARMACOKINETICS

Variably absorbed from the GI tract. Completely absorbed after IM administration. Protein binding: 50%-60%. Widely distributed. Metabolized intracellularly in the liver. Excreted primarily in urine. Removed by hemodialysis but not by

Methotrexate Sodium (Generic Name)

peritoneal dialysis. *Half-life:* 8-12 h (large doses, 8-15 h).

# AVAILABILITY

Tablets: 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg. Injection Solution: 25 mg/mL. Injection, Lyophilized Powder: 1g.

# INDICATIONS AND DOSAGES

Head and neck cancer
 PO, IV, IM
 Adults, Elderly. 25-50 mg/m<sup>2</sup> once weekly.

# Choriocarcinoma, chorioadenoma destruens, hydatidiform mole, trophoblastic neoplasms

PO, IM Adults, Elderly. 15-30 mg/day for 5 days; repeat 3-5 times with 1-2 wks between courses.

### Breast cancer

IV

Adults, Elderly. 30-60 mg/m<sup>2</sup> days 1 and 8 q3-4wk.

# ALL

PO, IV, IM Adults, Elderly. Induction: 3.3 mg/m<sup>2</sup>/day in combination with other chemotherapeutic agents. Maintenance: 30 mg/m<sup>2</sup>/wk PO or IM in divided doses or 2.5 mg/kg

#### IV every 14 days. • Burkitt's lymphoma

PO

*Adults.* 10-25 mg/day for 4-8 days; repeat with 7- to 10-day rest between courses.

# Lymphosarcoma

PO

Adults, Elderly. 0.625-2.5 mg/kg/ day.

#### Mycosis fungoides PO

*Adults, Elderly.* 5-50 mg once weekly or 15-37.5 mg twice weekly.

Rheumatoid arthritis PO *Adults, Elderly.* 7.5 mg once a wk or 2.5 mg q12h for 3 doses once a wk. Maximum: 20 mg/wk.

# • Juvenile rheumatoid arthritis PO

*Children.* The recommended starting dose is 10 mg/m<sup>2</sup> given once weekly.

#### Psoriasis

# PO

*Adults, Elderly.* 10-25 mg once a wk or 2.5-5 mg q12h for 3 doses once a wk.

IM

Adults, Elderly. 10-25 mg once a wk.

# Antineoplastic dosage for children

PO, IM Children. 7.5-30 mg/m<sup>2</sup>/wk or q2wk.

#### Dosage in renal impairment

Creatinine clearance 61-80 mL/min. Reduce dose by 25%.

Creatinine clearance 51-60 mL/min. Reduce dose by 33%.

Creatinine clearance 10-50 mL/min. Reduce dose by 50%-70%.

 Other dosage adjustments Expect therapy interruption for any more severe GI, oral, blood or other toxicity.

# CONTRAINDICATIONS

Contraindicated in nursing mothers and those with hypersensitivity to the drug. In patients with psoriasis or rheumatoid arthritis also contraindicated if pregnant, alcoholic, or have alcoholic liver disease, chronic liver disease, immunodeficiency syndromes, or preexisting blood dyscrasias.

# INTERACTIONS

#### Drug

Amoxicillin, tetracycline, doxycycline: Suspected increase in methotrexate toxicity.

#### Aspirin, alcohol, NSAIDs:

Increased toxicity of methotrexate, especially with high dose regimens. **Cyclosporine:** Increased levels of both, increased toxicity.

**Proton-pump inhibitors (PPIs; e.g., omeprazole):** Possible increased risk of methotrexate toxicity.

Sulfonamides, co-trimoxazole, trimethoprim: Increased hematologic toxicity.

Herbal

Unknown.

#### Food

Carbonated beverages (e.g., colas): If consumed in large quantities, possible increased risk of methotrexate toxicity.

# IV INCOMPATIBILITIES

Amiodarone, amphotericin B, caspofungin (Cancidas), diazepam, diltiazem, dopamine, droperidol, gentamicin, idarubicin, levofloxacin (Levaquin), midazolam, nicardipine, phenytoin, propofol, quinupristindalfopristin (Synercid), TPN.

# SIDE EFFECTS

#### Frequent

Nausea, vomiting, stomatitis; burning and erythema at psoriatic site (in patients with psoriasis), photosensitivity.

#### Occasional

Diarrhea, rash, dermatitis, pruritus, alopecia, dizziness, anorexia, malaise, headache, drowsiness, blurred vision.

#### SERIOUS REACTIONS

• GI toxicity may produce gingivitis, glossitis, pharyngitis, stomatitis, enteritis, and hematemesis.

 Hepatotoxicity is more likely to occur with frequent small doses than with large intermittent doses.

• Pulmonary toxicity may be characterized by interstitial pneumonitis.

 Hematologic toxicity, which may develop rapidly from marked myelosuppression, may be manifested as leukopenia, thrombocytopenia, anemia, and hemorrhage. Patients are then immunosuppressed, and susceptible to potentially serious infection risk, including opportunistic infection.

 Dermatologic toxicity may produce a rash, pruritus, urticaria, pigmentation, photosensitivity, petechiae, ecchymosis, and pustules.

• Severe nephrotoxicity may produce azotemia, hematuria, and renal failure.

#### **PRECAUTIONS & CONSIDERATIONS**

Methotrexate has been reported to cause fetal death and/or congenital anomalies. Therefore, it is not recommended for women of childbearing potential unless there is clear medical evidence that the benefits can be expected to outweigh the considered risks. Pregnancy should be avoided if either partner is receiving methotrexrate; during and for a minimum of 3 mo after therapy for males, and during and for a least 1 ovulatory cycle after therapy for females. Women on methotrexate should not breastfeed their infants. Use with caution in patients with renal or hepatic impairment, ascites, pleural effusions, debility, peptic ulcer disease, ulcerative colitis, active infection. Baseline assessment should include a complete blood count with differential and platelet counts, hepatic enzymes, renal function tests, and a chest x-ray. Maintain adequate hydration. During therapy of rheumatoid arthritis and psoriasis, monitor CBC at least monthly, renal function and LFTs every 1-2 mo. More frequent monitoring is indicated during antineoplastic therapy.

#### Storage

Store tablets and injectable at room temperature. Injection solution diluted for administration in D5W or NS is stable for up to 24 h at room temperature.

#### Administration

CAUTION: Observe usual cautions for handling, preparing, administering, and disposing of parenteral cytotoxic drugs. Formulations containing preservatives must not be used for intrathecal or high-dose therapy. May be administered IV as slow push, short bolus infusion, or 24to 42-h continuous infusion. See manufacturer's recommendations for appropriate solutions and volumes. For oral use, always check dosage against indication for use. Dosages for ambulatory conditions, such as rheumatoid arthritis, are usually once weekly and do not exceed 20-30 mg/ wk maximum in adults. Medication errors that occur can be fatal or cause significant morbidity.

### Methscopolamine Bromide

meth-scoe-pol'a-meen bro'myde Pamine, Pamine Forte

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticholinergics, gastrointestinals

# **MECHANISM OF ACTION**

A peripheral anticholinergic agent that has limited ability to cross the blood-brain barrier and provides a peripheral blockade of muscarinic receptors. *Therapeutic Effect:* Reduces the volume and the total acid content of gastric secretions, inhibits salivation, and reduces Gl motility. The drug has not been shown to be effective at healing peptic ulcers, reducing their recurrence, or preventing complications.

#### PHARMACOKINETICS

Poorly and unreliably absorbed from the GI tract. Limited ability to cross the blood-brain barrier. Excreted primarily in the urine and the bile. The effects of methscopolamine appear to occur within 1 h and last for 4-6 h. Primarily excreted in urine. *Half-life:* Unknown.

#### AVAILABILITY

*Tablets:* 2.5 mg (Pamine), 5 mg (Pamine Forte).

# INDICATIONS AND DOSAGES Peptic ulcer (historical)

Adults, Elderly. Initially, 2.5 mg 30 min before meals and 2.5-5 mg at bedtime. Starting dose 12.5 mg/day is most effective. May increase dose by 5 mg every 12 h. Can start with 20 mg/day in 5-mg doses, each half an hour before meals and at bedtime in severe GI distress.

#### **OFF-LABEL USES**

Gastrointestinal spasm.

#### CONTRAINDICATIONS

Reflux esophagitis, glaucoma, obstructed uropathy, obstructed disease of the GI tract (pyloroduodenal stenosis), paralytic ileus, intestinal atony of elderly or debilitated individuals, unstable cardiovascular status in acute hemorrhage, severe ulcerative colitis, toxic megacolon, complicated ulcerative colitis, myasthenia gravis, hypersensitivity to methscopolamine, any component of the formulation, or related drugs.

Methscopolamine Bromide (Generic Name)

# INTERACTIONS

#### Drug

**Antacids:** May decrease absorption of methscopolamine.

Antipsychotic agents: May produce additive anticholinergic effects.

Tricyclic antidepressants, anticholinergics: May produce additive anticholinergic effects.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Dry mouth, throat, and nose, urinary hesitancy and/or retention, constipation, tachycardia, palpitations, headache, insomnia, dry skin, urticaria, weakness.

# SERIOUS REACTIONS

 Overdosage may vary from central nervous system (CNS) depression, including sedation, apnea, hypotension, cardiovascular collapse, or death to severe paradoxical reaction (such as hallucinations, tremor, and seizures).

# **PRECAUTIONS & CONSIDERATIONS**

Caution is necessary in patients with diarrhea because it may be an early symptom of incomplete intestinal obstruction. Large doses should be used cautiously because methscopolamine may suppress intestinal motility, causing paralytic ileus and precipitate, or aggravate toxic megacolon. Caution is also warranted in patients with autonomic neuropathy, benign prostatic hyperplasia, hyperthyroidism, ulcerative colitis, hepatic or renal dysfunction, arrhythmias, cardiovascular disease, congestive heart failure, hypertension, or in elderly patients. Elderly patients are at an increased risk of developing confusion, dizziness, hyperexcitability, hypotension, and sedation. It is unknown whether methscopolamine crosses the placenta or is excreted in breast milk; caution warranted in lactation. Anticholinergics may suppress lactation. Safety and efficacy have not been established in children.

Expected responses to the drug include dizziness, drowsiness, and dry mouth. Tasks that require mental alertness or motor skills should be avoided until the effects of the drug are known. Report any Gl bleeding.

#### Storage

Store at controlled room temperature. Administration

Take methscopolamine 30 min before meals and at bedtime.

# **Methsuximide**

meth-sux'i-mide Celontin Do not confuse with methoxsalen.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticonvulsants, succinimides

# **MECHANISM OF ACTION**

A succinimide anticonvulsant agent that increases the seizure threshold, suppresses paroxysmal spike-andwave pattern in absence seizures and depresses nerve transmission in the motor cortex. *Therapeutic Effect:* Controls absence (petit mal) seizures.

Methsuximide (Generic Name)

# PHARMACOKINETICS

Rapidly metabolized in liver to active metabolite, *N*-desmethylmethsuximide. Excreted primarily in urine. Unknown whether it is removed by hemodialysis. *Half-life*: 1.4 h.

# AVAILABILITY

Capsules: 300 mg (Celontin).

# INDICATIONS AND DOSAGES Absence seizures

#### PO

Adults, Elderly. Initially, 300 mg/day for the first week. Increase dosage by 300 mg/day at weekly intervals until response is attained. Maintenance: 1200 mg/day divided 2-4 times/day. Do not exceed 1200 mg/day. *Children*. Initially, 10-15 mg/kg/ day PO given in 3-4 divided doses. Increase weekly up to a maximum of 30 mg/kg/day PO. Maintenance: Mean of 20 mg/kg day for children < 30 kg, and 14 mg/kg/day if > 30 kg.

# **OFF-LABEL USES**

Partial complex (psychomotor) seizures.

# CONTRAINDICATIONS

Hypersensitivity to succinimides or any component of the formulation.

# INTERACTIONS

#### Drug

Alcohol, benzodiazepines, barbiturates, and other CNS depressants: May cause increased sedative effects.

Anticonvulsants: May increase plasma concentrations of other anticonvulsants.

**Cyclosporine:** May decrease cyclosporine blood levels by increasing its metabolism.

Haloperidol: May cause change in frequency and pattern of seizures.

# Phenothiazines, thioxanthenes,

**barbiturates:** May cause decreased effects of these drugs. **Herbal** 

#### Herba

Evening primrose oil: May decrease the effects of methsuximide. Ginkgo biloba: May decrease the effects of methsuximide. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

Frequent

Drowsiness, dizziness, nausea, vomiting.

#### Occasional

Visual abnormalities, such as spots before eyes, difficulty focusing, blurred vision, dry mouth or pharynx, tongue irritation, nervousness, insomnia, headache, constipation or diarrhea, rash, weight loss, proteinuria, edema.

#### Rare

Systemic lupus-like syndrome, CNS depression.

#### SERIOUS REACTIONS

• Toxic reactions appear as blood dyscrasias, including aplastic anemia, agranulocytosis, thrombocytopenia, leukopenia, leukocytosis, eosinophilia.

• Dermatologic effects, such as rash, urticaria, pruritus, photosensitivity, Stevens-Johnson syndrome.

• Abrupt withdrawal may precipitate status epilepticus.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired cardiac, liver, or renal function. Caution should be used in any seizure type. Methsuximide is not first-line therapy. It is unknown if methsuximide crosses the placenta and is distributed in breast milk. Behavioral changes are more likely to occur in children taking methsuximide. Elderly patients are more susceptible to agitation, atrioventricular (AV) block, bradycardia, and confusion. Blood tests should be repeated frequently during first 3 mo of therapy and at monthly intervals thereafter for 2-3 yr. Assess patients for stress tolerance to avoid changes in seizure frequency and frequency of seizure control adjustments being needed.

Drowsiness usually disappears during therapy. Tasks that require mental alertness and motor skills should be avoided.

#### Storage

Keep at controlled room temperature. Heat of 104° F or higher will melt the drug.

#### Administration

Take with meals to reduce risk of GI distress. Be aware when replacement by another anticonvulsant is necessary, plan to decrease methsuximide gradually as therapy begins with a low replacement dose. Abrupt withdrawal of the drug may precipitate seizures. Methsuximide must be used in combination with other anticonvulsants in patients with both absence and tonic-clonic seizures.

# **Methylcellulose**

meth-ill-cell'you-los ★ Citrucel Do not confuse Citrucel with Citracal.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

**Classification:** Laxatives, bulk-forming

# **MECHANISM OF ACTION**

A bulk-forming laxative that dissolves and expands in water. *Therapeutic Effect:* Provides increased bulk and moisture content in stool, increasing peristalsis and bowel motility.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	12-24 h	NA	NA

Acts in small and large intestines. Full effect may not be evident for 2-3 days.

# AVAILABILITY

*Caplets:* 500 mg. *Powder for Oral Solution:* Each adult dose contains 2 g; also available sugar-free.

# INDICATIONS AND DOSAGES Constipation

PO (POWDER) Adults, Elderly. 1 tbsp (15 mL) in 8 oz water 1-3 times a day. Children 6-12 yr. 1 tsp (5 mL) in 4 oz water 3-4 times a day. PO (CAPLETS) Adults. 2 caplets up to 6 times/day.

# CONTRAINDICATIONS

Abdominal pain, dysphagia, nausea, partial bowel obstruction, symptoms of appendicitis, vomiting, or difficulty swallowing.

# INTERACTIONS

#### Drug

Other oral medications: No specific drug interactions noted; however, it may be advisable to separate fiber administration from that of other oral drugs by 1-2 h. Herbal

None known.

# Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose level if taking sugar-containing product.

# SIDE EFFECTS

#### Rare

Some degree of abdominal discomfort, nausea, mild cramps.

# SERIOUS REACTIONS

• Esophageal or bowel obstruction may occur if administered with < 250 mL or 1 full glass of liquid.

# **PRECAUTIONS & CONSIDERATIONS**

Methylcellulose can be used safely in pregnancy. Safety and efficacy of methylcellulose have not been established in children younger than 6 yr. No age-related precautions have been noted in elderly patients. Pattern of daily bowel activity and stool consistency should be monitored. Caution is warranted in individuals who have difficulty swallowing, ileostomy, colostomy. Those with diabetes may choose a sugar-free powder, or the caplets, which contain no carbohydrates. **Storage** 

Store at room temperature, protected from high humidity. Keep tightly closed. Administration

Powder should not be swallowed in dry form but should be mixed with at least 1 full glass (8 oz) of liquid. For all products, a full glass of water should be taken with each dose; an inadequate amount of fluid may cause choking or swelling in the throat. To promote defecation, increase fluid intake, exercise, and eat a high-fiber diet.

# **Methyldopa**

meth-ill-doe'pa ★ Aldomet ▲ Apo-Methyldopa, Novomedopa **Do not confuse Aldomet with Anzemet.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antihypertensives, centrally acting

# **MECHANISM OF ACTION**

An antihypertensive agent that stimulates central inhibitory α-adrenergic receptors, lowers arterial pressure, and reduces plasma renin activity. *Therapeutic Effect:* Reduces BP.

# PHARMACOKINETICS

IV form hydrolyzed from methyldopate to methyldopa; onset similar for both PO and IV. Roughly 50% of PO absorbed. Crosses the blood-brain barrier and the placenta, and small amount appears in breast milk. Maximum BP effect at 4-6 h after dose; duration 12-24 h. Eliminated biphasically, 95% during the initial phase (plasma half-life of 2 h) and the rest much more slowly. Unabsorbed drug excreted in the feces. Half-life doubled in renal impairment

# AVAILABILITY

Tablets: 250 mg, 500 mg. Injection: 50 mg/mL.

# INDICATIONS AND DOSAGES Moderate to severe hypertension PO

Adults. Initially, 250 mg 2-3 times a day for 2 days. Adjust dosage

Methyldopa (Generic Name)

at intervals of 2 days (minimum). Maximum: 3 g/day. *Elderly*. Initially, 125 mg 1-2 times a day. May increase by 125 mg q2-3 days. Maintenance: 500 mg to 2 g/day in 2-4 divided doses. *Children*. Initially, 10 mg/kg/day given in 2-4 divided doses. Maximum: 65 mg/kg/day or 3 g/day, whichever is less. IV *Adults*. 250-1000 mg q6-8h. Maximum: 4 g/day.

*Children*. Initially, 20-40 mg/kg/day in divided doses q6h. Maximum: 65 mg/kg/day or 3 g/day, whichever is less.

# CONTRAINDICATIONS

Hepatic disease, pheochromocytoma, previous liver problems with methyldopa, hypersensitivity, treatment with MAO inhibitors.

# INTERACTIONS

#### Drug

**Epinephrine and other sympathomimetics:** May increase pressor response.

General anesthetics: May increase hypotensive action of these drugs. Haloperidol, alcohol and other central nervous system (CNS) depressants: May increase sedative effects of these drugs.

Hypotensive-producing medications, such as antihypertensives and diuretics: May increase the effects of methyldopa.

Indomethacin and other NSAIDs: May decrease effects of methyldopa. Iron supplements: Decrease oral absorption of methyldopa.

**Lithium:** May increase the risk of lithium toxicity.

MAOIs: May cause

hyperexcitability. Contraindicated. NSAIDs, tricyclic antidepressants: May decrease the effects of methyldopa.

# Herbal

None known. Food None known.

# IV INCOMPATIBILITIES

Acyclovir, amphotericin B, diazepam, furosemide, imipenem/ cilastatin (Primaxin), pentobarbital, phenobarbital, phenytoin, piperacillin/tazobactam (Zosyn).

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum prolactin, alkaline phosphatase, bilirubin, creatinine, potassium, sodium, uric acid, AST (SGOT), and ALT (SGPT) levels. May produce positive Coombs' test and prolong prothrombin time.

# SIDE EFFECTS

#### Frequent

Peripheral edema, somnolence, headache, dry mouth.

# Occasional

Mental changes (such as anxiety, depression), decreased sexual function or libido, diarrhea, swelling of breasts, nausea, vomiting, lightheadedness, paresthesia, rhinitis.

# SERIOUS REACTIONS

Hepatotoxicity (abnormal liver function test results, jaundice, hepatitis), hemolytic anemia, unexplained fever, and flu-like symptoms may occur. If these conditions appear, discontinue the medication and contact the physician.
Granulocytopenia.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment. Dizziness, drowsiness, and light-headedness may occur. Tasks requiring mental alertness and motor skills should be avoided. BP, pulse, weight, and liver function tests should be monitored before and during therapy. BP and pulse should be monitored every 30 min until stabilized. Chronic use may cause infection, bleeding, or poor healing, and these symptoms should be reported so medication changes can be considered. Orthostatic hypotension may result with rapid positional changes; caution is warranted. **Storage** 

Store oral forms and unopened injection at room temperature. Once diluted in D5W for infusion, stable for 24 h at room temperature.

#### Administration

For IV infusion, add the prescribed dose to 100 mL D5W and infuse over 30-60 min. Alternatively, add the prescribed dose to D5W to make a final concentration of 10 mg/mL and infuse over 30-60 min.

Orally may give without regard to food. Do not give at the same time as iron supplements.

# Methylergonovine

meth-ill-er-goe-noe'veen ★ Methergine Do not confuse Methergine with Brethine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Ergot alkaloids, oxytocics

#### MECHANISM OF ACTION

An ergot alkaloid that stimulates  $\alpha$ -adrenergic and serotonin receptors, producing arterial vasoconstriction. Causes vasospasm of coronary arteries and directly stimulates uterine muscle. *Therapeutic Effect:* Increases strength and frequency of uterine contractions. Decreases uterine bleeding.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	5-10 min	NA	NA
IV	Immediate	NA	3 h
IM	2-5 min	NA	NA

Rapidly absorbed from the GI tract after IM administration. Distributed rapidly to plasma, extracellular fluid, and tissues. Metabolized in the liver and undergoes first-pass effect. Excreted in urine. *Half-life*: IV ( $\alpha$  phase), 2-3 min or less; IV ( $\beta$  phase), 20-30 min or longer.

#### **AVAILABILITY**

Tablets: 0.2 mg. Injection: 0.2 mg/mL.

#### INDICATIONS AND DOSAGES

#### Prevention and treatment of postpartum and postabortion hemorrhage due to atony or involution PO

*Adults.* 0.2 mg 3-4 times a day. Continue for up to 7 days, but 48 h of use is usually sufficient. IV. IM

*Adults*. Initially, 0.2 mg. May repeat q2-4h for no more than a total of 0.8 mg/day for no more than 7 days.

#### **OFF-LABEL USES**

Treatment of incomplete abortion.

#### CONTRAINDICATIONS

Hypertension, toxemia, untreated hypocalcemia. Use during pregnancy is contraindicated except following obstetric delivery or abortion. Also, carefully screen for drug interactions; potent inhibitors of CYP3A4 are generally contraindicated.

# INTERACTIONS

#### Drug

Vasoconstrictors, vasopressors: May increase the effects of methylergonovine. Protease inhibitors, clarithromycin, erythromycin, itraconazole, ketoconazole, and other potent CYP3A4 inhibitors: Increase rick of grant taxiaity. Generally

risk of ergot toxicity. Generally contraindicated.

Less potent CYP3A4 inhibitors (e.g, nefazodone, fluconazole, fluoxetine, fluvoxamine, zileuton): Coadminister with caution as could increase risk of ergot side effects.

Serotonin-receptor agonists ("triptans" for migraine): Do not use within 24 h of ergot alkaloids due to potential for serious coronary or cerebral ischemia.

**Tobacco smoking:** Increases risk for ergot ischemia; avoid.

**Sympathomimetics:** May increase effects.

#### Herbal

None known.

#### Food

Grapefruit juice: May increase risk of ergot toxicity.

#### DIAGNOSTIC TEST EFFECTS

May decrease serum prolactin concentration.

# IV INCOMPATIBILITIES

No specific information available; compatibility not widely studied.

# 🗏 IV COMPATIBILITIES

Heparin, potassium.

#### SIDE EFFECTS

#### Frequent

Nausea, uterine cramping, vomiting. Occasional

Abdominal pain, diarrhea, dizziness, diaphoresis, tinnitus, bradycardia, chest pain.

### Rare

Allergic reaction, such as rash and itching; dyspnea; severe or sudden hypertension.

#### SERIOUS REACTIONS

 Severe hypertensive episodes may result in cerebrovascular accident, coronary vasospasm and chest pain, serious arrhythmias, and seizures.
 Hypertensive effects are more frequent with patient susceptibility, rapid IV administration, and concurrent use of regional anesthesia or vasoconstrictors.

• Peripheral ischemia may lead to gangrene.

# **PRECAUTIONS & CONSIDERATIONS**

 Drug is not intended for use in any location other than a hospital setting.
 Methylergonovine should never be used for induction or augmentation of labor.

Caution is warranted in patients with coronary artery disease, hepatic or renal impairment, occlusive peripheral vascular disease, and sepsis. Methylergonovine use is contraindicated during pregnancy. Small amounts of the drug are distributed in breast milk; caution is warranted in lactation, but the drug, in short term (a few days) use, may be given while breastfeeding. Safety and efficacy of methylergonovine use in children or elderly patients are unknown. Avoid smoking because of added effects of vasoconstriction.

Notify the physician of chest pain, increased bleeding, cold or pale feet or hands, cramping, or foul-smelling lochia. Be aware that the drug may diminish circulation. BP, pulse rate, and uterine tone should be monitored every 15 min until stable for 1-2 h.

#### Storage

Store tablets at room temperature. Refrigerate vials. Protect from light. Administration

! Methylergonovine should never be used for induction or augmentation of labor.

Administration may be PO, IV, or IM. Initial dose may be given parenterally, followed by an oral regimen.

IM route is the preferred administration. Monitor BP, heart rate, and uterine response prior to and during dosing. Use IV route in life-threatening situations only, as prescribed. Dilute drug with 0.9% NaCl to a volume of 5 mL. Give over at least 1 min, carefully monitoring BP.

Methylnaltrexone

meth'ill-nal-trex'own

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Gastrointestinal agents, peripheral opioid μ-receptor antagonist

# **MECHANISM OF ACTION**

A unique narcotic antagonist that displaces opioids at opioidoccupied  $\mu$ -receptor sites in the gastrointestinal tract, without impacting the pain-relieving actions of opioid agonists within the CNS. *Therapeutic Effect:* Reduces opioid-induced constipation.

#### PHARMACOKINETICS

Following SC use absorbed rapidly, with peak concentrations (Cmax) achieved at approximately 0.5 h. Moderate tissue distribution. Does not cross the blood brain barrier. Protein binding: 11%-15.3%. Minor amounts of metabolites formed. Conversion to methyl-6-naltrexol isomers (5% of total) and methylnaltrexone sulfate (1.3% of total are the primary pathways of metabolism). N-demethylation of methylnaltrexone to produce naltrexone is not significant. The drug is eliminated primarily as the unchanged drug. Approximately 50% is excreted in the urine and somewhat less in feces. *Half-life:* Roughly 8 h.

#### AVAILABILITY

*Injection*: 12 mg per 0.6 mL singleuse vial (Relistor).

#### INDICATIONS AND DOSAGES

#### Opioid-induced constipation in patients receiving palliative care, when response to laxative therapy has not been sufficient

SC

Adults, Elderly. The usual dose is given every other day SC, but may be increased to no more frequently than q24h if needed. Dose amount is based on weight as follows; once dose is calculated, round injection volume to the nearest 0.1 mL.

< 38 kg: Give 0.15 mg/kg SC every other day.

38-61 kg: Give 8 mg SC every other day.

62-114 kg: Give 12 mg SC every other day.

115 kg or above: Give 0.15 mg/kg SC every other day.

Dosage in renal impairment

CrCl < 30 mL/min: Reduce normal dose by 50%.

#### CONTRAINDICATIONS

Hypersensitivity; known or suspected mechanical GI obstruction.

#### INTERACTIONS

Drug, Herbal, and Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Frequent (> 5%)

Abdominal pain, flatulence, nausea, dizziness, diarrhea, and hyperhidrosis.

#### SERIOUS REACTIONS

 Rare cases of gastrointestinal (GI) perforation have been reported.
 Perforations have occurred in the stomach, duodenum, or colon. Any part of the GI tract might be affected.
 Overdosage may produce orthostatic hypotension.

# PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with severe renal or hepatic impairment. Also use with caution in patients who may have risk factors for GI perforation, such as peptic ulcer disease. Has not been studied in patients who have peritoneal catheters in place. Unknown whether crosses placenta or is excreted in breast milk; warrants caution in lactation and in pregnancy. Safety and efficacy are not established in children.

If severe or persistent diarrhea or severe abdominal symptoms occur, advise patients to discontinue therapy and consult their physician.

#### Storage

Store injection at room temperature and protect from light. Do not freeze. Once drawn into a syringe, the syringe is stable for 24 h at room temperature.

#### Administration

Methylnaltrexone is for subcutaneous injection only into the upper arm, abdomen, or thigh. Do not administer more than 1 dose in a 24-h period. Most patients have a bowel movement within a few minutes to a few hours after taking a dose; roughly 30% of patients have a bowel movement within 30 min.

# Methylphenidate Hydrochloride

meth-ill-fen'i-date high-droh-klor'ide Concerta, Daytrana, Metadate CD, Metadate ER, Methylin Chewable, Methylin Oral Solution, Methylin ER, Ritalin, Ritalin LA, Ritalin SR ♪ Biphentin, Concerta, Ritalin, Ritalin SR Do not confuse Ritalin with Rifadin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Stimulants, central nervous system (CNS)

#### **MECHANISM OF ACTION**

A CNS stimulant that blocks the reuptake of norepinephrine and dopamine into presynaptic neurons. *Therapeutic Effect:* The exact mode of action in attention deficit hyperactivity disorder (ADHD) is not know. Decreases motor restlessness and fatigue; increases motor activity, attention span, and mental alertness; produces mild euphoria.

#### PHARMACOKINETICS

Onset	Peak	Duration
Immediate release	2 h	3-5 h
Sustained release	4-7 h	3-8 h
Extended release	N/A	8-12 h

Slowly and incompletely absorbed from the GI tract. Protein binding: 15%. Metabolized in the liver. Eliminated in urine and in feces by biliary system. Unknown whether it is removed by hemodialysis. *Half-life*: 2-4 h.

Methylphenidate Hydrochloride (Generic Name)

# AVAILABILITY

Capsules (Extended Release [Metadate CD]): 10 mg, 20 mg, 30 mg. Capsules (Extended Release [Ritalin LA]): 20 mg, 30 mg, 40 mg. Tablets (Ritalin): 5 mg, 10 mg, 20 mg. Tablets (Extended Release [Metadate ER, Methylin ER]): 10 mg, 20 mg. Tablets (Extended Release [Concerta]): 18 mg, 27 mg, 36 mg, 54 mg. Tablets (Sustained Release [Ritalin SR]): 20 mg. Tablets (Chewable [Methylin]): 2.5 mg, 5 mg, 10 mg. Oral Solution (Methylin): 5 mg/5 mL, 10 mg/5 mL. Transdermal System (Daytrana 9-h patch): 10 mg, 15 mg, 20 mg, 30 mg.

#### INDICATIONS AND DOSAGES Attention deficit hyperactivity disorder (ADHD) PO

Adults, Children 6 yr and older. Immediate release: Initially, 2.5-5 mg before breakfast and lunch. May increase by 5-10 mg/day at weekly intervals. Maximum: 60 mg/day.

TRANSDERMAL (DAYTRANA) *Children 6 yr and older*. Initially, 10-mg patch once a day worn for 9 h only; may increase at weekly intervals. Maximum: 30 mg/day. Use the same initial dose even if converting from another dose form. PO (CONCERTA)

Adults, Children 6 yr and older. Initially, 18 mg once a day; may increase by 18 mg/day at weekly intervals. Maximum: 54-72 mg/day. PO (METADATE CD)

*Adults, Children 6 yr and older.* Initially, 20 mg/day. May increase by 20 mg/day at weekly intervals. Maximum: 60 mg/day.

# PO (RITALIN LA)

Adults, Children 6 yr and older. Initially, 20 mg/day. May increase by 10 mg/day at weekly intervals. Maximum: 60 mg/day. Patients changing from methylphenidate multiple daily doses to once-daily extended-release oral forms. Convert at same daily dose and give once daily. • Narcolepsy PO Adults, Elderly. 10 mg 2-3 times a day. Range: 10-60 mg/day.

# **OFF-LABEL USES**

Treatment of refractory mental depression in adults.

# CONTRAINDICATIONS

Hypersensitivity to methylphenidate or dexmethylphenidate or product components. Do not use within 14 days of MAOIs, marked agitation, glaucoma, Tourette's syndrome or tics, known serious cardiac abnormalities or serious heart rhythmic problems.

# INTERACTIONS

#### Drug

Antihypertensives: Decreased effect of antihypertensives may occur. Clonidine: Severe toxic reactions occur with methylphenidate.

MAOIs, linezolid: May increase the effects of methylphenidate such as severe hypertensive episodes. MAOIs are contraindicated.

**Other CNS stimulants:** May have an additive effect.

**Phenytoin, phenobarbital:** May inhibit the metabolism of these anticonvulsants; monitor.

**Tricyclic antidepressants, SSRIs:** Dosage of these drugs may need to be decreased.

Warfarin: May inhibit the metabolism of warfarin. Monitor INR.

#### Herbal

None known.

#### Food

**Caffeine:** May be useful to limit caffeinated beverages.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent (≥ 5%)

Appetite decreased, insomnia, nausea. Skin patches may cause application site erythema. Occasional

#### Occasional

Dizziness, drowsiness, headache, irritability, abdominal pain, fever, rash, arthralgia, vomiting.

#### Rare

Blurred vision, anxiety, hostility or aggression, Tourette's syndrome (marked by uncontrolled vocal outbursts, repetitive body movements, and tics), palpitations.

#### SERIOUS REACTIONS

• Withdrawal after prolonged therapy may unmask symptoms of the underlying disorder. Do not abruptly discontinue since dependency may occur with long-term use.

 CNS stimulant use associated with serious cardiovascular events and sudden death in patients with cardiac abnormalities or serious heart problems.

• Methylphenidate may lower the seizure threshold in those with a history of seizures.

 Rarely, mood changes can be severe and may include aggressive behaviors or other serious mood problems.

• Rarely, cerebral vasculitis and hemorrhage reported.

 Overdose produces excessive sympathomimetic effects, including vomiting, tremor, hyperreflexia, seizures, confusion, hallucinations, and diaphoresis. • Prolonged administration to children with ADHD may delay growth.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hypertension, seizures, acute stress reaction, emotional instability, and a history of drug dependence. It is unknown whether methylphenidate crosses the placenta or is distributed in breast milk; therefore, caution is warranted in lactation. Children are more prone to develop abdominal pain, anorexia, weight loss, and insomnia. Long-term methylphenidate use may inhibit growth in children. No age-related precautions have been noted in elderly patients.

Tasks that require mental alertness and motor skills should be avoided until response to the drug is established. Notify the physician if fever, anxiety, an increase in hostile or aggressive behavior, palpitations, a rash, vomiting or, for those with a seizure disorder, an increase in the number of seizures, occurs. CBC, WBC count with differential, and platelet should be monitored. Baseline height and weight should be obtained at the beginning and periodically throughout therapy. **Storage** 

Store all dosage forms at room temperature; keep oral forms tightly closed. Keep transdermal patch in sealed foil wrapper until time of use. Do not refrigerate of freeze skin patches.

#### Administration

Take immediate-release methylphenidate 30-45 min before meals (usually before breakfast and lunch). Take the last dose before 6 PM to help prevent insomnia. Do not cut, crush, or chew extendedrelease tablets or capsules. Open the Metadate CD or Ritalin LA or capsule and sprinkle the pellets on applesauce, if desired. Do not chew.

Swallow Concerta whole with liquids; the drug is in a nonabsorbable controlled rate shell. The empty shell matrix may be noted in patient stool but is not cause for alarm.

The Daytrana patch is placed on a dry, clean area of the hip and held in place for 30 seconds; apply 2 h before the effect is desired. Do not use on damaged or irritated skin. Do not use patch if it appears damaged after opening. Rotate hips of application daily. Do not cut/trim patch. Do not expose to a heat source (e.g., heating pads, electric blankets) as this may cause overdose. Remember to remove patch after no longer than 9 h of wear. Peel off slowly.

### Methylprednisolone

meth-il-pred-niss'oh-lone ★ 🏜 Medrol, Depo-Medrol, A-Methapred, Solu-Medrol Do not confuse methylprednisolone with medroxyprogesterone, or Medrol with Mebaral.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Glucocorticoid, immediate acting

#### MECHANISM OF ACTION

An adrenocortical steroid that suppresses the migration of polymorphonuclear leukocytes and reverses increased capillary permeability. Therapeutic Effect: Decreases inflammation.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	NA	1-2 h	30-36 h

Route	Onset	Peak	Duration
IM	NA	4-8 days	1-4 wks

Well absorbed from the GI tract after IM administration. Widely distributed. Metabolized in the liver. Excreted in urine. Removed by hemodialysis. Half-life: 3.5 h.

# **AVAILABILITY**

Tablets (Medrol): 2 mg, 4 mg, 8 mg, 16 mg, 32 mg. Injection Powder for Reconstitution (A-Methapred, Solu-Medrol): 40 mg, 125 mg, 500 mg, 1 g. Injection Suspension (Depo-Medrol): 20 mg/mL, 40 mg/mL, 80 mg/mL.

# INDICATIONS AND DOSAGES

Substitution therapy for deficiency states: acute or chronic adrenal insufficiency, adrenal insufficiency secondary to pituitary insufficiency, and congenital adrenal hyperplasia; nonendocrine disorders: allergic, collagen, hepatic, intestinal tract, ocular, renal, and skin diseases; arthritis, bronchial asthma; cerebral edema; malignancies; rhematoid carditis

#### PO

Adults, Elderly. Usual range: 4-60 mg/day, given in 4 divided doses. IV (METHYLPREDNISOLONE SODIUM SUCCINATE) Adults, Elderly. Usual range: 40-250 mg q4-6h. Repeat q4-6h for 48-72 h. Spinal cord injury

IV BOLUS AND INFUSION Adults, Elderly. 30 mg/kg over 15 min. Maintenance dose: 5.4 mg/kg/h for 23 h, to be given within 45 min of bolus dose.

#### Usual IM dosage

IM (METHYLPREDNISOLONE ACETATE) Adults, Elderly. 10-80 mg. Frequency

of repeat doses dependent on condition being treated.

Methylprednisolone (Generic Name)

# INTRA-ARTICULAR,

INTRALESIONAL *Adults, Elderly.* 4-40 mg, up to 80 mg q1-5wk.

# Usual pediatric dose

PO/IM/IV Pediatric. 0.5-1.7 mg/kg/day or 5-25 mg/m<sup>2</sup>/day in 2-4 divided doses.

# CONTRAINDICATIONS

Hypersensitivity to product, systemic fungal infections; some injections contain benzyl alcohol and are not for use in neonates.

# INTERACTIONS

#### Drug

Acetaminophen (chronic, high dose): May increase risk of hepatotoxicity.

Alcohol, salicylates, NSAIDs: Possible increase in GI effects. Amphotericin: May increase hypokalemia.

Barbiturates, rifampin, rifabutin: Possible decreased action. Digoxin: May increase the risk of digoxin toxicity caused by hypokalemia.

Diuretics, insulin, oral hypoglycemics, potassium supplements: May decrease the effects of these drugs.

Hepatic enzyme inducers: May decrease the effects of methylprednisolone.

Ketoconazole, macrolide antibiotics: Possible increased activity.

Live-virus vaccines: May decrease the patient's antibody response to vaccine, increase vaccine side effects, and potentiate virus replication. Herbal and Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase blood cholesterol, glucose and serum lipid, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

# IV INCOMPATIBILITIES

Ampicillin/sulbactam (Unasyn), calcium chloride or gluconate, caspofungin (Cancidas), cefotaxime, ciprofloxacin (Cipro), diazepam, diltiazem (Cardizem), diphenhydramine, docetaxel (Taxotere), etoposide (VePesid), filgrastim (Neupogen), gemcitabine (Gemzar), haloperidol, hydralazine, ketamine, lansoprazole (Prevacid), magnesium sulfate, paclitaxel (Taxol), pantoprazole (Protonix), phenytoin, potassium chloride, propofol (Diprivan), protamine, quinupristindalfopristin (Synercid), thiamine, vecuronium, vinorelbine (Navelbine).

# **IV COMPATIBILITIES**

Dopamine (Intropin), heparin, midazolam (Versed), theophylline.

# SIDE EFFECTS

#### Frequent

Insomnia, heartburn, anxiety, abdominal distention, diaphoresis, acne, mood swings, increased appetite, facial flushing, GI distress, delayed wound healing, increased susceptibility to infection, diarrhea, or constipation.

# Occasional

Headache, edema, tachycardia, change in skin color, frequent urination, depression.

#### Rare

Psychosis, increased blood coagulability, hallucinations.

# SERIOUS REACTIONS

 Long-term therapy may cause hypocalcemia, hypokalemia, muscle wasting (especially in arms and legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, and congestive heart failure (CHF).  Abruptly withdrawing the drug after long-term therapy may cause anorexia, nausea, fever, headache, sudden severe myalgia, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

 Chronic corticosterioids raise risk of immunosuppression and resultant increased risk for infection.

 Long-term use may increase intraocular pressure or produce cataracts.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with cirrhosis, CHF, diabetes mellitus, hypertension, hypothyroidism, thromboembolic disorders, and ulcerative colitis. Methylprednisolone crosses the placenta and is distributed in breast milk. Women taking methylprednisolone should not breastfeed. Prolonged methylprednisolone use in the first trimester of pregnancy may cause cleft palate in the neonate. Prolonged treatment or high dosages may decrease cortisol secretion and shortterm growth rate in children. No agerelated precautions have been noted in elderly patients. Severe stress, including serious infection, surgery, or trauma, may require an increase in methylprednisolone dosage. Dentist or another physician should be informed of methylprednisolone therapy if taken within the past 12 mo.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. Blood glucose level, intake and output, BP, serum electrolyte levels, pattern of daily bowel activity, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms. In long-term therapy, signs and symptoms of hypocalcemia (such as muscle twitching, cramps, and positive Chvostek or Trousseau signs) or hypokalemia (such as ECG changes, nausea and vomiting, irritability, weakness and muscle cramps, and numbness or tingling, especially in the lower extremities) should be reported to health care providers immediately.

#### Storage

Store tablets and vials for injection at room temperature. Use diluted injection within 48 h at room temperature. Infusions and IVPB are stable for 24 h at room temperature. Administration

Individualize dosage based on the disease, person, and response.

Take oral methylprednisolone with food or milk. Take single doses before 9 AM; give multiple doses at evenly spaced intervals. Do not abruptly discontinue the drug or change the dosage or schedule; the drug must be withdrawn gradually under medical supervision.

Only methylprednisolone sodium succinate should be given intravenously (IV). Administer directly into a vein over 2-3 min. Doses ≥ 2 mg/kg or 250 mg usually given as IVPB unless emergent situation. Large doses (≥ 500 mg) given IVPB usually given over 30-60 min. Compatible solutions include D5W and 0.9% NaCl. Largedose infusions for spinal cord injury are usually prepared in 500 mL 0.9% NaCl.

For IM use, methylprednisolone acetate should not be further diluted. Shake acetate injection suspension well before IM use. Give deep IM injection into gluteus maximus. Methylprednisolone acetate may be given locally as an intra-articular injection.

# Methyltestosterone

meth-il-tes-tos'te-rone ★ Android, Methitest, Testred Do not confuse with methylprednisolone.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: III

**Classification:** Androgens, hormones/hormone modifiers

# **MECHANISM OF ACTION**

A synthetic testosterone derivative with androgen activity that promotes growth and development of male sex organs and maintains secondary sex characteristics in androgen-deficient males. *Therapeutic Effect:* Treats hypogonadism and delayed puberty in males.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 98%. Metabolized in liver. Primarily excreted in urine. Unknown whether it is removed by hemodialysis. *Half-life*: 10-100 min.

# AVAILABILITY

*Capsules:* 10 mg (Android, Testred). *Tablets:* 10 mg (Methitest).

# INDICATIONS AND DOSAGES

 Breast cancer, palliative PO
 Adults, Elderly, Females.
 50-200 mg/day.
 Delayed puberty, males PO

Adolescents. 5-25 mg/day for 4-6 mo. BUCCAL Adolescents. 2.5-12.5 mg/day for 4-6 mo.

#### Hypogonadism, males PO

Adults. 10-50 mg/day. BUCCAL Adults. 5-25 mg/day.

# **OFF-LABEL USES**

Hereditary angioedema.

# CONTRAINDICATIONS

Pregnancy, prostatic or breast cancer in males, hypersensitivity to methyltestosterone or any component of its formulation.

# INTERACTIONS

#### Drug

**ACTH, corticosteroids:** Possible increased edema risk.

Antidiabetic agents, insulin: May alter antidiabetic agent requirements or promote hypoglycemia.

**Bupropion:** May increase the risk of seizures by decreasing seizure threshold.

**Cyclosporine:** May increase risk of cyclosporine toxicity.

Liver-toxic medications: May increase risk of liver toxicity.

Oral anticoagulants: May increase the effects of oral

anticoagulants. Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood hemoglobin and hematocrit, LDL concentrations, serum alkaline phosphatase, bilirubin, calcium, potassium, SGOT (AST) levels, and sodium levels. May decrease HDL concentrations.

# SIDE EFFECTS

#### Frequent

Gynecomastia, acne, amenorrhea or other menstrual irregularities.

Females: Hirsutism, deepening of voice, clitoral enlargement that may not be reversible when drug is discontinued. Occasional

Edema, nausea, insomnia, oligospermia, priapism, male pattern of baldness, bladder irritability, hypercalcemia in immobilized patients or those with breast cancer, hypercholesterolemia. **Rare** 

Polycythemia.

# SERIOUS REACTIONS

• Cholestatic jaundice, hepatocellular neoplasms, peliosis hepatitis, edema with or without CHF and suppression of clotting factors II, V, VII, and X have been reported.

Priapism.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes, CHF, or preexisting cardiac, liver or renal disease, epilepsy, history of migraine, other conditions that may be aggravated by fluid retention, and hypertension due to the risk of increased BP. Methyltestosterone should not be used during pregnancy or lactation. Safety and efficacy of methyltestosterone have not been established in prepubertal children, so use with caution. Be aware that methyltestosterone use in elderly patients may increase the risk of hyperplasia or stimulate the growth of occult prostate carcinoma. Adequate calories and protein should be consumed.

Acne, nausea, pedal edema, or vomiting may occur. Women should report deepening of voice, hoarseness, and menstrual irregularities. Men should report difficulty urinating, frequent erections, and gynecomastia. Weight should be obtained each day. Weekly weight gains of more than 5 lb should be reported.

#### Storage

Store at room temperature. Administration Give methyltestosterone with meals.

# Metipranolol Hydrochloride

met-ee-pran'-oh-lol high-drohklor'ide ★ OptiPranolol **Do not confuse with metoprolol** or propranolol.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Ophthalmic agents, antiglaucoma agents, β-adrenergic blockers

# MECHANISM OF ACTION

An antiglaucoma agent that nonselectively blocks β-adrenergic receptors. Reduces aqueous humor production. *Therapeutic Effect:* Reduces intraocular pressure (IOP).

# PHARMACOKINETICS

Route	Onset	Peak	Duration
Eyedrops	0.5-3 h	2-7 h	≥ 24 h

Systemic absorption may occur.

# AVAILABILITY

Ophthalmic solution: 0.3%.

# INDICATIONS AND DOSAGES

• Glaucoma, ocular hypertension OPHTHALMIC Adults, Elderly. Instill 1 drop 2 times a day.

# CONTRAINDICATIONS

Bronchial asthma or chronic obstructive pulmonary disease, cardiogenic shock, overt cardiac

# 1024 Metoclopramide

failure, second- or third- degree heart atrioventricular block, severe sinus bradycardia, hypersensitivity to metipranolol or any component of the formulation.

# DRUG INTERACTIONS

**Oral β-blockers:** Additive systemic effects.

Calcium channel blockers: Hypotension.

#### SIDE EFFECTS

#### Frequent

Eye burning/stinging, hyperemia, blurred vision, headache, fatigue. **Occasional** 

#### Occasional

Sensitivity to light, dizziness. Rare

#### Rare

Dry eye, conjunctivitis, eye pain, rash.

#### SERIOUS REACTIONS

• Ophthalmic overdosage may produce bradycardia, hypotension, bronchospasm, and acute cardiac failure.

• Arrhythmias and myocardial infarction have been reported.

#### PRECAUTIONS & CONSIDERATIONS

Caution in patients with hyperthyroidism, diabetes, cerebrovascular insufficiency, and depression. Safety and efficacy not established in children. No unique precautions in elderly.

#### Storage

Store at room temperature. Administration

Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Instill drop(s) and gently close the eyes for 1-2 min. Do not blink. Use nasolacrimal occlusion to reduce systemic absorption. Do not touch the tip of the dropper to any surface to avoid contamination. Wait several minutes before use of other eyedrops.

# Metoclopramide

met'oh-kloe-pra'mide ★ Reglan, Metozolv ODT ◆ Apo-Metoclop Do not confuse Reglan with Renagel.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Gastrointestinal agents, prokinetics, antiemetics

#### **MECHANISM OF ACTION**

A dopamine receptor antagonist that stimulates motility of the upper GI tract and decreases reflux into the esophagus. Also raises the threshold of activity in the chemoreceptor trigger zone. *Therapeutic Effect:* Accelerates intestinal transit and gastric emptying; relieves nausea and vomiting.

# PHARMACOKINETICS

# Route Onset (min) Peak Duration

PO	30-60	NA	NA
IV	1-3	NA	NA
IM	10-15	NA	NA

Well absorbed from the GI tract. Metabolized in the liver. Protein binding: 30%. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 4-6 h.

#### AVAILABILITY

Oral Solution: 5 mg/5 mL. Tablets: 5 mg, 10 mg.

Metoclopramide (Generic Name)

Injection: 5 mg/mL. Orally Disintegrating Tablets (ODT): 5 mg, 10 mg.

# INDICATIONS AND DOSAGES

#### Prevention of chemotherapyinduced nausea and vomiting IV

Adults, Elderly, Children. 1-2 mg/ kg 30 min before chemotherapy; repeat q2h for 2 doses, then q3h as needed.

#### Postoperative nausea and vomiting IV

Adults, Elderly, Children 15 yr and older: 10 mg; repeat q6-8h as needed. Children 14 yr and younger.

0.1-0.2 mg/kg/dose; repeat q6-8h as needed.

#### Diabetic gastroparesis PO, IV

Adults. 10 mg 30 min before meals and at bedtime for 2-8 wks. PO

Elderly. Initially, 5 mg 30 min before meals and at bedtime. May increase to 10 mg.

IV

Elderly. 5 mg over 1-2 min. May increase to 10 mg.

#### Symptomatic gastroesophageal reflux

# PO

Adults. 10-15 mg up to 4 times a day or single doses up to 20 mg as needed. Elderly. Initially, 5 mg 4 times a day. May increase to 10 mg. Children. 0.4-0.8 mg/kg/day in

4 divided doses.

#### To facilitate small bowel intubation (single dose) IV

Adults, Elderly. 10 mg as a single dose.

Children 6-14 yr. 2.5-5 mg as a single dose.

Children younger than 6 yr.

0.1 mg/kg as a single dose.

#### Dosage in renal impairment

Initial dosage is modified based on creatinine clearance

Creatinine	Initial % of	
Clearance (mL/min)	normal dose	
< 40 mL/min	50	

May be increased or decreased to clinical effect.

# **OFF-LABEL USES**

Prevention of aspiration pneumonia; persistent hiccups, slow gastric emptying, vascular headaches to offset nausea from ergot alkaloids.

# CONTRAINDICATIONS

Concurrent use of medications likely to produce extrapyramidal reactions, GI hemorrhage, GI obstruction or perforation, history of seizure disorders, pheochromocytoma, hypersensitivity to metoclopramide.

# INTERACTIONS

#### Drug

Alcohol, other central nervous system (CNS) suppressants: May increase CNS depressant effect. Anticholinergics, opioids: Decreased GI action. Digoxin, levodopa: Changes in GI transit time with metoclopramide may alter oral absorption and therapeutic response; monitor. MAOIs: Use cautiously; may increase risk of hypertension. Herbal None known Food None known

# DIAGNOSTIC TEST EFFECTS

May increase serum aldosterone and prolactin concentrations.

# IV INCOMPATIBILITIES

Allopurinol (Aloprim), cefepime (Maxipime), diazepam, doxorubicin liposomal (Doxil), furosemide (Lasix), lansoprazole (Prevacid), phenytoin, propofol (Diprivan).

# **IV COMPATIBILITIES**

Dexamethasone, diltiazem (Cardizem), diphenhydramine (Benadryl), fentanyl (Sublimaze), heparin, hydromorphone (Dilaudid), morphine, potassium chloride.

# SIDE EFFECTS

#### Frequent (10%)

Somnolence, restlessness, fatigue, lethargy.

#### **Occasional (3%)**

Dizziness, anxiety, headache, insomnia, breast tenderness, altered menstruation, constipation, rash, dry mouth, galactorrhea, gynecomastia.

#### Rare (< 3%)

Hypotension or hypertension, tachycardia.

# SERIOUS REACTIONS

• Extrapyramidal reactions occur most commonly in children and young adults (18-30 yr) receiving large doses (2 mg/kg) during chemotherapy and are usually limited to akathisia (involuntary limb movement and facial grimacing).

Neuroleptic malignant syndrome.

#### PRECAUTIONS & CONSIDERATIONS

Treatment can cause tardive dyskinesia, which is often irreversible. The risk increases with duration of treatment and total cumulative dose. Limit treatment to < 12 wks unless benefits outweigh risks. Caution is warranted in patients with cirrhosis, CHF, and renal impairment. Metoclopramide crosses the placenta and is distributed in breast milk; therefore, caution is warranted in lactation. Children and young adults (aged 18-30 yr) are more susceptible to dystonic reactions at larger doses during chemotherapy, usually evidenced by akathisia of the face and limbs. Elderly patients are more likely to have parkinsonian reactions and dyskinesias after long-term therapy. Alcohol and tasks that require mental alertness or motor skills should be avoided.

Dizziness, drowsiness, and dry mouth may occur. Notify the physician if involuntary eye, facial, or limb movement occurs. BP, heart rate, renal function, skin for rash, and pattern of daily bowel activity and stool consistency should be monitored.

#### Storage

Store oral dose forms and vials at room temperature. Protect from freezing and light. Protect ODT from moisture; do not remove from package until time of use. After dilution, IV piggyback infusion is stable for 48 h.

#### Administration

! Metoclopramide may be given by PO and IM routes and by IV push or IV infusion. Doses of 2 mg/kg or more or prolonged therapy may increase the incidence of side effects.

Take oral metoclopramide 30 min before meals and at bedtime. Crush tablets as needed. ODT dose form is taken without liquid. Remove ODT from package with dry hands and place on the tongue. Do not use broken or crumbled tablets. Disintegrates on the tongue in approximately 1 min.
For IV use, dilute doses > 10 mg in 50 mL, 0.9% NaCl (preferred), or dextrose 5%, lactated Ringer's solution. Infuse over 15 min. Give slow IV push of 10 mg over 1-2 min. Too-rapid IV injection may produce intense anxiety or restlessness, followed by drowsiness.

## Metolazone

met-tole'a-zone Zaroxolyn Do not confuse metolazone with metaxalone, or Zaroxolyn with Zarontin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in pregnancy-induced hypertension)

#### Classification:

Antihypertensives, diuretics, thiazide-like

## **MECHANISM OF ACTION**

An oral quinazoline thiazide-like diuretic and antihypertensive. As a diuretic, blocks reabsorption of sodium, potassium, and chloride at the distal convoluted tubule, increasing renal excretion of sodium and water. As an antihypertensive, reduces plasma and extracellular fluid volume and peripheral vascular resistance. *Therapeutic Effect:* Promotes diuresis and reduces BP.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO (diuretic)	1 h	2 h	12-24 h

Incompletely absorbed from the GI tract. Protein binding: 95%. Primarily excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* 14 h.

## AVAILABILITY

Tablets (Extended Release [Zaroxolyn]): 2.5 mg, 5 mg, 10 mg.

## INDICATIONS AND DOSAGES Edema

PO (ZAROXOLYN) Adults, Elderly. 2.5-20 mg/day. Children. 0.2-0.4 mg/kg/day in 1-2 divided doses. > Hypertension PO (ZAROXOLYN) Adults, Elderly. 2.5-5 mg/day.

## CONTRAINDICATIONS

Anuria, hepatic coma or precoma. Cross-allergy may occur when given to patients allergic to sulfonamidederived drugs, thiazides, or quinethazone.

## INTERACTIONS

#### Drug

**Cholestyramine, colestipol:** May decrease the absorption and effects of metolazone.

**Digoxin:** May increase the risk of digoxin toxicity when associated with metolazone-induced hypokalemia.

**Indomethacin and other NSAIDs:** May have decreased hypotensive

response.

**Lithium:** May increase the risk of lithium toxicity.

**Tetracyclines:** May increase risk of photosensitization.

## Herbal

None known. Food None known.

Metolazone (Generic Name)

## **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose and serum cholesterol, LDL, bilirubin, calcium, creatinine, uric acid, and triglyceride levels. May decrease urinary calcium, and serum magnesium, potassium, and sodium levels.

## SIDE EFFECTS

#### Expected

Increase in urinary frequency and urine volume.

#### Frequent (9%-10%)

Dizziness, light-headedness, headache.

#### Occasional (4%-6%)

Muscle cramps and spasm, fatigue, lethargy.

### Rare (< 2%)

Asthenia, palpitations, depression, nausea, vomiting, abdominal bloating, constipation, diarrhea, urticaria.

### SERIOUS REACTIONS

• Vigorous diuresis may lead to profound water and electrolyte depletion, resulting in hypokalemia, hyponatremia, and dehydration.

Acute hypotensive episodes may occur.

• Hyperglycemia may occur during prolonged therapy.

• Pancreatitis, paresthesia, blood dyscrasias, pulmonary

edema, allergic pneumonitis, and dermatologic reactions occur rarely.

• Overdose can lead to lethargy and coma without changes in electrolytes or hydration.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes, elevated cholesterol and triglyceride levels, gout, hepatic impairment, lupus erythematosus, and severe renal disease.

Metolazone crosses the placenta,

and a small amount is distributed in breast milk. Breastfeeding is not recommended for patients taking this drug. No age-related precautions have been noted in children. Elderly patients may be more sensitive to the drug's electrolyte and hypotensive effects. Age-related renal impairment may require cautious use in elderly patients. Consuming foods high in potassium, such as apricots, bananas, legumes, meat, orange juice, raisins, whole grains, including cereals, and white and sweet potatoes, is encouraged. Patient should be advised about limiting salt intake and sodiumcontaining products.

An increase in the frequency and volume of urination may occur. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Hyponatremia may result in cold and clammy skin, confusion, and thirst. Any of these indicators should be reported immediately. Because of the possible cardiovascular effects, patients should be evaluated for stress tolerance during therapy. Storage

Store at room temperature protected from light.

#### Administration

Take metolazone with food or milk if GI upset occurs, preferably with breakfast to help prevent nocturia.

## **Metoprolol**

me-toe'pro-lole Lopressor, Toprol XL Apo-Metoprolol, Betaloc, Nu-Metop, Lopressor Do not confuse metoprolol with metaproterenol or metolazone. Do not confuse Toprol XL with Topamax or Lopressor with Lyrica.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

*Classification:* Antihypertensives, β-adrenergic blocker

## **MECHANISM OF ACTION**

An antianginal, antihypertensive, and myocardial infarction (MI) adjunct that selectively blocks  $\beta_1$ -adrenergic receptors; high dosages may block  $\beta_2$ -adrenergic receptors. Decreases oxygen requirements. Large doses increase airway resistance. *Therapeutic Effect:* Slows sinus node heart rate, decreases cardiac output, and reduces BP. Also decreases myocardial ischemia severity.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	10-15 min	1h	6 h
PO (extended release)	N/A	6-12 h	24 h
IV	Immediate	20 min	5-8 h

Well absorbed from the GI tract. Protein binding: 12%. Widely distributed. Metabolized in the liver (undergoes significant first-pass metabolism). Primarily excreted in urine. Removed by hemodialysis. Half-life: 3-7 h.

## AVAILABILITY

Tablets (Lopressor): 25 mg, 50 mg, 100 mg. Tablets (Extended Release [Toprol

*XL]):* 25 mg, 50 mg, 100 mg, 200 mg. *Injection (Lopressor):* 1 mg/mL.

# INDICATIONS AND DOSAGES Mild to moderate hypertension PO

*Adults.* Initially, 100 mg/day as single or divided dose. Increase at weekly (or longer) intervals. Maintenance: 100-450 mg/day. *Elderly.* Initially, 25 mg/day. Range: 25-300 mg/day.

#### PO (EXTENDED-RELEASE TABLETS)

*Adults.* 50-100 mg/day as single dose. May increase at least at weekly intervals until optimum BP attained. Maximum: 200 mg/day.

## Chronic, stable angina pectoris PO

*Adults.* Initially, 100 mg/day as single or divided dose. Increase at weekly (or longer) intervals. Maintenance: 100-450 mg/day. PO (EXTENDED-RELEASE TABLETS)

Adults. Initially, 100 mg/day as single dose. May increase at least at weekly intervals until optimum clinical response achieved. Maximum: 200 mg/day.

► Congestive heart failure (CHF) PO (EXTENDED-RELEASE TABLETS)

*Adults*. Initially, 25 mg/day. May double dose q2wk. Maximum: 200 mg/day.

### • Early treatment of MI IV

*Adults.* 5 mg q2min for 3 doses, followed by 50 mg orally q6h for 48 h. Begin oral dose 15 min after

Metoprolol (Generic Name)

last IV dose. Or, in patients who do not tolerate full IV dose, give 25-50 mg orally q6h, 15 min after last IV dose.

### Late treatment and maintenance after an MI

PO

*Adults*. Target dose: 100 mg twice a day for at least 3 mo.

## **OFF-LABEL USES**

To increase survival rate in diabetic patients with coronary artery disease (CAD); treatment or prevention of anxiety; cardiac arrhythmias; hypertrophic cardiomyopathy; mitral valve prolapse syndrome; pheochromocytoma; tremors; thyrotoxicosis; vascular headache.

## CONTRAINDICATIONS

Cardiogenic shock, MI with a heart rate < 45 beats/min or systolic BP < 100 mm Hg, overt heart failure, second- or third-degree heart block, sinus bradycardia, hypersensitivity to metoprolol and related derivatives (cross-sensitivity between β-blockers can occur), sick sinus syndrome, peripheral arterial circulatory disorders.

## INTERACTIONS

#### Drug

Cimetidine: May increase metoprolol blood concentration. Didanosine: May decrease effects. Diphenhydramine: May increase plasma concentrations. Diuretics, other antihypertensives: May increase hypotensive effect. Epinephrine, levonordefrin, isoproterenol, other sympathomimetics: May decrease β-blocking, β-adrenergic effects. Fentanyl derivatives, inhalation anesthetics: Possible increased hypotension and bradycardia. Indomethacin and other NSAIDs, sympathomimetics: Possible decreased antihypertensive effects. Insulin, oral hypoglycemics: May mask symptoms of hypoglycemia and prolong hypoglycemic effect of these drugs. Lidocaine: May slow metabolism of lidocaine. NSAIDs: May decrease antihypertensive effect. Sympathomimetics, xanthines: May mutually inhibit effects. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum antinuclear antibody titer and BUN, serum lipoprotein, serum LDH, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, serum uric acid, AST (SGOT), ALT (SGPT), and serum triglyceride levels.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), diazepam, lepirudin, pantoprazole, phenytoin.

## **IV COMPATIBILITIES**

Alteplase (Activase), morphine.

## SIDE EFFECTS

Metoprolol is generally well tolerated, with transient and mild side effects. Frequent

Diminished sexual function, drowsiness, insomnia, unusual fatigue or weakness, bradycardia, low blood pressure.

#### Occasional

Anxiety, nervousness, diarrhea, constipation, nausea, vomiting, nasal congestion, abdominal discomfort, dizziness, difficulty breathing, cold hands or feet.

#### Rare

Altered taste, dry eyes, nightmares, depression, paresthesia, allergic reaction (rash, pruritus).

#### SERIOUS REACTIONS

• Overdose may produce profound bradycardia, AV block, hypotension, and bronchospasm.

 Abrupt withdrawal of metoprolol may result in diaphoresis, palpitations, headache, tremulousness, exacerbation of angina, MI, and ventricular arrhythmias.

 Metoprolol administration may precipitate CHF and MI in patients with heart disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.

 Hypoglycemia may occur in patients with previously controlled diabetes.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bronchospastic disease, diabetes, hyperthyroidism, impaired renal function, inadequate cardiac function, and peripheral vascular disease. Metoprolol crosses the placenta and is distributed in breast milk; therefore, care in lactation is warranted. Metoprolol use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, or hypothermia during childbirth. The safety and efficacy of metoprolol have not been established in children. In elderly patients, age-related peripheral vascular disease may increase susceptibility to decreased peripheral

circulation. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval.

Notify the physician of excessive fatigue, headache, prolonged dizziness, shortness of breath, or weight gain. BP for hypotension, respiratory status for shortness of breath, pattern of daily bowel activity and stool consistency, ECG for arrhythmias, and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 55 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. In those receiving metoprolol for treatment of angina, the onset, type (sharp, dull, squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, including exertion and emotional stress, should be recorded. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed. Do not abruptly discontinue metoprolol; may result in symptoms of diaphoresis, palpitations, headache, tremors, angina, MI, and ventricular arrhythmias.

#### Storage

Store at room temperature. Protect injection from freezing and light. Once injection opened, use immediately and discard any unused portion.

#### Administration

Immediate-release tablets are taken with food at regular intervals. May crush tablets if necessary.

Extended-release tablets should not be cut, crushed, or chewed. May take without regard to meals at the same general time each day.

For IV use, give undiluted as necessary. Administer IV injection

over 1 min. Monitor the patient's ECG and BP during administration.

## Metronidazole Hydrochloride

me-troe-ni'da-zole high-drohklor'ide ➡ Flagyl, Flagyl ER, MetroCream, MetroGel, MetroLotion, Noritate, Nydamax, Vandazole ➡ Florazole, Florazole ER, NidaGel, Rosasol

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Anti-infectives, nitroimidazoles, amebicides, dermatologic agents

#### **MECHANISM OF ACTION**

A nitroimidazole derivative that disrupts bacterial and protozoal DNA, inhibiting nucleic acid synthesis. *Therapeutic Effect:* Produces bactericidal, antiprotozoal, amebicidal, and trichomonacidal effects. Good anaerobic coverage. Produces anti-inflammatory and immunosuppressive effects when applied topically.

## PHARMACOKINETICS

Well absorbed from the GI tract; minimally absorbed after topical application. Protein binding: < 20%. Widely distributed; crosses blood-brain barrier. Metabolized in the liver to active metabolite. Primarily excreted in urine; partially eliminated in feces. Removed by hemodialysis. *Half-life:* 8 h (increased in alcoholic hepatic disease and in neonates).

### AVAILABILITY

Capsules (Flagyl): 375 mg. Tablets (Flagyl): 250 mg, 500 mg. Tablets (Extended Release [Flagyl ER]): 750 mg. Premixed IV Infusion: 500 mg/ 100 mL. Lotion: 0.75%. Topical Gel (MetroGel): 0.75%. Topical Cream (MetroCream): 0.75%. Topical Cream (Noritate): 1%. Vaginal Gel (MetroGel-Vaginal): 0.75%.

## INDICATIONS AND DOSAGES Amebiasis

#### PO

Adults, Elderly. 500-750 mg q8h for 7-10 days. Children. 35-50 mg/kg/day in divided doses q8h.

#### Trichomoniasis

#### PO

*Adults, Elderly.* 250 mg q8h for 7 days, 375 mg twice daily for 7 days, or 2 g as a single dose. *Children.* 15-30 mg/kg/day in divided doses q8h.

 Anaerobic skin and skin-structure infection, CNS, lower respiratory tract, bone, joint, intra-abdominal, gynelogic infections; endocarditis; septicemia IV, PO

Adults, Elderly, Children. Loading dose of 15 mg/kg, usually given IV initially. Then, 7.5 mg/kg/dose q6h IV or PO. A common dose in adults is 500 mg q6h. Maximum: 4 g/day.

#### Antibiotic-associated pseudomembranous colitis PO

Adults, Elderly. 250-500 mg 3-4 times a day for 10-14 days. *Children.* 30 mg/kg/day in divided doses q6h for 7-10 days.

Metronidazole Hydrochloride (Generic Name)

## Helicobacter pylori infections PO

*Adults, Elderly.* 250-500 mg 3 times a day (in combination). *Children.* 15-20 mg/kg/day in 2 divided doses.

## Bacterial vaginosis PO

*Adults*. 750 mg at bedtime for 7 days. INTRAVAGINAL

*Adults.* One full applicator twice a day, or once a day at bedtime for 5 days. Vandazole is always given once daily.

## Rosacea

TOPICAL

*Adults.* Apply thin layer of lotion or gel to affected area twice a day or cream once a day.

#### Dosage in hepatic impairment IV OR PO

Reduce dosage or administration frequency. The daily dose may need to be reduced by 50%-60% in severe hapatic disease.

## **OFF-LABEL USES**

Inflammatory bowel disease, pruritus of primary biliary cirrhosis (PBC), pelvic inflammatory disease, dental abscess.

## CONTRAINDICATIONS

Hypersensitivity to metronidazole or other nitroimidazole derivatives (also parabens with topical application).

Alcohol and alcohol-containing foods and products.

Do not use during the first trimester of pregnancy for trichomoniasis.

## INTERACTIONS

#### Drug

Alcohol and alcohol-containing products: May cause a disulfiramtype reaction. Generally, do not ingest during treatment and for 3 days after treatment. Oral medication solutions containing alcohol include amprenavir, ritonavir, sertraline, cough elixirs, and some intravenous products (e.g., paclitaxel). Bortezomib, possibly other drugs causing neuropathy: Increased risk of peripheral neuropathy. Busulfan: Decreased busulfan clearance. Carbamazepine: Increased carbamazepine levels possible; monitor. Cimetidine: Increased metronidazole concentrations. 5-FU, floxuridine: Possible increased risk of 5-FU toxicity. Disulfiram: May increase the risk of toxicity. Lithium: may increase risk of lithium toxicity; monitor. Mycophenolate, cyclosporine: Alterations in immunosuppressants reported; use with caution. Phenobarbital: May reduce metronidazole efficacy. Tacrolimus: Possible increased levels of tacrolimus. Warfarin: Potentiates anticoagulant effect; monitor INR. Herbal None known. Food Ethanol: (See Alcohol above).

## DIAGNOSTIC TEST EFFECTS

May increase serum LDH, AST (SGOT), and ALT (SGPT) levels. Mild decrease in leukocytes. May interfere with select laboratory assays involving oxidation-reduction of nicotinamide adenine dinucleotide (NADH).

## IV INCOMPATIBILITIES

NOTE: The manufacturer recommends against infusing with other medications or infusion solutions. Amphotericin B complex (Abelcet, AmBisome, Amphotec),

#### 1034 Metronidazole Hydrochloride

aztreonam, caspofungin (Cancidas), daptomycin, diazepam, drotrecogen alfa (Xigris), filgrastim (Neupogen), lansoprazole (Prevacid), pantoprazole (Protonix), phenytoin, procainamide, quinupristin/ dalfopristin (Synercid).

## **IV COMPATIBILITIES**

Diltiazem (Cardizem), dopamine, heparin, hydromorphone (Dilaudid), lorazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine.

## SIDE EFFECTS

#### Frequent

Systemic: Anorexia, nausea, dry mouth, metallic taste. Vaginal: Symptomatic cervicitis and vaginitis, abdominal cramps, uterine pain.

#### Occasional

Systemic: Diarrhea or constipation, vomiting, dizziness, erythematous rash, urticaria, reddish brown urine. Topical: Transient erythema, mild dryness, burning, irritation, stinging, tearing when applied too close to eyes.

Vaginal: Vaginal, perineal, or vulvar itching; vulvar swelling.

#### Rare

Mild, transient leukopenia; thrombophlebitis with IV therapy, visual impairment.

### SERIOUS REACTIONS

• Oral therapy may result in furry tongue, glossitis, cystitis, dysuria, pancreatitis, and flattening of T waves on ECG readings.

 Peripheral neuropathy, manifested as numbness and tingling in hands or feet, is usually reversible if treatment is stopped immediately after neurologic symptoms appear.

· Seizures occur occasionally.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with blood dyscrasias, central nervous system (CNS) disorders, severe hepatic dysfunction, predisposition to edema, and in those receiving corticosteroid therapy concurrently. Metronidazole readily crosses the placenta and is distributed in breast milk; caution warranted in lactation. Metronidazole use is contraindicated during the first trimester of pregnancy in women with trichomoniasis. Topical use during pregnancy or breastfeeding is discouraged. No age-related precautions have been noted in children; however, the safety and efficacy of topical administration in those younger than 21 yr have not been established. Age-related hepatic impairment may require a dosage adjustment in elderly patients. Prolonged indwelling catheters should be avoided. Avoid alcohol and alcohol-containing preparations (such as cough syrups and elixirs) during and for at least 3 days post therapy, excessive sunlight, exposure to very hot and cold temperatures, and hot and spicy foods while taking metronidazole. Avoid sexual intercourse, if taking metronidazole for trichomoniasis, until the full treatment is completed.

Urine may become reddish brown during therapy. Skin should be examined for rash and urticaria. Pattern of daily bowel activity and stool consistency should be monitored; document the number and characteristics of stools in those with amebiasis. Be alert for signs and symptoms of superinfection, including abdominal pain, moderate to severe diarrhea, severe anal or genital pruritus, and severe mouth soreness. In addition, be alert for neurologic symptoms such as dizziness and paresthesia. Any of these symptoms should be reported to a health care provider immediately for reevaluation of medical choice. Avoid tasks requiring mental alertness or motor skills until the drug is established. Metronidazole acts on papules, pustules, and erythema but has no effect on ocular problems (conjunctivitis, keratitis, blepharitis), rhinophyma (hypertrophy of nose), or telangiectasia.

#### Storage

Store all products at room temperature; protect from excessive heat and freezing. Do not remove overwrap of premixed infusion until time of use.

#### Administration

Regular-release tablets/capsules may be given without regard to meals. Extended-release tablets are taken on an empty stomach, at least 1 h before or 2 h after meals. Do not cut or crush extended-release product.

For topical dermatologic use, apply and rub in a thin film after washing; avoid eye contact.

For vaginal use, use supplied applicators to measure dose and administer. Once-daily dose is given at bedtime.

For IV use, infuse metronidazole over 30-60 min. Do not give as an IV bolus injection.

## **Metyrosine**

me-tye'roe-seen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Adrenal agents, catecholamine inhibitor

## **MECHANISM OF ACTION**

A tyrosine hydroxylase inhibitor that blocks conversion of tyrosine to dihydroxyphenylalanine, the rate-limiting step in the biosynthetic pathway of catecholamines. *Therapeutic Effect*: Reduces levels of endogenous catecholamines.

## PHARMACOKINETICS

Well absorbed from the GI tract. Metabolized in the liver. Excreted primarily in the urine. *Half-life*: 7.2 h.

## AVAILABILITY

Capsules: 250 mg (Demser).

## INDICATIONS AND DOSAGES Pheochromocytoma

PO

Adults, Elderly, Children 12 yr and older. Initially, 250 mg 4 times/day. Increase by 250-500 mg/day up to 4 g/day. Maintenance: 2-4 g/day in 4 divided doses.

## CONTRAINDICATIONS

Hypertension of unknown etiology, hypersensitivity to metyrosine or any component of the formulation.

#### INTERACTIONS Drug

Alcohol and CNS depressants: May increase CNS depressant effects.

Phenothiazines, haloperidol, metoclopramide: May potentiate extrapyramidal symptoms (EPS). Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Crystalluria may occur if hydration not adequate. Spurious increases in urinary catecholamines may be observed due to the presence of metabolites of the drug.

## SIDE EFFECTS

#### Frequent

Drowsiness, extrapyramidal symptoms, diarrhea.

### Occasional

Galactorrhea, edema of the breasts, nausea, vomiting, dry mouth, impotence, nasal congestion.

#### Rare

Lower extremity edema, urinary problems, urticaria, anemia, depression, disorientation, crystalluria.

## SERIOUS REACTIONS

Hematologic disorders

 (including eosinophilia,
 anemia, thrombocytopenia, and
 thrombocytosis), increased liver
 enzymes, peripheral edema, and
 hypersensitivity reactions such as
 urticaria and pharyngeal edema have
 been reported rarely.

• Psychic stimulation when the drug is discontinued.

#### PRECAUTIONS & CONSIDERATIONS

! Medication may be given in advance of adrenal tumor removal, usually 5-7 days before surgery.

Caution should be used with impaired liver or renal function. It is unknown whether metyrosine is distributed in breast milk; caution in lactation is warranted. Safety and efficacy of metyrosine have not been established in children younger than 12 yr old. Elderly patients with impaired renal function may need dose adjustment. Alcoholic beverages should be avoided during therapy.

Trismus may indicate overdosage and needs to be reported. Storage

Store at room temperature.

#### Administration

Take without regard to food. Maintain adequate fluid intake.

## Micafungin

mye'ca-fun'jin

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antifungal, systemic, echinocandins

## **MECHANISM OF ACTION**

An antifungal that inhibits the synthesis of glucan, a vital component of fungal cell formation, thereby damaging the fungal cell membrane. *Therapeutic Effect:* Fungicidal; active against a variety of *Candida* species.

## PHARMACOKINETICS

Distributed in tissue. Protein binding: > 99%. Slowly metabolized in liver to two metabolites. Excreted primarily in feces (72%) and to a lesser extent in the urine. Not removed by hemodialysis. *Half-life*: 13-18 h.

## AVAILABILITY

Powder for Injection: 50-mg, 100-mg vials.

## INDICATIONS AND DOSAGES

Invasive candidiasis; candidemia, peritonitis, and abscesses
 IV INFUSION
 Adults, Elderly. Give 100 mg daily.
 Esophageal candidiasis
 IV INFUSION
 Adults, Elderly. Give 150 mg daily.
 Candida infection prophylaxis following hematopoietic stem cell transplant
 IV INFUSION

Adults, Elderly. Give 50 mg daily.

## CONTRAINDICATIONS

Hypersensitivity to micafungin, any component of the product, or other echinocandins.

## INTERACTIONS

#### Drug

#### Sirolimus, nifedipine, itraconazole:

May increase AUC (exposure) of these drugs systemically; monitor for toxicity and need for dosage decrease.

#### Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, serum creatinine, SGOT (AST), SGPT (ALT). May decrease hemoglobin, hematocrit, platelet count, and serum potassium and magnesium levels.

## IV INCOMPATIBILITIES

Do not mix or infuse micafungin with any other medication. Precipitation promptly occurs.

## SIDE EFFECTS

#### Frequent

Diarrhea, nausea, vomiting, pyrexia, hypokalemia, thrombocytopenia, headache, mucosal inflammation, constipation.

#### Occasional

Phlebitis is more common when given peripherally. Histaminemediated symptoms, including rash, pruritus, facial swelling, and vasodilatation. Hypomagnesemia, elevated liver enzymes may occur.

## SERIOUS REACTIONS

 Hypersensitivity reactions (characterized by rash, facial swelling, pruritus, and a sensation of warmth) or anaphylaxis may occur.

- Isolated cases of acute intravascular hemolysis, hemolytic anemia, and hemoglobinuria.
- Isolated cases of hepatic dysfunction, hepatitis, and hepatic failure.
- Isolated cases of acute renal failure.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted for patients with advanced liver function impairment. It is not known if micafungin crosses the placenta or is excreted in human milk; it is possible the drug could cause fetal harm. Be aware that the safety and efficacy of micafungin have not been established in children. There are no special precautions for elderly patients.

Baseline temperature, liver function test results, and history of allergies should be obtained before giving the drug. If increased shortness of breath, itching, facial swelling, or a rash occurs, notify the physician. Report pain, burning, or swelling at the IV infusion site. Monitor for signs of clinical improvement.

#### Storage

Unopened vials are stored at room temperature. The reconstituted vial solution, before diluted to an infusion solution, may be held at room temperature for 24 h. The final infusion solution can be stored at room temperature for 24 h and must be protected from light. Discard the solution if it contains particulate or is discolored.

#### Administration

Micafungin is for intravenous infusion only. Aseptically add 5 mL of 0.9% NaCl (without a bacteriostatic agent) to each 50-mg vial or 100-mg vial to obtain a concentration of 10 mg/mL or 20 mg/mL, respectively. Gently swirl (but do not shake) to facilitate dissolution without foaming. The diluted solution should be protected from light. Further dilute with 100 mL of either 0.9% NaCl or D5W for infusion. Administer IV infusion over at least 60 min.

## Miconazole

mih-kon'ah-zole ▲ Baza Antifungal, Cruex, Desenex, Fungoid, Lotrimin AF Powder and Powder Spray, Micaderm, Micatin, Mitrazol, Monistat-1, Monistat-3, Monistat-7, Neosporin AF, Oravig, Zeasorb AF ▲ Monistat-1, Monistat-3, Monistat-7, Monistat-Derm, Micatin, Micozole

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Topical and vaginal dose forms OTC; buccal tablets Rx only.

**Classification:** Antifungals, imidazole

#### **MECHANISM OF ACTION**

An imidazole derivative that inhibits synthesis of ergosterol (vital component of fungal cell formation), damaging cell membrane. *Therapeutic Effect:* Fungistatic; may be fungicidal, depending on concentration.

## PHARMACOKINETICS

Widely distributed in tissues. Metabolized in liver. Primarily excreted in urine. *Half-life*: 24 h. Topical: No systemic absorption following application to intact skin. Intravaginally: Small amount absorbed systemically. Buccal: Small amount absorbed systemically.

## AVAILABILITY

*Buccal Tablet:* 50 mg (Oravig). *Vaginal Suppository:* 100 mg (Monistat-7), 200 mg (Monistat-3), 1200 mg (Monistat-1).

Vaginal Cream: 4% (Monistat-3), 2% (Monistat-7). Topical Cream: 2% (Baza Antifungal, Micaderm, Neosporin AF). Topical Powder: 2% (Desenex, Lotrimin AF, Micatin, Mitrazol, Zeasorb AF). Topical Lotion: 2% (Zeasorb AF). Topical Ointment: 2%. Topical Solution: 2% (Fungoid Tincture). Topical Spray Powder: 2% (Cruex, Desenex, Lotrimin-AF, Neosporin AF). Topical Spray Solution: 2% (Lotrimin AF, Neosporin AF). Topical Gel: 2% (Zeasorb AF).

## INDICATIONS AND DOSAGES

Vulvovaginal candidiasis INTRAVAGINALLY Adults, Elderly. One 200-mg suppository at bedtime for 3 days; one 100-mg suppository or one applicatorful at bedtime for 7 days, or one 1200 mg suppository at bedtime as single dose.

#### Topical fungal infections, cutaneous candidiasis TOPICAL

Adults, Elderly, Children 2 yr and older: Apply liberally 2 times/day, morning and evening. Usually for 2-4 wks.

#### • Oral thrush BUCCAL

Adults, Children 16 yr and older. Apply 50-mg buccal tablet to upper gum region (just above the incisor tooth) once daily for 14 days.

## CONTRAINDICATIONS

Hypersensitivity to miconazole or any component of the formulation. Topically: Children younger than 2 yr old.

## INTERACTIONS

#### Drug

**Ergot alkaloids, phenytoin:** Although systemic exposure is

nominal, could affect clearance of these agents; use caution.

**Nonoxynol-9:** Vaginal miconazole may inactivate the spermicide, leading to contraceptive failure. Do not use together.

**Oral hypoglycemics, warfarin:** May increase effects of these drugs, even with nonsystemic use (e.g., vaginal use).

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent

Phlebitis, fever, chills, rash, itching, nausea, vomiting.

Buccal use: Diarrhea, headache, nausea, dysgeusia, upper abdominal pain, vomiting.

#### Occasional

Dizziness, drowsiness, headache, flushed face, abdominal pain, constipation, diarrhea, decreased appetite. Topical: Itching, burning, stinging,

erythema, urticaria. Vaginal: Vulvovaginal burning, itching, irritation, headache, skin rash.

#### SERIOUS REACTIONS

• Anemia, thrombocytopenia, and liver toxicity occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with liver impairment. It is unknown whether miconazole crosses the placenta or is excreted in breast milk; therefore, caution warranted in pregnancy and lactation. No age-related precautions have been noted in children or elderly patients. Medical consultation is necessary before administering antibiotics because of the propensity of antibiotic therapy to evoke a vaginal yeast infection.

#### Storage

Store at room temperature. Protect buccal tablets from moisture.

#### Administration

Apply buccal tablet in the morning after brushing the teeth; apply with dry hands. Place rounded surface against upper gum just above the incisor tooth; hold in place for 30 seconds to ensure adhesion. Tablet will gradually dissolve. Alternate sides of the mouth with each application. Do not crush, chew, or swallow. Do not chew gum. If tablet falls off within the first 6 h, reposition the same tablet. If it still does not adhere, a new tablet should be placed.

For intravaginal use, insert high in vagina. Be aware that the base in the vaginal preparation interacts with certain latex products such as contraceptive diaphragm.

For topical administration, wash and dry area before applying medication. Apply a thin layer on affected area. Avoid contact with eyes. Keep areas clean, dry; wear light clothing for ventilation. Separate personal items in contact with affected areas.

## Midazolam Hydrochloride

mid-az′zoe-lam high-droh-klor′ide ★ Versed ▲ Apo-Midazolam Do not confuse Versed with VePesid.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

**Classification:** Benzodiazepines, preanesthetics, sedatives adjunct

## **MECHANISM OF ACTION**

A benzodiazepine that enhances the action of  $\gamma$ -aminobutyric acid, one of the major inhibitory neurotransmitters in the brain. *Therapeutic Effect:* Produces anxiolytic, hypnotic, anticonvulsant, muscle relaxant, and amnestic effects.

## PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration
PO	10-20	NA	NA
IV	1-5	5-7	20-30 min
IM	5-15	15-60	2-6 h

Well absorbed after IM administration. Protein binding: 97%. Metabolized in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 1-5 h.

## AVAILABILITY

Syrup: 2 mg/mL. Injection: 1 mg/mL, 5 mg/mL.

## INDICATIONS AND DOSAGES

Preoperative sedation PO Children. 0.25-0.5 mg/kg. Maximum: 20 mg. IV Children 6-12 yr: 0.025-0.05 mg/kg. Usual maximum: 10 mg. Children 6 mo to 5 vr. 0.05-0.1 mg/kg. Usual maximum: 6 mg. IM Adults, Elderly, 0.07-0.08 mg/kg 30-60 min before surgery. Children. 0.1-0.15 mg/kg 30-60 min before surgery. Maximum: 10 mg. Conscious sedation for diagnostic, therapeutic, and endoscopic procedures IV

*Adults, Elderly.* 1-2.5 mg over 2 min. Titrate as needed. Maximum total dose: 2.5-5 mg.

#### Conscious sedation during mechanical ventilation IV

Adults, Elderly. 0.01-0.05 mg/kg; may repeat q10-15min until adequately sedated. Then continuous infusion at initial rate of 0.02-0.1 mg/kg/h (1-7 mg/h). *Children older than 32 wks.* Initially, 1 mcg/kg/min as continuous infusion. *Children 32 wks and younger.* Initially, 0.5 mcg/kg/min as continuous infusion.

#### Status epilepticus IV

Children older than 2 mo. Loading dose of 0.15 mg/kg followed by continuous infusion of 1 mcg/kg/min. Titrate as needed. Range: 1-18 mcg/kg/min.

## CONTRAINDICATIONS

Acute alcohol intoxication, acute angle-closure glaucoma, coma, shock, hypersensitivity to drug, cherries (PO syrup), or other components.

Nelfinavir, ritonavir, indinavir, saquinavir: Contraindicated use.

## INTERACTIONS Drug

Alcohol, other CNS depressants: May increase CNS and respiratory depression and hypotensive effects of midazolam.

Erythromycin, clarithromycin, ketoconazole, itraconazole, fluconazole, miconazole (systemic), diltiazem,

**fluvoxamine:** Likely increased serum levels and prolonged effect of benzodiazepines.

Hypotension-producing medications: May increase hypotensive effects of midazolam.

#### Protease inhibitors: Increase

midazolam concentrations. Generally contraindicated.

#### Herbal

Kava kava, valerian: May increase CNS depression.

#### Food

**Grapefruit juice:** Increases the oral absorption and systemic availability of midazolam.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Albumin, ampicillin and sulbactam (Unasyn), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), bumetanide (Bumex), co-trimoxazole (Bactrim), dexamethasone (Decadron), fosphenytoin (Cerebyx), furosemide (Lasix), hydrocortisone (Solu-Cortef), methotrexate, nafcillin (Nafcil), sodium bicarbonate, sodium pentothal (Thiopental).

## **IV COMPATIBILITIES**

Amiodarone (Cordarone), calcium gluconate, diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), etomidate (Amidate), fentanyl (Sublimaze), heparin, hydromorphone (Dilaudid), insulin, lorazepam (Ativan), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

## SIDE EFFECTS

#### Frequent (4%-10%)

Decreased respiratory rate, tenderness at IM or IV injection site, pain during injection, oxygen desaturation, hiccups.

#### Occasional (2%-3%)

Hypotension, paradoxical CNS reaction.

#### Rare (< 2%)

Nausea, vomiting, headache, coughing.

## SERIOUS REACTIONS

• Inadequate or excessive dosage or improper administration may result in cerebral hypoxia, agitation, involuntary movements, hyperactivity, and combativeness.

• A too-rapid IV rate, excessive doses, or a single large dose increases the risk of respiratory depression or arrest.

• Respiratory depression or apnea may produce hypoxia and cardiac arrest.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute illness, CHF, pulmonary, renal, or hepatic impairment, severe fluid and electrolyte imbalance, and treated angle-closure glaucoma. Midazolam crosses the placenta; it is unknown whether midazolam is distributed in breast milk: caution in lactation is warranted Women on long-term therapy should use effective contraception during therapy. Notify the physician immediately if she becomes or might be pregnant. Neonates are more likely to experience respiratory depression. In elderly patients, age-related renal impairment may require dosage adjustment.

! Respiratory depression or apnea may produce hypoxia and cardiac arrest. Flumazenil would be reversal agent.

Midazolam produces an amnesic effect. Vital signs should be obtained before and after administering midazolam. Respiratory rate and oxygen saturation should be monitored continuously during parenteral administration to detect apnea and respiratory depression. Sedation should be assessed every 3-5 min.

! All doses of midazolam must be reduced when used in combination with any CNS depressant; serious respiratory and cardiovascular depression, including death, has occurred when midazolam is used in combination with other CNS depressants or is given too rapidly. Medically compromised and elderly patients are at the greatest risk for this effect.

#### Storage

Store vials at room temperature. Administration

! Midazolam dosage is individualized based on age, underlying disease, and medications and on the desired effect.

! Oral drug is not for home administration; nor should it be used chronically. Give only if patient is under direct observation of a health care professional. Measure oral midazolam solution with calibrated oral device to ensure accurate dosage.

Midazolam injection may be given undiluted or as an infusion. Ensure that resuscitative supplies, such as endotracheal tubes, suction equipment, and oxygen, are readily available. Administer the drug by slow IV injection in incremental doses. Give each incremental dose over 2 min or more and wait at least 2 min between doses. Reduce the IV rate in patients older than 60 yr, debilitated patients, and those with chronic diseases or impaired pulmonary function. A too-rapid IV rate, excessive doses, or a single large dose increases the risk of respiratory depression or arrest.

For IM use, inject the drug deep into a large muscle mass, such as the gluteus maximus.

Do *not* inject intrathecally or via epidural.

## **Midodrine**

mid'o-dreen ★ Amatine, ProAmatine Do not confuse ProAmatine with Amantadine or protamine, or midodrine with Midrin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Vasopressor; orthostatic hypotension adjunct

#### MECHANISM OF ACTION

A vasopressor that forms the active metabolite desglymidodrine, an  $\alpha_1$ agonist, activating alpha receptors of the arteriolar and venous vasculature. *Therapeutic Effect:* Increases vascular tone and BP.

#### PHARMACOKINETICS

Peak: 1-2 h. Bioavailability 90%. *Half-life:* 3-4 h.

#### AVAILABILITY

Tablets: 2.5 mg, 5 mg, 10 mg.

# INDICATIONS AND DOSAGES • Orthostatic hypotension PO

Adults, Elderly. 10 mg 3 times a day. Give during the day when patient is upright, such as upon arising, midday, and late afternoon. Do not give later than 6 PM.

 Dosage in renal impairment
 For adults and elderly patients, give 2.5 mg 3 times a day; increase gradually, as tolerated.

#### CONTRAINDICATIONS

Acute renal function impairment, persistent hypertension, pheochromocytoma, severe cardiac disease, thyrotoxicosis, urine retention.

Midodrine (Generic Name)

#### INTERACTIONS

#### Drug

**α-Adrenergic agonists:** Increased risk of pressor effects. **Digoxin:** May have additive bradycardia effects. **Sodium-retaining steroids (such** 

**as fludrocortisone):** May increase sodium retention.

Vasoconstrictors: May have an additive vasoconstricting effect. Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (7%-20%)

Paresthesia, piloerection, pruritus, dysuria, supine hypertension. Occasional (< 1%-7%)

Pain, rash, chills, headache, facial flushing, confusion, dry mouth, anxiety.

## SERIOUS REACTIONS

· Supine hypertension.

#### **PRECAUTIONS & CONSIDERATIONS**

Midodrine can cause marked elevation of supine blood pressure, and it should be used only in patients whose lives are considerably impaired by their condition despite standard clinical care. There is no strong evidence that this drug greatly improves daily quality of life.

Caution is warranted with a history of vision problems and renal and hepatic impairment. BP and liver and renal function test results should be monitored. OTC medications, such as cough, cold, and diet preparations, should be avoided because they may affect BP.

#### Administration

Do not take the last dose of the day after the evening meal or < 4 h before bedtime. Do not take the medication while lying down. Caution warranted with position changes due to possible development of orthostatic hypotension.

## **Mifepristone**

miff-eh-pris'tone Mifeprex Do not confuse Mifeprex with Mirapex or mifepristone with misoprostol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

Classification: Abortifacients

## **MECHANISM OF ACTION**

An abortifacient that has antiprogestational activity resulting from competitive interaction with progesterone. Inhibits the activity of endogenous or exogenous progesterone. Also has antiglucocorticoid and weak antiandrogenic activity. *Therapeutic Effect:* Terminates early pregnancy by interrupting progesterone support to the endometrium and sensitizing the uterine muscle to prostaglandins.

## PHARMACOKINETICS

Rapidly absorbed; absolute bioavailability (20 mg oral dose) is 90%, 98% protein bound; nonlinear kinetics. Metabolized in liver by CYP450 3A4 hepatic enzymes. Eliminated in feces and urine. *Half-life:* 18 h.

## AVAILABILITY

Tablets: 200 mg.

## INDICATIONS AND DOSAGES

#### Termination of pregnancy at ≤ 49 days (7 wks) gestation PO

*Adults.* Day 1: 600 mg mifepristone as single dose. Day 3: 400 mcg misoprostol. Day 14: Post-treatment examination.

## **OFF-LABEL USES**

Cushing's syndrome, endometriosis, intrauterine fetal death or nonviable early pregnancy, postcoital contraception, refractory hormoneresponsive breast cancer.

## CONTRAINDICATIONS

Chronic adrenal failure, concurrent long-term steroid or anticoagulant therapy, confirmed or suspected ectopic pregnancy, intrauterine device (IUD) in place, hemorrhagic disorders, inherited porphyria.

## INTERACTIONS

#### Drug

## Anticoagulants and chronic corticosteroid therapy:

Mifepristone is contraindicated in any patients taking these drugs.

Carbamazepine, phenobarbital, phenytoin, rifampin: May increase the metabolism of mifepristone. Herbal

## St. John's wort: May increase the

metabolism of mifepristone. Food

**Grapefruit juice:** May inhibit the metabolism of mifepristone.

## DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin level and hematocrit and RBC count.

## SIDE EFFECTS

## Frequent (> 10%)

Headache, dizziness, abdominal pain, nausea, vomiting, diarrhea, fatigue.

#### Occasional (3%-10%)

Uterine hemorrhage, insomnia, vaginitis, dyspepsia, back pain, fever, viral infections, rigors.

#### Rare (1%-2%)

Anxiety, syncope, anemia, asthenia, leg pain, sinusitis, leucorrhea.

## SERIOUS REACTIONS

 With long-term use or overdose, potential for adrenocortical insufficiency or adrenal failure.

• Remote potential for teratogenesis should pregnancy not be successfully terminated with use.

• Rare reports of allergic reactions, including toxic epidermal necrolysis or serious skin rash.

• Potential for serious systemic bacterial infection following abortion, such as sepsis.

• Prolonged or heavy bleeding following regimen.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disease, diabetes, hepatic or renal impairment, hypertension, severe anemia, and in persons older than 35 yr of age or who smoke more than 10 cigarettes a day. Be aware that anticonvulsants, erythromycin, itraconazole, ketoconazole, and rifampin may inhibit the metabolism of mifepristone. Uterine cramping and vaginal bleeding may occur. Hemoglobin level and hematocrit should be monitored. An IUD, if in place, should be removed before therapy begins.

! Sometimes serious or fatal infection and bleeding occur very

rapidly following spontaneous, surgical, and medical abortions, including the use of mifepristone. Immediately report sustained fever > 100.4° F, severe abdominal pain, prolonged heavy bleeding, syncope. Bacterial infections may have atypical presentations. Health care provider must supervise administration of mifepristone. Clinical examination is necessary to confirm complete termination of pregnancy 14 days post treatment. Bleeding for 9-16 days is not unexpected; heavy bleeding must be reported immediately.

#### Storage

Store tablets in original carton at room temperature.

#### Administration

! Treatment with mifepristone and misoprostol requires three office visits; only distributed to registered prescribers in the United States.

Complete termination occurs in the majority of patients within 4-24 h after taking misoprostol.

#### Miglitol

mig-lee'tall

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antidiabetic agents,  $\alpha$ -glucosidase inhibitors

#### **MECHANISM OF ACTION**

An  $\alpha$ -glucosidase inhibitor that delays the digestion of ingested carbohydrates into simple sugars such as glucose. *Therapeutic Effect:* Lowers postprandial hyperglycemia.

#### PHARMACOKINETICS

PO: Peak plasma levels 2-3 h; negligible plasma protein binding, not metabolized, urinary excretion.

## AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg.

## INDICATIONS AND DOSAGES Diabetes mellitus type 2

Use as single drug or in combination with insulin or oral hypoglycemics (sulfonylureas, metformin) when diet control is ineffective in controlling blood glucose levels. PO

Adults, Elderly. Initially, 25 mg 3 times a day with first bite of each main meal. Maintenance: 50 mg 3 times a day. Maximum: 100 mg 3 times a day.

## CONTRAINDICATIONS

Colonic ulceration, diabetic ketoacidosis, hypersensitivity to miglitol, inflammatory bowel disease, partial intestinal obstruction. Use in those with severe renal dysfunction (SCr > 2 mg/dL) not recommended.

## INTERACTIONS

#### Drug

Digoxin: May affect bioavailability of oral digoxin, and dose adjustment may be needed. Herbal None known. Food

None known.

#### **DIAGNOSTIC TEST EFFECTS**

Transient low serum iron without changes to hemoglobin or hematocrit.

## SIDE EFFECTS

#### Frequent (10%-40%)

Flatulence, loose stools, diarrhea, abdominal pain.

Miglitol (Generic Name)

#### **Occasional (5%)**

Rash.

#### SERIOUS REACTIONS

 None reported. Hypoglycemia usually only occurs if other antidiabetic agents are used in the regimen.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment. Adequate studies have not been done in pregnant women. Miglitol is distributed to a very low amount in breast milk; caution warranted in lactation. Safety and efficacy have not been established in children.

Food intake and blood glucose should be monitored before and during therapy. A 1-h postprandial glucose may be helpful in optimizing dosage during initial treatment. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry glucose-based supplement for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy. Type 2 diabetic patients may be using insulin concomitantly; if symptomatic hypoglycemia occurs while taking miglitol, use glucose rather than sucrose to reverse hypoglycemic effect

owing to interference with sucrose metabolism.

#### Storage

Store at room temperature.

#### Administration

Take with the first bite of each main meal. If a meal is skipped, do not give that dose.

#### Miglustat

mig-lew'stat ★ 👾 Zavesca

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Metabolic agents, enzyme inhibitor

#### MECHANISM OF ACTION

A Gaucher's disease agent that inhibits the enzyme glucosylceramide synthase, reducing the rate of synthesis of most glycosphingolipids. Allows the residual activity of the deficient enzyme, glucocerebrosidase, to be more effective in degrading lysosomal storage within tissues. *Therapeutic Effect*: Minimizes conditions associated with Gaucher's disease, such as anemia and bone disease.

#### PHARMACOKINETICS

PO: Maximum plasma levels attained in 2-2.5 h; oral bioavailability 97%, no plasma protein binding. Excreted unchanged in the urine. *Half-life:* Approximately 6-7 h.

#### AVAILABILITY

Capsules: 100 mg.

INDICATIONS AND DOSAGES • Gaucher's disease PO *Adults, Elderly.* One 100-mg capsule 3 times a day at regular intervals.

Dosage in renal impairment

Adults. CrCl 50-70 mL/min: Reduce to 100 mg twice a day. CrCl 30-49 mL/min: 100 mg once a day. CrCl < 30 mL/min: Not recommended.

## CONTRAINDICATIONS

Women who are or may become pregnant, severe renal impairment, hypersensitivity.

### INTERACTIONS

#### Drug

Aspirin, NSAIDs, other salicylates: May decrease platelet aggregation. Imiglucerase: May decrease the effects of imiglucerase.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known but should provide pretreatment neurologic evaluation.

#### SIDE EFFECTS

Expected (65%-89%) Diarrhea, weight loss. Frequent (11%-39%) Hand tremor, flatulence, headache,

abdominal pain, nausea.

Occasional (4%-7%)

Paresthesia, anorexia, dyspepsia, leg cramps, vomiting, neuropathy.

#### SERIOUS REACTIONS

• Thrombocytopenia occurs in 7% of patients.

• Overdose produces dizziness and neutropenia.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired fertility and renal

function. Reliable contraceptive methods are necessary during miglustat treatment and for 3 mo afterward. Notify the physician and plan to stop miglustat therapy before trying to conceive. Avoid highcarbohydrate foods during miglustat treatment if diarrhea occurs. Contraindicated in pregnancy; extreme caution is warranted in lactation.

Notify the physician of hand tremor. Adequate hydration should be maintained. Baseline neurologic evaluation should be performed, with follow-up evaluations every 6 mo throughout treatment. Pattern of daily bowel activity and stool consistency and weight should be monitored.

#### Storage

Store at room temperature. Administration

Take miglustat without regard to food. Do not open, crush, or break capsules.

## Milnacipran

mil-na′sip-ran ★ Savella

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antidepressants, selective serotonin/norepinephrine reuptake inhibitor (SNRI)

#### **MECHANISM OF ACTION**

An agent related to SNRI antidepressants that inhibits serotonin and norepinephrine reuptake at neuronal presynaptic membranes; is a less potent inhibitor of dopamine reuptake. *Therapeutic Effect*: Relieves fibromyalgia pain through an unknown mechanism.

Milnacipran (Generic Name)

## PHARMACOKINETICS

Well absorbed from the GI tract. Undergoes minimal CYP450 metabolism, with the majority of the dose excreted unchanged in urine (55%), and has a low binding to plasma proteins (13%). *Half-life:* 6-8 h.

## AVAILABILITY

*Tablets*: 12.5 mg, 25 mg, 50 mg, 100 mg.

## INDICATIONS AND DOSAGES Fibromyalgia

PO

Adults, Elderly. Give 12.5 mg once daily on day 1. On days 2-3: give 12.5 mg twice per day. On days 4-7: increase to 25 mg twice per day. After day 7: may give 50 mg twice daily. If needed, maximum is 100 mg twice per day.

#### Dosage adjustments for renal impairment

CrCl 5-29 mL/min: Reduce maintenance dose to 25 mg PO twice per day. If needed, maximum is 50 mg twice daily. End-stage renal disease: Not recommended.

## CONTRAINDICATIONS

Hypersensitivity to drug. Uncontrolled angle-closure glaucoma; use during or within 14 days of MAOIs. Contains FD&C Yellow No. 5 (tartrazine), which may cause allergic-type reactions (including bronchial asthma) in susceptible persons. Avoid use with linezolid (Zyvox) and IV methylene blue due to risk of serotonin syndrome.

## INTERACTIONS

#### Drug

Alcohol: May increase risk of liver dysfunction. Milnacipran

may increase the effects of alcohol.

Buspirone, meperidine, serotonin agonists, SSRIs/SNRIs, sibutramine, tramadol, trazodone: May increase risk of serotonin syndrome.

MAOIs, linezolid: May cause serotonin syndrome, characterized by autonomic hyperactivity, coma, diaphoresis, excitement, hyperthermia, and rigidity. Contraindicated.

#### Herbal

St John's wort: May increase risk of serotonin-related adverse effects.

## Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

**Frequent (≥ 10%)** 

Nausea, constipation, headache, dizziness, hot flash, insomnia.

## Occasional (3%-10%)

Vomiting, dry mouth, migraine, fatigue, anorexia, abdominal pain, diaphoresis/hyperhidrosis, anxiety, BP increased, increased heart rate, rash.

#### Rare (2% or less)

Blurred vision, pruritus, sexual dysfunction, paresthesia, tremor, insomnia, chest discomfort.

## SERIOUS REACTIONS

• May slightly increase the patient's heart rate or blood pressure.

 Increased liver enzymes and reports of severe liver injury, including fulminant hepatitis, occur rarely.

• May increase the risk of bleeding events due to platelet dysfunction.

• Activation of mania or hypomania in bipolar patients can occur.

SIADH and hyponatremia may occur with SSRIs and SNRIs.
Withdrawal syndrome may occur with abrupt discontinuation. Gradually taper dose.

## **PRECAUTIONS & CONSIDERATIONS**

Antidepressants may increase the risk of suicidal ideation in children. adolescents, and young adults with depression and psychiatric disorders. Closely monitor when initiating therapy, especially the first 2 mo; monitor for suicidal thoughts, other changes in mood, and for unusual behaviors. Milnacipran is not approved for the treatment of depression or bipolar disorders. Caution is warranted with conditions that may slow gastric emptying, hepatic impairment, history of anemia, history of seizures, renal impairment, mania, hypomania, bipolar, and suicidal tendencies. The effect of milnacipran on pregnancy or lactation is not known. Breastfeeding is not recommended. Be aware that the safety and efficacy of this drug have not been established in children

Dizziness may occur, so avoid alcohol and tasks that require mental alertness or motor skills until the effects of the drug are known. Blood chemistry tests to assess hepatic and renal function should be performed before and periodically during therapy. Monitor for improvement in symptoms. Report unusual changes in behavior promptly. **Storage** 

Store at room temperature. Administration

Take without regard to meals. Take with food or milk if GI distress occurs. The therapeutic effects (decrease in pain and fibromyalgia scores) will be noted within 1-4 wks. Do not abruptly discontinue the drug. Milrinone Lactate

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

Classification: Inotropes

#### **MECHANISM OF ACTION**

A cardiac inotropic agent that inhibits phosphodiesterase, which increases cyclic adenosine monophosphate and potentiates the delivery of calcium to myocardial contractile systems. *Therapeutic Effect:* Relaxes vascular muscle, causing vasodilation. Increases cardiac output; decreases pulmonary capillary wedge pressure and vascular resistance.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	5-15 min	NA	NA

Protein binding: 70%. Primarily excreted unchanged in urine. *Half-life:* 2.4 h.

#### AVAILABILITY

Injection: 1 mg/mL. IV Infusion (Premix): 200 mcg/mL.

# INDICATIONS AND DOSAGES Short-term management of congestive heart failure (CHF)

IV INFUSION

Adults. Initially, 50 mcg/kg over 10 min. Continue with maintenance infusion rate of 0.375-0.75 mcg/ kg/min based on hemodynamic and clinical response. Total daily dosage: 0.59-1.13 mg/kg/day.

## Dosage in renal impairment

The recommended adjusted maintenance infusion rates are as

## 1050 Milrinone Lactate

follows; titrate to attain clinical goals. CrCl > 50 mL/min: No adjustment needed.

CrCl 41-50 mL/min: 0.43 mcg/kg/min. CrCl 31-40 mL/min: 0.38 mcg/kg/min. CrCl 21-30 mL/min: 0.33 mcg/kg/min. CrCl 11-20 mL/min: 0.28 mcg/kg/min. CrCl 6-10 mL/min: 0.23 mcg/kg/min. CrCl 5 mL/min or less: 0.20 mcg/ kg/min.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

**Cardiac glycosides:** Produces additive inotropic effects.

Herbal

None known.

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Diazepam, esmolol, furosemide (Lasix), imipenem/cilastatin (Primaxin), lansoprazole (Prevacid), lidocaine, ondansetron (Zofran), pantoprazole, (Protonix), phenytoin, procainamide.

## **IV COMPATIBILITIES**

Calcium gluconate, digoxin (Lanoxin), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), heparin, magnesium, midazolam (Versed), nitroglycerin, potassium, propofol (Diprivan).

## SIDE EFFECTS

Occasional (1%-3%) Headache, hypotension. Rare (< 1%) Angina, chest pain.

## SERIOUS REACTIONS

• Supraventricular and ventricular arrhythmias (12%), nonsustained ventricular tachycardia (2%), and sustained ventricular tachycardia (1%) may occur.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with atrial fibrillation or flutter, history of ventricular arrhythmias, impaired renal function, and severe obstructive aortic or pulmonic valvular disease. It is unknown whether milrinone crosses the placenta or is distributed in breast milk; therefore, caution is warranted in lactation. The safety and efficacy of milrinone have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment.

Notify the physician if palpitations or chest pain occurs. Cardiac output, heart rate, BP, renal function, and serum potassium levels should be assessed before beginning treatment and during IV therapy. Breath sounds for crackles and rhonchi and skin for edema should also be assessed. Headache, tremors should be reported immediately; should not use for more than 5 days concurrently. **Storage** 

Store at room temperature. Do not freeze. Avoid excessive heat. For premix infusion bags, remove overwrap just prior to adminstration. Administration

For IV infusion, dilute 20-mg (20-mL) vial with 80 mL diluent (0.9% NaCl, D5W) or 10-mg (10-mL) vial with 40 mL diluent to provide concentration of 200 mcg/mL. For a loading-dose IV injection, administer milrinone undiluted slowly over 10 min. Use a controlled-rate infusion device for maintenance infusion. Monitor for arrhythmias and hypotension during IV therapy. If one or both of these conditions occur, reduce or temporarily discontinue infusion until condition stabilizes.

## Minocycline Hydrochloride

mi-noe-sye'kleen high-droh-klor'ide Arestin, Dynacin, Minocin, Minocin PAC, Solodyn **Do not confuse Dynacin with Dynabac or Minocin with Mithracin or niacin.** 

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Tetracycline anti-infective

#### **MECHANISM OF ACTION**

A tetracycline antibiotic that inhibits bacterial protein synthesis by binding to ribosomes. *Therapeutic Effects:* Bacteriostatic.

## PHARMACOKINETICS

PO: Peak 2-3 h. 55%-88% protein bound; excreted in urine, feces, breast milk; crosses placenta. *Half-life:* 11-17 h.

## AVAILABILITY

Capsules (Minocin): 50 mg, 75 mg, 100 mg. Tablets (Dynacin): 50 mg, 75 mg, 100 mg. Microspheres for Periodontal Use: 1 mg (Arestin). Extended-Release Tablets: 45 mg, 55 mg, 65 mg, 80 mg, 90 mg, 105 mg, 115 mg, 135 mg (Solodyn). Powder for Injection (Minocin): 100 mg.

#### INDICATIONS AND DOSAGES

Mild, moderate, or severe prostate, urinary tract, central nervous system (CNS) infections (excluding meningitis); uncomplicated gonorrhea; brucellosis; skin granulomas; cholera; trachoma; nocardiasis; yaws; syphillis when penicillins are contraindicated PO/IV

Adults, Elderly. Initially, 100-200 mg, then 100 mg q12h or 50 mg q6h. PO/IV Children older than 8 yr. Initially,

4 mg/kg, then 2 mg/kg q12h.

#### Periodontitis

*Adults.* 1 unit dose cartridge (1 mg) per periodontal pocket.

## Non-nodular moderate to severe acne vulgaris

Adults. 200 mg PO for 1 dose, then 100 mg q12h. Alternatively, 100 or 200 mg for 1 dose, then 50 mg q6h.

*Children 8 yr and older.* Initially 4 mg/kg for 1 dose, then 2 mg/kg q12h (do not exceed adult doses). PO (EXTENDED-RELEASE TABLETS, SOLODYN) *Adults and Children 12 yr and older.* Dose is roughly 1 mg/kg

once per day given for 12 wks. Use following conversions for patient weight: 126-135 kg: 135 mg once daily.

103-125 kg: 115 mg once daily. 78-102 kg: 90 mg once daily. 55-77 kg: 65 mg once daily. 45-54 kg: 45 mg once daily.

## • Renal impairment dosing

Do not exceed an adult dose of 200 mg total per day.

## CONTRAINDICATIONS

Children younger than 8 yr, hypersensitivity to tetracyclines, last half of pregnancy.

Minocycline Hydrochloride (Generic Name)

## INTERACTIONS

## Drug

#### Carbamazepine, phenytoin:

May decrease minocycline blood concentration.

Cholestyramine, colestipol: May decrease minocycline absorption. Isotretinoin: Contraindicated use.

**Oral contraceptives:** May decrease the effects of oral contraceptives.

#### Herbal

**St. John's wort:** May increase the risk of photosensitivity.

#### Food

Antacids; milk; other magnesium-, iron-, calcium-, and aluminumcontaining products: Decreased anti-infective effect. Separate times of administration.

## IV INCOMPATIBILITIES

Do not mix minocycline with any other medications.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, amylase, bilirubin, AST (SGOT), and ALT (SGPT) levels. May increase eosinophil counts.

## SIDE EFFECTS

#### Frequent

Dizziness, light-headedness, diarrhea, nausea, vomiting, abdominal cramps, possibly severe photosensitivity, drowsiness, vertigo.

## Occasional

Altered pigmentation of skin or mucous membranes, rectal or genital pruritus, stomatitis, eosinophilia.

## SERIOUS REACTIONS

• Superinfection (especially fungal), anaphylaxis, and benign intracranial hypertension may occur. • Benign increased intracranial pressure (pseudotumor cerebri).

• Pseudomembranous colitis from *Clostridium difficile* infection may occur during treatment or at any time several mo after therapy is discontinued.

• Tinnitus and hearing loss have been reported during IV use.

• Interstitial nephritis, azotemia, metabolic acidosis, acute renal failure.

• Rare cases of autoimmune syndromes, including a lupus-like syndrome or hepatitis with jaundice, eosinophilia.

• Tooth discoloration and enamel hypoplasia in children.

• Esophageal ulceration from improper administration.

Prolonged chronic use has a possible association with thyroid cancer.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with renal impairment and in those who cannot avoid sun or ultraviolet exposure because such exposure may produce a severe photosensitivity reaction.

History of allergies, especially to tetracyclines or sulfites, should be determined before drug therapy. Dizziness, drowsiness, and vertigo may occur while taking minocycline. Avoid tasks that require mental alertness or motor skills until response to the drug is established. Pattern of daily bowel activity, stool consistency, food intake and tolerance, renal function, skin for rash should be assessed. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, diarrhea, sore tongue, fever, fatigue, and ulceration or changes of the oral mucosa or tongue; report symptoms to health care provider immediately. BP and level of consciousness should be monitored because of the potential for increased intracranial pressure. Do not use in patients under 8 yr or in pregnancy because of the likelihood of permanent intrinsic staining in erupted permanent teeth not associated with the calcification stage. Advise patient to report any signs or symptoms associated with frequent loose stools or bloody diarrhea, both of which could indicate pseudomembranous colitis or C. difficile infection. Advise patient to maintain compliance with oral contraceptive medications while using an additional nonhormonal form of contraception throughout the duration of therapy.

#### Storage

Store the drug at room temperature. Administration

Ingestion of adequate amounts of fluids along with capsule and tablet forms is recommended to reduce the risk of esophageal irritation and ulceration. Do not give oral forms at bedtime. Pellet-filled capsules and extended-release tablets should be swallowed whole.

Microspheres for periodontal use are administered by the periodontist.

Injectable form is rarely used but is given by slow IV infusion only after dilution. Reconstitute vial with 5 mL sterile water for injection and immediately further dilute to 500 mL or 1000 mL with 0.9% NaCl, D5W, D5W/0.9%NaCl, or lactated Ringer's but not with other solutions containing calcium because a precipitate may form, especially in neutral and alkaline solutions. The infusion is acidic and may cause thrombophlebitis. Infuse over a period of 6 h.

## Minoxidil

min-nox'i-dill
★ Rogaine, Rogaine Extra
Strength, Loniten
▲ Apo-Gain, Minox
Do not confuse Loniten with
Lotensin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC (topical solution)

**Classification:** Antihypertensives, vasodilators

## **MECHANISM OF ACTION**

An antihypertensive and hair growth stimulant that has direct action on vascular smooth muscle, producing vasodilation of arterioles. *Therapeutic Effect:* Decreases peripheral vascular resistance and BP; increases cutaneous blood flow; stimulates hair follicle epithelium and hair follicle growth.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5 h	2-8 h	2-5 days

Well absorbed from the GI tract; minimal absorption after topical application. Protein binding: None. Widely distributed. Metabolized in the liver to active metabolite. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 4.2 h.

#### AVAILABILITY

Tablets (Loniten): 2.5 mg, 10 mg. Topical Solution (Rogaine): 2% (20 mg/mL). Topical Solution (Rogaine Extra Strength): 5% (50 mg/mL).

Minoxidil (Generic Name)

#### Topical Foam: 5%

## INDICATIONS AND DOSAGES

 Severe symptomatic hypertension, hypertension associated with organ damage; hypertension that has failed to respond to maximal therapeutic dosages of a diuretic or two other antihypertensives PO

Adults, Children 12 yr and older: Initially, 5 mg/day. Increase after at least 3-day intervals to 10 mg, then 20 mg, then up to 40 mg/day in 1-2 doses. Maximum: 100 mg/day. *Elderly*. Initially, 2.5 mg/day. May increase gradually. Maintenance: 10-40 mg/day. Maximum: 100 mg/ day.

*Children under 12 yr.* Initially, 0.1-0.2 mg/kg (5-mg maximum) daily. Gradually increase at minimum 3-day intervals. Maintenance: 0.25-1 mg/kg/day divided in 1-2 doses. Maximum: 50 mg/day.

#### Hair regrowth

#### TOPICAL

*Adults.* 1 mL to affected areas of scalp 2 times a day. Total daily dose not to exceed 2 mL.

#### CONTRAINDICATIONS

Pheochromocytoma, hypersensitivity.

#### INTERACTIONS

#### Drug

Central nervous system (CNS) depressants used in conscious sedation technique: May increase hypotensive effect.

**Parenteral antihypertensives:** May increase hypotensive effect.

## NSAIDs, indomethacin,

#### sympathomimetics: May

decrease the hypotensive effects of minoxidil.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase plasma renin activity and BUN, serum alkaline phosphatase, serum creatinine, and serum sodium levels. May decrease blood hemoglobin and hematocrit levels and erythrocyte count.

### SIDE EFFECTS

#### Frequent

PO: Edema with concurrent weight gain, hypertrichosis (elongation, thickening, increased pigmentation of fine body hair; develops in 80% of patients within 3-6 wks after beginning therapy).

#### Occasional

PO: T-wave changes (usually revert to pretreatment state with continued therapy or drug withdrawal). Topical: Pruritus, rash, dry or flaking skin, erythema.

#### Rare

PO: Breast tenderness, headache, photosensitivity reaction. Topical: Allergic reaction, alopecia, burning sensation at scalp, soreness

at hair root, headache, visual disturbances.

## SERIOUS REACTIONS

 Tachycardia and angina pectoris may occur because of increased oxygen demands associated with increased heart rate and cardiac output.

 Fluid and electrolyte imbalance and CHF may occur, especially if a diuretic is not given concurrently with minoxidil.

• Too rapid reduction in BP may result in syncope, cerebrovascular accident (CVA), myocardial
infarction (MI), and ocular or vestibular ischemia.

 Hypersensitivity may occur, usually in form of skin rash; serious rashes include bullous rash and Stevens-Johnson syndrome.

 Pericardial effusion and tamponade may be seen in patients with impaired renal function who are not on dialysis.

# **PRECAUTIONS & CONSIDERATIONS**

Minoxidil is generally reserved for hypertensive patients who do not respond adequately to maximum therapeutic doses of a diuretic and 2 other agents. Angina may worsen or appear for the first time during treatment; use with caution in patients with recent MI or angina. Also use with caution in patients with fluid retention; may exacerbate CHF or renal impairment. Minoxidil crosses the placenta and is distributed in breast milk; use during pregnancy and lactation is not recommended. No age-related precautions have been noted in children, but dosages must be carefully titrated. Elderly patients are more sensitive to the drug's hypotensive effects. Exposure to sunlight and artificial light sources should be avoided.

BP should be assessed on both arms. Take the patient's pulse for 1 full min immediately before giving the medication. If pulse rate increases 20 beats/min or more over baseline, or systolic or diastolic BP decreases more than 20 mm Hg, withhold minoxidil and contact the physician. Weight and electrolytes should also be monitored during therapy. Report any sudden weight gain over 5 lb, or any dyspnea. Because of the cardiovascular effects of this medication, patients should be assessed for stress tolerance

before initiating therapy. Postural changes should be made slowly in consideration of possible orthostatic hypotension developing.

#### Storage

Store at room temperature away from excessive heat. The topical solutions and foam are flammable and should be kept away from flame.

#### Administration

Take oral minoxidil without regard to food. Can take with food if GI upset occurs. Crush tablets if necessary. Maximum BP response occurs 3-7 days after initiation of minoxidil therapy.

For topical use, shampoo and dry hair before applying medication. Wash hands immediately after application. Avoid getting in the eyes. Treatment must continue on a permanent basis and any cessation of treatment will reverse new hair growth. A response to treatment is usually seen within 4 mo.

## Mirtazapine

mir-taz'a-peen ★ Remeron, Remeron Soltab ★ Remeron, Remeron RD Do not confuse Remeron with Premarin.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, tetracyclic

#### MECHANISM OF ACTION

A tetracyclic compound that acts as an antagonist at presynaptic  $\alpha_2$ -adrenergic receptors, increasing both norepinephrine and serotonin neurotransmission. Has low anticholinergic activity. *Therapeutic Effect:* Relieves depression and produces sedative effects.

Mirtazapine (Generic Name)

# PHARMACOKINETICS

Rapidly and completely absorbed after PO administration; absorption not affected by food. Protein binding: 85%. Metabolized in the liver. Primarily excreted in urine. Unknown if removed by hemodialysis. *Halflife*: 20-40 h (longer in males [37 h] than females [26 h]).

# AVAILABILITY

Tablets: 7.5 mg, 15 mg, 30 mg, 45 mg. Tablets (Disintegrating): 15 mg, 30 mg, 45 mg.

# INDICATIONS AND DOSAGES Depression

PO

*Adults.* Initially, 15 mg at bedtime. May increase by 15 mg/day q1-2wk. Maximum: 45 mg/day. *Elderly.* Initially, 7.5 mg at bedtime. May increase by 7.5-15 mg/day q1-2wk. Maximum: 45 mg/day.

# **OFF-LABEL USES**

Essential tremor, intractable pruritus.

# CONTRAINDICATIONS

Use within 14 days of MAOIs, hypersensitivity. Avoid use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

# INTERACTIONS

## Drug

Alcohol, diazepam and other benzodiazepines: May increase impairment of cognition and motor skills.

**Linezolid:** May increase the risk of serotonin syndrome.

**MAOIs:** May increase the risk of neuroleptic malignant syndrome, hypertensive crisis, and severe seizures. Contraindicated.

**Opioid analgesics:** May impair cognitive or motor performance. **Herbal** 

## None known.

## Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum cholesterol, triglyceride, AST (SGOT), and ALT (SGPT) levels. May reduce serum sodium.

# SIDE EFFECTS

### Frequent

Somnolence (54%), dry mouth (25%), increased appetite (17%), constipation (13%), weight gain (12%).

## Occasional

Asthenia (8%), dizziness (7%), flu-like symptoms (5%), abnormal dreams (4%).

# Rare

Abdominal discomfort, vasodilation, paresthesia, acne, dry skin, thirst, arthralgia.

# SERIOUS REACTIONS

• Mirtazapine poses a higher risk of seizures than tricyclic antidepressants, especially in those with no previous history of seizures.

• Overdose may produce cardiovascular effects, such as severe orthostatic hypotension, dizziness, tachycardia, palpitations, and arrhythmias.

 Abrupt discontinuation after prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

- · Agranulocytosis occurs rarely.
- Hyponatremia.

• Severe skin reactions are rare but may include Stevens-Johnson syndrome, bullous dermatitis, erythema multiforme and toxic epidermal necrolysis.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disorders, GI disorders, angle-closure glaucoma, benign prostatic hyperplasia, hepatic or renal impairment, and urine retention. It is unknown whether mirtazapine is distributed in breast milk; caution is warranted in lactation. Antidepressant drugs increase the risk of suicidal thinking and behavior (suicidality) in children, adolescents, and young adults (ages 18-24) with major depressive disorder (MDD) and other psychiatric disorders. Monitor patients for the emergence of suicidal thoughts, agitation, irritability, or other unusal changes in behavior during therapy. The safety and efficacy of mirtazapine have not been established in children. In elderly patients, age-related renal impairment may require cautious use.

Drowsiness and dizziness may occur, so avoid alcohol and tasks that require mental alertness or motor skills. CBC, serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels should be assessed before and periodically during therapy to assess hepatic and renal function in patients on long-term therapy. ECG should also be performed to assess for arrhythmias. Use caution in surgery with sedation or general anesthesia because of the greater risk of hypotensive episode.

#### Storage

Store at room temperature. Keep disintegrating tablets in blister pack until time of use.

## Administration

! Make sure at least 14 days elapse between the use of MAOIs and mirtazapine.

Take mirtazapine at bedtime without regard to food. Scored tablets may be crushed or broken if needed.

Orally disintegrating tablets may be placed on tongue to dissolve. No water is necessary. Avoid abrupt discontinuation after long-term use.

### Misoprostol

mis-oh-pros'toll
Cytotec
Do not confuse Cytotec with
Cytomel.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: X

**Classification:** Gastrointestinal agents, prostaglandin analog, gastric mucosal protectant, abortifacient (when used with mifepristone)

# **MECHANISM OF ACTION**

A prostaglandin that inhibits basal, nocturnal gastric acid secretion via direct action on parietal cells. *Therapeutic Effect:* Increases production of protective gastric mucus. Produces uterine contractions and cervical ripening.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Rapidly converted to active metabolite. Primarily excreted in urine. *Half-life:* 20-40 min.

### AVAILABILITY

*Tablets:* 100 mcg, 200 mcg (Cytotec).

# INDICATIONS AND DOSAGES Prevention of NSAID-induced

gastric ulcer PO

*Adults*. 200 mcg 4 times/day with food (last dose at bedtime).

Misoprostol (Generic Name)

Continue for duration of NSAID therapy. May reduce dosage to 100 mcg if 200-mcg dose is not tolerable.

*Elderly.* 100-200 mcg 4 times/day with food.

# • Termination of early pregnancy PO

See mifepristone monograph for FDA-approved regimen. Only used in combination with mifepristone.

# **OFF-LABEL USES**

Treatment of gastric ulcer; also used in low-dose intravaginal protocols for cervical ripening.

# CONTRAINDICATIONS

Pregnancy (produces uterine contractions), hypersensitivity to misoprostol or any component of the formulation.

# INTERACTIONS

#### Drug

Antacids: May decrease misoprostol effectiveness.

**NSAIDs:** May increase upper GI distress or cause ulceration.

**Phenylbutazone:** May increase neurosensory effects (headache, dizziness, ataxia).

### Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

Frequent Abdominal pain, diarrhea. Occasional Nausea, flatulence, dyspepsia, headache. Rare

Vomiting, constipation.

# SERIOUS REACTIONS

• Overdosage may produce sedation, tremor, convulsions, dyspnea, palpitations, hypotension, and bradycardia.

• Hyperstimulation of uterus and possible uterine rupture (use during labor).

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with renal impairment and women of childbearing age. Females must use an effective contraception method during treatment. Be aware that misoprostol is contraindicated in pregnancy and will produce uterine contractions, uterine bleeding, and expulsion of products of conception. May also be teratogenic in first trimester. Be aware that it is unknown whether misoprostol is distributed in breast milk; caution is warranted in lactation. Women of childbearing potential should not use this drug unless capable of complying with effective contraceptive measures. Safety and efficacy have not been established in children. No age-related precautions have been noted in elderly patients.

#### Storage

Store at room temperature in a dry area.

#### Administration

Take with or after meals to minimize diarrhea. The last dose of the day is taken at bedtime.

# Mitotane

mye'toe-tane ★ 🐏 Lysodren

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antineoplastics, adrenal hormone modifier

Mitotane (Generic Name)

# **MECHANISM OF ACTION**

A hormonal agent that inhibits activity of the adrenal cortex. *Therapeutic Effect:* Suppresses functional and nonfunctional adrenocortical neoplasms by direct cytoxic effect.

# PHARMACOKINETICS

Adequately absorbed orally (40%). Hepatic metabolism; excreted in urine, bile. *Half-life:* 18-19 days.

# AVAILABILITY

Tablets: 500 mg.

# INDICATIONS AND DOSAGES Adrenocortical carcinomas PO

*Adults, Elderly.* Initially, 2-6 g/day in 3-4 divided doses. Increase by 2-4 g/day every 3-7 days up to 9-10 g/day. Range: 2-16 g/day.

# **OFF-LABEL USES**

Treatment of Cushing's syndrome.

# CONTRAINDICATIONS

Known hypersensitivity to mitotane. NOTE: Temporarily discontinue if shock or severe trauma, since adrenal suppression is the drug's prime action. Exogenous steroids should be administered, since the depressed adrenal may not immediately start to secrete steroids in response to the traumatic event.

## INTERACTIONS

#### Drug

All central nervous system (CNS) depressants: May increase CNS depression. Corticosteroids: Decreased effects; use hydrocortisone instead. Warfarin: Accelerates warfarin metabolism; monitor INR. Herbal

None known.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease levels of plasma cortisol, urinary 17-hydroxycorticosteroids, proteinbound iodine, and serum uric acid.

# SIDE EFFECTS

#### Frequent (> 15%)

Anorexia, nausea, vomiting, diarrhea, lethargy, somnolence, adrenocortical insufficiency, dizziness, vertigo, maculopapular rash, hypouricemia.

## Occasional (<15%)

Blurred or double vision, retinopathy, hearing loss, excessive salivation, urine abnormalities (hematuria, cystitis, albuminuria), hypertension, orthostatic hypotension, flushing, wheezing, dyspnea, generalized aching, fever.

## SERIOUS REACTIONS

• Brain damage and functional impairment may occur with long-term, high-dosage therapy.

• Adrenal insufficiency may require adrenal steroid replacement.

## PRECAUTIONS & CONSIDERATIONS

Brain damage and functional impairment may occur with long-term, high-dose therapy. Drug may cause adrenal hypofunction; administer hydrocortisone or mineralocorticoid as needed after evaluation and monitoring.

Caution is warranted with impaired hepatic function. Vaccinations and coming in contact with crowds, people with known infections, and anyone who has recently received a live-virus vaccine should be avoided.

Dizziness and drowsiness may occur; tasks that require mental alertness or motor skills should be avoided. Notify the physician if darkening of the skin, diarrhea, depression, loss of appetite, nausea and vomiting, or rash occurs. Adequate hydration should be maintained to prevent urinary side effects. Liver function test results, serum uric acid levels, and urine tests, including urine chemistry and urinalysis, should be assessed. Be aware that neurologic and behavioral assessments are performed periodically on those receiving prolonged therapy (> 2 yr). **Storage** 

Store at room temperature. Administration

CAUTION: The manufacturer recommends the following precautions with this cytotoxic drug. To minimize the risk of dermal exposure, always wear impervious gloves when handling. Do not crush the tablets. Perssonnel should avoid exposure to crushed and/or broken tablets. If contact occurs, wash immediately and thoroughly.

Taking with food may improve oral absorption.

Modafinil mode-ah-feen'awl

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: IV

**Classification:** Central nervous system (CNS) stimulants

#### MECHANISM OF ACTION

An  $\alpha_1$ -agonist that may bind to dopamine reuptake carrier sites, increasing  $\alpha$  activity and decreasing  $\Theta$ , T, and  $\beta$  brain wave activity. *Therapeutic Effect*: Reduces the number of sleep episodes and total daytime sleep.

### PHARMACOKINETICS

Well absorbed. Protein binding: 60%. Widely distributed. Metabolized in the liver. Excreted by the kidneys. Unknown if removed by hemodialysis. *Half-life*: 8-10 h.

#### AVAILABILITY

Tablets: 100 mg, 200 mg.

# INDICATIONS AND DOSAGES Narcolepsy, other sleep disorders PO

Adults, Elderly, Adolescents 16 yr and older. 200-400 mg/day.

## Dosage in hepatic impairment

Reduce normal dosage by 50% in those with moderate to severe liver disease.

#### CONTRAINDICATIONS

Hypersensitivity to modafinil or armodafinil.

## INTERACTIONS

Drug

Antifungals, erythromycins, other CYP450 isoenzyme inhibitors: Could result in increased modafinil concentrations.

**Cyclosporine, hormonal contraceptives, theophylline:** May decrease plasma concentrations of these drugs.

Diazepam, phenytoin, propranolol, tricyclic antidepressants, warfarin; and other CYPC19 and CYP2C9 substrates: May increase plasma

concentrations of these drugs. Other CNS stimulants: May

increase CNS stimulation.

Herbal

None known.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase gamma glutamyltransferase (GGT) and alkaline phosphatase.

Modafinil (Generic Name)

# **Mitoxantrone**

mye-toe-zan'trone

CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastics, synthetic anthraquinone

# **MECHANISM OF ACTION**

An anthracenedione that is related to the anthracyclines and that inhibits DNA and RNA synthesis. Active throughout the entire cell cycle. Inhibits B-cell, T-cell, and macrophage proliferation and the secretion of interferon gamma, tumor necrosis factor- $\alpha$ , and interleukin-2. *Therapeutic Effect*: Causes cell death. Slows worsening of neurologic disability and reduces relapse rate in MS.

# PHARMACOKINETICS

Protein binding: 78%. Widely distributed. Metabolized in the liver. Primarily eliminated in feces by the biliary system. Not removed by hemodialysis. *Half-life*: 2.3-13 days.

# AVAILABILITY

Injection: 2 mg/mL.

# INDICATIONS AND DOSAGES Acute myelogenous leukemia (AML)

IV Adults, Elderly, Children 2 yr and older. 12 mg/m<sup>2</sup> once a day on days 1-3 is a common first-cycle regimen. Children younger than 2 yr. 0.4 mg/kg once a day for 3-5 days. > AML in relapse

#### AML in relapse IV

Adults, Elderly, Children older than 2 yr. 12 mg/m<sup>2</sup> once a day for 3-5 days is common regimen.

## Prostate cancer

IV Adults, Elderly. 12-14 mg/m<sup>2</sup> every 21 days. ► Multiple sclerosis

IV Adults, Elderly. 12 mg/m<sup>2</sup>/dose q3mo.

# **OFF-LABEL USES**

Treatment of breast or hepatic carcinoma, ovarian cancer, various sarcomas, non-Hodgkin's lymphoma.

# CONTRAINDICATIONS

Baseline left ventricular ejection fraction < 50%, cumulative lifetime mitoxantrone dose of 140 mg/m<sup>2</sup>, hypersensitivity.

# INTERACTIONS

#### Drug

Aspirin, other salicylates, NSAIDs: Avoid use.

Antigout medications: May decrease the effects of these drugs.

Bone marrow depressants: May increase myelosuppression.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin and uric acid, AST (SGOT), and ALT (SGPT) levels.

# IV INCOMPATIBILITIES

NOTE: It is recommended that mitoxantrone not be mixed with other drugs.

Amphotericin B, azithromycin, most cephalosporins, clindamycin, dexamethasone, diazepam, digoxin, ertapenem, fosphenytoin, furosemide, heparin, lansoprazole, methylprednisolone, nafcillin, nitroprusside, paclitaxel (Taxol), pantoprazole, phenytoin, pemetrexed, piperacillin/tazobactum (Zosyn), potassium and sodium phosphates, propofol, ticarcillin, TPN, voriconazole.

# 🗏 IV COMPATIBILITIES

Allopurinol (Aloprim), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), ondansetron (Zofran), potassium chloride.

#### SIDE EFFECTS

#### Expected

Temporary discoloration of urine and sclera (blue-green).

### Frequent (> 10%)

Nausea, vomiting, diarrhea, cough, headache, stomatitis, abdominal discomfort, fever, alopecia.

#### Occasional (4%-9%)

Ecchymosis, fungal infection, conjunctivitis, urinary tract infection.

Rare (3%) Arrhythmias.

#### SERIOUS REACTIONS

Myelosuppression may be severe, resulting in GI bleeding, hematologic toxicity, sepsis, and pneumonia.
Renal failure, seizures, and jaundice may occur.

• Extravasation can cause serious pain, discoloration, skin necrosis.

• Cardiac arrhythmias, ECG changes, heart failure. Decreased ejection fraction may be permanent.

Anaphylaxis (rare).

• Mitoxantrone increases the risk of developing secondary acute myeloid leukemia.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired hepatobiliary

function and preexisting myelosuppression and in those who have previously been treated with cardiotoxic medications. Patients with hepatic impairment have higher mitoxantrone exposure because of reduced clearance. Mitoxantrone use should be avoided during pregnancy, especially during the first trimester, because it can cause fetal harm. Contraceptive measures should be used. Breastfeeding also is not recommended. The safety and efficacy of mitoxantrone have not been established in children. No age-related precautions have been noted in elderly patients. Vaccinations and coming in contact with crowds and people with known infections should be avoided.

Urine will appear blue or green and sclera may have a blue tint for 24 h after mitoxantrone administration. Notify the physician if fever, signs of local infection, unusual bleeding from any site, bluish skin, burning or erythema of oral mucosa, difficulty swallowing, oral ulcerations, or sore throat occurs. Adequate hydration should be maintained to protect against renal impairment. Hematologic status and liver, renal, and pulmonary function test.

## Storage

Store vials at room temperature. Do not freeze.

#### Administration

! CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

! Must be diluted before use. Dilute with at least 50 mL D5W or 0.9% NaCl. Do not administer by subcutaneous, IM, intrathecal, or intraarterial injection. Do not give IV push over < 3 min. Give IV bolus over at least 3 min or intermittent IV infusion over 15-60 min into the tubing of a freely running IV infusion of 0.9% NaCl or dextrose 5% injection. Administer IV infusion of 0.02-0.5 mg/mL in D5W or 0.9% NaCl.

Take care to avoid extravasation.

While not a vesicant, significant irritation may occur. If extravasation occurs, the infusion should be stopped and completed via another vein, preferably in another limb. Use of a larger vein is preferable.

# SIDE EFFECTS

## Frequent

Headache, nausea, nervousness, rhinitis, diarrhea, back pain, anxiety, insomnia, dizziness, and dyspepsia. Occasional

Anorexia, dry mouth or skin, muscle stiffness, polydipsia, paraesthesia, tremor, vomiting.

# SERIOUS REACTIONS

• Mania, delusions, hallucinations, suicidal ideation and aggression, some resulting in hospitalization.

- Serious rash, including Stevens-Johnson syndrome, TEN, and eosinophilia.
- Serious hypersensitivity with angioedema (rare).

• Chest pain, palpitations, dyspnea, and transient ischemic T-wave changes reported in association with certain cardiac problems.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic impairment or a history of clinically significant mitral valve prolapse, left ventricular hypertrophy, and seizures. Nonhormonal contraceptive methods should be used during modafinil therapy and 1 mo afterward because modafinil decreases the effectiveness of hormonal contraceptives. It is unknown whether modafinil is excreted in breast milk; caution warranted in lactation. Use caution when giving modafinil to pregnant women. The safety and efficacy of this drug have not been established in children younger than 16 yr. Age-related hepatic or renal impairment may require decreased dosage in elderly patients.

Dizziness may occur, so tasks that require mental alertness and motor skills should be avoided until response to the drug is established. Sleep pattern should be assessed throughout therapy. Should only be used in patients with a diagnosis of narcolepsy, obstructive sleep apneahypopnea syndrome, or shift-work sleep disorder.

#### Storage

Store at room temperature.

## Administration

Take modafinil without regard to food. If treating narcolepsy, dose is taken as single dose in the morning. In patients with shift-work sleep disorder, the drug is taken 1 h before the start of the work shift.

# Moexipril Hydrochloride

moe-ex'a-prile high-droh-klor'ide

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antihypertensives, angiotensin-converting enzyme (ACE) inhibitors

# **MECHANISM OF ACTION**

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system and prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. *Therapeutic Effect:* Reduces peripheral arterial resistance and lowers BP.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	3-6 h	24 h

Incompletely absorbed from the GI tract. Food decreases drug absorption. Rapidly converted to active

Moexipril Hydrochloride (Generic Name)

# 1062 Moexipril Hydrochloride

metabolite. Protein binding: 50%. Primarily recovered in feces, partially excreted in urine. Unknown whether removed by dialysis. *Half-life:* 1 h, metabolite 2-9 h.

## AVAILABILITY

Tablets: 7.5 mg, 15 mg.

# INDICATIONS AND DOSAGES

## Hypertension

PO

*Adults, Elderly.* For patients not receiving diuretics, initial dose is 7.5 mg once a day 1 h before meals. Adjust according to BP effect. Maintenance: 7.5-30 mg a day in 1-2 divided doses 1 h before meals.

# Hypertension in patients with impaired renal function PO

Adults, Elderly. 3.75 mg once a day in patients with creatinine clearance of 40 mL/min or less. Maximum: May titrate up to 15 mg/day.

# CONTRAINDICATIONS

Hypersensitivity to moexipril, history of angioedema related to ACE inhibitors, hereditary angioedema.

# INTERACTIONS

#### Drug

#### Alcohol, antihypertensives,

**diuretics:** May increase the effects of moexipril.

**Lithium:** Increased risk of lithium toxicity.

NSAIDs, salicylates: Renal adverse effects may be increased. May decrease effectiveness of moexipril.

Potassium-sparing diuretics, drospirenone, eplerenone, potassium supplements: Increased risk of hyperkalemia.

## Herbal

None known.

## Food

All food: Decreases absorption by up to 50%. Administer on empty stomatch.

# DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive serum antinuclear antibody titer.

# SIDE EFFECTS

#### Occasional

Cough, headache (6%); dizziness (4%); fatigue (3%); hyperkalemia. **Rare** 

Flushing, rash, myalgia, nausea, vomiting.

# SERIOUS REACTIONS

• Excessive hypotension (first-dose syncope) may occur in patients with CHF and in those who are severely salt or volume depleted.

• Angioedema (swelling of face and lips) occurs rarely.

Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus (SLE), and impaired renal function.
Nephrotic syndrome may be noted in those with history of renal disease.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with angina, aortic stenosis, cerebrovascular disease, cerebrovascular and coronary insufficiency, hypovolemia, ischemic heart disease, renal impairment, severe CHF, sodium depletion, and those on dialysis and/or receiving diuretics. Moexipril crosses the placenta, is distributed in breast milk, and may cause fetal or neonatal morbidity or mortality. Discontinue as soon as possible after pregnancy is detected. Safety and efficacy of moexipril have not been established in children. In elderly patients, age-related renal impairment may require cautious use of moexipril.

Dizziness may occur. Notify the physician if chest pain, cough, difficulty breathing, fever, sore throat, or swelling of the eyes, face, feet, hands, lips, or tongue occurs. BP should be obtained immediately before giving each moexipril dose, in addition to regular monitoring. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the patient in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning moexipril therapy, then every 2 wks for the next 3 mo, and periodically thereafter. BUN, serum creatinine, serum potassium, renal function, and white blood cell count (WBC) should also be monitored. Lungs should be auscultated for rales. Heart rate should be assessed for irregularities. Storage

Store at room temperature. Administration

Take moexipril 1 h before meals. Crush tablets if necessary.

## **Mometasone Furoate**

mo-met'a-sone fur'oh-ate ★ Asmanex Twisthaler, Elocon, Nasonex ♥ Nasonex

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Respiratory agents, dermatologics, synthetic corticosteroids

## **MECHANISM OF ACTION**

A medium-potency adrenocorticosteroid that inhibits the release of inflammatory cells, preventing early activation of the allergic reaction. *Therapeutic Effect:* Decreases response to seasonal and perennial rhinitis, stabilizes asthma, reduces

inflammatory skin response.

# PHARMACOKINETICS

Undetectable in plasma. Protein binding: 98%-99%. The swallowed portion undergoes extensive metabolism. Excreted primarily through bile and, to a lesser extent, urine. *Half-life:* 5.8 h (nasal).

# AVAILABILITY

Nasal Spray: 50 mcg/spray. Topical Cream: 0.1%. Topical Ointment: 0.1%. Topical Lotion: 0.1%. Oral Inhalation: 110 mcg/actuation, 220 mcg/actuation (Asmanex Twisthaler).

# INDICATIONS AND DOSAGES Allergic rhinitis

NASAL SPRAY Adults, Elderly, Children 12 yr and older. 2 sprays in each nostril once a day. Children 2-11 yr. 1 spray in each nostril once a day. > Asthma

# Astnma INHALATION

Adults, Elderly, Children 12 yr and older. Initially inhale 220 mcg (1 puff) once a day. Maximum: 880 mcg once a day. Children 4-11 yr. Initially, 110 mcg once daily.

 Corticosteroid-responsive dermatoses

TOPICAL Adults, Elderly, Children 12 yr and older. Apply cream, lotion, or ointment to affected area once a day.

## Nasal polyp

NASAL SPRAY Adults, Elderly. 2 sprays in each nostril 2 times/day.

# CONTRAINDICATIONS

Hypersensitivity to any corticosteroid, persistently positive sputum cultures for *Candida albicans*, systemic fungal infections, untreated localized infection involving nasal mucosa. For Asmanex: Known hypersensitivity to milk proteins or any ingredients of the inhaler, as the inhaler contains trace milk proteins and lactose.

# INTERACTIONS

#### Drug

Ketoconazole (potent inhibitor of

**CYP3A4):** May increase plasma levels of mometasone.

#### Herbal

None known.

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Nasal irritation, stinging, sore throat, headache.

#### Rare

Nasal or pharyngeal candidiasis, sinus infection, HPA axis suppression.

# SERIOUS REACTIONS

 An acute hypersensitivity reaction, including urticaria, angioedema, and severe bronchospasm, occurs rarely.

• As with other inhaled drugs for asthma, an immediate increase in wheezing may occur after use. If it occurs immediately treat with a fast-acting inhaled bronchodilator. Discontinue the inhaler. • Transfer from systemic to local steroid therapy may unmask previously suppressed bronchial asthma condition.

• Nasal septum perforation with prolonged improper use of nasal spray.

· Adrenal insufficiency.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with adrenal insufficiency, cirrhosis, diabetes mellitus, glaucoma, hypothyroidism, osteoporosis, tuberculosis, and untreated infection. It is unknown whether mometasone crosses the placenta or is distributed in breast milk; caution warranted in lactation and pregnancy. In children, prolonged treatment and high dosages may decrease cortisol secretion and short-term growth rate. Some young children do not generate sufficient inspiratory flow to use the dry powder inhaler. No age-related precautions have been noted in elderly patients.

Pulse rate and quality, ABG levels, and respiratory rate, depth, rhythm, and type should be monitored. Symptoms should start to improve within 2 days of the first dose, but the drug's maximum benefit may take up to 2 wks to appear. Notify the physician if symptoms fail to improve. **Storage** 

Store at room temperature in a dry place protected from light. Discard the Twisthaler 45 days after opening the foil pouch or when dose counter reads "00," whichever is first.

#### Administration

For inhalation, see instructions for use of the Twisthaler. Exhale completely and place the mouthpiece between the lips. Inhale and hold breath for as long as possible before exhaling. Allow 1 min between inhalations to promote deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness and oral candidiasis. Once-daily inhalation doses are administered in the evening.

For nasal use, clear the nasal passages before using mometasone. Prime nasal unit before first use by pumping the activator 10 times or until a fine spray appears, away from others. If the unit has not been used for 1 wk, reprime by pumping until a fine spray appears. Tilt head slightly forward. Insert spray tip up into the nostril, pointing toward the inflamed nasal turbinates, away from nasal septum. Spray the drug into the nostril while holding the other nostril closed, and at the same time inhale through the nose.

# Montelukast

mon-te'loo-kast

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Respiratory agents, anti-inflammatory agents, leukotriene receptor antagonists

## **MECHANISM OF ACTION**

An antiasthmatic that binds to cysteinyl leukotriene receptors, inhibiting the effects of leukotrienes on bronchial smooth muscle. *Therapeutic Effect:* Decreases bronchoconstriction, vascular permeability, mucosal edema, and mucus production.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	NA	NA	24 h
PO (chewable)	NA	NA	24 h

Rapidly absorbed from the GI tract. Protein binding: 99%. Extensively metabolized in the liver. Excreted almost exclusively in feces. *Half-life*: 2.7-5.5 h (slightly longer in elderly patients).

## AVAILABILITY

Oral Granules: 4 mg/packet. Tablets: 10 mg. Tablets (Chewable): 4 mg, 5 mg.

# INDICATIONS AND DOSAGES Bronchial asthma and seasonal and perennial allergic rhinitis

**and perennial allergic rhinitis** PO

Adults, Elderly, Adolescents older than 14 yr. One 10-mg tablet a day, taken in the evening. Children 6-14 yr. One 5-mg chewable tablet a day, taken in the evening.

*Children 2-5 yr.* One 4-mg chewable tablet a day, taken in the evening, or 1 packet of 4-mg oral granules. *Children, Infants age 6-23 mo.* 1 packet 4-mg oral granules daily, in the evening.

# For the prevention of exerciseinduced bronchospasm

Adults, Children 15 yr and older. 10 mg PO for 1 dose 2 h or more before exercise. Do not take additional doses within 24 h. If already on for another indication, do not take additional dose for exercise. Rescue medications (e.g.,  $\beta$ agonists) should be available.

## CONTRAINDICATIONS

Hypersensitivity. Not for acute asthma attacks.

Montelukast (Generic Name)

# INTERACTIONS

## Drug

CYP2C8 substrates (cerivastatin, repaglinide, rosiglitazone, ploglitazone, paclitaxel):

Montelukast inhibits CYP2C8 and may raise concentrations and side effect risks of these drugs.

Phenobarbital, rifampin: May decrease montelukast's duration of action.

Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels. May rarely increase eosinophils or decrease platelets.

# SIDE EFFECTS

## Frequent ( $\geq 5\%$ )

Fever, headache, pharyngitis, cough, abdominal pain, diarrhea, otitis, rhinorrhea, sinusitis, upper respiratory infection.

### **Occasional (4%)**

Influenza.

#### Rare (2%-3%)

Abdominal pain, dyspepsia, dizziness, fatigue, dental pain.

# SERIOUS REACTIONS

 Systemic eosinophilia, Churg-Strauss syndrome, vasculitis, thrombocytopenia, erythema multiforme have all been rarely reported.

· Rare cases of eosinophilic infiltration of the liver (hypersensivity hepatitis), cholestatic hepatitis, liver injury, pancreatitis.

· Reports post-market of agitation, aggressive behavior, confusion (disorientation), hallucinations, seizures, tremor, mood disorders, suicidal ideation.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic impairment and in those who are tapering systemic corticosteroid dosage during montelukast therapy. Use montelukast during pregnancy only if necessary. It is unknown whether montelukast is excreted in breast milk. No age-related precautions have been noted in children older than 6 yr or in elderly patients. Parents of children with phenylketonuria should be informed that montelukast chewable tablets contain phenylalanine, a component of aspartame. Be aware montelukast is not intended to treat acute asthma attacks. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid aspirin and NSAIDs while taking montelukast.

Pulse rate and quality, as well as respiratory depth, rate, rhythm, and type, should be monitored. Fingernails and lips should also be assessed for a blue or dusky color in light-skinned patients and a gray color in dark-skinned patients, which may be signs of hypoxemia.

Report any neuropsychiatric events, such as changes in mood, behavior, or sleep, promptly.

#### Storage

Store all products at room temperature. Granules and chewable tablets should be kept in original containers and protected from light and moisture.

## Administration

Take montelukast tablets in the evening without regard to food. Do not abruptly substitute montelukast for inhaled or oral corticosteroids. Take montelukast as prescribed, even during symptom-free periods and exacerbations. Do not alter the dosage or abruptly discontinue other asthma medications.

Chewable tablets should be chewed thoroughly before swallowing. For oral granules, may administer directly in mouth; dissolved in 1 tsp (5 mL) of cold or room-temperature formula or breast milk or mixed with a spoonful of cold food such as applesauce, carrots, rice, or ice cream.

# Morphine

mor'feen

 Astramorph, Avinza, DepoDur, Duramorph, Infumorph, Kadian, MS Contin, Oramorph SR
 Doloral, Kadian, M-Eslon, MS Contin, MS IR, Statex
 Do not confuse morphine with hydromorphone.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

**Classification:** Analgesics, opiate agonists

## **MECHANISM OF ACTION**

An opioid agonist that binds with opioid receptors in the central nervous system (CNS). *Therapeutic Effect:* Alters the perception of and emotional response to pain; produces generalized CNS depression.

## PHARMACOKINETICS

Route	Onset	Peak (h)	Duration (h)
Oral solution	NA	1	3-5
Tablets	NA	1	3-5
Tablets (ER)	NA	3-4	8-12

Route	Onset	Peak (h)	Duration (h)
IV	Rapid	0.3	3-5
IM	5-30 min	0.5-1	3-5
Epidural	NA	1	12-20
Subcutane- ous	NA	1.1-5	3-5
Rectal	NA	0.5-1	3-7

Variably absorbed from the GI tract. Readily absorbed after IM or SC administration. Protein binding: 20%-35%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 2-3 h (increased in patients with hepatic disease).

# AVAILABILITY

ORAL PRODUCTS Oral Solution: 10 mg/5 mL, 20 mg/ 5 mL. Concentrated Oral Solution: 100 mg/5 mL. Tablets, Immediate Release: 15 mg, 30 mg. Capsules (Extended Release [Kadian]): 10 mg, 20 mg, 30 mg, 50 mg, 60 mg, 80 mg, 100 mg. Capules (Biphasic Extended Release [Avinza]): 30 mg, 45 mg, 60 mg, 75 mg, 90 mg, 120 mg. Tablets (Extended Release [MS Contin, Oramorph SR]): 15 mg, 30 mg, 60 mg, 100 mg, 200 mg. RECTAL Suppository: 5 mg, 10 mg, 20 mg, 30 mg. INJECTABLE PRODUCTS Solution for Injection: 0.5 mg/mL, 1 mg/mL, 2 mg/mL, 4 mg/mL, 5 mg/mL, 8 mg/mL, 10 mg/mL, 15 mg/mL, 25 mg/mL, 50 mg/mL. Solution for Injection (Preservative Free): 0.5 mg/mL, 1 mg/mL, 10 mg/ mL, 25 mg/mL, 50 mg/mL.

Morphine (Generic Name)

*Epidural and Intrathecal via Infusion Device (Infumorph PF):* 10 mg/mL, 25 mg/mL.

Epidural, Intrathecal, IV Infusion Device (Astramorph PF, Duramorph PF): 0.5 mg/mL, 1 mg/mL, 4 mg/mL. IV Infusion (via Patient-Controlled Analgesia [PCA]): 1 mg/mL, 5 mg/mL.

Liposomal Extended-Release Suspension (DepoDur, Epidural use only): 10 mg/mL, 15 mg/1.5mL.

# INDICATIONS AND DOSAGES

Dosage should be titrated to desired effect.

! Accidental overdose has occured with use of high-potency prompt-release oral solutions.

! Always double-check selected product and strength against medication order, appropriateness of route, and age and opiate tolerance of the patient.

## Analgesia

PO (PROMPT RELEASE) *Adults, Elderly.* 10-30 mg q3-4h as needed.

Children. 0.15-0.3 mg/kg q3-4h as needed.

## IM

*Adults, Elderly.* 5-10 mg q3-4h as needed.

*Children.* 0.1 mg/kg q3-4 h as needed. IV

*Adults, Elderly.* 2.5-10 mg q3-4h as needed. NOTE: Repeated doses (e.g., 1-2 mg) may be given more frequently

(e.g., every hour) if needed.

*Children.* 0.05-0.1 mg/kg q3-4h as needed.

IV CONTINUOUS INFUSION Adults, Elderly. 0.8-10 mg/h. Range: Up to 80 mg/h.

EPIDURAL (BUT NOT DEPODUR) Adults, Elderly. Initially, 1-6 mg bolus, infusion rate: 0.1-0.2 mg/h.

Maximum: 10 mg/24 h.

# INTRATHECAL (UNPRESERVED, E.G., DURAMORPH)

*Adults, Elderly.* One tenth of the epidural dose: 0.2-1 mg/dose. EPIDURAL (DEPO-DUR ONLY) *Adults, Elderly,* 15-mg single dose. Some patients may benefit from 20 mg, but increased side effect risk. Usually given 30 min before surgery.

# Patient-controlled analgesia (PCA)

#### IV

*Adults, Elderly.* Loading dose: 5-10 mg. Intermittent bolus: 0.5-3 mg. Lockout interval: 5-12 min. Continuous infusion: 1-10 mg/h. 4-h limit: 20-30 mg.

#### Analgesia in patients with moderate to severe pain needing the drug for an extended period of time

# PO (EXTENDED RELEASE [AVINZA])

Adults, Elderly. Dosage requirement should be established using promptrelease formulations and is based on total daily dose (one-half the dose is given q12h or one-third the dose is given q8h).

## PO (EXTENDED RELEASE [KADIAN])

Adults, Elderly. Dosage

requirement should be established using prompt-release formulations and is based on total daily dose.

Dose is given once a day or divided and given q12h.

PO (EXTENDED RELEASE

[MS CONTIN, ORAMORPH SR] *Adults, Elderly.* Dosage requirement should be established using promptrelease formulations and is based on total daily dose. The total daily dose requirement is divided and given q8h or q12h.

*Children.* 0.3-0.6 mg/kg/dose q12h.

# CONTRAINDICATIONS

Hypersensitivity, acute or severe asthma, GI obstruction, severe hepatic or renal impairment, severe respiratory depression, asthma, severe liver or renal impairment.

## INTERACTIONS

#### Drug

# Alcohol, other CNS depressants:

May increase CNS or respiratory depression and hypotension. ! Alcohol may result in the

rapid release and absorption of a potentially fatal dose of morphine from extended-release products.

Anticholinergics: May increase anticholinergic effects.

**MAOIs:** May produce a severe, sometimes fatal reaction; expect to administer one-quarter of usual morphine dose.

#### Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum amylase and lipase levels.

# IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), cefepime (Maxipime), doxorubicin liposomal (Doxil), thiopental.

# **IV COMPATIBILITIES**

Amiodarone (Cordarone), bumetanide (Bumex), bupivacaine (Marcaine, Sensorcaine), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), heparin, lidocaine, lorazepam (Ativan), magnesium, midazolam (Versed), milrinone (Primacor), nitroglycerin, potassium, propofol (Diprivan).

# SIDE EFFECTS

#### Frequent

Sedation, decreased BP (including orthostatic hypotension), diaphoresis, facial flushing, constipation, dizziness, somnolence, nausea, vomiting.

## Occasional

Allergic reaction (rash, pruritus), dyspnea, confusion, palpitations, tremors, urine retention, abdominal cramps, vision changes, dry mouth, headache, decreased appetite, pain or burning at injection site.

# Rare

Paralytic ileus.

# SERIOUS REACTIONS

• Overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

• The patient who uses morphine repeatedly may develop a tolerance to the drug's analgesic effect and physical dependence.

• The drug may have a prolonged duration of action and cumulative effect in those with hepatic and renal impairment.

# **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used in patients with chronic obstructive pulmonary disease (COPD), cor pulmonale, head injury, hypoxia, hypercapnia, increased intracranial pressure, preexisting respiratory depression, and severe hypotension. Caution is also warranted with Addison's disease, alcoholism, biliary tract disease,

CNS depression, hypothyroidism, pancreatitis, benign prostatic hyperplasia, seizure disorders, toxic psychosis, urethral stricture, and in elderly or debilitated patients. Morphine crosses the placenta and is distributed in breast milk; caution in pregnancy and lactation is warranted. Regular use of opioids during pregnancy may produce withdrawal symptoms in the neonate, such as diarrhea, excessive crying, fever, hyperactive reflexes, irritability, seizures, sneezing, tremors, vomiting, and yawning. Morphine may prolong labor if administered in the latent phase of the first stage of labor or before the cervix is dilated 4-5 cm. The neonate may develop respiratory depression if the mother receives morphine during labor. Children and elderly patients are more prone to experience paradoxical excitement. Children younger than 2 yr and elderly patients are more susceptible to the drug's respiratory depressant effects. Most extendedrelease products are not appropriate for children. Age-related renal impairment may increase the risk of urine retention in elderly patients.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. Pattern of daily bowel activity and clinical improvement should be monitored. Vital signs should be monitored for 5-10 min after IV administration and 15-30 min after IM or SC injection. Be alert for bradycardia and hypotension. The drug should be held and the physician should be notified if the respiratory rate is 12 breaths/min or less in an adult or 20 breaths/min or

less in a child. When using scheduled or extended-release dosages, monitor breakthrough pain and need for additional medications.

#### Storage

Store oral dose forms at room temperature protected from light and moisture. Unopened DepoDur epidural suspension is refrigerated; stable for 30 days once removed from refrigerator. Other injections stored at room temperature. Do not freeze injections. Do not heat sterilize. Administration

! Expect to reduce morphine dosage for debilitated and elderly patients and those using CNS depressants concurrently. Titrate dosage to desired effect, as prescribed. Morphine's side effects are dependent on the dosage and route of administration. Ambulatory patients and those not in severe pain are more prone to experience dizziness, nausea, and vomiting than those in the supine position and those in severe pain.

For oral use, mix the liquid form with fruit juice to improve the taste. Do not crush, open, or break extended-release capsules. Kadian (extended-release capsules) contents may be sprinkled on applesauce just before administration or may be flushed down a gastrostomy tube; do not crush or chew during administration.

Morphine may be given undiluted as IV push. For IV injection, 2.5-15 mg morphine may be diluted in 4-5 mL sterile water for injection. For continuous IV infusion, dilute to a concentration of 0.1-1 mg/mL in D5W and administer through a controlled infusion device. Place the patient in the recumbent position before giving parenteral morphine. Always administer IV morphine very slowly because rapid IV administration increases the risk of a severe anaphylactic reaction, marked by apnea, cardiac arrest, and circulatory collapse.

For IM and SC administration, inject the drug slowly; rotate injection sites. Know that patients with circulatory impairment are at increased risk for overdose because of delayed absorption of repeated injections.

For rectal use, if the suppository is too soft, refrigerate it for 30 min or run cold water over the foil wrapper. Remove the foil wrapper; remove and moisten the suppository with cold water before inserting it well into the rectum.

Intrathecal: Only select injections are preservative free and suitable for intrathecal use. Pay close attention to dose limits.

# Moxifloxacin Hydrochloride

moks-i-floks'a-sin high-drohklor'ide Avelox, Avelox IV, Moxeza, Vigamox Do not confuse Avelox with Avonex or moxifloxacin with minoxidil.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anti-infectives, fluoroquinolones

## **MECHANISM OF ACTION**

A fluoroquinolone that inhibits two enzymes, topoisomerase II and IV, in susceptible microorganisms. *Therapeutic Effect:* Interferes with bacterial DNA replication. Prevents or delays emergence of resistant organisms. Bactericidal.

## PHARMACOKINETICS

Well absorbed from the GI tract after PO administration. Protein binding: 50%. Widely distributed throughout body with tissue concentration often exceeding plasma concentration. Metabolized in liver. Primarily excreted in urine with a lesser amount in feces. *Half-life*: 10.7-13.3 h.

## AVAILABILITY

Tablets (Avelox): 400 mg. Injection (Avelox IV): 400 mg. Ophthalmic Solution (Moxeza, Vigamox): 0.5%.

## INDICATIONS AND DOSAGES

 Acute bacterial sinusitis, community-acquired pneumonia, complicated intra-abdominal infection

IV/PO

*Adults, Elderly.* 400 mg q24h for 10 days (sinusitis); 7-14 days (pneumonia or intra-abdominal infusion).

# Acute bacterial exacerbation of chronic bronchitis.

IV/PO

*Adults, Elderly.* 400 mg q24h for 5 days.

#### Skin and skin-structure infection IV/PO

*Adults, Elderly.* 400 mg once a day for 7 days (uncomplicated), up to 21 days if complicated.

### Topical treatment of bacterial conjunctivitis caused by susceptible strains of bacteria

OPHTHALMIC (VIGAMOX) Adults, Elderly, Children older than 1 yr: 1 drop 3 times/day for 7 days. OPHTHALMIC (MOXEZA) Adults, Elderly, Children older than 4 mos. 1 drop 2 times/day for 7 days.

## CONTRAINDICATIONS

Hypersensitivity to quinolones.

Moxifloxacin Hydrochloride (Generic Name)

# INTERACTIONS

## Drug

Antacids, didanosine chewable, buffered tablets or pediatric powder for oral solution, iron preparations, sucralfate, zinc preparations: May decrease moxifloxacin absorption. Medications prolonging the QT interval (e.g., class 1a and class III antiarrhythmics, ervthromycin, tricyclic antidepressants): Possible risk of QT interval elongation. NSAIDs: Increased risk of central nervous system (CNS) stimulation and seizures. Herbal and Food

None known.

DIAGNOSTIC TEST EFFECTS

May increase blood sugar. Rare reports of changes in CBC or LFTs.

# IV INCOMPATIBILITIES

Do not add or infuse other drugs simultaneously through the same IV line. Flush line before and after use if same IV line is used with other medications.

# SIDE EFFECTS

Frequent (6%-8%)

Nausea, diarrhea. Occasional (2%-3%)

Dizziness, headache, abdominal pain, vomiting. Ophthalmic (1%-6%): Conjunctival irritation, reduced visual acuity, dry eye, keratitis, eye pain, ocular itching, swelling of tissue around cornea, eye discharge, fever, cough, pharyngitis, rash, rhinitis. **Rare (1%)** 

Change in sense of taste, dyspepsia (heartburn, indigestion), photosensitivity.

# SERIOUS REACTIONS

 Pseudomembranous colitis as evidenced by fever, severe abdominal cramps or pain, and severe watery diarrhea may occur.

• Superinfection manifested as anal or genital pruritus, moderate to severe diarrhea, and stomatitis may occur.

- · Tendonopathy and tendon rupture.
- · QT prolongation.
- · Seizures (rare).
- · Serious hypersensitivity reaction.
- Rare reports of benign intracranial hypertension (pseudotumor cerebri).

• Exacerbation of myasthenia, may be severe and lead to weakness of respiratory muscles.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cerebral arthrosclerosis, CNS disorders, liver or renal impairment, diabetes mellitus, seizures, those with a prolonged QT interval, uncorrected hypokalemia, and those receiving medications that might prolong the OT interval. May exacerbate myasthenia gravis or other neuromuscular conditions. Be aware that moxifloxacin may be distributed in breast milk and is generally not recommended for use in pregnancy. Be aware that the safety and efficacy of systemic moxifloxacin have not been established in children. Opthalmic forms have not been used in infants younger than 4 mos. No age-related precautions have been noted in elderly patients.

Avoid exposure to sunlight and ultraviolet light, and wear sunscreen and protective clothing if photosensitivity develops.

Abdominal pain, altered sense of taste, dyspepsia (heartburn, indigestion), headache, vomiting, and signs and symptoms of infections should be assessed. Pattern of daily bowel activity, stool consistency, and WBC count should be monitored. History of hypersensitivity to moxifloxacin and other quinolones should be determined before therapy.

#### Storage

Store at room temperature. Do not refrigerate. Remove overwrap of premix IV infusion just prior to administration.

#### Administration

Take oral moxifloxacin without regard to meals. Take 4 h before or 8 h after antacids, didanosine chewable, buffered tablets or pediatric powder for oral solution, iron preparations, multivitamins with minerals, or sucralfate. Take full course of therapy.

For ophthalmic use, tilt the head back, and look up. With a gloved finger, gently pull the lower eyelid down until a pocket is formed. Place drops into the center of the pocket. Close the eye gently, and apply gentle finger pressure to the lacrimal sac at the inner canthus. Remove excess solution around the eye with a tissue.

Infuse IV over 60 min or longer. IV formulation is available in ready-to-use containers. Give by IV infusion only. Avoid rapid or bolus IV infusion.

# Mupirocin

mew-peer'oh-sin Bactroban, Centany Bactroban Do not confuse Bactroban with Bactrim or Bacitracin

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Topical anti-infective

## **MECHANISM OF ACTION**

An antibacterial agent that inhibits bacterial protein, RNA synthesis. Less effective on DNA synthesis. Effective against most gram-positive aerobic bacteria, including MRSA. *Therapeutic Effect:* Prevents bacterial growth and replication. Bacteriostatic. Nasal: Eradicates nasal colonization of MRSA.

# PHARMACOKINETICS

Metabolized in skin to inactive metabolite. Transported to skin surface; removed by normal skin desquamation.

## AVAILABILITY

Ointment: 2% (Bactroban, Centany). Nasal Ointment: 2% (Bactroban). Cream: 2% (Bactroban).

# INDICATIONS AND DOSAGES Impetigo, infected traumatic skin lesions

TOPICAL Adults, Elderly, Children. Apply 3 times/day (may cover w/gauze). > Nasal colonization of resistant

Staphylococcus aureus INTRANASAL

*Adults, Elderly, Children 12 yr and older.* Apply 2 times/day for 5 days.

# **OFF-LABEL USES**

Treatment of infected eczema, folliculitis, minor bacterial skin infections.

## CONTRAINDICATIONS

Hypersensitivity to mupirocin or any component of the formulation.

#### INTERACTIONS

Drug None known. Herbal None known.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Frequent

Nasal: Headache, rhinitis, upper respiratory congestion, pharyngitis, altered taste.

## Occasional

Nasal: Burning, stinging, cough. Topical: Pain, burning, stinging, itching.

#### Rare

Nasal: Pruritis, diarrhea, dry mouth, epistaxis, nausea, rash. Topical: Rash, nausea, dry skin, contact dermatitis.

# SERIOUS REACTIONS

 Superinfection may result in bacterial or fungal infections, especially with prolonged or repeated therapy.

## PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with impaired renal function. It is unknown whether mupirocin crosses the placenta or is distributed in breast milk. Use with caution. Safety and efficacy of nasal preparation have not been established in children younger than 12 yr. No age-related precautions have been noted in children or elderly patients. Isolation precautions will be in effect for those with highly communicable conditions or resistant organisms. **Storage** 

Store at room temperature.

#### Administration

Gown and gloves are to be worn until 24 h after therapy is effective. Impetigo is spread by direct contact with moist discharges. For skin application, apply small amount to affected areas. Cover affected areas with gauze dressing if desired.

Apply nasally inside the nose. After application, close the nostrils by pressing together and releasing the sides of the nose repetitively for approximately 1 min. This will spread the ointment throughout the nares. Discard single-use tubes immediately after use.

# Mycophenolate

my-co-fen'o-late

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

## Classification:

Immunosuppressives

# **MECHANISM OF ACTION**

An immunologic agent that suppresses the immunologically mediated inflammatory response by inhibiting inosine monophosphate dehydrogenase, an enzyme that deprives lymphocytes of nucleotides necessary for DNA and RNA synthesis, thus inhibiting the proliferation of T and B lymphocytes. *Therapeutic Effect:* Prevents transplant rejection.

# PHARMACOKINETICS

Rapidly and extensively absorbed after PO administration (food decreases drug plasma concentration but does not affect absorption). Protein binding: 97%. Completely hydrolyzed to active metabolite mycophenolic acid. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 17.9 h.

Mycophenolate (Generic Name)

# AVAILABILITY

Mycophenolate Mofetil (CellCept) Capsules: 250 mg. Oral Suspension: 200 mg/mL. Tablets: 500 mg. Injection: 500 mg. Mycophenolate Sodium (Myfortic) Tablets, Delayed Release: 180 mg, 360 mg.

# INDICATIONS AND DOSAGES

Mycophenolate mofetil (CellCept)

 Prevention of renal transplant rejection

PO, IVAdults, Elderly. 1 g twice a day.Prevention of heart transplant

rejection

PO, IV

Adults, Elderly. 1.5 g twice a day.

# Prevention of liver transplant rejection

PO Adults, Elderly. 1.5 g twice a day. IV

Adults, Elderly. 1 g twice a day.

## Usual pediatric dosage PO

Cellcept suspension: 600 mg/m<sup>2</sup>/dose twice daily, not to exceed 2 g/day. Cellcept capsules: 750 mg twice daily if BSA of 1.25-1.5 m<sup>2</sup> or 1 g twice daily if BSA > 1.5 m<sup>2</sup>.

# Mycophenolate sodium

# (Myfortic)

## Prevention of renal transplant rejection

PO

*Adults, Elderly.* 720 mg twice a day in combination with corticosteroids and cyclosporine.

## Usual pediatric dosage PO

*Myfortic tablets:* 400 mg/m<sup>2</sup>/dose twice daily (not to exceed 720 mg/ dose); do not use if BSA is <1.19m<sup>2</sup> due to inability to give proper dosing with limited tablet strengths.

# **OFF-LABEL USES**

Treatment of transplantation rejection, graft-versus-host disease, uveitis, myasthenia gravis.

# CONTRAINDICATIONS

Hypersensitivity to mycophenolic acid.

# INTERACTIONS

### Drug

Acyclovir, ganciclovir: May increase plasma concentrations of both drugs in patients with renal impairment.

Antacids (aluminum and magnesium-containing),

cholestyramine: May decrease the

absorption of mycophenolate.

### Hormonal contraceptives:

Mycophenolate can reduce effectiveness; use 2 adequate forms of contraception.

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

Other immunosuppressants: May increase the risk of infection or lymphomas. Azathioprine use not recommended due to bone marrow suppression.

**Probenecid:** May increase mycophenolate plasma concentration.

Norfloxacin, metronidazole,

rifampin: Lower mycophenolate concentrations. Avoid co-use.

# Herbal

Echinacea: May decrease the effects of mycophenolate.

Food

All foods: May decrease mycophenolate plasma concentration.

# DIAGNOSTIC TEST EFFECTS

Lowered WBC, red cell counts. May increase serum cholesterol, alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels. May increase or decrease blood glucose as well as serum lipid, calcium, potassium, phosphate, and uric acid levels.

# IV INCOMPATIBILITIES

Mycophenolate is compatible only with D5W. Do not infuse it concurrently with other drugs or IV solutions.

# SIDE EFFECTS

### Frequent (20%-37%)

Urinary tract infection, hypertension, peripheral edema, diarrhea, constipation, fever, headache, nausea.

#### Occasional (10%-18%)

Dyspepsia; dyspnea; cough; hematuria; asthenia; vomiting; edema; tremors; abdominal, chest, or back pain; oral candidiasis; acne. **Rare (6%-9%)** 

Insomnia, respiratory tract infection, rash, dizziness. Phlebitis with intravenous use.

# SERIOUS REACTIONS

• Significant anemia, leukopenia, thrombocytopenia, neutropenia, and leukocytosis may occur, particularly in those undergoing renal transplant rejection.

• Sepsis and infection occur occasionally.

· GI tract hemorrhage occurs rarely.

 Patients receiving mycophenolate have an increased risk of developing secondary malignancy, like lymphoma or skin cancer.

• Progressive multifocal encephalopathy or viral-related nephropathies may occur secondary to immunosuppression.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with active serious digestive disease,

neutropenia, and renal impairment. Women who might become pregnant should use effective contraception before, during, and for 6 wks after discontinuing mycophenolate therapy, even if there is a history of infertility. Two forms of contraception should be used concurrently (e.g., hormonal and nonhormonal) unless patient will remain abstinent. Pregnancy test should be attained 1 wk before starting treatment. Mycophenolate increases risk of congenital malformations and spontaneous abortion. It is unknown whether mycophenolate is distributed in breast milk. Women taking this drug should avoid breastfeeding. The safety and efficacy of mycophenolate have not been established in children. Age-related renal impairment may require a dosage adjustment in elderly patients.

Notify the physician of abdominal pain, fever, sore throat, or unusual bleeding or bruising. CBC should be obtained weekly during the first month of therapy, twice monthly during the second and third month, then monthly for the rest of the first year. The dosage should be reduced or discontinued if a rapid fall in WBC count occurs.

#### Storage

Store tablets at room temperature in tightly closed container. Store the reconstituted suspension in the refrigerator or at room temperature. It remains stable for 60 days after reconstitution. Store vials at room temperature. Do not freeze.

#### Administration

! Do not interchange different mycophenolate dosage forms or product brands; they are not equivalent.

Give oral mycophenolate mofetil on an empty stomach. Do not open

or crush capsules. Avoid inhaling the powder in capsules, and keep the powder away from the skin and mucous membranes. If contact occurs, wash thoroughly with soap and water, and rinse the eyes profusely with plain water.

The suspension can be administered orally or by nasogastric tube (minimum size: 8 French). Shake well before each use.

Mycophenolate sodium delayedrelease tablets and mycophenolate mofetil are not interchangeable because the rate of absorption is not equivalent. Take delayed-release tablets on an empty stomach 1 h before or 2 h after food. Do not crush, chew, or cut. Swallow whole to maintain the integrity of the enteric coating.

For IV use, reconstitute each 500mg vial with 14 mL D5W. Gently agitate the vial. For a 1-g dose, further dilute with 140 mL D5W; for a 1.5-g dose, further dilute with 210 mL D5W to provide a concentration of 6 mg/mL. Infuse the drug over at least 2 h.

# **Nabumetone**

★ na-byu'me-tone

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAIDs)

# **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces the inflammatory response and intensity of pain.

# PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 99%. Widely distributed. Metabolized in the liver to active metabolite. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 22-30 h.

# AVAILABILITY

Tablets: 500 mg, 750 mg.

# INDICATIONS AND DOSAGES

# Acute or chronic rheumatoid and osteoarthritis

PO

*Adults, Elderly:* Initially, 1000 mg as a single dose or in 2 divided doses. May increase up to 2000 mg/day as a single or in 2 divided doses. If patient < 50 kg, usual maximum is 1000 mg/day.

## Dosage in renal impairment

CrCl ≥ 50 mL/min: No adjustment. CrCl 30-49 mL/min: Initially 750 mg/day; maximum 1500 mg/day. CrCl 10-30 mL/min: Initially 500 mg/day; maximum 1000 mg/day.

# CONTRAINDICATIONS

History of hypersensitivity to aspirin or NSAIDs; use within 14 days of coronary artery bypass graft surgery.

# INTERACTIONS

#### Drug

Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, other salicylates, corticosteroids: May increase the risk of GI side effects such as bleeding. NSAIDs may negate the cardioprotective effect of ASA.

**Bone marrow depressants:** May increase the risk of hematologic reactions.

**Cyclosporine:** May decrease renal function.

**Heparin, oral anticoagulants, thrombolytics:** May increase the effects of these drugs.

Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Probenecid:** May increase the nabumetone blood concentration. **SSRIs, SNRIs:** Increased risk of Gl bleeding.

## Herbal

**Feverfew:** May decrease the effects of feverfew.

**Ginkgo biloba:** May increase the risk of bleeding.

Food

Alcohol: May increase dizziness or increase risk of GI bleeding.

# DIAGNOSTIC TEST EFFECTS

May increase BUN level; urine protein levels; and serum LDH, alkaline phosphatase, creatinine, potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum uric acid level.

Nabumetone (Generic Name)

#### SIDE EFFECTS

#### Frequent (12%-14%)

Diarrhea, abdominal cramps or pain, dyspepsia.

#### Occasional (4%-9%)

Nausea, constipation, flatulence, dizziness, headache. **Rare (1%-3%)** Vomiting, stomatitis, confusion.

#### SERIOUS REACTIONS

Overdose may result in acute hypotension and tachycardia.
Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, nephrotoxicity (dysuria, cystitis, hematuria, proteinuria, nephrotic syndrome), severe hepatic reactions (cholestasis, jaundice), and severe hypersensitivity reactions (bronchospasm, angioedema).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic or renal impairment, peptic ulcer disease, and in those using anticoagulants. Nabumetone is distributed in low concentrations in breast milk: caution is warranted in lactation. Nabumetone should not be used during the last trimester of pregnancy because it can cause adverse effects in the fetus, such as premature closing of the ductus arteriosus. The safety and efficacy of this drug have not been established in children. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may require a reduced drug dosage.

Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors. Use caution in patients with fluid retention, heart failure, or hypertension. Use lowest effective dose. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 halflives before surgical procedures. Because the drug may cause dizziness, do not perform tasks requiring mental concentration until the effects of the drug are known.

Blood chemistry studies, renal and liver function studies, and pattern of daily bowel activity and stool consistency should be assessed before and during therapy. Therapeutic response, such as decreased pain, stiffness, swelling, and increased joint mobility, should be evaluated.

#### Storage

Store at room temperature. Administration

Swallow tablets whole. Take nabumetone with food, milk, or antacids if GI distress occurs.

## Nadolol

nay-doe'lole Corgard Apo-Nadol Do not confuse Corgard with Coreg.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensives, antianginal agents,  $\beta$ -adrenergic blockers

#### **MECHANISM OF ACTION**

A nonselective  $\beta$ -blocker that blocks  $\beta_1$ - and  $\beta_2$ -adrenergenic receptors. Large doses increase airway resistance. *Therapeutic Effect:* Slows sinus heart rate, decreases

Nadolol (Generic Name)

cardiac output and BP. Decreases myocardial ischemia severity by decreasing oxygen requirements.

## PHARMACOKINETICS

PO: Onset variable, peak 3-4 h, duration 17-24 h. Not metabolized; excreted unchanged in urine, bile, and breast milk. *Half-life*: 16-24 h.

## AVAILABILITY

Tablets: 20 mg, 40 mg, 80 mg.

# INDICATIONS AND DOSAGES Mild to moderate hypertension or angina

PO

*Adults, Elderly.* Initially, 40 mg/day. May increase by 40-80 mg at intervals of 3-7 days. Maximum: 240 mg/day for angina, 320 mg/day for hypertension.

 Dosage in renal impairment
 Dosage is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage Interval
31-50	24-36 h
10-30	24-48 h
< 10	40-60 h

## **OFF-LABEL USES**

Treatment of atrial fibrillation hypertrophic cardiomyopathy, pheochromocytoma, essential tremor, thyrotoxicosis, vascular headache prophylaxis.

## CONTRAINDICATIONS

Bronchial asthma, cardiogenic shock, second- or third-degree heart block, sinus bradycardia, overt cardiac failure.

## INTERACTIONS

#### Drug

**Cimetidine:** May increase nadolol blood concentration.

**Diuretics, other antihypertensives:** May increase hypotensive effect. Fentanyl, hydrocarbon inhalation anesthetics: May increase hypotension, myocardial depression. Indomethacin, other NSAIDs: May decrease hypotensive effects. Insulin, oral hypoglycemics: May mask symptoms of hypoglycemia and prolong the hypoglycemic effect of insulin and oral hypoglycemics. Lidocaine: Slows metabolism of nadolol. NSAIDs: May decrease antihypertensive effect. Sympathomimetics (epinephrine, norepinephrine, isoproterenol),

**xanthines:** May mutually inhibit effects.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum antinuclear antibody titer and BUN, serum LDH, serum lipoprotein, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, serum uric acid, AST (SGOT), ALT (SGPT), and serum triglyceride levels.

#### SIDE EFFECTS

Nadolol is generally well tolerated, with transient and mild side effects.

## Frequent

Diminished sexual ability, drowsiness, unusual fatigue or weakness.

#### Occasional

Bradycardia, difficulty breathing, depression, cold hands or feet, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting.

#### Rare

Altered taste, dry eyes, itching.

#### SERIOUS REACTIONS

 Overdose may produce profound bradycardia and hypotension.
 Abrupt withdrawal of nadolol may result in diaphoresis, palpitations, headache, tremulousness, exacerbation of angina, MI, and ventricular arrhythmias.

 May precipitate CHF and MI in patients with cardiac disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.

• Hypoglycemia may occur in patients with previously controlled diabetes.

• Bronchospasm, allergic reactions, or decreased blood counts occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes mellitus, hyperthyroidism, chronic bronchitis or asthma, impaired hepatic and renal function, and inadequate cardiac function. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval. Tasks that require mental alertness or motor skills should be avoided until drug effects are known. Use caution with postural changes.

Notify the physician of confusion, depression, difficulty breathing, dizziness, fever, rash, slow pulse, sore throat, swelling of arms and legs, or unusual bleeding or bruising. BP for hypotension; respiratory status; pattern of daily bowel activity and stool consistency; and pulse for quality, rate, and rhythm should be monitored. If pulse rate is < 55 beats/min or systolic BP  $\leq$  90 mm Hg, withhold the medication and contact the physician. In those receiving nadolol for treatment of angina, the onset, type (sharp, dull, squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, including exertion and emotional stress, should

be recorded. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed. Storage

## Store at room temperature. Administration

Take nadolol without regard to meals. Tablets may be crushed. Do not abruptly discontinue; tapering recommended.

#### Nafarelin

naf′a-rel′in ★ 🐏 Synarel

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

**Classification:** Hormones, gonadotropin-releasing hormone analog

#### MECHANISM OF ACTION

A potent agonistic analog of gonadotropin-releasing hormone (GnRH). At the onset of administration, it stimulates the release of the pituitary gonadotropins, LH and FSH, resulting in a temporary increase of gonadal steroidogenesis. Repeated dosing abolishes the stimulatory effect on the pituitary gland. *Therapeutic Effect:* In adult females, causes proliferative endometrial tissue to become inactive and atrophic. In children with central precocious puberty, arrests premature pubertal development.

#### PHARMACOKINETICS

Systemic absorption following intranasal administration is rapid; peak concentrations within 10-40 min. Nafarelin is administered topically to the nasal mucosa (intranasally). 80% of nafarelin is bound to plasma proteins. Six major metabolites have been identified, but metabolic paths are not clear. *Half-life*: 3 h.

## AVAILABILITY

Nasal Spray: Delivers 200 mcg/spray.

## INDICATIONS AND DOSAGES

## Endometriosis:

Nasal

Adult females. The recommended dose is 400 mcg/day; this is achieved by one spray (200 mcg) into one nostril in the AM and one spray into the other nostril in the PM. Begin the first dose between days 2 and 4 of the menstrual cycle. If this dose does not produce amenorrhea after 2 months of treatment, the dose may be increased to 800 mcg daily; this is given as one spray into each nostril in the morning (a total of 2 sprays) and again in the evening. Treatment is continued for up to 6 months.

## Precocious puberty:

Nasal

Children. The recommended dose is 1600 mcg per day. The dose can be increased to 1800 mcg daily if adequate suppression cannot be achieved at 1600 mcg/day. The 1600 mcg dose is achieved by 2 sprays (400 mcg) into each nostril in the morning (4 total sprays) and 2 sprays into each nostril in the evening (4 total sprays), a total of 8 sprays per day. The 1800-mcg dose is achieved by 3 sprays (600 mcg) into alternating nostrils 3 times a day (a total of 9 sprays per day). If well tolerated, continue treatment until resumption of puberty is desired.

## CONTRAINDICATIONS

Pregnancy, breastfeeding, hypersensitivity to drug or GnRH analogs, undiagnosed abnormal uterine bleeding.

#### INTERACTIONS Drug

#### Nasal decongestants and other

**nasal sprays:** Should not be used until at least 2 hours following dosing with nafarelin to avoid interference with it.

## Herbal

**Black cohosh, chasteberry:** May interfere with appropriate actions of nafarelin; avoid.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

Diagnostic tests of pituitary gonadotropic and gonadal functions conducted during treatment and up to 4-8 wks after discontinuation of therapy with nafarelin may be misleading. May increase serum triglycerides and cholesterol.

## SIDE EFFECTS

#### Frequent

Hot flashes (ranging from mild flushing to diaphoresis). Females: Amenorrhea, spotting. Ovarian cysts early in therapy. Males and females (early in treatment): Acne, transient breast enlargement, emotional lability, transient increase in pubic hair, body odor and increased sweating, seborrhea.

#### Occasional

Dizziness, edema, headache, change in appetite, nausea, insomnia, weight gain.

Females: Hirsutism, decreased libido, vaginitis or vaginal dryness, altered mood.

Males: Constipation, decreased testicle size, gynecomastia, impotence.

#### Rare

Palpitations, blurred vision, paresthesia, rash, breast engorgement, lactation, eye pain, arthralgia.

#### **Serious Reactions**

Pulmonary embolism and MI occur rarely.

• Decreased bone density may lead to osteoporosis with longer term use in adults.

• Rare infarction of pituitary gland and pituitary apoplexy.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted when administered to children receiving long-term therapy; monitor growth and weight and other developmental patterns. Use is contraindicated in pregnancy and breastfeeding. Pregnancy should be determined before therapy. Nonhormonal contraceptives should be used in females of childbearing potential. Females should notify the physician of menstrual bleeding patterns, symptoms of endometriosis, or if pregnancy occurs. The patient should be assessed for peripheral edema, palpitations, sleep-pattern or mood changes, and visual difficulties. Report sudden headache associated with vomiting, visual changes, and altered mental status immediately to physician. Storage

Store the nasal spray upright at room temperature, protected from light. Do not freeze. A bottle should not be used for longer than 30 days (60 sprays). Discard any unused drug at that time.

#### Administration

! Compliance with regimen is essential; irregular or incomplete daily doses will result in lack of effectiveness.

Remove cap. Prime the spray pump before first use by pumping the activator 7-10 times until a fine mist appears. Gently blow nose to clear it before administration. Patient should tilt his or her head forward. Gently insert the tip of the spray bottle into the nostril and direct tip back and toward outer wall of the nose; gently close opposite nostril with finger. Spray as directed in each nostril to deliver the right dosage, while gently sniffing. Once the dose has been delivered, the patient should tilt the head backward for a few seconds to ensure appropriate dose delivery. Sneezing during or immediately after dosing should be avoided, if possible, since this may impair drug absorption.

The spray tip should be cleaned after each dose. The spray tip should be rinsed with warm water while wiping tip with a finger or soft cloth for 15 seconds. Dry the tip with a soft cloth or tissue. To avoid the spread of infection, do not use the sprayer in more than one person.

## Nafcillin Sodium

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antibiotics, antistaphylococcal penicillins, penicillinase-resistant penicillins

#### MECHANISM OF ACTION

A penicillin that acts as a bactericidal in susceptible penicillinase-producing staphlococcal microorganisms. *Therapeutic Effect:* Inhibits bacterial cell wall synthesis. Bactericidal.

#### PHARMACOKINETICS

Protein binding: 87%-90%. Widely distributed in bile, pleural, amniotic, synovial fluids. Metabolized in liver. Excreted 30% unchanged primarily in urine. High cerebrospinal fluid penetration with inflamed meninges. Equally cleared by liver and kidney; hemodialysis does not increase rate of clearance. *Half-life:* 0.5-1 h (half-life increased in neonates).

## AVAILABILITY

*Powder for Injection:* 1 g, 2 g (as base). *Premixed IVPB Infusion:* 1 g/50 mL, 2 g/100 mL.

## INDICATIONS AND DOSAGES

 Methicillin-sensitive staphylococcal infections (bacteremia, endocarditis, meningitis, skin and tissue, pneumonia, bone and joint infections) IV

*Adults, Elderly.* 500 mg q4h or 1-2 g q4h (severe infection), infused over 30-60 min. May give IM if needed.

## **OFF-LABEL USES**

Surgical prophylaxis.

## CONTRAINDICATIONS

Hypersensitivity (anaphylactic) to any penicillin or to any component of the formulations.

## INTERACTIONS

#### Drug

**Cyclosporine:** Potential for subtherapeutic cyclosporine levels. In organ transplant patients, monitor cyclosporine levels.

**Probenecid:** May increase nafcillin blood concentration and risk for nafcillin toxicity.

**Warfarin**: Nafcillin in high dosages may decrease the effects of warfarin. Monitor INR.

#### Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May cause positive Coombs' test. May cause false-positive test for urine protein when sulfosalicylic acid test is used.

## IV INCOMPATIBILITIES

Caspofungin (Cancidas), diltiazem, droperidol (Inapsine), fentanyl, hydralazine, inamrinone, insulin, labetalol, meperidine, midazolam (Versed), nalbuphine (Nubain), nesiritide, phenytoin, protamine sulfate, succinylcholine, vancomycin, vecuronium, verapamil.

## SIDE EFFECTS

#### Frequent

Mild hypersensitivity reaction (fever, rash, pruritus); GI effects (nausea, vomiting, diarrhea).

#### Occasional

Phlebitis, thrombophlebitis (more common in elderly).

## Rare

Extravasation with IV administration. Increased serum sodium with high IV doses.

## SERIOUS REACTIONS

- Anaphylactoid reactions.
- Superinfections, antibioticassociated colitis may result from altered bacterial balance.

• Hematologic effects (especially involving platelets, WBCs), severe hypersensitivity reactions, and anaphylaxis occur rarely.

- · Thrombophlebitis.
- Neurotoxic reactions (rare).
- Interstitial nephritis (rare).

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with antibiotic-associated colitis or a history of allergies, especially to cephalosporins or other beta-lactams. Nafcillin crosses the placenta and is distributed in breast milk in low concentrations, warranting caution in lactation. Not approved for IV use in neonates or children. Delayed excretion may occur in neonates or infants.

Report itching, rash, hives, difficulty breathing, diarrhea, loose foul-smelling stools, and injection site reactions for medical assessment immediately.

#### Storage

Reconstituted parenteral solution is stable for 3 days at room temperature and 7 days when refrigerated or 12 wks when frozen. Premixed IVPB are delivered frozen. The thawed premixed IVPB is stable for 21 days under refrigeration or 72 h at room temperature. Do not refreeze. Administration

Be certain to space doses evenly around the clock.

Stop infusion if patient complains of pain. Because of potential for hypersensitivity or anaphylaxis, start the initial dose at a few drops per minute and increase slowly to the ordered rate; stay with the patient for the first 10-15 min, then check every 10 min. Doses are diluted in 50-100 mL of either 0.9% NaCl or dextrose 5% injection. Infuse over 30-60 min.

For IM use, reconstitute with sterile water for injection (unpreserved for neonates), 0.9% NaCl. Add 3.4 mL to the 1-g vial or 6.6 mL to the 2-g vial. Final concentration is 250 mg mL. After withdrawing required dose, administer by deep intragluteal injection immediately after reconstitution.

## Naftifine

naf'ti-feen Maftin Do not confuse naftifine with nafcillin or nafarelin.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Antifungals, topical, dermatologics

#### **MECHANISM OF ACTION**

An antifungal that selectively inhibits the enzyme squalene

epoxidase in a dose-dependent manner, which results in the primary sterol, ergosterol, within the fungal membrane not being synthesized. *Therapeutic Effect:* Results in fungal cell death. Fungistatic and fungicidal.

## PHARMACOKINETICS

Minimal systemic absorption. Metabolized in the liver. Excreted in the urine as well as the feces and bile. *Half-life:* 48-72 h.

## AVAILABILITY

Gel: 1% (Naftin). Cream: 1% (Naftin).

# INDICATIONS AND DOSAGES Tinea pedis, tinea cruris, tinea corporis

TOPICAL

Adults, Elderly, Children 12 yr and older. Apply cream 1 time a day for 4 wks or until signs and symptoms significantly improve. Apply gel 2 times a day for 4 wks or until signs and symptoms significantly improve.

#### **OFF-LABEL USES**

Trichomycosis.

## CONTRAINDICATIONS

Hypersensitivity to naftifine or any of its components.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Frequent Burning, stinging.

#### Occasional

Erythema, itching, dryness, irritation.

## SERIOUS REACTIONS

• Excessive irritation may indicate hypersensitivity reaction.

#### PRECAUTIONS & CONSIDERATIONS

Occlusive dressings should be avoided. It is unknown whether naftifine is distributed in breast milk, warranting caution in lactation. Safety and efficacy of naftifine have not been established in children. Use in pregnancy only after determination that benefits outweigh possible risks. No age-related precautions have been noted in elderly patients. Storage

Store at room temperature. Gel contains a large percentage of alcohol and may be flammable. Avoid heat and flame.

#### Administration

Naftifine is for external use only. Topical therapy should not exceed 4 wks without clinical reevaluation. Avoid getting the topical form in contact with the eyes, mouth, nose, or other mucous membranes. Wash hands after application.

## Nalbuphine Hydrochloride

nal'byoo-feen high-droh-klor'ide Nubain **Do not confuse Nubain with** Navane.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used for prolonged periods or at high dosages at term)

**Classification:** Analgesic, mixed opiate agonist-antagonist

## **MECHANISM OF ACTION**

A narcotic agonist-antagonist that binds with opioid receptors in the central nervous system (CNS). Analgesic potency equivalent to that of morphine on a milligram basis; primarily a  $\kappa$  agonist/partial  $\mu$  antagonist. May displace opioid agonists and competitively inhibit their action; may precipitate withdrawal symptoms. *Therapeutic Effect*: Alters the perception of and emotional response to pain.

## PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration (h)
IV	2-3	30	3-6
IM	< 15	60	3-6
SC	< 15	NA	3-6

Well absorbed after IM or SC administration. Protein binding: 50%. Metabolized in the liver. Eliminated primarily in feces by biliary secretion. Crosses the placenta. *Half-life:* 3.5-5 h.

## AVAILABILITY

Injection: 10 mg/mL, 20 mg/mL.

#### INDICATIONS AND DOSAGES Analgesia (moderate to severe pain, obstetric)

IV, IM, SC

*Adults, Elderly.* 10 mg q3-6h as needed. Do not exceed maximum single dose of 20 mg or daily dose of 160 mg. For patients receiving long-term narcotic analgesics of similar duration of action, give 25% of usual dose.

Children. 0.1 mg/kg q3-6h as needed.

#### Supplement to anesthesia IV

*Adults, Elderly.* Induction: 0.3-3 mg/kg over 10-15 min. Maintenance: 0.25-0.5 mg/kg as needed.

## CONTRAINDICATIONS

Hypersensitivity to nalbuphine.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants, barbiturates: May increase CNS or respiratory depression and hypotension.

**Buprenorphine:** May decrease the effects of nalbuphine.

**MAOIs:** May produce a severe, reaction; plan to administer 25% of the usual nalbuphine dose.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase levels. May interfere with enzymatic methods to detect opioids.

## IV INCOMPATIBILITIES

Physically incompatible with nafcillin and keterolac (Toradol). Also incompatible with amphotericin B complex (Abelcet, AmBisome, Amphotec), anidulafungin (Eraxis), cefepime (Maxipime), diazepam, furosemide (Lasix), hydrocortisone (Solu-Cortef), imipenem/cilastatin (Primaxin), indomethacin, methotrexate, methylprednisolone (Solu-Medrol), oxacillin, pantoprazole (Protonix), pentobarbital, phenobarbital, piperacillin and tazobactam (Zosyn), sargramostim (Leukine), sodium bicarbonate, TPN.

## **IV COMPATIBILITIES**

Diphenhydramine (Benadryl), droperidol (Inapsine), glycopyrrolate (Robinul), hydroxyzine (Vistaril), lidocaine, midazolam (Versed), propofol (Diprivan).

## SIDE EFFECTS

Frequent (35%) Sedation.

Occasional (3%-9%)

Diaphoresis, cold and clammy skin, nausea, vomiting, dizziness, vertigo, dry mouth, headache, hypotension. **Rare** (< 1%)

Restlessness, emotional lability, paresthesia, flushing, paradoxical reaction.

## SERIOUS REACTIONS

 Abrupt withdrawal after prolonged use may produce symptoms of narcotic withdrawal, such as abdominal cramping, rhinorrhea, lacrimation, anxiety, fever, and piloerection (goose bumps).
 Overdose results in severe

respiratory depression, skeletal muscle flaccidity, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

• Repeated use may result in drug tolerance and physical dependence.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in pregnancy and in patients who are opioid dependent or have head trauma, increased intracranial pressure, hepatic or renal impairment, recent MI, respiratory depression, and those about to undergo biliary tract surgery. Nalbuphine readily crosses the placenta and is distributed in breast milk, but the amount is low; use caution. Children may experience paradoxical excitement; not approved for children < 18 yr. Children younger than 2 yr and elderly patients are more likely to develop respiratory depression. In elderly patients, age-related renal impairment may increase the risk of urine retention. Overdose is evidenced by respiratory depression, hypoxemia, sedation.

#### 1088 Naloxone Hydrochloride

Low abuse potential but withdrawal symptoms on discontinuation after long-term use; can be abused by patients with narcotic abuse potential. Ensure naloxone, oxygen, resuscitation, and intubation equipment are available if needed.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. BP, pulse rate and quality, respirations, pattern of daily bowel activity and stool consistency, and clinical improvement of pain should be monitored.

#### Storage

Store at room temperature. Do not administer if particulate matter is present or solution is discolored.

#### Administration

For IV use, nalbuphine may be given undiluted. For IV push, administer each 10 mg over 3-5 min.

For IM use, rotate IM injection sites, inject into a large muscle mass.

## Naloxone Hydrochloride

nal-oks'one high-droh-klor'ide

Do not confuse naloxone with naltrexone, or Narcan with Norcuron.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Antidotes, narcotic antagonist

#### MECHANISM OF ACTION

A narcotic antagonist that displaces opioids at opioid-occupied receptor sites in the central nervous system (CNS). *Therapeutic Effect:* Reverses opioid-induced sleep or sedation, increases respiratory rate, raises BP to normal range.

#### PHARMACOKINETICS

Route	Onset (min)	Peak	Duration (min)
IV	1-2	NA	20-60
IM	2-5	NA	*
SC	2-5	NA	20-60

<sup>\*</sup>IM produces a more prolonged duration than IV.

Well absorbed after IM or SC administration. Metabolized in the liver. Excreted primarily in urine. *Half-life:* 60-100 min.

#### AVAILABILITY

Injection: 0.4 mg/mL, 1 mg/mL.

## INDICATIONS AND DOSAGES • Opioid toxicity

IV, IM, SC

*Adults, Elderly.* 0.4-2 mg q2-3min as needed. May repeat q20-60min. If no response after a cumulative dose of 10 mg; question diagnosis of opioid toxicity.

#### Opioid toxicity in children

! Initially, American Academy of Pediatrics recommends 0.1 mg/kg for infants and children < 5 yr and weighing < 20 kg and if the child is  $\geq$  5 yr, giving an initial dose of 2 mg. *Children 5 yr and older and weighing*  $\geq$  22 kg. 2 mg/dose; if no response, may repeat q2-3 min. May need to repeat q20-60 min. *Children and Infants younger than* 5 yr and weighing < 22 kg. 0.1 mg/ kg; if no response, repeat q2-3 min. May need to repeat q20-60 min.

## Postanesthesia narcotic reversal IV

Adults. 0.1-0.2 mg; may repeat q2-3 min. Children. 0.01 mg/kg; may repeat q2-3 min.

## CONTRAINDICATIONS

Hypersensitivity to naloxone.

## INTERACTIONS

#### Drug

## Butorphanol, nalbuphine, opioid agonist analgesics, pentazocine:

Reverses the analgesic and adverse effects of these drugs and may precipitate withdrawal symptoms. Herbal

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), diazepam, lansoprazole (Prevacid), pantoprazole (Protonix), phenytoin.

## **IV COMPATIBILITIES**

Heparin, ondansetron (Zofran), propofol (Diprivan).

## SIDE EFFECTS

None known; little or no pharmacologic effect in absence of narcotics.

#### SERIOUS REACTIONS

• Too-rapid reversal of narcoticinduced respiratory depression may result in nausea, vomiting, tremors, increased BP, and tachycardia.

• Excessive dosage in postoperative patients may produce significant excitement, tremors, and reversal of analgesia.

• Patients with cardiovascular disease may experience hypotension or hypertension, ventricular tachycardia and fibrillation, and pulmonary edema.

• May precipitate acute withdrawal in opioid-dependent patients.

## **PRECAUTIONS & CONSIDERATIONS**

Drug is intended for acute use only. Risk of seizures; be aware of this possibility. Buprenorphrine-mediated depression may not be completely reversed.

Caution is warranted in patients with chronic cardiovascular or pulmonary disease, postoperative patients (to avoid cardiovascular complications), and those suspected of having opioid dependence. It is unknown whether naloxone crosses the placenta or is distributed in breast milk. No agerelated precautions have been noted in children or elderly patients.

Notify the physician of pain or increased sedation. Vital signs, especially respiratory rate and rhythm, should be monitored. Serious cardiovascular events have been associated with opioid reversal in postoperative patients; doses should be carefully titrated to reduce these events. **Storage** 

Store the parenteral form at room temperature and protect it from light. The reconstituted solution remains stable in D5W or 0.9% NaCl at 4 mcg/mL for 24 h; discard any unused solution.

#### Administration

For continuous IV infusion, dilute each 2 mg of naloxone with 500 mL D5W or 0.9% NaCl to provide a concentration of 4 mcg/mL.

Naloxone may also be administered undiluted. Give each 0.4 mg as IV push over 15 seconds. Use the 0.4-mg/ mL and 1-mg/mL vials for adults. The 0.4 mg/mL preparation can also be accurately dosed for children and infants using appropriately sized syringes (e.g., 1 mL).

For IM use, inject naloxone in a large muscle mass.

## Naltrexone

nal-trex′one 📩 ReVia, Vivitrol 🌄 ReVia

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Substance abuse deterrent, narcotic antagonist

## **MECHANISM OF ACTION**

A narcotic antagonist that displaces opioids at opioid-occupied receptor sites in the central nervous system (CNS). *Therapeutic Effect:* Blocks physical effects of opioid analgesics; decreases craving for alcohol and relapse rate in alcoholism.

#### PHARMACOKINETICS

Rapidly and nearly completely absorbed from GI tract. Peak 2 h followed by second peak 2-3 days later. Extensive first pass effect after oral administration. Low plasma protein binding (20%). Eliminated through urine; undergoes enterohepatic recirculation. *Half-life*: 5-10 days.

## AVAILABILITY

*Tablets:* 50 mg. (ReVia). *Injection for Suspension:* 380 mg/vial (Vivitrol).

#### INDICATIONS AND DOSAGES > Naloxone challenge test to determine whether patient is opioid dependent (prior to ReVia)

! Expect to perform the naloxone challenge test if there is any question

that the patient is opioid dependent. Do not administer naltrexone until the naloxone challenge test is negative.

#### IV NALOXONE

Adults, Elderly. Draw 2 mL (0.8 mg) of naloxone into syringe. Inject 0.5 mL (0.2 mg); while needle is still in the vein, observe the patient for 30 seconds for withdrawal signs or symptoms. If no evidence of withdrawal, inject remaining 1.5 mL (0.6 mg); observe patient for additional 20 min for withdrawal signs or symptoms.

#### SC NALOXONE

*Adults, Elderly.* Inject 2 mL (0.8 mg) of naloxone; observe patient for 45 min for withdrawal signs or symptoms.

## Treatment of opioid dependence in patients who have been opioid free for at least 7-10 days

PO (REVIA)

Adults, Elderly. Initially, 25 mg. Observe patient for 1 h. If no withdrawal signs or symptoms appear, give another 25 mg. If a total of 50 mg does not elicit withdrawal, give 50-150 mg/day. Other common regimens are 100 mg every other day or 150 mg every 3 days.

#### Adjunctive treatment of alcohol dependence

#### PO OR IM

*Adults, Elderly.* 50 mg once a day for 12 wks (ReVia) or 380 mg IM every 4 wks (Vivitrol).

## CONTRAINDICATIONS

Acute opioid withdrawal, failed naloxone challenge test, history of hypersensitivity to naltrexone, opioid dependence (e.g., currently receiving opioid maintenance or opiates for analgesia), positive urine screen for opioids; acute hepatitis or liver failure. Do not use Vivitrol for opioid withdrawal.

Naltrexone Hydrochloride (Generic Name)

#### **INTERACTIONS**

#### Drug

**Disulfiram:** May increase hepatotoxicity.

Opioid-containing products (including analgesics, antidiarrheals, and antitussives):

Blocks the therapeutic effects of these drugs. The concurrent use of any opioid, including methadone, is contraindicated.

**Thioridazine:** May produce lethargy and somnolence.

#### Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels, bilirubin.

## SIDE EFFECTS

#### Frequent

Insomnia, anxiety, nervousness, headache, low energy, abdominal cramps, nausea, vomiting, arthralgia, myalgia.

#### Occasional

Dizziness, nervousness, fatigue, insomnia, vomiting, anxiety, suicidal ideation. Irritability, increased energy, anorexia, diarrhea or constipation, rash, chills, increased thirst.

#### SERIOUS REACTIONS

 Signs and symptoms of opioid withdrawal include stuffy or runny nose, tearing, yawning, diaphoresis, tremor, vomiting, piloerection, feeling of temperature change, bone pain, arthralgia, myalgia, abdominal cramps, and feeling of skin crawling.

 Accidental naltrexone overdose produces withdrawal symptoms within 5 min of ingestion that may last for up to 48 h. Symptoms include confusion, visual hallucinations, somnolence, and significant vomiting and diarrhea.
Hepatocellular injury may occur with large doses. The margin of separation between the apparently safe dose of naltrexone and the dose causing hepatic injury appears to be only five-fold or less.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with active hepatic disease. Before treatment, baseline laboratory tests, including creatinine clearance, serum bilirubin, AST (SGOT), and ALT (SGPT) levels, should be obtained. Liver function should be monitored throughout therapy.

Unknown whether excreted in breast milk; warrants caution in lactation. Safety and efficacy in children are not established. Taking opioids while on naltrexone may lead to fatal overdose or coma. Not safe for use in rapid opioid withdrawal procedures.

Be aware that opioid-containing drugs used during naltrexone therapy will have no effect. Any attempt to overcome naltrexone's prolonged 24to 72-h blockade of opioid effects by taking large amounts of opioids may result in coma, serious injury, or death. Notify the physician if abdominal pain lasts longer than 3 days or if dark urine, white stools, or yellowing of the whites of the eyes occurs. Overdose is evidenced by abdominal pain, dizziness, nausea, and somnolence.

#### Storage

Store the tablets at room temperature and protect from light.

Injection should be stored in the refrigerator. If removed from refrigerator, injection vial is stable for 7 days at room temperature until mixed.

#### Administration

Take oral naltrexone with antacids, after meals, or with food to avoid adverse GI effects.

Injection is for intramuscular use only. Remove injection from refrigerator roughly 45 min before giving. Use only diluent provided to reconstitute; 3.4 mL of the supplied diluent will be added to the vial. Vigorously shake to obtain a uniform suspension. After reconstitution the IM suspension will be milky white without clumps. Measure 4 mL of the dose as directed and use immediately. Give IM injection deep into gluteal muscle. Do *not* administer intravenously.

## Naphazoline

naf-az'oh-leen ★ AK-Con, All Clear, Clear Eyes Redness Relief, Napha Forte ★ Abalon, AK-Con, Refresh Redness Relief, Naphcon Forte

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

*Classification:* Ophthalmic agents, vasoconstrictor

## **MECHANISM OF ACTION**

A sympathomimetic that directly acts on  $\alpha$ -adrenergic receptors in conjunctival arterioles. *Therapeutic Effect:* Causes vasoconstriction, resulting in decreased eye redness.

## PHARMACOKINETICS

Instillation: Duration 2-3 h.

## AVAILABILITY

Ophthalmic Solution: 0.012%, 0.1%.

## INDICATIONS AND DOSAGES

 Control of hyperemia in patients with superficial corneal vascularity; relief of congestion and inflammation; for use during ocular diagnostic procedures

OPHTHALMIC Adults, Elderly, Children older than 6 yr: 1-2 drops in affected eye up to 4 times per day, for up to 72 h.

## CONTRAINDICATIONS

Angle-closure glaucoma, before peripheral iridectomy, patients with a narrow angle who do not have glaucoma.

## INTERACTIONS

#### Drug

Maprotiline, MAOIs, tricyclic antidepressants: May increase pressor effects. Avoid use with MAOIs due to risk of hypertensive crisis.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Occasional

Ophthalmic: Blurred vision, dilated pupils, increased eye irritation, redness, lacrimation.

## SERIOUS REACTIONS

 If systemically absorbed, the patient may experience tachycardia, palpitations, headache, insomnia, light-headedness, nausea, nervousness, and tremor.

• Overdose in patients older than 60 yr may produce hallucinations, CNS depression, and seizures.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes, heart disease (including coronary artery disease), hypertension, and hyperthyroidism. Storage

Store in a tightly closed container. Do not freeze.

#### Administration

Avoid touching bottle tip to any surface so contamination does not occur. Do not use while contact lenses are in place. Discontinue the drug and contact the physician if acute eye redness or eye pain, floating spots, vision changes, headache, dizziness, insomnia, irregular heartbeat, tremor, or weakness occurs.

### Naproxen/Naproxen Sodium

na-prox'en Naproxen (EC-Naprosyn, Naprelan, Naprosyn) Naproxen Sodium (Aleve, Anaprox, Anaprox DS, Midol Extended-Relief, Pamprin All Day) Do not confuse Aleve with Alesse, Anaspaz.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in third trimester or near delivery) OTC (220-mg gelcaps, 220-mg tablets)

#### **Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAIDs)

## **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces the inflammatory response and intensity of pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	<1h	NA	≤7h
PO (antirheu- matic)	< 14 day	2-4 wks	NA

Completely absorbed from the GI tract. Protein binding: 99%. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 13 h.

## AVAILABILITY

Gelcaps (Aleve): 220 mg naproxen sodium (equivalent to 200 mg naproxen) (OTC). Oral Suspension (Naprosyn): 125 mg/5 mL naproxen. Tablets (Aleve): 220 mg naproxen (OTC). Tablets (Anaprox): 275 mg naproxen sodium (equivalent to 250 mg naproxen). Tablets (Anaprox DS): 550 mg naproxen sodium (equivalent to 500 mg naproxen). Tablets (Controlled Release [EC-Naprosyn]): 375 mg naproxen, 500 mg naproxen. Tablets (Controlled Release [Naprelan]): 550 mg naproxen sodium (equivalent to 500 mg naproxen).

#### INDICATIONS AND DOSAGES • Rheumatoid arthritis, osteoarthritis, ankylosing spondylitis PO

Adults, Elderly. 250-500 mg naproxen (275-550 mg naproxen sodium) twice a day or 250 mg naproxen (275 mg naproxen sodium) in morning and 500 mg naproxen (550 mg naproxen sodium) in evening. Naprelan: 750-1000 mg once a day.

Naproxen/Naproxen Sodium (Generic Name)

## Acute gouty arthritis

## PO

*Adults, Elderly.* Initially, 750 mg naproxen (825 mg naproxen sodium), then 250 mg naproxen (275 mg naproxen sodium) q8h until attack subsides. Naprelan: Initially, 1000-1500 mg, then 1000 mg once a day until attack subsides.

## Mild to moderate pain, dysmenorrhea, bursitis, tendinitis PO

Adults, Elderly. Initially, 500 mg naproxen (550 mg naproxen sodium), then 250 mg naproxen (275 mg naproxen sodium) q6-8h as needed. Maximum: 1.25 g/day naproxen (1.375 g/day naproxen sodium). Naprelan: 1000 mg once a day.

Juvenile rheumatoid arthritis

PO (NAPROXEN ONLY) Children. 10-15 mg/kg/day in 2 divided doses. Maximum: 1000 mg/day.

## **OFF-LABEL USES**

Treatment of vascular headaches.

## CONTRAINDICATIONS

Hypersensitivity to aspirin, naproxen, or other NSAIDs; use within 14 days of coronary artery bypass graft surgery.

## INTERACTIONS

#### Drug

Antihypertensives, diuretics: May decrease the effects of these drugs. Aspirin, other salicylates, corticosteroids: May increase the risk of GI side effects such as bleeding. NSAID's may negate cardioprotective effects of ASA. Bone marrow depressants: May increase the risk of hematologic reactions. Cyclosporine: Possible risk of decreased renal function. Heparin, oral anticoagulants, thrombolytics: May increase the

effects of these drugs. Lithium: May increase the blood

concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Probenecid:** May increase the naproxen blood concentration.

**SSRIs, SNRIs:** Increased risk of GI bleeding.

**Tetracyclines:** May increase risk of photosensitization.

#### Herbal

**Feverfew:** May decrease the effects of feverfew.

**Ginkgo biloba:** May increase the risk of bleeding.

Food

Alcohol: May increase the risk of side effects such as dizziness or GI bleeding.

## **DIAGNOSTIC TEST EFFECTS**

May prolong bleeding time and alter blood glucose level. May increase serum hepatic function test results. May decrease serum sodium and uric acid levels.

## SIDE EFFECTS

#### Frequent (4%-9%)

Nausea, constipation, abdominal cramps or pain, heartburn, dizziness, headache, somnolence.

## Occasional (1%-3%)

Stomatitis, diarrhea, indigestion, fluid retention. Rare (< 1%)

Vomiting, confusion.

## SERIOUS REACTIONS

• Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, severe hepatic reactions (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome). • Severe hypersensitivity reaction (fever, chills, bronchospasm).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac disease, hypertension, GI disease, impaired hepatic or renal function, and those using anticoagulants concurrently. Naproxen crosses the placenta and is distributed in breast milk, warranting caution in lactation. Naproxen should not be used during the third trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closing of the ductus arteriosus. The safety and efficacy of naproxen have not been established in children younger than 2 yr. Children older than 2 yr are at an increased risk for developing a rash during naproxen therapy. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may increase the risk of hepatotoxicity and renal toxicity; a reduced dosage is recommended. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Use lowest effective dose. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 halflives before surgical procedures. Because the drug may cause dizziness, do not perform tasks requiring mental concentration or motor skills until the effects of the drug are known.

Notify the physician if black or tarry stools, persistent headache, rash, visual disturbances, or weight gain occurs. CBC (particularly hemoglobin, hematocrit, and platelet count), BUN level, serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels to assess hepatic and renal function, and pattern of daily bowel activity and stool consistency should be assessed during therapy. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness; improved grip strength; and increased joint mobility, should be evaluated. Administration

**!** Each 275- or 550-mg tablet of naproxen sodium equals 250 or 500 mg of naproxen, respectively.

Swallow enteric-coated tablets whole; scored tablets may be broken or crushed. Take naproxen with food, milk, or antacids if GI distress occurs. Shake oral suspension well before each use.

#### Naratriptan

nare-a-trip'tan Amerge Do not confuse Amerge with Amaryl.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Migraine agents, serotonin agonists

#### MECHANISM OF ACTION

A serotonin receptor agonist that binds selectively to vascular receptors, producing a vasoconstrictive effect on cranial blood vessels. *Therapeutic Effect:* Relieves migraine headache.

## PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 28%-31%. Metabolized by the liver to inactive metabolite. Eliminated primarily in urine and, to a lesser extent, in feces. *Half-life:* 6 h (increased in hepatic or renal impairment).

## AVAILABILITY

Tablets: 1 mg, 2.5 mg.

## INDICATIONS AND DOSAGES Acute migraine attack

PO Adults. 1 mg or 2.5 mg. If headache improves but then returns, dose may be repeated after 4 h. Maximum: 5 mg/24 h.

#### Dosage in mild to moderate renal or hepatic impairment

A lower starting dose is recommended. Do not exceed 2.5 mg/24 h.

## CONTRAINDICATIONS

Basilar or hemiplegic migraine, cerebrovascular or peripheral vascular disease, coronary artery disease, ischemic heart disease (including angina pectoris, history of myocardial infarction [MI], silent ischemia, and Prinzmetal angina), severe hepatic impairment—(Child-Pugh grade C), severe renal impairment (serum creatinine < 15 mL/min), uncontrolled hypertension, use within 24 h of ergotamine-containing preparations or another serotonin receptor agonist, use within 14 days of MAOIs.

## INTERACTIONS

#### Drug

**5-HT**<sub>1</sub> **agonists:** Do not use within 24 h.

## **Ergotamine-containing**

**medications:** May produce a vasospastic reaction. Contraindicated within 24 h.

#### Fluoxetine, fluvoxamine,

paroxetine, sertraline: May produce hyperreflexia, incoordination, and weakness (serotonin syndrome). MAOIs: Contraindicated within 14 days.

**Oral contraceptives:** Decrease naratriptan clearance and volume of distribution.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Occasional (5%)

#### Nausea. Rare (2%)

Paresthesia; dizziness; fatigue; somnolence; jaw, neck, or throat pressure, photophobia.

## SERIOUS REACTIONS

 Corneal opacities and other ocular defects may occur.
 Cardiac reactions (including ischemia, coronary artery vasospasm, and MI) and noncardiac vasospasm-related reactions (such as hemorrhage or cerebrovascular accident) occur rarely, particularly in patients with hypertension, diabetes, or a strong family history of coronary artery disease; obese patients; smokers; men older than 40 yr; and postmenopausal women.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with mild to moderate hepatic or renal impairment and cardiovascular risk factors. It is unknown whether naratriptan is excreted in breast milk, warranting caution in lactation. The safety and efficacy of naratriptan have not been established in children. Naratriptan is not recommended for elderly patients. Tasks that require mental alertness or motor skills should be avoided.

Notify the physician immediately if anxiety, chest pain, palpitations, or tightness in the throat occurs. Migraines and associated symptoms, including nausea and vomiting, photophobia, and phonophobia (sound sensitivity), should be assessed before and during treatment.

## Storage

Store at room temperature.

#### Administration

Take naratriptan without regard to food. Swallow tablets whole; do not crush them.

## Natalizumab

nat-ah-lih′zoo-mab ★ 🏜 Tysabri

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Neurologic agents, immunologic agents, monoclonal antibodies

## **MECHANISM OF ACTION**

A monoclonal antibody that binds to the surface of leukocytes, inhibiting their adhesion to the vascular endothelial cells of the GI tract and preventing them from migrating across the endothelium into inflamed parenchymal tissue. *Therapeutic Effect:* Decreases clinical exacerbations of multiple sclerosis and decreases GI inflammation.

#### PHARMACOKINETICS

Half-life: 11 days.

#### AVAILABILITY

Injection Solution: 300 mg/15 mL.

## INDICATIONS AND DOSAGES

Relapses of multiple sclerosis
 IV INFUSION
 Adults Elderly 300 mg infused ov

*Adults, Elderly.* 300 mg infused over 1 h every 4 wks.

Crohn's disease

IV INFUSION *Adults, Elderly.* 300 mg infused over 1 h every 4 wks.

## CONTRAINDICATIONS

Multifocal leukoencephalopathy, hypersensitivity to product or murine proteins.

## INTERACTIONS

Drug

#### Antineoplastic, corticosteroid, immunosuppressant, immodulating agents: May cause increase in infection. Not typically used together. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Increases basophil, eosinophil, lymphocyte, monocyte, and RBC counts. May alter liver function test results.

## IV INCOMPATIBILITIES

Do not mix natalizumab with any other medication or with any diluent other than 0.9% NaCl.

#### SIDE EFFECTS

#### Frequent (15%-35%)

Headache, fatigue, depression, arthralgia.

## Occasional (5%-10%)

Abdominal discomfort, rash, urinary frequency or urgency, menstrual irregularities, dysmenorrhea, dermatitis.

#### Rare (2%-4%)

Pruritus, chest discomfort, local bleeding, rigors, tremor, syncope.

## SERIOUS REACTIONS

· Potential increased risk of infection.

• Progressive multifocal leukoencephalopathy (PML); can be progressively disabling and fatal. Withhold dose if a symptom suggestive of PML is noted.

- Hypersensitivity.
- · Hepatotoxicity.

## PRECAUTIONS & CONSIDERATIONS

! Increased risk of progressive multifocal leukoencephalopathy that can lead to death or disability. Patients receiving natalizumab must be enrolled and meet conditions of special distribution and registration program (TOUCH program).

Caution is warranted in patients with chronic progressive multiple sclerosis. It is unknown whether natalizumab crosses the placenta or is distributed in breast milk, warranting caution in lactation. The safety and efficacy of natalizumab have not been established in children younger than 18 yr. No age-related precautions have been noted for elderly patients.

Notify the physician of arthralgia, rash, depression, menstrual irregularities, or urinary changes. CBC and liver function test results should be monitored.

Monitor patients for any new sign or symptom suggestive of PML. Typical symptoms include progressive weakness or clumsiness of limbs, disturbance of vision, and changes in thinking, memory, personality, and orientation. **Storage** 

Protect natalizumab vials from light. Do not freeze them. After reconstitution, the solution is stable for 8 h if refrigerated.

#### Administration

To reconstitute, withdraw 15 mL (300 mg) natalizumab from the vial and inject it into 100 mL 0.9% NaCl. Invert the bag to mix the solution completely. Do not shake it. Inspect the solution for particles. Discard it if it contains particles or becomes discolored. Infuse natalizumab over 1 h. Following the infusion, flush the IV line with 0.9% NaCl. Observe patient for 1 h after infusion.

## Natamycin

na-ta-mye′sin ★ Natacyn Do not confuse with naproxen.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antifungals, ophthalmics

## **MECHANISM OF ACTION**

A polyene antifungal agent that increases cell membrane permeability in susceptible fungi. *Therapeutic Effect:* Fungicidal.

## PHARMACOKINETICS

Minimal systemic absorption. Adheres to cornea and is retained in conjunctival fornices.

## AVAILABILITY

*Ophthalmic Suspension:* 5% (Natacyn).

#### INDICATIONS AND DOSAGES • Fungal keratitis, ophthalmic fungal infections

OPHTHALMIC

Adults, Elderly. Instill 1 drop in conjunctival sac every 1-2 h. After

3-4 days, reduce to 1 drop 6-8 times daily. Usual course of therapy is 2-3 wks or until the fungal infection is resolved. If limited to blepharitis or conjunctivitis, application 4-6 times/day may be sufficient.

## CONTRAINDICATIONS

Hypersensitivity to natamycin or any component of the formulation.

#### INTERACTIONS

#### Drug

#### Topical corticosteroids: May

increase risk of toxicity. Concomitant use is contraindicated.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Occasional (3%-10%)

Blurred vision, eye irritation, eye pain, photophobia.

## SERIOUS REACTIONS

• Vomiting and diarrhea have occurred with large doses in the treatment of systemic mycoses.

## PRECAUTIONS & CONSIDERATIONS

If symptoms do not improve within 7-10 days, or become worse, notify the physician. It is unknown whether natamycin is excreted in breast milk, warranting caution in lactation. Safety and efficacy of natamycin have not been established in children. No age-related precautions have been noted in elderly patients.

#### Storage

May be stored in refrigerator or at room temperature. Do not freeze. Avoid exposure to light and excessive heat.

#### Administration

Shake ophthalmic suspension before using. Do not touch dropper to eye. Remove contact lenses and do not wear during treatment. Gently clean eye of any exudate before instilling medication. Form a slight pouch and instill; close the eye and allow the medication to cover the eye before reopening. Wipe away gently any extra medication.

## Nateglinide

na-tegʻlin-ide ★ 🏜 Starlix

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, meglitinide

## **MECHANISM OF ACTION**

An antihyperglycemic that stimulates the release of insulin from  $\beta$ -cells of the pancreas by depolarizing  $\beta$ -cells, leading to an opening of calcium channels. Resulting calcium influx induces insulin secretion. *Therapeutic Effect:* Lowers blood glucose concentration.

## PHARMACOKINETICS

PO: Rapid absorption; peak plasma levels in 1 h; bioavailability 73%. Plasma protein binding 98%, hepatic metabolism by CYP450 A29 isoenzyme (70%) and CYP450 3A4 isoenzyme (30%); excretion in urine and feces.

## AVAILABILITY

Tablets: 60 mg, 120 mg.

# INDICATIONS AND DOSAGES Diabetes mellitus type 2 PO

*Adult, Elderly.* 120 mg 3 times a day before meals. Initially, 60 mg/dose may be given in patients close to goal HbA1C. May be used with metformin or a thiaolidinedione.

## CONTRAINDICATIONS

Diabetic ketoacidosis, type 1 diabetes mellitus, hypersensitivity.

## INTERACTIONS

#### Drug

β-Blockers, MAOIs, NSAIDs, salicylates: May increase hypoglycemic effect of nateglinide. Rifampin, phenytoin, corticosteroids, thiazide diuretics, thyroid medication, sympathomimetics: May decrease hypoglycemic effect of nateglinide. Herbal

St. John's wort: May decrease hypoglycemic effect of nateglinide. **Food** 

**Liquid meal:** Peak plasma levels may be significantly reduced if administered 10 min before a liquid meal.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Frequent (10%) Upper respiratory tract infection. Occasional (3%-4%) Back pain, flu symptoms, dizziness, arthropathy, diarrhea. Rare (2%) Bronchitis, cough.

## SERIOUS REACTIONS

• Hypoglycemia occurs in < 2% of patients.

## **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with hepatic or renal impairment. No adequate, well-controlled studies exist in pregnant women. Caution should be exercised when nateglinide is used during pregnancy. It is unknown whether nateglinide is distributed into breast milk. The manufacturer recommends that patients do not breastfeed. The safety and efficacy of nateglinide have not been established in children.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store at room temperature, tightly closed.

#### Administration

Ideally, take within 15 min of a meal; however, may take immediately or as long as 30 min before a meal. Allow at least 1 wk to elapse to assess the response to the drug before new dose adjustment is made.

## Nebivolol

na-biv'oh-lol Bystolic Do not confuse nebivolol with atenolol or timolol, or Bystolic with bisoprolol.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antihypertensive agents,  $\beta$ -blocking

## **MECHANISM OF ACTION**

A  $\beta_1$ -adrenergic blocker that is primarily selective until doses are greater than 10 mg/day, at which some activation of  $\beta_2$ -receptors occurs. Acts as an antihypertensive agent by blocking  $\beta_1$ -adrenergic receptors in vascular tissue and decreasing vascular resistance. *Therapeutic Effect:* Slows sinus node heart rate, decreasing cardiac contractility and BP.

## PHARMACOKINETICS

Exact bioavailability has not been determined. Protein binding: 98%. Liver metabolism. Nebivolol is metabolized by a number of routes, including glucuronidation and hydroxylation by CYP2D6. Metabolites contribute to activity. Excreted in urine and feces; 38% of the dose was recovered in urine and 44% in feces in extensive metabolizers. *Half-life*: 12-19 h (increased in severely impaired renal or hepatic function).

## AVAILABILITY

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg.

## INDICATIONS AND DOSAGES

Hypertension PO *Adults. Elderly.* Start with 5 mg once daily, as monotherapy or in combination with other agents. The dose can be increased at 2-wk intervals as needed and tolerated up to 40 mg/day.

#### Dosage in hepatic or renal impairment

For Child-Pugh class A or B or CrCl < 30 mL/min. 2.5 mg once daily initially, titrate carefully to desired clinical effect.

## CONTRAINDICATIONS

Severe bradycardia, heart block greater than 1st degree, cardiogenic shock, decompensated CHF, sick sinus syndrome (unless a permanent pacemaker is in place), severe hepatic impairment (Child-Pugh class C), hypersensitive to any component of product.

#### INTERACTIONS Drug

**Cimetidine:** May increase nebivolol blood concentration.

**Diuretics, other antihypertensives:** May increase hypotensive effects; calcium channel blockers would have additive cardiac conduction effects. Discontinue  $\beta$ -blocker several days before a clonidine taper.

**CYP2D6** inhibitors (e.g., quinidine, propafenone, fluoxetine, paroxetine): May significantly

increase nebivolol exposure. Insulin, oral hypoglycemics: May mask symptoms of hypoglycemia and prolong hypoglycemic effect of insulin and oral hypoglycemics. NSAIDs: May decrease antihypertensive effects.

**Sympathomimetics:** May inhibit blood pressure lowering.

## Herbal

None known. Food None known.

Nebivolol (Generic Name)

## DIAGNOSTIC TEST EFFECTS

Increase in BUN, uric acid, triglycerides and a decrease in HDL cholesterol and platelet count.

## SIDE EFFECTS

Nebivolol is generally well tolerated, with mild and transient side effects.

#### Frequent

Headache, fatigue, diarrhea, nausea, dizziness.

#### Occasional

Cold extremities, insomnia, chest pain, bradycardia, hypotension, dyspnea, rash, peripheral edema.

## Rare

Urinary frequency, impotence or decreased libido, mental depression. Asthenia, hyperuricemia, hyperlipidemia. Arthralgia, myalgia, confusion (especially in the elderly).

## SERIOUS REACTIONS

• Overdose may produce profound bradycardia and hypotension.

• Abrupt withdrawal may result in diaphoresis, palpitations, headache, and tremors.

 May precipitate CHF or MI in patients with cardiac disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.

• Hypoglycemia may occur in patients with previously controlled diabetes.

 Thrombocytopenia, manifested as unusual bruising or bleeding, occurs rarely.

• Rare hypersensitivity, including anaphylaxis, allergic vasculitis, or angioedema.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bronchospastic disease, diabetes, hyperthyroidism, impaired renal or hepatic function, inadequate cardiac function, and peripheral vascular disease. Nebivolol likely crosses the placenta and is likely distributed in breast milk. Use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, and hypothermia. This drug is not yet approved for use in children. Use cautiously in elderly patients, who may have age-related peripheral vascular disease and impaired renal function.

Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval. Orthostatic hypotension may occur, so rise slowly from a lying to sitting position and dangle the legs from the bed momentarily before standing. Notify the physician of confusion, depression, dizziness, rash, or unusual bruising or bleeding. BP for hypotension; respiratory status for shortness of breath; and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is < 55 beats/min or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed.

#### Storage

Store at room temperature. Administration

Take oral nebivolol without regard to meals. Crush tablets if necessary. Do not abruptly discontinue the drug. Compliance is essential to control hypertension.

## **Nedocromil Sodium**

ned-oh-crow'mil so'dee-um

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Ophthalmics, anti-inflammatory agents, mast cell stabilizers

## **MECHANISM OF ACTION**

A mast cell stabilizer that prevents the activation and release of inflammatory mediators, such as histamine, leukotrienes, mast cells, eosinophils, and monocytes. *Therapeutic Effect:* Reduces ocular symptoms of allergies.

## PHARMACOKINETICS

Low systemic absorption.

**AVAILABILITY** *Ophthalmic Solution (Alocril):* 2%.

## INDICATIONS AND DOSAGES

Allergic conjunctivitis
 OPHTHALMIC
 Adults, Elderly, Children 3 yr and older:
 1-2 drops in each eye twice a day.

## CONTRAINDICATIONS

Hypersensitivity to nedocromil.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Temporary ocular burning, irritation, stinging, headache, unpleasant taste, and nasal congestion.

#### Rare

Asthma, conjunctivitis, eye redness, photophobia, and rhinitis.

## SERIOUS REACTIONS

• None known.

## **PRECAUTIONS & CONSIDERATIONS**

Users of contact lenses should refrain from wearing lenses while exhibiting the signs and symptoms of allergic conjunctivitis. Use with caution in pregnancy and lactation. There are no specific precautions for children over 3 yr of age or the elderly.

#### Storage

May refrigerate or keep at room temperature. Protect the drug from direct exposure to light.

#### Administration

Prior to ophthalmic administration, wash hands. Tilt head back slightly, look up, and pull lower eyelid down to form a pouch. Squeeze drop(s) into pouch then close eye gently. Do not touch bottle tip to any surface.

## **Nefazodone**

★ neh-faz'oh-doan

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, miscellaneous

## **MECHANISM OF ACTION**

Exact mechanism is unknown. Appears to inhibit neuronal uptake of serotonin and norepinephrine and to

Nefazodone (Generic Name)

antagonize  $\alpha_1$ -adrenergic receptors. *Therapeutic Effect:* Relieves depression.

## PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract; food delays absorption. Protein binding: 99%. Widely distributed in body tissues, including the central nervous system (CNS). Extensively metabolized via the liver to active metabolites. Excreted in urine and eliminated in feces. Unknown whether removed by hemodialysis. *Half-life:* 2-4 h.

## AVAILABILITY

*Tablets:* 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

#### INDICATIONS AND DOSAGES • Depression, prevention of relapse in acute depressive episode PO

*Adults.* Initially, 200 mg/day in 2 divided doses. Gradually increase by 100-200 mg/day at intervals of at least 1 wk. Range: 300-600 mg/day. *Elderly.* Initially, 100 mg/day in 2 divided doses. Subsequent dosage titration based on clinical response. Range: 200-400 mg/day.

## CONTRAINDICATIONS

Do not use within 14 days of MAOIs, previous history of liver problems from nefazodone, or hypersensitivity to nefazodone or trazodone.

Coadministration of terfenadine, cisapride, astemizole, pimozide, carbamazepine or triazolam is contraindicated.

## INTERACTIONS

NOTE: Because nefazodone is a potent CYP3A4 inhibitor, many prescription medications contraindicate its use. Check prescribing information for other medications carefully before using nefazodone.

## Drug

Alprazolam: May increase the blood concentration and risk of toxicity of alprazolam.

**Carbamazepine:** Reduces nefazodone concentrations significantly.

Substrates of CYP3A4: May risk interaction with drugs metabolized with CYP3A4. Important examples of substrates include ergot alkaloids, antiarrhythmic drugs, statins, and protease inhibitors.

**MAOIs:** May produce severe reactions if used concurrently with or within 14 days of MAOI discontinuation.

Triazolam: Increases triazolam concentration by 75%. Try to avoid, or greatly reduce triazolam dose. Herbal

St. John's wort: May increase the risk of adverse effects. Avoid. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase LFTs.

## SIDE EFFECTS

#### Frequent

Headache (36%); dry mouth, somnolence (25%); nausea (22%); dizziness (17%); constipation (14%); insomnia, asthenia, lightheadedness (10%).

## Occasional

Dyspepsia, blurred vision (9%); diarrhea, infection (8%); confusion, abnormal vision (7%); pharyngitis (6%); increased appetite (5%); orthostatic hypotension, flushing, feeling of warmth (4%); peripheral edema, cough, flu-like symptoms (3%).

#### SERIOUS REACTIONS

Serious reactions, such as hyperthermia, rigidity, myoclonus, extreme agitation, delirium, and coma, will occur due to MAOI interaction.
Hepatotoxicity.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cerebrovascular or cardiovascular disease, recent myocardial infarction, dehydration, hypovolemia, cirrhosis, a history of hypomania or mania, and a history of seizures. It is unknown whether nefazodone crosses the placenta or is distributed in breast milk, warranting caution in lactation. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments. The safety and efficacy of this drug have not been established in children. Elderly and debilitated patients are more susceptible to side effects. Lower dosages are recommended for elderly patients, although no agerelated precautions have been noted for this age group.

Drowsiness, dizziness, and light-headedness may occur, so avoid alcohol and tasks that require mental alertness or motor skills. BP and pulse rate should be assessed during therapy. Caution is warranted in postural changes because of possible orthostatic hypotension developing.

Patients who develop evidence of hepatocellular injury such as increased serum AST or serum ALT levels  $\geq$  3 times the upper limit of normal (ULN) should be withdrawn from the drug.

#### Storage

Store at room temperature.

#### Administration

! Allow at least 14 days to elapse before switching the patient from an MAOI to nefazodone and at least 7 days to elapse before switching the patient from nefazodone to an MAOI.

Take nefazodone without regard to food.

## Nelfinavir

nel-fin'eh-veer

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiretrovirals, protease inhibitors

#### MECHANISM OF ACTION

Inhibits the activity of HIV-1 protease, the enzyme necessary for the formation of infectious HIV. *Therapeutic Effect:* Formation of immature noninfectious viral particles rather than HIV replication.

#### PHARMACOKINETICS

Well absorbed after PO administration (absorption increased with food). Protein binding: 98%. Metabolized in the liver. Highly bound to plasma proteins. Eliminated primarily in feces. Unknown if removed by hemodialysis. *Half-life*: 3.5-5 h.

#### AVAILABILITY

Powder for Oral Suspension: 50 mg/g. Tablets: 250 mg, 625 mg.

Nelfinavir (Generic Name)

## Nelarabine

nel-are'a-been Arranon Atriance Do not confuse nelarabine with cladribine or fludarabine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic, antimetabolite, purine analog

## **MECHANISM OF ACTION**

A prodrug for ARA-G (deoxyguanosine analog 9-β-Darab inofuranosylguanine), which acts as an intracellular cytotoxic agent and inhibits DNA synthesis. Once inside the cell, ARA-G is mono-phosphorylated and converted to ARA-GTP. Accumulation of ARA-GTP in leukemic blasts allows for incorporation into DNA. Incorporation into DNA halts DNA synthesis and causes apoptosis. Also inhibits RNA synthesis. More toxic to T-lymphoblasts than other blast cells. Therapeutic Effect: Leads to tumor cell death.

## PHARMACOKINETICS

After IV administration, both nelarabine and ARA-G are rapidly distributed to body tissues. Protein binding: < 25%. The principal route of metabolism for nelarabine is hepatic O-demethylation by adenosine deaminase to form ARA-G, which undergoes hydrolysis to form guanine. In addition, some nelarabine is hydrolyzed to form methylguanine, which is O-demethylated to form guanine. Guanine is N-deaminated to form xanthine, which is further oxidized to yield uric acid. Nelarabine and ARA-G are partially eliminated by the kidneys. *Half-life:* Nelarabine, 18 min; ARA-G, 3.2 h (in adults, slightly shorter in children).

## AVAILABILITY

Injection Solution: 250 mg/50 mL (5 mg/mL).

## INDICATIONS AND DOSAGES

#### T-cell lymphocytic leukemia or T-cell lymphoma

IV INFUSION

*Adults, Elderly.* 1500 mg/m<sup>2</sup> over 2 h on days 1, 3, and 5. Cycle is repeated every 21 days.

*Children.* 650 mg/m<sup>2</sup> administered over 1 h daily for 5 consecutive days. Cycle is repeated every 21 days.

#### Dosage for toxicities

Expect dosage to be discontinued for significant neurotoxicity and delayed for significant hematologic toxicity.

▶ Dosage in renal cell impairment Give if CrCl < 50 mL/min only when benefits outweigh risks due to lack of data.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

**Pentostatin:** Coadministration is not recommended due to similar actions.

Vaccines, live virus: Avoid use. Altered immune response and increased risk of secondary transmission of infection from vaccine.

## Herbal

None known. Food

None known.

## IV INCOMPATIBILITIES

Do not mix with or infuse with other medications.

#### DIAGNOSTIC TEST EFFECTS

May elevate serum uric acid, serum creatinine. Decreased RBC, WBC, and platelet counts. Electrolyte disturbances may occur.

#### SIDE EFFECTS

#### Frequent (> 20%)

Anemia, thrombocytopenia, neutropenia, nausea, diarrhea, vomiting, constipation, fatigue, pyrexia, cough, and dyspnea.

## Common (> 10%)

Somnolence, dizziness, weakness, peripheral neuropathy, hypoesthesia, headache, peripheral edema, and paresthesia.

#### Rare

Blurred vision.

### SERIOUS REACTIONS

 Dose-limiting toxicity is neurotoxicity. Serious neurotoxicity may cause seizures, paralysis, and coma.

 Bone marrow depression is manifested as hematologic toxicity (principally leukopenia, anemia, thrombocytopenia).

 Hyperkalemia, hyperphosphatemia, hyperuricemia, hypocalcemia, and decreased urine output may be indicative of tumor lysis syndrome (TLS). Appropriate measures must be taken to prevent severe electrolyte imbalances and renal toxicity.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution and closely monitor patients with hepatic or renal dysfunction. Fetal harm can occur if given to a pregnant woman. Adequate contraception is recommended during treatment. Breastfeeding is not recommended since it is not known if nelarabine is excreted in breast milk. The elderly may be more susceptible to drug toxicities and age-related organ dysfunction.

Monitor CBC with differential and platelet count and renal function before each dose. Patients should avoid those recently vaccinated with live-virus vaccines or crowds. Any of the following symptoms should be reported immediately: rash, hives, difficulty breathing, fever, chills; these symptoms can be indicators of possible infection: bleeding or unusual bruising, mouth sores, dark urine, yellowing of skin or eyes, pain, redness, swelling at injection site; persistent nausea, vomiting, diarrhea, appetite loss, or worsening general body weakness. Maintain adequate hydration during therapy to avoid developing hyperuricemia and urate precipitation.

#### Storage

Store unopened vials at controlled room temperature. Once transferred to appropriate infusion container, the drug is stable for 8 h at room temperature.

#### Administration

CAUTION: Observe and exercise usual cautions for handling, preparing, and administering cytotoxic drugs.

Administer nelarabine by IV infusion only. The solution is given undiluted. The appropriate dose is transferred into PVC infusion bags or glass containers and administered as a 2-h infusion in adult patients and as a 1-h infusion in pediatric patients. Appropriate measures (e.g., hydration, urine alkalinization, and prophylaxis with allopurinol) must be taken to prevent hyperuricemia.
### INDICATIONS AND DOSAGES HIV infection

#### PO

Adults and Children > 13 yrs. 750 mg (three 250-mg tablets) 3 times a day or 1250 mg twice a day in combination with other antiretroviral agents. *Children aged 2-13 yr.* 25-35 mg/kg/dose 3 times a day or 45-55 mg/kg/dose twice daily. Maximum: 750 mg q8h.

#### CONTRAINDICATIONS

Hypersensitivity; coadministration with amiodarone, quinidine, ergot alkaloids, pimozide, triazolam, midazolam, rifampin, St. John's wort, and proton-pump inhibitors; moderate or severe liver dysfunction.

#### INTERACTIONS

NOTE: Please see detailed manufacturer's information for management of drug interactions. In some cases, dosage adjustment or an alternate agent is recommended.

#### Drug

Alcohol, psychoactive drugs: May produce additive central nervous system (CNS) effects.

Alprazolam, midazolam, triazolam: Increases the risk of prolonged sedation. Contraindicated. Amiodarone: May increase amiodarone levels. Contraindicated. Anticonvulsants, rifabutin, rifampin: Decrease nelfinavir plasma concentration. Bosentan, colchicine: Increases the levels of these drugs. Adjust dose. Cyclosporine, other immunosuppressants: May increase blood concentrations; use with caution and monitor closely. Ergot alkaloids: Effects of ergot alkaloids may be increased. Contraindicated.

**Erythromycin, ketoconazole:** May increase plasma levels.

**Fentanyl:** May increase plasma concentrations of fentanyl.

HMG-CoA reductase inhibitors: Increases statin concentrations. Use not recommended with lovastatin, simvastatin, and rosuvastatin. Indinavir, saquinavir: Increases plasma concentration of these drugs.

**Oral contraceptives:** Decreases the efficacy of the O.C.

Phosphodiesterase-5 inhibitors (e.g., sildenafil, vardenafil, tadalafil): Increases PDE-5 inhibitor blood levels and risk of hypotension. Contraindicated for use with sildenafil for pulmonary HTN.

**Ritonavir:** Increases nelfinavir plasma concentration.

#### Herbal

**St. John's wort:** May decrease plasma concentration and effects of nelfinavir. Avoid, as nelfinavir will become ineffective.

#### Food

All foods: Increase nelfinavir plasma concentration. Take with food.

#### DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin values and neutrophil and WBC counts. May increase serum CK, AST (SGOT), and ALT (SGPT) levels. Increased lipids, blood glucose.

#### SIDE EFFECTS

#### Frequent

Diarrhea (> 20%), nausea, rash, gas. Occasional

Asthenia, fatigue; insomnia; accumulation of fat in waist, abdomen, or back of neck (buffalo hump, lipodystrophy). **Bare** 

Abnormal taste sensation, hyperglycemia, new-onset diabetes, sexual dysfunction.

#### SERIOUS REACTIONS

• Jaundice, bilirubinemia, rare cases of hepatitis/liver failure or pancreatitis.

• Serious hypersensitivity reactions have included erythema multiforme or Stevens-Johnson syndrome or anaphylactoid reactions.

• Spontaneous bleeding in patients with hemophilia.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with mild liver function impairment. It is unknown whether nelfinavir is excreted in breast milk. Breastfeeding is not recommended because of the possibility of HIV transmission. Use caution in pregnancy; adherence to contraception should be advised, including the use of non-hormonal methods. No age-related precautions have been noted in children older than 2 yr. Nelfinavir is not a cure for HIV infection, nor does it reduce the risk of transmitting HIV to others. Monitor the patient for signs and symptoms of opportunistic infections as evidenced by chills, cough, fever, and myalgia. Expect to check to establish an accurate baseline before beginning drug therapy. Assess the pattern of daily bowel activity and stool consistency.

#### Storage

Store drug at room temperature, keep it in the original container, and protect it from moisture.

#### Administration

Take with food, a light meal, or snack. Mix oral powder with a small amount of dietary supplement, formula, milk, soy formula, soy milk, or dairy food such as pudding or ice cream. The entire contents must be consumed to receive a full dose. Do not mix with acidic food, such as apple juice, applesauce, or orange juice, or with water. Take the medication every day as prescribed, and evenly space drug doses around the clock.

#### **Neomycin Sulfate**

nee-oh-mye'sin sull'fate

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D OTC (topical ointment 0.5% only)

**Classification:** Antibiotics, aminoglycosides

#### **MECHANISM OF ACTION**

An aminoglycoside antibiotic that binds to bacterial 30S ribosomal subunits. *Therapeutic Effect:* Interferes with bacterial protein synthesis; bactericidal.

#### PHARMACOKINETICS

Poorly absorbed from the GI tract. Rapidly distributed to tissues. Removed by dialysis. 97% eliminated through feces.

#### AVAILABILITY

Tablets: 500 mg. Oral Solution: 125 mg/5 mL (Neo-Fradin). Ointment: 0.5%.

#### INDICATIONS AND DOSAGES • Preoperative bowel antisepsis prophylaxis PO

*Adults, Elderly.* 1 g neomycin plus 1 g erythromycin on day prior to surgery at 1 PM, 2 PM, and 11 PM.

### • Hepatic encephalopathy PO

Adults, Elderly. 4-12 g/day in divided doses q4-6h.

Neomycin Sulfate (Generic Name)

#### Diarrhea caused by Escherichia coli

#### PO

Adults, Elderly. 3 g/day in divided doses q6h.

#### Minor skin infections

IRRIGATION, TOPICAL *Adults, Elderly, Children.* Usual dosage, apply to affected area 1-3 times/day.

#### CONTRAINDICATIONS

Hypersensitivity to neomycin, other aminoglycosides (cross-sensitivity), or their components; patients with intestinal stricture, any inflammatory or ulcerative GI disease.

#### INTERACTIONS

#### Drug

Anticoagulants: May increase anticoagulant effect and lower vitamin K availability.

Digoxin, fluorouracil, methotrexate, penicillin V, vitamin B<sub>12</sub>: May inhibit absorption of these drugs.

Nephrotoxic medications, other aminoglycosides, ototoxic, neurotoxic or nephrotoxic medications: May increase nephrotoxicity and ototoxicity if significant systemic absorption occurs.

Potent diuretics (ethacrynic

acid, furosemide): May increase neomycin toxicity.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum creatitine.

#### SIDE EFFECTS

#### Frequent

Systemic: Nausea, vomiting, diarrhea, irritation of mouth or rectal area. Topical: Itching, redness, swelling, rash.

#### Rare

Systemic: Malabsorption syndrome, neuromuscular blockade (difficulty breathing, drowsiness, weakness).

#### SERIOUS REACTIONS

 Nephrotoxicity (as evidenced by increased BUN and serum creatinine levels and decreased creatinine clearance) may be reversible if the drug is stopped at the first sign of nephrotoxic symptoms.

 Irreversible ototoxicity (manifested as tinnitus, dizziness, and impaired hearing) and neurotoxicity (as evidenced by headache, dizziness, lethargy, tremor, and visual disturbances) occur occasionally.

• Severe respiratory depression and anaphylaxis occur rarely.

• Superinfections, particularly fungal infections, may occur.

#### PRECAUTIONS & CONSIDERATIONS

! Systemic absorption may occur after oral administration, increasing the risk of toxicity.

Caution is warranted in elderly patients, infants, and other patients with renal insufficiency, as well as those with neuromuscular disorders, hearing loss, or vertigo. Aminoglycosides can cause fetal harm when administered to a pregnant woman. Use caution in systemic use in lactation.

Expect to correct dehydration before beginning neomycin therapy. Establish the patient's baseline hearing acuity before beginning therapy. Signs and symptoms of hypersensitivity reaction should be monitored. With topical application, symptoms may include a rash, redness, or itching. If dizziness, impaired hearing, or ringing in the ears occurs, notify the physician. Report diarrhea with blood or pus, hearing loss, tinnitus, vestibular symptoms, muscle twitch, numbness, skin tingling, loose or foul-smelling stools.

#### Storage

Store at controlled room temperature.

#### Administration

Continue taking neomycin for the full course of treatment, and space doses evenly around the clock.

#### **Neostigmine**

nee-oh-stig'meen Prostigmin Do not confuse neostigmine with physostigmine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Cholinesterase inhibitors

#### **MECHANISM OF ACTION**

A cholinergic that prevents destruction of acetylcholine by inhibiting the enzyme acetylcholinesterase, thus enhancing impulse transmission across the myoneural junction. *Therapeutic Effect:* Improves intestinal and skeletal muscle tone; stimulates salivary and sweat gland secretions.

#### PHARMACOKINETICS

PO: Onset 45-75 min, duration 2.5-4 h. IM/SC: Onset 10-30 min, duration 2.5-4 h.

IV: Onset 4-8 min, duration 2-4 h. Metabolized in the liver, excreted in urine.

#### AVAILABILITY

Tablets: 15 mg. Injection: 0.5 mg/mL, 1 mg/mL.

# INDICATIONS AND DOSAGES Myasthenia gravis PO

Adults, Elderly. Initially, 15-30 mg 3-4 times a day. Increase as necessary. Maintenance: 150 mg/day (range of 15-375 mg). *Children*. 2 mg/kg/day divided q3-4hr. IV, IM, SC *Adults*. 0.5-2.5 mg as needed q1-3h. Usual maximum: 10 mg/24h. *Children*. 0.01-0.04 mg/kg q2-4h.

#### Diagnosis of myasthenia gravis IM

*Adults, Elderly.* 0.022 mg/kg. If cholinergic reaction occurs, discontinue tests and administer 0.4-0.6 mg or more atropine sulfate intravenously.

*Children.* 0.025-0.04 mg/kg preceded by atropine sulfate 0.011 mg/kg subcutaneously.

#### Prevention of postoperative urinary retention

IM, SC

*Adults, Elderly.* 0.25 mg q4-6h for 2-3 days.

 Postoperative abdominal distention and urine retention IM, SC

*Adults, Elderly.* 0.5-1 mg. Catheterize patient if voiding does not occur within 1 h. After voiding, administer 0.5 mg q3h for 5 injections.

### Reversal of neuromuscular blockade (with atropine)

Adults, Elderly. 0.5-2.5 mg given slowly. Children. 0.025-0.08 mg/kg/dose. Infants. 0.025-0.1 mg/kg/dose.

#### CONTRAINDICATIONS

GI or genitourinary obstruction, peritonitis, hypersensitivity.

#### INTERACTIONS

#### Drug

Anticholinergics: Reverse or prevent the effects of neostigmine; may be contraindicated. Cholinesterase inhibitors: May increase the risk of toxicity. Ester-type local anesthetics: May increase risk of toxicity. Hydrocarbon inhalation anesthetics, corticosteroids: Decreased action. Neuromuscular blockers: Antagonizes the effects of these drugs. Procainamide, quinidine: May antagonize the action of

neostigmine.

**Succinylcholine:** May increase activity of succinylcholine.

#### Herbal

None known.

Food None known.

DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

None known.

#### **IV COMPATIBILITIES**

Glycopyrrolate (Robinul), heparin, ondansetron (Zofran), potassium chloride, thiopental (Pentothal).

#### SIDE EFFECTS

#### Frequent

Muscarinic effects (diarrhea, diaphoresis, increased salivation, nausea, vomiting, abdominal cramps or pain).

#### Occasional

Muscarinic effects (urinary urgency or frequency, increased bronchial secretions, miosis, lacrimation).

#### SERIOUS REACTIONS

 Overdose produces a cholinergic crisis manifested as abdominal discomfort or cramps, nausea, vomiting, diarrhea, flushing, facial warmth, excessive salivation, diaphoresis, lacrimation, pallor, bradycardia or tachycardia, hypotension, bronchospasm, urinary urgency, blurred vision, miosis, and fasciculation (involuntary muscular contractions visible under the skin).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with arrhythmias, asthma, bradycardia, epilepsy, hyperthyroidism, peptic ulcer disease, and recent coronary occlusion.

Notify the physician of diarrhea, difficulty breathing, increased salivation, irregular heartbeat, muscle weakness, nausea and vomiting, severe abdominal pain, or increased sweating. Vital signs, muscle strength, and fluid intake and output should be monitored. Therapeutic response to the drug, including decreased fatigue, improved chewing and swallowing, and increased muscle strength, should also be assessed.

#### Storage

Store at room temperature, protect from light.

#### Administration

! Discontinue all anticholinesterase therapy at least 8 h before testing. Plan to give 0.01 mg/kg atropine sulfate IV simultaneously with neostigmine, or IM 30 min before administering neostigmine, to prevent adverse effects. Give IV at a rate of 0.5 mg over 1 min.

Expect to give larger doses when the patient is most tired. Adminster orally with food or milk to minimize GI irritation.

#### Nepafenac

neh-pa-fen'ak Nevanac Do not confuse nepafenac with bromfenac or diclofenac.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D in late pregnancy)

**Classification:** Nonsteroidal anti-inflammatory drugs (NSAID), ophthalmic

#### **MECHANISM OF ACTION**

An NSAID prodrug that is rapidly converted to amfenac in the cornea and ocular tissues. The prodrug structure allows nepafenac to rapidly penetrate the cornea and reach its target sites, while minimizing surface accumulation and reducing ocular surface complications. Inhibits prostaglandin synthesis, reducing the intensity of pain and inflammation. In animal eyes, prostaglandins have been shown to produce disruption of the blood-aqueous humor barrier, vasodilatation, increased vascular permeability, leukocytosis, and increased intraocular pressure. Therapeutic Effect: Produces analgesic and anti-inflammatory effects in the eye.

#### PHARMACOKINETICS

Two to 3 h after bilateral ophthalmic administration, given 3 times daily, low but quantifiable plasma concentrations of nepafenac and amfenac were observed in the majority of subjects. No other data available.

#### AVAILABILITY

*Ophthalmic Suspension (Nevanac):* 0.1%.

## INDICATIONS AND DOSAGES Relief of ocular pain and inflammation in patients who has

inflammation in patients who have had cataract extraction OPHTHALMIC

Adults, Elderly, and Children 10 yr of age and older. Apply 1 drop to affected eye(s) 3 times daily beginning 24 h before surgery, then continue on the day of surgery and for 2 wks.

#### CONTRAINDICATIONS

Hypersensitivity to nepafenac, to other NSAIDs, or any formulation ingredient.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (5%-10%)

Capsular opacity, decreased visual acuity, foreign body sensation, increased intraocular pressure, and sticky sensation.

#### Occasional (1%-5%)

Conjunctival edema, corneal edema, dry eye, lid margin crusting, ocular discomfort, ocular hyperemia, ocular pain, ocular pruritus, photophobia, tearing, and vitreous detachment. Some effects are probably the result of the surgical procedure. Systemic side effects like headache, hypertension, nausea/vomiting, and sinusitis have been reported.

#### SERIOUS REACTIONS

· Rare hypersensitivity reactions.

· Corneal adverse events such as

thinning, erosion, or perforation.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in those with sulfite sensitivity, or previous allergic reactions to other NSAIDS; crossreactivity may occur. There have been reports that ocularly applied NSAIDs may cause increased bleeding of ocular tissues following ocular surgery. Topical NSAIDS may slow or delay healing, or may cause keratitis. Use with caution in patients with known bleeding tendencies or who are on medications affecting bleeding times. Patients with complicated ocular surgeries, corneal denervation, corneal epithelial defects, diabetes mellitus, dry eye syndrome, or repeat ocular surgeries may be at increased risk for corneal adverse events that may become sight threatening. Use more than 24 h prior to surgery or use beyond 14 days postsurgery may increase patient risk for the occurrence and severity of corneal adverse events. Patients should not wear contact lenses during treatment. The safety and efficacy of nepafenac have not been established in children < 10 yr. Use during pregnancy or lactation only if clearly needed; avoid use in late pregnancy due to potential effect on ductus arteriosis. No particular precautions needed in elderly patients.

Therapeutic response, such as decreased pain, surgical healing, and inflammation, should be assessed. **Storage** 

Store at controlled room temperature.

#### Administration

Shake well before each use. Take care to avoid contamination; do not allow dropper tip to touch any surface. Wash hands before use. Place index finger on the lower eyelid and pull gently until a pouch is formed. Place the prescribed number of drops in the pouch. Gently close the eye, and apply digital pressure to the lacrimal sac for 1-2 min to minimize the risk of systemic effects. Blot excess solution with a tissue.

### Nesiritide

neh-sir'i-tide ★ 🗳 Natrecor

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Cardiovascular agents, inotropes, brain natriuretic peptide; endogenous hormone

#### **MECHANISM OF ACTION**

A brain natriuretic peptide that facilitates cardiovascular homeostasis and fluid status through counterregulation of the reninangiotensin-aldosterone system, stimulating cyclic guanosine monophosphate, thereby leading to smooth muscle cell relaxation. *Therapeutic Effect:* Promotes vasodilation, natriuresis, and diuresis, correcting congestive heart failure (CHF).

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	15-30 min	1-2 h	4 h

Excreted primarily in the heart by the left ventricle. Metabolized by

the natriuretic neutral endopeptidase enzymes on the vascular luminal surface. *Half-life:* 18-23 min.

#### AVAILABILITY

*Injection Powder for Reconstitution:* 1.5 mg vial.

#### INDICATIONS AND DOSAGES

 Treatment of acutely decompensated CHF in patients with dyspnea at rest or with minimal activity

IV INFUSION

Adults, Elderly. 2 mcg/kg bolus, followed by a continuous IV infusion of 0.01 mcg/kg/min. May be incrementally increased q3h to a maximum of 0.03 mcg/kg/min.

#### CONTRAINDICATIONS

Cardiogenic shock, systolic BP < 90 mm Hg, low cardiac filling pressures, hypersensitivity to nesiritide or product components, such as *E. coli*–derived proteins.

#### INTERACTIONS

#### Drug

ACE inhibitors, IV nitroglycerin, milrinone, nitroprusside: May increase risk of hypotension. Herbal

### None known.

None known.

#### DIAGNOSTIC TEST EFFECTS

May see elevation in serum creatinine.

#### IV INCOMPATIBILITIES

Manufacturer states not to mix or infuse with any other medications. Ampicillin, ampicillin-sulbactam (Unasyn), bumetanide (Bumex), cefepime (Maxipime), diazepam, enalapril (Vasotec), ethacrynic acid (Edecrin), furosemide, (Lasix), heparin, hydralazine (Apresoline), insulin, labetalol, micafungin (Mycamine), pantoprazole, (Protonix), phenytoin, piperacillintazobactam (Zosyn), sodium metabisulfite.

#### SIDE EFFECTS

Frequent (11%) Hypotension.

#### Occasional (3%-8%)

Headache, nausea, bradycardia, azotemia, increased serum creatinine, back pain, diaphoresis.

#### Rare (≤ 1%)

Confusion, paresthesia, somnolence, tremor.

#### SERIOUS REACTIONS

 Ventricular arrhythmias, including ventricular tachycardia, atrial fibrillation, AV node conduction abnormalities, and angina pectoris occur rarely.

• Hypotension requiring medical intervention.

· Hypersensitivity (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

I Drug is intended for acute use in hospitals or emergency rooms.

Caution is warranted in patients with atrial conduction defects, constrictive pericarditis, hypotension, hepatic impairment, pericardial tamponade, renal impairment, restrictive or obstructive cardiomyopathy, significant valvular stenosis, suspected low cardiac filling pressures, and ventricular conduction defects. It is unknown whether nesiritide crosses the placenta or is distributed in breast milk, warranting caution in lactation. The safety and efficacy of nesiritide have not been established in children. No age-related precautions have been noted for elderly patients.

BP should be obtained immediately before each nesiritide dose, in addition to regular monitoring. Be alert to BP fluctuations. Place the patient in the supine position with legs elevated unless an excessive reduction in BP occurs. Intake and output records should be maintained. Notify the physician of chest pain, palpitations, cardiac arrhythmias, decreased urine output, or severe decrease in BP or heart rate.

#### Storage

Store vial at room temperature. Once reconstituted, store at room temperature or refrigerate; use within 24 h.

#### Administration

Do not mix with other injections or infusions. Do not give IM.

Reconstitute one 1.5-mg vial with 5 mL D5W, 0.9% NaCl, 0.2% NaCl, or any combination thereof. Swirl or rock gently, and add to 250-mL bag D5W, 0.9% NaCl, 0.2% NaCl, or any combination thereof yielding a solution of 6 mcg/mL. Give initially as an IV bolus over approximately 60 seconds, followed by continuous IV infusion. The bolus dose is drawn from the infusion bag. Titrate infusion rate up no more frequently than every 3 h.

The catheter must be flushed with a compatible solution between IV administration of nesiritide and other drugs.

#### Nevirapine

neh-veer'a-peen Viramune, Viramune XR

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antiretrovirals, nonnucleoside reverse transcriptase inhibitors (NNRTI)

#### MECHANISM OF ACTION

A nonnucleoside reverse transcriptase inhibitor that binds directly to HIV-1 reverse transcriptase, thus changing the shape of this enzyme and blocking RNA- and DNA-dependent polymerase activity. *Therapeutic Effect*: Interferes with HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Readily absorbed after PO administration. Protein binding: 60%. Widely distributed. Extensively metabolized in the liver. Excreted primarily in urine. *Half-life*: 45 h (single dose), 25-30 h (multiple doses).

#### AVAILABILITY

Tablets: 200 mg. Oral Suspension: 50 mg/5 mL. Extended-Release Tablets: 400 mg.

## INDICATIONS AND DOSAGES HIV infection

PO Adults. 200 mg once a day for 14 days (to reduce the risk of rash). Maintenance: 200 mg twice a day in combination with nucleoside analogs. Alternatively, give 400 mg once daily of extended-release form for maintenance treatment, after the 14 day lead-in period with immediate-release product. *Children 15 days old and older*. 150 mg/m<sup>2</sup> once daily for 14 days, followed by 150 mg/m<sup>2</sup> twice daily. Do not exceed 400 mg/day.

#### **OFF-LABEL USES**

To reduce the risk of transmitting HIV from infected mother to newborn.

Nevirapine (Generic Name)

#### CONTRAINDICATIONS

Hypersensitivity, moderate to severe hepatic impairment.

#### INTERACTIONS

#### Drug

**Clarithromycin:** May decrease activity of clarithromycin. **Efavirenz, methadone:** May decrease concentrations of these

drugs. Fluconazone: May increase concentration of nevirapine.

**Ketoconazole:** Contraindicated; nevirapine negates ketoconazole effectiveness.

**Oral contraceptives:** May reduce effectiveness of oral contraception. **Rifampin, rifabutin:** May decrease

nevirapine levels. Avoid. Warfarin and other related

anticoagualants: May increase INR. Herbal

**St. John's wort:** May decrease blood concentration and effects of nevirapine. Avoid.

Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May significantly increase serum bilirubin, GGT, AST (SGOT), and ALT (SGPT) levels. May significantly decrease hemoglobin level and neutrophil and platelet counts.

#### SIDE EFFECTS

#### Frequent (3%-8%)

Rash, fever, headache, nausea, fatigue, myalgia, granulocytopenia (more common in children).

#### Occasional (1%-3%)

Stomatitis (burning, erythema, or ulceration of the oral mucosa; dysphagia).

#### Rare (<1%)

Fat redistribution syndrome with buffalo hump, central obesity. Paresthesia, abdominal pain.

#### SERIOUS REACTIONS

• Hepatitis and rash may become severe and life threatening. Severe life-threatening and sometimes fatal fulminant and cholestatic hepatic necrosis/failure.

Immune reconstitution syndrome.

#### **PRECAUTIONS & CONSIDERATIONS**

! 14-day dosing regimen must be strictly followed, with 18 wks of patient monitoring for skin and hepatic issues, especially if systemic symptoms occur with them. Extra vigilance is warranted during the first 6 wks, which is the period of greatest risk.

Caution is warranted in patients with a history of mild liver impairment. Breastfeeding is not recommended for mothers with HIV-1 infection. Drug is excreted in breast milk; breastfeeding is contraindicated. Barrier contraception must be used in combination with other methods (e.g., hormonal contraceptives). Nevirapine is not a cure for HIV infection, nor does it reduce risk of transmission to others. Use in combination with other antiretrovirals; do not use as monotherapy. Expect to obtain history of all prescription and nonprescription medications before giving the drug. Monitor for signs and symptoms of adverse side effects as the response to the drug is established.

#### Storage

Store at room temperature. Administration

Continue taking nevirapine for the full course of treatment. May take without regard to food.

The suspension should be shaken gently before each use.

The extended-release tablets should be swallowed whole and must not be chewed, crushed, or divided. NOTE: If any dosing is interrupted for greater than 7 days, restart 14-day lead-in dosing.

#### Niacin (Vitamin B<sub>3</sub>; Nicotinic Acid)

nye'a-sin

Niacor, Niaspan, Slo-Niacin Do not confuse niacin, Niacor, or Niaspan with minocin, Nitro-Bid or nicotine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A (C if used at dosages above the recommended daily allowance)

#### Classification:

Antihyperlipidemics; vitamins, water soluble; B vitamins

**MECHANISM OF ACTION** 

Nicotinic acid form is an antihyperlipidemic, water-soluble vitamin that is a component of two coenzymes needed for tissue respiration, lipid metabolism, and glycogenolysis. *Therapeutic Effect:* Reduces total, LDL, and VLDL cholesterol levels and triglyceride levels; increases HDL cholesterol concentration.

NOTE: Niacinamide, another form of vitamin  $B_3$ , is not effective as an antilipemic and is only used as a dietary supplement.

#### PHARMACOKINETICS

Widely distributed. Metabolized in the liver. Primarily excreted in urine. *Half-life:* 45 min.

#### AVAILABILITY

Capsules (Timed Release): 250 mg, 500 mg.

Tablets (Niacor): 50 mg, 100 mg, 250 mg, 500 mg. Tablets (Timed Release [Slo-Niacin]): 250 mg, 500 mg, 750 mg. Tablets (Timed Release [Niaspan]): 500 mg, 750 mg, 1000 mg.

#### INDICATIONS AND DOSAGES Hyperlipidemia

PO (IMMEDIATE RELEASE, NICOTINIC ACID ONLY) Adults, Elderly. Initially, 50-100 mg twice a day for 7 days. Increase gradually by doubling dose weekly up to 1-1.5 g/day in 2-3 doses. Maximum: 3 g/day. Children. Initially, 100-250 mg/day (maximum 10 mg/kg/day) in 3 divided doses. May increase by 100 mg/wk or 250 mg q2-3wk. Maximum: 2250 mg/day. PO (TIMED RELEASE) Adults, Elderly. Initially, 250 mg or 500 mg/day at bedtime for 1 wk; then increase to 500 mg twice a day. Maintenance: 2 g/day.

#### Nutritional supplement

PO (IMMEDIATE RELEASE) Adults, Elderly. 10-20 mg/day. Maximum: 100 mg/day.

#### Pellagra

PO (IMMEDIATE RELEASE) Adults, Elderly. 50-100 mg 3-4 times a day. Maximum: 500 mg/day. Children. 50-100 mg 3 times a day.

#### CONTRAINDICATIONS

Active peptic ulcer disease, arterial hemorrhage, significant hepatic dysfunction, hypersensitivity to niacin or any formulation components.

#### INTERACTIONS

#### Drug

Antidiabetic agents, insulin: Niacin use may alter glycemic control. Monitor for needed adjustments.

Niacin (Vitamin B<sub>3</sub>; Nicotinic Acid) (Generic Name)

### Lovastatin, pravastatin, simvastatin, and other HMG-CoA reductase

**inhibitors:** May increase the risk of myalgia and rhabdomyolysis.

Warfarin: Occasional reports of increased INR; monitor.

#### Herbal

None known.

#### Food

Alcohol and hot drinks: May increase risk of niacin side effects, such as flushing.

#### DIAGNOSTIC TEST EFFECTS

May increase serum uric acid, AST, ALT, and blood glucose levels. May increase PT. May decrease platelets or serum phosphorus level.

#### SIDE EFFECTS

#### Frequent

Flushing (especially of the face and neck) occurring within 20 min of drug administration and lasting for 30-60 min, GI upset, pruritus. Flushing will decrease with continued therapy.

#### Occasional

Dizziness, hypotension, headache, blurred vision, burning or tingling of skin, flatulence, nausea, vomiting, diarrhea.

#### Rare

Hyperglycemia, glycosuria, rash, hyperpigmentation, dry skin.

#### SERIOUS REACTIONS

Arrhythmias occur rarely.

• Hepatic toxicity, necrosis (rare, but more common with sustained-release dosage forms).

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, gallbladder disease, gout, and a history of hepatic disease or jaundice. Do not exceed recommended dietary intake (RDI) during pregnancy and lactation unless medically necessary. No agerelated precautions have been noted in children or elderly patients. Niacin use is not recommended for children younger than 2 yr.

Be aware that itching, flushing of the skin, sensation of warmth, and tingling may occur. Notify the physician of dark urine, dizziness, loss of appetite, nausea, vomiting, weakness, yellowing of the skin, blurred vision, headache, or complaints of myalgia. Pattern of daily bowel activity and stool consistency should be assessed. Blood glucose level, serum cholesterol and triglyceride levels, and hepatic function test results should be checked at baseline and periodically during treatment.

#### Storage

Store at room temperature. Administration

#### Avoid administration with alcohol or hot liquids to reduce incidence of flushing. Pretreatment with aspirin or NSAIDs can minimize skin flushing (if patient not allergic). Administration with food can lessen

Niaspan tablets should be taken at bedtime, after a low-fat snack. Extended-release products should not be broken, crushed, or chewed, but should be swallowed whole.

#### Nicardipine Hydrochloride

GI distress and pruritus.

nye-card'i-peen high-droh-klor'ide Cardene SR, Cardene IV Do not confuse nicardipine with nifedipine, Cardene with codeine, or Cardene SR with Cardizem SR or codeine.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antihypertensives, antianginals, calcium channel blockers (dihydropyridine group)

Nicardipine Hydrochloride (Generic Name)

#### **MECHANISM OF ACTION**

An antianginal and antihypertensive agent that inhibits calcium ion movement across cell membranes, depressing contraction of cardiac and vascular smooth muscle. *Therapeutic Effect:* Increases heart rate and cardiac output. Decreases systemic vascular resistance and BP.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	0.5-2h	1-2 h	8 h

Rapidly, completely absorbed from the GI tract. Protein binding: 95%. Undergoes first-pass metabolism in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Halflife*: 2-4 h.

Ν

#### AVAILABILITY

Capsules: 20 mg, 30 mg. Capsules, (Sustained Release [Cardene SR]): 30 mg, 45 mg, 60 mg. Injection (Cardene IV): 2.5 mg/mL. Premixed Infusion Bags: 20 mg/200 mL, 40 mg/200 mL.

#### INDICATIONS AND DOSAGES

#### Chronic stable (effort-associated) angina

PO *Adults, Elderly*: Initially, 20 mg 3 times a day. Range: 20-40 mg 3 times a day.

#### Essential hypertension PO

*Adults, Elderly.* Initially, 20 mg 3 times a day. Range: 20-40 mg 3 times a day.

PO (SUSTAINED RELEASE) *Adults, Elderly.* Initially, 30 mg twice a day. Range: 30-60 mg twice a day.

#### Short-term treatment of hypertension when oral therapy is not feasible or desirable (substitute for oral nicardipine) IV INFUSION

*Adults, Elderly.* 0.5 mg/h (for patient receiving 20 mg PO q8h); 1.2 mg/h (for patient receiving 30 mg PO q8h); 2.2 mg/h (for patient receiving 40 mg PO q8h).

#### Patients not already receiving nicardipine

IV INFUSION

Adults, Elderly (gradual BP decrease). Initially, 5 mg/h. May increase by 2.5 mg/h q15min. After BP goal is achieved, decrease rate to 3 mg/h.

Adults, Elderly (rapid BP decrease). Initially, 5 mg/h. May increase by 2.5 mg/h q5min. Maximum: 15 mg/h until desired BP is attained. After BP goal is achieved, decrease rate to 3 mg/h.

#### Changing from IV to oral antihypertensive therapy

Adults, Elderly. A 50% offset of action occurs roughly 30 min after infusion is discontinued. Initiate other antihypertensives upon discontinuation of the infusion. If PO nicardipine is to be used, administer the first dose 1 h prior to weaning infusion off.

#### Dosage in hepatic impairment PO

For adults and elderly patients, initially give 20 mg twice a day; then titrate to response.

#### Dosage in renal impairment PO

For adults and elderly patients, initially give 20 mg q8h (30 mg twice a day sustained-release capsules); then titrate to response.

#### **OFF-LABEL USES**

Diabetic nephropathy, hypertensive urgency, postoperative hypertension.

#### CONTRAINDICATIONS

Atrial fibrillation or flutter associated with accessory conduction pathways, cardiogenic shock, congestive heart failure (CHF), second- or third-degree heart block, severe hypotension, sinus bradycardia, ventricular tachycardia, advanced aortic stenosis.

#### INTERACTIONS

#### Drug

β-Blockers: May have additive effect. Carbamazepine: May increase effect of carbamazepine. Cyclosporine: May increase cyclosporine levels. Digoxin: May have additive heart effects, monitor digoxin levels.

Erythromycin, ketoconazole, cimetidine, other CYP3A4 inhibitors: May increase plasma levels requiring patient monitoring. Hypokalemia-producing agents (such as furosemide and certain other diuretics): May increase risk of arrhythmias.

Indomethacin, possibly other NSAIDs, phenobarbital: May decrease effect of nicardipine. Parenteral and inhalational general anesthetics or other drugs with hypotensive effects: May increase effects of these drugs. Herbal

**St. John's wort:** May decrease effect of nicardipine.

#### Food

**Grapefruit, grapefruit juice:** May alter absorption of nicardipine and increase serum concentrations.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Ampicillin, ampicillin-sulbactam (Unasyn), cefepime (Maxipime), ertapenem (Invanz), furosemide (Lasix), heparin, lansoprazole (Prevacid IV), micafungin (Mycamine), pantoprazole (Protonix), thiopental (Pentothal), tigecycline (Tygacil).

#### **IV COMPATIBILITIES**

Diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), epinephrine, hydromorphone (Dilaudid), labetalol (Trandate), lorazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, nitroglycerin, norepinephrine (Levophed).

#### SIDE EFFECTS Frequent (7%-10%)

Headache, facial flushing, peripheral edema, light-headedness, dizziness.

#### Occasional (3%-6%)

Asthenia (loss of strength, energy), palpitations, angina, tachycardia. Rare (< 2%)

Nausea, abdominal cramps, dyspepsia, dry mouth, rash.

#### SERIOUS REACTIONS

• Overdose produces confusion, slurred speech, somnolence, marked hypotension, and bradycardia.

Syncope.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiomyopathy, edema, hepatic or renal impairment, severe left ventricular dysfunction, sick sinus syndrome, and in those concurrently receiving β-blockers or digoxin. It is unclear whether nicardipine crosses the placenta. It should be administered only when the benefit to the mother exceeds the risk to the fetus. It is unknown whether nicardipine is distributed in breast milk, warranting caution in lactation. The safety and efficacy of nicardipine have not been established in children. In elderly patients, age-related renal impairment may require cautious

use. Alcohol and caffeine should be limited while taking nicardipine. Patient should be advised to remain compliant with dietary sodium restrictions.

Notify the physician if anginal pain is not relieved by the medication and if constipation, dizziness, irregular heartbeat, nausea, shortness of breath, swelling, or symptoms of hypotension such as lightheadedness occur. BP for hypotension, skin for dermatitis, facial flushing and rash, liver function test results, ECG and pulse for tachycardia should be assessed. The onset, type (sharp, dull, or squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, such as exertion and emotional stress, should be recorded. Sublingual nitroglycerin therapy may be used for relief of anginal pain. Caution with postural changes to prevent orthostatic hypotension from developing.

#### Storage

Store at room temperature. Store diluted IV solution for up to 24 h at room temperature.

#### Administration

Do not crush, open, or break sustained-release capsules. Take oral nicardipine without regard to food.

For IV use, dilute each 25-mg vial with 250 mL D5W, 0.9% NaCl, 0.45% NaCl, or any combination thereof to provide a concentration of 0.1 mg/mL. Maximum concentration is 0.4 mg/ mL. Give by slow IV infusion. Change IV site every 12 h if drug is administered by a peripheral rather than a central venous catheter line.

#### Nicotine

nik'o-teen ▲ Commit, NicoDerm CQ, Nicorette, Nicotrol, Nicotrol NS ▲ Habitrol Do not confuse NicoDerm with Nitroderm.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (chewing gum), all other forms: D

Classification: Smoking deterrent

#### MECHANISM OF ACTION

A cholinergic-receptor agonist binds to acetylcholine receptors, producing both stimulating and depressant effects on the peripheral and central nervous systems. *Therapeutic Effect:* Provides a source of nicotine during nicotine withdrawal and reduces withdrawal symptoms.

#### PHARMACOKINETICS

Absorbed slowly after transdermal administration. Protein binding: 5%. Metabolized in the liver. Excreted primarily in urine. *Half-life:* 4 h.

#### AVAILABILITY

Chewing Gum (Nicorette, OTC): 2 mg, 4 mg. Lozenge (Commit): 2 mg, 4 mg. Transdermal Patch (NicoDerm CQ, Nicotrol): 7 mg, 14 mg, 21 mg. Nasal Spray (Nicotrol NS): 0.5 mg/spray. Inhalation (Nicotrol Inhaler):10 mg cartridge.

# INDICATIONS AND DOSAGES Smoking cessation aid to relieve nicotine withdrawal symptoms

PO (CHEWING GUM) Adults, Elderly. Usually, 10-12 pieces/day. Maximum: 30 pieces/day.

#### PO (LOZENGE)

! For those who smoke the first cigarette within 30 min of waking, administer the 4-mg lozenge; otherwise, administer the 2-mg lozenge.

*Adults, Elderly.* One 4-mg or 2-mg lozenge q1-2h for the first 6 wks; one lozenge q2-4h for wks 7-9; and one lozenge q4-8h for wks 10-12. Maximum: 1 lozenge at a time, 5 lozenges/6 h, 20 lozenges/day.

TRANSDERMAL

Adults, Elderly who smoke 10 cigarettes or more per day. Follow the guidelines below:

Step 1: 21 mg/day for 4-6 wks.

Step 2: 14 mg/day for 2 wks. Step 3: 7 mg/day for 2 wks.

Adults, Elderly who smoke

< 10 cigarettes per day. Follow the guidelines below:

Step 1: 14 mg/day for 6 wks. Step 2: 7 mg/day for 2 wks. Patients weighing < 100 lb, patients with a history of cardiovascular disease. Initially, 14 mg/day for 4-6 wks, then 7 mg/day for 2-4 wks. NASAL

Adults, Elderly. 1-2 doses/h (1 dose = 2 sprays [1 in each nostril] = 1 mg). Maximum: 5 doses (5 mg)/h; 40 doses (40 mg)/day. INHALER (NICOTROL) Adults, Elderly. Puff on nicotine

cartridge mouthpiece for about 20 min as needed.

#### CONTRAINDICATIONS

Immediate post-myocardial infarction (MI) period, lifethreatening arrhythmias, severe or worsening angina, uncontrolled hypertension. Patients with such cardiac disease should be under physician care rather than self-use. Patients who continue to smoke, chew tobacco, use snuff are not candidates.

#### **INTERACTIONS**

#### Drug

Acetaminophen, caffeine, oxazepam, pentazocine, theophylline,

**β-adrenergic blockers, insulin,** warfarin, tricyclic antidepressants, antipsychotics: Increased effects of these drugs as smoking ceases. Expect a need to decrease dose as smoking ceases.

**Bupropion:** Use of nicotine with bupropion for smoking cessation may elevate blood pressure. Monitor BP.

**Cimetidine:** May reduce nicotine clearance.

**Ergot alkaloids:** Increases risk of vasconstriction.

Use of more than 1 nicotine product: Do not use 2 nicotinecontanining products at one time. Herbal

None known.

Food

**Coffee, colas, acidic beverages:** May interfere with nicotine gum; do not drink these while gum is in mouth.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS

#### Frequent

All forms: Hiccups, nausea, headache.

Gum: Mouth or throat soreness, nausea, hiccups.

Transdermal: Erythema, pruritus, or burning at application site.

#### Occasional

All forms: Eructation, GI upset, dry mouth, insomnia, diaphoresis, irritability.

Gum: Hiccups, hoarseness.

Inhaler: Mouth or throat irritation, cough.

#### Rare

All forms: Dizziness, myalgia, arthralgia.

#### SERIOUS REACTIONS

 Overdose produces palpitations, tachyarrhythmias, seizures, depression, confusion, diaphoresis, hypotension, rapid or weak pulse, and dyspnea. Lethal dose for adults is 40-60 mg. Death results from respiratory paralysis. NOTE: In children, toxic doses are much smaller.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with eczematous dermatitis, esophagitis, hyperthyroidism, insulin-dependent diabetes mellitus, oral or pharyngeal inflammation, peptic ulcer disease, pheochromocytoma, or severe renal impairment. Nicotine passes freely into breast milk, and smoking and nicotine are associated with a decrease in fetal breathing movements during pregenancy. The use of nicotine is not recommended for breastfeeding women. Nicotine use is not recommended for children. In elderly patients, an age-related decrease in cardiac function may require cautious use.

Notify the physician of itching or a persistent rash during treatment with the transdermal patch. Vital signs, including BP and pulse rate, should be obtained before and during treatment. Storage

Store all products at room temperature. Keep gum and patches in overwraps until time of use to prevent loss of potency. Administration

Expect to individualize nicotine dosage and to administer the drug when the patient plans to stop smoking.

Chew 1 piece of gum slowly and intermittently for 30 min when there is an urge to smoke. Chew until the distinctive peppery nicotine taste or slight tingling in mouth occurs. Then, park in the cheek. When the tingling is almost gone, after approximately

1 min, repeat the chewing procedure to allow constant, slow buccal absorption. Do not chew too rapidly because this may cause nausea and throat irritation. Do not swallow the gum.

For transdermal use, apply the patch as soon as it has been removed from the protective pouch. Use only an intact pouch. Do not cut the patch. Apply the patch only once daily to a hairless, clean, dry area on the upper body or outer arm. Rotate application sites; do not use the same site for 7 days or the same patch for longer than 24 h. Wash hands with water alone after applying the patch because soap may increase nicotine absorption. To discard a used patch, fold it in half with the sticky sides together, place it in the pouch of the new patch, and discard it in a receptacle that is not accessible to children or pets. Do not smoke while wearing the patch.

To avoid possible burns, remove patch if the patient will go to MRI (magentic resonance imaging) procedures. If insomnia occurs, patients may remove the daily patch at bedtime each day.

To use the inhaler, insert the cartridge into mouthpiece and puff vigorously for 20 min.

#### Nifedipine

nve-fed'i-peen ★ Adalat CC, Afeditab CR, Nifediac CC, Nifedical XL, Procardia, Procardia XL Do not confuse nifedipine with nicardipine or nimodipine.

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

Classification: Antihypertensives, antianginals, calcium channel blockers (dihydropyridine group)

Nifedipine (Generic Name)

#### **MECHANISM OF ACTION**

An antianginal and antihypertensive agent that inhibits calcium ion movement across cell membranes, depressing contraction of cardiac and vascular smooth muscle. *Therapeutic Effect:* Increases heart rate and cardiac output. Decreases systemic vascular resistance and BP.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
Sublingual	1-5 min	NA	NA
PO	20-30 min	NA	4-8 h
PO (extended release)	2 h	NA	24 h

Rapidly, completely absorbed from the GI tract. Protein binding: 92%-98%. Undergoes first-pass metabolism in the liver. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 2-5 h.

#### AVAILABILITY

Capsules (Procardia): 10 mg. Tablets (Extended Release [Adalat CC, Afeditab CR, Nifediac CC]): 30 mg, 60 mg, 90 mg. Tablets (Extended Release, Osmotic Release [Procardia XL, Nifedical XL]): 30 mg, 60 mg, 90 mg.

#### INDICATIONS AND DOSAGES > Prinzmetal variant angina, chronic stable (effort-associated) angina

#### PO

*Adults, Elderly.* Initially, 10 mg 3 times a day. Increase at 7- to 14-day intervals. Maintenance: 10 mg 3 times a day up to 30 mg 4 times a day. PO (EXTENDED RELEASE) *Adults, Elderly.* Initially, 30-60 mg/ day. Maintenance: Up to 90 mg/day.

#### Essential hypertension

PO (EXTENDED RELEASE) *Adults, Elderly.* Initially, 30-60 mg/day. Maintenance: Up to 120 mg/day.

#### **OFF-LABEL USES**

Premature labor, intractable hiccups, diabetic nephropathy migraine prophylaxis.

#### CONTRAINDICATIONS

Hypersensitivity, advanced aortic stenosis, severe hypotension. Use of potent CYP3A4 inducers.

#### INTERACTIONS

Drug

**β-Blockers:** May have additive effect.

Carbamazepine: May increase effects of carbamazepine. Digoxin: May increase digoxin blood

concentration. Hypokalemia-producing agents

(such as furosemide and certain other diuretics): May increase risk of arrhythmias.

Indomethacin, other NSAIDs, phenobarbital: May decrease effect of these drugs.

Inhibitors of CYP3A4

**isoenzymes:** May increase effects of nifedipine.

Parenteral and inhalational general anesthetics or other drugs with hypotensive actions: May increase these effects.

Potent CYP3A4 inducers (e.g., rifampin, barbiturates): Decrease effects of nifedipine significantly; contraindicated.

#### Herbal

None known. Food

Grapefruit, grapefruit juice: May increase nifedipine plasma concentration. Avoid.

#### DIAGNOSTIC TEST EFFECTS

Rare, usually transient, but occasionaly significant elevations of enzymes such as alkaline phosphatase, CPK, LDH, SGOT, and SGPT have been noted. Serum creatinine or BUN may also increase rarely. May cause positive ANA and direct Coombs' test.

#### SIDE EFFECTS

#### Frequent (11%-30%)

Peripheral edema, headache, flushed skin, dizziness.

#### Occasional (6%-12%)

Nausea, shakiness, muscle cramps and pain, somnolence, palpitations, nasal congestion, cough, dyspnea, wheezing.

#### Rare (3%-5%)

Hypotension, rash, pruritus, urticaria, constipation, abdominal discomfort, flatulence, sexual difficulties.

#### SERIOUS REACTIONS

• Nifedipine may precipitate CHF and myocardial infarction (MI) in patients with cardiac disease and peripheral ischemia.

• Overdose produces nausea, somnolence, confusion, and slurred speech; excessive hypotension, ECG changes may occur, including heart block.

• When given via the sublingual method for rapid control of hypertension, may cause profound hypotension, acute MI, or death. Do not use nifedipine for this purpose.

• Rare reports of Gl obstuction or bezoar with osmotic-type extendedrelease dosage forms in patients at risk.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired hepatic and renal function.

Caution is advised in patients with cardiac conduction problems, heart failure, or existing edema. It is unclear whether nifedipine crosses the placenta. It should be administered only when the benefit to the mother outweighs the risk to the fetus. An insignificant amount of nifedipine is distributed in breast milk. The safety and efficacy of nifedipine have not been established in children. In elderly patients, age-related renal impairment may require cautious use. Alcohol and tasks that require alertness and motor skills should also be avoided until the effects of the drug are known. Patients should be advised to remain compliant with dietary sodium restrictions.

Use extended-release products with caution in patients with risk factors for Gl ileus or obstruction, since, rarely, obstruction has been reported.

Dizziness or light-headedness may occur. Notify the physician if irregular heartbeat, prolonged dizziness, nausea, or shortness of breath occurs. BP and liver function should be monitored. Skin should be assessed for flushing and peripheral edema, especially behind the medial malleolus and the sacral area. The onset, type (sharp, dull, or squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, such as exertion and emotional stress, should be recorded. Be aware that concurrent administration of sublingual nitroglycerin therapy may be used for relief of anginal pain. Overdose produces nausea, somnolence, confusion, and slurred speech.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Do not crush or break extendedrelease tablets. Take oral nifedipine without regard to meals.

! Never give the contents of the immediate-release capsules sublingually.

Avoid coadministration with grapefruit juice.

#### Nilotinib

ni-loe'ti-nib 🗙 Tasigna

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic, signal transduction inhibitors

#### **MECHANISM OF ACTION**

Highly specific; inhibits BCR-ABL tyrosine kinase, an enzyme created by the Philadelphia chromosome abnormality found in select leukemia cell lines. Also inhibits C-KIT and platelet derived growth factor. *Therapeutic Effect:* Suppresses tumor growth during the three stages of chronic myeloid leukemia (CML): blast crisis, accelerated phase, and chronic phase.

#### PHARMACOKINETICS

Absorption is greatly increased by food; must take on an empty stomach. Total gastrectomy decreases absorption significantly (53%). Protein binding: 98%. Metabolized in liver, primarily by CYP3A4 to inactive metabolites. Primarily eliminated in feces (93%, 69% as unchanged); minimal excretion in urine (4%, 0.1% unchanged). *Halflife*: 17 h.

#### AVAILABILITY

Capsules (Hard Gelatin): 150 mg, 200 mg.

#### INDICATIONS AND DOSAGES

 Chronic phase or accelerated phase Philadelphia chromosomepositive CML (Ph+ CML), resistant or intolerant to prior therapy, including imatinib

PO

*Adults.* 400 mg twice a day (morning and evening).

Newly diagnosed Ph+ CML PO

Adults. 300 mg twice a day.

Dosage for hepatic impairment Patients are given a lower starting dosage initially, then slowly titrated to the full dosage if tolerated. See manufacturer's recommendations based on disease state and hepatic status.

Dosage adjustment for toxicities Expect temporary discontinuation or a reduction in dosage in patients with myelosuppression grade 3 or higher. Withhold therapy if QTc prolongation occurs. Elevated hepatic enzymes, lipase, amylase, or bilirubin may require a dose reduction. See manufacturer's information for recommendations.

#### CONTRAINDICATIONS

Hypersensitivity to nilotinib or its components. Do not use in patients with hypokalemia, hypomagnesemia, or long QT syndrome.

#### INTERACTIONS

NOTE: Nilotinib inhibits p-glycoprotein, CYP3A4, CYP2C8, CYP2C9, CYP2D6, and UGT1A1, increasing the concentrations of drugs eliminated by these enzymes. The drug may induce CYP2B6, CYP2C8, and CYP2C9 and decrease the concentrations of drugs that are eliminated by these enzymes.

#### Drug

H<sub>2</sub> antagonists, proton-pump inhibitors: Decreased nilotinib absorption. Avoid if possible. Anticoagulants, NSAIDs: Increased risk of bleeding.

Strong CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, ketoconazole, nefazodone, protease inhibitors, voriconazole): May increase the levels and adverse effects of nilotinib. Avoid use when possible. Should treatment with any of these agents be required, interrupt nilotinib treatment or continue dose reduction.

**CYP3A4 substrates (midazolam, triazolam):** Increased plasma concentrations of these drugs roughly 30% with increased risk of CNS depression.

CYP3A4 inducers (e.g., dexamethasone, phenytoin, carbamazepine, rifampin, rifabutin, rifapentine, phenobarbital):

Decreased nilotinib activity and levels. Avoid. Increasing nilotinib dose may not ensure efficacy.

QTc-prolonging medications (e.g., antiarrhythmics: amiodarone, disopyramide, procainamide, quinidine, and sotalol) and other drugs that may prolong QT interval (e.g., cisapride, chloroquine, clarithromycin, haloperidol, methadone, moxifloxacin, pimozide,

thioridazine, and others): Avoid co-use. Should treatment with any of these agents be required, interrupt nilotinib treatment.

#### Herbal

**St. John's wort:** Decrease nilotinib levels. Avoid.

#### Food

All food: Increased nilotinib

exposure and side effects; must take on empty stomach.

**Grapefruit juice:** May increase nilotinib levels and adverse effects. Do *not* drink grapefruit juice while taking nilotinib.

#### **DIAGNOSTIC TEST EFFECTS**

Elevations in bilirubin, AST/ ALT, and alkaline phosphatase. Decreased WBC and platelets. Lowered phosphate, potassium, calcium, and sodium blood concentrations. QTc prolongation on ECG. May elevate serum lipase, amylase, or uric acid.

### SIDE EFFECTS

#### Frequent

Neutropenia, thrombocytopenia, anemia. Also, rash, pruritus, headache, nausea, fatigue, myalgia, nasopharyngitis, constipation, diarrhea, abdominal pain, vomiting, arthralgia, pyrexia, upper urinary tract infection, back pain, cough, and asthenia.

#### Occasional

Electrolyte imbalances, febrile neutropenia, vertigo, angina, peripheral edema, dyspnea, epistaxis, prolonged QT interval, elevated hepatic enzymes, insomnia, dizziness, hypoesthesia, paresthesia.

#### Less Common

Hypersensitivity, tumor lysis syndrome, eye hemorrhage, periorbital edema, eye pruritus, conjunctivitis, dry eye, night sweats, eczema, dry skin.

#### SERIOUS REACTIONS

• Nilotinib may cause severe bone marrow suppression (thrombocytopenia, neutropenia, anemia).

- · Hepatitis, jaundice.
- · Pancreatitis.
- Fluid retention may cause pulmonary edema.

• QT prolongation, torsades de pointes and other arrhythmias, sudden death.

• Tumor lysis syndrome and hyperuricemia.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with impaired hepatic function, cardiovascular disease (uncontrolled or significant cardiovascular disease, including recent myocardial infarction, congestive heart failure, unstable angina, or clinically significant bradycardia), pulmonary disease, history of pancreatitis, and patients potentially at risk for OT prolongation. Correct electrolyte imbalance prior to initiating treatment, and carefully monitor serum electrolytes. Safety and effectiveness have not been established in children. Fluid retention may occur more often in the elderly. Women of childbearing potential should be advised to use adequate contraception as the drug may cause fetal harm. Breast milk excretion unknown; do not breastfeed.

#### Storage

Store at room temperature. Keep in original blister pack until time of use.

#### Administration

Must take on an empty stomach; do not consume food 2 h before or 1 h after taking a dose. Capsules should be swallowed whole, not crushed or cut. Do not give with grapefruit juice.

If patient is unable to swallow capsules, the contents of each capsule may be dispersed in one teaspoon (5 mL) of cool applesauce. Take immediately (within 15 minutes) and do not store for future use.

#### Nilutamide

nih-lute'ah-myd 🛃 Nilandron

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Hormone modifier, anti-androgen, antineoplastic

#### **MECHANISM OF ACTION**

An antiandrogen hormone and antineoplastic agent that competitively inhibits androgen action by binding to androgen receptors in target tissue. *Therapeutic Effect:* Decreases growth of abnormal prostate tissue.

#### PHARMACOKINETICS

Consistently well absorbed. Undergoes distribution phase. Moderate protein binding, includes  $\alpha$ -1-glycoprotein. Extensively liver metabolized to 5 metabolites; one shows partial activity of the parent drug. Roughly 62% of dose is eliminated in the urine; less than 2% is excreted unchanged. Minor elimination in feces. *Half-Life*: 38-59 h (parent drug).

#### AVAILABILITY

Tablets: 150 mg.

# INDICATIONS AND DOSAGES Metastatic prostate cancer PO

*Adults, Elderly.* 300 mg once a day for 30 days, then 150 mg once a day. Begin on day of, or day after, surgical castration.

#### CONTRAINDICATIONS

Severe hepatic impairment, severe respiratory insufficiency, hypersensitivity.

#### INTERACTIONS

#### Drug

Warfarin, phenytoin, theophylline, other drugs metabolized by CYP450 with narrow therapeutic

**margin:** Nilutamide may cause delayed elimination and increases the levels of these drugs.

#### Herbal

None known.

#### Food

Alcohol: Intolerance to alcohol (facial flushes, malaise, hypotension) may occur. Avoid.

#### DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels.

#### SIDE EFFECTS

#### Frequent (> 10%)

Hot flashes, delay in recovering vision after bright illumination (such as sun, television, bright lights), decreased libido, diminished sexual function, mild nausea, gynecomastia, alcohol intolerance, insomnia, headache.

#### Occasional (< 10%)

Constipation, hypertension, dizziness, dyspnea, urinary tract infection.

#### SERIOUS REACTIONS

Interstitial pneumonitis occurs rarely.

· Hepatitis, severe liver injury.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatitis and markedly increased serum hepatic function test results. Avoid driving at night. Tinted glasses are recommended to help decrease the visual effect of bright headlights and streetlights.

Notify the physician if signs of hepatotoxicity occur, such as

abdominal pain, dark urine, fatigue, and jaundice. A baseline chest radiogram and liver function tests should be obtained before therapy and periodically during long-term therapy.

Be alert for exertional dyspnea, worsening shortness of breath, cough, chest pain, and fever. Get a baseline chest x-ray before treating. Most cases of lung problems occur in the first 3 mo of treatment. X-rays may show intersitial or alveolointerstitial changes, and PFTs reveal a restrictive pattern if symptoms occur, discontinue the drug and evaluate.

#### Storage

Store at room temperature protected from light. Keep in foil blister packaging until time of use.

#### Administration

Take oral nilutamide with or without food.

#### Nimodipine

nye-mode'i-peen Nimotop Do not confuse nimodipine with nifedipine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Neurologic agents, selective calcium channel blockers (dihydropyridine group)

#### **MECHANISM OF ACTION**

A cerebral vasospasm agent that inhibits movement of calcium ions across vascular smooth-muscle cell membranes. More specific to the CNS than other drugs in the class. *Therapeutic Effect:* Produces favorable effect on severity of neurologic deficits due to cerebral vasospasm. Exerts greatest effect on cerebral arteries; may prevent cerebral spasm.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 95%. Metabolized in the liver. Excreted in urine; eliminated in feces. Not removed by hemodialysis. *Half-life*: terminal, 3 h.

#### AVAILABILITY

Capsules: 30 mg.

#### INDICATIONS AND DOSAGES

 Improvement in neurologic deficits after subarachnoid hemorrhage from ruptured congenital aneurysms
 PO

*Adults, Elderly.* 60 mg q4h for 21 days. Begin within 96 h of subarachnoid hemorrhage.

### Dosage in hepatic impairment (cirrhosis)

*Adults.* 30 mg q4h for 21 days; closely monitor BP and heart rate.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS

#### Drug

Anesthetics, other antihypertensive medications: May increase risk of hypotension.

β-Blockers: May prolong SA and AV conduction, which may lead to severe hypotension, bradycardia, and cardiac failure.

**Cimetidine:** Increases nimodipine concentrations.

**Erythromycin, itraconazole, ketoconazole, protease inhibitors:** May inhibit the metabolism of nimodipine.

Indomethacin and possibly other NSAIDs: May antagonize antihypertensive effect.

#### Rifabutin, rifampin: May

increase the metabolism of

nimodipine. Sympathomimetics: May reduce antihypertensive effects. Herbal

Garlic: May increase antihypertensive effect. Ginseng, yohimbe: May worsen hypertension. Food

**Grapefruit juice:** May increase nimodipine blood concentration and risk of toxicity. Avoid.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

#### SIDE EFFECTS

#### Occasional (2%-6%)

Hypotension, peripheral edema, diarrhea, headache.

#### Rare (< 2%)

Allergic reaction (rash, hives), tachycardia, flushing of skin.

#### SERIOUS REACTIONS

 Overdose produces nausea, weakness, dizziness, confusion, slurred speech, hypotension, and cardiac effects similar to other CCBs.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired hepatic and renal function. It is unknown whether nimodipine crosses the placenta or is distributed in breast milk; caution is warranted in lactation. The safety and efficacy of nimodipine have not been established in children. Elderly patients may also experience greater hypotensive response and constipation.

Notify the physician if constipation, dizziness, irregular heartbeat, nausea, shortness of breath, or swelling occurs. Liver function, neurologic response, BP, and heart rate should be assessed before and during therapy. If the pulse rate is 60 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Storage

Keep at room temperature in original foil packaging until time of use; protect from light and do not freeze.

#### Administration

If unable to swallow, place a hole in both ends of a capsule with an 18-gauge needle to extract contents into a syringe. Empty contents of syringe into a nasogastric (NG) tube: flush tube with 30 mL normal saline. Avoid coadministration with grapefruit juice.

Do not administer contents of capsules IV. Fatal medication errors have occurred.

#### **Nisoldipine**

nye'soul-dih-peen 🛨 Sular Do not confuse nisoldipine with nicardipine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antihypertensives, calcium channel antagonist (dihydropyridine group)

#### MECHANISM OF ACTION

A calcium channel blocker that inhibits calcium ion movement across cell membrane, depressing contraction of cardiac and vascular smooth muscle. Therapeutic Effect: Increases heart rate and cardiac output. Decreases systemic vascular resistance and BP.

#### PHARMACOKINETICS

Poor absorption from the GI tract. Food increases bioavailability. Protein binding: > 99%. Metabolism occurs in the gut wall. Primarily excreted in urine. Not removed by hemodialysis. Half-life: 7-12 h.

#### **AVAILABILITY**

Tablets (Extended Release): 8.5 mg, 17 mg, 25.5 mg, 34 mg (Sular).

#### INDICATIONS AND DOSAGES Hypertension PO

Adults. Initially, 17 mg once daily; then increase by 8.5 mg/wk or longer intervals until therapeutic BP response is attained. In the elderly or in those with impaired liver function, start 8.5 mg once daily. Increase by 8.5 mg/wk to therapeutic response. Maintenance: 17-34 mg once daily.

#### **OFF-LABEL USES**

Stable angina pectoris.

#### CONTRAINDICATIONS

Sick sinus syndrome/second- or third degree AV block (except in presence of pacemaker), hypersensitivity to nisoldipine or any component of the formulation.

#### INTERACTIONS

#### Drug

Amiodarone: May increase risk of bradycardia, atrioventricular block, or sinus arrest.

β-Blockers: May have additive effect.

Delavirdine, ketoconazole, voriconazole: May increase serum nisoldipine concentrations.

Digoxin: May increase digoxin blood concentration.

Nisoldipine (Generic Name)

**Epirubicin:** May increase risk of heart failure.

Fentanyl: May increase risk of severe hypotension.

#### NSAIDs, oral anticoagulants: May increase risk of gastrointestinal hemorrhage and/or antagonism of hypotensive effect.

**Phenytoin, fosphenytoin:** May decrease nisoldipine concentrations.

**Quinidine:** May increase risk of quinidine toxicity.

#### Quinupristin/dalfopristin,

**saquinavir:** May increase risk of nisoldipine toxicity.

**Rifampin:** May decrease nisoldipine efficacy.

#### Herbal

Licorice, ma huang, peppermint oil, yohimbine: May decrease effectiveness of nisoldipine. St. John's wort: May decrease

bioavailability of nisoldipine.

#### Grapefruit and grapefruit juice, or high-fat meal: May increase nisoldipine plasma concentration. Avoid.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent

Giddiness, dizziness, lightheadedness, peripheral edema, headache, flushing, weakness, nausea.

#### Occasional

Transient hypotension, heartburn, muscle cramps, nasal congestion, cough, wheezing, sore throat, palpitations, nervousness, mood changes.

#### Rare

Increase in frequency, intensity, duration of anginal attack during initial therapy.

#### SERIOUS REACTIONS

• May precipitate CHF and myocardial infarction (MI) in patients with cardiac disease and peripheral ischemia.

- Symptomatic hypotension; syncope.
- Overdose produces nausea,

drowsiness, confusion, and slurred speech.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired liver or renal function, aortic stenosis, or cirrhosis. It is unknown whether nisoldipine crosses the placenta or is distributed in breast milk, warranting caution in lactation. Safety and efficacy of nisoldipine have not been established in children. Agerelated renal impairment may require cautious use in elderly patients.

Rise slowly from lying to sitting position and permit legs to dangle from bed momentarily before standing to reduce hypotensive effect. Contact physician if irregular heartbeat, shortness of breath, pronounced dizziness, or nausea occurs.

#### Storage

Store at room temperature. Protect from light and moisture.

#### Administration

Swallow capsule whole. Do not chew, divide, or crush. Take at the same time each day to ensure minimal fluctuation of serum levels.

Do not administer with grapefruit juice. Take on an empty stomach 1 h before or 2 h after a meal.

#### **Nitazoxanide**

nigh-tazz-oks'ah-nide Alinia

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

Classification: Antiprotozoals

Nitazoxanide (Generic Name), Alinia (Brand Name)

#### **MECHANISM OF ACTION**

An antiparasitic that interferes with the body's reaction to pyruvate ferredoxin oxidoreductase, an enzyme essential for anaerobic energy metabolism. *Therapeutic Effect*: Produces antiprotozoal activity, reducing or terminating diarrheal episodes.

#### PHARMACOKINETICS

Rapidly hydrolyzed to an active metabolite. Protein binding: 99%. Excreted in the urine, bile, and feces. *Half-life*: 2-4 h.

#### AVAILABILITY

Powder for Oral Suspension: 100 mg/5 mL. Tablet: 500 mg.

#### INDICATIONS AND DOSAGES

#### Infectious diarrhea due to Giardia lamblia or Cryptosporidium parvum PO

Adults, Children 12 yr and older. 500 mg q12h for 3 days. Children 4-11 yr. 200 mg (10 mL) q12h for 3 days. Children 12-47 mo. 100 mg (5 mL) q12h for 3 days.

#### **OFF-LABEL USES**

Alternative agent for *C. dificile*-associated diarrhea.

#### CONTRAINDICATIONS

History of sensitivity to the drug.

#### INTERACTIONS

#### Drug

**Warfarin:** Potential for displacement from protein-binding sites and increase in effect. Monitor INR.

#### Herbal

None known.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum creatinine and ALT (SGPT) levels.

#### SIDE EFFECTS

Occasional (8%) Abdominal pain. Rare (1%-2%) Diarrhea, vomiting, headache.

#### SERIOUS REACTIONS

None known.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with biliary or hepatic disease, GI disorders, and renal impairment. The oral suspension contains sucrose and caution is warranted if patient has diabetes mellitus. There are no adequate data in pregnancy. It is unknown if nitazoxanide is distributed in breast milk, warranting cautious use in lactation. The safety and efficacy of nitazoxanide have not been established in children less than 1 yr of age. Nitazoxanide is not indicated for use in elderly patients.

Pattern of daily bowel activity and stool consistency, electrolytes, and hydration status should be monitored. Patients should be cautioned to maintain hydration and electrolyte levels following recovery.

#### Storage

Store unreconstituted powder at room temperature. Reconstituted solution is stable for 7 days at room temperature.

#### Administration

Take with food. Shake oral suspension well before each use.

#### Nitrofurantoin

nye-troe-fyoor'an-toyn Furadantin, Macrobid, Macrodantin 🍄 Macrobid

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Antibiotics, nitrofurans, urinary anti-infectives.

#### **MECHANISM OF ACTION**

An antibacterial urinary tract infection (UTI) agent that inhibits the synthesis of bacterial DNA, RNA, proteins, and cell walls by altering or inactivating ribosomal proteins. *Therapeutic Effect*: Bacteriostatic (bactericidal at high concentrations).

#### PHARMACOKINETICS

Microcrystalline form rapidly and completely absorbed; macrocrystalline form more slowly absorbed. Food increases absorption. Protein binding: 60%-90%. Primarily concentrated in urine and kidneys. Metabolized in most body tissues. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 20-60 min.

#### AVAILABILITY

Capsules (Macrobid [Macrocrystalline]): 100 mg. Capsules (Macrodantin [Macrocrystalline]): 25 mg, 50 mg, 100 mg. Oral Suspension (Furadantin [Microcrystalline]): 25 mg/5 mL.

# INDICATIONS AND DOSAGES Urinary tract infections (UTIs) PO

*Adults, Elderly, Children older than 12 yr.* (Furadantin, Macrodantin): 50-100 mg q6h with food for 7 days and 3 days thereafter until sterile urine is obtained. Maximum: 400mg/day or roughly 7 mg/g/day. (Macrobid): 100 mg 2 times/day. *Children older than 1 mo and younger than 12 yr*. (Furadantin, Macrodantin): 5-7 mg/kg/day in divided doses q6h with food for 7 days and 3 days thereafter until sterile urine is obtained. Maximum: 400 mg/day.

#### Long-term prevention of UTIs

PO (Furadantin, Macrodantin, not Macrobid): Adults, Elderly. 50-100 mg at bedtime. Children. 1-2 mg/kg/day as a single dose or in 2 divided doses not to exceed maximum: 100 mg/day.

#### **OFF-LABEL USES**

Prevention of bacterial UTIs.

#### CONTRAINDICATIONS

Hypersensitivity, including previous history of cholestatic jaundice/ hepatic dysfunction associated with nitrofurantoin. Anuria, oliguria, substantial renal impairment (creatinine clearance < 60 mL/min); infants younger than 1 mo old because of the risk of hemolytic anemia.

#### INTERACTIONS Drug

Antacids containing magnesium salts: May decrease absorption and anti-infective activity of nitrofurantoin.

Anticholinergic drugs: May increase absorption of nitrofurantoin. Probenecid: May increase blood concentration and toxicity of nitrofurantoin. Zalcitabine: May increase the risk of neurotoxicity.

#### Herbal

None known.

Nitrofurantoin (Generic Name)
#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

Urinary creatine elevation and false positive glucose determination with Benedict reagent.

## SIDE EFFECTS

#### Frequent

Anorexia, nausea, vomiting, dark urine. **Occasional** 

Abdominal pain, diarrhea, rash, pruritus, urticaria, hypertension, headache, dizziness, drowsiness.

#### Rare

Photosensitivity, transient alopecia, asthmatic exacerbation in those with history of asthma.

## SERIOUS REACTIONS

• Hepatotoxicity, peripheral neuropathy (may be irreversible), Stevens-Johnson syndrome, and anaphylaxis occur rarely.

- · Hemolytic anemia.
- Intersitial pneumonitis or pulmonary fibrosis.

• Pseudomembranous colitis and other superinfections.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with debilitated patients (greater risk of peripheral neuropathy) and in patients with anemia, diabetes mellitus, electrolyte imbalance, glucose-6-phosphate dehydrogenase (G6PD) deficiency (greater risk of hemolytic anemia), renal impairment, or vitamin B deficiency. Nitrofurantoin readily crosses the placenta and is distributed in breast milk. Nitrofurantoin use is contraindicated at term and during breastfeeding if the infant is suspected of having G6PD deficiency. No age-related precautions have been noted in children older than 1 mo. Elderly

patients are more likely to develop acute pneumonitis and peripheral neuropathy and may require a dosage adjustment because of age-related renal impairment. Avoid sun and ultraviolet light.

Urine may turn dark yellow, orange, or brown. Hair loss may occur but is only temporary. Notify the physician if chest pain, cough, difficult breathing, fever, or numbness and tingling occur. Intake and output, renal function, bowel activity, skin for rash, and breathing should be monitored. Overdosage is manifested by vomiting.

#### Storage

Store at room temperature.

### Administration

Take nitrofurantoin with food or milk to enhance absorption and reduce GI upset.

Shake suspension well before each use.

## Nitroglycerin

nye-troe-gli'ser-in Minitran, Nitro-Bid, Nitro-Dur, Nitrolingual, NitroMist, Nitrostat, Nitro-Time, Rectiv Nitroject, Transderm-Nitro, Trinipatch Do not confuse nitroglycerin with nitroprusside; Nitro-Bid with Nicobid; Nitro-Dur with Nicoderm; Nitrostat with Hyperstat, Nilstat.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antianginals, vasodilators

## **MECHANISM OF ACTION**

A nitrate that decreases myocardial oxygen demand. Reduces left ventricular preload and afterload.

Therapeutic Effect: Dilates coronary arteries and improves collateral blood flow to ischemic areas within myocardium. IV form produces peripheral vasodilation. Rectally, helps blood flow and educes sphincter tone/anal pressure, to reduce pain assist healing of anal fissures.

## PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration
Sublingual	1-3	4-8	30-60 min
Translingual spray	2	4-10	30-60 min
Buccal tablet	2-5	4-10	2 hr
PO (extended release)	20-45	45-120	4-8 h
Topical	15-60	30-120	2-12 h
Transdermal patch	40-60	60-180	18-24 h
IV	Immed- iate	1-2	3-5 min

Well absorbed after PO, sublingual, and topical administration. Undergoes extensive first-pass metabolism. Metabolized in the liver and by enzymes in the bloodstream. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 1-4 min.

## AVAILABILITY

Capsules (Extended Release [Nitro-Time]): 2.5 mg, 6.5 mg, 9 mg. Tablets (Sublingual [Nitrostat]): 0.3 mg, 0.4 mg, 0.6 mg. Spray (Translingual [Nitrolingual, NitroMist]): 0.4 mg/spray. IV Infusion Solution: 0.1 mg/mL, 0.2 mg/mL, 0.4 mg/mL. Topical Ointment (Nitro-Bid): 2%. Transdermal Patch (Minitran): 0.1 mg/h, 0.2 mg/h, 0.3 mg/h, 0.4 mg/h. Transdermal Patch (NitroDur): 0.1 mg/h, 0.2 mg/h, 0.3 mg/h, 0.4 mg/h, 0.6 mg/h, 0.8 mg/h. Solution for Injection: 50 mg/10 mL. Topical Ointment (Nitro-Bid): 2%; 1 inch = 15 mg. Rectal Ointment (Rectiv): 0.4%.

#### INDICATIONS AND DOSAGES Acute relief of angina pectoris, acute prophylaxis

LINGUAL SPRAY

*Adults, Elderly.* 1 spray onto or under tongue q3-5min until relief is noted (no more than 3 sprays in 15-min period). SUBLINGUAL

*Adults, Elderly.* 0.4 mg or 0.6 mg q5min until relief is noted (no more than 3 doses in 15-min period). Use prophylactically 5-10 min before activities that may cause an acute attack.

• Long-term prophylaxis of angina PO (EXTENDED RELEASE) *Adults, Elderly.* 2.5-9 mg q8-12h. TOPICAL

*Adults, Elderly.* Initially, ½ inch q8h. Increase by ½ inch with each application. Range: 1-2 inches q8h up to 4-5 inches q4h.

TRANSDERMAL PATCH *Adults, Elderly.* Initially, 0.2-0.4 mg/h. Maintenance: 0.4-0.8 mg/h. Consider patch on for 12-14 h, patch off for 10-12 h (prevents tolerance).

## Congestive heart failure (CHF) associated with acute myocardial infarction (MI)

IV

Adults, Elderly. Initially,

5 mcg/min via infusion pump. Increase in 5-mcg/min increments at 3- to 5-min intervals until BP response is noted or until dosage reaches 20 mcg/min; then increase as needed by 10 mcg/min. Dosage may be further titrated according to clinical, therapeutic response up to 200 mcg/min. *Children*. Initially, 0.25-0.5 mcg/kg/ min; titrate by 0.5-1 mcg/kg/min, at 3-to 5-min intervals, up to 20 mcg/ kg/min.

## Pain of Anal Fissure

RECTAL

*Adults, Elderly.* Apply 1 inch of 0.4% rectal ointment intra-anally q12h for up to 3 weeks.

## CONTRAINDICATIONS

Allergic reactions to organic nitrates are extremely rare but do occur; contraindicated if allergic. Allergy to adhesives (transdermal). Also contraindicated in pericardial tamponade, restrictive cardiomyopathy, constrictive pericardiits, increased intracranial pressure, or where cardiac output is dependent upon venous return. Contraindicated with phosphodiesterase (PDE-5) inhibitors (e.g., sildenafil, vardenafil, tadalafil, avanafil).

## INTERACTIONS

#### Drug

Alcohol, opioids, benzodiazepines, phenthiazines, other drugs used in conscious sedation techniques: May increase hypotensive effects. Other antihypertensives, vasodilators: May increase risk of orthostatic hypotension. Sildenafil, tadalafil, vardenafil, avanafil: Concurrent use of these drugs produces significant hypotension. Contraindicated. Herbal

None known.

#### Food

Alcohol: May increase risk of orthostatic hypotension.

## DIAGNOSTIC TEST EFFECTS

May increase blood methemoglobin, urine catecholamine, and urine vanillylmandelic acid concentrations.

## IV INCOMPATIBILITIES

Alteplase (Activase) diazepam, lansoprazole (Prevacid IV), levofloxacin (Levaquin), phenytoin. Do not administer with blood products.

## **IV COMPATIBILITIES**

Amiodarone (Cordarone), diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), epinephrine, famotidine (Pepcid), fentanyl (Sublimaze), furosemide (Lasix), heparin, hydromorphone (Dilaudid), insulin, labetalol (Trandate), lidocaine, lorazepam (Ativan), midazolam (Versed), milrinone (Primacor), morphine, nicardipine (Cardene), nitroprusside (Nipride), norepinephrine (Levophed), propofol (Diprivan).

#### SIDE EFFECTS Frequent

Headache (possibly severe; occurs mostly in early therapy, diminishes rapidly in intensity, and usually disappears during continued treatment), transient flushing of face and neck, dizziness (especially if patient is standing immobile or is in a warm environment), weakness, orthostatic hypotension, syncope. Sublingual: Burning, tingling sensation at oral point of dissolution. Ointment: Erythema, pruritus.

## Occasional

GI upset, paresthesia. Transdermal: Contact dermatitis.

## SERIOUS REACTIONS

• Nitroglycerin should be discontinued if blurred vision or dry mouth occurs; evaluate for overdosage (IV). Rarely, methemoglobinemia occurs.

• Severe orthostatic hypotension may occur, manifested by fainting,

pulselessness, cold or clammy skin, and diaphoresis.

 Tolerance may occur with repeated, prolonged therapy; minor tolerance may occur with intermittent use of sublingual tablets.

• High doses of nitroglycerin tend to produce severe headache.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute MI, blood volume depletion from therapy, glaucoma (contraindicated in closed-angle glaucoma), hepatic or renal disease, and systolic BP < 90 mm Hg. It is unknown whether nitroglycerin crosses the placenta or is distributed in breast milk, warranting caution in lactation. The safety and efficacy of nitroglycerin have not been established in children. Elderly patients are more susceptible to the hypotensive effects of nitroglycerin. In elderly patients, age-related renal impairment may require cautious use. Alcohol should be avoided because it intensifies the drug's hypotensive effect. If alcohol is ingested soon after taking nitrates, an acute hypotensive episode marked by pallor, vertigo, and a drop in BP may occur.

Dizziness, light-headedness, and headache may occur. Rise slowly from a lying to a sitting position and dangle legs momentarily before standing to avoid the drug's hypotensive effect. Notify the physician of facial or neck flushing. The onset, type (sharp, dull, or squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, such as exertion and emotional stress, should be recorded before therapy begins. Apical pulse and BP should be determined before administration and periodically after

the dose has been given. ECG should be closely monitored during IV administration.

#### Storage

Keep sublingual tablets in their original container.

Lingual sprays should be stored upright; flammable and under pressure: keep away from heat and flame. Store injection vials and premixed infusion at room temperature, away from heat. Protect from freezing. Prepared infusions stable for up to 48 h at room temperature.

#### Administration

! Do not give nitrates if the patient has recently taken Cialis, Levitra, Stendra, or Viagra.

Swallow extended-release capsules whole; capsules should not be chewed or crushed. Take nitroglycerin, preferably on an empty stomach; take the medication with meals if headache occurs during therapy.

Prime lingual spray prior to first use. Do not shake aerosol canister before lingual spraying. Use the translingual spray only when sitting down. Spray under the tongue and avoid inhaling or swallowing lingual spray.

For sublingual use, dissolve under the tongue and avoid swallowing. Administer while seated. To lessen the burning sensation under the tongue, place the tablet in the buccal pouch. Take sublingual tablets at the first sign of angina. If anginal pain is not relieved within 5 min of the first dose, seek emergency assistance and dissolve a second tablet under the tongue. If the second dose does not relieve anginal pain within 5 min, dissolve a third tablet under the tongue.

For topical use, spread a thin layer on clean, dry, hairless skin of the upper arm or body, not below the knee or elbow, using the applicator or dose-measuring papers. Do not use fingers; do not rub or massage into skin.

! Transdermal patch should be removed before cardioversion or defibrillation because the electrical current may cause arching, which can burn the person and damage the paddles. Also, remove prior to any MRI procedure to avoid burns.

For transdermal use, apply patch on clean, dry, hairless skin of the upper arm or body, not below the knee or elbow.

The IV form is available in readyto-use infusions. To use, dilute vials in 250 or 500 mL D5W or 0.9% NaCl to a maximum concentration of 250 mg/250 mL. Use microdrop or infusion pump.

For rectal oinment use, a disposable surgical glove or a finger cot should be placed on the finger. Gently squeeze tube until a line of ointment the length of the measuring line is expressed onto the covered finger. Gently insert into the anal canal using the covered finger no further than to the first finger joint and apply around the side of the anal canal. If this cannot be achieved due to pain, apply instead directily to the outside of the anus. Wash hands after application.

#### Nitroprusside

nye-troe-pruss'ide Nitropress Nipride Do not confuse nitroprusside with nitroglycerin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antihypertensive agents, vasodilators

## **MECHANISM OF ACTION**

A potent vasodilator used to treat emergent hypertensive conditions; acts directly on arterial and venous smooth muscle. Decreases peripheral vascular resistance, preload and afterload; improves cardiac output. *Therapeutic Effect*: Dilates coronary arteries, decreases oxygen consumption, and relieves persistent chest pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	1-2 min	Dependent on infusion rate	Dissipates rapidly after stopping IV, 1-10 min

Reacts with hemoglobin in erythrocytes, producing cyanmethemoglobin, and cyanide ions. Excreted primarily in urine. *Half-life:* < 10 min.

#### AVAILABILITY

Injection: 25 mg/mL.

#### INDICATIONS AND DOSAGES Immediate reduction of BP in hypertensive crisis; to produce controlled hypotension in surgical

procedures to reduce bleeding; treatment of acute congestive heart failure (CHF)

IV

Adults, Elderly, Children. Initially, 0.3 mcg/kg/min. Range: 0.5-10 mcg/ kg/min. Do not exceed 10 mcg/ kg/min (risk of precipitous drop in BP). Maximal rate for short-term use. To maintain the thiocyanate concentration below 1 mmole/L, the rate of a prolonged infusion (i.e., > 72 h), should not exceed 3 mcg/ kg/min and 1 mcg/kg/min in anuric patients.

## **OFF-LABEL USES**

Control of paroxysmal hypertension before and during surgery for pheochromocytoma, peripheral vasospasm caused by ergot alkaloid overdose, treatment adjunct with dopamine for acute myocardial infarction (MI), valvular regurgitation.

## CONTRAINDICATIONS

Compensatory hypertension (atrioventricular [AV] shunt or coarctation of aorta), inadequate cerebral circulation, moribund patients (ASA Class 5E), congenital Leber's optic atrophy, tobacco amblyopia, acute CHF with reduced peripheral vascular resistance, preexisting cyanide toxicity.

## INTERACTIONS

#### Drug

Antihypertensives, ganglionic blockers, volatile anesthetics: May increase hypotensive effect. Dobutamine: May increase cardiac output and decrease pulmonary

wedge pressure.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Acylovir, caspofungin (Cancidas), ceftazidime (Fortaz), cisatracurium (Nimbex), diazepam, drotrecogin alfa (Xigris), erythromycin, hydralazine, hydroxyzine, levofloxacin (Levaquin), phenytoin, promethazine, quinupristin/ dalfopristin (Synercid), voriconazole.

## 🗏 IV COMPATIBILITIES

Diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), enalapril (Vasotec), heparin, insulin, labetalol (Normodyne, Trandate), lidocaine, midazolam (Versed), milrinone (Primacor), nitroglycerin, propofol (Diprivan).

## SIDE EFFECTS

#### Occasional

Flushing of skin, increased intracranial pressure, rash, pain or redness at injection site.

#### SERIOUS REACTIONS

• A too-rapid IV infusion rate reduces BP too quickly.

 Nausea, vomiting, diaphoresis, apprehension, headache, restlessness, muscle twitching, dizziness, palpitations, retrosternal pain, and abdominal pain may occur.
 Symptoms disappear rapidly if rate of administration is slowed or drug is temporarily discontinued.

• Overdose produces metabolic acidosis and cyanide toxicity (rare). Except when used briefly or at low (< 2 mcg/kg/min) infusion rates, sodium nitroprusside gives rise to important quantities of cyanide ion, which can reach toxic, potentially lethal levels.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hyponatremia, hypothyroidism, severe hepatic or renal impairment, and in elderly patients. It is unknown whether nitroprusside crosses the placenta or is distributed in breast milk, warranting caution in lactation. The safety and efficacy of nitroprusside have not been established in children. Elderly patients are more sensitive to the drug's hypotensive effect. In elderly patients, age-related renal impairment may require cautious use. Be aware of signs and symptoms of metabolic acidosis, including disorientation, headache,

hyperventilation, nausea, vomiting, and weakness. Alcohol should be avoided because it intensifies the drug's hypotensive effect. If alcohol is ingested soon after taking, an acute hypotensive episode marked by pallor, vertigo, and a drop in BP may occur.

Notify the physician of pain, redness, or swelling at the IV insertion, dizziness, headache, nausea, palpitations, or other unusual signs or symptoms. Desired BP levels should be determined with the physician before treatment; it is normally maintained at about 30% to 40% below pretreatment levels. BP and ECG should be monitored before and during treatment. Acid-base balance, electrolyte levels, intake and output, and laboratory results should also be assessed. Nitroprusside should be discontinued if the therapeutic response is not achieved within 10 min after IV infusion at 10 mcg/kg/min is initiated.

Report symptoms of rare cyanide toxicity from drug metabolism evidenced by venous hyperoxemia with bright red venous blood, lactic acidosis, air hunger, confusion. Storage

Protect solution from light. Use only freshly prepared solution. Once the solution has been prepared, it must be used within 24 h. Discard unused portion. Protect infusion from light with opaque wrapper.

#### Administration

Inspect IV solution, which normally appears faint brown. A color change from brown to blue, green, or dark red indicates drug deterioration. Use only freshly prepared solution. Further dilute with 250-500 mL D5W to provide a concentration of 200 mcg/mL to 50 mcg/mL, respectively, up to a maximum concentration of 200 mg/250 mL.

Wrap infusion bottle in aluminum foil immediately after mixing to protect from light. Give by IV infusion only using infusion rate chart provided by manufacturer or facility protocol. Administer using IV infusion pump and lock in the rate. The rate of infusion should be monitored frequently. To avoid cyanide toxicity, infusion at the maximum dose rate should never last more than 10 minutes. Be alert for extravasation, which produces severe pain and sloughing.

#### Nizatidine

ni-za'ti-deen ★ 👾 Axid, Axid AR

#### CATEGORY AND SCHEDULE Pregnancy Risk Category: B

Classification: Antihistamines, H2 receptor antagonist

#### MECHANISM OF ACTION

An antiulcer agent and gastric acid secretion inhibitor that inhibits histamine action at H2 receptors of parietal cells. Therapeutic Effect: Inhibits basal and nocturnal gastric acid secretion.

## PHARMACOKINETICS

Rapidly, well absorbed from the GI tract. Protein binding: 35%. Metabolized in the liver. Excreted primarily in urine. Not removed by hemodialysis. Half-life: 1-2 h (increased with impaired renal function).

## **AVAILABILITY**

Capsules: 150 mg, 300 mg. Oral Solution: 15 mg/mL. Tablets (OTC): 75 mg.

Nizatidine (Generic Name)

## INDICATIONS AND DOSAGES

Active duodenal ulcer PO

*Adults, Elderly.* 300 mg at bedtime or 150 mg twice a day.

#### Prevention of duodenal ulcer recurrence

#### PO

Adults, Elderly. 150 mg at bedtime.

## Gastroesophageal reflux disease (GERD)

#### PO

Adults, Elderly. 150 mg twice a day. • Active benign gastric ulcer

#### PO

*Adults, Elderly.* 150 mg twice a day or 300 mg at bedtime.

## Dyspepsia

#### PO (OTC)

*Adults, Elderly.* 75 mg 30-60 min before meals; no more than 2 tablets a day.

#### Dosage in renal impairment

Dosage adjustment is based on creatinine clearance.

Creatinine Clearance (mL/min)	Active Ulcer Disease	Maintenance Therapy
20-50	150 mg every bedtime	150 mg every other day
< 20	150 mg every other day	150 mg every 3 days

## **OFF-LABEL USES**

Gastric hypersecretory conditions, stress-ulcer prophylaxis, pediatric use.

## CONTRAINDICATIONS

Hypersensitivity to nizatidine or other  $H_2$  antagonists.

## INTERACTIONS

#### Drug

Antacids: May decrease the absorption of nizatidine.

**Aspirin:** May increase serum salicylate levels with high doses of aspirin.

#### Atazanavir, itraconazole, ketoconazole: Nizatidine may decrease absorption. Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. May cause falsepositive tests for urobilinogen with Multistix<sup>®</sup>.

## SIDE EFFECTS

Occasional (2%) Somnolence, fatigue, headache. Rare (1%) Diaphoresis, rash.

## SERIOUS REACTIONS

 Asymptomatic ventricular tachycardia, hyperuricemia not associated with gout, and nephrolithiasis occur rarely.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired hepatic or renal function. Nizatidine crosses the placenta and is distributed in breast milk, warranting caution in pregnancy and lactation. The safety and efficacy of nizatidine have not been established in children younger than 16 yr of age. No agerelated precautions have been noted in elderly patients. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established. Also, avoid alcohol, aspirin, and coffee, all of which may cause GI distress, during nizatidine therapy.

Notify the physician if acid indigestion, gastric distress, or

#### 1142 Norepinephrine Bitartrate

heartburn occurs after 2 wks of continuous nizatidine therapy. Blood chemistry laboratory test results, including BUN, serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels, to assess hepatic and renal function should be obtained before and during therapy.

#### Storage

Store at room temperature. Keep tighly closed.

#### Administration

Take nizatidine without regard to meals. Take right before eating for heartburn prevention. Do not administer within 1 h of magnesiumor aluminum-containing antacids because it can decrease the absorption of nizatidine.

## Norepinephrine Bitartrate

nor-ep-i-nef'rin bye-tar'trayte Levophed Do not confuse Levophed with Levid or Levbid. Do not confuse norepinephrine with epinephrine, phenylephrine, or Neosynephrine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Adrenergic agonists, vasopressors, intropes

## **MECHANISM OF ACTION**

A sympathomimetic that stimulates  $\beta_1$ -adrenergic receptors and  $\alpha$ -adrenergic receptors, increasing peripheral resistance. Enhances contractile myocardial force, increases cardiac output. Constricts resistance and capacitance vessels. *Therapeutic Effect:* Increases systemic BP and coronary blood flow.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	Rapid	1-2 min	NA

Localized in sympathetic tissue. Metabolized by MAO and COMT. Primarily excreted in urine.

## AVAILABILITY

Injection: 1 mg/mL.

## INDICATIONS AND DOSAGES

#### Acute hypotension unresponsive to fluid volume replacement IV

Adults, Elderly. Initially, administer at 0.5-1 mcg/min. Adjust rate of flow to establish and maintain desired BP. Average maintenance dose: 2-4 mcg/ min. Usual maximum 8-12 mcg/min. In cardiac arrest, dose may reach 30 mcg/min. *Children.* Initially, 0.05-0.1

mcg/kg/min; titrate to desired effect. Maximum: 1-2 mcg/kg/min.

#### CONTRAINDICATIONS

Hypovolemic states (unless as an emergency measure), mesenteric or peripheral vascular thrombosis, profound hypoxia.

#### INTERACTIONS

#### Drug

β-Blockers: May have mutually inhibitory effects.
Digoxin: May increase risk of arrhythmias.
Ergonovine, oxytocin: May increase vasoconstriction.
Halogenated hydrocarbon anesthetics: May increase risk of arrhythmias.

Maprotiline, tricyclic antidepressants, oxytocin, guanethidine: Increased risk of severe hypotension. Methyldopa: May decrease the effects of methyldopa. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### IV INCOMPATIBILITIES

Aminophylline, amphotericin B, diazepam, drotrecogin alfa (Xigris), regular insulin, pantoprazole (Protonix), phenobarbital, phenytoin, sodium bicarbonate, thiopental.

## 🗏 IV COMPATIBILITIES

Amiodarone (Cordarone), calcium gluconate, diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), epinephrine, esmolol (Brevibloc), fentanyl (Sublimaze), heparin, hydromorphone (Dilaudid), labetalol (Trandate), lorazepam (Ativan), magnesium, midazolam (Versed), milrinone (Primacor), morphine, nicardipine (Cardene), nitroglycerin, potassium chloride, propofol (Diprivan).

## SIDE EFFECTS

#### Occasional (3%-5%)

Anxiety, bradycardia, palpitations. Rare (1%-2%)

Nausea, anginal pain, shortness of breath, fever.

#### SERIOUS REACTIONS

• Extravasation may produce tissue necrosis and sloughing; infiltrate area with phentolamine if this occurs.

 Overdose is manifested as severe hypertension with violent headache (which may be the first clinical sign of overdose), arrhythmias, photophobia, retrosternal or pharyngeal pain, pallor, excessive sweating, and vomiting.

• Prolonged therapy may result in plasma volume depletion. Hypotension may recur if plasma volume is not restored.

#### PRECAUTIONS & CONSIDERATIONS

! This drug is used in acute settings in hospitals or emergencies for selected hypotensive episodes.

Caution is warranted in patients with hypertension, hypothyroidism, severe cardiac disease, and concurrent MAOI therapy. Norepinephrine readily crosses the placenta and may produce fetal anoxia as a result of constriction of uterine blood vessels and uterine contraction. Use in pregnancy is contraindicated unless the benefits of therapy clearly outweigh potential risks to the mother and fetus. No age-related precautions have been noted in children or elderly patients.

BP and ECG should be monitored continuously. Be alert to precipitous drops in BP. Intake and output should be assessed hourly or as ordered. If urine output is < 30 mL/h, the infusion should be stopped unless the systolic BP falls below 80 mm Hg. Prolonged therapy may result in plasma volume depleting, causing hypotension to persist or not return to normal levels.

#### Storage

Store at room temperature. IV infusion is stable for 24 h at room temperature.

#### Administration

! Expect to restore blood and fluid volume before administering norepinephrine.

Do not use if solution is brown or contains precipitate. Add 4 mL (4 mg) to 1 L of D5W for a 4-mcg/mL solution. A common concentration is 4 mg/250 mL for a concentration of

16 mcg/mL. Maximum concentration: 32 mcg/mL. Administer infusion through a central venous catheter, if available, to avoid extravasation. Closely monitor the infusion flow rate with a microdrip or infusion pump. Monitor the BP every 2 min during the infusion until desired therapeutic response is achieved, then every 5 min during the remainder of the infusion. Never leave unattended during the infusion. Be alert to any complaint of headache. Plan to maintain BP at 80-100 mm Hg in previously normotensive patients. Reduce the infusion gradually, as prescribed. Avoid abrupt withdrawal. Check the peripherally inserted catheter IV site frequently for signs of extravasation, including blanching, coldness, hardness, and pallor to the extremity. If extravasation occurs, expect to infiltrate the affected area with 10-15 mL sterile saline containing 5-10 mg phentolamine. Know that phentolamine does not alter the pressor effects of norepinephrine.

For prevention of extravasation effects, phentolamine may be added to the norepinephrine infusion.

## Norethindrone

nor-eth'in-drone ★ Aygestin, Camila, Errin, Heather, Jolivette, Micronor, Nora-BE, Nor-QD Micronor, Norlutate

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Hormonal agent, progesterone derivative, progestinonly contraceptive

#### MECHANISM OF ACTION

A synthetic progestin that is used as a single agent or in combination with estrogens for the treatment of gynecological disorders. It inhibits secretion of pituitary gonadotropin (LH), which prevents follicular maturation and ovulation. *Therapeutic Effect*: Transforms endometrium from proliferative to secretory in an estrogenprimed endometrium, promotes mammary gland development, relaxes uterine smooth muscle.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Widely distributed. Protein binding: 61%. Metabolized in liver. Excreted in urine and feces. *Half-life:* 4-13 h.

#### AVAILABILITY

Contraceptive Tablets: 0.35 mg (Camila, Errin, Jolivette, Micronor, Nora-BE, Nor-QD). Tablets, as Norethindrone Acetate: 5 mg (Aygestin).

## INDICATIONS AND DOSAGES Contraception

PO

Adults.1 tablet/day (0.35 mg/day). > Amenorrhea and abnormal uterine bleeding PO (NORETHINDRONE ACETATE) Adults. 2.5-10 mg per day, given

cyclically for 5-10 days.

### Endometriosis

PO (NORETHINDRONE ACETATE)

*Adults.* 5 mg/day for 14 days, increase at increments of 2.5 mg/day every 2 wks up to 15 mg/day continue for 6-9 mo or until breakthrough bleeding demands temporary discontinuation.

#### CONTRAINDICATIONS

Acute liver disease, benign or malignant liver tumors, hypersensitivity to norethindrone or any component of the formulation,

Norethindrone (Generic Name)

known or suspected carcinoma of the breast, known or suspected pregnancy, undiagnosed abnormal genital bleeding.

## INTERACTIONS

#### Drug

Antibiotics such as the penicillins and erythromycin, barbiturates: May decrease effectiveness of norethindrone. Amprenavir, nelfinavir, nevirapine, ritonavir: May decrease norethindrone concentrations. Aprepitant: May decrease the effects of both drugs. Atorvastatin, rosuvastatin: May increase concentrations of norethindrone. Benzodiazepines: May increase risk of benzodiazepine toxicity. Cyclosporine: May increase risk of cyclosporine toxicity. CYP3A4 inducers (carbamazepine, phenobarbital, phenytoin, rifampin, rifabutin): May decrease the levels and/or effects of norethindrone. Corticosteroids: May prolong the effects of cortisones. Fluconazole: May increase risk of adverse effects of norethindrone. Griseofulvin, modafinil, primidone: May decrease effectiveness of norethindrone. Lamotrigine: May increase or decrease plasma lamotrigine concentrations. Selegiline: May increase the risk of adverse effects of selegiline. Theophylline: May increase the risk of theophylline toxicity. Thiazolidinediones: May decrease the effects of norethindrone. Warfarin: May increase or decrease anticoagulant effects. Zolmitriptan: May increase risk of adverse effects of zolmitriptan.

#### Herbal

**Licorice:** May increase risk of fluid retention and elevated blood pressure.

**Red clover:** May alter effectiveness of norethindrone or increase side effects.

**St. John's wort:** May decrease plasma concentrations of norethindrone.

Vitamin C (at high doses, more than 1 g/day): May increase adverse effects of norethindrone.

#### Food

**Caffeine:** May increase CNS stimulation.

## DIAGNOSTIC TEST EFFECTS

May increase LDL concentrations and serum alkaline phosphatase levels. May decrease glucose tolerance and HDL concentrations. May cause abnormal thyroid, metapyrone, liver, and endocrine function tests.

## SIDE EFFECTS

#### Occasional

Breast tenderness, dizziness, headache, breakthrough bleeding, amenorrhea, menstrual irregularity, nausea, weakness.

#### Rare

Mental depression, fever, insomnia, rash, acne, increased breast tenderness, weight gain/ loss, changes in cervical erosion and secretions, cholestatic jaundice.

## SERIOUS REACTIONS

• Thrombophlebitis, cerebrovascular disorders, retinal thrombosis, cholestatic jaundice, and pulmonary embolism occur rarely.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with conditions aggravated by

fluid retention, delayed follicular atresia or ovarian cysts, asthma, cardiac dysfunction, epilepsy, migraine headache, renal insufficiency, diabetes mellitus, thromboembolism, or a history of mental depression. Norethindrone may be harmful to fetus and is contraindicated in pregnancy. Patient's pregnancy status should be assessed before beginning therapy. If pregnancy is suspected, notify physician immediately. Norethindrone contraception is compatible during breastfeeding. Safety and efficacy of this drug have not been established in children. No age-related precautions have been noted in elderly patients. Avoid smoking while taking norethindrone.

Menstrual spotting may occur between periods. Pain, redness, swelling, or warmth in the calf; chest pain; migraine headache; peripheral paresthesia; sudden decrease in vision; and sudden shortness of breath should be reported immediately. Patient should be advised to use an additional nonhormonal form of birth control during therapy if antibiotics or anti-infectives are prescribed while remaining compliant with the oral contraceptive therapy schedule.

#### Storage

Store at room temperature; protect from moisture.

#### Administration

For oral contraception to be effective, take norethindrone at the same time each day. Do not take a break between packs. Do not skip doses.

When used for HRT during menopause, or for other hormonal purposes, take at roughly same time daily; may take with food.

## Norfloxacin

nor-flox′a-sin 📩 Noroxin 酔 Apo-Norflox

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

**Classification:** Anti-infectives; fluoroquinolones

#### MECHANISM OF ACTION

A quinolone that inhibits DNA gyrase in susceptible microorganisms, interfering with bacterial cell replication and repair. *Therapeutic Effect:* Bactericidal.

#### PHARMACOKINETICS

PO: Peak 1 h, steady state in 2 days. Excreted in urine as active drug and metabolites. *Half-life*: 3-4 h.

#### AVAILABILITY

Tablets: 400 mg.

## INDICATIONS AND DOSAGES

## Urinary tract infections (UTIs) PO

*Adults, Elderly.* 400 mg twice a day for 3-21 days.

#### Prostatitis

PO

Adults. 400 mg twice a day for 4-6 wks.

#### Uncomplicated gonococcal infections

CDC no longer recommends use due to resistant organisms.

...

Adults. 800 mg as a single dose.

> **Dosage in renal impairment** Dosage and frequency are modified based on creatinine clearance.

Norfloxacin (Generic Name), Noroxin (Brand Name)

Creatinine Clearance (mL/min)	Adult Dosage (mg)
≥ 30	400 twice a day
< 30	400 once a day

### CONTRAINDICATIONS

Children younger than 18 yr because of risk arthropathy (systemic use). Hypersensitivity to norfloxacin, other quinolones, or their components.

## INTERACTIONS

#### Drug

Antacids, sucralfate, iron supplements, multivitamins with minerals, zinc, didanozine: May decrease norfloxacin absorption. Cyclosporine: May increase cyclosporine concentrations. Oral anticoagulants: May increase effects of oral anticoagulants. Theophylline: Decreases clearance and may increase blood

concentration and risk of toxicity of theophylline.

## Herbal

None known.

#### Food

**Dairy products:** May decrease norfloxacin absorption.

## DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, creatinine, LDH, AST (SGOT), and ALT (SGPT) levels.

#### SIDE EFFECTS

Burning or discomfort. Other reactions were conjunctival hypermia, chemosis, corneal deposits, photophobia, and a bitter taste following installations.

#### Frequent

Nausea, headache, dizziness.

#### Rare

Vomiting, diarrhea, abdominal cramping, dry mouth, bitter taste, nervousness, drowsiness, insomnia, photosensitivity, tinnitus, crystalluria, rash, fever, seizures.

#### SERIOUS REACTIONS

• Superinfection, anaphylaxis, Stevens-Johnson syndrome, and arthropathy occur rarely.

- Hypersensitivity reactions, including photosensitivity (as evidenced by rash, pruritus, blisters, edema, and burning skin), have occurred.
- · Tendonitis and tendon rupture.
- · Hypoglycemia.

 Benign intracranial hypertension (pseudotumor cerebri) reported rarely.

• Exacerbation on myasthenia, may be severe and lead to weakness of respiratory muscles.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired renal function and a predisposition to seizures. Use with caution in those with CNS disorders; conditions such as myasthenia gravis may be aggravated. Use with caution in patients with cardiac arrhythmias or risks for QT prolongation. The drug should be used in pregnancy only if clearly needed. The drug is expected to be excreted in breast milk, and use during lactation is not recommended. Safety and effectiveness have not been established in children.

Use appropriate precautions to avoid UV exposure due to potential photosensitivity. Dizziness, headache, nausea, signs of infection, and vaginitis should be evaluated. Patients should be cautioned to watch for pain, swelling, or tenderness

#### 1148 Nortriptyline Hydrochloride

in any tendon or ligament in the shoulder, hand, or Achilles tendon, and report any of these symptoms for evaluation by a health care practitioner.

#### Storage

Store at room temperature. Administration

Take norfloxacin with 8 oz of water 1 h before or 2 h after a meal and consume several glasses of water between meals. Do not take antacids, divalent cations, dairy products, or didanosine within 2 h of norfloxacin.

## Nortriptyline Hydrochloride

nor-trip'ti-leen high-droh-klor'ide Pamelor Aventyl, Norventyl Do not confuse nortriptyline with amitriptyline. Do not confuse Pamelor with Panlor DC.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antidepressants, tricyclic

#### **MECHANISM OF ACTION**

A tricyclic antidepressant that blocks reuptake of the neurotransmitters norepinephrine and serotonin at neuronal presynaptic membranes, increasing their availability at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 86%-95%. Metabolized in the liver. Primarily excreted in the urine. *Half-life*: 17.6 h.

#### AVAILABILITY

Capsules: 10 mg, 25 mg. Capsules (Pamelor): 10 mg, 25 mg, 50 mg, 75 mg. Oral Solution: 10 mg/5 mL.

## INDICATIONS AND DOSAGES Depression

## PO

Adults. Initially 25-50 mg/day. Usual dose is 75-100 mg/day in 1-4 divided doses. Reduce dosage gradually to effective maintenance level. Maximum: 150 mg/day. *Elderly*. Initially, 10-25 mg at bedtime. May increase by 25 mg every 3-7 days. Maximum: 150 mg/day. *Children 12 yr and older*: 30-50 mg/day in 3-4 divided doses. **Entresis (off-label)** PO *Children 12 yr and older*: 25-35 mg/

day. Children aged 8-11 yr: 10-20 mg/day.

*Children aged 8-11 yr.* 10-20 mg/day. *Children aged 6-7 yr.* 10 mg/day.

#### **OFF-LABEL USES**

Treatment of neurogenic pain, panic disorder; prevention of migraine headache, enuresis.

#### CONTRAINDICATIONS

Acute recovery period after myocardial infarction (MI), use within 14 days of MAOIs, hypersensitivity to drug or other dibenzazepines. Avoid use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

## INTERACTIONS

Drug

Alcohol, other central nervous system (CNS) depressants, barbiturates, benzodiazepines: May increase CNS and respiratory depression and the hypotensive effects of nortriptyline.

Antihistamines, phenothiazines, muscarinic blockers: May increase anticholinergic effects.

Nortriptyline Hydrochloride (Generic Name)

Antithyroid agents: May increase the risk of agranulocytosis.

**Cimetidine:** May increase the blood concentration and risk of toxicity of nortriptyline.

#### Clonidine, guanadrel,

guanethidine: May decrease the effects of these drugs.

**Linezolid:** May increase the risk of serotonin syndrome. Avoid.

**MAOIs:** May increase the risk of neuroleptic malignant syndrome, seizures, hyperpyrexia, and hypertensive crisis.

## Agents that prolong the QT

interval: May increase risk of cardiac arrhythmias.

**Phenothiazines:** May increase the anticholinergic and sedative effects of nortriptyline.

**Sympathomimetics, epinephrine, levonordefrin:** May increase the risk of cardiac effects.

#### Herbal

**St. John's wort:** Avoid concurrent use with St. John's wort.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May alter blood glucose level and ECG readings. The therapeutic range is 50-150 mg/mL.

#### SIDE EFFECTS

#### Frequent

Somnolence, fatigue, dry mouth, blurred vision, constipation, delayed micturition, orthostatic hypotension, diaphoresis, impaired concentration, increased appetite, urine retention.

#### Occasional

GI disturbances (nausea, GI distress, metallic taste), photosensitivity.

#### Rare

Paradoxical reactions (agitation, restlessness, nightmares, insomnia), extrapyramidal symptoms (particularly fine hand tremor).

#### SERIOUS REACTIONS

 Overdose may produce seizures; cardiovascular effects, such as severe orthostatic hypotension, dizziness, tachycardia, palpitations, and arrhythmias; and altered temperature regulation, such as hyperpyrexia or hypothermia.

 Abrupt discontinuation after prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

• Rare allergic reactions.

· Cardiac arrhythmias.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac disease, diabetes mellitus, glaucoma, hiatal hernia, history of seizures, history of urinary obstruction or urine retention, hyperthyroidism, increased IOP, prostatic hypertrophy, hepatic or renal disease, and schizophrenia. Children are more sensitive to an acute overdose and are at increased risk for toxicity. Safety and effectiveness of nortriptyline have not been established in children. Antidepressants have been associated with an increased risk of suicidal thinking and behavior in children, adolescents, and young adults with major depressive disorder and other psychiatric disorders. Be alert to suicidal thoughts, irritability, hostility, and other unusual changes in behavior in any patient, especially during early antidepressant treatment and when the dose is adjusted. Elderly patients are more sensitive to the drug's anticholinergic effects. Sunscreens and protective clothing should be worn because the drug may cause photosensitivity to sunlight.

Anticholinergic, sedative, and hypotensive effects may occur, but tolerance usually develops. Because dizziness may occur, change positions slowly, avoid alcohol and tasks that require alertness or motor skills. Pattern of daily bowel activity and stool consistency, bladder for urine retention, BP and pulse rate, and ECG should be assessed during therapy.

## Storage

Store at room temperature.

#### Administration

! Make sure at least 14 days elapse between the use of MAOIs and nortriptyline.

Take nortriptyline with food or milk if GI distress occurs. Nortriptyline's therapeutic effect may be noted in 2-3 wks.

## Nystatin

nye-stat'in Bio-Statin, Pediaderm-AF, Pedi-Dri Nyaderm Do not confuse nystatin or Bio-Statin with HMG-CoA reductase inhibitors ("statins").

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (vaginal); C (PO, topical)

**Classification:** Antifungals, polyene type

## **MECHANISM OF ACTION**

A fungistatic antifungal that binds to sterols in the fungal cell membrane. *Therapeutic Effect:* Increases fungal cell-membrane permeability, allowing loss of potassium and other cellular components.

## PHARMACOKINETICS

PO: Poorly absorbed from the GI tract. Eliminated unchanged in feces. Topical: Not absorbed systemically from intact skin.

## AVAILABILITY

Oral Suspension: 100,000 units/mL.

Capsules (Bio-Statin): 100,000 units, 500,000 units. Tablets: 500,000 units. Vaginal Tablets: 100,000 units. Cream (Pediaderm-AF): 100,000 units/g. Ointment: 100,000 units/g. Topical Powder (Pedi-Dri): 100,000 units/g.

# INDICATIONS AND DOSAGES Intestinal infections PO

Adults, Elderly. 500,000-1,000,000 units q8h.

#### Oral candidiasis

PO

*Adults, Elderly, Children.* 400,000-600,000 units swished and swallowed 4 times/day.

Infants. 200,000 units 4 times/day.

#### Vaginal infections

VAGINAL

*Adults, Elderly, Adolescents.* 1 tablet/ day vaginally at bedtime for 14 days.

#### • Cutaneous candidal infections TOPICAL

Adults, Elderly, Children. Apply 2-4 times/day.

#### **OFF-LABEL USES**

Prophylaxis of oropharyngeal candidiasis.

#### CONTRAINDICATIONS

Hypersensitivity to nystatin or any components in formulation.

#### INTERACTIONS

Drug, Herbal, and Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional

PO: Diarrhea, nausea, stomach pain, vomiting, bad taste.

Nystatin (Generic Name)

Topical: Skin irritation. Vaginal: Vaginal irritation.

#### SERIOUS REACTIONS

• High dosages of oral form may produce nausea, vomiting, diarrhea, and GI distress.

## **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether nystatin is distributed in breast milk, warranting caution in lactation. During pregnancy, no particular cautions are noted with vaginal tablets other than that manual insertion is desirable over use of applicator. No age-related precautions have been noted for suspension or topical use in children. Lozenges are not recommended for use in children 5 yr old or younger. Topical nystatin is commonly used in neonates/infants in the diaper area. No age-related precautions have been noted in elderly patients.

Confirm that cultures or histologic tests were done for accurate diagnosis before giving the drug. Assess for increased irritation with topical application or increased vaginal discharge with vaginal application. Separate personal items that come in contact with affected areas. Notify the physician if diarrhea, nausea, stomach pain, or vomiting develops.

#### Storage

Oral, topical, and vaginal products are stored at room temperature. Protect from high heat and freezing. Administration

Shake suspension well before administration. Place and hold the suspension in the mouth or swish throughout the mouth as long as possible before swallowing. In infants, place half of dose in each cheek/side of mouth.

Use nystatin cream or powder sparingly on erythematous areas. Rub the topical creams or ointments well into affected areas, keep affected areas clean and dry, and wear light clothing for ventilation. Avoid contact with eyes.

Insert the vaginal form high into the vagina at bedtime. Vaginal use should be continued during menses. Consider using condoms during therapy and sexual intercourse.

## Octreotide

ok-tree'oh-tide

🖈 🖤 Sandostatin, Sandostatin LAR Do not confuse octreotide with OctreoScan, or Sandostatin with Sandimmune or Sandoglobulin.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Gastrointestinal agents, secretory inhibitor, growth hormone suppressant

## MECHANISM OF ACTION

Potent inhibitor of growth hormone, glucagon, and insulin. Blunts LH response to GnRH, decreases splanchnic blood flow, and inhibits secretion of serotonin, gastrin, vasoactive intestinal peptide, secretin, motilin, pancreatic polypeptide, and TSH. Therapeutic Effect: Reduces acromegaly; reduces diarrhea due to intestinal carcinoid tumors; helps control bleeding varices.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
SC	NA	NA	Up to 12 h

Rapidly and completely absorbed from injection site. Excreted in urine. Removed by hemodialysis. Half-life: 15h

## **AVAILABILITY**

Injection (Sandostatin): 50 mcg/mL, 100 mcg/mL, 200 mcg/mL, 500 mcg/mL, 1 mg/mL. Suspension for Depot Injection (Sandostatin LAR): 10-mg, 20-mg, 30-mg vials.

## INDICATIONS AND DOSAGES Carcinoid tumors

IV, SC (SANDOSTATIN)

Adults, Elderly. 100-600 mcg/day in 2-4 divided doses. IM (SANDOSTATIN LAR) Adults, Elderly, 20 mg q4wk.

#### VIPomas

IV, SC (SANDOSTATIN) Adults, Elderly. 200-300 mcg/day in 2-4 divided doses. Titrate to response. IM (SANDOSTATIN LAR) Adults, Elderly. 20 mg q4wk.

Esophageal varices (off-label use) IV (SANDOSTATIN) Adults, Elderly. Bolus of 25-50 mcg followed by IV infusion of 25-50 mcg/h.

## Acromegaly

IV, SC (SANDOSTATIN) NOTE: GH and IGF-I levels guide titration.

Adults, Elderly. 50 mcg 3 times a day. Increase as needed. Maximum: 500 mcg 3 times a day. IM (SANDOSTATIN LAR) Adults, Elderly. 20 mg q4wk for 3 mo. Maximum: 40 mg q4wk.

## **OFF-LABEL USES**

Treatment of AIDS-associated secretory diarrhea, chemotherapyinduced diarrhea, insulinomas, small-bowel fistulas, control of bleeding esophageal varices, adjunct for hepatorenal syndrome.

## CONTRAINDICATIONS

Sensitivity to the drug or product components.

## IV INCOMPATIBILITIES

Not compatible in TPN. Other incompatibilities include diazepam, micafungin, pantoprazole, phenytoin.

#### INTERACTIONS Drug

Bromocriptine: May decrease bromocriptine clearance. Cyclosporine: May lower cyclosporine concentrations, which could increase risk of rejection. Monitor.

Insulin, oral antidiabetics: May

alter glucose concentrations.

Vitamin B<sub>12</sub>: May reduce vitamin B12 levels.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum thyroxine  $(T_4)$ concentration. May increase or decrease blood glucose. Depressed vitamin B12 levels and abnormal Schilling tests.

#### SIDE EFFECTS

#### Frequent (6%-10%, 30%-35% in acromegaly patients)

Diarrhea, nausea, abdominal discomfort, headache, injection site pain, sinus bradycardia.

## Occasional (1%-5%)

Vomiting, flatulence, constipation, alopecia, facial flushing, pruritus, dizziness, fatigue, arrhythmias, ecchymosis, blurred vision.

## Rare (<1%)

Depression, diminished libido, vertigo, palpitations, dyspnea.

#### SERIOUS REACTIONS

 Severe symptomatic hypoglycemia in patients with diabetes.

 Rare cases of ECG changes, such as QT prolongation, bradycardia.

· Patients using octreotide may develop cholelithiasis or, with prolonged high dosages, hypothyroidism.

· GI bleeding, hepatitis, pancreatitis, and seizures occur rarely.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with insulin-dependent diabetes and renal failure. It is unknown whether octreotide is excreted in breast milk; therefore, caution is warranted in lactation. The children's dosage has

not been established. No age-related precautions have been noted in elderly patients.

Notify the physician of unusual signs or symptoms, such as palpitations or unusual bleeding. Blood glucose levels, BP, pulse rate, respiratory rate, weight, growth hormone, pattern of daily bowel activity and stool consistency, fecal fat, fluid and electrolyte balance, and thyroid function test results should be monitored. Be alert for decreased urine output and peripheral edema, especially of the ankles. Take care in making abrupt postural changes because of the possible risk of orthostatic hypotension developing. Any signs of infection should be reported immediately.

#### Storage

Store injection solution and depot suspension under refrigeration and protect from light. At room temperature, the injection solution is stable for 14 days if protected from light. If solution is diluted as an IV infusion, stable for 24 h at room temperature.

#### Administration

Sandostatin administration may be IV or SC. Sandostatin LAR administration may be only IM.

Do not use solution if it becomes discolored or contains particulates.

Inject Sandostatin LAR depot in a large muscle mass at 4-wk intervals. Avoid deltoid injections.

Sandostatin injection solution is usually administered as an SC injection. Avoid multiple injections at the same site within a week. If injection solution is given IV, it may be diluted in 50-200 mL 0.9% NaCl or D5W and infused over 15-30 min or administered by IV push over 3-5 min. Continuous infusions often given over 24 h.

## Ofatumumab

oh'fa-tue'moo-mab ★ Arzerra. Do not confuse with omalizumab.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antineoplastics, monoclonal antibodies

## MECHANISM OF ACTION

Binds to CD20 antigen on B lymphocyte cells and produces complement-dependent cell lysis and antibody-dependent cell-mediated cytotoxicity. *Therapeutic Effect:* Produces cytotoxicity, reducing tumor size.

## PHARMACOKINETICS

Due to the depletion of B cells, the clearance of ofatumumab decreased substantially after subsequent infusions compared to the first infusion. *Half-life:* Mean of 14 days between first and 12th doses (range 2.3 days to 61 days).

## AVAILABILITY

Solution for Injection: 100 mg/5 mL.

#### INDICATIONS AND DOSAGES > B-cell chronic lymphocytic leukemia in patients failing

## alemtuzumab and fludarabine IV INFUSION

Adults, Elderly. 300 mg via IV infusion for the first dose. Then, 1 wk later, give 2000 mg via IV infusion once weekly for 7 doses; then 4 wks later, give 2000 mg via IV infusion once q4wk for 4 doses. The course is 12 total doses given over 24 wks.

## CONTRAINDICATIONS

None.

#### INTERACTIONS Drug

Live-virus vaccines: May potentiate viral replication, increase side effects, and decrease the patient's antibody response to the vaccine. Other immunosuppressants or chemotherapy agents: May enhance adverse effect or toxicity profile; specific data are not available.

#### Herbal

None known.

None known.

## **DIAGNOSTIC TEST EFFECTS**

May decrease platelet count and WBC count.

## IV INCOMPATIBILITIES

Do not mix of a umumab with any other medications.

## SIDE EFFECTS

#### **Frequent (≥ 10%)**

Neutropenia, pneumonia, pyrexia, cough, diarrhea, anemia, fatigue, dyspnea, rash, nausea, bronchitis and other upper respiratory tract infections, infections in other sites. Occasional (< 10%)

#### Nasopharyngitis, herpes zoster, sepsis, anemia, insomnia, headache, increased BP, tachycardia, hyperhidrosis, urticaria, back pain, muscle cramps, peripheral edema, dizziness, chills.

## SERIOUS REACTIONS

• Prolonged and severe thrombocytopenia.

• Serious infections; hepatitis B reactivation, including fulminant hepatitis and death, occurs with other drugs directed against CD20.

 Serious infusion reactions manifesting as bronchospasm, dyspnea, laryngeal edema, pulmonary edema, flushing, hypertension, hypotension, syncope, cardiac ischemia/infarction, back pain, abdominal pain, pyrexia, rash, urticaria, and angioedema. More common with first 2 infusions.
Progressive multifocal leukoencephalopathy (PML); discontinue drug if suspected.
Obstruction of the small intestine.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in those with known exposure to hepatitis B or with cardiac disease. Based on animal data, of atumumab has the potential to cause depletion of B-lymphocytes in the fetus. Effective contraception is recommended for women of childbearing potential; use should be avoided in pregnancy. Discontinue breastfeeding during treatment. The safety and efficacy of ofatumumab have not been established in children. Avoid contact with anyone who has recently received a live-virus vaccine or who has an active infection. Crowds should also be avoided.

Infusion-related reactions, including chills, fever, hypotension, and rigors, should be monitored. Signs and symptoms of hematologic toxicity, including excessive fatigue or weakness, ecchymosis, fever, signs of local infection, sore throat, or unusual bleeding from any site, should be assessed. CBC should be monitored frequently during and after therapy to assess for anemia, neutropenia, and thrombocytopenia.

#### Storage

Refrigerate unopened injection vial. Do not freeze. Protect from light. Start the infusion within 12 h after preparation; use within 24 h. Discard the solution if it becomes discolored or contains particulate matter.

#### Administration

! Expect to pretreat with 1000 mg orally of acetaminophen, along with an antihistamine and a corticosteroid.

Pretreatment is given 30 min to 2 h before each infusion to minimize infusion-related side effects.

Do not give by IV push or bolus. To prepare the IV infusion, withdraw the needed amount from the vial into a syringe. Inject the dose after removing an equal volume of saline from the 1000 mL 0.9% NaCl infusion bag. Gently invert the bag to mix the contents; do not shake it. The final infusion concentration of the 300 mg initial dose is 0.3 mg/mL. The final concentration for the subsequent 2000 mg infusions will be 2 mg/mL.

Administer using an infusion pump with the in-line filter supplied with product, and polyvinyl chloride (PVC) administration sets. Flush the intravenous line with 0.9% NaCl before and after each dose. The infusion must be titrated during the first dose, second dose, and subsequent doses. See manufacturer's specific instructions. Maximum rate for the first two treatments is 200 mL/h after titration. Other treatments can be given up to 400 mL/h if tolerated after titration.

## Ofloxacin

o-flox'a-sin Floxin, Floxin Otic, Ocuflox Ocuflox Do not confuse Floxin with Flexeril or Flexon, or Ocuflox with Ocufen.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Anti-infectives, fluoroquinolones

#### MECHANISM OF ACTION

A fluoroquinolone antibiotic that inhibits DNA gyrase in susceptible microorganisms, interfering with

Ofloxacin (Generic Name)

bacterial cell replication and repair. *Therapeutic Effect*: Bactericidal.

## PHARMACOKINETICS

Rapidly and well absorbed from the GI tract. Protein binding: 20%-25%. Widely distributed (including to the cerebrospinal fluid [CSF]). Metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 4.7-7 h (increased in impaired renal function, cirrhosis, and elderly patients).

## AVAILABILITY

Tablets (Floxin): 200 mg, 300 mg, 400 mg. Ophthalmic Solution (Ocuflox): 0.3%. Otic Solution (Floxin): 0.3%.

## INDICATIONS AND DOSAGES

## Uncomplicated urinary tract

infection (UTI) PO

*Adults, Elderly.* 200 mg q12h for 3-7 days.

## Complicated urinary tract infection (UTIs)

PO

*Adults, Elderly.* 200 mg q12h for 10 days.

## Pelvic inflammatory disease (PID) PO

*Adults, Elderly.* 400 mg q12h for 10-14 days.

 Lower respiratory tract, skin, and skin-structure infections

Adults, Elderly. 400 mg q12h for 10 days.

## Prostatitis, sexually transmitted diseases (cervicitis, urethritis) PO

*Adults, Elderly.* 300 mg q12h for 7 days or for 6 wks for prostatitis.

#### Acute, uncomplicated gonorrhea

NOTE: Due to increased prevalence of quinolone-resistance, CDC no longer recommends.

#### PO

Adults, Elderly. 400 mg 1 time.

## Bacterial conjunctivitis OPHTHALMIC

Adults, Elderly, Children  $\geq 1$  yr. 1-2 drops q2-4h for 2 days, then 4 times a day for 5 days.

#### Corneal ulcers, bacterial OPHTHALMIC

*Adults.* 1-2 drops q30min while awake for 2 days, then q60min while awake for 5-7 days, then 4 times a day.

#### Acute otitis media with typanostomy tubes OTIC

*Children aged 1-12 yr.* 5 drops into the affected ear 2 times/day for 10 days.

## Otitis externa

#### OTIC

*Adults, Elderly, Children 12 yr and older.* 10 drops into the affected ear once a day for 7 days.

*Children aged 6 mo to 11 yr.* 5 drops into the affected ear once a day for 7 days.

#### Dosage in hepatic impairment (adults)

Do not exceed 400 mg/day.

#### Dosage in renal impairment (adults)

After a normal initial dose, systemic dosage and frequency are based on creatinine clearance.

Creatinine Clearance (mL/min)	Adjusted Dose	Dosage Interval (h)
> 50	None	q12
20-50	None	q24
< 20	1/2	q24

## CONTRAINDICATIONS

Hypersensitivity to any quinolones.

## INTERACTIONS

Drug

Antacids, sucralfate: May decrease absorption and effects of ofloxacin.

**Caffeine:** May increase the effects of caffeine.

Class IA (quinidine, procainamide), or Class III (amiodarone, sotalol) antiarrhythmic agents: May have additive effects on QT interval.

**Corticosteroids:** May increase risk of tendon rupture.

**Oral antidiabetic agents:** May potentiate hypoglycemic actions. **Warfarin:** May potentiate

anticoagulant effect; monitor INR.

Theophylline: May increase

theophylline blood concentration and risk of toxicity.

#### Herbal

None known.

#### Food

Caffeine: See above; may limit caffeinated beverages.

#### DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (7%-10%)

Nausea, headache, insomnia. Occasional (3%-5%) Abdominal pain, diarrhea, vomiting,

dry mouth, flatulence, dizziness, fatigue, drowsiness, rash, pruritus, fever.

#### Rare (<1%)

Constipation, paresthesia, chest pain, visual disturbances.

#### SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may occur from altered bacterial balance.

 Hypersensitivity reactions, including photosensitivity (as evidenced by rash, pruritus, blisters, edema, and burning skin), have occurred.

• Arthropathy (swelling, pain, and clubbing of fingers and toes, degeneration of stress-bearing portion of a joint) may occur if the systemic drug is given to children (rare).

- · Tendonitis or tendon rupture.
- Rare reports of QT prolongation, arrhythmia, torsade de pointes.
- · Hypoglycemia (rare).

• Rare reports of benign intracranial hypertension (pseudotumor cerebri) with quinolone class.

• Exacerbation of myasthenia, may be severe and lead to weakness of respiratory muscles.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with central nervous system (CNS) disorders, QT prolongation or electrolyte imbalance, diabetes, renal impairment, or seizures. Myasthenia gravis or other neuromuscular conditions may be aggravated. Ofloxacin may mask or delay symptoms of syphilis. Ofloxacin is distributed in breast milk. If possible, pregnant or breastfeeding women should avoid taking the drug because of the risk of arthropathy in the fetus or infant. The safety and efficacy of systemic ofloxacin have not been established in children. Age-related renal impairment may require a dosage adjustment for oral and parenteral forms. Avoid exposure to sunlight and ultraviolet light and wear sunscreen and protective clothing if photosensitivity develops.

Care is important in high sun exposure situations as a result of increased photosensitivity.

Dizziness, drowsiness, headache, and insomnia may occur while taking ofloxacin. Avoid tasks requiring mental alertness or motor skills until response to ofloxacin is established. Maintain hydration. Signs and symptoms of infection, mental status, WBC count, skin for rash, pattern of daily bowel activity and stool consistency should be monitored. Be alert for signs of superinfection, such as anal or genital pruritus, fever, stomatitis, and vaginitis, which should be reported immediately to the health care provider.

Caution is warranted in individuals who are physically active, exercise, and are generally mobile; ruptures of the tendons in the hand, shoulder, and Achilles tendon have been reported with fluoroquinolone use; such injury may require surgical repair and extended disability. Patients experiencing pain or inflammation in a tendon should be advised to rest and refrain from exercise until the situation can be medically evaluated.

#### Storage

Store at room temperature. Administration

May take tablets without regard to food. Take antacids containing aluminum or magnesium or products containing iron or zinc within 2 h before or after taking ofloxacin.

For ophthalmic use, tilt the head back and place the solution in the conjunctival sac. Close the eye; then press gently on the lacrimal sac for 1 min. Do not use ophthalmic solutions for injection. To avoid contamination, do not touch tip of dropper to any other surface.

For otic use, lie down with the head turned so that the affected ear is upright. Warm solution in hands for 1-2 min. Instill drops toward the canal wall, not directly on the eardrum. Pull the auricle down and back in children and up and back in adults. Maintain position for 5 min per ear treated to ensure penetration into ear.

#### Olanzapine

oh-lan'za-peen Zyprexa, Zyprexa Intramuscular, Zyprexa Relprevv, Zyprexa Zydis Do not confuse olanzapine with olsalazine, or Zyprexa with Zyrtec or Zyvox.

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

#### MECHANISM OF ACTION

A dibenzapine derivative that antagonizes  $\alpha_1$ -adrenergic, dopamine, histamine, muscarinic, and serotonin receptors. Produces anticholinergic, histaminic, and central nervous system (CNS) depressant effects. *Therapeutic Effect*: Diminishes manifestations of psychotic symptoms, stabilizes moods.

#### PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 93%. Extensively distributed throughout the body. Undergoes extensive first-pass metabolism in the liver. Excreted primarily in urine and, to a lesser extent, in feces. Not removed by dialysis. *Half-life*: 21-54 h. Extended release injection half life: 30 days.

#### AVAILABILITY

Tablets (Zyprexa): 2.5 mg, 5 mg, 7.5 mg, 10 mg, 15 mg, 20 mg. Tablets (Orally Disintegrating [Zyprexa Zydis]): 5 mg, 10 mg, 15 mg, 20 mg. Injection Powder for Solution (Zvprexa Intramuscular): 10 mg.

Olanzapine (Generic Name), Zyprexa (Brand Name)

Powder for Suspension for IM Use (Zyprexa Relprevv): 210 mg, 300 mg, and 405 mg vials.

## INDICATIONS AND DOSAGES Schizophrenia

#### PO

*Adults.* Initially, 5-10 mg once daily. Target dose: 10 mg/day within several days. If further adjustments are indicated, may increase by 5-10 mg/day at 7-day intervals. Range: 10-20 mg/day.

*Children 13 yr and older.* Initially, 2.5 mg/day. Titrate as necessary, up to 20 mg/day.

IM (ZYPREXA RELPREVV ONLY) Adults. 150 mg, 210 mg, or 300 mg every 2 wks or may give 300 mg or 405 mg every 4 wks. Manufacturer information gives titration for PO or IM depot conversion.

#### Bipolar mania PO

Adults. Initially, 10-15 mg/day (monotherapy) or 10 mg/day (with lithium or valproate). May increase by 5 mg/day at intervals of at least 24 h. Maximum: 20 mg/day. Children 13 yr and older. Initially, 2.5 mg/day. Titrate as necessary up to 20 mg/day.

 Dosage for elderly or debilitated patients and those predisposed to hypotensive reactions

The initial dosage for these patients is 5 mg/day, then titrate with caution according to indication.

#### Control of agitation in schizophrenic or bipolar patients IM (ZYPREXA INJECTION SOLUTION)

Adults, Elderly. 2.5-10 mg. May repeat 2 h after first dose and 4 h after 2nd dose. Maximum: 30 mg/ day. Use lower doses (5-7.5 mg) if at risk for hypotension or if debilitated.

## **OFF-LABEL USES**

Behavioral disturbance secondary to dementia, adjunct for refractory depression along with conventional antidepressants.

#### CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants, diazepam: May increase CNS depressant effects. Anticholinergic agents: May increase anticholinergic effects. Antihypertensives: May increase the hypotensive effects of these drugs. Carbamazepine: Increases olanzapine clearance. Ciprofloxacin, fluvoxamine: May increase the olanzapine blood concentration. Dopamine agonists, levodopa: May antagonize the effects of these drugs. Imipramine, theophylline: May inhibit the metabolism of these drugs. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May significantly increase serum GGT, prolactin, AST (SGOT), and ALT (SGPT) levels, cholesterol or triglycerides, blood sugar.

## SIDE EFFECTS

#### Frequent

Somnolence (26%), agitation (23%), insomnia (20%), headache (17%), nervousness (16%), hostility (15%), dizziness (11%), rhinitis (10%), weight gain, hyperprolactinemia. **Occasional** 

Anxiety, constipation (9%); nonaggressive atypical behavior (8%); dry mouth (7%); weight gain (6%); orthostatic hypotension, fever, arthralgia, restlessness, cough, pharyngitis, visual changes (dim vision) (5%), extrapyramidal symptoms, fatigue.

#### Rare

Tachycardia; back, chest, abdominal, or extremity pain; tremor.

## SERIOUS REACTIONS

 Rare reactions include seizures and neuroleptic malignant syndrome, a potentially fatal syndrome characterized by hyperpyrexia, muscle rigidity, irregular pulse or BP, tachycardia, diaphoresis, and cardiac arrhythmias.

- Extrapyramidal symptoms and dysphagia may also occur.
- Overdose (300 mg) produces drowsiness and slurred speech.

• Development of hyperglycemia/ diabetes.

· QT prolongation (rare).

• Zyprexa Relprevv: May cause delirium/sedation syndrome after injection.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hypersensitivity, hepatic impairment, cerebrovascular disease, cardiovascular disease (such as conduction abnormalities, heart failure, or history of myocardial infarction [MI] or ischemia), history of seizures or conditions that lower the seizure threshold (such as Alzheimer's disease), and conditions predisposing to hypotension (such as dehydration, hypovolemia, and use of antihypertensives). Extreme caution should be used with elderly patients who are at risk for aspiration pneumonia, those who are concurrently taking hepatotoxic drugs, and those who should avoid anticholinergics (such as persons with benign prostatic hyperplasia).

Elderly patients with dementiarelated psychosis had a significantly higher incidence of cerebrovascular adverse events (e.g., stroke, TIA) and increased risk of mortality. It is unknown whether olanzapine crosses the placenta or is distributed in breast milk. The safety and efficacy of olanzapine have not been established in children less than 13 yr.

Drowsiness may occur but generally subsides with continued therapy. Tasks requiring mental alertness or motor skills should be avoided. Dehydration, particularly during exercise; exposure to extreme heat; and concurrent use of medications that cause dry mouth or other drying effects should also be avoided. A healthy diet and exercise program should be maintained to minimize weight gain. Notify the physician of extrapyramidal symptoms or excessive sedation. BP and therapeutic response should be assessed. Rapid postural changes should be avoided due to possible development of orthostatic hypotension.

Symptoms including sore tongue, problems eating or swallowing, fever, or infection need to be reported immediately.

#### Storage

Store at room temperature. Keep orally disintegrating tablets in blister until time of use. Unopened injection should be protected from light; do not freeze. Once constituted, drug is stable for 1 h at room temperature. Administration

Take olanzapine without regard to food. Take as ordered and do not abruptly discontinue the drug or increase the dosage. Orally dissolving tablets may be dissolved on tongue without water. Zyprexa IM is for IM use only. Dissolve vial contents with 2.1 mL of sterile water for injection (resulting solution is 5 mg/mL). Inject slowly, deep into muscle mass. Incompatible with diazepam, lorazepam, and haloperidol.

Zyprexa Relprevv injection suspension is for deep IM gluteal injection only; do not confuse the dosage form with the IM injection solution. *Never* give intravenously. Use the diluent provided to reconstitute. Use gloves when reconstituting, as Zyprexa Relprevv is irritating to the skin. Relprevv form *must* be administered in a health care facility with emergency equipment, and patient must be observed for 3 h following each dose.

#### Olmesartan Medoxomil

ohl-me-sar'tan med-ox'o-myl Benicar 🍟 Olmetec

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antihypertensive agents, angiotensin II receptor antagonists

## **MECHANISM OF ACTION**

An angiotensin II receptor, type AT<sub>1</sub>, antagonist that blocks the vasoconstrictor and aldosteronesecreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT<sub>1</sub> receptors. *Therapeutic Effect*: Causes vasodilation, decreases peripheral resistance, and decreases BP.

## PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Hydroxylated in GI tract to active form. Metabolized in the GI tract. Recovered primarily in feces and, to a lesser extent, in urine. Not removed by hemodialysis. *Half-life*: 13 h.

## AVAILABILITY

Tablets: 5 mg, 20 mg, 40 mg.

# INDICATIONS AND DOSAGES Hypertension PO

Adults, Elderly, Patients with mildly impaired hepatic or renal function. 20 mg once a day in patients who are not volume depleted. After 2 wks of therapy, if further reduction in BP is needed, may increase dosage to 40 mg/day.

Children 6 yr and older. Initially, 10 mg once per day for weight of 20-34 kg or 20 mg once per day for weight  $\ge$  35 kg. After 2 wks, the dose can increase to a maximum of 20 mg once daily for those < 35 kg or 40 mg once daily for those  $\ge$  35 kg.

## CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS Drug

Antihypertensives: Additive antihypertensive effect; ACE inhibitors may increase risk of hyperkalemia or renal effects. NSAIDs: Possible diminished antihypertensive effect.

## Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase blood hemoglobin and hematocrit levels.

Olmesartan Medoxomil (Generic Name), Benicar (Brand Name)
#### SIDE EFFECTS

Occasional (3%)

Dizziness. Rare (< 2%)

Headache, diarrhea, upper respiratory tract infection. Increases in serum creatinine, hyperkalemia.

#### SERIOUS REACTIONS

• Overdosage may manifest as hypotension and tachycardia.

· Angioedema is rare.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and renal impairment and renal arterial stenosis, and in patients with diabetes mellitus. Patients who are volume-depleted or salt-depleted are at increased risk for hypotension. It is unknown whether olmesartan is distributed in breast milk. It may cause fetal or neonatal morbidity or mortality. Therefore, caution is warranted in lactation; discontinue use as soon as pregnancy is confirmed; assess patient for pregnancy before prescribing. Safety and efficacy of olmesartan have not been established in children under the age of 6 yr. No age-related precautions have been noted in elderly patients.

Dizziness may occur. Tasks that require mental alertness or motor skills should be avoided. Apical pulse and BP should be assessed immediately before each olmesartan dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the patient in the supine position with feet slightly elevated and notify the physician. Diagnostic tests, such as hemoglobin and hematocrit levels and liver function tests, should be assessed. Maintain adequate hydration; exercising outside during

hot weather should be avoided to decrease the risk of dehydration and hypotension. Caution is warranted when sedation or general anesthesia is required due to risk of hypotensive episode.

#### Storage

Store tablets at room temperature. The compounded oral suspension should be refrigerated and is stable up to 4 wks.

#### Administration

Take olmesartan without regard to meals. For children who cannot swallow tablets, the manufacturer supplies a recipe for a compounded suspension. Shake well before each use; measure dose with calibrated oral syringe.

#### Olopatadine

oh-loe-pa'ta-deen ★ Patanase, Patanol, Pataday ◆ Patanol

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antihistamine; mast cell stabilizer, ophthalmic, nasal

## **MECHANISM OF ACTION**

An antihistamine that inhibits histamine release from the mast cell. *Therapeutic Effect:* Inhibits symptoms associated with allergic conjunctivitis/allergic rhinitis.

### PHARMACOKINETICS

The time to peak concentration is < 2 h and duration of action is 8 h. Minimal absorption after topical administration. Metabolized to inactive metabolites. Primarily excreted in urine. *Half-life:* 3-8 h.

### AVAILABILITY

Nasal Spray Solution: 0.6%. Ophthalmic Solution: 0.1%, 0.2%.

## INDICATIONS AND DOSAGES Allergic conjunctivitis

OPHTHALMIC

Adults, Elderly, Children 3 yr and older: 0.1% solution: 1-2 drops in affected eye(s) twice daily q6-8h; 0.2% solution: 1 drop in affected eye(s) once daily.

#### Seasonal allergic rhinitis INTRANASAL

Adults, Elderly, Children 12 yr and older. 2 sprays per nostril once daily. Children 6-11 yrs. 1 spray per nostril twice daily.

#### CONTRAINDICATIONS

Hypersensitivity to olopatadine hydrochloride or any other component of the formulation.

### INTERACTIONS

#### Drug

Anticholinergics: Enhanced anticholinergic effects. CNS depressants: Enhanced somnolence. Herbal None known. Food None known.

## SIDE EFFECTS

#### Occasional

Ophthalmic use: Headache, weakness, cold syndrome, taste perversion, burning, stinging, dry eyes, foreign body sensation, hyperemia, keratitis, eyelid edema, itching, pharyngitis, rhinitis, sinusitis. Nasal spray: Bitter taste, nasal ulceration, epistaxis, pharyngolaryngeal pain, postnasal drip, cough, throat irritation, somnolence, dry mouth.

#### SERIOUS REACTIONS

· None reported.

#### PRECAUTIONS & CONSIDERATIONS

While rare, somnolence may occur with nasal use and may require caution with normal activities until effects of the drug are known. Use caution in pregnancy and lactation due to lack of data.

#### Storage

Store at room temperature. Administration

Do not use ophthalmic olopatadine while wearing contacts. Wait 15 min after use before reinserting. To avoid contamination, do not touch the dropper tip to the eye area.

Prime nasal spray before initial use and when not used for more than 7 days. Avoid spraying in the eyes.

## **Olsalazine Sodium**

ohl-sal'ah-zeen soo'dee-um Dipentum Do not confuse olsalazine with olanzapine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Gastrointestinal, anti-inflammatory, 5-amino-salicylates

#### MECHANISM OF ACTION

A salicylic acid derivative that is converted to 5-aminosalicylic acid in the colon by bacterial action. Blocks prostaglandin production in bowel mucosa. *Therapeutic Effect*: Reduces colonic inflammation in inflammatory bowel disease.

Olsalazine Sodium (Generic Name), Dipentum (Brand Name)

## 1164 Olsalazine Sodium

## PHARMACOKINETICS

PO: Partially absorbed; peak attained in 1.5 h. Excreted in urine as 5-aminosalicylic acid and metabolites; crosses placenta. *Halflife:* 5-10 h.

## AVAILABILITY

Capsules: 250 mg.

## INDICATIONS AND DOSAGES Maintenance of controlled

ulcerative colitis

*Adults, Elderly.* 1 g/day in 2 divided doses, preferably q12h.

## **OFF-LABEL USES**

Treatment of Crohn's disease.

## CONTRAINDICATIONS

History of hypersensitivity to 5-aminosalicylates or other salicylates.

## INTERACTIONS Drug

Antacids: Do not administer olsalazine sodium with antacids. Azithoprine, mercaptopurine:

May increase side effects of these antineoplastics.

Warfarin, low-molecular-weight heparins: Possible increased risk for bleeding or excessive anticoagulation.

#### Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase AST (SGOT) and ALT (SGPT) levels.

## SIDE EFFECTS

#### Frequent (5%-10%)

Headache, diarrhea (17%), abdominal pain or cramps, nausea.

### Occasional (1%-5%)

Depression, fatigue, dyspepsia, upper respiratory tract infection, decreased appetite, rash, itching, arthralgia.

Rare (1%)

Dizziness, vomiting, stomatitis.

## SERIOUS REACTIONS

• Sensitivity may occur in susceptible patients, manifested by cramping, headache, diarrhea, fever, rash, hives, itching, and wheezing. Discontinue drug immediately.

• Excessive diarrhea associated with extreme fatigue is noted rarely.

· Hepatotoxicity (rare).

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with preexisting renal or hepatic disease. The drug should not be used during pregnancy or lactation. Safety and efficacy are not established in children. Serum alkaline phosphatase, AST, and ALT levels should be obtained before therapy. Adequate fluid intake should be maintained. Daily bowel activity and stool consistency and skin for rash should be assessed. Notify physician if persistent or increasing cramping, diarrhea, fever, pruritus, or rash occurs; olsalazine should be discontinued. Avoid adiminstration of any drug that could aggravate inflammatory colon disease; medical consultation is necessary for appropriate antibiotic selection.

#### Storage

Store at room temperature.

#### Administration

Take olsalazine with food in evenly divided doses.

## Omalizumab

oh-mah-liz'uw-mab Xolair Do not confuse with ofatumumab.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Anti-IgE monoclonal antibodies

## **MECHANISM OF ACTION**

A monoclonal antibody that selectively binds to human immunoglobulin E (IgE), preventing it from binding to the surface of mast cells and basophils. *Therapeutic Effect:* Prevents or reduces the number of asthmatic attacks because of allergens.

## PHARMACOKINETICS

Absorbed slowly after SC administration, with peak concentration in 7-8 days. Excreted

#### 4-wk Dosing Table

by the liver, reticuloendothelial system, and endothelial cells. *Half-life:* 26 days.

## AVAILABILITY

*Powder for Injection:* 202.5 mg, provides 150 mg/1.2 mL after reconstitution.

## **INDICATIONS AND DOSAGES**

Moderate to severe persistent asthma in patients who are reactive to a perennial allergen and whose asthma symptoms have been inadequately controlled with inhaled corticosteroids

SC

Adults, Elderly, Children 12 yr and older. 150-375 mg every 2 or 4 wks; dose and dosing frequency are individualized based on weight and pretreatment immunoglobulin E (IgE) level (as shown below).

Pretreatment Serum IgE Levels (units/mL)	Weight 30-60 kg	Weight 61-70 kg	Weight 71-90 kg	Weight 91-150 kg
30-100 mg	150 mg	150 mg	150 mg	300 mg
101-200 mg	300 mg	300 mg	300 mg	See next table
201-300 mg	300 mg	See next table	See next table	See next table

## 2-wk Dosing Table

Pretreatment Serum IgE Levels (units/mL)	Weight 30-60 kg	Weight 61-70 kg	Weight 71-90 kg	Weight 91-150 kg
101-200	See preceding table	See preceding table	See preceding table	225 mg
201-300	See preceding table	225 mg	225 mg	300 mg
301-400	225 mg	225 mg	300 mg	Do not dose
401-500	300 mg	300 mg	375 mg	Do not dose
501-600	300 mg	375 mg	Do not dose	Do not dose
601-700	375 mg	Do not dose	Do not dose	Do not dose

## **OFF-LABEL USES**

Treatment of asthma resulting from food allergies.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum IgE levels.

## SIDE EFFECTS

#### Frequent (11%-45%)

Injection site ecchymosis, redness, warmth, stinging, and urticaria; viral infections; sinusitis; headache; pharyngitis.

## Occasional (3%-8%)

Arthralgia, leg pain, fatigue, dizziness.

### Rare (2%)

Arm pain, earache, dermatitis, pruritus.

## SERIOUS REACTIONS

 Anaphylaxis occurs within 2 h of the first dose or subsequent doses in 0.1% of patients.

 Malignant neoplasms occur in 0.5% of patients.

## PRECAUTIONS & CONSIDERATIONS

Omalizumab is not intended to reverse acute bronchospasm or status asthmaticus. Because IgE is present in breast milk, omalizumab is also believed to be present in breast milk. Use omalizumab only if clearly needed. The safety and efficacy of omalizumab have not been established in children younger than 12 yr. No age-related precautions have been noted in elderly patients.

Drink plenty of fluids to decrease the thickness of lung secretions.

Serum total IgE levels should be obtained before beginning omalizumab therapy because the drug dosage is based on these pretreatment levels. Pulse rate and quality as well as respiratory depth, rate, rhythm, and type should be monitored. Fingernails and lips should also be assessed for a blue or dusky color in light-skinned patients and a gray color in darkskinned patients, which may be signs of hypoxemia. Rapidly acting sympathomimetic inhalants should be available for emergency use.

#### Storage

Store omalizumab in the refrigerator. The reconstituted solution is stable for 8 h if refrigerated or 4 h if stored at room temperature. Protect from direct sunlight.

#### Administration

Expect to base omalizumab dosage on serum IgE levels obtained before beginning treatment. Do not use serum IgE levels obtained during treatment to determine omalizumab dosage because IgE levels remain elevated for up to 1 yr after the drug has been discontinued.

Use only clear or slightly opalescent solution; the solution is slightly viscous. Use only sterile water for injection to prepare for SC administration. Draw 1.4 mL sterile water for injection into a 3-mL syringe with a 1-inch, 18-gauge needle, and inject contents into the vial of powder. Swirl the vial for approximately 1 min; do not shake it. Then swirl the vial again for 5-10 seconds every 5 min until no gel-like particles appear in the solution. The drug takes 15-20 min to dissolve. Do not use the solution if the contents fail to dissolve completely in 40 min. Invert the vial for 15 seconds to allow the solution

to drain toward the stopper. Using a new 3-mL syringe with a 1-inch, 18-gauge needle, withdraw the required 1.2-mL dose and replace the 18-gauge needle with a 25-gauge needle for SC administration. SC administration may take 5-10 seconds because of omalizumab's viscosity. Patients are usually observed in office for 2 h following a dose.

## Omeprazole

om-eh-pray'zole Prilosec, Prilosec OTC Losec Do not confuse Prilosec with prilocaine, Prinivil, Prozac, or Prevacid, or omeprazole with olmesartan. Do not confuse

Losec with Lasix.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Gastrointestinal agents, antiulcer agents, proton pump-inhibitors (PPI)

## **MECHANISM OF ACTION**

A benzimidazole that is converted to active metabolites that irreversibly bind to and inhibit hydrogenpotassium adenosine triphosphatase, an enzyme on the surface of gastric parietal cells. Inhibits hydrogen ion transport into gastric lumen. *Therapeutic Effect*: Increases gastric pH, reduces gastric acid production.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	2 h	72 h

Rapidly absorbed from the GI tract. Protein binding: 95%. Primarily distributed into gastric parietal cells. Metabolized extensively in the liver. Primarily excreted in urine. Unknown whether removed by hemodialysis. *Half-life:* 0.5-1 h (increased in patients with hepatic impairment).

## AVAILABILITY

Capsules (Delayed Release [Prilosec]): 10 mg, 20 mg, 40 mg. Delayed-Release Tablets (Prilosec OTC): 20 mg.

Delayed-Release Granules for Oral Suspension: 2.5-mg, 10-mg packets.

## INDICATIONS AND DOSAGES

 Erosive esophagitis, poorly responsive gastroesophageal reflux disease (GERD), active duodenal ulcer, prevention and treatment of NSAID-induced ulcers PO

Adults, Elderly. 20 mg/day.

## To maintain healing of erosive esophagitis

PO

Adults, Elderly. 20 mg/day.

## Pathologic hypersecretory conditions

PO

*Adults, Elderly.* Initially, 60 mg/day up to 120 mg 3 times a day.

## Duodenal ulcer caused by Helicobacter pylori

*Adults, Elderly.* 20 mg twice a day for 10 days, with antibiotics.

## • Active benign gastric ulcer PO

Adults, Elderly. 40 mg/day for 4-8 wks. Dyspepsia (OTC use)

*Adults.* 20 mg once daily for no more than 14 days. Contact physician regarding long-term treatment if heartburn continues.

Usual pediatric dosage

Children 1-16 yr and  $\ge 20$  kg. 20 mg once daily. See adult dosage if > 16 yr. Children 1-16 yr and 10 to < 20 kg. 10 mg once daily.

Omeprazole (Generic Name)

*Children* 1-16 yr and 5 to < 10 kg. 5 mg/day.

## **OFF-LABEL USES**

Prevention of NSAID-induced ulcers, stress-ulcer prophylaxis.

## CONTRAINDICATIONS

Hypersensitivity to omeprazole or related drugs, including interstitial nephritis.

## INTERACTIONS

#### Drug

**Clopidogrel:** Do not use omeprazole with clopidogrel. PPI may decrease the conversion of clopidogrel to its active metabolite, thereby reducing its effectiveness.

Diazepam, oral anticoagulants (warfarin), phenytoin: May increase the blood concentration of diazepam, oral anticoagulants, and phenytoin.

Ketoconazole: Decreases ketoconazole absorption. Methotrexate: May increase risk of

methotrexate toxicity. **Protease inhibitors:** Reduces absorption of many. Some contraindicate use of omeprazole concurrently.

**Rifampin:** May decrease levels and efficacy of omeprazole.

**Tacrolimus:** May increase serum levels.

## Herbal

St. John's wort: May decrease the levels of omeprazole. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels. Rare decreases in platelet counts. May decrease serum magnesium in chronic use.

## SIDE EFFECTS

Frequent (7%) Headache. Occasional (2%-3%) Diarrhea, abdominal pain, nausea. Rare (2%)

Dizziness, asthenia or loss of strength, vomiting, constipation, upper respiratory tract infection, back pain, rash, cough.

## SERIOUS REACTIONS

- · Anaphylaxis/angioedema.
- · Interstitial nephritis.

• In chronic use, may cause hypomagnesemia.

• In chronic use, may increase risk of bone fracture.

• Possible alteration of GI microflora which increases risk of *C. dificile*– assosiated diarrhea (CDAD).

## PRECAUTIONS & CONSIDERATIONS

It is unknown whether omeprazole crosses the placenta; caution warranted in pregnancy. Omeprazole is excreted in human milk; a decision should be made whether to discontinue breastfeeding. Safety and efficacy have not been established in children under 1 yr. No age-related precautions have been noted in elderly patients. Consider dose reduction in chronic hepatic disease or Asian patients.

Notify the physician if headache, diarrhea, discomfort, or nausea occurs during omeprazole therapy. Serum chemistry laboratory values, particularly serum alkaline phosphatase, AST, and ALT levels should be obtained to assess liver function. Loose or soft stool may be noted early in the therapy protocol. Do not use Prilosec OTC for more than 2 wks without medical consultation. **Storage** 

Store at room temperature. Do not prepare granules ahead of time of administration.

## Administration

Take omeprazole before meals. Do not crush capsules; swallow capsules whole. If patient has difficulty swallowing, capsule may be opened and contents sprinkled on a tablespoon of cool applesauce. Swallow without chewing and follow with a sip of water. The oral suspension is prepared as follows: Mix 2.5- or 10-mg packet into 5 or 15 mL of water, respectively. Stir and allow to thicken 2-3 min. Stir and drink. Can also be given via nasogastric tube.

#### Onabotulinumtoxin A (formerly Botulinum Toxin Type A)

on-a-bot'yoo-lin-num toks'in type a

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Miscellaneous skeletal muscle relaxants

## **MECHANISM OF ACTION**

A neurotoxin that blocks neuromuscular conduction by binding to receptor sites on motor nerve endings and inhibiting the release of acetylcholine, resulting in muscle denervation. *Therapeutic Effect*: Reduces muscle activity.

## AVAILABILITY

*Injection:* 50 units, 100 units, 200 units, per vial.

## INDICATIONS AND DOSAGES

 Cervical dystonia in patients who have previously tolerated botulinum toxin type A

IM Adults, Elderly. Mean dose of 236 units (range: 198-300 units) divided among the affected muscles, based on patient's head and neck position, localization of pain, muscle hypertrophy, patient response, and adverse reaction history.

#### Cervical dystonia in patients who have not previously been treated with botulinum toxin type A IM

*Adults, Elderly.* Administer at lower dosage than for patients who have previously tolerated the drug. Limit total dose injected into the sternocleidomastoid muscles to 100 units or less to decrease incidence of dysphagia.

#### Strabismus

#### IM

Adults, Children older than 12 yr. 1.25-2.5 units into any one muscle. Children 2 mo to 12 yr. 1-2.5 units into any one muscle.

## Blepharospasm

IM

*Adults. Initially, 1.25-2.5 units.* May increase up to 2.5-5.0 units at repeat treatments. Maximum: 5 units per injection or cumulative dose of 200 units over a 30-day period.

## Improvement of brow furrow/ glabellar lines

*Adults 65 yr and younger.* 20 units total dose injected over 5 sites.

## Axillary hyperhidrosis

INTRADERMAL

Adults. 50 units per axilla.

### Prevention of migraine in chronic cases

#### IM

Adults 65 yr and younger. 155 units IM as 5 units/injection divided across 7 specific head and neck muscle areas (see product literature). Total of 31 injections per treatment cycle, which is repeated q12 weeks.

 Urinary incontinence due to detrusor overactivity caused by neurologic conditions

### 1170 Onabotulinumtoxin A (formerly Botulinum Toxin Type A)

#### IM

*Adults 65 yr and younger.* 200 units IM per treatment, injected into the detrusor muscle (see product literature), avoiding the trigone. Do not re-treat for at least 12 weeks.

#### **OFF-LABEL USES**

Treatment of dynamic muscle contracture in children with cerebral palsy, focal task-specific dystonia, head and neck tremor unresponsive to drug therapy, hemifacial spasms, laryngeal dystonia, oromandibular dystonia, spasmodic torticollis, writer's cramp.

### CONTRAINDICATIONS

Infection at proposed injection sites, hypersensitivity to albumin, botulinum toxin, or any component of the formulation.

#### INTERACTIONS

#### Drug

Aminoglycoside antibiotics, other drugs that interfere with neuromuscular transmission (such as curare-like compounds): May potentiate the effects of botulinum toxin type A.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (11%-15%)

Localized pain, tenderness, or bruising at injection site; localized weakness in injected muscle; upper respiratory tract infection; neck pain; headache.

#### Occasional (2%-10%)

Increased cough, flu-like symptoms, back pain, rhinitis, dizziness, hypertonia, soreness at injection site, asthenia, dry mouth, nausea, somnolence.

#### Rare

Stiffness, numbness, diplopia, ptosis.

#### SERIOUS REACTIONS

Mild to moderate dysphagia occurs in approximately 20% of patients.
Arrhythmias and severe dysphagia (manifested as aspiration, pneumonia, and dyspnea) occur rarely but may cause death. Immediate medical attention may be required in cases of respiratory, speech, or swallowing difficulties.

 Overdose produces systemic weakness and muscle paralysis, respiratory failure, death. May also result from distant spread of toxin from site injected.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with neuromuscular junctional disorders, such as amyotrophic lateral sclerosis, Lambert-Eaton syndrome, motor neuropathy, and myasthenia gravis, because they may experience significant systemic effects, including respiratory compromise, and severe dysphagia. Be aware of signs of dysphagia and aspiration pneumonia, including fever, sputum production, and dyspnea after treatment. Safety and effectiveness are not established in children < 12 yr for blepharospasm or strabismus, < 16 yr for cervical dystonia, and < 18 yr for hyperhidrosis.

Clinical improvement should begin within 2 wks of the injection, but the drug's maximum benefit will appear approximately 6 wks after the injection. Resume normal activity slowly and carefully. Seek medical attention immediately if respiratory, speech, or swallowing difficulties occur.

#### Storage

Store drug vials in the refrigerator. The reconstituted solution may be refrigerated for up to 24 h. Administer the drug within 24 h after reconstitution. The solution normally appears as clear and colorless; discard the solution if particulate matter is present.

#### Administration

! The potency units of Botox products are not interchangeable with other preparations of botulinum toxin products.

Plan to have a physician inject the drug into the affected muscle.

Expect to administer the drug at the lowest effective dosage and at the longest effective dosing interval to avoid formation of neutralizing antibodies. Dilute drug with preservative-free 0.9% NaCl. See manufacturer's diluent table for diluent amounts per vial strength for concentration desired by the physician for administration, dependent on indication for use. Slowly and gently inject the diluent into the vial to avoid producing bubbles. Then rotate the vial gently to mix the drug. If a vacuum does not pull the diluent into the vial, discard it.

For IM use, assist the physican, as necessary, while he or she injects the drug into the affected muscles using a 25-, 27-, or 30-gauge needle for superficial muscles and a 22-gauge needle for deeper muscles. See labeling for needle type recommended per injection indication and site. Do not inject through pen marks to avoid permanent tattoo-like effect.

For intradermal injection, inject each dose at a 45-degree angle to a depth of approximately 2 mm.

#### Ondansetron Hydrochloride

on-dan-seh'tron high-droh-klor'ide Zofran, Zofran ODT, Zuplenz Do not confuse Zofran with Zantac or Zosyn.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antiemetics, selective 5-HT<sub>3</sub> serotonin receptor antagonists

### **MECHANISM OF ACTION**

An antiemetic that blocks serotonin, both peripherally on vagal nerve terminals and centrally in the chemoreceptor trigger zone. *Therapeutic Effect*: Prevents nausea and vomiting.

#### PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 70%-76%. Metabolized in the liver. Primarily excreted in urine. Unknown whether removed by hemodialysis. All tablets are bioequivalently interchangeable. *Half-life*: 4 h.

#### AVAILABILITY

Oral Solution (Zofran): 4 mg/5 mL. Orally Disintegrating Film, (Zuplenz): 4 mg, 8 mg. Tablets (Zofran): 4 mg, 8 mg, 24 mg. Tablets (Orally Disintegrating [Zofran ODT]): 4 mg, 8 mg. Injection (Zofran): 2 mg/mL.

#### INDICATIONS AND DOSAGES > Prevention of chemotherapyinduced nausea and vomiting PO

Adults, Elderly, Children older than 11 yr. 24 mg as a single dose 30 min

Ondansetron Hydrochloride (Generic Name)

## 1172 Ondansetron Hydrochloride

before starting chemotherapy, or 8 mg 30 min before chemotherapy and again 8 h after first dose; then q12h for 1-2 days.

*Children 4-11 yr.* 4 mg 30 min before chemotherapy and again 4 and 8 h after chemotherapy, then q8h for 1-2 days. IV INFUSION

Adults, Elderly, Children 4-18 yr. Maximum of 16 mg/dose for adults or 0.15 mg/kg/dose 30 min before chemotherapy, then 4 and 8 h after chemotherapy.

## Prevention of radiation-induced nausea and vomiting PO

*Adults, Elderly.* 8 mg 1-2 h before radiation, followed by 8 mg 3 times a day, or if radiation is intermittent, 8-mg single dose 1-2 h before radiation.

#### Prevention of postoperative nausea and vomiting

IV, IM Adults, Elderly. 4 mg undiluted over 2-5 min.

*Children weighing* < 40 kg. 0.1 mg/kg. *Children weighing* ≥ 40 kg. 4 mg. PO

*Adults, Elderly.* 16 mg given as two 8-mg tablets 1 h before anesthesia.

## **OFF-LABEL USES**

Hyperemesis gravidarum.

## CONTRAINDICATIONS

Hypersensitivity to ondansetron or other selective 5-HT<sub>3</sub> receptor antagonists. Use with apomorphine.

## INTERACTIONS

#### Drug

Apomorphine: Causes profound hypotension and loss of consciousness; contraindicated. Class IA (quinidine, procainamide), or Class III (amiodarone, sotalol) antiarrhythmic agents: May have additive risk QT interval.

#### Phenytoin, carbamazepine,

rifampicin: May decrease levels of ondansetron.

Tramadol: May increase patientcontrolled administration of tramadol. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May transiently increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels.

## IV INCOMPATIBILITIES

Acyclovir (Zovirax), allopurinol (Aloprim), aminophylline, amphotericin B (Fungizone), amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin (Polycillin), ampicillin and sulbactam (Unasyn), cefepime (Maxipime), cefoperazone (Cefobid), ertapenem, 5-fluorouracil, furosemide, insulin (regular), lansoprazole, lorazepam (Ativan), meropenem (Merrem IV), methylprednisolone (Solu-Medrol), micafungin, pantoprazole.

## **IV COMPATIBILITIES**

Carboplatin (Paraplatin), cisplatin (Platinol), cyclophosphamide (Cytoxan), cytarabine (Cytosar), dacarbazine (DTIC-Dome), daunorubicin (Cerubidine), dexamethasone (Decadron), diphenhydramine (Benadryl), docetaxel (Taxotere), dopamine (Intropin), etoposide (VePesid), gemcitabine (Gemzar), heparin, hydromorphone (Dilaudid), ifosfamide (Ifex), magnesium, mannitol, mesna (Mesnex), methotrexate, metoclopramide (Reglan), mitomycin (Mutamycin), mitoxantrone (Novantrone), morphine, paclitaxel (Taxol), potassium chloride, teniposide

(Vumon), topotecan (Hycamtin), vinblastine (Velban), vincristine (Oncovin), vinorelbine (Navelbine).

### SIDE EFFECTS

#### Frequent (5%-13%)

Anxiety, dizziness, somnolence, headache, fatigue, constipation, diarrhea, hypoxia, urine retention. Occasional (2%-4%)

Abdominal pain, xerostomia, fever, feeling of cold, redness and pain at injection site, paresthesia, asthenia. **Rare (1%)** 

Hypersensitivity reaction (including rash and pruritus), blurred vision.

#### SERIOUS REACTIONS

• Overdose may produce a combination of central nervous system (CNS) stimulant and depressant effects.

- Rare case of dystonic reactions.
- Rare cases of temporary vision loss, for a few minutes up to 48 h.

• Liver failure and death have been reported in patients with cancer receiving concurrent potentially hepatotoxic chemotherapy and antibiotics.

• QT prolongation, arrhythmia, torsade de pointes.

#### **PRECAUTIONS & CONSIDERATIONS**

Ondansetron is not a drug that stimulates gastric or intestinal peristalsis. It should not be used instead of nasogastric suction. Avoid use in patients with congenital long QT syndrome and ECG monitoring is recommended in patients with electrolyte imbalance (e.g., hypokalemia or hypomagnesemia), heart failure, bradycardia, or if other medications that might cause QT prolongation are in use. Animal data have not indicated fetal harm. In humans, it is unknown whether ondansetron crosses the placenta or is distributed in breast milk. The safety

and efficacy of ondansetron have not been established in neonates. No agerelated precautions have been noted in elderly patients. Alcohol, barbiturates, and tasks that require mental alertness or motor skills should be avoided.

Dizziness or drowsiness may occur. Pattern of daily bowel activity and stool consistency, hydration status, bilirubin, AST (SGOT), and ALT (SGPT) levels should be monitored. Onset of sudden blindness, which usually resolves in 2-3 h, should be immediately reported as it may indicate overdosage.

#### Storage

Store vials and oral products at room temperature. The infusion is stable for 48 h after dilution.

### Administration

! Give all oral doses 30 min before chemotherapy and repeat at 8-h intervals, as prescribed.

Take ondansetron without regard to food. Orally disintegrating film or tablets may be dissolved on tongue without water.

For IV use, ondansetron may be given undiluted as an IV push over 2-5 min for doses up to 4 mg only. For IV infusion, dilute with 50 mL D5W or 0.9% NaCl before administration, and infuse over 15 min. May also give IM if dose is 4 mg or less.

## Oprelvekin (Interleukin-11 [IL-11])

oh-prel've-kin Neumega Do not confuse Neumega with Neupogen. Do not confuse with interleukin-2.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Hematopoietic agents; platelet growth factor, interleukins.

## **MECHANISM OF ACTION**

A hematopoietic recombinant version of human interleukin-11 (IL-11) that stimulates production of blood platelets, essential to the blood-clotting process. *Therapeutic Effect*: Increases platelet production.

## PHARMACOKINETICS

Peak 1-6 h following single subcutaneous dose. Rapidly excreted by the kidneys. *Half-life:* 6.9 h.

## AVAILABILITY

Injection: 5 mg.

## INDICATIONS AND DOSAGES Prevention of thrombocytopenia as

a result of chemotherapy

SC

*Adults.* 50 mcg/kg once a day, beginning 6-24 h after completion of chemotherapy, and usually for 10-21 days.

Dosage in renal impairment

If CrCl < 30 mL/min, reduce to 25 mcg/kg once daily (i.e., a 50% dose reduction).

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

**Platelet inhibitors, aspirin:** Caution is warranted with NSAIDs and aspirin, which can affect platelet function.

**Thiazide loop diuretics:** Increase risk of hypokalemia.

Herbal

None known.

Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May decrease albumin levels, hemoglobin and hematocrit (dilutional effect), usually within 3-5 days of initiation of therapy; reverses about 1 wk after therapy discontinued.

### SIDE EFFECTS Frequent

Nausea or vomiting (77%), fluid retention (59%), neutropenic fever (48%), diarrhea (43%), rhinitis (42%), headache (41%), dizziness (38%), fever (36%), insomnia (33%), cough (29%), rash or pharyngitis (25%), tachycardia (20%), vasodilation (19%).

## SERIOUS REACTIONS

• Transient atrial fibrillation or flutter occurs in 10% of patients and may be caused by increased plasma volume; oprelvekin is not directly arrhythmogenic. Arrhythmias usually are brief and spontaneously convert to normal sinus rhythm.

- Papilledema, especially in children.
- · Serious acute hypersensitivity.
- Congestive heart failure, dyspnea, pulmonary edema.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with congestive heart failure (CHF), fluid retention, renal problems, stroke, or TIA and in those with a history of atrial arrhythmia. Although drug has been used in children, a safe and effective dose is not established; the effective dose often exceeds the maximum tolerated dose of 50 mcg/kg/day.

Notify the physician of palpitations or dyspnea. Fluid and electrolyte status should be closely monitored, particularly if the patient is receiving diuretic therapy. Fluid retention should be assessed as evidenced by dyspnea on exertion and peripheral edema; it generally occurs during the first week of therapy and continues for the duration of treatment. An ECG should be obtained. Platelet count should also be periodically assessed for therapeutic response. An electric razor and soft toothbrush should be uesd until platelet count is within normal range. CBC should be obtained before chemotherapy and at regular intervals thereafter.

## Storage

Store in refrigerator. Once reconstituted, use within 3 h. Administration

**!** Begin oprelvekin administration 6-24 h following completion of chemotherapy dose. Discontinue at least 48 h before starting next chemotherapy cycle.

For SC use, add 1 mL sterile water for injection to provide concentration of 5 mg/mL oprelvekin. Inject along inside surface of vial, and swirl contents gently to avoid excessive agitation. Discard unused portion. Give single injection in the abdomen, thigh, hip, or upper arm. Continue drug dosing until postnadir platelet count is > 50,000 cells/mcL. Expect drug to be discontinued at least 2 days before next planned chemotherapy cycle.

## Orlistat

ohr'lih-stat Central, Alli (OTC) Do not confuse Xenical with Xeloda.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X OTC (Alli)

**Classification:** Gastrointestinals, obesity agents, lipase inhibitors

#### **MECHANISM OF ACTION**

A gastric and pancreatic lipase inhibitor that inhibits absorption of dietary fats by inactivating gastric and pancreatic enzymes. *Therapeutic Effect*: Resulting caloric deficit may positively affect weight control.

#### PHARMACOKINETICS

Minimal absorption after administration. Protein binding: 99%. Primarily eliminated unchanged in feces. Unknown if removed by hemodialysis. *Half-life*: 1-2 h.

#### AVAILABILITY

Capsules: 120 mg (Rx). Capsules: 60 mg (OTC).

#### INDICATIONS AND DOSAGES • Weight reduction in patients with body mass index of 27 kg/m<sup>2</sup> or over PO

Adults, Elderly, Children aged 12 yr and older. 120 mg 3 times a day (Xenical); 60 mg 3 times/day (Alli).

#### CONTRAINDICATIONS

Cholestasis, chronic malabsorption syndrome, hypersensitivity.

## INTERACTIONS

Drug

Antidiabetic medications, insulin: Doses may require adjustment as glycemic control improves with weight loss.

**Cyclosporine**: Reduces cyclosporine absorption; do not coadminister. If necessary, give cyclosporine 2 h before or after orlistat.

**Fat-soluble vitamins:** Orlistat reduces absortion; take multivitamin supplement to ensure adequate nutrition. Take 2 h before or after orlistat, preferably at bedtime. **Levothyroxine:** May decrease

absorption of thyroid hormone. Administer at least 4 h apart.

**Warfarin:** May increase response to warfarin by limiting vitamin K absorption; monitor INR carefully.

Orlistat (Generic Name), Xenical (Brand Name)

#### 1176 Orphenadrine

#### Herbal and Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Decreases blood glucose, total cholesterol, and serum LDL levels. Decreases absorption and levels of fat-soluble vitamins (A, D, E, K).

Rarely see increase in ALT and AST levels with prescription use.

#### SIDE EFFECTS

#### Frequent (20%-30%)

Headache, abdominal discomfort, flatulence, fecal urgency, fatty or oily stool.

#### Occasional (5%-14%)

Back pain, menstrual irregularity, nausea, fatigue, diarrhea, dizziness. Rare (< 4%)

Anxiety, rash, myalgia, dry skin, vomiting.

## SERIOUS REACTIONS

· Cholelithiasis.

· Severe liver injury with hepatocellular necrosis or acute hepatic failure reported with prescription use (rare).

 Hyperoxaluria or calcium oxalate nephrolithiasis.

#### PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with a history of pancreatitis or kidney stones. It is unknown whether orlistat is excreted in breast milk. Orlistat use is contraindicated during pregnancy. Use during lactation is permitted with proper vitamin supplementation. Safety and efficacy of orlistat have not been established in children under 12 yr; use in older children only under health professional supervision. No agerelated precautions have been noted in elderly patients.

Unpleasant side effects, such as flatulence and fecal urgency, may

occur but should diminish with time. Laboratory studies, such as blood glucose levels and lipid profile, should be obtained before and during therapy. Changes in coagulation parameters as well as height and weight should also be monitored. Monitor patients who are severely obese for diabetes or cardiovascular disease before beginning therapy.

#### Storage

Store at room temperature; protect from moisture.

#### Administration

Orlistat's side effects tend to be transient in nature, gradually diminishing during treatment as long as patient adheres to low-fat diet.

A nutritionally balanced, reducedcalorie diet should be maintained. Carbohydrates, fats, and protein should be distributed over three main meals. Patients should be counseled to take a multivitamin containing fat-soluble vitamins to ensure adequate nutrition. Give orlistat with each main meal or up to 1 h after such meals. If a meal is skipped, then skip that scheduled dose of orlistat. Weight loss will be most evident in the first 6 mo of use.

#### Orphenadrine or-fen'a-dreen ★ 🍁 Norflex

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Skeletal muscle relaxants

## MECHANISM OF ACTION

A skeletal muscle relaxant that is structurally related to diphenhydramine and may be

Orphenadrine (Generic Name)

thought to affect skeletal muscle indirectly by central atropine-like effects. *Therapeutic Effect*: Relieves musculoskeletal pain.

## PHARMACOKINETICS

Well absorbed after PO and IM absorption. Protein binding: low. Metabolized in liver. Primarily excreted in urine and feces. *Half-life:* 14 h.

## AVAILABILITY

Injection: 30 mg/mL (Norflex). Tablets (Extended Release): 100 mg (Norflex).

## INDICATIONS AND DOSAGES Musculoskeletal pain

M/IV Adults, Elderly. 60 mg 2 times/day. Switch to oral form for maintenance. PO Adults, Elderly. 100 mg 2 times/day.

## **OFF-LABEL USES**

Drug-induced extrapyramidal reactions.

## CONTRAINDICATIONS

Angle-closure glaucoma, myasthenia gravis, pyloric or duodenal obstruction, stenosing peptic ulcer, prostatic hypertrophy, obstruction of the bladder neck, achalasia, cardiospasm (megaesophagus), hypersensitivity to orphenadrine or any component of the formulation.

## INTERACTIONS

#### Drug

Alcohol, central nervous system (CNS) depressants, propoxyphene: May increase CNS sedative effects. Anticholinergics: May increase anticholinergic effects. Propoxyphene: Reports of confusion, tremors, anxiety.

#### Herbal

St. John's wort, valerian, kava kava, gotu kola: May increase CNS depression. Food

None known.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

## IV INCOMPATIBILITIES

None known.

## 🗏 IV COMPATIBILITIES

None known.

## SIDE EFFECTS

#### Frequent

Drowsiness; dizziness; muscular weakness; hypotension; dry mouth, nose, throat, and lips; urinary retention; thickening of bronchial secretions; palpitations; tachycardia; constipation.

### Elderly, Frequent

Sedation, dizziness, hypotension. **Occasional** 

Flushing, visual or hearing disturbances, paresthesia, diaphoresis, chills, euphoria.

#### SERIOUS REACTIONS

 Hypersensitivity reaction, such as eczema, pruritus, rash, cardiac disturbances, and photosensitivity, may occur.

 Overdosage may vary from CNS depression, including sedation, apnea, hypotension, cardiovascular collapse, or death to severe paradoxical reaction, such as hallucinations, tremor, and seizures.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with tachycardia, cardiac decompensation, coronary insufficiency, cardiac arrhythmias, or urinary retention. It is unknown whether orphenadrine crosses the placenta or is distributed in breast milk; therefore, caution in lactation and pregnancy is warranted. Safety and efficacy of orphenadrine have not been established in children. Not a preferred drug for the elderly due to side effect risks.

Drowsiness and dizziness may occur but usually diminish with continued therapy. Avoid alcohol and tasks that require mental alertness or motor skills until the effects of the drug are known.

If bloody or tarry stools, continued weakness, diarrhea, fatigue, itching, nausea, or skin rash occurs, notify the physician.

#### Storage

Store oral and injection formulations at room temperature. Protect injection from light. Solution for injection normally appears clear, colorless; discard if cloudy or precipitate is present.

#### Administration

Do not crush extended-release product. Give without regard to food.

For IV, may administer undiluted. Give slowly over 5 min, with patient in the supine position. Keep patient supine for at least 10 min. IM is injected deeply into a large muscle, such as the deltoid.

Oseltamivir

ah-suhl-tahm'ah-veer 🗙 🍁 Tamiflu

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antivirals, neuraminidase inhibitors

#### MECHANISM OF ACTION

A selective inhibitor of influenza virus neuraminidase, an enzyme essential for viral replication. Acts against both influenza A and B viruses. *Therapeutic Effect*: Suppresses the spread of infection within the respiratory system and reduces the duration of clinical symptoms. Resistance may occur and will vary based on season and geographic location.

#### PHARMACOKINETICS

Readily absorbed. Protein binding: 3%. Extensively converted to active drug in the liver. Primarily excreted in urine. *Half-life*: 6-10 h.

#### AVAILABILITY

*Capsules:* 30 mg, 45 mg, 75 mg. *Oral Suspension:* 12 mg/mL.

#### INDICATIONS AND DOSAGES

NOTE: Because of the development of resistance, prescribers should consider available influenza susceptibility patterns when choosing appropriate treatments.

#### Influenza A or B infection

NOTE: Initiate within 72 h of symptom onset.

#### PO

Adults, Elderly, Adolescents  $\geq 13$  yr and Children weighing > 40 kg. 75 mg twice a day for 5 days. Children weighing 24-40 kg. 60 mg twice a day for 5 days. Children weighing 16-23 kg. 45 mg twice a day for 5 days. Children weighing  $\leq 15$  kg. 30 mg twice a day for 5 days. Infants 14 days of age and older. 3 mg/kg/dose twice a day for 5 days. Prevention of influenza NOTE: Begin within 48 h of contact

with symptomatic individual.

Adults, Elderly, Adolescents  $\geq 13$  yr. 75 mg once a day for 10 days-6 weeks.

© 2005 GS Oseltamivir (Generic Name), Tamiflu (Brand Name) *Children 1-12 yr.* Children receive the usual weight-based dose, but are given this dose just once per day for prevention. Do not give to infants.

#### Dosage in renal impairment PO

CrCL 10-30 mL/min or less. *Adult, Elderly.* Decreased to 75 mg once a day for 5 days for active treatment. For prophylaxis, decrease to 75 mg every other day or 30 mg once daily. No data available for children. No data for CrCl < 10 mL/min.

## **OFF-LABEL USES**

Use in swine flu (H1N1) treatment.

## CONTRAINDICATIONS

Hypersensitivity to oseltamivir or any of its components, use in infants and neonates.

#### INTERACTIONS

#### Drug

Intranasal influenza vaccine: Do not give at same time; oseltamivir may interfere with response to vaccine. Give live vaccine 48 h after last oseltamivir dose whenever possible. Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

## Frequent (5%)

Nausea, vomiting, diarrhea. Occasional (1%-4%) Abdominal pain, bronchitis,

dizziness, headache, cough, insomnia, fatigue, vertigo, conjunctivitis, epistaxis.

## SERIOUS REACTIONS

• Colitis, pneumonia, and pyrexia occur rarely.

· Rare reports of hypothermia.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal function impairment. Be aware that it is unknown whether oseltamivir is excreted in breast milk; therefore, caution in lactation is warranted. Oseltamivir is most suitable for treating influenza type A. Safety and efficacy of this drug have not been established in infants younger than 14 days of age. No age-related precautions have been noted in elderly patients. Be aware that oseltamivir is not a substitute for a flu shot. Blood glucose should be monitored. Oseltamivir is on the Centers for Disease Control and Prevention (CDC) list of approved medications for use in pandemic H5N1 flu (avian flu).

#### Storage

Store capsules at room temperature. After reconstitution, store suspension at room temperature for up to 10 days or may store refrigerated for up to 17 days. Do not freeze. In times of drug shortage, the manufacturer provides instructions for extemporaneous formulation of the suspension in product literature.

## Administration

Give oseltamivir without regard to food. The drug should be started as soon as possible within the first 48 h of the first appearance of flu symptoms. The entire duration of therapy should be followed. Shake oral suspension well before each use.

If the oral suspension product is not available, the capsules may be opened and mixed with sweetened liquids such as regular or sugar-free chocolate syrup.

## Oxacillin

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: B

**Classification:** Antibiotics, antistaphylococcal penicillins, penicillinase-resistant penicillin

#### **MECHANISM OF ACTION**

A penicillin that binds to bacterial membranes. *Therapeutic Effect*: Bactericidal.

## PHARMACOKINETICS

PO/IM: Peak 30-60 min; duration 4-6 h.

IV: Peak 5 min; duration 4-6 h. Metabolized in the liver; excreted in bile, urine, and breast milk; crosses the placenta. *Half-life*: 30-60 min.

## AVAILABILITY

Powder for Injection: 1-g vials, 2-g vials.

Pre-mix IVPB Solution: 1 g/50 mL, 2 g/50 mL.

#### INDICATIONS AND DOSAGES

## Upper respiratory tract, skin and skin-structure infections IV. IM

*Adults, Elderly, Children weighing* 40 kg or more. 250-500 mg q4-6h. Maximum: 12 g/day.

*Children weighing* < 40 kg. 50 mg/ kg/day in divided doses q6h.

## Lower respiratory tract and other serious infections

#### IV, IM

Adults, Elderly, Children weighing  $\geq 40 \text{ kg. 1 g q4-6h. Maximum:}$ 12 g/day.

*Children and Infants weighing* < 40 kg. 100 mg/kg/day in divided doses q4-6 h. Neonates require extended dosage intervals and lower total daily dosage (e.g., 25-75 mg/kg/day).

### CONTRAINDICATIONS

Hypersensitivity to any penicillin.

### INTERACTIONS

#### Drug

**Aminoglycosides:** Infusions must be separated by 1 h due to physical incompatibility.

**Erythromycin, lincosamides, tetracyclines:** Possible decrease in antimicrobial effectiveness.

**Methotrexate:** Possible increase in methotrexate toxicity.

**Oral contraceptives:** May decrease effectiveness of these medications. **Probenecid:** May increase oxacillin blood concentration and risk of toxicity.

#### Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase AST (SGOT) levels. May cause a positive Coombs' test.

## IV INCOMPATIBILITIES

Amikacin, amphotericin B, caffeine, calcium chloride, calcium gluconate, diazepam, dobutamine, doxycycline, esmolol, gentamicin, haloperidol, hydralazine, inamrinone, phenytoin, promethazine, protamine, tobramycin.

## SIDE EFFECTS

#### Frequent

Mild hypersensitivity reaction (fever, rash, pruritus), GI effects (nausea, vomiting, diarrhea).

#### Occasional

Phlebitis, thrombophlebitis (more common in elderly), hepatotoxicity (with high IV dosage).

## SERIOUS REACTIONS

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance. • A mild to severe hypersensitivity reaction may occur in those allergic to penicillins.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired renal function or a history of allergies, especially to cephalosporins. History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting should be monitored. Intake and output, renal function tests, urinalysis, and the injection sites should be assessed.

For patients using oral contraceptives, there is a potential risk for decreased effectiveness; the patient should be advised to comply with the oral dosing schedule of contraceptives while taking this medication, as well as use an additional nonhormonal birth control method throughout the duration of treatment.

#### Storage

Store vials at room temperature. Once reconstituted, the solution remains stable for 3 days at room temperature or 7 days refrigerated. When further diluted with D5W or 0.9% NaCl, the solution is stable for 24 h.

Premix IVPB solution comes frozen. Thawed solution stable for 21 days under refrigeration or 48 h at room temperature.

#### Administration

For IV use add 5 mL to each 250-mg vial (concentration 50 mg/ mL) or add 10 mL sterile water for injection to each 1-g vial to provide a concentration of 100 mg/mL. For piggyback administration, further dilute with 50-100 mL D5W or 0.9% NaCl. Administer IV piggyback over 30 min to 1h. Slower infusion time and IV concentrations of 20 mg/mL or less may help limit phlebitis. If needed, the drug may be given IV push slowly over 10 min after vial reconstitution.

For IM use, reconstitute each 1 g vial with 5.7 mL of sterile water for injection to provide a concentration of 250 mg/1.5 mL of oxacillin. Administer the injection deep into a large muscle mass within 1 h of preparation.

## Oxandrolone

ox-an'droe-lone Oxandrin Do not confuse with testolactone or nandrolone, or oxymethalone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: III

**Classification:** Androgenic anabolic steroid

#### MECHANISM OF ACTION

A synthetic testosterone derivative that promotes growth and development of male sex organs, maintains secondary sex characteristics in androgendeficient males. *Therapeutic Effect*: Androgenic and anabolic actions.

Oxandrolone (Generic Name)

## **Oxaliplatin**

ahks-al-eh-plah′tin ★ 🍁 Eloxatin

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic; platinum analog

## **MECHANISM OF ACTION**

A platinum-containing complex that cross-links with DNA strands, preventing cell division. Cell cycle– phase nonspecific. *Therapeutic Effect:* Inhibits DNA replication.

## PHARMACOKINETICS

Rapidly distributed. Protein binding: 90%. Undergoes rapid, extensive nonenzymatic biotransformation. Excreted in urine. *Half-life*: 391 h (terminal).

## AVAILABILITY

Injection Solution: 5 mg/mL.

## INDICATIONS AND DOSAGES

Metastatic colon or rectal cancer in patients whose disease has recurred or progressed during or within 6 mo of completing first-line therapy with bolus 5-fluorouracil (5-FU), leucovorin, and irinotecan

IV

*Adults.* Day 1: Oxaliplatin 85 mg/m<sup>2</sup> in 250-500 mL D5W and leucovorin 200 mg/m<sup>2</sup>, both given simultaneously over more than 2 h in separate bags using a Y-line, followed by 5-FU 400 mg/m<sup>2</sup> IV bolus given over 2-4 min, followed by 5-FU 600 mg/m<sup>2</sup> in 500 mL D5W as a 22-h continuous IV infusion. Day 2: Leucovorin 200 mg/m<sup>2</sup> IV infusion given over more than 2 h, followed by 5-FU 400 mg/m<sup>2</sup> IV bolus given over 2-4 min, followed by 5-FU 600 mg/m<sup>2</sup> in 500 mL D5W as a 22-h continuous IV infusion.

#### Dosage adjustments for neurotoxicity, gastrointestinal toxicity, or hematologic toxicity:

Expect doses to be decreased or withheld depending on degree of toxicity and indication for use.

## **OFF-LABEL USES**

Ovarian cancer, pancreatic cancer, non-Hodgkin's lymphoma, breast cancer, lung cancer, prostate cancer, germ-cell carcinomas, and malignant mesothelioma.

## CONTRAINDICATIONS

History of allergy to platinum compounds.

## DRUG INTERACTIONS

Drug None reported. Herbal None known. Food None known.

## IV INCOMPATIBILITIES

Alkaline medications or solutions (e.g., 5-fluorouracil), aluminum needles or IV sets, sodium chloride solution or chloridecontaining solutions, diazepam, cefepime.

## SIDE EFFECTS

#### Frequent

Peripheral or sensory neuropathy (usually occurs in hands, feet, perioral area, and throat but may present as jaw spasm, abnormal tongue sensation, eye pain, chest pressure, or difficulty walking, swallowing, or writing), nausea, fatigue, diarrhea, vomiting, constipation, abdominal pain, fever, anorexia, anemia, increased liver enzymes.

#### Occasional

Stomatitis, earache, insomnia, cough, difficulty breathing, backache, edema.

#### Rare

Dyspepsia, dizziness, rhinitis, flushing, alopecia.

#### SERIOUS REACTIONS

• Peripheral or sensory neuropathy can occur, sometimes precipitated or exacerbated by drinking or holding a glass of cold liquid during the IV infusion.

 Pulmonary fibrosis, characterized by a nonproductive cough, dyspnea, crackles, and radiologic pulmonary infiltrates, may require drug discontinuation.

• Hypersensitivity reaction (rash, urticaria, pruritus, anaphylaxis).

· Hepatotoxicity.

Extravasation necrosis.

#### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with renal function impairment. Dose adjustments may be necessary in patients with renal impairment, neurosensory toxicity, gastrointestinal toxicity, neutropenia, or thrombocytopenia. Premedication with antiemetics is recommended. Avoid mucositis prophylaxis with ice chips during oxaliplatin infusion. Elderly may be more sensitive to adverse effects. Safety and efficacy not established in children. Avoid use in pregnancy or breastfeeding.

#### Storage

Store at room temperature in original carton. Do not freeze; protect from light. After dilution, can be kept up to 6 h at room temperature or up to 24 h under refrigeration.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

**!** Expect premedication with antiemetics, including 5-HT<sub>3</sub> blockers with or without a corticosteroid. Regimens do not require prehydration.

Must be diluted in D5W (usually 250 mL or 500 mL). Administer over 2-6 h. Flush infusion line with D5W before administration of any concomitant medications.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 94%-97%. Metabolized in liver. Primarily excreted in urine. Unknown whether removed by hemodialysis. *Half-life:* 5-13 h.

## AVAILABILITY

Tablets: 2.5 mg, 10 mg (Oxandrin).

## INDICATIONS AND DOSAGES Cachexia

Adults, Elderly. 2.5-20 mg in divided doses 2-4 times/day usually for 2-4 wks. Course of therapy is based on individual response. Repeat intermittently as needed. *Children*. Total daily dose is less than or equal to 0.1 mg/kg. Repeat intermittently as needed.

## **OFF-LABEL USES**

AIDS wasting syndrome, growth failure, Turner's syndrome.

## CONTRAINDICATIONS

Nephrosis, carcinoma of breast or prostate hypercalcemia, pregnancy, hypersensitivity to oxandrolone or any component of the formulation, nephrosis.

## **INTERACTIONS**

#### Drug

Adrenocorticotropic hormone (ACTH), adrenal steroids: May

increase the risk of edema and acne. Adrenal steroids: May increase the effects of the adrenal steroids.

#### Insulin, oral hypoglycemic

**agents:** May increase the effects of hypoglycemic agents.

**Oral anticoagulants:** May increase the effects of oral anticoagulants. Monitor INR.

## Herbal

Chaparral, comfrey, eucalyptus, germander, jin bu huan, kava kava,

## pennyroyal, skullcap, valerian:

May increase liver enzymes and risk of hepatic toxicity. Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May decrease levels of thyroxinebinding globulin, resulting in decreased total  $T_4$  serum levels and increased resin uptake of  $T_3$  and  $T_4$ . May increase PBI and radioactive iodine uptake.

May decrease HDL, increase LDL. May increase LFTs or cause suppression of clotting factors II, V, VII, and X, and an increase in PT.

## SIDE EFFECTS

#### Frequent

Gynecomastia, acne, amenorrhea, other menstrual irregularities. Females: Hirsutism, deepening of voice, clitoral enlargement that may not be reversible when drug is discontinued.

## Occasional

Edema, nausea, insomnia, oligospermia, priapism, male pattern baldness, bladder irritability, hypercalcemia in immobilized patients or those with breast cancer, hypercholesterolemia.

## Rare

Polycythemia with high dosage.

## SERIOUS REACTIONS

 Peliosis hepatitis of the liver, spleen replaced with blood-filled cysts, hepatic neoplasms, and hepatocellular carcinoma have been associated with prolonged high-dosage, anaphylactic reactions.

- Children: Compromised adult stature.
- · Cholestatic jaundice.
- · Priapism.
- · Increased risk arteriosclerosis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes, epilepsy, and liver, cardiac, and renal disease. The drug is contraindicated during pregnancy. Oxandrolone use is contraindicated during lactation and is excreted in breast milk. Oxandrolone may accelerate bone maturation more rapidly than linear growth in children, and the effect may continue for 6 mo after the drug has been stopped. Its use in elderly patients may increase the risk of hyperplasia or stimulate growth of occult prostate carcinoma. Salt intake should be reduced.

Acne, nausea, pedal edema, or vomiting may occur. Women should report deepening of voice, hoarseness, and menstrual irregularities. Men should report difficulty urinating, frequent erections, and gynecomastia. Weight should be obtained each day. Weekly weight gains of more than 5 lb should be reported. Signs of anemia should be reported to health care provider. Avoid unnecessary activities that could result in unnecessary injury and bleeding.

#### Storage

Store oxandrolone at room temperature away from moisture, heat, and direct light.

#### Administration

Take oxandrolone with or without food. Take with a full glass of water. Duration of therapy will depend on the response of the patient.

## Oxaprozin

ox-a-pro'zin Daypro Do not confuse oxaprozin with oxazepam.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

# **Classification:** Analgesics, nonsteroidal anti-inflammatory drugs

## **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect*: Reduces the inflammatory response and intensity of pain.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 99%. Widely distributed. Metabolized in the liver. Primarily excreted in urine; partially eliminated in feces. Not removed by hemodialysis. *Half-life:* 42-50 h.

## AVAILABILITY

Tablets: 600 mg.

## INDICATIONS AND DOSAGES Osteoarthritis

#### PO

*Adults, Elderly.* 1200 mg once a day (600 mg in patients with low body weight or mild disease). Maximum: 1800 mg/day.

### Rheumatoid arthritis

PO

*Adults, Elderly.* 1200 mg once a day. Range: 600-1800 mg/day.

Oxaprozin (Generic Name)

### Juvenile rheumatoid arthritis (6 yr and older)

Children weighing > 54 kg. 1200 mg/day. Children weighing 32-54 kg. 900 mg/day. Children weighing 22-31 kg. 600 mg/day.

### Dosage in renal impairment

For adults and elderly patients with renal impairment, the recommended initial dose is 600 mg/day; may be increased up to 1200 mg/day.

## CONTRAINDICATIONS

Active peptic ulcer disease, chronic inflammation of GI tract, GI bleeding or ulceration, history of hypersensitivity to aspirin or NSAIDs, use within 10-14 days of coronary artery bypass graft (CABG).

## INTERACTIONS

#### Drug

Antihypertensives: May decrease the effects of these drugs. Aspirin, other salicylates, corticosteroids: May increase the risk of GI side effects such as bleeding. NSAIDs may negate cardioprotective effects of ASA. Bone marrow depressants: May increase the risk of hematologic reactions.

**Cyclosporine:** May increase risk of decreased renal function.

**Diuretics**, β-adrenergic blockers, **ACE inhibitors:** May decrease antihypertensive effects.

**First-time users of SSRIs also taking NSAIDs:** May have a higher risk of GI effects.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of these drugs.

**Lithium:** May increase the concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of methotrexate toxicity.

**Probenecid:** May increase the oxaprozin blood concentration. **SSRIs, SNRIs:** Increased risk of GI bleeding.

### Herbal

**Feverfew:** May decrease the effects of feverfew.

**Ginkgo biloba:** May increase the risk of bleeding.

Food

Alcohol: May increase the risk of dizziness or GI bleeding.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum creatinine, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

#### Occasional (3%-9%)

Nausea, diarrhea, constipation, dyspepsia, edema.

## Rare (< 3%)

Vomiting, abdominal cramps or pain, flatulence, anorexia, confusion, tinnitus, insomnia, somnolence.

## SERIOUS REACTIONS

• Hypertension, acute renal failure, respiratory depression, GI bleeding, and coma occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with a history of GI tract disease, hepatic or renal impairment, and a predisposition to fluid retention. It is unknown whether oxaprozin is excreted in breast milk; therefore, caution is warranted in lactation. Oxaprozin should not be used during the third trimester of pregnancy because it may cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. The safety and efficacy of oxaprozin have not been established in children. In elderly patients, GI bleeding or ulceration is more likely to cause serious complications, and age-related renal impairment may increase the risk of hepatotoxicity or renal toxicity; a decreased dosage is recommended. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 halflives before surgical procedures. Tasks that require mental alertness or motor skills should also be avoided until the drug's effects are known.

Notify the physician if bleeding, ecchymosis, edema, confusion, or weight gain occurs. BUN, serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels to assess hepatic and renal function should be assessed during therapy. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness; improved grip strength; and increased joint mobility, should be evaluated. Signs of blood dyscrasias including infection, poor circulation, bleeding, and poor healing should be reported to the health care provider immediately.

#### Storage

Store at room temperature tightly closed and protected from light.

#### Administration

Take oxaprozin with food, milk, or antacids if GI distress occurs.

#### Oxazepam

★ ox-a'ze-pam Do not confuse oxazepam with oxaprozin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

**Classification:** Anxiolytics, benzodiazepines

#### **MECHANISM OF ACTION**

A benzodiazepine that potentiates the effects of  $\gamma$ -aminobutyric acid by binding to specific receptors in the central nervous system. *Therapeutic Effect*: Produces anxiolytic effect and skeletal muscle relaxation.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 97%. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 5-20 h.

#### AVAILABILITY

Capsules: 10 mg, 15 mg, 30 mg.

# INDICATIONS AND DOSAGES Mild to moderate anxiety PO

*Adults.* 10-15 mg 3-4 times a day. *Elderly.* Initially, 10 mg 3 times a day. May gradually increase up to 15 mg 3-4 times daily.

#### Severe anxiety PO

Adults. 15-30 mg 3-4 times a day. Alcohol withdrawal

PO

Adults. 15-30 mg 3-4 times a day.

Oxazepam (Generic Name)

## CONTRAINDICATIONS

Hypersensitivity, psychoses, pregnancy.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants, anticonvulsant medications: May potentiate CNS depression.

#### Herbal

Kava kava, valerian: May increase CNS depression. Food None known.

## DIAGNOSTIC TEST EFFECTS

May elevate serum alkaline phosphatase, bilirubin, LDH, AST (SGOT), and ALT (SGPT) levels. May produce abnormal renal function test results.

## SIDE EFFECTS

#### Frequent

Mild, transient somnolence at beginning of therapy. Occasional Dizziness, headache. Rare

Paradoxical CNS reactions, such as hyperactivity or nervousness in children and excitement or restlessness in the elderly or debilitated (generally noted during the first 2 wks of therapy), memory impairment.

## SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal or muscle cramps, diaphoresis, vomiting, and seizures.

• Overdose results in somnolence, confusion, diminished reflexes, and coma.

· Syncope.

• Rare reports of jaundice, hypersensitivity, blood dyscrasias.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of drug dependence, CNS or respiratory depression, severe hepatic or renal impairment. Women on longterm therapy should use effective contraception during therapy and notify the physician if she becomes or may be pregnant. Alcohol and other CNS depressants should be avoided. While oxazepam has been used in children > 6 yr of age, absolute dosage has not been established.

Drowsiness and dizziness may occur. Tasks requiring mental alertness or motor skills should be avoided. CBC, blood chemistry, and hepatic and renal function should be monitored, especially during longterm therapy because of possible cardiovascular effects.

Psychological and physical dependence may occur with chronic administration. Elderly patients should be evaluated for adjustments in dosage. Abrupt withdrawal may result in pronounced irritability, restlessness, hand tremors, abdominal or muscle cramps, diaphoresis, vomiting, seizures. Storage

Store at room temperature. Administration

! Do not abruptly discontinue after long-term use. May give without regard to food.

## **Oxcarbazepine**

oks-kar-bays'uh-peen Trileptal **Do not confuse with** carbamazepine.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Anticonvulsants

Oxcarbazepine (Generic Name)

# **MECHANISM OF ACTION**

An anticonvulsant that blocks sodium channels, resulting in stabilization of hyperexcited neural membranes, inhibition of repetitive neuronal firing, and diminishing synaptic impulses. *Therapeutic Effect*: Prevents seizures.

# PHARMACOKINETICS

Completely absorbed from GI tract and extensively metabolized in the liver to active metabolite. Protein binding: 40%. Primarily excreted in urine. *Halflife*: 2 h; metabolite, 6-10 h.

# AVAILABILITY

Oral Suspension: 300 mg/5 mL. Tablets: 150 mg, 300 mg, 600 mg.

# INDICATIONS AND DOSAGES Adjunctive treatment of seizures PO

Adults, Elderly, and Children > 16 yr. Initially, 600 mg/day in 2 divided doses. May increase by up to 600 mg/ day at weekly intervals. Recommended daily dose is 1200 mg/day. *Children aged 2-16 yr.* 8-10 mg/kg/ day initially, divided twice daily. Maximum: 600 mg/day, divided. Maintenance (based on weight); all daily doses divided and given twice daily: > 39 kg: 1800 mg/day; 29.1-39 kg: 1200 mg/day; 20-29 kg: 900 mg/day. If < 20 kg, then the maximum dose is 60 mg/kg/day, divided and given twice daily.

#### Conversion to monotherapy PO

Adults, Elderly. 600 mg/day in 2 divided doses (while decreasing concomitant anticonvulsant over 3-6 wks). May increase by 600 mg/ day at weekly intervals up to 2400 mg/day.

*Children age 4 yr and older.* Initially, 8-10 mg/kg/day in 2 divided doses with simultaneous initial reduction of dose of concomitant antiepileptic.

#### Initiation of monotherapy PO

*Adults, Elderly.* 600 mg/day in 2 divided doses. May increase by 300 mg/day every 3 days up to 2400 mg/day.

*Children age 4 yr and older.* Initially, 8-10 mg/kg/day in 2 divided doses. Increase at 3-day intervals by 5 mg/ kg/day to achieve maintenance dose by weight:

(70 kg): 1500-2100 mg/day; (60-69 kg): 1200-2100 mg/day; (50-59 kg): 1200-1800 mg/day; (45-49 kg): 1200-1500 mg/day; (35-44 kg): 900-1500 mg/day; (25-34 kg): 900-1200 mg/day; (20-24 kg): 600-900 mg/day.

 Dosage in renal impairment
 For patients with creatinine clearance
 30 mL/min, give 50% of normal starting dose, then titrate slowly to desired dose.

# **OFF-LABEL USES**

Bipolar disorder, trigeminal neuralgia.

# CONTRAINDICATIONS

Hypersensitivity to this drug or to carbamazepine.

# INTERACTIONS

#### Drug

All central nervous system (CNS) depressants, alcohol: May increase CNS depressive effects.

Calcium channel blockers: Oxcarbazepine may lower blood levels.

Carbamazepine, phenobarbital, phenytoin, valproic acid, verapamil: May decrease the

blood concentration and effects of oxcarbazepine.

**CYP450 3A4/5 enzyme inducers:** May decrease plasma levels.

#### 1188 Oxcarbazepine

#### Oral contraceptives: May

decrease the effectiveness of birth control.

**Phenobarbital, phenytoin:** May increase the blood concentration and risk of toxicity of these drugs.

# Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase GGT level and other hepatic function test results. May increase or decrease blood glucose level. May decrease serum calcium, potassium, and sodium levels.

#### SIDE EFFECTS

#### Frequent (13%-22%)

Dizziness, nausea, headache, somnolence, fatigue, vertigo. Occasional (5%-7%)

Vomiting, diarrhea, ataxia, nervousness, heartburn, indigestion, epigastric pain, constipation. **Rare (4%)** 

Tremor, rash, back pain, epistaxis, sinusitis, diplopia.

# SERIOUS REACTIONS

• Clinically significant hyponatremia may occur.

 Serious hypersensitivity or rashes, including Stevens-Johnson syndrome and TENS.

• Aplastic anemia, agranulocytosis (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment and a hypersensitivity to carbamazepine. Oxcarbazepine crosses the placenta and is distributed in breast milk. Oxcarbazepine is related to carbamazepine, considered to be teratogenic. If used in pregnancy, close monitoring is needed to ensure adequate seizure control. No age-related precautions have been noted in children older than 4 yr. In elderly patients, age-related renal impairment may require dosage adjustment. Antiepileptic drugs (AEDs) may increase the risk of suicidal thoughts or behavior. Monitor for the emergence of worsening of depression, suicidal thoughts or behavior, and/or any unusual changes in mood or behavior.

Drowsiness may occur, so alcohol and tasks requiring mental alertness or motor skills should be avoided. Notify the physician if dizziness, headache, nausea, and rash occur. Seizure disorder, including the onset, duration, frequency, intensity, and type of seizures, should be assessed before and during treatment. Serum sodium levels should be monitored; signs and symptoms of hyponatremia include confusion, headache, lethargy, malaise, and nausea.

#### Storage

Store all products at room temperature; keep suspension in original container. Use or discard suspension within 7 wks of first opening the bottle.

#### Administration

! If the patient must change to another anticonvulsant, plan to decrease the oxcarbazepine dose gradually as therapy begins with a low dose of the replacement drug. Do not abruptly discontinue.

May take without regard to food. Shake the oral suspension well. Do not administer it simultaneously with any other liquid medicine. Dosage may be mixed in a small glass of water if desired.

# Oxiconazole

ox-i-con'a-zole Oxistat Do not confuse Oxistat with Nitrostat.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antifungals, topical,

# **MECHANISM OF ACTION**

An imidazole antifungal agent that inhibits ergosterol synthesis. *Therapeutic Effect*: Destroys cytoplasmic membrane integrity of fungi. Fungicidal.

# PHARMACOKINETICS

Low systemic absorption. Absorbed and distributed in each layer of the dermis. Excreted in the urine.

# AVAILABILITY

Cream: 1% (Oxistat). Lotion: 1% (Oxistat).

# INDICATIONS AND DOSAGES Tinea pedis

TOPICAL

Adults, Elderly, Children aged 12 yr and older. Apply 1-2 times daily for 1 mo or until signs and symptoms significantly improve.

#### • Tinea cruris, tinea corporis TOPICAL

Adults, Elderly, Children aged 12 yr and older. Apply 1-2 times daily for 2 wks or until signs and symptoms significantly improve.

# CONTRAINDICATIONS

Hypersensitivity to oxiconazole.

INTERACTIONS Drug None known.

#### Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

Occasional

Itching, local irritation, stinging, dryness.

# SERIOUS REACTIONS

• Hypersensitivity reactions characterized by rash, swelling, pruritus, maceration, and a sensation of warmth may occur.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with known hypersensitivity to other antifungal agents. It is unknown whether oxiconazole is distributed in breast milk; caution is warranted during lactation. Safety and efficacy of oxiconazole have not been established in children younger than 12 yr. No age-related precautions have been noted in elderly patients.

Signs and symptoms of a local reaction include blistering, burning, irritation, itching, oozing, redness, and swelling. Oxiconazole should be discontinued and the physician should be notified immediately. Hypersensitivity manifests as rash, swelling, pruritus, maceration, and sense of warmth and should be reported.

#### Storage

Store at room temperature. Administration

Oxiconazole is for external use only. Shake lotion well before using. Apply and rub gently into the affected and surrounding area. Avoid contact with eyes, mouth, nose, or other mucous membranes. Topical therapy may be used for 2-4 wks. Area should not be covered with an occlusive dressing. Keep area clean and dry and wear light clothing to promote ventilation.

# Oxybutynin

ox-i-byoo'ti-nin Anturol, Ditropan, Ditropan XL, Gelnique, Oxytrol Ditropan XL, Oxytrol, Uromax Do not confuse oxybutynin with Oxycontin, or Ditropan with diazepam.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anticholinergics, urinary antispasmodic, urinary incontinence agents

# **MECHANISM OF ACTION**

An anticholinergic that exerts antispasmodic (papaverine-like) and antimuscarinic (atropine-like) action on the detrusor smooth muscle of the bladder. *Therapeutic Effect*: Increases bladder capacity and delays desire to void.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	0.5-1 h	3-6 h	6-10 h

Rapidly absorbed from the GI tract. Metabolized in the liver. Primarily excreted in urine. Unknown if removed by hemodialysis. *Half-life:* 1-2.3 h.

# AVAILABILITY

Syrup (Ditropan): 5 mg/5 mL. Tablets (Ditropan): 5 mg. Tablets (Extended Release [Ditropan XL]): 5 mg, 10 mg, 15 mg. Transdermal (Oxytrol): 3.9 mg per 24 h. Topical Gel (Gelnique): 10%; available in packets. Transdermal Gel (Anturol): 3%; available in pump.

# INDICATIONS AND DOSAGES

 Neurogenic bladder, overactive bladder

Adults. 5 mg 2-3 times a day up to 5 mg 4 times a day. Elderly. 2.5-5 mg twice a day. May increase by 2.5 mg/day every 1-2 days. Children 5 yr and older. 5 mg twice a day up to 5 mg 3 times a day. PO (EXTENDED RELEASE) Adults. 5-10 mg once daily, up to 30 mg/day. Children 6 yr and older. 5 mg once daily, up to 20 mg/day. TRANSDERMAL Adults. One patch (delivering 3.9 mg/24 h) applied twice a week. Apply every 3-4 days. TOPICAL GEL (GELNIQUE 10%) Adults. Apply 1 packet (100 mg) once daily. TOPICAL GEL (ANTUROL 3%) Adults. Apply 3 pumps (84 mg/day) once daily to skin.

# CONTRAINDICATIONS

Hypersensitivity to oxybutynin or product components, urinary retention, gastric retention and other severe decreased GI motility conditions, uncontrolled narrow-angle glaucoma.

# INTERACTIONS

Drug

Anticholinergics (such as antihistamines): May increase the anticholinergic effects of oxybutynin.

Alcohol, central nervous system (CNS) depressants: May increase CNS depressant effects.

Oxybutynin (Generic Name)

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Constipation, dry mouth, somnolence, decreased perspiration. Occasional

Decreased lacrimation or salivation, impotence, urinary hesitancy and retention, suppressed lactation, blurred vision, mydriasis, nausea or vomiting, insomnia, heat prostration.

# SERIOUS REACTIONS

 Overdose produces CNS excitation (including nervousness, restlessness, hallucinations, and irritability), hypotension or hypertension, confusion, tachycardia, facial flushing, and respiratory depression.
 Rare reports of serious hypersensitivity, including angioedema.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiovascular disease, glaucoma, suspected glaucoma, hypertension, hyperthyroidism, hepatic or renal impairment, neuropathy, benign prostatic hyperplasia, and reflux esophagitis. It is unknown whether oxybutynin crosses the placenta or is distributed in breast milk; therefore, caution in lactation is warranted. No age-related precautions have been noted in children older than 5 yr. Elderly patients may be more sensitive to the drug's anticholinergic effects, such as dry mouth and urine retention. Avoid alcohol and tasks that require mental alertness and motor skills until response to the drug is established.

Drowsiness and dizziness may occur. Intake and output, pattern of daily bowel and urinary activity, and symptomatic relief should be assessed. The physician should be informed of xerostomic effects such as sore tongue, problems eating or swallowing, so that medication change can be evaluated.

#### Storage

Store at room temperature. Keep transdermal system in foil pouch until time of use. Gel is flammable; avoid excessive heat or flame.

#### Administration

Take oxybutynin without regard to food. Extended-release tablets should not be crushed or chewed.

Transdermal patch is applied to clear, dry skin of abdomen, hip, or buttock. Do not cut patch. Rotate application sites with each use. Remove patch prior to any MRI procedure to avoid burning.

Gently rub in gel on the abdomen, upper arms/shoulders, or thighs; the same site should not be used on consecutive days.

# Oxycodone

ox-ee-koe'done ★ ETH-Oxydose, OxyContin, OxyFast, Oxecta Roxicodone, Roxicodone Intensol ▲ OxyContin, Oxy IR, Supeudol Do not confuse oxycodone with hydrocodone or oxybutynin.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

**Classification:** Analgesics, narcotic, synthetic opiate agonist

Oxycodone (Generic Name)

# **MECHANISM OF ACTION**

An opioid analgesic that binds with opioid receptors in the central nervous system (CNS). *Therapeutic Effect*: Alters the perception of and emotional response to pain.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO, immediate release	10-15 min	30-60 min	4-5 h
PO, controlled release	NA	NA	12 h

Moderately absorbed from the GI tract. Protein binding: 38%-45%. Widely distributed. Metabolized in the liver. Excreted in urine. Unknown whether removed by hemodialysis. *Half-life:* 2-3 h (3.2 h controlled release).

# AVAILABILITY

Tablets (Oxecta, Immediate Release with risk-aversion technology): 5 mg, 7.5 mg. Capsules (Immediate Release): 5 mg. Oral Concentrate (Oxydose, OxyFast, Roxicodone Intensol): 20 mg/mL. Oral Solution (Roxicodone): 5 mg/5 mL. Tablets (Roxicodone): 5 mg, 15 mg, 30 mg. Tablets (Extended Release with riskaversion technology [OxyContin]): 10 mg, 15 mg, 20 mg, 40 mg, 60 mg, 80 mg.

# INDICATIONS AND DOSAGES Analgesia

PO (CONTROLLED RELEASE) *Adults, Elderly.* Initially, 10 mg q12h. May increase every 1-2 days by 25%-50%. PO (IMMEDIATE RELEASE) *Adults, Elderly.* Initially, 5 mg q6h as needed. May increase up to 30 mg q4h. Usual: 10-30 mg q4h as needed.

# CONTRAINDICATIONS

Hypersensitivity, severe respiratory depression in unmonitored setting, severe bronchial asthma, hypercarbia, paralytic ileus.

# INTERACTIONS

Drug

Alcohol, other CNS depressants, other narcotics, sedativehypnotics, skeletal muscle relaxants, phenothiazines, benzodiazepines: May increase CNS or respiratory depression and

#### hypotension. Anticholinergics (e.g.,

antihistamines): May increase anticholinergic effects.

**Potent CYP2D6 inhibitors:** May increase oxycodone exposure.

**Ritonavir:** May cause a significant increase in oxycodone plasma concentrations.

# Herbal

None known.

# Food

**Alcohol:** Avoid as increase risk of CNS or respiratory depression and hypotension.

# DIAGNOSTIC TEST EFFECTS

May increase serum amylase and lipase levels. May cross-react with other urine drug screens, like those for cocaine or marijuana. See manufacturer recommendations to avoid misinterpreatation

# SIDE EFFECTS

#### Frequent

Somnolence, dizziness, hypotension (including orthostatic hypotension), anorexia, constipation.

#### Occasional

Confusion, diaphoresis, facial flushing, urine retention, constipation, dry mouth, nausea, voniting, headache, rash.

#### Rare

Allergic reaction, depression, paradoxical CNS hyperactivity or nervousness in children, paradoxical excitement and restlessness in elderly or debilitated patients.

#### SERIOUS REACTIONS

 Overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

 Hepatotoxicity may occur with overdose of the acetaminophen component of fixed-combination products (see separate Oxycodone; Acetaminophen monograph).

• The patient who uses oxycodone repeatedly may develop a tolerance to the drug's analgesic effect and physical dependence.

#### **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used in patients with acute alcoholism. history of narcotic addiction, anoxia, CNS depression, hypercapnia, respiratory depression or dysfunction, seizures, shock, or untreated myxedema. Caution is also warranted with acute abdominal conditions. Addison's disease. chronic obstructive pulmonary disease (COPD), hypothyroidism, hepatic impairment, increased intracranial pressure, prostatic hypertrophy, and urethral stricture. Oxycodone readily crosses the placenta and is distributed in breast milk. Regular use of opioids during pregnancy may produce withdrawal symptoms in the neonate, including

irritability, diarrhea, excessive crying, fever, hyperactive reflexes, seizures, sneezing, tremors, vomiting, and yawning. The neonate may develop respiratory depression if the mother receives oxycodone during labor. Children are more prone to experience paradoxical excitement. Children and elderly patients are more susceptible to the drug's respiratory depressant effects. Age-related renal impairment may increase the risk of urine retention in elderly patients.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. BP, respiratory rate, mental status, pattern of daily bowel activity, and clinical improvement should be monitored. The drug should be withheld and the physician should be notified if the respiratory rate is 12 breaths/min or less in an adult or 20 breaths/min or less in a child.

Some predisposed patients may develop a tolerance to the drug's analgesic effect and physical dependence. Abrupt discontinuation of the drug may result in withdrawal effects.

#### Storage

Store products at room temperature, protected from light and moisture. Discard OxyFast solution 90 days after opening the bottle.

#### Administration

! Be aware that oxycodone's side effects are dependent on the dosage. Know that ambulatory patients are more likely to experience dizziness, hypotension, nausea, and vomiting than those in the supine position.

Take oral oxycodone without regard to food.

#### 1194 Oxycodone; Acetaminophen

! Swallow OxyContin immediaterelease tablets whole; do not crush, chew, or dissolve in liquid as the tablets will form a gel. Administer one tablet at a time, with sufficient liquid to ensure complete esophageal transit. Crushing may lead to rapid release and potential for fatal accidental overdose. Take in a consistent way either with or without food for each dose.

! Swallow Oxecta immediate-release tablets whole; do not crush, chew, or dissolve in mouth or in liquid as a gel will form that is not easy to swallow and may clog feeding tubes. take with enough water to ensure complete transit.

Concentrated oral solution: Use care in measuring dose—highly concentrated. May add to 30 mL of liquid or semisolid food just before administration.

# Oxycodone; Acetaminophen

ox-ee-koe'done; ah-seet'ah-min-oh-fen Endocet, Magnacet, Narvox, Percocet, PRIMLEV, Roxicet, Tylox, Xolox

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

*Classification*: Analgesics, narcotic, synthetic opiate agonist– acetaminophen combination

#### **MECHANISM OF ACTION**

Oxycodone is an opioid analgesic that binds with opioid receptors in the central nervous system (CNS).

Acetaminophen is a central analgesic whose exact mechanism is unknown. *Therapeutic Effect:* Alters the perception of and emotional response to pain; antipyretic effect.

#### PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: approximately 45% (oxycodone). Widely distributed. Metabolized in the liver; excretion primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 3-5 h.

#### AVAILABILITY

NOTE: Other products may exist on the market; the following list includes the more common brands and strength combinations of oxycodone/ acetaminophen (all combination strengths given in mg/mg) available. Oral Solution: 5/325 per 5 mL (Roxicet). Tablet: 2.5/300 (PRIMLEV); 2.5/325 (Percocet); 5/300 (PRIMLEV); 5/325 (Percocet, Roxicet, Endocet); 5/500 (Roxicet); 7.5/300 (PRIMLEV); 7.5/325 (Percocet, Endocet); 10/300 (PRIMLEV); 10/500 (Xolox); 10/650 (Percocet, Endocet). Capsule: 5/500 (Tylox).

# INDICATIONS AND DOSAGES Analgesia:

**PO (IMMEDIATE RELEASE)** *Adults, Elderly.* Initially, 2.5-5 mg q6h as needed for pain, based on the oxycodone component. May titrate to effect, but in general do not exceed more than 10 mg of oxycodone or 1000 mg acetaminophen in any one oral dose for this combination. Maximum dosages: Do not exceed 3600-4000 mg/day of acetaminophen. If patient requires larger oxycodone doses for pain control, reassess products to be used to accomplish pain management. *Children 13 yr and older.* Doses are adjusted based on body weight. Do not exceed regular adult doses.

# CONTRAINDICATIONS

Hypersensitivity, severe respiratory depression in unmonitored setting, severe bronchial asthma or COPD or other conditions of severe respiratory compromise, hypercarbia, paralytic ileus.

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants, other narcotics, sedative-hypnotics, skeletal muscle relaxants, phenothiazines, benzodiazepines: May increase CNS or respiratory depression. Anticholinergics (e.g., antihistamines): May increase anticholinergic effects. Lamivudine, zidovudine: Acetaminophen may enhance clearance. Potent CYP2D6 inhibitors: May increase oxycodone exposure. Potentially hepatotoxic medications (e.g., imatinib, phenytoin), CYP2E1 inducers (isoniazid), or liver enzyme inhibitors such as cimetidine: May increase risk of acetaminophen hepatotoxicity with prolonged high dose or single toxic dose of acetaminophen. Ritonavir and other protease inhibitors: May cause a significant increase in oxycodone plasma concentrations; closely monitor patient. Warfarin: Most data indicate significant interaction not likely; however, any time a new

nkely; however, any time a new medication is added and taken regularly, INR monitoring is recommended.

#### Herbal

Chaparral, comfrey: In theory, potential hepatotoxicity; avoid use. Food

Alcohol: Avoid due to increased risk of CNS or respiratory depression.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum amylase and lipase levels. May cross-react with other urine drug screens, such as those for cocaine or marijuana. See manufacturer recommendations to avoid misinterpretation.

# SIDE EFFECTS

#### Frequent

Somnolence, dizziness, hypotension (including orthostatic hypotension), anorexia, constipation.

#### Occasional

Confusion, diaphoresis, facial flushing, urine retention, constipation, dry mouth, nausea, vomiting, headache, rash.

#### Rare

Allergic reaction, depression, paradoxical CNS hyperactivity or nervousness in children, paradoxical excitement and restlessness in elderly or debilitated patients.

# SERIOUS REACTIONS

• Overdose results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures, stupor, and coma.

• Hepatotoxicity may occur with overdose of the acetaminophen component.

• The patient who uses oxycodone repeatedly may develop a tolerance to the drug's analgesic effect and physical dependence.

#### PRECAUTIONS & CONSIDERATIONS

Acetaminophen should be avoided in patients with severe hepatic disease and in those with alcoholism or regular alcohol consumption of more than 3 drinks per day. Extreme caution should be used in patients with anoxia, CNS depression, respiratory disease, seizures, shock, or untreated myxedema. Caution for oxycodone use also warranted with acute abdominal conditions. Addison's disease. chronic obstructive pulmonary disease (COPD), hypothyroidism, hepatic impairment, increased intracranial pressure, prostatic hypertrophy, and urethral stricture. Oxycodone readily crosses the placenta and is distributed in breast milk: use caution in use during lactation. Regular use of opioids during pregnancy may produce withdrawal symptoms in the neonate. The neonate may exhibit respiratory depression at delivery. Acetaminophen should be used with caution in patients with G6PD deficiency, and avoid prolonged use in renal impairment. The efficacy and safety of fixeddose oxycodone/acetaminophen combinations have not been established in children < 12 vr of age.

Elderly patients are more susceptible to oxycodone's respiratorydepressant effects, and age-related renal impairment may increase the risk of urine retention in elderly patients.

Dizziness and drowsiness may occur, so change positions slowly and avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until response to the drug is established. BP, respiratory rate, mental status, pattern of daily bowel activity, and clinical improvement should be monitored. The drug should be withheld and the physician should be notified if the respiratory rate is 12 breaths/ min or less in an adult or 20 breaths/min or less in a child, or if patient exhibits noted CNS depression. Overdose manifests as respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, and extreme somnolence progressing to seizures and stupor; any of these symptoms should be reported immediately. Hepatotoxicity may result from overdose of the acetaminophen component of fixed-combination products. Take a careful assessment of patients' medication list, and assess for other products that may contain acetaminophen. Total daily maximum dosages should not be exceeded.

Some predisposed patients may develop a tolerance to the drug's analgesic effect and physical dependence. Abrupt discontinuation of the drug may result in withdrawal effects.

#### Storage

Store products at room temperature. Administration

! Be aware that oxycodone's side effects are dependent on the dosage. Careful titration should be observed in opiate-naïve patients.

! Be aware that these products have a potential for abuse, and accidental overdose may result in death.

Ambulatory and opiate-naïve patients may be more likely to experience dizziness, hypotension, nausea, and vomiting.

Take oral tablets without regard to food. Food may decrease GI irritation. Take with plenty of fluid.

# Oxymetholone

ox-ee-meth'oh-lone Anadrol Anapolon Do not confuse with oxycodone or oxandrolone.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: III

*Classification:* Androgenicanabolic steroid.

# **MECHANISM OF ACTION**

An androgenic-anabolic steroid that is a synthetic derivative of testosterone synthesized to accentuate anabolic as opposed to androgenic effects. *Therapeutic Effect*: Improves nitrogen balance in conditions of unfavorable protein metabolism with adequate caloric and protein intake, stimulates erythropoiesis, suppresses gonadotropic functions of pituitary, and may exert a direct effect upon the testes.

# PHARMACOKINETICS

Metabolized in the liver via reduction and oxidation. Unchanged oxymetholone and its metabolites are excreted in urine. *Half-life*: Unknown.

# AVAILABILITY

Tablets: 50 mg (Anadrol).

# INDICATIONS AND DOSAGES

 Anemia, chronic renal failure, acquired aplastic anemia, chemotherapy-induced myelosuppression, Fanconi anemia, red cell aplasia PO

Adults, Elderly, Children. 1-5 mg/kg/ day. Response is not immediate, and a minimum of 3-6 mo should be given.

# CONTRAINDICATIONS

Cardiac impairment, pregnancy, prostatic or breast cancer in males, metastatic breast cancer in women with active hypercalcemia, nephrosis or nephrotic phase of nephritis, severe liver disease, hypersensitivity to oxymetholone or any of its components.

#### INTERACTIONS Drug

ACTH, adrenal steroids: May increase effects of adrenal steroids. Hepatotoxic medications: May increase liver toxicity.

**Insulin, oral hypoglycemics:** May increase the effects of hypoglycemic agents.

Oral anticoagulants: May increase effects of oral anticoagulants. Herbal

# Chaparral, comfrey, germander, jin bu huan: May increase liver enzymes.

**Eucalyptus, valerian:** May increase risk of hepatotoxicity.

Kava kava, pennyroyal, skullcap: May increase risk of liver damage. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood hemoglobin and hematocrit, LDL concentrations, serum alkaline phosphatase, bilirubin, calcium, potassium, SGOT (AST) levels, and sodium levels. May decrease HDL concentrations.

May cause suppression of clotting factors II, V, VII, and X, and an increase in PT.

#### SIDE EFFECTS Frequent

Gynecomastia, acne. Females: Hirsutism, deepening of voice, clitoral enlargement that may not be reversible when drug is

#### 1198 Oxymorphone Hydrochloride

discontinued, amenorrhea, menstrual irregularities.

#### Occasional

Edema, nausea, insomnia, oligospermia, male pattern baldness, bladder irritability, hypercalcemia in immobilized patients or those with breast cancer, hypercholesterolemia.

#### Rare

Liver damage, hypersensitivity.

#### SERIOUS REACTIONS

 Cholestatic jaundice, hepatic necrosis, and death occur rarely but have been reported in association with long-term androgenic-anabolic steroid use.

Priapism.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes, liver or renal impairment, congestive heart failure, hypertension, coronary artery disease, previous myocardial infarction, lipid-lipoprotein abnormalities, benign prostatic hyperplasia. Oxymetholone use is contraindicated during pregnancy and lactation and is excreted in breast milk. Safety and efficacy of oxymethalone have not been established in children and elderly patients. Adequate calories and protein should be consumed.

Acne, nausea, pedal edema, or vomiting may occur. Women should report deepening of voice, hoarseness, and menstrual irregularities. Men should report difficulty urinating, frequent erections, and gynecomastia. Weight should be obtained each day. Weekly weight gains of more than 5 lb should be reported. Storage

Store at room temperature.

#### Administration

Dose should be individualized. Response is not often immediate and a minimum trial of 3-6 mo should be given. May give without regard to food.

# Oxymorphone Hydrochloride

ox-ee-mor'fone high-droh-klor'ide Numorphan, Opana, Opana ER Do not confuse with morphine or hydromorphone.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category B (D if used for prolonged periods or at high dosages at term) Controlled Substance Schedule: II

**Classification:** Analgesics, narcotic, opiate agonists

# **MECHANISM OF ACTION**

An opioid agonist, similar to morphine, that binds at opiate receptor sites in the central nervous system (CNS). *Therapeutic Effect*: Reduces intensity of pain stimuli incoming from sensory nerve endings, altering pain perception and emotional response to pain; suppresses cough reflex.

#### PHARMACOKINETICS

Route	Onset (min)	Peak (min)	Duration (h)
SC	5-10	30-90	4-6
IM	5-10	30-60	3-6
IV	5-10	15-30	3-6

Well absorbed from the GI tract after oral administration. Widely distributed. Metabolized in liver via glucuronidation. Excreted in

Oxymorphone Hydrochloride (Generic Name), Opana (Brand Name)

urine. *Half-life:* 7-9 h for immediate release; 9-11 h for controlled release.

# AVAILABILITY

#### Numorphan

*Injection:* 1 mg/mL, 1.5 mg/mL. **Opana** 

Tablet: 5 mg, 10 mg Injection: 1 mg/mL

#### **Opana ER**

Tablets (Extended Release, with riskaversion technology): 5 mg, 10 mg, 20 mg, 40 mg.

# INDICATIONS AND DOSAGES

#### Analgesic, anxiety, preanesthesia IV

Adults, Elderly, Children 12 yr and older. Initially 0.5 mg. SC/IM

*Adults, Elderly, Children 12 yr and older.* 1-1.5 mg IM or SC q4-6h as needed.

# Acute or chronic moderate to severe pain

#### PO

Adults, Elderly. 10-20 mg q4-6h (Opana) or 5 mg q12h, increasing by 5-10 mg q12h every 3-7 days (Opana ER). NOTE: Opana ER is not for as-needed use and should be given only to patients needing continuous, around-the-clock pain relief.

# Obstetric analgesic

IM Adults, Children 12 yr and older. 0.5-1 mg IM during labor.

# 0.5 T mg nyi during i

# **OFF-LABEL USES**

Cancer pain, intractable pain in narcotic-tolerant patients.

# CONTRAINDICATIONS

Hypersensitivity to drug or morphine analogs, severe respiratory depression in unmonitored setting, severe bronchial asthma, hypercarbia, paralytic ileus, moderate to severe hepatic impairment. The extended-release forms are contraindicated for use to treat acute pain for opioid-naïve patients.

# INTERACTIONS

# Drug

Anticholinergics: May increase urinary retention and severe constipation.

Alcohol, CNS depressants, tricyclic antidepressants: May increase CNS or respiratory depression, hypotension, profound sedation or coma. Alcohol increases maximum concentrations of oxymorphone.

**Cimetidine:** May increase activity of oxymorphone.

**MAOIs:** May produce severe, fatal reaction; plan to reduce dose to one-quarter usual dose.

- Mixed antagonist/agonist opioid analgesics (buprenorphine, butorphanol, nalbuphine,
- pentazocine): May reduce

oxymorphone effects and precipitate withdrawal.

**Phenothiazines:** May decrease effect of oxymorphone.

**Propofol:** May increase risk of bradycardia.

Herbal

**Ginseng:** May decrease opioid analgesic effectiveness.

**Gotu kola, kava kava, valerian:** May increase CNS or respiratory depression.

**St. John's wort:** May increase sedation.

#### Food

Alcohol: Avoid due to increased risk of CNS or respiratory depression and hypotension. Alcohol administration with Opana ER can cause immediate release of high doses and potential fatal overdose.

# DIAGNOSTIC TEST EFFECTS

May increase serum amylase levels and plasma lipase concentrations.

#### IV INCOMPATIBILITIES

No data available.

#### 🗏 IV COMPATIBILITIES

Glycopyrrolate (Robinul), hydroxyzine (Vistaril), ranitidine (Zantac).

#### SIDE EFFECTS

#### Frequent

Drowsiness, dizziness, hypotension, decreased appetite, tolerance, constipation, or dependence.

#### Occasional

Confusion, diaphoresis, facial flushing, urinary retention, dry mouth, nausea, vomiting, headache, pain at injection site, abdominal cramps.

#### Rare

Allergic reaction, depression.

#### SERIOUS REACTIONS

• Hypotension, paralytic ileus, respiratory depression, and toxic megacolon rarely occur.

 Overdosage results in respiratory depression, skeletal muscle flaccidity, cold or clammy skin, cyanosis, extreme somnolence progressing to seizures, stupor, and coma.

 Tolerance to analgesic effect and physical dependence may occur with repeated use.

 Prolonged duration of action and cumulative effect may occur in patients with impaired liver or renal function.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with acute alcoholism, a history of narcotic addiction, anoxia, CNS depression, hypercapnia, respiratory depression or dysfunction, seizures, shock, untreated myxedema, acute abdominal conditions, Addison's disease, chronic obstructive pulmonary disease (COPD), hypothyroidism, impaired liver function, increased intracranial pressure, and urethral stricture. Oxymorphone readily crosses the placenta, and it is unknown whether oxymorphone is distributed in breast milk. Its use may prolong labor if administered in the latent phase of the first stage of labor or before cervical dilation of 4-5 cm has occurred. Respiratory depression may occur in a neonate if the mother receives opiates during labor. Regular use of opiates during pregnancy may produce withdrawal symptoms in the neonate, including diarrhea, excessive crying, fever, hyperactive reflexes, irritability, seizures, sneezing, tremors, vomiting, and yawning. Safety and efficacy of oxymorphone have not been established in children younger than 12 yr. Elderly patients may be more susceptible to respiratory depression, and the drug may cause paradoxical excitement. Age-related prostatic hypertrophy or obstruction and renal impairment may increase the risk of urinary retention, and dosage adjustment is recommended in elderly patients. Alcohol and tasks that require mental alertness and motor skills should be avoided during therapy. Drug dependence and tolerance may occur with prolonged use at high dosages.

Excessive sedation or drowsiness, slow or shallow breathing, low BP, slow heart rate, and severe constipation should be reported to health care providers immediately.

Dizziness, hypotension, nausea, and vomiting may be experienced more frequently than those in supine position or having severe pain. Storage

Store injection formulation at room temperature and protect from light. Slight yellow discoloration of parenteral form does not indicate a loss of potency. Oral dose forms are stored at room temperature.

#### Administration

! Oxymorphone's side effects depend on the dosage amount and route of administration. A high-concentration injection should be used only in patients currently receiving high doses of another opiate agonist for severe, chronic pain caused by cancer or tolerance to opiate agonists.

May give undiluted as IV push or may give as IM or SC injection.

Extended-release or the immediate-release tablets should be given on an empty stomach either 1 h before or 2 h after eating.

! Swallow Opana ER tablets whole; do not crush, chew or dissolve in liquid. Administer with sufficient liquid to ensure complete esophageal transit. Crushing or the consumption of alcohol may lead to rapid release and potential for fatal accidental overdose.

# Oxytocin

ox-ee-toe'sin → Pitocin Do not confuse Pitocin with Pitressin.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Hormone, oxytocic

#### **MECHANISM OF ACTION**

An oxytocic that affects uterine myofibril activity and stimulates mammary smooth muscle. *Therapeutic Effect:* Contracts uterine smooth muscle. Enhances lactation.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	Immediate	NA	1 h
IM	3-5 min	NA	2-3 h

Protein binding: 30%. Distributed in extracellular fluid. Metabolized in the liver and kidney. Primarily excreted in urine. *Half-life:* 1-6 min.

#### AVAILABILITY

Injection: 10 units/mL.

# INDICATIONS AND DOSAGES

 Induction or stimulation of labor IV

Adults. 0.5-1 milliunit/min. May gradually increase in increments of 1-2 milliunit/min. Rates of 9-10 milliunit/min are rarely required.

#### Abortion, adjunct IV

Adults. 10-20 milliunit/min.

Maximum: 30 units in any 12-h period.

Control of postpartum bleeding
 IV INFUSION

*Adults.* 10-40 units in 1 L IV fluid at a rate sufficient to control uterine atony. IM

Adults. 10 units (total dose) after delivery.

# CONTRAINDICATIONS

Adequate uterine activity that fails to progress, cephalopelvic disproportion, fetal distress without imminent delivery, grand multiparity, hyperactive or hypertonic uterus, obstetric emergencies that favor surgical intervention, prematurity, unengaged fetal head, unfavorable fetal position or presentation, when vaginal delivery is contraindicated (such as active genital herpes infection, placenta previa, or cord presentation, invasive cervical carcinoma), elective induction of labor.

# INTERACTIONS

Drug Caudal block anesthetics, vasopressors: May increase pressor effects.

#### 1202 Oxytocin

**Cyclopropane anesthetics:** May cause maternal hypotension, bradycardia, abnormal AV rhythm. **Other oxytocics:** May cause cervical lacerations, uterine hypertonus, or uterine rupture.

## Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

# IV INCOMPATIBILITIES

Amphotericin B, diazepam, phenytoin, remifentanil.

#### 🗏 IV COMPATIBILITIES

Heparin, insulin, multivitamins, potassium chloride, sodium bicarbonate, sodium bisulfite.

#### SIDE EFFECTS

#### Occasional

Tachycardia, premature ventricular contractions, hypotension, nausea, vomiting.

#### SERIOUS REACTIONS

Hypertonicity may occur with tearing of the uterus, increased bleeding, abruptio placentae, and cervical and vaginal lacerations.
In the fetus, bradycardia, CNS or brain damage, trauma due to rapid propulsion, low Apgar score at 5 min, and retinal hemorrhage occur rarely. • Prolonged IV infusion of oxytocin with excessive fluid volume has caused severe water intoxication with seizures, coma, and death.

#### PRECAUTIONS & CONSIDERATIONS

Induction of labor should be for medical, not elective, reasons. Oxytocin should be used as indicated and is not known to cause fetal abnormalities. Oxytocin is present in small amounts in breast milk. Oxytocin is not recommended for use in pregnant women because it may precipitate contractions and abortions. Oxytocin is contraindicated in elective induction of labor. Oxytocin is not used in children or elderly patients.

BP, pulse, respiration rates, intake and output, uterine contractions, including duration, frequency, and strength, and fetal heart rate should be monitored every 15 min. If uterine contractions last longer than 1 min, occur more frequently than every 2 min, or stop, notify the physician. Be alert to potential water intoxication and for unexpected or increased blood loss. **Storage** 

Store at room temperature. Administration

Dilute 10-40 units (1-4 mL) in 1000 mL of 0.9% NaCl, lactated Ringer's solution, or D5W to provide a concentration of 10-40 milliunits/ mL solution. Give by IV infusion and use an infusion device to control prescribed rate of flow.

# Paliperidone

pal-e-per'i-done Invega, Invega Sustenna Do not confuse paliperidone with risperidone, or Invega with Invanz.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

#### **MECHANISM OF ACTION**

A benzisoxazole derivative that is the active metabolite of risperidone. Activity is mediated through a combination of central dopamine type 2 (D2) and serotonin type 2 (5HT2A) receptor antagonism. Also active as an antagonist at  $\alpha_1$ - and  $\alpha_2$ -adrenergic receptors and H<sub>1</sub> histamine receptors. *Therapeutic Effect:* Suppresses psychotic behavior and stabilizes moods.

# PHARMACOKINETICS

Oral form bioavailability roughly 28%; exposure increases when administered with food. Protein binding: 74%. Extensively metabolized in the liver. Excreted primarily in urine and feces. *Half-life*: Oral: 23 h (increased in those with renal impairment); Injection: 25-49 days.

# AVAILABILITY

Tablets, Extended Release (Invega): 1.5 mg, 3 mg, 6 mg, 9 mg. Injection, Extended-Release Suspension (Invega Sustenna): 39 mg, 78 mg, 117 mg, 156 mg, 234 mg.

# INDICATIONS AND DOSAGES

 Schizophrenia/schizoaffective disorder Adults. 6 mg in the morning once daily. Initial dose titration is not required. If clinical assessment warrants, adjust up or down at increments of 3 mg/day no more than every 5 days. Maximum: 12 mg/day. PO

Adolescents 12 to 17 yrs of age. Recommended doses are based on weight:

Weight < 51 kg: Initially, 3 mg once daily. Usual dose is 3-12 mg/day, with titration of no more than 3 mg/day increments every 5 days. Maximum: 12 mg/day.

Weight ≤ 51 kg: Initially, 3 mg once daily. Usual dose is 3-6 mg/day, with titration of no more than 3 mg/day increments every 5 days. Maximum: 6 mg/day.

IM

Adults, Elderly. Give 234 mg on treatment day 1; 1 wk later, give 156 mg—both doses are given in deltoid muscle. The monthly maintenance dose is usually 117 mg IM (range of 39-234 mg). Monthly maintenance doses are given in either the deltoid or gluteal muscle.

 Dosage in renal impairment (oral) CrCl 50-79 mL/min: No more than 3 mg/day initially; dosage is titrated slowly to desired effect. Maximum: 6 mg/day.

CrCl 10-49 mL/min: No more than 1.5 mg/day initially; dosage is titrated slowly to desired effect. Maximum: 3 mg/day.

#### Dosage in renal impairment (IM) (adults)

CrCl 50-79 mL/min: Give 156 mg IM on treatment day 1; 1 wk later, give 117 mg IM—both doses are given in deltoid muscle. Monthly maintenance dose is 78 mg IM (range of 39-78 mg) in either the deltoid or gluteal muscle. CrCl < 50 mL/min: Do not use IM

injection for dosing.

Paliperidone (Generic Name), Kepivance (Brand Name)

# Paclitaxel

pak-leh-tax'ell Abraxane, Taxol Do not confuse paclitaxel with Paxil, or Taxol with Taxotere. NOTE: Abraxane should not be interchanged with Taxol; the two paclitaxel formulations are not equivalent.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic, taxanes

# **MECHANISM OF ACTION**

An antineoplastic agent in the taxoid family that disrupts the microtubular cell network, which is essential for cellular function. Blocks cells in the late G2 phase and M phase of the cell. *Therapeutic Effect*: Inhibits cellular mitosis and replication.

# PHARMACOKINETICS

Does not readily cross the bloodbrain barrier. Protein binding: 89%-98%. Metabolized in the liver to active metabolites; eliminated by the bile. Not removed by hemodialysis. *Half-life:* 1.3-8.6 h.

# AVAILABILITY

Injection: 6 mg/mL. Injection, Protein-Bound (Abraxane): 100 mg.

# INDICATIONS AND DOSAGES

Ovarian cancer
 IV (TAXOL)
 Adults. 175 mg/m²/dose over 3 h
 or 135 mg/m²/dose over 24 h given
 q3wk. Follow with cisplatin 75 mg/m².
 Breast cancer
 IV (TAXOL)

Adults, Elderly. 175 mg/m<sup>2</sup>/dose over 3 h q3wk or 135 mg/m<sup>2</sup> over 24 h. IV (ABRAXANE) Adults, Elderly. 260 mg/m<sup>2</sup> over 30 min q3wk.

#### Non-small cell lung cancer IV (TAXOL)

Adults, Elderly. 135 mg/m<sup>2</sup> over 24 h, followed by cisplatin 75 mg/m<sup>2</sup> q3wk.

 Kaposi's sarcoma IV (TAXOL)

Adults, Elderly. 135 mg/m<sup>2</sup>/dose over 3 h q3wk or 100 mg/m<sup>2</sup>/dose over 3 h q2wk.

Dosage in hepatic impairment

Dosage adjustment may be needed based on liver enzymes, bilirubin levels, disease being treated, and product selected for use. See manufacturer information for details.

# CONTRAINDICATIONS

History of hypersensitivity to paclitaxel or other drugs formulated in polyoxyethylated castor oil (Cremophor EL); patients with solid tumors who have baseline neutrophil counts < 1500 cells/mm<sup>3</sup> or patients with AIDS-related Kaposi's sarcoma who have baseline neutrophil counts < 1000 cells/mm<sup>3</sup>.

# INTERACTIONS

#### Drugs

Strong CYP2C8 and CYP3A4 isoenzyme inhibitors (diazepam, ketoconazole, midazolam): Possible increase in action.

# Herbal

St. John's wort: May decrease paclitaxel levels.

None known.

# IV INCOMPATIBILITIES

Polyvinylchloride (PVC) infusion sets (Taxol only). Abraxane is compatible with PVC.

#### SIDE EFFECTS

#### Expected

Diarrhea, alopecia, nausea, vomiting, neutropenia.

#### Frequent

Myalgia or arthralgia, peripheral neuropathy.

#### Occasional

Mucositis, hypotension during infusion, pain or redness at injection site, thrombocytopenia.

#### Rare

Bradycardia, severe hypotension, angioedema, generalized urticaria.

# SERIOUS REACTIONS

 Severe hypersensitivity reactions, severe cardiac conduction abnormalities, severe peripheral neuropathy.

· Bone marrow suppression.

#### PRECAUTIONS & CONSIDERATIONS

Administer only under supervision of experienced cancer chemotherapy physician. Caution should be exercised in patients with bone marrow depression, AV block, hepatic impairment, recent myocardial infarction, angina pectoris, history of congestive heart failure, or currently using drug with effect on cardiac conduction system. Neutropenic nadir occurs at approximately day 11 of paclitaxel therapy. Elderly may have higher incidence of severe neuropathy, severe myelosuppression, or cardiovascular events. Avoid use in pregnant or breastfeeding patients. Safety and efficacy not established in children.

#### Storage

Store at room temperature in original package. Paclitaxel solutions for infusion stable at room temperature for up to 27 h. Paclitaxel proteinbound (Abraxane) solutions prepared for infusion are stable at room temperature up to 8 h.

#### Administration

CAUTION: Observe and exercise usual precautions for handling, preparing, and administering solutions of cytotoxic drugs.

*Taxol:* Premedicate with dexamethasone, diphenhydramine, and an H<sub>2</sub> antagonist. Use of an in-line filter of not greater than 0.22 micron is required during administration. Taxol is usually diluted in 0.9% NaCl, but other solutions are compatible (see manufacturer's info). Do not use PVC bags or tubing.

*Abraxane:* Protein-bound paclitaxel (Abraxane) is not interchangeable with conventional paclitaxel. Can be prepared and administered with PVC bags and infusion sets. Premedication is *not* required for Abraxane. Vials are reconstituted with 0.9% NaCl to form a suspension containing 5 mg/ mL for infusion; the infusion solution is milky-white and homogeneous. Filtration is not recommended.

# Palifermin

pal-ih-fur′min ★ 👾 Kepivance

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Keratinocyte growth factor

# **MECHANISM OF ACTION**

An antineoplastic adjunct that binds to the keratinocyte growth factor receptor, present on epithelial cells of the buccal mucosa and tongue, resulting in the proliferation, differentiation, and migration of epithelial cells. *Therapeutic Effect:* Reduces incidence and duration of severe oral mucositis.

# PHARMACOKINETICS

Linear pharmacokinetics and extravascular distribution. Total body clearance is twofold to fourfold higher in cancer patients than in healthy volunteers. *Half-life:* 3.3-5.7 h.

# AVAILABILITY

Injection: 6.25-mg vials.

# INDICATIONS AND DOSAGES Prevention of oral mucositis IV

*Adults, Elderly.* The total regimen is 6 doses of 60 mcg/kg/day. Give the first 3 doses prior to myelotoxic therapy, for 3 consecutive days, with the third dose given 24-48 h before chemotherapy. The last 3 doses are given after myelotoxic therapy. The first of these are administered after, but on the same day of, hematopoietic stem cell infusion but at least 4 days after the most recent administration of palifermin.

# CONTRAINDICATIONS

Patients allergic to *Escherichia coli*–derived proteins or any component of the product.

# INTERACTIONS

#### Drug

#### Myelotoxic chemotherapy:

Administration of palifermin during or within 24 h before or after myelotoxic chemotherapy results in increased severity and duration of oral mucositis.

#### Herbal

None known. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May elevate serum lipase and serum amylase levels.

# IV INCOMPATIBILITIES

Heparin, palifermin binds to heparin. No other data available.

# SIDE EFFECTS

#### Frequent (28%-62%)

Rash, fever, pruritus, erythema, edema, pain at injection site.

# Occasional (10%-17%)

Mouth and tongue thickness or discoloration, altered taste, dysesthesia (hyperesthesia, hypoesthesia, paresthesia), arthralgia.

# SERIOUS REACTIONS

• Transient hypertension occurs occasionally.

# **PRECAUTIONS & CONSIDERATIONS**

Use palifermin cautiously in women who are pregnant or breastfeeding. Excretion in breast milk is unknown. Safety and efficacy in children have not been established.

# Storage

Store unopened vials in refrigerator. If not used immediately, the reconstituted solution may be stored in the refrigerator for 24 h. Protect from light. Warm to room temperature for up to 1 h before administration. Discard the solution if it is left at room temperature for longer than 1 h or if it becomes discolored or contains particles.

#### Administration

Reconstitute palifermin using aseptic technique. Slowly inject 1.2 mL of sterile water for injection to yield a final concentration of 5 mg/mL. Swirl gently to dissolve. Do not shake or agitate the solution. Dissolution takes < 3 min. Administer by IV bolus injection. If heparin is being used to maintain an IV line, use 0.9% NaCl to rinse the IV line before and after palifermin administration.

# CONTRAINDICATIONS

Known hypersensitivity to either paliperidone or risperidone, or to any product excipients.

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Antihypertensives: Might increase risk of orthostasis.

**Carbamazepine:** May decrease the paliperidone blood concentration. **CYP2D6 inhibitors:** May increase

the levels/effects of paliperidone.

**Dopamine agonists, levodopa:** May decrease the effects of these drugs. **Valproic acid/divalproex:** May increase the adverse effects/toxicity of paliperidone; raises levels up to 50%.

#### Herbal

**St. John's wort:** May lower paliperidone blood concentration.

# DIAGNOSTIC TEST EFFECTS

May increase serum prolactin, blood glucose levels. May cause ECG changes. May increase serum cholesterol and triglycerides. Occasionally lowers WBC.

# SIDE EFFECTS

#### Frequent (≥ 5%)

Extrapyramidal symptoms, tachycardia, akathisia, tremor, somnolence, dyspepsia, constipation, increase in weight, nasopharyngitis, injection site reactions, dizziness.

# Occasional (1%-5%)

Insomnia, headache, nausea, vomiting, rash, abdominal pain, dry skin.

#### Rare (<1%)

Visual disturbances, fever, back pain, cough, arthralgia, angina, agitation or aggressive behavior, orthostatic hypotension, breast swelling.

# SERIOUS REACTIONS

 Rare reactions include tardive dyskinesia (characterized by tongue protrusion, puffing of the cheeks, and chewing or puckering of the mouth) and neuroleptic malignant syndrome (marked by hyperpyrexia, muscle rigidity, change in mental status, irregular BP, tachycardia, or diaphoresis).

- · Priapism.
- Neutropenia/agranulocytosis (rare).
- · Seizures.
- · New-onset diabetes mellitus,
- hyperlipidemia.

• Orthostatic hypotension with IM dosing.

# PRECAUTIONS & CONSIDERATIONS

Elderly patients with dementiarelated psychosis had a significantly higher incidence of cerebrovascular adverse events (e.g., stroke, TIA) and increased risk of mortality. Caution is warranted in patients with breast cancer, hepatic or renal impairment, seizure disorders, recent MI, those at risk for aspiration pneumonia, suicidal tendencies. Paliperidone use should be avoided in combination with other drugs that are known to prolong the QT interval, in patients with congenital long QT syndrome, and in patients with a history of cardiac arrhythmias. Be aware that the drug may increase the risk of hyperglycemia or worsen diabetes mellitus. It is unknown whether paliperidone crosses the placenta or is excreted in breast milk. Breastfeeding is not recommended. The safety and efficacy of this drug have not been established in children under 12 yr of age for oral dosing. Elderly patients are more susceptible to orthostatic hypotension and may require a

dosage adjustment because of agerelated renal impairment.

Drowsiness and dizziness may occur but generally subside with continued therapy. Tasks requiring mental alertness or motor skills should be avoided. Notify the physician if altered gait, difficulty breathing, palpitations, pain or swelling in breasts, severe dizziness or fainting, trembling fingers, unusual movements, rash, fever, or visual changes occur. BP, heart rate, liver function test results, ECG, and weight should be assessed.

#### Storage

Store extended-release tablets and injection at room temperature. Protect tablets from moisture.

#### Administration

Swallow extended-release tablets whole with the aid of liquids. Do not chew, divide, or crush. The medication is contained within a nonabsorbable shell that will release the drug at a controlled rate. The tablet shell is eliminated from the body; patients should not be concerned if they occasionally notice something that looks like a tablet in their stool.

Give injection by the IM route only; do not administer intravenously. Initiate the first 2 doses in the deltoid muscle. Monthly maintenance doses can be administered in either the deltoid or gluteal muscle. Shake the syringe vigorously for a minimum of 10 seconds to ensure a homogeneous suspension. Use appropriate needle sizes. For deltoid injection, use a 1<sup>1</sup>/<sub>2</sub>-inch 22G needle for patients  $\geq$  90 kg ( $\geq$  200 lb) and 1-inch 23G needle for patients < 90 kg (< 200 lb). For gluteal injection, use 11/2-inch 22G needle regardless of patient weight.

#### **Palonosetron**

pal-oh-noe'seh-tron ★ Aloxi

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

*Classification:* Antiemetics, 5-HT<sub>3</sub> serotonin receptor antagonist

# **MECHANISM OF ACTION**

A 5-HT<sub>3</sub> receptor antagonist that acts centrally in the chemoreceptor trigger zone and peripherally at the vagal nerve terminals. *Therapeutic Effect*: Prevents nausea and vomiting associated with chemotherapy.

#### PHARMACOKINETICS

Protein binding: 62%. Eliminated in urine. *Half-life:* 40 h.

# AVAILABILITY

Injection: 0.25 mg/5 mL. Capsules: 0.5 mg.

#### INDICATIONS AND DOSAGES

 Chemotherapy-induced nausea and vomiting associated with moderately and highly emetogenic cancer chemotherapy IV

*Adults, Elderly.* 0.25 mg as a single dose 30 min before starting chemotherapy.

#### PO

*Adults, Elderly.* 0.5 mg as a single dose 60 min before starting chemotherapy.

#### Post-op nausea/vomiting prevention IV

Adults. 0.075 mg single dose, pre-anesthesia.

#### CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

Drug, Herbal, and Food None known.

#### DIAGNOSTIC TEST EFFECTS

None are well documented but may transiently increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels.

# IV INCOMPATIBILITIES

Do not mix palonosetron with any other drugs.

#### SIDE EFFECTS

Occasional (5%-9%) Headache, constipation. Rare (< 1%) Diarrhea, dizziness, fatigue, abdominal pain, insomnia, anxiety, hyperkalemia, weakness.

# SERIOUS REACTIONS

 Overdose may produce a combination of central nervous system (CNS) stimulant and depressant effects: Nonsustained tachycardia, bradycardia, hypotension.
 QT prolongation or arrthythmia; bradycardia.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with history of cardiovascular disease. It is unknown whether palonosetron is excreted in breast milk. The safety and efficacy of palonosetron have not been established in children. No age-related precautions have been noted for elderly patients. Hypersensitivity may occur in patients who have exhibited hypersensitivity to other selective 5-HT<sub>3</sub> receptor antagonists.

Administer with caution in patients who have or may develop prolongation of cardiac conduction intervals, particularly QTc.

Alcohol, barbiturates, and tasks that require mental alertness or

motor skills should be avoided until the effects of the drug are known.

Dizziness or drowsiness may occur. Pattern of daily bowel activity and stool consistency and hydration status should be monitored. Intolerable headache, persistent or intolerable constipation or diarrhea could be indicative of a serious reaction and should be reported immediately.

#### Storage

Store vials and capsules at room temperature. The solution normally appears clear and colorless.

#### Administration

Give the drug undiluted as an IV push over 30 seconds. Flush the IV line with 0.9% NaCl before and after administration.

Oral capsules may be taken without regard to food.

#### Pamidronate Disodium

pam-id'drow-nate ★ ▲ Aredia **Do not confuse Aredia with** Adriamycin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

Classification: Bisphosphonates

#### **MECHANISM OF ACTION**

A bisphosphonate that binds to bone and inhibits osteoclast-mediated calcium resorption. *Therapeutic Effect:* Lowers serum calcium concentrations.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	24-48 h	5-7 days	NA

After IV administration, rapidly absorbed by bone. Slowly excreted unchanged in urine. Unknown whether removed by hemodialysis. *Half-life:* Bone, 300 days; unmetabolized, 2.5 h.

# AVAILABILITY

Powder for Injection: 30 mg, 90 mg. Injection Solution: 3 mg/mL, 6 mg/mL, 9 mg/mL.

# INDICATIONS AND DOSAGES

 Hypercalcemia of malignancy IV INFUSION

Adults, Elderly: Moderate hypercalcemia (corrected serum calcium level 12-13.5 mg/dL): 60-90 mg over 2-24 h. Severe hypercalcemia (corrected serum calcium level > 13.5 mg/dL): 90 mg over 2-24 h.

# Paget's disease

IV INFUSION Adults, Elderly. 30 mg/day over 4 h for 3 days.

#### Osteolytic bone lesion

IV INFUSION *Adults, Elderly.* 90 mg over 4 h once a month.

# CONTRAINDICATIONS

Hypersensitivity to pamidronate or other bisphosphonates, such as etidronate, tiludronate, risedronate, and alendronate. For bone metastases, do not use pamidronate if CrCl is < 30 ml/min. In other indications, decide whether the potential benefit outweighs the potential risk.

# INTERACTIONS

#### Drug

Calcium-containing medications, vitamin D, and antacids: Possible antagonism of pamidronate in treatment of hypercalcemia. Use with other potentially nephrotoxic medications: May increase the risk of renal dysfunction. Herbal and Food None known.

# DIAGNOSTIC TEST EFFECTS

May decrease serum phosphate, magnesium, calcium, and potassium levels.

# **IV INCOMPATIBILITIES**

Calcium-containing IV fluids, including lactated Ringer's solutions.

# **DIAGNOSTIC TEST EFFECTS**

Lowered serum phosphorus, potassium, magnesium, and calcium. May increase serum creatinine.

# SIDE EFFECTS

#### Frequent (> 10%)

Temperature elevation (at least  $1^{\circ}$  C or  $1.8^{\circ}$  F) 24-48 h after administration; redness, swelling, induration, pain at catheter site in patients receiving 90 mg; anorexia, nausea, fatigue, hypophosphatemia, myalgia.

#### Occasional (1%-10%)

Constipation, rhinitis, palpitations, bone or musculoskeletal pain.

# SERIOUS REACTIONS

• Hypophosphatemia, hypokalemia, hypomagnesemia, and hypocalcemia occur more frequently with higher dosages.

• Anemia, hypertension, tachycardia, atrial fibrillation, and somnolence occur more frequently with 90-mg doses.

- · GI hemorrhage occurs rarely.
- Deterioration in renal function that may lead to renal failure.
- · Osteonecrosis of the jaw.

# **PRECAUTIONS & CONSIDERATIONS**

Dental implants are contraindicated for patients taking this drug.

Caution is warranted with cardiac failure and renal impairment. Because no adequate and wellcontrolled studies have been conducted in pregnant women, it is unknown whether pamidronate causes fetal harm or is excreted in breast milk. Safety and efficacy of pamidronate have not been established in children. Elderly patients may become overhydrated and require careful monitoring of fluid and electrolytes. Dilute the drug in a smaller volume for elderly patients.

Hematocrit, hemoglobin, BUN, creatinine levels, and serum electrolyte levels, including serum calcium levels, should be established. If renal function deteriorates significantly, the use of further doses must be carefully assessed. Pattern of daily bowel activity and stool consistency, BP, pulse, and temperature should also be monitored.

#### Storage

Store parenteral form at room temperature. The reconstituted vial is stable for 24 h when refrigerated; the IV solution is stable for 24 h after dilution.

#### Administration

Reconstitute each 30-mg vial with 10 mL sterile water for injection to provide concentration of 3 mg/mL. Allow the drug to dissolve before withdrawing. Further dilute with 1000 mL sterile 0.45% or 0.9% NaCl or D5W. Administer as IV infusion over 2-24 h for treatment of hypercalcemia and over 4 h for other indications. Adequate hydration is essential during pamidronate administration. Avoid overhydration in those with the potential for heart failure. Be alert for potential GI hemorrhage in those receiving a 90-mg dose.

#### **Pancrelipase**

pan-kre-li'pase

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

**Classification:** Pancreatic enzymes

# **MECHANISM OF ACTION**

Digestive enzymes that replace endogenous pancreatic enzymes. *Therapeutic Effect:* Assist in digestion of protein, starch, and fats.

# AVAILABILITY

NOTE: These products are not considered bioequivalent by the FDA and cannot be interchanged. *Capsules (Delayed Release, Creon ONLY):* 

- 6000 units of lipase; 19,000 units of protease; 30,000 units of amylase.
- 12,000 units of lipase; 38,000 units of protease; 60,000 units of amylase.
- 24,000 units of lipase; 76,000 units of protease; 120,000 units of amylase. *Capsules (with Enteric-Coated Microspheres, Pancreaze ONLY):*
- Pancreaze MT4: 4200 units of lipase; 10,000 units of protease; 17,500 units of amylase.
- Pancreaze MT10: 10,500 units of lipase; 25,000 units of protease; 43,750 units of amylase.

• Pancreaze MT16: 16,800 units of lipase; 40,000 USP units of protease; 70,000 units of amylase.

• Pancreaze MT20: 21,000 units of lipase; 37,000 units of protease; 61,000 units of amylase.

Capsules (Delayed Release. ZenPep ONLY):

• 5000 units of lipase; 17,000 units of protease; 27,000 units of amylase.

10,000 units of lipase; 34,000 units of protease; 55,000 units of amylase.
15,000 units of lipase; 51,000 units of protease; 82,000 units of amylase.
20,000 units of lipase; 68,000 units of protease; 109,000 units of amylase.

# PHARMACOKINETICS

Pancreatic enzymes are not absorbed from the GI tract in any appreciable amount and are not systemically active. Enteric coatings or delayed release prevents inactivation by gastric acids.

#### INDICATIONS AND DOSAGES

Pancreatic enzyme replacement or supplement when enzymes are absent or deficient, such as with chronic pancreatitis, cystic fibrosis, or ductal obstruction from cancer of the pancreas or common bile duct; to reduce malabsorption; treatment of steatorrhea associated with bowel resection or postgastrectomy syndrome

PO

Adults, Children 4 vr and older. Initiate with 500 lipase units/kg per meal (maximum 2500 lipase units/kg per meal or a total of 10,000 lipase units/kg per day or less than 4000 lipase units/g fat ingested per day). Usually, half of the prescribed dose is given with each snack. The total daily dose should reflect roughly 3 meals plus 2-3 snacks per day. Elderly. See adult dose. Enzyme doses expressed as lipase units/kg per meal should be decreased in older patients because they weigh more but tend to ingest less fat/kg in the diet. Children 12 mo of age up to 4 vr. Initiate with 1000 lipase units/kg per meal (maximum 2500 lipase units/ kg per meal or 10,000 lipase units/ kg per day) or less than 4000 lipase units/g fat ingested per day. Usually, half of the prescribed dose is given with each snack. The total daily dose

should reflect roughly 3 meals plus 2-3 snacks per day.

*Infants (up to 12 mo).* May give 2000-4000 lipase units per 120 mL of formula or per breastfeeding per day. Do not mix product contents directly into formula or breast milk.

• Dosage adjustments and limits Dosing should not exceed the recommended maximum set forth by the Cystic Fibrosis Foundation Consensus Conferences Guidelines, as listed above. If steatorrhea persists, may increase cautiously. There is great inter-individual variation in response to enzymes. Changes in dosage may require an adjustment period of several days.

# CONTRAINDICATIONS

None absolute. Rarely, patients allergic to pork might have severe hypersensitivity to porcine-derived pancreatic enzyme products.

# INTERACTIONS

#### Drug

Acarbose, miglitol: May decrease the effects of these antidiabetic drugs. Antacids: May decrease the effects of pancrelipase. Separate administration times. Iron supplements: May decrease the absorption of iron supplements. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

Porcine-derived products contain purines that may increase blood uric acid levels.

# SIDE EFFECTS

#### Frequent

Diarrhea, abdominal pain, vomiting, constipation, flatulence, nausea, bloating and cramping.

#### Occasional

Perianal irritation, mucosal irritation, cough, nasopharyngitis.

#### Rare

Allergic reaction, mouth irritation, shortness of breath, wheezing.

# SERIOUS REACTIONS

 Excessive dosage may produce nausea, vomiting, bloating, constipation, cramping, and diarrhea.

• Hyperuricosuria and hyperuricemia have occurred with extremely high dosages.

• Excessive dosage in children (e.g., > 6000 lipase units/kg/dose) may contribute to fibrosing colonopathy and colonic stricture.

# **PRECAUTIONS & CONSIDERATIONS**

Fibrosing colonopathy is assosiated with high-dose use of pancreatic enzyme replacement in the treatment of cystic fibrosis patients; follow dosing recommendations. Use caution in patients with gout, renal impairment, or hyperuricemia. Because of the animal origin of the products, there is theoretical risk of viral transmission with all pancreatic enzyme products. It is unknown whether pancrelipase crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in elderly patients. Storage

Store at room temperature tightly closed. If exposed to moisture conditions > 70% for any period of time, the enzymes become inactive and should be discarded.

#### Administration

! Most products are not bioequivalent; brands should not be changed or substituted without the advice of a medical practitioner. Take before or with meals or snacks. For infants, give immediately prior to each feeding. Contents of capsules may be mixed with a small amount of apple sauce, or other acidic food (pH of 4.5 or less; e.g., baby food, bananas, or pears). Contents may also be administered directly to the mouth. Follow administration with breast milk or formula. Do not mix directly into formula or breast milk. Do not crush, chew, or retain in the mouth to avoid oral mucosal irritation.

For children and other patients who are unable to swallow intact capsules, the capsules may be carefully opened and the contents sprinkled on small amounts of acidic soft food (pH 4.5 or less; commercial preparations of bananas, pears, applesauce). Swallow immediately. Do not crush or chew. Follow with water or juice. Do not retain drug in the mouth.

During administration, take care not to inhale capsule contents as this is irritating and may produce an asthma attack

# **Pantoprazole**

pan-toe-pra'zole Protonix Panto, Pantoloc Do not confuse Protonix with Lotronex.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Gastrointestinals, antiulcer agents, proton-pump inhibitors (PPI)

# **MECHANISM OF ACTION**

A benzimidazole that is converted to active metabolites that irreversibly bind to and inhibit hydrogenpotassium adenosine triphosphate, an enzyme on the surface of gastric parietal cells. Inhibits hydrogen ion transport into gastric lumen.

Pantoprazole (Generic Name)

# Panitumumab

pan-ih-tu-mue'mab

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C.

**Classification:** Antineoplastic agent, monoclonal antibodies, signal transduction inhibitor

# **MECHANISM OF ACTION**

An antineoplastic agent that binds specifically to epidermal growth factor receptor (EGFR) on normal and tumor cells and competitively inhibits the binding of ligands for EGFR. Blocks phosphorylation and activation of intracellular tyrosine kinases, resulting in inhibition of cell survival, growth, proliferation, and transformation. *Therapeutic Effect:* Inhibits growth and survival of selected human tumor cell lines expressing EGFR.

# PHARMACOKINETICS

Pharmacokinetic parameters other than half-life have not been established. *Half-life:* 4-11 days.

# AVAILABILITY

Injection Solution: 20 mg/mL.

# INDICATIONS AND DOSAGES

# EGFR-positive metastatic colorectal cancer

IV Adı

*Adults.* 6 mg/kg administered over 60 min every 14 days. Doses > 1000 mg should be administered over 90 min.

# Dosing adjustments

INFUSION REACTIONS Infusion reactions, mild to moderate (grade 1 or 2): Reduce the infusion rate by 50% for the duration of infusion. Infusion reactions, severe (grade 3 or 4): Immediately and permanently discontinue.

#### Dermatologic toxicity

Dermatologic toxicity (grade 3 or 4): Withhold panitumumab if skin toxicity does not improve to grade 2 or lower within 1 mo; permanently discontinue.

Dermatologic toxicity (grade 2 or lower) and the patient is symptomatically improved after withholding no more than 2 doses of panitumumab. Treatment may be resumed at 50% the original dose. If toxicities recur, permanently discontinue drug. If toxicities do not recur, subsequent doses may be increased in increments of 25% of the original dose until the recommended dose of 6 mg/kg is obtained.

# INTERACTIONS

#### Drug

Aspirin, NSAIDs: Increased GI irritation, nausea, vomiting. Irinotecan: Increased frequency and severity of diarrhea.

Chemotherapy: Increased toxicity with combination chemotherapy. Food and Herbal

None reported.

# **DIAGNOSTIC TEST EFFECTS**

May decrease serum magnesium, calcium levels.

# IV INCOMPATIBILITIES

Do not mix or infuse with other medications. Flush IV with 0.9% NaCl before and after administration.

# SIDE EFFECTS

#### Frequent

Dermatologic toxicity, erythema, acneiform rash, pruritus, hypomagnesemia, fatigue, exfoliation, abdominal pain, paronychia, nausea, rash, diarrhea, constipation, fissures, vomiting, cough, acne, peripheral edema, dry skin.

#### Occasional

Nail disorder, stomatitis, mucositis, eyelash growth, conjunctivitis, ocular hyperemia, lacrimation increased.

#### Rare

Infusion reactions, eye/eyelid irritation.

#### SERIOUS REACTIONS

• Dermatologic toxicities, severe.

• Severe infusion reactions occur in 1%; fatal reactions reported in postmarket experience.

Pulmonary fibrosis.

#### PRECAUTIONS & CONSIDERATIONS

EGFR testing necessary to identify patients eligible for therapy. Use caution in patients with any hypersensitivities to panitumumab or its components. Sunlight may exacerbate skin reactions. Advise patients to wear sunscreen and protective clothing to limit sun exposure. Increased toxicity has been observed in patients receiving panitumumab in combination with chemotherapy. Safety and efficacy in children have not been established. Avoid use in pregnancy; use contraception during and for 6 mo after the last dose. Avoid breastfeeding during and for 2 mo after the last dose.

Monitor for severe infusion reactions during infusion. Monitor skin reactions; severe reactions require drug discontinuation permanently. Monitor daily serum electrolytes, as replacement therapy may be needed. Report any wheezing, progressive dyspnea, or other lung symptoms promptly.

#### Storage

Store vials in original cartons in refrigerator. Protect from light. Use diluted solution within 6 h of preparation if stored at room temperature or within 24 h if stored in the refrigerator.

#### Administration

Dilute solution with NS. Infuse over 60 min; doses over 1000 mg should be infused over 90 min. Administer with IV infusion pump using a low-protein binding 0.2or 0.22-micrometer in-line filter. Flush line with NS before and after administration. *Therapeutic Effect:* Increases gastric pH and reduces gastric acid production.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	NA	2.5 h	24 h

Rapidly absorbed from the GI tract. Protein binding: 98%. Primarily distributed into gastric parietal cells. Metabolized extensively in the liver. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 1 h.

# AVAILABILITY

Tablets (Delayed Release): 20 mg, 40 mg. Powder for Injection: 40 mg. Granules (Delayed Release) for Oral Suspension: 40 mg.

# INDICATIONS AND DOSAGES

# Erosive esophagitis

PO

Adults, Elderly, Older Children  $\geq 40$  kg. 40 mg/day for up to 8 wks. If not healed after 8 wks, may continue an additional 8 wks.

Children  $\ge 5yr$  and weighing 15 kg to < 40 kg. 20 mg once daily for up to 8 wks.

IV

Adults, Elderly. 40 mg/day for 7-10 days.

# Hypersecretory conditions: Zollinger-Ellison syndrome PO

Adults, Elderly. Initially, 40 mg twice a day. May increase to 240 mg/day. IV

*Adults, Elderly.* 80 mg twice a day. May increase to 80 mg q8h.

# CONTRAINDICATIONS

Known hypersensitivity to any component of the formulation.

# INTERACTIONS

#### Drug

Atazanavir, nelfinavir, delavirdine: Pantoprazole substantially decreases therapeutic effect.

**Clopidogrel:** When possible, do not give PPI with clopidogrel, as PPI will prevent activation of clopidogrel via CYP2C19.

Ketoconazole, ampicillin esters, dasatinib, iron salts: Pantoprazole may interfere with drug absorption. Methotrexate: May increase risk of methotrexate toxicity.

**Rifampin:** May decrease pantoprazole levels and efficacy. **Warfarin:** Possible increases in INR and prothrombin time.

# Herbal

St. John's wort: May decrease the levels of pantoprazole. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum creatinine, cholesterol, and uric acid levels.

# IV INCOMPATIBILITIES

Do not mix with other medications. Flush IV with D5W, 0.9% NaCl, or lactated Ringer's solution before and after administration.

# SIDE EFFECTS

#### Occasional

Diarrhea, headache, dizziness, pruritus, rash.

# SERIOUS REACTIONS

- · Hepatomegaly (rare).
- Serious hypersensitivity/ dermatologic reactions (rare), such as angioedema, anaphylaxis, Stevens-Johnson syndrome.
- Neutropenia or thrombocytopenia.
- In chronic use, may cause
- hypomagnesemia.
• In chronic use, may increase risk of bone fracture.

• Possible alteration of GI microflora which increases risk of *Clostridium dificile*-associated diarrhea (CDAD).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a chronic or current hepatic disease. It is unknown whether pantoprazole crosses the placenta. The drug crosses into breast milk, and breastfeeding during use is not recommended. Safety and efficacy of pantoprazole have not been established in children under the age of 5 yr. No age-related precautions have been noted in elderly patients. Serum chemistry laboratory values, including serum creatinine and cholesterol levels, should be obtained before therapy.

#### Storage

Store oral forms at room temperature. Refrigerate vials and protect from light; do not freeze reconstituted vials. Once diluted, the drug is stable for 2 h at room temperature.

#### Administration

Take oral pantoprazole without regard to meals. Do not crush or split tablet; swallow tablet whole.

Granules should only be administered 30 min prior to a meal in apple juice or with a teaspoon of applesauce or give via NG tube in apple juice only. Granules will not dissolve and should not be chewed. Do not use any other liquids or foods to administer.

For IV use, mix 40-mg vial with 10 mL 0.9% NaCl injection. Infuse over 2 min. May also further dilute in 100 mL of D5W or 0.9% NaCl and infuse over 15 min. Do not administer by IV push or any other parenteral routes.

# **Paricalcitol**

pare-i-cal′sih-tal ★ Zemplar

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Vitamin D analogs, bone resorption inhibitors, renal agents

# **MECHANISM OF ACTION**

A fat-soluble vitamin that is essential for absorption, utilization of calcium phosphate, and normal calcification of bone. *Therapeutic Effect:* Stimulates calcium and phosphate absorption from the small intestine, promotes the secretion of calcium from bone to blood, promotes renal tubule phosphate resorption, acts on bone cells to stimulate skeletal growth and on parathyroid gland to suppress hormone synthesis and secretion.

# PHARMACOKINETICS

Protein binding: More than 99%. Metabolized in the liver by multiple hepatic enzymes, including CYP3A4. Eliminated primarily in feces; minimal excretion in urine. Not removed by hemodialysis. *Half-life*: 13-17 h.

# AVAILABILITY

*Injection:* 2 mcg/mL, 5 mcg/mL (Zemplar). *Capsules:* 1 mcg, 2 mcg, 4 mcg (Zemplar).

# INDICATIONS AND DOSAGES Hyperparathyroidism and renal osteodystrophy

Dosage is determined based on serum Ca, serum P, and plasma iPTH. Monitor at least q2wk for 3 mo, monthly for 3 mo, and then every 3 mo thereafter. In general, adjust no more frequently than q2-4 wk.

Paricalcitol (Generic Name), Zemplar (Brand Name)

# Predialysis stage 3 or 4 chronic kidney disease

#### PO

Adults with an iPTH  $\leq 500 \text{ pg/mL}$ . Initially, 1 mcg PO once daily or 2 mcg given 3 times per week given no more frequently than every other day. Adults with an iPTH > 500 pg/mL. Initially, 2 mcg PO once daily or 4 mcg PO 3 times per wk given no more than god.

If Ca level or the Ca times P product elevated. Decrease or hold dose until normalized.

If iPTH concentrations are < 60 pg/mL or they decrease by > 60%. Decrease by 1 mcg/dose if given daily, or 2 mcg per dose if 3 times/ wk. May further reduce or interrupt until normalized.

If iPTH decreases by  $\geq 30\%$  or  $\leq 60\%$ . Maintain same dose.

If iPTH decreases bv < 30%, is the same, or is increasing. Increase by 1 mcg/dose for daily dosage or 2 mcg/ dose for the 3 times/wk regimen.

# Stage 5 end-stage renal disease on dialysis

PO

Adults. Initially calculate as follows: dose (mcgs) = baseline iPTH (pg/ mL)/80. To avoid hypercalcemia, baseline serum Ca should be  $\leq 9.5$ mg/dL. Give calculated dose 3 times/ wk, and no more frequently than every other day. Doses range from 1.6-24.7 mcg (mean 7-10 mcg per dose). If Ca level or Ca times P product elevated. Decrease recent dose by 2-4 mcg. May further reduce or interrupt until normalized.

IV

Adults. Initially, 0.04-0.1 mcg/kg IV bolus given no more than every other day; give at any time during dialysis. NOTE: Initial doses usually 2.5-5 mcg. Doses as high as 0.24 mcg/kg (total dose 16.8 mcg) have been administered.

If Ca level elevated, Ca times P product is > 75, or iPTH decreases bv > 60%. Decrease or hold dose. *If iPTH decreases by < 30%, stays* the same, or is increasing. Increase by 2-4 mcg/dose.

If iPTH decreases bv > 30% or < 60% or is 1.5-3 times ULN. Maintain the same dose.

#### Usual pediatric dose for chronic kidney disease

Children 5 vr and older. With iPTH < 500 pg/mL, initial dose 0.04 mcg/ kg given 3 times/wk during dialysis. If iPTH  $\geq$  500 pg/mL, initial dose 0.08 mcg/kg given 3 times/wk. Titrate dose by 0.04 mcg/kg based on lab values.

# CONTRAINDICATIONS

Hypercalcemia, malabsorption syndrome, vitamin D toxicity, hypersensitivity to other vitamin D products or analogs.

# INTERACTIONS

#### Drug

Aluminum-containing antacid (long-term use): May increase aluminum concentration and aluminum bone toxicity. Calcium-containing preparations, thiazide diuretics: May increase the risk of hypercalcemia. Cholestyramine and other fatabsorbing impairing drugs: May decrease absorption. Digoxin: May increase the risk of digitalis toxicity. Magnesium-containing antacids: May increase magnesium concentration. Strong CYP3A4 inhibitors: Atazanavir, clarithromycin, indinavir, itraconazole, ketoconazole, nefazodone, nelfinavir, ritonavir, saquinavir, telithromycin, variconazole: increases risk of toxicity. Herbal None known.

#### Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May decrease serum alkaline phosphatase. Elevated serum calcium.

# SIDE EFFECTS

#### Common

Diarrhea, headache, hypertension, dizziness, nausea, vomiting.

#### Occasional

Edema, infection, dehydration. Rare

Palpitations, rash, pruritis.

# SERIOUS REACTIONS

• Early signs of overdosage are manifested as headache, somnolence, hypercalcemia, anorexia, nausea, vomiting, dry mouth, constipation, muscle and bone pain, and metallic taste sensation, weakness.

• Later signs of overdosage are evidenced by hypercalcemia, hypercalciuria, hyperphosphatemia, oversuppression of PTH, polyuria, polydipsia, anorexia, weight loss, nocturia, photophobia, rhinorrhea, pruritus, disorientation, hallucinations, hyperthermia, hypertension, and cardiac arrhythmias.

· Hypersensitivity reaction.

## PRECAUTIONS & CONSIDERATIONS

Caution is necessary in concomitant use of digoxin. It is unknown whether paricalcitol crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children younger than 5 yr. No age-related precautions have been noted in elderly patients. Consume foods rich in vitamin D, including eggs, leafy vegetables, margarine, meats, milk, vegetable oils, and vegetable shortening.

Serum alkaline phosphatase, BUN, serum calcium, serum creatinine,

serum magnesium, serum phosphate, and urinary calcium levels should be monitored monthly once therapeutic dosage is established for 3 mo, then every 3 mo thereafter. The therapeutic serum calcium level is 9-10 mg/dL. **Storage** 

#### Store at room temperature. Administration

Give injection form as an IV bolus dose no more frequently than every other day, given at any time during dialysis. Capsules may be administered without regard to food. Discard any unused portion.

# Paromomycin

par-oh-moe-mye<sup>2</sup>sin ★ ➡ Humatin Do not confuse Humatin with Humira.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Amebicide, antibiotics, aminoglycosides, antiprotozoals

# **MECHANISM OF ACTION**

An antibacterial agent that acts directly on amoebas and against normal and pathogenic organisms in the GI tract. Interferes with bacterial protein synthesis by binding to 30S ribosomal subunits. *Therapeutic Effect*: Produces amoebicidal effects. Suppresses intestinal flora, thus limiting ammonia production in patients with hepatic encephalopathy.

# PHARMACOKINETICS

Poorly absorbed from the GI tract; most of the dose is eliminated unchanged in feces.

# AVAILABILITY

Capsules: 250 mg.

Paromomycin (Generic Name)

# INDICATIONS AND DOSAGES

Intestinal amebiasis

PO

*Adults, Elderly, Children.* 25-35 mg/kg/day given in divided doses q8h for 5-10 days.

# Hepatic coma

PO Adults, Elderly. 4 g/day given in divided doses q6-12h for 5-6 days.

# **OFF-LABEL USES**

Cryptosporidiosis, giardiasis, leishmaniasis, microsporidiosis, mycobacterial infections, tapeworm infestation, trichomoniasis, typhoid carriers.

# CONTRAINDICATIONS

Intestinal obstruction, hypersensitivity to paromomycin or any of its components. Use caution if sensitive to tartrazine dye, as contained in some capsules.

# INTERACTIONS

#### Drug

**Digoxin:** May decrease digoxin serum concentrations and efficacy.

# Herbal

None known.

#### Food

**Xylose, sucrose, fats:** May cause decreased absorption of xylose, sucrose, and fats.

# DIAGNOSTIC TEST EFFECTS

May increase LDH concentrations, SGOT (AST) and SGPT (ALT) levels.

# SIDE EFFECTS

#### Occasional

Diarrhea, abdominal cramps, nausea, vomiting, heartburn. **Rare** Rash, pruritus, vertigo.

### SERIOUS REACTIONS

• Nephrotoxicity (rare), ototoxicity (rare). Overdosage may result in nausea, vomiting, and diarrhea.

· Superinfection.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with proven ulcerative bowel disease as this increases risk for systemic absorption and renal toxicity. Liver and renal function tests should be performed before administering paromomycin. It is unknown whether paromomycin crosses the placenta and is distributed in breast milk. No precautions have been noted in children or elderly patients.

Sore throat, oral burning sensations, fever or fatigue, any or all can be indicative of superinfection and should be reported immediately. Impaired hearing should be reported immediately.

#### Storage

Store at room temperature; protect from moisture.

#### Administration

Give with meals. Take full course of therapy and do not skip doses.

# Paroxetine Hydrochloride

par-ox'e-teen Paxil, Paxil CR, Pexeva Do not confuse paroxetine with pyridoxine, or Paxil with Doxil or Taxol.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antidepressants, selective serotonin reuptake inhibitors (SSRIs)

Paroxetine Hydrocholoride (Generic Name)

# **MECHANISM OF ACTION**

An antidepressant, anxiolytic, and antiobsessional agent that selectively blocks uptake of the neurotransmitter serotonin at neuronal presynaptic membranes, thereby increasing its availability at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression, reduces obsessivecompulsive behavior, decreases anxiety.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 95%. Widely distributed. Metabolized in the liver. Excreted in urine. Not removed by hemodialysis. *Half-life:* 15-20 h.

# AVAILABILITY

*Oral Suspension (Paxil):* 10 mg/5 mL. *Tablets (Paxil, Pexeva):*10 mg, 20 mg, 30 mg, 40 mg. *Tablets (Controlled Release [Paxil CR]):*12.5 mg, 25 mg, 37.5 mg.

# INDICATIONS AND DOSAGES Major depressive disorder PO

*Adults.* Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Maximum: 50 mg/day.

PO (CONTROLLED RELEASE) Adults. Initially, 25 mg/day. May increase by 12.5 mg/day at intervals of more than 1 wk. Maximum: 62.5 mg/day.

# • Generalized anxiety disorder PO

*Adults*. Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20-50 mg/day.

# • Obsessive compulsive disorder PO

*Adults*. Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20-60 mg/day.

#### Panic disorder PO

*Adults*. Initially, 10-20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 10-60 mg/day.

PO (CONTROLLED RELEASE) Adults. Initially 12.5 mg/day. May increase by 12.5 mg/day at intervals of more than 1 wk. Maximum: 75 mg/day.

# Social anxiety disorder PO

*Adults*. Initially 20 mg/day. May increase by 10 mg/day at intervals of > 1 wk. Range: 20-60 mg/day.

PO (CONTROLLED RELEASE) Adults. Initially, 12.5 mg/day. May increase by 12.5 mg/day at intervals of more than 1 wk. Maximum: 37.5 mg/day.

#### Post-traumatic stress disorder PO

*Adults*. Initially, 20 mg/day. May increase by 10 mg/day at intervals of more than 1 wk. Range: 20-60 mg/day.

#### Premenstrual dysphoric disorder PO

*Adults.* Paxil CR: Initially, 12.5 mg/day. May increase by 12.5 mg at weekly intervals to a maximum of 37.5 mg/day. May also give during luteal phase only.

# CONTRAINDICATIONS

Use within 14 days of MAOIs. Hypersensitivity. Contraindicated for use with linezolid, pimozide, IV methylene blue, or thioridazine.

# INTERACTIONS

**Cimetidine:** May increase paroxetine blood concentration. **Diazepam:** Increased half-life of diazepam in the presence of paroxetine.

#### Drugs metabolized by CYP2D6 (e.g., risperidone, phenothiazines, TCAs, propafenone, flecainide):

May increase risk of side effects due to inhibition of CYP2D6 by paroxetine. **MAOIs:** May cause serotonin syndrome, marked by excitement, diaphoresis, rigidity, hyperthermia, autonomic hyperactivity, coma, and neuroleptic malignant syndrome. Contraindicated.

**Phenobarbital, phenytoin:** May decrease paroxetine blood concentration.

**Pimozide and thioridazine:** Contraindicated. May result in prolonged QT intervals.

Other antidepressants and alcohol: Possible increased side effects. Sibutramine, serotonin agonists (triptants): Additive serotonin effects and increased risk serotonin syndrome.

**Tamoxifen:** Paroxetine may reduce efficacy due to CYP2D6 effects; choose different antidepressant.

Theophylline: Rare reports of increased theophylline levels. Monitor. Warfarin: May increase effects of warfarin; monitor INR. Herbal

**St. John's wort:** May increase paroxetine's pharmacologic effects and risk of toxicity.

Tryptophan: May cause headache, nausea, sweating, and dizziness similar to serotonin syndrome. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum LFTs. May cause lowered serum sodium; may cause platelet dysfunction.

# SIDE EFFECTS

#### Frequent

Nausea (26%); somnolence (23%); headache, dry mouth (18%); asthenia

(15%); constipation (15%); dizziness, insomnia (13%); diarrhea (12%); diaphoresis (11%); tremor (8%). Occasional

Decreased appetite, respiratory disturbance (such as increased cough) (6%); anxiety, nervousness (5%); flatulence, paresthesia, yawning (4%); decreased libido, sexual dysfunction, abdominal discomfort (3%).

#### Rare

Palpitations, vomiting, blurred vision, altered taste, confusion, restless legs syndrome; may affect male sperm quality.

# SERIOUS REACTIONS

• Overdose may produce seizures, nausea, vomiting, agitation, and restlessness (serotonin syndrome).

- · Bleeding with platelet dysfunction.
- Hyponatremia and SIADH in elderly especially.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with suicidal tendency, cardiac disease, a history of seizures, impaired platelet aggregation, mania, hepatic and renal impairment, in volume-depleted patients, and in those using diuretics. Paroxetine use is not recommended in pregnancy due to a potential for teratogenic and nonteratogenic adverse effects and neonatal withdrawal. It is distributed in breast milk. The safety and efficacy of this drug have not been established in children. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2

mo of therapy or following dosage adjustments. In elderly patients, agerelated renal impairment may require dosage adjustment.

Alcohol and tasks that require mental alertness or motor skills should be avoided. CBC and liver and renal function tests should be performed before and periodically during therapy, especially with longterm use.

#### Storage

Store all products at room temperature.

#### Administration

! Make sure at least 14 days elapse between the use of MAOIs and paroxetine.

Take paroxetine as a single morning dose. Give it with food or milk if GI distress occurs. Scored tablets may be crushed or broken.

If discontinuing, expect tapering of dose to avoid withdrawal syndrome.

#### Pazopanib

pay-zoe'pan-ib

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, signal transduction inhibitor.

# **MECHANISM OF ACTION**

An oral multikinase inhibitor of angiogenesis. The drug inhibits vascular endothelial growth factor receptor (VEGFR)-1, VEGFR-2, VEGFR-3, platelet-derived growth factor receptor (PDGFR)- $\alpha$  and - $\beta$ , fibroblast growth factor receptor (FGFR)-1 and -3, cytokine receptor (Kit), interleukin-2 receptor inducible T-cell kinase (Itk), leukocyte-specific protein tyrosine kinase (Lck), and transmembrane glycoprotein receptor tyrosine kinase (c-Fms). *Therapeutic Effect:* Inhibits tumor growth.

### PHARMACOKINETICS

Well absorbed after oral administration of whole tablets; administration of crushed tablet greatly increases drug exposure and therefore tablets should not be crushed. Systemic exposure also increased when given with food, so the drug should be given on empty stomach. Protein binding: 99%. Substrate for P-glycoprotein and breast cancer resistant protein (BCRP). Hepatic metabolism via CYP3A4 (major), CYP1A2 (minor) and CYP2C8 (minor). Pazopanib inhibits most CYP450 isoenzymes, as well as UGT. Fecal excretion. Half-life: 30.9 h (increased in hepatic impairment or hyperbilirubinemia).

#### AVAILABILITY

Tablet: 200 mg.

# INDICATIONS AND DOSAGES Advanced renal cell cancer

PO

*Adults, Elderly.* 800 mg once daily on an empty stomach.

#### Dosage adjustment for moderate hepatic impairment

200 mg orally once daily. Not recommended in patients with severe hepatic impairment.

#### Dosage adjustment if strong CYP3A4 inhibitors used

Reduce dosage to 400 mg once daily if interacting drug cannot be avoided.

# CONTRAINDICATIONS

None absolute. Hypersensitivity, severe hepatic impairment potential contraindications.

# INTERACTIONS

## Drug

CYP3A4 inhibitors (e.g., ketoconazole, nefazodone, clarithromycin, itraconazole, protease inhibitors for HIV):

Pasopanib levels may increase. Consider reducing dose if alternate treatment not available.

# CYP3A4 inducers (e.g., rifampin, phenytoin, carbamazepine,

**phenobarbital):** May increase metabolism of pazopanib and thus decrease levels. If inducer must be used, then pazopanib is not recommended.

**Warfarin:** Pazopanib has the potential to compete for CYP2C9 metabolism and could possible alter warfarin response; monitor INR.

### Herbal

**St. John's wort:** Do not use with pazopanib as it will decrease pazopanib levels and efficacy. **Food** 

All food: Increased pazopanib exposure and risk of side effects; take on empty stomach.

Grapefruit juice: May increase pazopanib exposure; do not take with grapefruit juice.

# DIAGNOSTIC TEST EFFECTS

Decreased WBC, platelets. Increased LFTs, TSH. Electrolyte abnormalities, ECG changes. May decrease magnesium and phosphorus levels, increase blood glucose.

# SIDE EFFECTS

# Frequent (> 20%)

Diarrhea, hypertension, hair color changes (depigmentation), nausea, anorexia, fatigue, and vomiting. Musculoskeletal pain, dyspnea, cough.

# Occasional

Alopecia, chest pain, dysgeusia (altered taste), dyspepsia, facial edema, hand-foot syndrome, proteinuria, rash, skin depigmentation, and weight loss. **Rare** 

Hypothyroidism.

# SERIOUS REACTIONS

 Serious hypersensitivity reactions occur rarely, and may include angioedema.

- · Leukopenia, thrombocytopenia.
- · Severe and fatal hepatotoxicity.
- · Serious bleeding (CNS,

gastrointestinal, hemoptysis, etc.) or GI perforations.

· Arterial thrombosis.

• QT prolongation or arrhythmia, heart failure.

· Delayed wound healing.

# PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with hepatic disease, high blood pressure, cardiac disease, heart failure or arrhythmia, QT prolongation, a history of stroke, GI disease with GI bleeding in the past 6 months or a history of GI perforation or fistula, thyroid disease, had recent surgery or scheduled for surgery. Do not use in patients who are pregnant or planning to become pregnant; the drug can cause fetal harm. It is not known if pazopanib passes into breast milk; do not breastfeed while taking this medication. This drug has not been approved for use in children.

#### Storage

Store tablets at room temperature. Administration

Give daily without food on an empty stomach (at least 1 h before or 2 h after a meal). Do not crush tablets. Do not take with grapefruit juice.

# Pegaptanib

peg-ap'ta-nib

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Ophthalmics, biologic agents, vascular endothelial growth factor (VEGF) inhibitor.

# **MECHANISM OF ACTION**

A biologic agent that binds to and inhibits vascular endothelial growth factor (VEGF). VEGFs induce angiogenesis and increase vascular permeability and inflammation, all of which contribute to the neovascular (wet) form of agerelated macular degeneration (AMD). *Therapeutic Effect:* Inhibits progression of age-related macular degeneration.

# PHARMACOKINETICS

Some systemic absorption after intraocular administration. Any absorbed drug is primarily eliminated in the urine as parent drug and metabolites. Metabolized primarily by endo- and exonucleases. *Half-life:* 10 days (range, 6-14 days).

# AVAILABILITY

Injection: 0.3-mg prefilled syringe.

#### INDICATIONS AND DOSAGES • Wet age-related macular

degeneration

INTRAVITREOUS INJECTION *Adults, Elderly.* 0.3 mg intravitreally, repeated every 6 wks.

# CONTRAINDICATIONS

Ocular or periocular infections, hypersensitivity to pegaptanib.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Temporary blurred vision, headache, dizziness.

#### Occasional

Burning sensation, eye pain, redness, light sensitivity, visual disturbances, increased intraocular pressure, corneal edema, eye discharge, vitreous floaters or opacities, keratitis.

#### Rare

Eye infection, cataract, allergic response, vision loss, nausea.

# SERIOUS REACTIONS

 Serious hypersensitivity reactions occur rarely, and may include angioedema.

• Endophthalmitis, retinal detachment, traumatic cataract or other event due to eye injection.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with severe renal insufficiency. Use in pregnancy only if clearly necessary; use caution during lactation. The safety and efficacy of pegaptanib have not been established in children. There are no specific age-related precautions for elderly patients.

Notify the physician if there is any sign of eye infection, eye pain, or visual loss. Report if the eye becomes red, sensitive to light, painful, or if there is a change in vision. Monitoring may consist of

# Pegaspargase

peg-as′par-jase ★ Oncaspar

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antineoplastics, natural and semisynthetic, asparaginase analog

# **MECHANISM OF ACTION**

An enzyme that breaks down extracellular supplies of the amino acid asparagine, which is necessary for the survival of leukemic cells. Binding to polyethylene glycol decreases the antigenicity of pegaspargase, making it less likely to cause a hypersensitivity reaction. Cell cycle–phase specific for G1 phase of cell division. *Therapeutic Effect*: Interferes with DNA, RNA, and protein synthesis in leukemic cells.

# AVAILABILITY

Injection: 750 international units/mL.

#### INDICATIONS AND DOSAGES

 Acute lymphocytic leukemia in combination with other chemotherapeutic agents IV. IM

Adults, Elderly, Children 1 yr and older. 2500 international units/m<sup>2</sup> every 14 days.

# IV INCOMPATIBILITIES

Do not mix with other drugs at Y-site.

Compatible only with dextrose 5% and 0.9% NaCl.

# CONTRAINDICATIONS

Previous anaphylactic reaction or significant hemorrhagic event or thrombosis associated with L-asparaginase or pegaspargase therapy, pancreatitis (current or previous).

# INTERACTIONS

#### Drug

Drug interactions are not well documented.

Antigout medications: May decrease the effects of these drugs. Live-virus vaccine: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

**Methotrexate:** May block the effects of methotrexate. To avoid, give pegaspargase at least 10-14 days prior to MTX or shortly after MTX.

**Steroids, vincristine:** May increase hyperglycemia, risk of neuropathy, and disturbances of erythropoiesis.

Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN, blood ammonia, and blood glucose levels; serum alkaline phosphatase, bilirubin, uric acid, AST (SGOT), and ALT (SGPT) levels; PT; and aPTT. May decrease blood clotting factors (including plasma fibrinogen, antithrombin, and plasminogen) as well as serum albumin, calcium, and cholesterol levels.

# SIDE EFFECTS

#### Frequent

Allergic reaction (including rash, urticaria, arthralgia, facial edema, hypotension, and respiratory distress). Occasional

Central nervous system (CNS) effects (including confusion,

drowsiness, depression, nervousness, and fatigue), stomatitis, hypoalbuminemia, uric acid nephropathy (manifested as edema of the feet or lower legs), hyperglycemia.

#### Rare

Hyperthermia (fever or chills), CNS thrombosis.

#### SERIOUS REACTIONS

• The patient may have a hypersensitivity reaction, including anaphylaxis, during therapy.

• Pancreatitis, as evidenced by severe abdominal pain with nausea and vomiting, is a common reaction.

• Hepatotoxicity, as evidenced by jaundice and abnormal hepatic enzyme test results, may occur, especially in patients with preexisting hepatic impairment.

• An increased risk of hematologic toxicity and coagulation disorders occurs occasionally.

· Seizures occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Vaccinations and coming in contact with crowds and people with known infections should be avoided.

Any hypersensitivity reactions with L-asparginase therapy previously warrants careful consideration as to whether this drug should be used. Nausea may occur but will decrease during therapy. Notify the physician if fever, signs of local infection, or unusual bleeding from any site occurs. Antihistamines, epinephrine, and corticosteroids should be kept readily available before and during pegaspargase administration to ensure an adequate airway and treat any allergic reaction.

Adequate hydration should be maintained to protect against renal impairment. CBC, bone marrow tests, fibrinogen level, PT, aPTT, liver, pancreatic and renal function test results should be monitored before beginning therapy and whenever a week or longer has elapsed between drug doses.

#### Storage

Refrigerate—do not freeze—vials. Discard the solution if it is cloudy or contains a precipitate. Also discard it if it has been stored at room temperature for longer than 48 h or if the vial has been previously frozen because freezing destroys the drug's potency.

#### Administration

CAUTION: Observe and exercise usual cautions for handling and preparing solutions of cytotoxic drugs.

Avoid excessive agitation of the vial (do not shake). The IM administration route is preferred because it poses less risk of coagulopathy, hepatotoxicity, and GI or renal disorders than the IV route. Use one dose per vial; do not reenter the vial. Discard any unused portion.

Administer no more than 2 mL at any one IM site. Use multiple injection sites if more than 2 mL is being administered.

For IV, add dose to 100 mL 0.9% NaCl or D5W and administer the drug through IV infusion that is already running. Infuse over 1-2 h.

Observe patient for at least 1 h after each dose of pegaspargase.

a check of intraocular pressure and also for perfusion of the optic nerve head immediately after the injection, within 30 min after the injection, and within the first week after the injection.

#### Storage

Refrigerate prefilled syringe. Do not freeze or shake.

#### Administration

Do not give intravenously. Only for use by ophthalmologists trained in these specialized intravitreal administration techniques. Do not mix with any other drugs or solutions. Adequate anesthesia and a broad-spectrum microbicide are necessary before injection. Prepare the syringe as directed. Use controlled aseptic conditions, which include the use of sterile gloves, a sterile drape, and a sterile eyelid speculum (or equivalent). Following the injection, monitor patient for elevation in intraocular pressure (IOP) and for endophthalmitis.

# Pegfilgrastim

pehg-phil-gras'tim Meulasta Do not confuse Neulasta with Neumega.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Hematopoietic agents, colony-stimulating factors (CSF)

#### **MECHANISM OF ACTION**

A colony-stimulating factor that regulates the production of neutrophils within bone marrow. Also a glycoprotein that primarily affects neutrophil progenitor proliferation, differentiation, and selected end-cell functional activation. *Therapeutic Effect:* Increases phagocytic ability and antibody-dependent destruction; decreases incidence of infection.

# PHARMACOKINETICS

Readily absorbed after subcutaneous administration. *Half-life:* 15-80 h.

### AVAILABILITY

Solution for Injection: 6 mg/0.6 mL prefilled syringe.

# INDICATIONS AND DOSAGES

 To decrease the incidence of infection and febrile neutropenia during myelosuppressive chemotherapy for non-myeloid malignancies

SC

*Adults, Elderly* > 45 kg. Give as a single 6-mg injection once per chemotherapy cycle.

# CONTRAINDICATIONS

Hypersensitivity to *Escherichia coli*-derived proteins, pegfilgrastim, filgrastim, or any other components of the product. Do not use for peripheral blood progenitor cell mobilization.

# INTERACTIONS

Drug

G-CSF, other exogenous growth factors: May result in development of antibodies causing immunemediated neutropenia. Lithium: May potentiate the release of neutrophils.

Herbal

None known.

Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

Expect increased WBC counts. May increase LDH concentrations, leukocyte alkaline phosphatase scores, and serum alkaline phosphatase and uric acid levels.

# SIDE EFFECTS

**Frequent (> 25%)** 

Bone pain.

# Occasional.

Nausea, fatigue, headache, arthralgia, peripheral edema, antibody formation, injection site reaction.

### SERIOUS REACTIONS

• Allergic reactions, such as anaphylaxis, rash, and urticaria, occur rarely.

• Cytopenia resulting from an antibody response to growth factors occurs rarely.

• Splenic rupture occurs rarely; assess for left upper abdominal or shoulder pain.

• Adult respiratory distress syndrome (ARDS) may occur in patients with sepsis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with concurrent use of medications with myeloid properties and in those with sickle cell disease. The G-CSF receptor through which pegfilgrastim acts has been found on tumor cell lines and it cannot be excluded that pegfilgrastim might influence tumor growth. It is unknown whether pegfilgrastim crosses the placenta or is distributed in breast milk. Safety and efficacy of pegfilgrastim have not been established in children. The prefilled syringe should not be used in infants, children, and adolescents weighing < 45 kg. No agerelated precautions have been noted in elderly patients.

CBC, hematocrit value, and platelet count should be obtained before initiation of pegfilgrastim therapy and routinely thereafter. Pattern of daily bowel activity and stool consistency should be assessed. Be aware of signs of peripheral edema, particularly behind the medial malleolus, which is usually the first area to show peripheral edema, and for evidence of mucositis (such as red mucous membranes, white patches, and extreme mouth soreness) and stomatitis.

#### Storage

Store in refrigerator in the carton until use but may warm to room temperature up to 48 h before use. Discard if left at room temperature for longer than 48 h. Protect from light. Avoid freezing, but if accidentally frozen, may allow to thaw in refrigerator before administration. Discard if freezing takes place a second time. Discard if discoloration or precipitate is present.

#### Administration

! Do not administer from 14 days before to 24 h after cytotoxic chemotherapy, as prescribed.

Do not shake prefilled syringe as this may disrupt the drug. If syringe is shaken, discard; do not use.

Pegfilgrastim should be injected subcutaneously. Compliance with pegfilgrastim regimen is important.

# Peginterferon Alfa-2a

peg-inn-ter-fear'on

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Biologic response modulators, interferons

# **MECHANISM OF ACTION**

An immunomodulator that binds to specific membrane receptors on the cell surface, inhibiting viral replication in virus-infected cells, suppressing cell proliferation, and producing reversible decreases in leukocyte and platelet counts. *Therapeutic Effect:* Inhibits hepatitis C virus.

# PHARMACOKINETICS

Readily absorbed after SC administration, with peak serum levels attained at 72-96 h. Excreted by the kidneys. *Half-life:* 80 h.

# AVAILABILITY

Injection: 180 mcg/mL. Prefilled Syringes for Injection: 180 mcg/0.5 mL.

# INDICATIONS AND DOSAGES Hepatitis C

SC (AS MONOTHERAPY) Adults 18 yr and older, Elderly. 180 mcg injected in abdomen or thigh once weekly for 48 wks. SC (IN COMBINATION WITH RIBAVIRIN)

180 mcg once weekly plus ribavirin (800-1200 mg/day in 2 divided doses) for 24-48 wks.

#### ▶ Dosage in renal impairment For patients who require hemodialysis, dosage is 135 mcg injected in the abdomen or thigh once weekly for 48 wks.

Dosage in hepatic impairment For patients with progressive ALT (SGPT) increases above baseline values, dosage is 135 mcg injected in the abdomen or thigh once weekly for 48 wks.

#### Dosage adjustment for hematology parameters

For patients with an absolute neutrophil count < 750 cells/mm<sup>3</sup>, reduce dose to 135 mcg (0.75 mL). For those with an absolute neutrophil count < 500 cells/mm<sup>3</sup>, discontinue treatment until the count returns to 1000 cells/mm<sup>3</sup>. For those with a platelet count < 50,000 cells/mm<sup>3</sup>, reduce dose to 90 mcg.

# CONTRAINDICATIONS

Hypersensitivity to *Escherichia coli*, protein, autoimmune hepatitis, decompensated hepatic disease, infants, neonates, benzyl alcohol hypersensitivity.

If used with ribavirin, also carefully review ribavirin contraindications.

# INTERACTIONS

#### Drug

Bone marrow depressants: May increase myelosuppression. Theophylline: May increase the serum level of theophylline. Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase ALT (SGPT) level. May decrease the absolute neutrophil, platelet, and WBC counts. May cause a slight decrease in blood hemoglobin level and hematocrit.

# SIDE EFFECTS

Frequent

Headache.

Alopecia, nausea, insomnia, anorexia, dizziness, diarrhea, abdominal pain, flu-like symptoms, psychiatric reactions (depression, irritability, anxiety), injection site reaction, impaired concentration, diaphoresis, dry mouth, nausea, yomiting.

# SERIOUS REACTIONS

• Serious, acute hypersensitivity reactions, such as urticaria, angioedema, bronchoconstriction, and anaphylaxis, may occur. Other rare reactions include pancreatitis, colitis, hyperthyroidism or hypothyroidism, endocrine disorders (e.g., diabetes mellitus), benzyl alcohol hypersensitivity, ophthalmologic disorders, and pulmonary disorders.

 Serious infections (bacterial, viral, fungal), some fatal, have been reported, especially if neutropenia occurs. Begin appropriate antiinfective therapy immediately and consider α interferon discontinuation.

#### **PRECAUTIONS & CONSIDERATIONS**

Monitor for new or exacerbation of the following serious events, some of which may become life threatening. Patients with persistently severe or worsening signs or symptoms should have their therapy withdrawn: Neuropsychiatric reactions, including severe depression. High/ persistent fever may indicate serious infection, particularly in patients with neutropenia. Interferons suppress bone marrow function and may cause severe cytopenias or bleeding that will require dose reduction or discontinuation. Those with HIV infection are most at risk. Watch for hypertension, supraventricular arrhythmias, chest pain, and myocardial infarction; administer with caution to those with preexisting or unstable cardiac disease. Ischemic and hemorrhagic cerebrovascular events have been observed. Patients with cirrhosis may be at risk of hepatic decompensation. Discontinue if Child-Pugh score  $\geq 6$ occurs. Hyperglycemia, hypoglycemia, and diabetes mellitus may worsen. Use with caution in patients with autoimmune disorders. Pulmonary disease, inflammatory bowel disease (colitis), and pancreatitis may be induced or aggravated. Use with caution in renal impairment (CrCl < 50 mL/min); note that ribavirin cotherapy must not be used if CrCl < 50 mL/min.

May aggravate hypothroidism and hyperthyroidism. Peginterferon alfa-2a may cause spontaneous abortion. It is unknown whether peginterferon alfa-2a is distributed in breast milk. The safety and efficacy of peginterferon alfa-2a have not been established in children younger than 18 yr. Cardiac, central nervous system (CNS), and systemic effects may be more severe in elderly patients, particularly in those with renal impairment. Avoid performing tasks requiring mental alertness or motor skills until response to the drug has been established.

Flu-like symptoms may occur but usually diminish with continued therapy. Notify the physician of depression or suicidal thoughts. CBC, ECG, urinalysis, BUN level, and serum alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels should be obtained before and routinely during therapy. Chest radiographs should be assessed for pulmonary infiltrates.

#### Storage

Refrigerate vials and prefilled syringes; protect from light and freezing.

#### Administration

Inject the drug subcutaneously in the abdomen or thigh. The drug's therapeutic effect should appear in 1-3 mo.

# Peginterferon Alfa-2b

peg-in-ter-feer'on ★ PegIntron, Sylatron ♥ Unitron PEG

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Biologic response modifier, interferons

# **MECHANISM OF ACTION**

An immunomodulator that inhibits viral replication in virusinfected cells, suppresses cell proliferation, increases phagocytic action of macrophages, and augments specific cytotoxicity of lymphocytes for target cells. *Therapeutic Effect*: Inhibits hepatitis C virus (HCV).

# AVAILABILITY

Injection Powder for Reconstitution, (PegIntron): 50 mcg, 80 mcg, 120 mcg, 150 mcg. Redipen Prefilled Syringes: 50 mcg/0.5 mL, 80 mcg/0.5 mL, 120 mcg/0.5 mL, 150 mcg/0.5 mL.

*Injection Powder for Reconstitution, (Sylatron):* 296 mcg, 444 mcg, or 888 mcg per vial.

### INDICATIONS AND DOSAGES

 Chronic hepatitis C, in conjunction with ribavirin and possibly anti-HCV antiviral protease inhibitor

SC (PEGINTRON ONLY) Adults, Elderly. Administer 1.5 mcg/kg once weekly based on body weight (see chart below) and give on the same day each week. Given in combination with ribavinin (oral dose is body weight dependent in range of 800-1400 mg PO per day). May also be given with HCV-specific protease inhibitors.

Patient naïve to treatment receive treatment for 48 weeks (genotype 1) or 24 weeks (genotype 2 or 3). Patients with prior treatment-resistant therapy are treated for 48 weeks regardless of genotype.

Weight (Kg)	PegIntron Dose (mcg)
<40 kg	50 mcg

Weight (Kg)	PegIntron Dose (mcg)
40-50 kg	64 mcg
51-60 kg	80 mcg
61-75 kg	96 mcg
76-85 kg	120 mcg
86-105 kg	150 mcg
>105 kg	calculate exact dose

SC (PEGINTRON ONLY)

*Children 3-17 yr of age.* Administer 60 mcg/m<sup>2</sup> once weekly for 48 weeks (genotype 1) or 24 weeks (genotype 2 or 3) on the same day each week. (NOTE: Given in combination with ribavirin [15 mg/kg/day PO divided into 2 doses]; see ribavirin literature).

# Chronic hepatitis C monotherapy SC

Adults. 1 mcg/kg/wk, with treatment continued for 1 year. Monotherapy only for those responsive to interferon alone who cannot take with ribavirin.

# Advanced melanoma, adjuvant therapy following resection

SC (SYLATRON ONLY) *Adults.* 6 mcg/kg once weekly for 8 doses followed by 3 mcg/kg once weekly for up to 5 yrs.

Dosage adjustments (all products). Expect dosage modification based on severity grade of side effects until the adverse event abates or decreases in severity. If persistent or recurrent, adverse drug reactions occur despite adjustments, discontinue treatment.

# CONTRAINDICATIONS

Hypersensitivity to *Escherichia*. *coli*, protein, autoimmune hepatitis, decompensated hepatic disease, infants, neonates. If used with ribavirin, also carefully review ribavirin contraindications.

# INTERACTIONS

### Drug

Bone marrow depressants: May increase myelosuppression. Theophylline: May increase the serum level of theophylline. Herbal

#### Herba

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose and ALT (SGPT) levels. May decrease blood neutrophil and platelet counts.

#### SIDE EFFECTS

#### Frequent

Flu-like symptoms; inflammation, bruising, pruritus, and irritation at injection site.

#### Occasional

Psychiatric reactions (depression, anxiety, emotional lability, irritability), insomnia, alopecia, diarrhea.

#### Rare

Rash, diaphoresis, dry skin, dizziness, flushing, vomiting, dyspepsia.

# SERIOUS REACTIONS

 Serious, acute hypersensitivity reactions (such as urticaria, angioedema, bronchoconstriction, and anaphylaxis), pulmonary disorders, endocrine disorders (e.g., diabetes mellitus), hypothyroidism, hyperthyroidism, and pancreatitis occur rarely.

• Ulcerative colitis may occur within 12 wks of starting treatment.

#### **PRECAUTIONS & CONSIDERATIONS**

Monitor for new or exacerbation of the following serious events, some of which may become life threatening. Patients with persistently severe or worsening signs or symptoms should have their therapy withdrawn. Neuropsychiatric reactions, including severe depression. High/ persistent fever may indicate serious infection, particularly in patients with neutropenia. Interferons suppress bone marrow function and may cause severe cytopenias or bleeding that will require dose reduction or discontinuation. Those with HIV infection are most at risk. Watch for hypertension, supraventricular arrhythmias, chest pain, and myocardial infarction; administer with caution to those with preexisting or unstable cardiac disease or pulmonary disease. Ischemic and hemorrhagic cerebrovascular events have been observed. Patients with cirrhosis may be at risk of hepatic decompensation. Discontinue if Child-Pugh score ≥ 6 occurs. Hyperglycemia, hypoglycemia, thyroid disease, and diabetes mellitus may worsen. Use with caution in patients with autoimmune disorders. Pulmonary disease, inflammatory bowel disease (colitis), and pancreatitis may be induced or aggravated. Use with caution in renal impairment (CrCl < 50 mL/min); note that ribavirin cotherapy for hepatitis C must not be used if CrCl < 50 mL/ min. Peginterferon alfa-2b may cause spontaneous abortion. It is unknown whether peginterferon alfa-2b is distributed in breast milk. The safety and efficacy of peginterferon alfa-2b have not been established in children younger than 3 yr.

Flu-like symptoms may occur but usually diminish with continued therapy. Notify the physician of bloody diarrhea, fever, persistent abdominal pain, depression, signs of infection, or unusual bruising or bleeding. CBC, ECG, urinalysis, BUN level, and serum alkaline phosphatase, creatinine, AST (SGOT), and ALT (SGPT) levels should be obtained before and routinely during therapy. Chest radiographs should be assessed for pulmonary infiltrates.

#### Storage

Store vials at room temperature. Use it immediately after reconstitution or, if necessary, refrigerate it for up to 24 h.

Refrigerate prefilled syringes (Redipens); protect from light and freezing. Once reconstituted, may store up to 24 h under refrigeration. Administration

Expect to premedicate with acetaminophen (500-1000 mg PO) or ibuprofen 30 min prior to the first dose, and as needed with subsequent dosing.

*For PagIntron:* Drug vials are reconstitued with the supplied diluent as directed in the PegIntron insert. Redipens are more commonly used. To reconstitute the Redipen, hold the pen upright (dose button facing down) and press the 2 halves of the pen together until there is an audible click. Gently invert the pen to mix the solution. Do *not* shake.

For Sylatron: Drug vials are reconstituted with 0.7 mL of sterile water for injection as directed in the Sylatron insert. Gently swirl, do not shake. Administration: Administer all brands SC, on the same day each week. Proper sites are the thigh, upper arm, or abdomen (except within a few inches of the navel). Rotate injection sites. Do not inject solution into an area where the skin is irritated, red, bruised, infected or has scars, stretch marks, or lumps. Compliance with therapy is critical to see intended results.

#### **Pegloticase**

peg-lot'e-case ★ 👾 Krystexxa

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

#### Classification:

Antihyperuricemic, uricase enzyme

#### MECHANISM OF ACTION

A recombinant, pegylated form of porcine-like urate oxidase (uricase), an enzyme not endogenous to humans that catalyzes enzymatic oxidation of uric acid into a readily excreted metabolite, allantoin, thus lowering high serum uric acid levels. *Therapeutic Effect:* Reduces uric acid concentrations in both serum and urine.

#### PHARMACOKINETICS

Onset of action within 24 h of first dose. No significant accumulation occurs. The enzyme is cleared metabolically. Effectively lowers uric acid for about 300 h. *Half-life:* Approximately 12-14 days.

#### AVAILABILITY

Solution for Injection: 8 mg/mL.

# INDICATIONS AND DOSAGES Refractory chronic gout: IV INFUSION

*Adults, Elderly.* 8 mg IV infusion given q2wk. NOTE: Concurrent gout flare prophylaxis (i.e., NSAID or colchicine at least 1 wk before the initiation of treatment) is recommended for at least the first 6 mos of therapy unless medically contraindicated or not tolerated.

# CONTRAINDICATIONS

Previous anaphylaxis to pegloticase. Glucose-6-phosphate dehydrogenase (G6PD) deficiency.

# **INTERACTIONS**

#### Drug

Allopurinol: In theory, may increase risk of xanthine renal calculi or nephropathy.

**Pegylated medications:** Pegloticase antibodies in theory might bind to these medications.

#### Herbal

None known.

Food None known.

# **DIAGNOSTIC TEST EFFECTS**

! Follow lab directions for the most current recommendations regarding appropriate handling of uric acid laboratory samples; similar products have been reported to interfere with uric acid sampling and require special handling; it is not clear if pegloticase also causes these issues.

# IV INCOMPATIBILITIES

Do not mix or infuse pegloticase with any other medications.

# SIDE EFFECTS

#### Frequent

Anaphylaxis and infusion-related reactions. Nausea, contusion or ecchymosis, nasopharyngitis, constipation, chest pain, and vomiting. Gout flares may increase in first 3 mos of treatment. Occasional

Headache, exacerbation of congestive heart failure.

# SERIOUS REACTIONS

• Severe hypersensitivity, including anaphylaxis, is reported in up to 6.5% of patients. Infusion-related reactions include symptoms that may overlap, such as urticaria (10.6%), dyspnea (7.1%), chest discomfort (9.5%), chest pain (9.5%), erythema (9.5%), and pruritus.

• Infusion reactions: Infusion reaction is higher in patients who have lost therapeutic response (e.g., anti-pegloticase antibodies).

# **PRECAUTIONS & CONSIDERATIONS**

Screen patients at higher risk for G6PD deficiency (e.g., those of African and Mediterranean ancestry) prior to treatment. Hydrogen peroxide, one of the by-products of breakdown of uric acid to allantoin, can induce hemolytic anemia or methemoglobinemia, especially in patients with G6PD deficiency or methemoglobin reductase deficiency. Appropriate patient monitoring and support measures should be given in the case of methemoglobinemia. Observe patients with heart failure for worsening of symptoms during treatment. Pregnant women should receive pegloticase only if clearly needed. It is unknown whether the drug crosses the placenta. It is not known if pegloticase is excreted in breast milk. Safety and efficacy have not been established in children.

Observe closely for infusion and allergic reactions, slowing infusion or stopping it if necessary. During therapy, good fluid intake should be encouraged; intake and output should be monitored. Check urine for cloudiness and unusual color and odor. Serum uric acid levels should also be assessed. If uric acid level increases to above 6 mg/dL, particularly when 2 consecutive levels above 6 mg/dL are observed, this may indicate loss of response to treatment; consider discontinuation.

#### Storage

Refrigerate unopened vials, protect from light, and do not shake or freeze.

Once diluted as an infusion, may refrigerate and use within 4 h of preparation; protect from light. Do not use if precipitate forms or solution is discolored. Allow the infusion to come to room temperature before giving to the patient.

#### Administration

! Patients should be premedicated with antihistamines and corticosteroids.

! For intravenous (IV) infusion use only. Do *not* give as an IV push or bolus.

Withdraw 1 mL (8 mg) of pegloticase from the vial and add to 250 mL of either 0.9% NaCl or 0.45% NaCl for injection. Invert gently to mix in bag. Do not shake.

Infuse IV over 120 min via an infusion pump. Monitor patients closely for signs and symptoms of infusion reactions. In the event of an infusion reaction, the infusion should be slowed, or stopped and restarted at a slower rate. If a severe infusion reaction occurs, discontinue infusion and institute treatment as needed.

Based on similar drugs, use a different line than the one used for other medications. If use of a separate line is not possible, it is recommended that the line be flushed with at least 15 mL of 0.9% NaCl prior to and after infusion with pegloticase.

After the infusion completes, the patient should be observed for 1 h for the occurrence of hypersensitivity or infusion-related reactions.

# Pegvisomant

peg-vis'oh-mant Somavert Do not confuse Somavert with somatrem or somatropin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Acromegaly agent, growth hormone analog

# **MECHANISM OF ACTION**

A protein that selectively binds to growth hormone (GH) receptors on cell surfaces, blocking the binding of endogenous growth hormones and interfering with growth hormone signal transduction. *Therapeutic Effect:* Decreases serum concentrations of insulin-like growth factor 1 (IGF-1) and other GH-responsive serum proteins.

# PHARMACOKINETICS

Not distributed extensively into tissues after SC administration. Less than 1% excreted in urine. *Half-life:* 6 days.

# AVAILABILITY

*Powder for Injection:* 10-mg, 15-mg, 20-mg vials.

# INDICATIONS AND DOSAGES Acromegaly

SC

*Adults, Elderly.* Initially, 40 mg as a loading dose, then 10 mg daily. After 4-6 wks, adjust dosage in 5-mg increments, up to 30 mg/day, based on serum IGF-1 concentrations.

# CONTRAINDICATIONS

Latex allergy (stopper on vial contains latex), intravenous administration.

# INTERACTIONS

#### Drug

Insulin, oral antidiabetics: May enhance the effects of these drugs, possibly resulting in hypoglycemia. Dosage should be decreased when initiating pegvisomant therapy. **Opioids:** Decreased serum

pegvisomant levels.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

Interferes with measurement of serum growth hormone concentration. May markedly increase AST (SGOT), ALT (SGPT), and serum transaminase levels. Decreases effect of insulin on carbohydrate metabolism.

# SIDE EFFECTS

#### Frequent

Infection (cold symptoms, upper respiratory tract infection, blister, ear infection), diarrhea, nausea.

# Occasional

Back pain, dizziness, injection site reaction, peripheral edema, paresthesia, sinusitis.

Rare

Diarrhea, paresthesia.

# SERIOUS REACTIONS

· Pegvisomant use may markedly elevate liver function test results, including serum transaminase levels. Substantial weight gain occurs rarely.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus and in elderly patients. It is unknown whether pegvisomant is excreted in breast milk. The safety and efficacy of pegvisomant have not been established in children. In elderly patients, treatment should begin at the low end of the dosage range.

Notify the physician of yellowing of the skin or sclera of eyes or any other adverse effects. Serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels should be monitored. Serum IGF-1 concentrations should be obtained 4-6 wks after therapy begins and periodically thereafter. The drug dosage should be adjusted based on these results, not on growth hormone assays. Progressive tumor growth with periodic imaging scans of the sella turcica should be monitored with tumors that secrete growth hormone. Diabetics should be assessed for hypoglycemia.

#### Storage

Store unreconstituted vials in the refrigerator. Administer the drug within 6 h of reconstitution.

#### Administration

The solution normally appears clear after reconstitution. Discard the solution if it appears cloudy or contains particles. Withdraw 1 mL sterile water for injection and inject it into the vial of pegvisomant, aiming the stream against the glass wall. Hold the vial between the palms of both hands and roll it gently to dissolve the powder; do not shake. Administer only one dose from each vial subcutaneously. Rotate injection sites daily.

# Pemirolast Potassium

peh-meer'oh-last poe-tass'ee-um Alamast

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Ophthalmic. ophthalmic anti-inflammatory

# Pemetrexed

pem-eh-trex'ed Alimta Do not confuse Pemetrexed with pralatrexate, or Alimta with Amitiza.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Antineoplastics, folic acid antagonist

# **MECHANISM OF ACTION**

An antimetabolite that disrupts folate-dependent enzymes essential for cell replication. *Therapeutic Effect:* Inhibits the growth of malignant cell lines.

# PHARMACOKINETICS

Protein binding: 81%. Most (70%-90%) of pemetrexed is eliminated in the urine as unchanged drug. Clearance is tied to glomerular filtration and tubular secretion. Not known if dialyzed. *Half-life:* 3.5 h (prolonged if CrCl < 90 mL/min).

# AVAILABILITY

Powder for Injection: 500 mg.

# INDICATIONS AND DOSAGES

! Pretreatment with corticosteroid (e.g., dexamethasone) the day before, day of, and 1 day after infusion, as prescribed, to reduce the incidence and severity of cutaneous reactions. To reduce toxicity, patients *must* take low-dose folic acid dose (usually 0.4-1 mg PO) or multivitamin with such folic acid every day. At least 5 daily doses *must* be taken during the 7-day period prior to the first dose; daily during the full course of therapy; and for 21 days after the last dose. Also give vitamin  $B_{12}$  (1000 mcg IM) for 1 dose during the week preceding the first dose and for every 3 cycles thereafter; the maintenance doses may be given the same day as pemetrexed.

# Malignant pleural mesothelioma, unresectable or nonsquamous nonsmall cell lung cancer IV

Adults, Elderly. 500 mg/m2 infused over 10 min on day 1 of each 21-day cycle when used in combination with cisplatin 75 mg/m2. Reductions in dosages are indicated as follows: For absolute neutrophil count (ANC) < 500 mm<sup>3</sup>, nadir platelets equal to 50,000/mm<sup>3</sup>, grade 3 or grade 4 toxicities, diarrhea requiring hospitalization: Reduce IV dose to 75% of previous dose. For nadir platelets  $< 50,000/mm^3$ regardless of nadir ANC or grades 3 or 4 mucositis: Reduce IV dose to 50% of previous dose. For grades 3 or 4 neurotoxicities or any hematologic or nonhematologic grades 3 or 4 toxicity after 2 dose

# CONTRAINDICATIONS

Hypersensitivity to pemetrexed, mannitol hypersensitivity.

reductions: Discontinue drug.

# INTERACTIONS

#### Drug

**Cisplatin:** Concomitant therapy may augment any adverse reactions. **Live vaccines:** Avoid during treatment.

Nephrotoxic agents, probenecid: May delay pemetrexed clearance. NSAIDs (short-acting, particularly ibuprofen, and long-acting, e.g., piroxicam): Increase the risk of myelosuppression and GI and renal toxicity. If the patient already has mild-moderate renal insufficiency, then short-acting NSAIDS (e.g., ibuprofen) should be discontinued 2 days before, the day of, and for 2 days after pemetrexed; long-acting NSAIDs (e.g., piroxicam) should be discontinued 5 days before, the day of, and for 2 days after pemetrexed. **Herbal** 

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May decrease platelet, RBC, and WBC counts.

# IV INCOMPATIBILITIES

Use only 0.9% NaCl to reconstitute; flush the line before and after the infusion. Do not add any other medications to the IV line. Known to be incompatible with calciumcontaining fluids, including lactated Ringer's injection and Ringer's injection.

# SIDE EFFECTS

#### Frequent

Fatigue, nausea, vomiting, constipation, anorexia, stomatitis, pharyngitis, diarrhea, neutropenia, leukopenia, anemia, thrombocytopenia, chest pains, rash, desquamation, mood alteration or depression, dyspnea.

#### Occasional

Allergic reaction, hypersensitivity, dehydration, creatinine elevation, fever, infection without neutropenia, infection with grade 3 or 4 neutropenia, hypertension, thrombosis, embolism.

#### Rare

Febrile neutropenia, renal failure, esophagitis, odynophagia, dysphagia.

# SERIOUS REACTIONS

• Myelosuppression, manifested as neutropenia, thrombocytopenia, or anemia, may occur.

- · Infection risk due to neutropenia.
- · GI toxicity can be severe.
- Hepatotoxicity.
- Renal toxicity.

• Serious skin reactions, such as desquamation, erythema mulitforme.

#### **PRECAUTIONS & CONSIDERATIONS**

CBC with differential platelet count should be assessed before starting therapy and again on days 8 and 15 of each cycle and before starting a new cycle. New cycles should not be started with ANC < 1500 mm<sup>3</sup>, platelet count  $\leq 100,000$  mm<sup>3</sup>, and creatinine clearance less than 45 mL/min.

Caution is warranted in patients with liver impairment as well as concurrent therapy with aspirin or other NSAIDs. Pemetrexed may be harmful to a fetus, and it is unknown whether pemetrexed is distributed in breast milk. Do not breastfeed once treatment has been initiated. Safety and efficacy of pemetrexed in children younger than 18 yr of age have not been established. Be aware that elderly patients may have higher incidence of fatigue, leukopenia, neutropenia, and thrombocytopenia.

Fastidious oral hygiene should be maintained. Do not have immunizations without physician's approval (drug lowers body's resistance). Crowds and those with infection should be avoided. Contraceptive measures should be used during therapy. Report fever, sore throat, signs of local infection, easy bruising, and unusual bleeding from any site immediately.

#### Storage

Store undiluted vial at room temperature. Reconstituted solution is stable for up to 24 h at room temperature or if refrigerated. Discard any reconstituted material after 24 h.

#### Administration

CAUTION: Observe and exercise usual cautions for handling, preparing, administering, and disposing of cytotoxic drugs.

Be aware that pretreatment with dexamethasone (or equivalent) will reduce the risk and incidence and severity of cutaneous reaction; treatment with folic acid and vitamin  $B_{12}$  will reduce risk of side effects.

Dilute 500-mg vial with 20 mL 0.9% NaCl to provide a concentration of 25 mg/mL. Gently swirl each vial until powder is completely dissolved. Solution appears clear and ranges in color from colorless to yellow or green-yellow. Further dilute prescribed amount of reconstituted solution to 100 mL with preservativefree sodium chloride (0.9% NaCl) and administer as IV infusion over 10 min.

# **MECHANISM OF ACTION**

An antiallergic agent that prevents the activation and release of mediators of inflammation (e.g., mast cells). *Therapeutic Effect:* Reduces symptoms of allergic conjunctivitis.

# PHARMACOKINETICS

Detected in plasma. Excreted in urine. *Half-life:* 4.5 h.

### AVAILABILITY

Ophthalmic Solution: 0.1%.

# INDICATIONS AND DOSAGES Allergic conjunctivitis

OPHTHALMIC Adults, Elderly, Children 3 yr and older. 1-2 drops in affected eye(s) 4 times/day.

#### CONTRAINDICATIONS

Hypersensitivity to any component of the formulation.

# INTERACTIONS

None reported.

#### SIDE EFFECTS

Ophthalmic: Transient ocular stinging, burning, itching, dry eye, foreign-body sensation, tearing. Other: Headache, rhinitis, cold and flu symptoms, sinusitis, sneezing/ nasal congestion.

#### SERIOUS REACTIONS

None reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Safety and efficacy not established in children less than 3 yr of age. Caution if breastfeeding. Storage

# Store at room temperature.

#### Administration

Do not wear contact lens if eyes are red. If eyes are not red, remove contact lens before administration and wait 10 min before reinserting.

Wash your hands before use. Tilt head back slightly and pull lower eyelid down with index finger to form a pouch. To avoid contamination, do not touch tip of bottle to any surface. Instill the prescribed number of drops into the pouch. Close the eye gently for a few moments to spread the drops.

# **Penbutolol**

pen-byoo-toh'lol ★ Levatol Do not confuse with pindolol, Felbatol, or levobunolol.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in the second or third trimester)

#### Classification:

Antihypertensives, β-adrenergic blockers

# **MECHANISM OF ACTION**

An antihypertensive that possesses nonselective  $\beta$ -blocking. Has moderate intrinsic sympathomimetic activity. *Therapeutic Effect:* Decreases heart rate, cardiac contractility, and BP; increases airway resistance, promoting bronchospasm, and decreases myocardial ischemia severity.

# PHARMACOKINETICS

Rapidly and completely (100%) absorbed from the GI tract. Protein binding: 80%-98%. Metabolized in liver. 90% excreted in urine. *Half-life:* 17-26 h.

#### AVAILABILITY

Tablets: 20 mg (Levatol).

# INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults, Elderly.* Initially, 20 mg/day as a single dose. May increase to 40-80 mg/day.

# CONTRAINDICATIONS

Cardiogenic shock, sinus bradycardia, second- or thirddegree AV block, bronchial asthma, uncompensated overt cardiac failure, and those with known hypersensitivity to penbutolol.

# INTERACTIONS

#### Drug

Calcium blockers: Increase risk of conduction disturbances. Clonidine: May potentiate BP effects, especially upon withdrawal. Cimetidine: May increase penbutolol concentrations. Digoxin: Increases concentrations of this drug. Diuretics, other hypotensives: May increase hypotensive effect. Ergot derivatives: May cause peripheral ischemia. Fentanyl: May cause severe hypotension. Hydrocarbon inhalation anesthetics: May increase hypotension, myocardial depression. Indomethacin, NSAIDs: May decrease antihypertensive effect. Insulin, oral hypoglycemics: May mask symptoms of hypoglycemia and prolong hypoglycemic effect of these drugs.

**Lidocaine:** May prolong the elimination of lidocaine leading to toxicity.

**Theophylline:** May reduce elimination of theophylline; may reduce effects of both drugs by pharmacologic antagonism.

Verapamil: May increase risk of hypotension and bradycardia.

#### Sympathomimetics, xanthines: May mutually inhibit effects. Herbal Dong quai: May decrease BP. St. John's wort, yohimbine:

May decrease effectiveness of penbutolol. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase ANA titer, SGOT (AST), SGPT (ALT), alkaline phosphatase, LDH, bilirubin, BUN, creatinine, potassium, uric acid, lipoproteins, triglycerides.

# SIDE EFFECTS

#### Frequent

Fatigue, dizziness, headache, insomnia, alteration of blood sugar levels, cough, bronchospasm.

#### Occasional

Decreased sexual ability, diarrhea, bradycardia, depression or emotional lability, cold hands or feet, constipation, nasal congestion, nausea, vomiting.

#### Rare

Altered taste; hypotension, edema; worsening angina.

# SERIOUS REACTIONS

• Abrupt withdrawal may result in sweating, palpitations, headache, and tremors.

- · AV block, heart failure.
- Hypersensitivity reactions.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with inadequate cardiac function, impaired renal or hepatic function, diabetes mellitus, COPD, myasthenia gravis, peripheral vascular disease, hypotension, and hyperthyroidism. It is unknown whether penbutolol crosses the placenta or is distributed in breast milk. Safety and efficacy of penbutolol have not been established in children. In elderly patients, the incidence of dizziness may be increased.

Dizziness and drowsiness may be experienced during treatment. Avoid alcohol and tasks that require mental alertness or motor skills until the effects of the drug are known. In addition, avoid nasal decongestants and over-the-counter (OTC) cold preparations, especially those containing stimulants, without physician approval. Medication should not be taken when pulse is irregular or < 60beats/min without advice of health care provider.

Abrupt withdrawal should be avoided, especially in hyperthyroidism, which could cause reactions similar to thyroid storm; rebound effects may produce angina or myocardial infarction (MI).

#### Storage

Store at room temperature. Keep tightly closed and protect from light.

#### Administration

May take without regard to food. The full antihypertensive effect of penbutolol should take 1-2 wks. Do not abruptly discontinue penbutolol but withdraw over a period of 1-2 wks.

# Penciclovir **Triphosphate**

pen-sye'kloe-veer ★ 🍁 Denavir Do not confuse with acyclovir or indinavir.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Antivirals

#### MECHANISM OF ACTION

Penciclovir triphosphate selectively inhibits herpes simplex virus (HSV) polymerase competitively with deoxyguanosine triphosphate. Consequently, herpes viral DNA synthesis and, therefore, replication are selectively inhibited. Therapeutic Effect: An antiviral compound that has inhibitory activity against HSV-1 and HSV-2.

# PHARMACOKINETICS

Measurable penciclovir concentrations were not detected in plasma or urine. The systemic absorption of penciclovir following topical administration has not been evaluated.

# **AVAILABILITY**

Cream: 10 mg/g.

# INDICATIONS AND DOSAGES

#### Herpes labialis (cold sores) TOPICAL

Adults, Elderly, Children 12 vr and over. Apply every 2 h during waking hours for a period of 4 days. Treatment should be started as early as possible (i.e., during the prodrome or when lesions appear).

#### **OFF-LABEL USES**

Topical adjunct to systemic treatment of herpes zoster.

# CONTRAINDICATIONS

Hypersensitivity to penciclovir or any of its components or any related compound.

# INTERACTIONS

Drug

OTC creams or ointments: May delay healing or increase risk of spreading the infection.

# Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent Headache. Occasional

#### Occasional

Change in sense of taste; decreased sensitivity of skin, particularly to touch; redness of the skin, skin rash (maculopapular, erythematous), local edema; skin discoloration; pruritus; hypoesthesia; parethesias; parosmia; urticaria; oral or pharyngeal edema.

#### Rare

Mild pain, burning, or stinging.

# **PRECAUTIONS & CONSIDERATIONS**

Viral strains resistant to acyclovir are likely to be resistant to penciclovir. Also, effectiveness has not been established in immunocompromised patients.

It is unknown whether penciclovir crosses the placenta or is distributed into breast milk. Safety and efficacy have not been established in children under 12 yr of age. No age-related precautions have been noted in elderly patients. Do not apply near eyes, ears, or mucous membranes. Local irritation should be reported to the health care provider.

#### Storage

Store at room temperature. Administration

Penciclovir is for external use only. Area of application should be clean and dry. Do not apply near the eyes. Apply every 2 h during waking hours for 4 days. Continue medication for the full time of treatment.

# Penicillin G Benzathine

pen-i-sill'in G ben'za-theen Bicillin LA Do not confuse with penicillin G potassium or penicillin G procaine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, benzathine salt of natural penicillin G

### **MECHANISM OF ACTION**

A penicillin that inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins of bacteria. Mostly used for gram-positive cocci (Staphylococcus, S. pyogenes, S. viridans, S. faecalis, S. bovis, S. Pneumoniae), spirochetes (Treponema palladium). Therapeutic Effect: Bactericidal.

# PHARMACOKINETICS

IM

Very slow absorption; hydrolyzed to penicillin G. IM administration of 600,000 units to adults results in therapeutic blood levels of 0.03-0.05 units/mL for up to 10 days; similar levels for up to 14 days after 1.2 million units IM. Protein binding: Roughly 60%. Widely distributed throughout body tissues, with highest levels in the kidneys and lesser amounts in the liver, skin, and intestines. Penetrates into all other tissues and the spinal fluid to a lesser degree. Crosses placenta, excreted in breast milk. Drug is excreted rapidly by tubular excretion. Delayed in neonates and those with reduced kidney function. Duration 21-28 days. Half-life: 30-60 min.

# AVAILABILITY

Injection Suspension (Prefilled Syringes [Bicillin LA]): 600,000 units/mL; 1.2 million units/2 mL; 2.4 million units/4 mL.

# INDICATIONS AND DOSAGES

Treatment of respiratory infections, scarlet fever, erysipelas, otitis media, pneumonia, skin and soft tissue infections, bejel, pinta, yaws.

#### Group A streptococcal infections IM

*Adults, Elderly.* 1.2 million units as a single dose.

Older children > 27 kg. 900,000 units as a single dose.

Children  $\leq 27$  kg. 300,000 units-600,000 units as a single dose.

#### Prevention of rheumatic fever IM

*Adults, Elderly.* 1.2 million units every 3-4 wks or 600,000 units twice monthly.

Children. 25,000-50,000 units/kg every 3-4 wks.

# Early syphilis

#### IM

*Adults, Elderly.* 2.4 million units divided and administered in 2 separate injection sites.

#### Congenital syphilis IM

*Children.* 50,000 units/kg as single injection after a 10-day course of aqueous penicillin G.

#### Syphilis of more than 1-yr duration

#### IM

*Adults, Elderly.* 2.4 million units divided and administered in 2 separate injection sites weekly for 3 wks.

*Children.* 50,000 units/kg weekly for 3 wks.

# CONTRAINDICATIONS

Hypersensitivity to any penicillin.

### INTERACTIONS

#### Drug

Erythromycin, lincomycins, tetracyclines: Possible decreased antimicrobial effect. Methotrexate: Suspected increased risk of toxicity. Probenecid, aspirin: Increases serum concentration of penicillin. Oral contraceptives: Advise patient of a low risk for decreased contraception action, to maintain compliance with oral contraceptive use while taking antibiotics like penicillin, and to consider using additional nonhormonal-based contraceptions for the duration of therapy.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May cause a positive Coombs' test.

# SIDE EFFECTS

#### Occasional

Р

Lethargy, fever, dizziness, rash, pain at injection site. Rare

Seizures, interstitial nephritis.

# SERIOUS REACTIONS

• Hypersensitivity reactions, ranging from chills, fever, and rash to anaphylaxis, may occur.

- Pseudomembranous colitis.
- Cardiac arrest or severe
- hypotension.

• Overdose can cause neuromuscular irritability and seizures.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a hypersensitivity to cephalosporins, impaired cardiac or renal function, or seizure disorders. History of allergies, especially to cephalosporins or penicillins,

#### 1236 Penicillin G Potassium

should be determined before giving the drug. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting should be monitored. CBC, renal function test results, and urinalysis should be assessed.

#### Storage

Store prefilled syringes in the refrigerator. Do not freeze them.

## Administration

Administer the drug undiluted by deep IM injection.

! Do not administer penicillin G benzathine IV, intra-arterially, or subcutaneously because doing so may cause heart attack, severe neurovascular damage, thrombosis, and death.

# Penicillin G Potassium

pen-i-sill'in G ★ Pfizerpen Do not confuse with penicillin G benzathine, penicillin G procaine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, penicillins

#### **MECHANISM OF ACTION**

A penicillin that inhibits bacterial cell wall synthesis by binding to one or more of the penicillin-binding proteins of bacteria. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Completely absorbed from IM injection sites. Peak blood levels reached rapidly after IV infusion. Bound primarily to albumin.

Widely distributed but has limited penetration into cerebrospinal fluid unless meninges inflamed. 60% excreted within 5 h by kidney. *Halflife:* 20-30 min (prolonged in renal impairment).

#### AVAILABILITY

Injection, Lyophilized Powder: 5 million units. Premixed Intravenous Piggyback (IVPB): 1 million units, 2 million units, 3 million units; all doses in 50 mL dextrose solution.

### INDICATIONS AND DOSAGES

 Sepsis, meningitis, pericarditis, endocarditis, pneumonia due to susceptible gram-positive organisms (not Staphylococcus aureus) and some gram-negative organisms

NOTE: Total daily dose dependent on severity and type of infection. IV, IM

Adults, Elderly. 2-24 million units/ day in divided doses q4-6h. *Children*.100,000-400,000 units/kg/ day in divided doses q4-6h.

#### Dosage in renal impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage Interval
10-50	Usual dose q8-12h
< 10	Usual dose q12-18h

#### CONTRAINDICATIONS

Hypersensitivity to any penicillin.

### INTERACTIONS

Drug Erythromycin, lincosamides, tetracyclines: May antagonize effects of penicillin. **Methotrexate:** Increased or prolonged plasma levels of methotrexate during high-dose penicillin treatment.

Oral contraceptives: Advise patient of a potential low risk for decreased contraceptive action, to maintain compliance with oral contraceptive while using antibiotics, and to consider using additional nonhormonal contraception for the duration of therapy.

Potassium-sparing agents: Consider potassium load during high-dose penicillin G potassium treatment. Probenecid, aspirin: Increased or prolonged plasma levels of penicillin. Typhoid vaccine: Potential decreased response; delay vaccine until penicillin treatment concluded. Herbal

None known. Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May cause a positive Coombs' test.

#### IV INCOMPATIBILITIES

Include aminophylline, amphotericin B, dextran, diazepam, dobutamine, erythromycin, fat (lipid) emulsion, haloperidol, inamrinone, pentobarbital, phenytoin, protamine, quinidine.

# 🗏 IV COMPATIBILITIES

Include amiodarone, aztreonam, calcium gluconate, cimetidine, clindamycin, digoxin, dopamine, famotidine, furosemide, magnesium sulfate, metoclopramide, morphine, nitroglycerin, oxytocin.

#### SIDE EFFECTS

#### Occasional

Lethargy, fever, dizziness, rash, electrolyte imbalance, diarrhea, thrombophlebitis.

#### Rare

Seizures, interstitial nephritis.

#### SERIOUS REACTIONS

 Hypersensitivity reactions ranging from rash, fever, and chills to anaphylaxis.

 Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a hypersensitivity to cephalosporins, impaired hepatic or renal function, a history of antibiotic-associated colitis, or seizure disorders. CBC, electrolyte levels, renal function test results, and urinalysis results should be monitored. Hypersensitivity to penicillin or cephalosporin should be established before beginning therapy. Any indications of superinfection, such as sore throat, oral burning sensation, fever, or fatigue, should be reported.

#### Storage

Thaw frozen premixed infusion bags at room temperature. The infusion is stable for 7 days if refrigerated and 24 hr at room temperature.

#### Administration

For IV use, follow the manufacturer's guidelines for dilution. After reconstitution, further dilute with 50-100 mL D5W or 0.9% NaCl to yield a final concentration of 100,000-500,000 units/mL (50,000 units/mL for infants and neonates). Infuse the solution over 1-2 hr for adults, 15-30 min for infants and children.

May be given IM if necessary. Dilute vial as directed to a usual concentration of 100,000 units/mL for IM use. In adults, the midlateral thigh or upper outer quadrant of the gluteus maximus may be used.

#### 1238 Penicillin V Potassium

In children and infants use the midlateral muscles of the thigh.

# Penicillin V Potassium

pen-i-sill'in V ★ Penicillin VK ▲ Apo-Pen VK, Novo-Pen VK, Nu-Pen VK

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, penicillins

#### **MECHANISM OF ACTION**

A penicillin that inhibits cell wall synthesis by binding to bacterial cell membranes. *Therapeutic Effect:* Bactericidal.

### PHARMACOKINETICS

Moderately absorbed from the GI tract. Protein binding: 80%. Widely distributed. Only a small amount of metabolism in the liver. Primarily excreted in urine. *Half-life:* 1 h (increased in impaired renal function).

# AVAILABILITY

*Tablets:* 250 mg, 500 mg. *Powder for Oral Solution:* 125 mg/5 mL, 250 mg/5 mL.

#### INDICATIONS AND DOSAGES

Effective for treatment of grampositive cocci (Staphylococcus aureus, S. viridans, S. faecalis, S. bovis, S. pneumoiae), gramnegative cocci (Neisseria gnorrhoeae, N. meningitis), gram-positive bacilli (Bacillus anthracis, Clostridium perfrignens, C. tetani, C. dipththeriae), gramnegative bacilli (S. moniliformis), spirochetes (Treponema palladium), Actinomyces, Peptococcus, and Peptostreptococcus spp.

 Mild to moderate respiratory tract or skin or skin-structure infections, otitis media, necrotizing ulcerative gingivitis

#### PO

Adults, Elderly, Children 12 yr and older. 125-500 mg q6-8h. Children younger than 12 yr: 25-50 mg/kg/day in divided doses q6-8h. Maximum: 3 g/day.

#### Primary prevention of rheumatic fever

PO

Adults, Elderly. 125-250 q6-8h for 10 days. Children. 250 mg 2-3 times/day for 10 days.

#### CONTRAINDICATIONS

Hypersensitivity to any penicillin.

# INTERACTIONS

#### Drug

Oral contraceptives: Advise patient of potential low risk for decreased contraceptive action, to maintain compliance with oral contraceptive use while taking antibiotics, and to consider using additional nonhormonal contraception during therapy. **Probenecid, aspirin:** May increase penicillin blood concentration and risk of toxicity.

Tetracyclines, lincomycins, and erythromycin: Decreased antimicrobial effectiveness.

#### Herbal and Food

None known.

# DIAGNOSTIC TEST EFFECTS

May cause a positive Coombs' test.

# SIDE EFFECTS

#### Frequent

Mild hypersensitivity reaction (chills, fever, rash), nausea, vomiting, diarrhea.

Penicillin V Potassium (Generic Name)
### Rare

Bleeding, allergic reaction, interstitial nephritis.

### SERIOUS REACTIONS

Severe hypersensitivity reactions, including anaphylaxis, may occur.
Antibiotic-associated colitis and other superinfections may result from high dosages or prolonged therapy.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment, a history of seizures, or a history of allergies, particularly to cephalosporins. Penicillin V readily crosses the placenta, appears in cord blood and amniotic fluid, and is distributed in breast milk in low concentrations. Penicillin V may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. Use caution when giving to neonates and young infants because their immature renal function may delay renal excretion of the drug. Age-related renal impairment may require dosage adjustment in elderly patients.

History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs of bleeding, including ecchymosis, overt bleeding, and swelling, should be assessed. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting, should also be monitored. Intake and output, renal function tests, hemoglobin levels, and urinalysis should be obtained

and reviewed. Possible superinfection evidenced by sore throat, oral burning sensation, fatigue, or fever should be reported immediately to the health care provider.

### Storage

Store tablets at room temperature. After reconstitution, the oral solution is stable for 14 days if refrigerated.

### Administration

Take the drug without regard to food. Space drug doses evenly around the clock.

### Pentamidine Isethionate

pen-tam'i-deen ice-ethy-eye-oh-nate NebuPent, Pentam-300

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiprotozoals

# MECHANISM OF ACTION

An anti-infective that interferes with nuclear metabolism and incorporation of nucleotides, inhibiting DNA, RNA, phospholipid, and protein synthesis. *Therapeutic Effect:* Produces antimicrobial and antiprotozoal effects.

### PHARMACOKINETICS

Well absorbed after IM administration; minimally absorbed after inhalation. Widely distributed. Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 6.4 h (IV), 9.1-13.2 h (IM) (increased in impaired renal function).

# AVAILABILITY

Injection (Pentam-300): 300 mg.

### 1240 Pentamidine Isethionate

*Powder for Nebulization (NebuPent):* 300 mg.

### INDICATIONS AND DOSAGES

 Treatment of *Pneumocystis* infections in immunocompromised patients (injection); prevention in high-risk HIV-infected patients (inhalant)

### Pneumocystis jaroveci pneumonia (PCP)

IV, IM Adults, Elderly, Children. 4 mg/kg/ day once a day for 14-21 days.

### Prevention of PCP

INHALATION Adults, Elderly. 300 mg q4wk. Children 5 yr and older: 300 mg q4wk.

### **OFF-LABEL USES**

Treatment of African trypanosomiasis, cutaneous or visceral leishmaniasis.

### CONTRAINDICATIONS

Hypersensitivity. NOTE: Concurrent use with some medications is not recommended (see Drug Interactions).

### INTERACTIONS

### Drug

Blood dyscrasia–producing medications, bone marrow depressants: May increase the abnormal hematologic effects of pentamidine.

**Didanosine, zalcitabine:** May increase the risk of pancreatitis. If IV pentamidine treatment is needed, temporarily interrupt treatment with these antivirals.

**Foscarnet:** May increase the risk of hypocalcemia, hypomagnesemia, and nephrotoxicity.

Nephrotoxic medications: May increase the risk of nephrotoxicity. Herbal

None known.

### Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels. May decrease serum calcium and magnesium levels. May alter blood glucose levels.

# IV INCOMPATIBILITIES

Do not mix with other medications.

Do *not* reconstitute or infuse with saline solutions, as precipitates will form.

# SIDE EFFECTS

### Frequent

Injection (> 10%): Abscess, pain at injection site.

Inhalation (> 5%): Fatigue, metallic taste, shortness of breath, decreased appetite, dizziness, rash, cough, nausea, vomiting, chills.

### Occasional

Injection (1%-10%): Nausea, decreased appetite, hypotension, fever, rash, altered taste, confusion. Inhalation (1%-5%): Diarrhea, headache, anemia, muscle pain.

### Rare

Injection (< 1%): Neuralgia, thrombocytopenia, phlebitis, dizziness, chest pain.

### SERIOUS REACTIONS

 Rare reactions include lifethreatening or fatal hypotension, cardiac arrhythmias, hypoglycemia, leukopenia, nephrotoxicity or renal failure, anaphylactic shock, Stevens-Johnson syndrome, and toxic epidermal necrolysis are reported with IM and IV routes; monitor BP continuously throughout the infusion, and every 30 min for 2 h thereafter and every 4 h after that until BP stabilizes. • Hyperglycemia and insulindependent diabetes mellitus (often permanent) may occur even months after therapy has stopped.

· Pancreatitis (with systemic use).

• Severe or sudden hypotension with IV or IM use.

· QT prolongation or arrhythmia.

• IM use is painful and may result in sterile abscess.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, hypertension, hypotension, or renal or hepatic impairment. It is unknown whether pentamidine crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children, although safety and efficacy of the inhalation formulation are not established. No information is available regarding pentamidine use in elderly patients. Avoid alcohol.

Be sure to monitor blood pressure frequently, keeping patient supine, while giving IV or IM. Report any light-headedness, palpitations, shakiness or sweating, shortness of breath, cough, or fever. Drowsiness, decreased appetite, and increased thirst and urination may develop in the months following therapy, which may be indicative of drug-induced hyperglycemia. Adequate hydration should be maintained.

IV and IM sites should be evaluated for abscess development. Skin should be examined for rash. Hematology, liver, and renal function tests should be performed. Be alert for respiratory difficulty when administering pentamidine by inhalation. **Storage** 

Store vials at room temperature. After reconstitution, the IV solution is stable at room temperature for 48 h. Store the aerosol at room temperature for 48 h.

### Administration

! Make sure the person is in the supine position during administration and has frequent BP checks until stable because of the risk of a lifethreatening hypotensive reaction. Have resuscitative equipment readily available.

For intermittent IV infusion (piggyback), reconstitute each vial with 3-5 mL D5W or sterile water for injection. Withdraw the desired dose and further dilute with 50-250 mL D5W. Infuse the drug over 60 min. Discard any unused portion. Do not give the drug by IV injection or rapid IV infusion because this increases the risk of severe hypotension.

For IM use, reconstitute each 300-mg vial with 3 mL sterile water for injection to provide a concentration of 100 mg/mL.

For aerosol (nebulizer) use, reconstitute each 300-mg vial with 6 mL sterile water for injection. Avoid using 0.9% NaCl because it may cause a precipitate to form. Do not mix pentamidine with other medications in the nebulizer reservoir.

# Pentazocine Hydrochloride

pen-tah-zoe'seen high-droh-klor'ide Talwin Combination Products: With naloxone, a narcotic antagonist (oral) (Talwin NX); with acetaminophen (oral) (Talacen)

### **CATEGORY AND SCHEDULE**

Pregnancy Category: C Controlled Substance Schedule: C-IV (injection only)

**Classification:** Analgesics, narcotic mixed agonist-antagonist

# **MECHANISM OF ACTION**

Narcotic antagonist and agonist that induces analgesia by stimulating the  $\kappa$ - and  $\sigma$ -receptors within the central nervous system (CNS). *Therapeutic Effect:* Alters processes affecting pain perception, emotional response to pain.

# PHARMACOKINETICS

Well absorbed after administration. Widely distributed, including the cerebrospinal fluid (CSF). Metabolized in liver via oxidative and glucuronide conjugation pathways, extensive first-pass effect. Excreted in small amounts in the bile and feces as unchanged drug. *Half-life:* 2-3 h (prolonged with hepatic impairment).

# AVAILABILITY

Tablets (Pentazocine + Naloxone [Talwin NX]): 50 mg pentazocine and 0.5 mg naloxone. Tablets (Acetaminophen + Pentazocine [Talacen]): 25mg pentazocine with 650 mg acetaminophen. Injection: 30 mg/mL (Talwin).

# INDICATIONS AND DOSAGES

Treatment of moderate to severe pain alone or in combination with aspirin or acetaminophen.

# Pain, analgesia, moderate to severe

PO (TALWIN NX) Adults, Elderly, Children 12 yr and older. 50 mg q3-4h. May increase to 100 mg q3-4h, if needed. Maximum: 600 mg/day. IM/IV

*Adults.* 30 mg q3-4h. Do not exceed 30 mg IV or 60 mg IM per dose. Maximum: 360 mg/day.

# Obstetric labor

# IM

Adults. 30 mg as a single dose.

# IV

*Adults.* 20 mg when contractions are regular. May repeat 2-3 times q2-3h.

# • Pain, analgesia, mild to moderate PO (TALACEN)

*Adults, Elderly, Children 12 yr and older.* 1 tablet PO q4h, up to 6 tablets/day.

# CONTRAINDICATIONS

Hypersensitivity to pentazocine or any component of the formulation such as acetaminophen, naloxone, or sulfites.

# INTERACTIONS

### Drug

Alcohol, central nervous system (CNS) depressants: May increase CNS or respiratory depression and hypotension.

Anticholinergics: Increased effect. Fluoxetine: May cause hypertension, diaphoresis, ataxia, flushing, nausea, dizziness, and anxiety.

**MAOIs:** May produce serotonin syndrome.

**Opioid analgesics:** May increase withdrawal symptoms or cause additive effects.

Sibutramine: May increase risk of serotonin syndrome.

Tramadol: Potential seizure risk. Herbal

**Tobacco smoking:** Increased pentazocine clearance.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase amylase and lipase.

# SIDE EFFECTS

Frequent

Drowsiness, euphoria, nausea, vomiting.

### Occasional

Allergic reaction, histamine reaction (decreased BP, increased

sweating, flushing, wheezing), urinary retention, altered vision, constipation, dizziness, dry mouth, headache, hypotension, pain/burning at injection site.

### SERIOUS REACTIONS

Overdosage results in severe respiratory depression, skeletal muscle flaccidity, cyanosis, extreme somnolence progressing to convulsions, stupor, and coma.
Abrupt withdrawal after prolonged use may produce symptoms of narcotic withdrawal (abdominal cramps, rhinorrhea, lacrimation, nausea, vomiting, restlessness, anxiety, increased temperature, piloerection).

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with head injury or increased intracranial pressure, respiratory disease, or respiratory depression before biliary tract surgery (produces spasm of spinchter of Oddi), acute myocardial infarction, severe heart disease, opioid dependence or abuse, addictive personality, impaired hepatic and renal function, acute abdominal conditions, Addison's disease, prostatic hypertrophy, and patients taking other narcotics. It is unknown whether pentazocine crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children less than 12 yr. Age-related renal or liver impairment may require decreased dosage. Use with caution in the elderly.

Pentazocine may cause withdrawal in patients currently dependent on narcotics. It may cause drowsiness and impaired judgment or coordination, so driving and tasks requiring alertness and coordination should be avoided. Alcohol should be avoided. Psychological and physical dependence may occur with chronic administration.

### Storage

Store at room temperature. Administration

Rotate injection site for IM use. SC route not recommended because of potential for severe local reactions. Avoid intra-arterial injection. Do not mix with barbiturates in solution or syringe.

May take oral pentazocine with food if GI upset occurs.

# **Pentobarbital**

pen-toe-bar'bi-tal Nembutal **Do not confuse with** phenobarbital.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: II

**Classification:** Anticonvulsants, preanesthetics, sedative/hypnotic, barbiturates

# **MECHANISM OF ACTION**

A barbiturate that binds at the  $\gamma$ -aminobutyric acid (GABA) receptor complex, enhancing GABA activity. *Therapeutic Effect:* Depresses central nervous system (CNS) activity and reticular activating system.

### PHARMACOKINETICS

Well absorbed after PO, parenteral administration. Protein binding: 35%-55%. Rapidly, widely distributed. Metabolized in liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 15-48 h.

# AVAILABILITY

Injection: 50 mg/mL.

# INDICATIONS AND DOSAGES

Preanesthetic

IM

Adults, Elderly. 150-200 mg. Children. 2-6 mg/kg. Maximum: 100 mg/dose.

### Hypnotic (historic use, not preferred)

IM *Adults, Elderly.* 150-200 mg at bedtime.

*Children.* 2-6 mg/kg. Maximum: 100 mg/dose at bedtime.

*Adults, Elderly.* 100 mg initially then, after 1 min, may give additional small doses at 1-3 min intervals, up to 500 mg total.

### Anticonvulsant

**!** NOTE: IV infusion use is for mechanically ventilated patients only. EEG burst suppression generally occurs at levels of 20-50 mcg/mL.

### IV Adults. 10-15 mg/kg loading dose given slowly over 1-2 h. Additional doses of 5-10 mg/kg may be given (maximum total load dose = 30 mg/kg). Maintenance of 0.5-1 mg/kg/hr, IV infusion. Titrate by 0.5 mg/kg/hr, as needed, based on serum levels and clinical

response.

# **OFF-LABEL USES**

For the reduction of increased intracranial pressure (ICP) in patients with head trauma (via coma induction if mechanically ventilated only). Sedative withdrawal.

# CONTRAINDICATIONS

Porphyria, hypersensitivity to barbiturates.

# INTERACTIONS

Drug

Alcohol, CNS depressants: May increase the depressive effects of pentobarbital.

Antihistamines, cold remedies (OTC): May have additive effect with any other CNS depressant ingredients.

Antiretroviral therapies for HIV: May decrease the effectiveness against HIV infection.

Barbiturates, chloral hydrate, opioid analgesics: May increase the risk of respiratory depression.

Carbamazepine: May increase metabolism.

**Corticosteroids:** May increase metabolism and decrease therapeutic effects.

**Doxycycline:** May decrease half-life. **Halogenated hydrocarbon** 

**anesthetics:** May cause hepatotoxicity.

Metoprolol: May decrease effectiveness.

**Procarbazine:** May increase the risk of CNS depression.

**Quetiapine:** May decrease serum quetiapine concentrations.

Theophylline: May decrease

theophylline effectiveness.

Tricyclic antidepressants and MAOIs: May increase metabolism

and decrease effectiveness.

Warfarin and coumarin anticoagulants: May decrease anticoagulant effectiveness. Herbal

Catnip oil: May increase risk of CNS depression. Eucalyptol: May decrease

effectiveness of barbiturates.

Kava kava, valerian: May increase CNS depression.

St. John's wort: May decrease CNS depressive effect of barbiturates.

None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

### IV INCOMPATIBILITIES

In general, do not mix or infuse with other drugs. Pentobarbital easily precipitates with changes in pH. Amikacin (Amikin), aminophylline, atracurium (Tacrium), benzquinamide, butorphanol, cefazolin (Ancef), chlorpheniramine, clindamycin (Cleocin), codeine, cyclizine, diphenhydramine (Benadryl), droperidol (Inapsine), fenoldopam (Corlopam), fentanyl, glycopyrrolate (Robinul), hyaluronidase (Wydase), hydrocortisone (Solu-Cortef), hydromorphone (Dilaudid), insulin, kanamycin (Kantrex), levorphanol (Levo-Dromoran), lidocaine, meperidine (Demerol), metaraminol (Aramin), methadone, methyldopa (Aldomet), metocurine (Metubine), midazolam (Versed), nalbuphine (Nubain), neostigmine (Prostigmin), opium alkaloids, oxytetracycline, pancuronium (Pavulon), penicillin G (Pfizerpen), pentazocine (Talwin), perphenazine (Trilafon), prochlorperazine (Compazine), promazine, propofol (Diprivan), ranitidine (Zantac), scopolamine, sodium bicarbonate, sodium iodide, streptomycin, thiamine, thiopental (Pentothal), triflupromazine (Stelazine), tripelennamine (PBZ), vancomycin (Vancocin), verapamil.

### SIDE EFFECTS

### Frequent

Bradycardia, hypotension, apnea with rapid injection, CNS depression, decreased respiration. Occasional

Agitation, confusion, dizziness, somnolence.

### Rare

Confusion, paradoxical CNS hyperactivity or nervousness in

children, excitement or restlessness in elderly.

### SERIOUS REACTIONS

 Agranulocytosis, megaloblastic anemia, apnea, hypoventilation, bradycardia, hypotension, syncope, hepatic damage, and Stevens-Johnson syndrome occur rarely.

 Abrupt withdrawal after prolonged therapy may produce effects ranging from markedly increased dreaming, nightmares or insomnia, tremor, sweating and vomiting, to hallucinations, delirium, seizures, and status epilepticus.

• Skin eruptions appear as hypersensitivity reactions.

• Overdosage produces cold or clammy skin, hypothermia, severe CNS depression, cyanosis, and rapid pulse.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with liver or renal impairment, in elderly patients, or in patients with debilitated, suicidal tendencies, or a history of drug or alcohol abuse. Pentobarbital readily crosses the placenta and is distributed in breast milk. Barbiturates may cause fetal harm. Withdrawal symptoms may appear in neonates born to women receiving barbiturates during the last trimester of pregnancy. Its use may cause paradoxical excitement in children. Elderly patients taking pentobarbital may exhibit confusion, excitement, and mental depression. Alcohol consumption and caffeine should be avoided while taking pentobarbital. Tasks that require mental alertness or motor skills should be avoided because pentobarbital may cause dizziness and drowsiness. Drug should not be given if respirations drop to 10/min or less or pupils become dilated.

### Storage

Store vials at room temperature.

### Administration

Be aware that dosage must be individualized based on patient's age, weight, and condition.

Do not inject more than 5 mL in any one IM injection site because it produces tissue irritation. Inject IM dorsogluteally or into lateral aspect of thigh.

May give IV injection undiluted by slow IV push no faster than 50 mg/min. Pentobarbital infusions must be prepared right before use; use a 0.45-micron in-line filter during administration. Mix in D5W or 0.9% NaCl injection to a concentration no greater than 8 mg/mL to avoid precipitation. An infusion is stable for no more than 12-24 h.

Expect to hydrate adequately before and immediately after infusion to decrease the risk of adverse renal effects. Parenteral routes should be pursued only when oral administration is impossible or impractical. Beware that inadvertent intra-arterial injection may result in arterial spasm with severe pain and tissue necrosis. Also know that extravasation in SC tissue may produce redness, tenderness, and tissue necrosis. If either occurs, treat with 0.5% procaine solution injected into affected area and apply moist heat.

# Pentosan Polysulfate

pen'toe-san poll'ee-sull'fate Elmiron Do not confuse pentosan with pentostatin.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

**Classification:** Urinary tract agents, anticoagulant

### **MECHANISM OF ACTION**

A negatively charged synthetic sulfated polysaccharide with heparinlike properties that appears to adhere to bladder wall mucosal membrane; it may act as a buffering agent to control cell permeability, preventing irritating solutes in the urine. Has anticoagulant/fibrinolytic effects. *Therapeutic Effect:* Relieves bladder pain.

# PHARMACOKINETICS

Poorly and erratically absorbed from the GI tract. Distributed in uroepithelium of the genitourinary tract, with lesser amount found in the liver, spleen, lung, skin, periosteum, and bone marrow. Metabolized in the liver and kidney (secondary). Eliminated in the urine. *Half-life*: 4.8 h.

### AVAILABILITY

Capsules: 100 mg (Elmiron).

# INDICATIONS AND DOSAGES Interstitial cystitis PO

Adults, Elderly. 100 mg 3 times/day.

### **OFF-LABEL USES**

Urolithiasis.

### CONTRAINDICATIONS

Hypersensitivity to pentosan polysulfate sodium or structurally related compounds.

### INTERACTIONS

Drug

Anticoagulants, high-dose aspirin: May increase risk of bleeding. NSAIDs: May increase risk of bleeding and GI effects. Herbal

Alfalfa, coenzyme Q, green tea: May decrease anticoagulant effectiveness.

Pentosan Polysulfate (Generic Name), Elmiron (Brand Name)

# Pentostatin

pen'toe-stat-in ★ Nipent **Do not confuse with pravastatin.** 

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic, purine analogs

# **MECHANISM OF ACTION**

An antimetabolite that inhibits the enzyme adenosine deaminase (ADA) (increases intracellular levels of adenine deoxynucleotide). Greatest activity in T-cells of lymphoid system. Inhibits ADA and RNA synthesis. Produces DNA damage. *Therapeutic Effect:* Leads to tumor cell death.

# PHARMACOKINETICS

After IV administration, rapidly distributed to body tissues (poorly distributed to cerebrospinal fluid). Protein binding: 4%. Excreted primarily in urine unchanged or as active metabolite. *Half-life:* 5.7 h (2.6-10 h).

# AVAILABILITY

Powder for Injection: 10 mg (Nipent), 2 mg/mL once reconstituted.

### INDICATIONS AND DOSAGES Hairy cell leukemia

IV

*Adults, Elderly.* 4 mg/m<sup>2</sup> q2wk until complete response is attained (without any major toxicity). Discontinue if no response in 6 mo; partial response in 12 mo.

### Dosage in renal impairment

Only when benefits justify risks, give 2-3 mg/m<sup>2</sup> in patients with creatinine clearance of < 60 mL/min. Avoidance recommended if CrCl < 30 ml/min.

# **OFF-LABEL USES**

Palliative therapy of chronic lymphocytic leukemia, prolymphocytic leukemia, cutaneous T-cell lymphoma.

# CONTRAINDICATIONS

Pentostatin hypersensitivity.

# INTERACTIONS

Drug

Allopurinol: May increase pentostatin toxicity.

# Carmustine, cyclophosphamide,

etoposide: Acute pulmonary edema, hypotension, and death when coadministered.

Fludarabine: Coadministration can cause severe pulmonary toxicity. Vidarabine: May increase toxic effect of both drugs.

# Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May elevate creatinine (3%-10%), hypercalcemia, hyponatremia (< 3%). Monitor CBC with differential and platelet count and renal function before each dose.

# SIDE EFFECTS

### Frequent

Nausea, vomiting, fever, fatigue, rash, pain, cough, upper respiratory tract infection, anorexia, diarrhea. Occasional

Headache, pharyngitis, sinusitis, myalgia, chills, peripheral edema, anorexia, blurred vision, conjunctivitis, skin discoloration, sweating, anxiety, depression, dizziness, confusion.

# SERIOUS REACTIONS

• Bone marrow depression is manifested as hematologic toxicity (principally leukopenia, anemia, thrombocytopenia). Doses higher than recommended (20-50 mg/m<sup>2</sup> in divided doses for more than 5 days) may produce severe renal, hepatic, pulmonary, or central nervous system (CNS) toxicity.

· Bleeding.

# PRECAUTIONS & CONSIDERATIONS

Do not exceed recommended doses as nephrotoxicity, hepatoxicity, pulmonary and CNS toxicities have occurred at doses higher than recommended. Any of the following symptoms should be reported immediately: rash, hives, difficulty breathing, fever, chills; these symptoms can be indicators of possible infection; bleeding or unusual bruising, mouth sores, dark urine, yellowing of skin or eyes, pain, redness, swelling at injection site; persistent nausea, vomiting, diarrhea, appetite loss, or worsening general body weakness. Maintain adequate hydration during therapy to avoid developing hyperuricemia and urate precipitation. Rashes, occasionally severe, are common and may worsen with continued treatment;

development of such rashes needs to be reported immediately because discontinuation of the drug therapy may be warranted.

### Storage

Refrigerate unopened vials; use reconstituted solution or infusion within 8 h of reconstitution.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

Administer only by IV; do not use intradermally, subcutaneously, intramuscularly, intra-arterially, or orally.

Reconstitute powder for injection with 5 mL sterile water for injection. Mix thoroughly to obtain complete dissolution to a 2 mg/mL concentration of pentostatin. Do not administer if particulate matter, cloudiness, or discoloration is noted. May administer reconstituted solution as a bolus injection given IV over 5 min, or may further dilute reconstituted solution with 25-50 mL of dextrose 5% in water or NaCl 0.9% injection for IV infusion over 20-30 min. Arnica, bilberry, black currant, bromelain, cat's claw, chamomile, clove oil, curcumin, dong quai, primrose oil, fenugreek, garlic, ginger, kava kava, licorice, red clover, skullcap, tan-shen : May increase risk of bleeding. Chondroitin, ginseng: May increase INR serum values and increase

anticoagulant effects.

# Food

The effect of food on absorption of pentosan polysulfate sodium is not known.

### DIAGNOSTIC TEST EFFECTS

May increase transaminase (ALT), alkaline phosphatase (SGOT), PTT, PT. May decrease WBC count, thrombocytes.

### SIDE EFFECTS

### Frequent

Alopecia areata (a single area on the scalp), diarrhea, nausea, headache, rash, abdominal pain, dyspepsia.

### Occasional

Dizziness, depression, increased liver function tests.

# SERIOUS REACTIONS

• Ecchymosis, epistaxis, gum hemorrhage have been reported (drug produces weak anticoagulant effect).

• Overdose may produce liver function abnormalities.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with GI ulcerations, polyps, diverticula, history of heparininduced thrombocytopenia, hepatic or splenic function impairment, concurrent anticoagulant, thrombolytic, or antiplatelet therapy, and recent intracranial, intraspinal, or ophthalmologic surgery. It is unknown whether pentosan polysulfate sodium is distributed in breast milk. Safety and efficacy of pentosan polysulfate sodium have not been established in children younger than 16 yr. No age-related precautions have been noted in elderly patients.

The physician should be notified if any bleeding from gums or nose, bloody or black bowel movements, coughing up blood, bloody vomit or vomit that looks like coffee grounds, or severe stomach pain or diarrhea that does not stop occurs.

### Storage

Store at room temperature. Administration

# Take with water on an empty stomach at least 1 h before or 2 h after meals.

# Pentoxifylline

pen-tox-if'ih-lin Trental **Do not confuse Trental with Tegretol, Trandate.** 

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Hemorrheologic agents, xanthine derivatives

# **MECHANISM OF ACTION**

Synthetic dimethylxanthine derivative that is a blood viscosityreducing agent that alters the flexibility of RBCs; inhibits production of tumor necrosis factor, neutrophil activation, and platelet aggregation. *Therapeutic Effect:* Reduces blood viscosity and improves blood flow.

### PHARMACOKINETICS

Well absorbed after oral administration. Undergoes firstpass metabolism in the liver.

Pentoxifylline (Generic Name)

Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 24-48 min; metabolite, 60-90 min.

# AVAILABILITY

Tablets (Controlled Release [Trental]): 400 mg.

# INDICATIONS AND DOSAGES

# Intermittent claudication related to chronic occlusive arterial disease of the limbs

PO

*Adults, Elderly.* 400 mg 3 times a day. Decrease to 400 mg twice a day if GI or CNS adverse effects occur. Continue for at least 8 wks.

# CONTRAINDICATIONS

History of intolerance to xanthine derivatives, such as caffeine, theophylline, or theobromine; recent cerebral or retinal hemorrhage.

# INTERACTIONS

### Drug

Antihypertensives: Slight additive effect on blood pressure. Aspirin, NSAIDs: May increase anticoagulant effects and risk of bleeding. Warfarin, platelet aggregation inhibitors: Potential for additive risk

of bleeding. Monitor.

Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

Rare reports of prolonged prothrombin time.

# SIDE EFFECTS

### Occasional (2%-5%)

Dizziness, nausea, altered taste, dyspepsia, marked by heartburn, epigastric pain, and indigestion.

### Rare (< 2%)

Rash, pruritus, anorexia, constipation, dry mouth, blurred vision, edema, nasal congestion, anxiety.

# SERIOUS REACTIONS

 Angina and chest pain occur rarely and may be accompanied by palpitations, tachycardia, and arrhythmias.

• Signs and symptoms of overdose, such as flushing, hypotension, nervousness, agitation, hand tremor, fever, and somnolence, appear 4-5 h after ingestion and last for 12 h.

• Rare reports of bleeding; primarily in patients with other risk factors for bleeding.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with chronic occlusive arterial disease, insulin-treated diabetes, hepatic or renal impairment, peptic ulcer disease, and recent surgery. It is unknown whether pentoxifylline crosses the placenta and is distributed in breast milk. Safety and efficacy of pentoxifylline have not been established in children. In elderly patients, age-related renal impairment may require cautious use. Caffeine should be limited and smoking should be avoided; smoking causes vasoconstriction and occlusion of peripheral blood vessels.

Dizziness may occur. Avoid tasks requiring mental alertness or motor skills until response to the drug has been established. Notify the physician of hand tremor. Notify the physician of red or dark urine, muscular pain or weakness, abdominal or back pain, gingival bleeding, black or red stool, coffee-ground vomitus, or blood-tinged mucus from cough. BP, heart rate and rhythm, pulse rate, serum creatinine (SCr), and AST (SGOT) levels should be monitored. Relief of signs and symptoms of intermittent claudication should be monitored; symptoms generally occur while walking or exercising or with weight bearing in the absence of walking or exercising. Patient's ability to tolerate stress should be considered as stress responses may compromise cardiovascular functions.

### Storage

Store at room temperature.

### Administration

Do not crush or break film-coated tablets. Take with meals to avoid GI upset. Therapeutic effect is generally noted in 2-4 wks.

# **Perindopril**

per-in'doh-pril 🛧 Aceon 🍁 Coversyl

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Angiotensinconverting enzyme (ACE) inhibitors

# **MECHANISM OF ACTION**

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system and prevents conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. *Therapeutic Effect:* Reduces peripheral arterial resistance and BP.

# AVAILABILITY

Tablets: 2 mg, 4 mg, 8 mg.

# INDICATIONS AND DOSAGES Hypertension PO

*Adults, Elderly.* 2-8 mg/day as single dose or in 2 divided doses. Initial dose is usually 4 mg once daily for 1-2 wks; then titrated. Maximum: 16 mg/day.

### • Reduction of cardiac events and mortality in patients with CAD PO

*Adults.* Initially, 4 mg once daily for 2 wk. Increase to 8 mg/day if tolerated. *Elderly.* Initially, 2 mg once daily for 1 wk. Increase to 4 mg once daily, then 8 mg/day if tolerated.

# **OFF-LABEL USES**

Management of heart failure.

# CONTRAINDICATIONS

Hypersensitivity or history of angioedema from previous treatment with ACE inhibitors, idiopathic or hereditary angioedema, bilateral renal artery stenosis.

# INTERACTIONS

Drug

Alcohol, antihypertensives, diuretics: May increase the effects of perindopril. Lithium: May increase lithium blood concentration and risk of lithium toxicity. NSAIDs, aspirin: May decrease hypotensive effects. Potassium-sparing diuretics, drospirenone, eplerenone, potassium supplements: May cause hyperkalemia. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST

Perindopril (Generic Name), Aceon (Brand Name)

(SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer.

# SIDE EFFECTS

### Occasional (1%-5%)

Cough, back pain, sinusitis, upper extremity pain, dyspepsia, fever, palpitations, hypotension, dizziness, fatigue, syncope.

### SERIOUS REACTIONS

• Excessive hypotension (first-dose syncope) may occur in patients with congestive heart failure (CHF) and in those who are severely salt or volume depleted.

• Angioedema (swelling of face and lips) and hyperkalemia occur rarely.

 Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in those with history of renal disease.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with a history of angioedema from previous treatment with ACE inhibitors, renal insufficiency, hypertension with CHF, renal artery stenosis, autoimmune disease, collagen vascular disease, pregnancy category C (first trimester), pregnancy category D (second and third trimesters), lactation. Perindopril crosses the placenta; it is unknown whether it is distributed in breast milk. Perindopril has caused fetal or neonatal morbidity or mortality. Safety and efficacy of perindopril have not been established in children. In elderly patients, agerelated renal impairment may require cautious use of perindopril.

Dizziness may occur. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the person in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning perindopril therapy, then every 2 wks for the next 3 mo, and periodically thereafter in patients with autoimmune disease, or renal impairment, and in those who are taking drugs that affect immune response or leukocyte count. BUN, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels should also be monitored.

### Storage

Store at room temperature; protect from moisture.

### Administration

Take perindopril 1 h before meals. Do not skip doses or voluntarily discontinue the drug to avoid severe rebound hypertension.

# Permethrin

per-meth'ren ★ A200 Lice, Acticin, Elimite, Nix, Pronto Plus, RID ♪ Nix, Kwellada-P

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Scabicides/ pediculicides

# **MECHANISM OF ACTION**

An antiparasitic agent that inhibits sodium influx through nerve cell membrane channels. *Therapeutic Effect:* Results in paralysis and death of parasites.

# PHARMACOKINETICS

Less than 2% absorption after topical application. Detected in residual amounts on hair for  $\geq 10$  days following treatment. Metabolized

by liver to inactive metabolites. Excreted in urine.

# AVAILABILITY

Cream: 5% (Acticin, Elimite). Creme Rinse, Topical: 1% (Nix). Lice Control Sprays for furniture, bedding: 0.25% (Nix). Shampoos or Hair Mouse/Gel Containing Piperonyl Butoxide, Pyrethrins in Combination (RID, A200 Lice, Pronto Plus): 4% with 0.33% pyrethrins.

# INDICATIONS AND DOSAGES Head lice

SHAMPOO, GEL, MOUSSE,
CREME RINSE (OTC)
Adults, Elderly, Children 2 mo and older. Shampoo hair, towel dry, apply to scalp, leave on for 10 min and rinse. Remove nits with nit comb.
Repeat application if live lice are present 7 days after initial treatment.
Scabies

TOPICAL CREAM (RX) Adults, Elderly, Children 2 mo and older. Apply from head to feet, leave on for 8-14 h. Wash with soap and water. Repeat application if living mites are present 14 days after initial treatment.

# **OFF-LABEL USES**

Demodicidosis, insect bite prophylaxis, leishmaniasis prophylaxis, malaria prophylaxis.

# CONTRAINDICATIONS

Infants younger than 2 mo, hypersensitivity to pyrethyroid, pyrethrin, chrysanthemums, or any component of the formulation.

# INTERACTIONS

Drug None known. Herbal None known.

### Food

None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

#### Occasional

Burning, pruritus, stinging, erythema, rash, swelling.

### SERIOUS REACTIONS

• Shortness of breath and difficulty breathing have been reported.

### PRECAUTIONS & CONSIDERATIONS

Caution should be used during pregnancy and in patients with asthma, pruritus, edema, and erythema. It is unknown whether permethrin is distributed in breast milk. No age-related precautions have been noted for suspension or topical use in children over 2 mo of age. Permethrin is not recommended for use in children 2 mo or younger. No age-related precautions have been noted in elderly patients.

### Storage

Store all products at room temperature. Sprays are toxic to honeybees and fish and aquatic organisms. Take care to store away from children and pets.

### Administration

Because scabies and lice are contagious, use caution to avoid spreading or infecting oneself. Use gloves when applying. Shampoo hair, towel dry, apply rinse to scalp, leave on for 10 min then rinse. Remove nits with nit comb. Repeat application if live lice are present 7 days after initial treatment. If live lice are detected 14 days after the initial application of permethrin, retreatment is indicated. Also, in epidemic settings, a second application is recommended 2 wks after the first.

When using the topical formulation, apply and rub gently into the affected and surrounding area. Apply from head to feet and leave on for 8-14 h. Wash with soap and water. Repeat application if living mites are present 14 days after initial treatment.

# Perphenazine

per-fen'a-zeen Do not confuse with promazine.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antipsychotics, phenothiazines

# **MECHANISM OF ACTION**

An antipsychotic agent and antiemetic that blocks postsynaptic dopamine receptor sites in the brain. *Therapeutic Effect:* Suppresses behavioral response in psychosis and relieves nausea and vomiting.

# AVAILABILITY

Tablets: 2 mg, 4 mg, 8 mg, 16 mg.

# INDICATIONS AND DOSAGES

 Treatment of psychotic disorders, schizophrenia

# Severe schizophrenia PO

*Adults.* 4-16 mg 2-4 times/day. Maximum: 64 mg/day. *Elderly.* Initially, 2-4 mg/day. May increase at intervals of 4-7 days by 2-4 mg/day up to 32 mg/day.

### Severe nausea and vomiting PO

*Adults*. 8-16 mg/day in divided doses up to 24 mg/day.

# CONTRAINDICATIONS

Coma, myelosuppression, severe cardiovascular disease, hepatic damage, phenothiazine or sulfite hypersensitivity, severe central nervous system (CNS) depression, subcortical brain damage.

# INTERACTIONS

### Drug

Alcohol, other CNS depressants, barbiturate anesthetics, opioid analgesics: May increase hypotensive effects and CNS and respiratory depression. Anticholinergics: May increase anticholinergic effects. Antihypertensives: May increase the risk of hypotension. Antithyroid agents: May increase the risk of agranulocytosis. Epinephrine: May cause hypotension, tachycardia. Haloperidol, droperidol, phenothiazines and related drugs, metoclopramide: May increase the severity and frequency of extrapyramidal symptoms. Levodopa: May decrease the effects of this drug. Lithium: May decrease perphenazine absorption and produce adverse neurologic effects. MAOIs, tricyclic antidepressants: May increase anticholinergic and sedative effects. Tetracyclines, fluoroquinolones, thiazide diuretics: Additive photosensitization. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May produce false-positive pregnancy and phenylketonuria test results. May produce ECG changes, including prolonged QT and QTc

Perphenazine (Generic Name)

intervals and T-wave depression or inversion.

# SIDE EFFECTS

#### Occasional

Marked photosensitivity, somnolence, dry mouth, blurred vision, lethargy, constipation or diarrhea, nasal congestion, peripheral edema, urine retention.

### Rare

Ocular changes, altered skin pigmentation, hypotension, dizziness, syncope.

### SERIOUS REACTIONS

• Extrapyramidal symptoms appear to be dose-related and are divided into 3 categories: akathisia (characterized by inability to sit still, tapping of feet), parkinsonian symptoms (including mask-like face, tremors, shuffling gait, hypersalivation), and acute dystonias (such as torticollis, opisthotonos, and oculogyric crisis).

• Tardive dyskinesia occurs rarely.

• Neuroleptic malignant syndrome (rare).

 Abrupt withdrawal after long-term therapy may precipitate nausea, vomiting, gastritis, dizziness, and tremors.

• QT prolongation, ECG changes, arrhythmia.

Blood dyscrasias.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired respiratory, hepatic, renal, or cardiac function; alcohol withdrawal; history of seizures; urinary retention; glaucoma; prostatic hypertrophy; or hypocalcemia (increases susceptibility to dystonias). Be aware that perphenazine crosses the placenta and is distributed in breast milk. Be aware that children may develop extrapyramidal symptoms (EPS) or neuromuscular symptoms, especially dystonias. Elderly patients with dementia-related psychosis have a significantly higher incidence of cerebrovascular adverse events (e.g., stroke, TIA) and increased risk of mortality. Elderly patients are more prone to anticholinergic effects, such as dry mouth, EPS, orthostatic hypotension, and sedation symptoms.

Urine may darken. Drowsiness may occur. Alcohol and tasks that require mental alertness or motor skills should be avoided. Exposure to artificial light and sunlight should also be avoided during therapy. EPS, tardive dyskinesia, and potentially fatal, rare neuroleptic malignant syndrome, such as altered mental status, fever, irregular pulse or BP, and muscle rigidity should be monitored. Hydration status should also be assessed.

Notify health care provider if significant xerostomic side effects occur (sore tongue, problems eating or swallowing, difficulty wearing prosthesis) for possible medication change.

#### Storage

Store tablets at room temperature. Administration

Therapeutic effect may take up to 6 wks to appear. Do not abruptly discontinue perphenazine. May administer tablets without regard to food.

# Phenazopyridine Hydrochloride

fen-az'o-peer'i-deen high-droh-klor'ide ★ Azo-Gesic, Azo-Standard, Pyridium ♪ Phenazo, Pyridium Do not confuse phenazopyridine with pyridoxine.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: B

**Classification:** Urinary tract analgesic, nonnarcotic

Phenazopyridine Hydrochloride (Generic Name)

# **MECHANISM OF ACTION**

An agent that exerts topical analgesic effect on urinary tract mucosa. *Therapeutic Effect:* Relieves urinary pain, burning, urgency, and frequency.

# PHARMACOKINETICS

Well absorbed from the GI tract. Partially metabolized in the liver. Primarily excreted in urine.

# AVAILABILITY

Tablets (Azo-Gesic, Azo-Standard, OTC): 95 mg. Tablets (Pyridium, Rx only): 100 mg, 200 mg.

# INDICATIONS AND DOSAGES

### Treatment of urinary tract irritation from infection; urinary analgesic

PO

*Adults*. 190-200 mg 3 times a day. Use for 2 days when used with an antibacterial agent.

*Children 6 yr and older.* 12 mg/kg/ day in 3 divided doses for 2 days. Use for 2 days when used with an antibacterial agent.

# Dosage in renal impairment Dosage interval is modified based on

creatinine clearance.

Creatinine Clearance	
(mL/min)	Dosage Interval
50-80	Usual dose q8-16h
< 50	Avoid use

# CONTRAINDICATIONS

Hepatic or renal insufficiency, G6PD deficiency, hypersensitivity to phenazopyridine.

# INTERACTIONS

Drug None known.

# Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May interfere with urinalysis tests based on color reactions, such as urinary glucose, ketones, protein, and 17-ketosteroids.

### SIDE EFFECTS

Expected

Discoloration of urine (reddish-orange).

### Occasional

Headache, GI disturbance, rash, pruritus.

# SERIOUS REACTIONS

• Overdose may lead to hemolytic anemia, nephrotoxicity, or hepatotoxicity. Patients with renal impairment or severe hypersensitivity to the drug may also develop these reactions.

• A massive, acute overdose may result in methemoglobinemia.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic or renal insufficiency or renal disease.

Notify the physician, and expect to discontinue the drug if skin or sclera turns yellow because this signifies impaired renal excretion. It is unknown whether phenazopyridine crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children older than 6 yr. Agerelated renal impairment may increase the risk of toxicity in elderly patients.

Urine may turn a reddish-orange color and may permanently stain clothing. Irreversible staining of soft contact lenses has been reported. Therapeutic response, including relief of urinary frequency, pain, and burning, should be assessed.

### Storage

Store at room temperature. Administration

Take phenazopyridine with food. Expect to discontinue the drug after 2 days as there is no evidence that it is effective after this period.

Maintain hydration during treatment.

# Phendimetrazine

fen-dye-me'tra-zeen ★ Adipost, Bontril PDM, Bontril Slow-Release, Melfiat, Prelu-2

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: III *Classification:* Anorexiants, amphetamine-like central nervous system (CNS) stimulant

### **MECHANISM OF ACTION**

A phenylalkylamine sympathomimetic agent with activity similar to amphetamines that stimulates the central nervous system CNS and elevates BP most likely mediated via norepinephrine and dopamine metabolism. Causes stimulation of the hypothalamus. *Therapeutic Effect:* Decreases appetite.

### PHARMACOKINETICS

The pharmacokinetics of phendimetrazine tartrate has not been well established. Metabolized to active metabolite, phendimetrazine. Excreted in urine. *Half-life:* 2-4 h.

### AVAILABILITY

Tablets: 35 mg (Bontril PDM). Capsules (Extended Release): 105 mg (Adipost, Bontril Slow-Release, Melfiat, Prelu-2).

# INDICATIONS AND DOSAGES Desity PO

*Adults, Elderly.* 105 mg/day in the morning or before the morning meal (sustained release); 35 mg 2-3 times/day (immediate release). Maximum: 70 mg 3 times/day.

### CONTRAINDICATIONS

Advanced arteriosclerosis, agitated states, glaucoma, drug abuse, hyperthyroidism, moderate to severe hypertension or pulmonary hypertension, symptomatic cardiovascular disease, use within 14 days of a MAOI, hypersensitivity to phendimetrazine or sympathomimetics. Anorexiants contraindicated in pregnancy.

# INTERACTIONS

Drug

Caffeine, caffeine-containing products: May increase risk of insomnia or dry mouth. Guanethidine: May decrease hypotensive effect of guanethidine. Hydrocarbon inhalants, general anesthetics: May increase risk of dysrhythmias. Insulin, antidiabetic agents: May alter insulin or medication requirements as obesity is treated or

diet changes. MAOIs or within 14 days of MAOIs: May increase risk of hypertensive crisis.

**Sibutramine:** May increase risk of hypertension and tachycardia.

Tricyclic antidepressants, phenothiazines: May increase cardiovascular effects.

Phendimetrazine (Generic Name)

### **Herbal and Food**

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

### Occasional

Constipation, nausea, diarrhea, dry mouth, dysuria, libido changes, flushing, hypertension, insomnia, nervousness, headache, dizziness, irritability, agitation, restlessness, palpitations, increased heart rate, sweating, tremor, urticaria.

### SERIOUS REACTIONS

 Multivalvular heart disease, cardiomyopathy, primary pulmonary hypertension, and arrhythmias occur rarely.

• Overdose may produce flushing, arrhythmias, and psychosis.

• Abrupt withdrawal following prolonged administration of high doses may produce extreme fatigue and depression.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus or mild hypertension. Use with caution in renal impairment. Anorexiants should not be used in pregnancy as they may cause fetal harm. It is unknown whether phendimetrazine is excreted in breast milk. Be aware that safety and efficacy of this drug have not been established in children. No age-related precautions have been noted in elderly patients. Tasks that require mental alertness or motor skills should be avoided. Palpitations, dizziness, dry mouth, and pronounced nervousness should be reported.

Psychological and physical dependence may occur with chronic administration.

### Storage

Store at room temperature. Administration

Take extended-release capsule in the morning, 60 min before the morning meal. Do not chew, crush, or open the capsules. Take immediate-release tablets 1 h before meals.

### Phenelzine Sulfate

fen′el-zeen sull′fate ★ ➡ Nardil

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressant, monoamine oxidase inhibitors (MAOIs)

# **MECHANISM OF ACTION**

An MAOI that inhibits the activity of the enzyme monoamine oxidase at central nervous system (CNS) storage sites, leading to increased levels of the neurotransmitters epinephrine, norepinephrine, serotonin, and dopamine at neuronal receptor sites. *Therapeutic Effect:* Relieves depression.

# AVAILABILITY

Tablets: 15 mg.

### INDICATIONS AND DOSAGES > Treatment of depression when uncontrolled by other means PO

*Adults.* 15 mg 3 times a day. May increase to 60-90 mg/day. After effect achieved, lower dosage to lowest effective dose. Maintenance dose may be as low as 15 mg a day or every other day as long as required.

Phenelzine Sulfate (Generic Name), Nardil (Brand Name)

*Elderly.* Initially, 7.5 mg/day. May increase by 7.5-15 mg/day q3-4wk up to 60 mg/day in divided doses.

# **OFF-LABEL USES**

Treatment of panic disorder, vascular or tension headaches.

# CONTRAINDICATIONS

Hypersensitivity. Includes, but not limited to, cardiovascular or cerebrovascular disease, hepatic or renal impairment, pheochromocytoma.

Many drugs are contraindicated for concurrent use with an MAOI; review drug interactions carefully and follow appropriate wash-out periods before prescribing phenelzine. Specific contraindications include meperidine, sympathomimetics, L-dopa, COMT-inhibitors, dextromethorphan, other MAOIs, linezolid, buspirone, serotonin drugs (SSRIs, dexfenfluramine, sibutramine), tryptophan, bupropion, cocaine, surgical anesthetics, guanethedine; certain foods also forbidden.

### INTERACTIONS Drug

Alcohol, other CNS depressants: May increase CNS depression and sedative effects.

Amphetamine, ephedrine, indirect acting sympathomimetics: Increased pressor effects.

Buspirone: May increase BP. Caffeine-containing medications: May increase the risk of cardiac arrhythmias and hypertension. Carbamazepine, cyclobenzaprine, maprotiline, other MAOIs: May precipitate hypertensive crisis, convulsions, hyperpyretic crisis. Dopamine, tryptophan: May cause sudden, severe hypertension. Fluoxetine, trazodone, tricyclic antidepressants: May cause serotonin syndrome. Insulin, oral antidiabetics: May increase the effects of these drugs. Meperidine, other opioid analgesics: May produce diaphoresis, immediate excitation, rigidity, and severe hypertension or hypotension, sometimes leading to severe respiratory distress, vascular collapse, seizures, coma, and death. Methylphenidate: May increase the CNS stimulant effects of methylphenidate. Herbal

None known.

Caffeine, chocolate, tyraminecontaining foods (such as aged cheese): May cause sudden, severe hypertension.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

### Frequent

Orthostatic hypotension, restlessness, GI upset, insomnia, dizziness, headache, lethargy, asthenia, dry mouth, peripheral edema.

### Occasional

Flushing, diaphoresis, rash, urinary frequency, increased appetite, transient impotence.

### Rare

Visual disturbances.

### SERIOUS REACTIONS

 Hypertensive crisis occurs rarely and is marked by severe hypertension, occipital headache radiating frontally, neck stiffness or soreness, nausea, vomiting, diaphoresis, fever or chilliness, clammy skin, dilated pupils, palpitations, tachycardia or bradycardia, and constricting chest pain. Intracranial bleeding occurs rarely in cases of severe hypertension.
Progressive necrotizing hepatocellular damage is very rare.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac arrhythmias, frequent or severe headaches, hypertension, suicidal tendencies, and within several hours of ingestion of a contraindicated substance, such as tyramine-containing foods. Foods that require bacteria or molds for their preparation or preservation (such as yogurt and aged cheese), foods containing tyramine (including avocados, bananas, broad beans, figs, papayas, raisins, sour cream, soy sauce, beer, wine, yeast extracts, meat tenderizers, and smoked or pickled meats), and excessive amounts of caffeine-containing foods or beverages (such as chocolate, coffee, and tea) should be avoided during therapy.

Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Phenelzine is not approved for use in children. Closely monitor treated patients for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments.

Alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician if headache or neck soreness or stiffness occurs. If hypertensive crisis occurs, phentolamine 5-10 mg IV should be administered. Liver function tests should be performed before and periodically during therapy, especially with long-term use. Storage

Store phenelzine tablets at room temperature. Do not freeze.

### Administration

Take the drug with food or milk to alleviate GI symptoms. Depression may start to lift during the first week of therapy, but phenelzine's full therapeutic effect may require 2-6 wks of therapy.

# **Phenobarbital**

fee-noe-bar'bi-tal Luminal Do not confuse phenobarbital with pentobarbital, or Luminal with Tuinal.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: IV

*Classification:* Anticonvulsants, barbiturates, sedatives

### **MECHANISM OF ACTION**

A barbiturate that enhances the activity of  $\gamma$ -aminobutyric acid (GABA) by binding to the GABA receptor complex. *Therapeutic Effect:* Depresses central nervous system (CNS) activity.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	20-60 min	NA	6-10 h
IV	5 min	30 min	4-10 h

Well absorbed after PO or parenteral administration. Protein binding:

Phenobarbital (Generic Name)

35%-50%. Rapidly and widely distributed. Metabolized in the liver. Excreted primarily in urine. Removed by hemodialysis. *Half-life:* 53-118 h.

# AVAILABILITY

*Elixir:* 20 mg/5 mL. *Tablets:* 15 mg, 30 mg, 60 mg, 100 mg. *Injection:* 60 mg/mL, 130 mg/mL.

# INDICATIONS AND DOSAGES Status epilepticus

IV

Adults, Elderly, Children, Neonates. Loading dose of 15-20 mg/kg as a single dose or in divided doses.

# Seizure control

PO, IV

Adults, Elderly, Children 12 yr and older: 1-3 mg/kg/day. Children aged 6-12 yr. 3-6 mg/kg/ day. Children aged 1-5 yr. 6-8 mg/kg/day. Children younger than 1 yr. 5-6 mg/ kg/day. Neonates. 3-4 mg/kg/day. Sedation PO, IM Adults, Elderly. 30-120 mg/day in 2-3 divided doses. Children. 2 mg/kg 3 times a day.

Hypnotic

### PO, IV, IM, SC

Adults. 100-200 mg at bedtime. Children. 3-5 mg/kg at bedtime.

# **OFF-LABEL USES**

Prevention and treatment of hyperbilirubinemia, chronic cholestasis.

# CONTRAINDICATIONS

Hypersensitivity to barbiturates, porphyria, marked hepatic impairment, or respiratory disease in which dyspnea or obstruction is evident.

# INTERACTIONS

### Drug

NOTE: Phenobarbital induces the metabolism of many important drugs. Alcohol, other CNS depressants: May increase the effects of phenobarbital. Antiretroviral protease inhibitors: May decrease PI blood concentrations, leading to loss of antiviral effect against HIV. Carbamazepine: May increase the metabolism of carbamazepine. Digoxin, glucocorticoids, metronidazole, quinidine, tricyclic antidepressants: May decrease the effects of these drugs. Hormonal contraceptives: May decrease blood concentrations, leading to loss of contraceptive efficacy. Higher dose regimens or alternative or additional methods may be needed. Phenytoin: Variable effects on serum concentrations; monitor closely. Theophylline: May reduce theophylline concentrations. Valproic acid: Increases the blood concentration and risk of toxicity of phenobarbital. Warfarin: May reduce anticoagulant effect. Monitor INR. Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May decrease serum bilirubin level. Therapeutic serum level is 10-40 mcg/mL; toxic serum level is > 50 mcg/mL.

# IV INCOMPATIBILITIES

NOTE: In general, phenobarbital sodium injection is incompatible with many other injectable medications.

Amphotericin B complex (Abelcet, AmBisome, Amphotec), fentanyl (Sublimaze), fosphenytoin (cerebyx), hydrocortisone (Solu-Cortef), hydromorphone (Dilaudid), insulin, morphine.

### SIDE EFFECTS

#### Frequent

IV: Bradycardia, hypotension, drowsiness.

Occasional (1%-3%)

#### Somnolence. Rare (< 1%)

Confusion; paradoxical CNS reactions, such as hyperactivity or nervousness in children and excitement or restlessness in elderly patients (generally noted during first 2 wks of therapy, particularly in the presence of uncontrolled pain).

# SERIOUS REACTIONS

• Abrupt withdrawal after prolonged therapy may produce increased dreaming, nightmares, insomnia, tremor, diaphoresis, vomiting, hallucinations, delirium, seizures, and status epilepticus.

• Skin eruptions may be a sign of a hypersensitivity reaction and may include exfoliative dermatitis, Stevens-Johnson syndrome, and toxic epidermic necrolysis.

Blood dyscrasias, hepatic disease, and hypocalcemia occur rarely.
Overdose produces cold or clammy skin, hypothermia, severe CNS depression, cyanosis, tachycardia, and Cheyne-Stokes respirations.

• Toxicity may result in severe renal impairment.

 With injection, extravasation may cause tissue necrosis of inadvertent errors in administration may cause nerve damage.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic and renal impairment. Phenobarbital readily crosses the placenta and is distributed in breast milk. Phenobarbital use lowers serum bilirubin concentrations in neonates, produces respiratory depression in neonates during labor, and may increase the risk of maternal bleeding and neonatal hemorrhage during delivery. Neonates born to women who use barbiturates during the last trimester of pregnancy may experience withdrawal symptoms. Phenobarbital use may cause paradoxical excitement in children. Elderly patients taking phenobarbital may exhibit confusion, excitement, and mental depression.

Drowsiness and dizziness may occur, so alcohol and tasks requiring mental alertness or motor skills should be avoided. Notify the physician if headache, nausea, and rash occur. BP, heart rate, respiratory rate, CNS status, renal and hepatic function, and seizure activity should be monitored.

### Storage

Store at room temperature. Administration

### PO

Take oral phenobarbital without regard to food. Crush tablets as needed. The elixir may be mixed with fruit juice, milk, or water. IV, IM

Phenobarbital may be given undiluted or may be diluted with NaCl, D5W, or lactated Ringer's solution. Expect to hydrate the patient adequately before and immediately after infusion to decrease the risk of adverse renal effects. Do not exceed an injection rate of 30 mg/min for children and 60 mg/min for adults. Injecting too rapidly may produce marked respiratory depression and severe hypotension. Be aware that inadvertent intra-arterial injection may result in arterial spasm with severe pain and tissue necrosis and that extravasation in subcutaneous tissue may produce redness, tenderness, and tissue necrosis. If either occurs, inject 0.5% procaine solution into the affected area and apply moist heat, as ordered.

For IM use, do not inject more than 5 mL in any one injection site because doing so may cause tissue irritation. Inject the drug deep intramuscularly.

# Phenoxybenzamine

fen-ox-ee-ben'za-meen

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antihypertensives, sympatholytics,  $\alpha$ -blocking agent

### MECHANISM OF ACTION

An antihypertensive that produces long-lasting noncompetitive α-adrenergic blockade of postganglionic synapses in exocrine glands and smooth muscles. Relaxes urethra and increases opening of the bladder. *Therapeutic Effect:* Controls hypertension.

# PHARMACOKINETICS

Well absorbed from the GI tract. Distributed into fatty tissue. Metabolized in liver. Eliminated in urine and feces. Not removed by hemodialysis. *Half-life:* 24 h.

### AVAILABILITY

Tablets: 10 mg (Dibenzyline).

### INDICATIONS AND DOSAGES

 Treatment of hypertension caused by pheochromocytoma
 PO Adults. Initially, 10 mg twice daily. May increase dose by 10 mg no more frequently than every other day to clinical response or a maximum of 20-40 mg 2-3 times/day.

### **OFF-LABEL USES**

Prostatic obstruction, Raynaud's disease, frostbite.

### CONTRAINDICATIONS

Any condition compromised by hypotension, hypersensitivity to phenoxybenzamine or any component of the formulation.

### INTERACTIONS Drug

a-Adrenergic agonists: May decrease the effects of phenoxybenzamine β-Blockers (used concurrently): May increase risk of toxicity (hypotension, tachycardia). CNS depressants: May increase risk of CNS depression. Ephedrine and OTC cold medicines containing ephedrine: May counteract hypotensive effects. Hypotensive-producing medications: May increase the effects of phenoxybenzamine. Herbal Licorice, ma huang, yohimbine: May decrease the effects of

May decrease the effects of phenoxybenzamine. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

Frequent

Headache, nasal congestion, dizziness, drowsiness.

### Occasional

Nausea, postural hypotension, syncope, dry mouth.

Phenoxybenzamine (Generic Name), Dibenzyline (Brand Name)

### Rare

Palpitations, diarrhea, constipation, inhibition of ejaculation, weakness, altered vision, miosis, confusion.

# SERIOUS REACTIONS

• Overdosage produces severe hypotension, irritability, lethargy, tachycardia, dizziness, and shock.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with congestive heart failure, coronary artery disease, and renal function impairment. It is unknown whether phenoxybenzamine crosses the placenta or is distributed into breast milk. Safety and efficacy have not been established in children. Elderly patients may be more sensitive to hypotensive effects and may be at risk of developing phenoxybenzamine-induced hypothermia.

Dizziness and light-headedness may occur. Use caution when driving and change positions slowly. Alcohol should be avoided.

### Storage

Store at room temperature.

### Administration

If GI irritation occurs, take with meals or milk.

# Phentermine

fen'ter-meen Adipex-P, Suprenza

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: IV

**Classification:** Obesity agents, sympathomimetics, anorexiants

# **MECHANISM OF ACTION**

A sympathomimetic amine structurally similar to dextroamphetamine and most likely mediated via norepinephrine and dopamine metabolism. Causes stimulation of the hypothalamus. *Therapeutic Effect:* Decreased appetite.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding around 96%. Metabolism in liver. Drug and metabolites excreted in urine. *Half-life*: 19-24 h.

# AVAILABILITY

Capsules (as Hydrochloride): 37.5 mg (Adipex-P). Tablets (as Hydrochloride): 37.5 mg (Adipex-P). Oral Disentegrating Tablets (as Hydrochloride): 15 mg, 30 mg (Suprenza).

# 

PO (ADIPEX-P) Adults, Children older than 16 yr. Usually 1 capsule or tablet (37.5 mg) daily, administered before breakfast or 1-2 h after breakfast. Can adjust dose with tablets; for some, halftablet (18.75 mg) daily is adequate. PO (SUPRENZA ODT). Adults, Children older than 16 yr. 15 mg or 30 mg once daily, administered with or without food. For some, 15 mg daily is adequate.

# CONTRAINDICATIONS

Advanced arteriosclerosis, agitated states, cardiovascular disease, anorexia nervosa, concurrent use or within 14 days of discontinuation of MAOI therapy, glaucoma, history of drug abuse, hypertension (moderate to severe), hyperthyroidism, hypersensitivity to

Phentermine (Generic Name)
phentermine or sympathomimetic amines. Do not use during pregnancy or lactation.

## INTERACTIONS

#### Drug

Caffeine and caffeine-containing products: Increased risk of insomnia. Fenfluramine: May increase risk of pulmonary hypertension and valvular heart disease. Hydrocarbon inhalants, general anesthetics: Increased risk of dysrhythmia. MAOIs: May increase risk of

hypertensive crisis (headache, hyperpyrexia, hypertension). Sibutramine: May increase risk of hypertension and tachycardia. Tricyclic antidepressants, ascorbic

acid, phenothiazines: Decreased effect of phentermine.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May interfere and give false-positive amphetamine EMIT assay result.

## SIDE EFFECTS

#### Occasional

Restlessness, insomnia, tremor, palpitations, tachycardia, elevation in BP, headache, dizziness, dry mouth, unpleasant taste, diarrhea or constipation, changes in libido.

## SERIOUS REACTIONS

 Primary pulmonary hypertension (PPH), psychotic episodes, and valvular heart disease rarely occur.

 Anorectic agents have been associated with regurgitant multivalvular heart disease involving mitral, aortic, or tricuspid valves.

 Prolonged use may cause physical or psychological dependence.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiovascular disease, psychosis, diabetes, insomnia, porphyria, mild hypertension, Tourette's syndrome, seizure disorders, renal impairment, and history of substance abuse. It is unknown whether phentermine is excreted in breast milk. Phentermine should not be used in pregnancy or lactation. Be aware that the safety and efficacy of this drug have not been established in children younger than 16 yr. Age-related renal impairment may require decreased dosage in elderly patients. Phentermine may be habit forming, and it should not be abruptly discontinued.

Caution is warranted in patients with a history of drug abuse or addictive personality as prolonged use can cause physical or psychological dependence.

Monitor response to therapy and advise patient regarding proper dietary goals. Have patients report immediately and deterioration in exercise tolerance. Discontinue in patients who develop new, unexplained symptoms of dyspnea, angina, syncope or lower extremity edema; evaluate for the possible presence of pulmonary hypertension. **Storage** 

Store at room temperature, tightly closed.

#### Administration

Do not take phentermine in the evening because it can cause insomnia. May take capsules or tablets before breakfast or 1-2 h after breakfast.

Orally disentegrating tablets (ODT) may be taken in AM with or without food. With dry hands, gently remove the ODT tablet from the bottle. Immediately place on top of the tongue where it will dissolve, then swallow with or without water.

# **Phentolamine**

fen-tole'a-meen

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Sympatholytics, α-blocking

# **MECHANISM OF ACTION**

An  $\alpha$ -adrenergic blocking agent that produces peripheral vasodilation and cardiac stimulation. *Therapeutic Effect:* Decreases BP.

# PHARMACOKINETICS

Poorly absorbed from the GI tract. Protein binding: 72%. Metabolized in liver. Eliminated in urine and feces. Not removed by hemodialysis. *Half-life*: 19 min.

# AVAILABILITY

Injection: 5 mg/mL.

# INDICATIONS AND DOSAGES

## Extravasation—norepinephrine SC

Adults, Elderly. Infiltrate area with a small amount (1 mL) of solution (made by diluting 5-10 mg in 10 mL of NS) within 12 h of extravasation. Do not exceed 0.1-0.2 mg/kg or 10 mg total. If dose is effective, normal skin color should return to the blanched area within 1 h.

*Children.* Infiltrate area with a small amount (1 mL) of solution (made by diluting 5-10 mg in 10 mL of NS) within 12 h of extravasation. Do not exceed 0.1-0.2 mg/kg or 5 mg total.

## Diagnosis of pheochromocytoma IM/IV

*Adults, Elderly.* 5 mg as a single dose.

*Children.* 0.05-0.1 mg/kg/dose. Maximum single dose: 5 mg.

# Surgery for pheochromocytoma: Hypertension

IM/IV Adults, Elderly. 5 mg given 1-2 h before procedure and repeated as needed every 2-4 h. *Children*. 0.05-0.1 mg/kg/dose given 1-2 h before procedure. Repeat as needed every 2-4 h until hypertension is controlled. Maximum single dose: 5 mg.

# • Hypertensive crisis IV

*Adults, Elderly.* 5-15 mg as a single dose.

# **OFF-LABEL USES**

Treatment of pralidoxime-induced hypertension, erectile dysfunction (with papaverine for intracavernous injection), extravasation-dopamine, epinephrine, hyperhidrosis.

# CONTRAINDICATIONS

Renal impairment, coronary or cerebral arteriosclerosis, hypersensitivity to phentolamine or related compounds.

# INTERACTIONS

Drug

Alcohol: May increase the risk of disulfiram-type reactions. β-Blockers: May exaggerate hypotensive effects. Epinephrine, ephedrine: May decrease the effects of phentolamine; may cause tachycardia. Sildenafil, tadalafil, vardenafil: May increase BP-lowering effects. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase liver function tests.

# IV INCOMPATIBILITIES

Amphotericin B, cefazolin, cefoxitin, clindamycin, diazepam, furosemide, regular insulin, ketorolac, penicillin G, phenobarbital, phenytoin.

# 🗏 IV COMPATIBILITIES

Amiodarone (Cordarone), dobutamine (Dobutrex), dopamine, phenylephrine, norepinephrine (Levophed), papaverine, phenylephrine, verapamil.

## SIDE EFFECTS

#### Occasional

Hypotension, tachycardia, arrhythmia, flushing, orthostatic hypotension, weakness, dizziness, nausea, vomiting, diarrhea, nasal congestion, pulmonary hypertension.

# SERIOUS REACTIONS

• Symptoms of overdosage include tachycardia, shock, vomiting, and dizziness.

• Mixed agents, such as epinephrine, may cause more hypotension.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with arrhythmias, cerebral vascular spasm or occlusion, hypotension, and tachycardia. Be aware that it is unknown whether phentolamine crosses the placenta or is distributed into breast milk. No age-related precautions have been noted in children or elderly patients.

Nasal congestion, increased heartbeat, palpitations, dizziness, headache, and hypotension are common side effects of phentolamine. BP should be monitored during its use. Symptoms including tachycardia, shock, vomiting, and dizziness may indicate overdosage and should be reported immediately.

#### Storage

Store at room temperature.

#### Administration

Phentolamine mesylate for injection is reconstituted for parenteral use by adding 1 mL of sterile water for injection to the vial, producing a solution containing 5 mg of phentolamine mesylate per milliliter. Discard any unused portion.

Phentolamine is sometimes added to peripheral pressor infusions to circumvent local tissue damage. The manufacturer indicates that admixing phentolamine at a concentration of 0.01 mg/mL with norepinephrine does not adversely affect the pressor action of norepinephrine.

Persons undergoing diagnostic testing for pheochromocytoma should be maintained in the supine position during phentolamine administration.

## Phenylephrine (Systemic)

Neo-Synephrine, Pediacare Decongestant, Sudafed PE, Sudogest PE **Do not confuse with** pseudoephedrine, epinephrine.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

*Classification:* Vasopressors, decongestants, sympathomimetic, α-adrenergic agonist

# MECHANISM OF ACTION

Phenylephrine is a powerful postsynaptic  $\alpha$ -receptor stimulant that acts on the  $\alpha$ -adrenergic receptors of vascular smooth muscle, with little effect on the  $\beta$ -receptors of the heart, lacking chronotropic and inotropic actions on the heart.

## 1266 Phenylephrine (Systemic)

Causes vasoconstriction of arterioles of nasal mucosa or conjunctiva, activates dilator muscles of the pupil to cause contraction, and produces systemic arterial vasoconstriction. *Therapeutic Effect:* Vasoconstriction, decreases heart rate, increases stroke output, increases blood pressure, decreases mucosal blood flow and relieves congestion, and increases systolic BP.

# PHARMACOKINETICS

Phenylephrine is irregularly absorbed from and readily metabolized in the GI tract. After IV administration, a pressor effect occurs almost immediately and persists for 15-20 min. After IM administration, a pressor effect occurs within 10-15 min and persists for 50 min to 1 h. The pharmacologic effects of phenylephrine are terminated at least partially by the uptake of the drug into the tissues. Phenylephrine is metabolized in the liver and intestine by the enzyme monoamine oxidase (MAO). The metabolites and their route and rate of excretion have not been identified. Half-life: Up to 2.5 h, variable.

Route	Onset	Peak	Duration
IV	Immediate	NA	15-20 min
IM	10-15 min	NA	0.5-2 h
SC	10-15 min	NA	1 h

# AVAILABILITY

Solution (Injection): 10 mg/mL. Tablets, OTC (Sudafed PE, Sudogest PE): 10 mg. Oral Solution (Sudafed PE, Pediacare Decongestant): 2.5 mg/5 mL.

# INDICATIONS AND DOSAGES

Treatment of nasal congestion (temporary relief), mild to moderate hypotension, paroxysmal supraventricular tachycardia (PSVT), hypotensive prophylaxis during spinal anesthesia, vasoconstriction during anesthesia.

## Paroxysmal supraventricular tachycardia (PSVT)

*Adults*. The initial dose, given by rapid IV injection, should not exceed 0.5 mg. Subsequent doses may be increased in increments of 0.1-0.2 mg. Maximum single dose is 1 mg IV. *Children.* 5-10 mcg/kg IV over 20-30 seconds.

## Mild to moderate hypotension SC/IM

*Adults.* 2-5 mg IM or SC (range 1-10 mg), repeated no more than every 10-15 min. Maximum initial IM or SC dose is 5 mg.

*Children.* 0.1 mg/kg IM or SC every 1-2 h as needed. Maximum dose is 5 mg.

IV

*Adults.* 0.2 mg IV (range 0.1-0.5 mg), given no more frequently than every 10-15 min. Maximum initial IV dose is 0.5 mg.

#### Severe hypotension or shock IM, SC

Adults, Elderly. 2-5 mg/dose q1-2h. Children. 0.1 mg/kg/dose q1-2h. IV BOLUS Adults, Elderly. 0.1-0.5 mg/dose q10-15min as needed. Children. 5-20 mcg/kg/dose q10-15min. IV INFUSION Adults. Initially, 100-180 mcg/min IV infusion, with dose titration to the desired MAP and SVR. A maintenance infusion rate of 40-60 mcg/min IV is usually adequate after BP stabilizes. Children. 5-20 mcg/kg IV bolus, followed by an initial IV infusion

of 0.1-0.5 mcg/kg/min, titrated to desired effect. Titrate to achieve desired effect.

# Hypotensive emergencies during spinal anesthesia

## IV

*Adults.* Initially, 0.2 mg IV. Subsequent doses should not exceed the previous dose by more than 0.1-0.2 mg. Maximum of 0.5 mg per dose.

# Hypotension during spinal anesthesia in children

IM/SC

*Children.* A dose of 0.044-0.088 mg/ kg IM or SC is recommended by the manufacturer.

## Hypotension prophylaxis during spinal anesthesia

## IM/SC

*Adults.* 2-3 mg SC or IM, 3 or 4 min before anesthesia. A dose of 2 mg SC or IM is usually adequate with low spinal anesthesia; 3 mg IM or SC may be necessary with high spinal anesthesia.

## Vasoconstriction in regional anesthesia

IV

Adults. The manufacturer states that the optimum concentration of phenylephrine HCl is 0.05 mg/mL (1:20,000). Solutions may be prepared for regional anesthesia by adding 1 mg of phenylephrine HCl to each 20 mL of local anesthesia solution. Some pressor response can be expected when at least 2 mg is injected.

# Prolongation of spinal anesthesia

IV

*Adults.* The addition of 2-5 mg to the anesthetic solution increases the duration of motor block by as much as 50% without an increase in the incidence of complications such as nausea, vomiting, or BP disturbances.

#### Nasal decongestion PO

Adults, Elderly, Children 13 yr and older. 10 mg q4-6h, up to 60 mg/day.

*Children 6-12 yr.* 5 mg q4-6h, up to 30 mg/day. *Children 4-5 yr.* 2.5 mg q4-6h, up to 15 mg/day.

# CONTRAINDICATIONS

Phenylephrine HCl injection should not be used with patients with severe hypertension, ventricular tachycardia or fibrillation, acute myocardial infarction (MI), atrial flutter or fibrillation, cardiac arrhythmias, cardiac disease, cardiomyopathy, closed-angle glaucoma, coronary artery disease, women who are in labor, during obstetric delivery, or in patients who have a known hypersensitivity to phenylephrine, sulfites, or to any one of its components.

# INTERACTIONS

Drug

**β-Adrenergic blockers:** Risk of bradycardia with systemic absorption.

Halothane: Vasopressors may cause serious cardiac arrhythmias during halothane anesthesia and therefore should be used only with great caution or not at all.

MAO inhibitors: The pressor effect of sympathomimetic pressor amines and adrenergic agents is markedly potentiated in patients receiving MAO inhibitors.

Nitrous oxide/oxygen gas inhalation: May complicate nasal administration.

**Oxytocics:** The pressure effect of sympathomimetic pressor amines is potentiated.

Tricyclic antidepressants:

Increased risk of dysrhythmias and hypertension.

## Herbal

None known.

# Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Nasal: Rebound nasal congestion due to overuse, especially when used for more than 3 days.

#### Occasional

Mild central nervous system (CNS) stimulation (restlessness, nervousness, tremors, headache, insomnia), headache, reflex bradycardia, excitability, restlessness, and rarely arrhythmias. Nasal: Stinging, burning, drying of nasal mucosa. Ophthalmic: Transient burning

or stinging, brow ache, blurred vision.

## SERIOUS REACTIONS

• Overdose may induce ventricular extrasystoles and short paroxysms of ventricular tachycardia, a sensation of fullness in the head, and tingling of the extremities. If an excessive elevation of BP occurs, it can be immediately relieved by an  $\alpha$ -adrenergic blocking agent (e.g., phentolamine).

 Peripheral vasoconstriction may lead to limb ischemia, gangrene.
 Administer phentolamine as soon as extravasation is noted.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with metabolic acidosis, acute pancreatitis, heart disease, pheochromocytoma, severe hypertension, thrombosis, ventricular tachycardia, hypercapnia, phenylketonuria, hypoxia, atrial fibrillation, narrowangle glaucoma, pulmonary hypertension, hypovolemia, mechanical obstruction such as severe valvular aortic stenosis, myocardial infarction, arterial embolism, atherosclerosis, Buerger's disease, cold injury such as frostbite, diabetic endarteritis, Raynaud's syndrome, and sensitivity to other sympathomimetics. It is unknown whether phenylephrine (systemic) crosses the placenta or is distributed into breast milk. Phenylephrine (systemic) should be used cautiously in children and elderly patients. Particular caution is warranted in children under 6 yr of age and in patients with diabetes, cardiovascular disease, hypertension, hyperthyroidism, increased intraocular pressure, prostatic hypertrophy, glaucoma, ischemic heart disease.

#### Storage Store at roor

Store at room temperature. Administration

To prepare a solution of phenylephrine for direct IV injection, 10 mg (1 mL) of phenylephrine hydrochloride injection should be diluted with 9 mL of sterile water for injection to provide a solution containing 1 mg of phenylephrine per milliliter. Infuse over 20-30 seconds into a large vein. Direct IV injection reserved for emergency administration.

To prepare a continuous IV infusion, final concentrations are usually 20-60 mcg/mL in either D5W or 0.9% NaCl. Whenever possible, infuse via central access. Infusion into very small veins can cause necrosis or gangrene.

Oral dose forms for nasal decongestant use may be given without regard to meals.

# Phenytoin

fen'i-toyn Dilantin, Dilantin Infatab, Dilantin-125 Suspension, Dilantin Kapseals, Phenytek Dilantin, Dilantin Infatab, Dilantin-125 Suspension, Dilantin Kapseals Do not confuse phenytoin with mephenytoin, or Dilantin with Dilaudid.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Anticonvulsants, hydantoins

# **MECHANISM OF ACTION**

A hydantoin anticonvulsant that stabilizes neuronal membranes in the motor cortex by decreasing sodium and calcium ion influx into the neurons. Also acts as an antiarrhythmic agent by decreasing abnormal ventricular automaticity and shortening the refractory period, QT interval, and action potential duration. *Therapeutic Effect*: Limits the spread of seizure activity. Restores normal cardiac rhythm.

# PHARMACOKINETICS

Slowly and variably absorbed after PO administration; slowly but completely absorbed after IM administration. Protein binding: 90%-95% (adults), 84% (neonates). Widely distributed; crosses the placenta and into breast milk. Metabolized in the liver. Phenytoin is one of only a few drugs in which metabolic capacity can be saturated at therapeutic levels. Below the saturation point, phenytoin is eliminated in a linear process. Above the saturation point, elimination is much slower and occurs via a zero-order process. Small increases in dose can produce large increases in plasma concentrations. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 22 h (oral), 14 h (Infatabs).

# AVAILABILITY

Chewable Tablets (Dilantin Infatabs): 50 mg. Capsules (Extended Release [Dilantin]): 30 mg (27.6 mg phenytoin), 100 mg (92 mg phenytoin). Capsules (Extended Release [Phenytek]): 200 mg, 300 mg. Oral Suspension (Dilantin): 125 mg/5 mL. Injection: 50 mg/mL.

# INDICATIONS AND DOSAGES

 Used in the treatment of status epilepticus of the grand mal type, prevention and treatment of seizures occurring during neurosurgery.
 Control of arrhythmias is common (off-label)

Status epilepticus IV

Adults, Elderly, Children. 15-20 mg/kg by slow IV, followed by a maintenance dose of 100 mg every 6-8 h, PO or IV. Maintenance dose: 300 mg/day in 2-3 divided doses for adults and elderly; 6-7 mg/kg/day for children 10-16 yr; 7-8 mg/kg/day for children 7-9 yr; 7.5-9 mg/kg/day for children 4-6 yr; 8-10 mg/kg/day for children 6 mo to 3 yr. IV rate should not exceed 1-3 mg/kg/min. *Neonates.* Loading dose: 15-20 mg/kg. Maintenance dose: 5-8 mg/kg/day.

#### Seizure control PO

*Adults, Elderly.* 100 mg or 125 mg suspension 3 times/day initially, followed by 300-400 mg/day, not to exceed 600 mg/day. Can administer

Phenytoin (Generic Name)

1 g loading dose in 3 divided doses (400 mg, 300 mg, 300 mg) given at 2-h intervals. Once control is established, extended release 300 mg/day may be administered once daily.

*Children 16 yr or younger.* PO 5 mg/ kg/day in 2-3 divided doses initially. Once control is established, follow with 4-8 mg/kg/day, not to exceed 300 mg/day.

Neurosurgery prophylaxis

*Adults.* 10-20 mg/kg IV load. Maintenance: 4-6 mg/kg/day in 2 doses during surgery and postoperatively.

# **OFF-LABEL USES**

Control of digoxin-induced arrhythmias, neuropathic pain/ diabetic neuropathy, rare use for migraine prophylaxis.

# CONTRAINDICATIONS

Hypersensitivity to hydantoins, seizures due to hypoglycemia. IV: Adams-Stokes syndrome, second- and third-degree AV block, sinoatrial block, sinus bradycardia.

# INTERACTIONS

NOTE: Many drugs may interact with phenytoin; closely review regimens. Commonly encountered interactions are listed.

## Drug

Acetaminophen: May increase hepatotoxicity potential with chronic use.

Alcohol, other central nervous system (CNS) depressants: May increase CNS depression.

Amiodarone, cimetidine, disulfiram, felbamate, isoniazid, oxyphenbutazone, phenylbutazone, phenacemide, sulfonamides, trimethoprim: May increase phenytoin blood concentration, effects, and risk of toxicity. Antacids, sucralfate: May decrease phenytoin absorption.

Antiretroviral protease inhibitors for HIV (PIs): May lead to loss of efficacy and possible resistance to the protease inhibitor; may increase phenytoin concentrations.

# Carbamazepine, rifampin, rifabutin: May decrease serum

levels of phenytoin.

Corticosteroids, certain antineoplastics, coumarin anticoagulants, doxycycline, levodopa, felodipine, methadone, loop diuretics, hormonal contraceptives, quinidine: May reduce serum levels of these agents and reduce efficacy.

CNS depressants, alcohol: May increase depressant effects. Cyclosporine: May reduce serum levels.

**Delavirdine:** May lead to loss of efficacy against HIV and possible HIV resistance.

**Disopyramide:** May cause decreased bioavailability and serum concentrations; may enhance anticholinergic effect.

# Fluconazole, ketoconazole,

**miconazole:** May increase phenytoin blood concentration.

Folic acid: May cause folic acid deficiency.

Lidocaine: May increase cardiac depressant effects.

Metyrapone: May cause a subnormal response to metyrapone. Mexiletine: May decrease cardiac effects and serum concentration.

**Nondepolarizing muscle relaxants:** May cause decreased effect or shorter duration of activity.

Phenobarbital, primidone, sodium valproate, valproic acid: May alter phenytoin levels, may increase phenobarbital levels, and decrease valproic acid levels.

## Sympathomimetics (e.g.,

**dopamine):** May cause profound hypotension and cardiac arrest. **Theophylline:** May decrease effects of both theophylline and phenytoin.

**Valproic acid:** May decrease the metabolism and increase the blood concentration of phenytoin.

## Herbal

None known.

## Food

**Enteral nutrition therapy:** May reduce serum concentrations of phenytoin. Hold enteral feedings 2 h prior to and after administration.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose level and serum GGT and alkaline phosphatase levels. Therapeutic serum level is 10-20 mcg/mL; toxic serum level is > 25 mcg/mL.

# IV INCOMPATIBILITIES

Do not mix with any other medications. Incompatible for dilution with dextrose-containing IV solutions.

# SIDE EFFECTS

## Frequent

Drowsiness, lethargy, confusion, slurred speech, irritability, gingival hyperplasia, hypersensitivity reaction (including fever, rash, and lymphadenopathy), constipation, dizziness, nausea, vomiting, pink-colored urine. With IV, may see hypotension, bradycardia.

## Occasional

Headache, hirsutism, coarsening of facial features, insomnia, muscle twitching.

## Rare

Dermatologic manifestations with fever: Scarlatiniform or morbiliform rashes.

## SERIOUS REACTIONS

• Abrupt withdrawal may precipitate status epilepticus.

 Local irritation, inflammation, tenderness, necrosis and sloughing with or without extravasation at site of injection or IV infusion.

• Blood dyscrasias, lymphadenopathy, and osteomalacia (caused by impaired vitamin D metabolism) may occur.

- Toxic phenytoin blood concentration (25 mcg/mL or more) may produce ataxia, nystagmus, or diplopia. As the level increases, extreme lethargy may lead to coma.
- Too rapid IV infusion may cause hypotension and cardiac arrhythmias.
- Hypersensitivity can manifest as serious skin reactions (e.g., Stevens-Johnson syndrome [SJS], toxic epidermal necrolysis [TEN], or drug reaction with eosinophilia and systemic symptoms [DRESS]) and may be life-threatening.
- Purple glove syndrome (characterized by limb edema, skin discoloration, and pain distal to the injection site) may progress to limb ischemia.

# **PRECAUTIONS & CONSIDERATIONS**

Because of variances in bioavailability, brand substitution of oral formulations is not recommended and should be avoided unless physician has approved brand interchange.

Extreme caution should be used in patients with congestive heart failure (CHF), myocardial damage, myocardial infarction (MI), and respiratory depression. Caution is also warranted with hyperglycemia, hypotension, hepatic and renal impairment, and severe myocardial insufficiency, alcohol abuse, hypotension, acute intermittent porphyria. Phenytoin crosses the placenta and is distributed in small

amounts in breast milk. Fetal hydantoin syndrome, marked by craniofacial abnormalities, digital or nail hypoplasia, and prenatal growth deficiency, has been reported. Pregnant women may experience more frequent seizures because of altered drug absorption and metabolism. Phenytoin use may increase the risk of neonatal hemorrhage and maternal bleeding during delivery. Children are more susceptible to coarsening of facial hair, hirsutism, and gingival hyperplasia. Lower dosages are recommended for elderly patients, although no age-related precautions have been noted for this age group.

Skin rash, nystagmus, ataxia, drowsiness, severe nausea or vomiting, gingival hyperplasia, or jaundice should be reported. Blood sugar levels may be affected by phenytoin, and changes in levels beyond normal should be reported.

Drowsiness, dizziness, and lethargy may occur, so alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician if fever, swollen glands, sore throat, a skin reaction, or signs of hematologic toxicity (such as a bleeding tendency, bruising, fatigue, or fever) occur. History of the seizure disorder, including the duration, frequency, and intensity of seizures, should be assessed. CBC and blood chemistry tests should be performed to assess hepatic function before and periodically during phenytoin therapy. Repeat the CBC 2 wks after beginning phenytoin therapy and 2 wks after the phenytoin maintenance dose is established. CBC should be performed every month for 1 yr after the maintenance dose is established and every 3 mo thereafter.

Discontinuation of the drug abruptly should be avoided as this could precipitate seizures or status epilepticus. Dosages should be reduced or other anticonvulsant medication should be introduced gradually. Storage

Oral dosage forms are stored at room temperature and protected from light and freezing. Injection should be stored in a cool, dry place at room temperature. For diluted infusions, prepare just prior to use and use within 1 h of preparation as the drug is poorly soluble and may precipitate.

## Administration

Take oral phenytoin with food if GI distress occurs. Do not chew, open, or break capsules or take any discolored capsules. Tablets may be chewed. Shake the oral suspension well before each use. If administering with tube feedings,

delay feeding 1-2 h before and after administration of phenytoin.

I Give phenytoin by IV push directly into a large vein through a large-gauge needle or IV catheter. Remember that the maintenance dose is usually given 12 h after the loading dose. Do not give IM, due to erratic absorption and potential for tissue necrosis.

A slight yellow discoloration of the solution will not affect its potency. Phenytoin may be given undiluted or may be diluted with 0.9% NaCl. Dilute phenytoin dosage in NS to a final concentration of  $\leq 6.7 \text{ mg/}$ mL (e.g., 1000 mg would be diluted with NS to a minimum volume of 150 mL). Complete infusion within 1 h of preparation. Must filter if diluted for IV infusion: Use 0.22- or a 0.45-micron final in-line filter between the IV catheter and IV tubing. The rate of IV phenytoin administration should not exceed 50 mg/min minute in adults and

1-3 mg/kg/min (or 50 mg per minute, whichever is slower) in pediatric and neonatal patients because of the risk of severe hypotension and cardiac arrhythmias. Careful cardiac monitoring is needed during and after administration. To minimize pain from chemical irritation of the vein, flush the catheter with sterile saline solution after each bolus dose of phenytoin.

## Phosphates, Potassium, Sodium, and Combinations

poe-tass'eeum fos'fates ★ Fleet Enema, Fleet Phospho-Soda, K-Phos 500, K-Phos Neutral, Osmoprep, Visicol

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Electrolyte replacement agents, minerals; gastrointestinal agents, laxatives

# **MECHANISM OF ACTION**

Electrolytes that participate in bone deposition, calcium metabolism, and utilization of B complex vitamins and act as a buffer in maintaining acid-base balance. Also exert an osmotic effect in the small intestine, producing distention and promoting peristalsis. *Therapeutic Effect:* Correct hypophosphatemia, acidify urine in urinary tract infections, help to prevent calcium deposits in urinary tract (unapproved use), and promote evacuation of the bowel.

## PHARMACOKINETICS

Following PO or IV use as a supplement, phosphate is absorbed via an active, energy-dependent process. Due to the formation of insoluble complexes, foods or drugs containing large amounts of calcium or aluminum decrease the amount of phosphate absorbed orally. Phosphorus is used in all energy-dependent body processes, where it is incorporated into molecules such as ATP. When used as a laxative or bowel evacuant, sodium phosphate salts act locally and quickly; no significant systemic distribution or metabolism is expected in most patients. Phosphate that is absorbed systemically is excreted almost exclusively by the kidneys. Half-life: Not available, but excretion is reduced in renal impairment.

# AVAILABILITY

LAXATIVES Oral Solution (Fleet Phospha-Soda): 4 mmol phosphate per mL. Enema (Fleet Enema): 2.25 oz, 4.5 oz. Tablets (Osmoprep): Total of 1.5 g of sodium phosphate per tablet. Tablets (Visicol): Total of 1.5 g of sodium phosphate per tablet. ELECTROLYTE REPLACEMENTS Tablets (K-Phos 500): 500 mg phosphate (sodium-free). Tablets (K-Phos Neutral): 250 mg (8 mmol) phosphate. Injection (potassium phosphate): 3 mmol phosphate and 4.4 mEq potassium per mL. Injection (sodium phosphate): 3 mmol phosphate and 4 mEq sodium per mL.

# INDICATIONS AND DOSAGES Hypophosphatemia

PO (K-PHOS, K-PHOS NEUTRAL) Adults, Elderly. 800 mg. Children > 10 yr of age. 1200 mg. Children 1-10 yr of age. 800 mg. Children 6-12 mo of age. 360 mg. Children up to 6 mo of age. 240 mg. IV INFUSION Adults, Elderly. 0.5 mmol/kg IV over 4-6 h.

## *Children*. 0.25 mmol/kg over 4-6 h. For bowel evacuation

PO (OSMOPREP)

*Adults, Elderly.* 32 tablets (48 g) PO total, taken as follows: The evening before colonoscopy, 4 tablets are taken with 8 oz of clear liquids q15min for a total of 20 tablets. On the day of colonoscopy (starting 3-5 h before), 4 tablets are taken with 8 oz of clear liquids q15min for a total of 12 tablets. Do not repeat this regimen within 7 days. PO (VISICOL)

Adults, Elderly. 40 tablets (60 g) PO total, taken as follows: The evening before colonoscopy, 3 tablets are taken with 8 oz of clear liquids q15min for a total of 20 tablets (last dose is 2 tablets). On the day of colonoscopy (starting 3-5 hours before), 3 tablets are taken with 8 oz of clear liquids q15min for a total of 20 tablets (the last dose is 2 tablets). Do not repeat this regimen within 7 days.

PO (FLEET PHOSPHO-SODA) Adults, Elderly, Children 13 yr and older: 30 or 45 mL, taken as follows. Dilute the dose in one 8-oz glass of clear liquid. Drink, then follow with at least 3 full glasses of clear liquids. Do not exceed recommended dosage. Children 5 to 12 yr. Reduction in the adult dose necessary. Consult physician.

RECTAL (FLEET ENEMA) Adults, Elderly, Children 13 yr and older. 1 bottle (118 ml) per rectum. RECTAL (FLEET ENEMA FOR CHILDREN)

*Children 5 to 11 yr.* 1 bottle (59 ml) per rectum.

*Children 2-4 yr.* ½ bottle (29.5 ml) per rectum; measured carefully by removing excess enema from bottle.

# For constipation

PO (FLEET PHOSPHO-SODA) Adults, Elderly, Children 10 yr and older: 1 tbsp (15 mL); dilute the dose with 4 oz of cool water. Drink, then follow with at least one additional 8-oz glass of cool water. *Children 5 to 9 yr.* ½ tbsp (7.5 mL); dilute the dose with 4 oz of cool water. Drink, then follow with at least one

# additional 8-oz glass of cool water.

# Urine acidification

PO Adults, Elderly. 8 mmol (250 mg) 4 times a day.

## **OFF-LABEL USES**

Prevention of calcium renal calculi.

# CONTRAINDICATIONS

Abdominal pain or fecal impaction (rectal dosage form), CHF, hyperkalemia, hypernatremia, hyperphosphatemia, hypocalcemia, hypomagnesemia, phosphate renal calculi, severe renal impairment.

## INTERACTIONS

## Drug

Amiloride, ACE inhibitors, NSAIDs, potassium-containing medications, potassium-sparing diuretics, salt substitutes containing potassium phosphate: May increase potassium blood concentration. Antacids: May decrease the absorption of phosphates.

Calcium-containing medications: May increase the risk of calcium deposition in soft tissues and decrease phosphate absorption. Digoxin: May increase the risk of heart block caused by hyperkalemia when given with potassium phosphates. Glucocorticoids: May cause edema when given with sodium phosphate.

**Iron and iron-containing products:** May inhibit absorption if taken within 2 h of phosphate dose.

**Phosphate-containing medications:** May increase the risk of hyperphosphatemia.

## Sodium-containing medications:

May increase the risk of edema when given with sodium phosphate.

Triamterine and other potassiumsparing diuretics: Concurrent use may increase the risk of

hyperkalemia developing.

## Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# **IV COMPATIBILITIES**

Diltiazem (Cardizem), enalapril (Vasotec), famotidine (Pepcid), magnesium sulfate, metoclopramide (Reglan).

# SIDE EFFECTS

## Frequent

Mild laxative effect (in first few days of therapy), decrease in frequency and amount of urination.

## Occasional

Diarrhea, nausea, abdominal pain, vomiting, slow or irregular heartbeat. **Rare** 

Headache, dizziness, confusion, heaviness of lower extremities, fatigue, muscle cramps, paresthesia, peripheral edema, arrhythmias, weight gain, thirst.

# SERIOUS REACTIONS

 Hyperphosphatemia may produce extraskeletal calcification, headache, confusion, muscle cramps, paresthesia, arrhythmias.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with adrenal insufficiency, cirrhosis, renal impairment, and concurrent use of potassium-sparing drugs. It is unknown whether phosphates cross the placenta or are distributed in breast milk. No age-related precautions have been noted in children or elderly patients.

Notify the physician of abdominal pain. Baseline phosphate levels and urinary pH should be obtained. Serum alkaline phosphatase, bilirubin, calcium, phosphorus, potassium, sodium, AST (SGOT), and ALT (SGPT) levels should be monitored throughout therapy. Pattern of daily bowel activity and stool consistency should also be assessed.

Injectible form contains aluminum, which may reach toxic levels with prolonged use; care is warranted in neonates.

## Storage

Store all products at room temperature; protect oral tablets from moisture.

## Administration

For oral use, dissolve tablets in a full glass of water. Give phosphates after meals or with food to decrease GI upset. Maintain high fluid intake to prevent renal calculi.

For IV use, dilute the drug before using. For peripheral lines, dilute at a concentration not to exceed 30 mmol per 500 mL. For central lines, may dilute 30 mmol in 250 mL. Generally, infuse over 4-6 h.

## Phosphorated Carbohydrate Solution

fos'for-ate-ed kar-boe-hye'drate

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: Not rated OTC

**Classification:** Gastrointestinal agents; antiemetics

# **MECHANISM OF ACTION**

An antiemetic whose mechanism of action has not been determined. Phosphorated carbohydrate solution consists of fructose, dextrose, and phosphoric acid, and it may directly act on the wall of the GI tract and reduce smooth muscle contraction and delay gastric emptying time through high osmotic pressure exerted by the solution of simple sugars. *Therapeutic Effect:* Relieves mild nausea and vomiting.

## PHARMACOKINETICS

Fructose is slowly absorbed from the GI tract. Metabolized in liver by phosphorylation and partly converted to liver glycogen and glucose. Excreted in urine.

Dextrose is rapidly absorbed from GI tract. Distributed and stored throughout tissues. Metabolized in liver to carbon dioxide and water.

# AVAILABILITY

Solution: 1.87 g fructose/1.87 g dextrose/21.5 mg phosphoric acid/ 5 mL (Emetrol).

# INDICATIONS AND DOSAGES Antiemetic

## PO

Adults, Elderly. 15-30 mL initially. May repeat dose every 15 min until distress subsides. Maximum: 5 doses in a 1-h period.

*Children 2 yr and older.* 5-10 mL initially. May repeat dose every 15 min until distress subsides. Maximum: 5 doses in a 1-h period. *Children under 2 yr.* Do not use.

# CONTRAINDICATIONS

Symptoms of appendicitis or inflamed bowel, hereditary fructose intolerance, hypersensitivity to any component of the formulation.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose concentrations.

## SIDE EFFECTS

**Frequent** Diarrhea, abdominal pain.

# SERIOUS REACTIONS

• Fructose intolerance includes symptoms of fainting; swelling of face, arms, and legs; unusual bleeding; vomiting; weight loss; and yellow eyes and skin.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus because the condition may be aggravated because of the solution's high carbohydrate content as well as with children and elderly because of the risk of fluid and electrolyte loss as a result of vomiting. It is unknown whether phosphorated carbohydrate solution crosses the placenta or is distributed in breast milk. Safety and efficacy of phosphorated carbohydrate solution have not been established in children younger than 2 yr of age. Storage

Store at room temperature tightly closed.

## Administration

May repeat dose after 15 min if distress does not subside. Do not dilute phosphorated carbohydrate solution. Do not drink any other fluids immediately before or after taking this drug. Do not exceed more than 5 doses in 1-h period. If symptoms do not cease after 5 doses, contact the patient's health care provider.

# **Physostigmine**

★ fi-zoe-stig/meen Do not confuse physostigmine with Prostigmin or pyridostigmine.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

## Classification:

Parasympathomimetic, cholinesterase inhibitors

# **MECHANISM OF ACTION**

A cholinergic that inhibits destruction of acetylcholine by enzyme acetylcholinesterase, thus enhancing impulse transmission across the myoneural junction. *Therapeutic Effect:* Improves skeletal muscle tone, stimulates salivary and sweat gland secretions.

# AVAILABILITY

Injection: 1 mg/mL.

# INDICATIONS AND DOSAGES

 To reverse central nervous system (CNS) effects of anticholinergic drugs and tricyclic antidepressants IV, IM

Adults, Elderly. Initially, 0.5-2 mg. If no response, repeat 10-30 min until response or adverse cholinergic effects occur. If initial response occurs, may give additional doses of 1-2 mg q30-60min as life-threatening signs, such as arrhythmias, seizures, and deep coma, recur.

*Children.* 0.01-0.03 mg/kg. May give additional doses q5-10min until response or adverse cholinergic

effects occur or total dose of 2 mg is given.

# **OFF-LABEL USES**

Treatment of hereditary ataxia.

# CONTRAINDICATIONS

Hypersensitivity, mechanical intestinal (ileus) or urinary obstruction. Take care to differentiate between cholinergic crisis and myasthenic crisis prior to use.

# INTERACTIONS

## Drug

Atropine: Use care when giving to counteract cholinesterase inhibitor side effects, as cholinergic crisis may be induced.

**Cholinesterase inhibitors:** May increase the risk of toxicity. **Neuromuscular blockers:** May prolong the action of succinylcholine and other related medicines.

**Quinine:** May antagonize the action of physostigmine.

Herbal None known.

Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# IV INCOMPATIBILITIES

Do not mix with any other medications.

# SIDE EFFECTS

## Expected

Miosis, increased GI and skeletal muscle tone, bradycardia, urinary frequency, lacrimation, sweating. Occasional

Marked drop in BP (hypertensive patients).

## Rare

Allergic reaction.

## SERIOUS REACTIONS

 Parenteral overdose produces a cholinergic crisis manifested as abdominal discomfort or cramps, nausea, vomiting, diarrhea, flushing, facial warmth, excessive salivation, diaphoresis, urinary urgency, and blurred vision. Seizures and bradycardia may occur. If overdose occurs, stop all anticholinergic drugs and immediately administer 0.6-1.2 mg atropine sulfate IM or IV for adults or 0.01 mg/kg for infants and children younger than 12 yr.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with bradycardia, bronchial asthma, epilepsy, GI disturbances, hypotension, parkinsonism, peptic ulcer disease, and disorders that may be adversely affected by drug's vagotonic effects and in those who have recently had a myocardial infarction. Those with renal impairment may require reduced dosage. Use with caution during pregnancy and breastfeeding. The elderly may be more sensitive to the drug's effects.

Adverse effects usually subside after the first few days of therapy. Vital signs should be assessed immediately before and every 15-30 min after physostigmine administration. Cholinergic reactions, such as abdominal pain, dyspnea, hypotension, arrhythmias, muscle weakness, and diaphoresis, after drug administration should be assessed.

#### Storage

Store the injection at room temperature protected from light. Do not freeze.

#### Administration

For adults, administer at a rate not exceeding 1 mg/min. For children, administer at a rate not exceeding 0.5 mg/min.

During IM and especially IV administration, frequently monitor pulse, respiratory rate, blood pressure, and neurologic status.

# Phytonadione

(vitamin K<sub>1</sub>) fye-toe-na-dye'own ★ Mephyton

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Drug Class: Vitamins, fat soluble

# **MECHANISM OF ACTION**

Needed for adequate blood clotting (factors II, VII, IX, X). *Therapeutic Effect:* Essential vitamin; reverses coagulopathy or coumarin toxicity.

## PHARMACOKINETICS

PO/Injection: Readily absorbed from duodenum and requires bile salts, rapid hepatic metabolism, onset of action 6-12 h, normal PT in 12-24 h, crosses placenta, renal and biliary excretion; because of severe side effects, restrict IV route when other administration routes are not available.

# AVAILABILITY

*Tablets:* 5 mg. *Injection:* 1 mg/0.5 mL (neonatal), 10 mg/mL.

# INDICATIONS AND DOSAGES

# Hypoprothrombinemia caused by vitamin K malabsorption PO/IM

*Adults.* 2-25 mg; may repeat or increase to 50 mg. *Children, Infants.* 2.5-5 mg as a single dose.

# Prevention of hemorrhagic disease of the newborn

## SC/IM

*Neonates.* 0.5-1 mg after birth; repeat in 6-8 h if required.

# Hypoprothrombinemia caused by oral anticoagulants

PO/SC/IM

Adults. 2.5-10 mg; may repeat 12-48 h after PO dose or 6-8 h after subcutaneous/IM dose, based on PT.

NOTE: PO administration is preferred over parenteral use for a supratherapeutic INR when no significant bleeding is present (see warfarin monograph).

# CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

## Drug

**Broad-spectrum antibiotics:** Decreased action. **Mineral oil, orlistat, bile-acid** 

**sequestrants:** Reduce oral absorption of vitamin K; separate administration times.

# Warfarin and coumarin

**anticoagulants:** Antagonist to coumarin anticoagulants.

# Herbal

None known.

#### Food

**Olestra:** Those consuming regular olestra spreads may reduce vitamin K absorption.

# SIDE EFFECTS

## Occasional

Taste alterations, headache, cardiac irrregularities (tachycardia), nausea, vomiting, hemoglobinuria, rash, urticaria, flushing, erythema, sweating, bronchospasms, dyspnea, cramp-like pain.

#### Rare

Hyperbilirubinemia.

## SERIOUS REACTIONS

· Severe hypersensitivity reactions.

## **PRECAUTIONS & CONSIDERATIONS**

Patients on chronic drug therapy may rarely have symptoms of blood dyscrasias, which can include infection, bleeding, and poor healing. Storage

Protect tablets from light. Store all products at room temperature. Protect injection from light and freezing.

## Administration

May give orally without regard to food. Do not administer orally at same time as orlistat.

Avoid IM administration in patients with coagulopathy. In neonates receiving prophylaxis at birth, the IM route is usually preferred. SC administration may result in erratic and delayed absorption. Dilute IV with normal saline or preservativefree D5W immediately before use if ordered doses exceed 1-2 mg. Protect from light. Infuse at a rate not to exceed 1 mg/min.

# Pilocarpine Hydrochloride

pye-loe-kar'peen high-dro-clor'ide ★ Isopto-Carpine, Pilopine-HS, Salagen ★ Akarpine, Diocarpine

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Cholinergic agonist

## **MECHANISM OF ACTION**

A cholinergic that increases exocrine gland secretions by stimulating cholinergic receptors. *Therapeutic Effect*: Improves symptoms of dry mouth in patients with salivary gland hypofunction.

Pilocarpine Hydrochloride (Generic Name)

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	20 min	1 h	3-5 h

Absorption decreased if taken with a high-fat meal. Inactivation of pilocarpine thought to occur at neuronal synapses and probably in plasma. Excreted in urine. *Half-life:* 4-12 h.

# AVAILABILITY

Tablets: 5 mg, 7.5 mg. Ophthalmic Solution: 1%, 2%, 4%. Ophthalmic Gel (Pilopine-HS): 4%.

## INDICATIONS AND DOSAGES > Dry mouth associated with radiation treatment for head and neck cancer

PO

*Adults, Elderly.* 5 mg 3 times a day. Range: 15-30 mg/day. Maximum: 2 tablets/dose.

#### Dry mouth associated with Sjögren's syndrome PO

*Adults, Elderly.* 5 mg 4 times a day. Range: 10-30 mg/day.

## ▶ **Dosage in hepatic impairment** *Adults, Elderly.* Dosage decreased to 5 mg twice a day for adults and elderly with hepatic impairment.

# For glaucoma or ocular hypertension

OPHTHALMIC SOLUTION Adults and Children 2 yr and older. 1 drop into affected eye(s) up to 4 times per day. Start with lowest concentration of drops. Children and Infants < 2 yr. 1 drop of 1% solution into affected eye(s) 3 times per day. OPHTHALMIC GEL

*Adults.* Apply a  $(\frac{1}{2})$ -inch ribbon to lower conjunctival sac of the affected eye(s) once daily at bedtime.

# For miosis induction OPHTHALMIC SOLUTION

Adults. Instill 1 drop (or 2 drops 5 min apart) of 1%, 2%, or 4% ophthalmic solution into the eye(s). Infants, Children. Instill 1 drop of 1% or 2% ophthalmic solution into the eye(s) 15-60 min prior to surgery.

# CONTRAINDICATIONS

Known hypersensitivity to pilocarpine; conditions in which miosis is undesirable, such as acute iritis and angle-closure glaucoma; uncontrolled asthma.

# INTERACTIONS

## Drug

Anticholinergics: May antagonize the effects of anticholinergics. β-Blockers: May produce conduction disturbances.

## Herbal

None known.

## Food

**High-fat meals:** May decrease the absorption rate of pilocarpine.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent (29%) Diaphoresis.

# Occasional (5%-11%)

Headache, dizziness, urinary frequency, flushing, dyspepsia, nausea, asthenia, lacrimation, visual disturbances.

## Rare (< 4%)

Diarrhea, abdominal pain, peripheral edema, chills.

# SERIOUS REACTIONS

• Patients with diaphoresis who do not drink enough fluids may develop dehydration.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic impairment, pulmonary disease, and significant cardiovascular disease. Use with caution in pregnancy and lactation. The safety and efficacy of oral pilocarpine have not been established in children. Elderly patients have an increased incidence of diarrhea, dizziness, and urinary frequency. Adequate hydration should be maintained. Avoid tasks that require mental alertness or motor skills until response to the drug has been established.

Visual changes may occur, especially at night. Caution when driving at night or when performing hazardous activities in reduced lighting due to visual blurring. Pattern of daily bowel activity and stool consistency and urinary frequency should be assessed. **Storage** 

Store at room temperature; protect from excessive heat.

#### Administration

Take pilocarpine without regard to food. To avoid contamination, do not to touch the tip of the dropper or tube to any surface. Gently pull down lower eyelid to form a pouch in which to instill drops or ointment. Gently close eye(s). Compress lacrimal duct gently to limit systemic absorption. Blot excess away with clean tissue. If administering with other ophthalmic agents, allow at least 5 min between administration times.

**Pimecrolimus** 

pim-e-kroe'li-mus 🗙 🖤 Elidel

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Dermatologics, immunosuppressives, topical anti-inflammatory

## **MECHANISM OF ACTION**

An immunomodulator that inhibits release of cytokine, an enzyme that produces an inflammatory reaction. *Therapeutic Effect:* Produces anti-inflammatory activity.

# PHARMACOKINETICS

Minimal systemic absorption with topical application. Metabolized in liver. Excreted in feces.

## AVAILABILITY

Cream: 1% (Elidel).

#### INDICATIONS AND DOSAGES • Atopic dermatitis (eczema) TOPICAL

Adults, Elderly, Children 2-17 yr. Apply to affected area twice daily. Rub in gently and completely. Use as long as symptoms persist; discontinue if disease resolves. If persists > 6 wks, re-evaluate.

## CONTRAINDICATIONS

Hypersensitivity to pimeerolimus or any component of the formulation, Netherton's syndrome (potential for increased systemic absorption), application to active cutaneous viral infections.

# INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Rare

Transient application-site sensation of burning or feeling of heat.

## SERIOUS REACTIONS

Lymphadenopathy and phototoxicity occur rarely.
May be associated with increased risk for skin cancer, lymphoma.

## PRECAUTIONS & CONSIDERATIONS

Only prescribed to those for whom other treatments have failed due to a possible risk of neoplastic disease (cancer), especially nonmelanoma skin cancer or lymphoma. Patients who have a new or changed skin lesion or lymphadenopathy should receive thorough examination. Caution should be used in immunocompromised patients and in those who are at an increased risk of varicella zoster virus infection, herpes simplex virus infection, or eczema herpeticum. Be aware that clinical infection at treatment sites should be cleared before commencing treatment. Consider discontinuing therapy if lymphadenopathy, or acute infections or if mononucleosis develops. It is unknown whether pimecrolimus is distributed in breast milk. Safety and efficacy of pimecrolimus have not been established in children vounger than 2 yr of age. No age-related precautions have been noted in elderly patients.

Artificial sunlight or tanning beds should be avoided.

#### Storage

Store at room temperature. Do not freeze.

## Administration

Gently cleanse area before application. Use occlusive dressings only as ordered. Apply sparingly and rub into area thoroughly. Do not use topical pimecrolimus on broken skin or in areas of infection, and do not apply to the face, inguinal areas, or wet skin.

# Pimozide

pi′moe-zide ★ 🐏 Orap

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antipsychotics

# **MECHANISM OF ACTION**

A diphenylbutylpiperidine that blocks dopamine at postsynaptic receptor sites in the brain. *Therapeutic Effect:* Suppresses motor and phonic tics in those with Tourette's syndrome.

# PHARMACOKINETICS

PO: Onset erratic, peak 6-8 h. *Half-life*: 50-55 h. Metabolized in the liver, excreted in the urine, feces.

## AVAILABILITY

Tablets: 1 mg, 2 mg (Orap).

# INDICATIONS AND DOSAGES Tourette's disorder PO

Suppression of tics requires a slow and gradual introduction of the drug, balanced against the side effects.

*Adults, Elderly.* 1-2 mg/day in a single dose or divided doses 3 times/ day. Maximum: 10 mg/day.

*Children older than 12 yr.* Initially, 0.05 mg/kg/day. Maximum: 10 mg/ day.

## Dosage adjustments for CYP2D6 poor metabolizers

Titration of doses should occur no more frequently than q14 days. *Children:* Maximum dose 0.05 mg/ kg/day.

*Adults:* At doses above 4 mg/day, perform CYP2D6 genotyping. If a poor metabolizer, do not exceed 4 mg/day.

Pimozide (Generic Name), Orap (Brand Name)

# **OFF-LABEL USE**

Delusions of parasitosis; refractory schizophrenia.

## CONTRAINDICATIONS

Hypersensitivity. Other contraindications: patients taking drugs that may cause motor and phonic tics (e.g., pemoline, methylphenidate, and amphetamines). Congenital long OT syndrome, history of cardiac arrhythmias, patients taking other drugs that prolong the QT interval or reduce pimozide metabolism (see contraindicated drug list), untreated hypokalemia or hypomagnesemia, severe CNS depression, or coma. Drugs that are contraindicated due to effect on QT or drug metabolism: Mesoridazine, thioridazine, class IA or III antiarrhythmics, macrolide antibiotics (e.g., clarithromycin, erythromycin, azithromycin), SSRIs (e.g., citalopram, escitalopram, paroxetine, sertraline, fluvoxamine), systemic azole antifungals (e.g., itraconazole, ketoconazole), protease inhibitors (e.g., ritonavir, saquinavir, indinavir, and nelfinavir), nefazodone, zileuton. Any drug that potently inhibits CYP3A4, CYP1A2, CYP2D6, or prolongs the OT interval should be avoided. INTERACTIONS NOTE: due to QT prolongation,

pimozide is contraindicated with many drugs; closely review manufacturer's labels before prescribing.

## Drug

Alcohol, CNS depressants: May increase CNS and respiratory depression.

Aprepitant: May increase pimozide plasma concentrations.

Azole antifungals (e.g., ketoconazole, itraconazole) and macrolide antibiotics (e.g., azithromycin, clarithromycin, erythromycin): Increase risk for OT prolongation: avoid. Belladonna alkaloids: May increase anticholinergic effects. **Class IA and III antiarrhythmics:** May increase risk for QT prolongation and cardiotoxicity. Drugs that prolong QT interval: May increase risk for QT prolongation and cardiotoxicity. Lithium: May increase extrapyramidal symptoms. Phenylalanine: May increase incidence of tardive dyskinesia. SSRIs: Increase pimozide levels and risk of QT prolongation; avoid. Tramadol: May increase risk of seizures. Herbal

**Betel nut:** May increase extrapyramidal side effects of pimozide.

Kava kava: May increase dopamine antagonist effects.

Food

**Grapefruit juice:** May inhibit metabolism of pimozide; avoid.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

## Occasional

Akathisia, dystonic extrapyramidal effects, parkinsonian extrapyramidal effects, tardive dyskinesia, blurred vision, ocular changes, constipation, decreased sweating, dry mouth, nasal congestion, dizziness, drowsiness, orthostatic hypotension, urinary retention, somnolence.

## Rare

Rash, cholestatic jaundice, priapism.

# SERIOUS REACTIONS

 Serious reactions such as blood dyscrasias, agranulocytosis, leukocytopenia, thrombocytopenia, cholestatic jaundice, tardive dyskinesia, neuroleptic malignant syndrome (NMS), constipation or paralytic ileus, priapism, QT prolongation and torsades de pointes, seizure, systemic lupus erythematosuslike syndrome, and temperatureregulation dysfunction (heatstroke or hypothermia) occur rarely.

• Abrupt withdrawal following longterm therapy may precipitate nausea, vomiting, gastritis, dizziness, and tremors.

#### **PRECAUTIONS & CONSIDERATIONS**

! Because of the significant risk for side effects, do not use for simple tics or tics other than those associated with Tourette's disorder.

Caution is necessary in patients with history of neuroleptic malignant syndrome, tardive dyskinesia, and impaired liver or kidney function. Caution is warranted with concomitant administration with inhibitors of cytochrome P450, 1A2, 2D6, and 3A4 enzymes as well as CNS depressants. Safety and effectiveness have not been established in children under the age of 12 yr. Elderly and debilitated patients may require a lower initial dose.

History of drug-induced leukopenia/neutropenia is a risk factor for side effects. Monitor CBC frequently. Monitor for fever or other symptoms or signs of infection or neutropenia; treat promptly if such symptoms or signs occur. If absolute neutrophil count < 1000/ mm<sup>3</sup>, discontinue the drug until full recovery. Signs of tardive dyskinesia or akathisia should be immediately reported. Assess current medication list for potential serious drug interaction.

#### Storage

Store at room temperature.

#### Administration

May give without regard to food, but do not administer with grapefruit juice. Administration as a single dose at bedtime once titrated may improve tolerance.

# Pindolol

pin'doe-loll

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in second or third trimester)

#### Classification:

Antihypertensives, β-adrenergic blockers

## **MECHANISM OF ACTION**

A nonselective  $\beta$ -blocker that blocks  $\beta_1$ - and  $\beta_2$ -adrenergic receptors. The partial agonist activity is greater for  $\beta_2$ - than  $\beta_1$ -receptors, making the drug a "vasodilatory"  $\beta$ -blocker, with intrinsic sympathomimetic actions. *Therapeutic Effect:* Slows heart rate, decreases cardiac output, decreases BP, and exhibits antiarrhythmic activity. Decreases myocardial ischemia severity by decreasing oxygen requirements.

## PHARMACOKINETICS

Completely absorbed from GI tract. Metabolized in liver. Primarily excreted in urine. *Half-life*: 3-4 h (half-life increased with impaired renal function, elderly).

#### AVAILABILITY

Tablets: 5 mg, 10 mg.

INDICATIONS AND DOSAGES
Mild to moderate hypertension
PO

Pindolol (Generic Name)

Adults. Initially, 5 mg 2 times/ day. Gradually increase dose by 10 mg/day at intervals of 2-4 wks. Maintenance: 10-30 mg/day in 2-3 divided doses. Maximum: 60 mg/day. *Elderly*. Usual elderly dosage: Initially, 5 mg/day. May increase by 5 mg q3-4wk.

# **OFF-LABEL USES**

Treatment of chronic angina pectoris.

## CONTRAINDICATIONS

Hypersensitivity, bronchial asthma; overt cardiac failure; cardiogenic shock; second- and third-degree AV block; severe bradycardia.

# INTERACTIONS

## Drug

Anticholinergics, hydrocarbon inhalation anesthetics, fentanyl derivatives: May increase risk of hypotension.

**Diuretics, other hypotensives:** May increase hypotensive effect of pindolol.

**Epinephrine, ephedrine:** May cause hypertension or bradycardia.

## Fluoxetine and other SSRI

antidepressants: May increase antidepressant effect.

**Indomethacin:** May decrease antihypertensive effects.

**Insulin and oral hypoglycemics:** May mask symptoms of hypoglycemia and/or prolong

hypoglycemic effect.

Lidocaine: May slow metabolism of drug.

Sympathomimetics,

phenothiazines, xanthines: May mutually inhibit effects of pindolol. Theophylline: May decrease bronchodilation effects. Herbal

None known.

## Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase ANA titer, SGOT (AST), SGPT (ALT), alkaline phosphatase, LDH, bilirubin, BUN, creatinine, potassium, uric acid, lipoproteins, and triglycerides.

## SIDE EFFECTS Frequent

Fatigue, dizziness, headache, insomnia, alteration of blood sugar levels, cough, bronchospasm.

## Occasional

Decreased sexual ability, diarrhea, bradycardia, depression or emotional lability, cold hands or feet, constipation, nasal congestion, nausea.

## Rare

Altered taste; hypotension, edema; worsening angina.

# SERIOUS REACTIONS

• Overdosage may produce profound bradycardia and hypotension.

• Abrupt withdrawal may result in sweating, palpitations, headache, and tremulousness.

 May precipitate CHF or myocardial infarction (MI) in patients with heart disease; thyroid storm in those with thyrotoxicosis; or peripheral ischemia in those with existing peripheral vascular disease.

• Signs of thrombocytopenia, such as unusual bleeding or bruising, occur rarely.

• Hypersensitivity reaction (rare).

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with bronchospastic disease, diabetes, hyperthyroidism, impaired renal or liver function, inadequate cardiac function, or peripheral vascular disease. Pindolol readily crosses the placenta and is distributed in breast milk. During delivery, pindolol may produce apnea, bradycardia, hypoglycemia, and hypothermia as well as low-birth-weight infants. Safety and efficacy have not been established in children. Caution should be used in elderly patients who may have age-related peripheral vascular disease. Nasal decongestants or over-thecounter (OTC) cold preparations (stimulants) should be avoided without physician approval. Excess salt and alcohol consumption should be limited.

Excessive fatigue, headache, prolonged dizziness, shortness of breath, or weight gain should be reported.

#### Storage

Store at room temperature, tightly closed and protected from light. Administration

May be given with or without regard to meals. Tablets may be crushed. Do not abruptly discontinue the drug.

# **Pioglitazone**

pye-oh-gli′ta-zone ★ ♥ Actos

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, thiazolidinedione

# MECHANISM OF ACTION

An antidiabetic that improves target-cell response to insulin without increasing pancreatic insulin secretion. Decreases hepatic glucose output and increases insulin-dependent glucose utilization in skeletal muscle. *Therapeutic Effect:* Lowers blood glucose concentration.

# PHARMACOKINETICS

Rapidly absorbed. Highly protein bound (99%), primarily to albumin. Metabolized in the liver. Excreted in urine. Unknown whether removed by hemodialysis. *Half-life*: 16-24 h.

# AVAILABILITY

Tablets: 15 mg, 30 mg, 45 mg.

# INDICATIONS AND DOSAGES

## Diabetes mellitus type 2, as monotherapy or in combination with other drugs

PO

Adults, Elderly. With insulin: Initially, 15-30 mg once a day. Initially continue current insulin dosage; then decrease insulin dosage by 10%-25% if hypoglycemia occurs or plasma glucose level decreases to < 100 mg/dL. Maximum: 45 mg/day. As monotherapy: Monotherapy is not to be used if patient is well controlled with diet and exercise alone. Initially, 15-30 mg/day. May increase dosage in increments until 45 mg/day is reached. With sulfonylureas: Initially, 15-30 mg/ day. Decrease sulfonylurea dosage if hypoglycemia occurs. With metformin: Initially, 15-30 mg/day. Dosage adjustment with strong

 Dosage adjustment with strong inhibitors of CYP2C8 (gemfibrozil)
 PO

Adults, Elderly. Do not exceed 15 mg/day of pioglitazone.

# CONTRAINDICATIONS

Active hepatic disease; diabetic ketoacidosis; increased serum transaminase levels, including ALT (SGPT) > 2.5 times normal serum level; type 1 diabetes mellitus; known NYHA class III or IV heart failure, hypersensitivity.

Pioglitazone (Generic Name), Actos (Brand Name)

# INTERACTIONS

# Drug

**Gemfibrozil:** May increase the effect and toxicity of pioglitazone. **Ketoconazole:** May significantly inhibit metabolism of pioglitazone.

Oral contraceptives: May alter the effects of oral contraceptives. Rifampin: May decrease the effectiveness of pioglitazone. Strong inhibitors of CYP2C8 (gemfibrozil): Increases levels of pioglitazone; use lower maximum dosage pioglitazone.

# Food

None known. Herbal

None known.

# DIAGNOSTIC TEST EFFECTS

May increase creatine kinase (CK) level. May decrease hemoglobin levels by 2%-4% and serum alkaline phosphatase, bilirubin, and transaminase ALT (SGOT) levels to 2.5 times normal serum levels. Fewer than 1% of patients experience ALT values 3 times the normal level.

## SIDE EFFECTS

## Frequent (9%-13%)

Headache, upper respiratory tract infection, edema.

## Occasional (5%-6%)

Sinusitis, myalgia, pharyngitis, aggravated diabetes mellitus.

## SERIOUS REACTIONS

 Possible increased risk of myocardial ischemic events such as angina or MI; rosiglitazone more likely to cause.

- New onset or exacerbation of congestive heart failure.
- Macular edema (rare).
- Hepatic impairment and jaundice (rare), but some cases of hepatic failure reported.

- · Rhabdomyolysis reported.
- May increase risk for bladder
- cancer after >1 yr of use.

## PRECAUTIONS & CONSIDERATIONS

May cause or exacerbate heart failure in some patients. Patients should be monitored for signs and symptoms of heart failure, including excessive, rapid weight gain, dyspnea, or edema. Pioglitazone should not be used in patients with symptomatic heart failure or New York Heart Association (NYHA) class III or IV heart failure.

Caution is warranted in patients with edema and hepatic impairment. It is unknown whether pioglitazone crosses the placenta or is distributed in breast milk. Pioglitazone use is not recommended in pregnant or breastfeeding women. Be aware that improvements in diabetic control may convert some anovulatory women to more regular ovulation; adequate contraception is advised. Safety and efficacy of pioglitazone have not been established in children. No age-related precautions have been noted in elderly patients. Avoid alcohol.

Food intake, blood glucose, and hemoglobin levels should be monitored before and during therapy. Hepatic enzyme levels should also be obtained before beginning pioglitazone therapy and periodically thereafter. Notify the physician of abdominal or chest pain, dark urine or light stool, hypoglycemic reactions, fever, nausea, palpitations, rash, vomiting, or yellowing of the eyes or skin. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea,

## 1288 Piperacillin/ Tazobactam

polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy. **Storage** 

Store tablets at room temperature. Administration

Take pioglitazone without regard to meals.

# Piperacillin/ Tazobactam

pi'per-a-sil-in/tay-zoe-bak'tam ★ Zosyn ₩ Tazocin Do not confuse Zosyn with Zofran or Zyvox.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antibiotics, extended-spectrum penicillin and β-lactamase inhibitor

# **MECHANISM OF ACTION**

Piperacillin inhibits cell wall synthesis by binding to bacterial cell membranes. Tazobactam inactivates bacterial β-lactamase. Active against gram-negative and anaerobic organisms, including *Pseudomonas* spp., as well as methicillin-sensitive gram positives. *Therapeutic Effect:* Bactericidal in susceptible organisms.

# PHARMACOKINETICS

Protein binding: 16%-30%. Widely distributed. Primarily excreted unchanged in urine. Removed by

hemodialysis. *Half-life*: 0.7-1.5 h (increased in hepatic cirrhosis and impaired renal function).

# AVAILABILITY

 Piperacillin/tazobactam is a combination product in a ratio of piperacillin to tazobactam.
 Powder for Injection: 2.25 g, 3.375 g, 4.5 g.
 Premix IVPB Infusion: 2.25 g/50 mL, 3.375 g/50 mL, 4.5 g/100 mL.

# INDICATIONS AND DOSAGES Severe infections

#### Severe infections IV

Adults, Elderly, Children > 40 kg. 4.5 g q6-8h or 3.375 g q6h.

# Moderate infections

IV

Adults, Elderly, Children > 40 kg. 2.25 g q6-8h or 3.375 g q6h.

## Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage
20-40	3.375 g q6h for nosocomial pneumonia, 2.25 g IV q6h for all other indications.
< 20	2.25 g q8h for all indications except nosocomial pneumonia (2.25 g q6h)

## Dosage in hemodialysis patients IV

*Adults, Elderly.* 2.25 g q8h with additional dose of 0.75 g after each dialysis session.

# CONTRAINDICATIONS

Hypersensitivity to any penicillin or β-lactamase inhibitor.

# INTERACTIONS

# Drug

Hepatotoxic medications: May increase the risk of hepatotoxicity. Probenecid: May increase piperacillin blood concentration and risk of toxicity. Herbal None known.

Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum sodium, alkaline phosphatase, bilirubin, LDH, AST (SGOT), and ALT (SGPT) levels. May decrease serum potassium level. May cause a positive Coombs' test.

# IV INCOMPATIBILITIES

Amiodarone, amphotericin B (Fungizone), amphocetiricin B complex (Abelcet, AmBisome, Amphotec), azithromycin (Zithromax), caspofungin (Cancidas), chlorpromazine (Thorazine), ciprofloxacin (Cipro), cisplatin, dacarbazine (DTIC), daunorubicin (Cerubidine), diltiazem, dobutamine (Dobutrex), doxorubicin (Adriamycin), doxorubicin liposomal (Doxil), droperidol (Inapsine), drotrecogin alfa (Xigris), famotidine (Pepcid), haloperidol (Haldol), hydroxyzine (Vistaril), idarubicin (Idamycin), insulin regular, levofloxacin (Levaquin), midazolam (Versed), minocycline (Minocin), nalbuphine (Nubain), phenytoin, prochlorperazine (Compazine), promethazine (Phenergan), rocuronium, tobramycin, vancomycin (Vancocin).

# **IV COMPATIBILITIES**

Aminophylline, bumetanide (Bumex), calcium gluconate, diphenhydramine (Benadryl), dopamine (Intropin), enalapril (Vasotec), furosemide (Lasix), granisetron (Kytril), heparin, hydrocortisone (Solu-Cortef), hydromorphone (Dilaudid), lorazepam (Ativan), magnesium sulfate, methylprednisolone (Solu-Medrol), metoclopramide (Reglan), morphine, ondansetron (Zofran), potassium chloride.

# SIDE EFFECTS

## Frequent

Diarrhea, headache, constipation, nausea, insomnia, rash.

## Occasional

Vomiting, dyspepsia, pruritus, fever, agitation, candidiasis, dizziness, abdominal pain, edema, anxiety, dyspnea, rhinitis.

# SERIOUS REACTIONS

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

- Seizures and other neurologic reactions are more likely to occur in patients with renal impairment and in those who have received an overdose.
- Severe hypersensitivity reactions, including anaphylaxis, occur rarely.
- · Rare bleeding disorders.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with a history of allergies, especially to penicillin and cephalosporins, a preexisting seizure disorder, or renal impairment. Piperacillin readily crosses the placenta, appears in cord blood and amniotic fluid, and is distributed in breast milk in low concentrations. Piperacillin may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. The safety and efficacy of piperacillin have not been established in children younger than 12 yr. Age-related renal impairment may require dosage adjustment in elderly patients.

History of allergies, especially to cephalosporins or penicillins, should

be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting, should be monitored. Electrolytes (especially potassium), intake and output, renal function tests, urinalysis, and the injection sites should be assessed.

#### Storage

Store vials at room temperature before opening.

The reconstituted vial is stable for 24 h at room temperature and 48 h if refrigerated. Premix IVPBs arrive frozen; once thawed, they are stable for 24 h at room temperature or up to 14 days refrigerated.

## Administration

For each gram of Zosyn, reconstitute with 5 mL D5W or 0.9% NaCl. Shake vigorously to dissolve. Further dilute with at least 50-100 mL D5W, 0.9% NaCl, dextrose 5% in 0.9% NaCl, or lactated Ringer's solution. Infuse the drug IV over 30 min.

# Piroxicam

peer-ox'i-kam Feldene Nu-Pirox Do not confuse Feldene with Seldane.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drug (NSAID)

# **MECHANISM OF ACTION**

An NSAID that produces analgesic, antipyretic and anti-inflammatory effects by inhibiting the cyclo oxygenase pathway in prostaglandin synthesis. *Therapeutic Effect:* Reduces inflammatory response and intensity of pain.

# PHARMACOKINETICS

Well absorbed orally. Protein binding: 99%. Metabolized in the liver; metabolites excreted in urine. *Half-life:* 3-3.5 h (increased in hepatic and renal impairment).

## AVAILABILITY

Capsules: 10 mg, 20 mg.

# INDICATIONS AND DOSAGES

# Acute or chronic rheumatoid arthritis and osteoarthritis

Adults, Elderly. Initially, 10-20 mg/ day as a single dose or in divided doses. Some patients may require up to 30-40 mg/day.

# **OFF-LABEL USES**

Treatment of acute gouty arthritis, ankylosing spondylitis.

# CONTRAINDICATIONS

Active peptic ulcer disease, chronic inflammation of the GI tract, GI bleeding or ulceration, history of hypersensitivity to aspirin or NSAIDs, myocardial infarction, coronary artery bypass graft surgery.

# INTERACTIONS

## Drug

Antihypertensives, diuretics: May decrease the effects of antihypertensives and diuretics. Aspirin, salicylates, corticosteroids: May increase the risk of GI bleeding and side

Piroxicam (Generic Name)

effects. NSAIDs may negate the cardioprotective effect of ASA. **Cyclosporine:** May increase risk of nephrotoxicity.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of heparin, oral anticoagulants, and thrombolytics.

**Lithium:** May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate:** May increase the risk of toxicity with methotrexate.

SSRIs, SNRIs:Increased risk of GI bleeding.

## Herbal

**Feverfew:** May increase the risk of bleeding.

**Ginkgo biloba:** May increase the risk of bleeding.

#### Food

Alcohol: May increase risk of dizziness, GI bleeding.

## DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels. May decrease serum uric acid levels.

## SIDE EFFECTS

#### Frequent (4%-9%)

Dyspepsia, nausea, dizziness. Occasional (1%-3%)

Diarrhea, constipation, abdominal cramps or pain, flatulence, stomatitis.

#### Rare (<1%)

Hypertension, urticaria, dysuria, ecchymosis, blurred vision, insomnia, phototoxicity.

## SERIOUS REACTIONS

• Rare reactions with long-term use include peptic ulcer disease, GI bleeding, gastritis, severe hepatic reaction (cholestasis, jaundice), nephrotoxicity (dysuria, hematuria, proteinuria, nephrotic syndrome), hematologic sensitivity (anemia, leukopenia, eosinophilia, thrombocytopenia), and a severe hypersensitivity reaction (fever, chills, bronchospasm).

#### **PRECAUTIONS & CONSIDERATIONS**

Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures. Caution is warranted with GI disease, impaired hepatic or renal function, and concurrent anticoagulant use. Notify the physician of pregnancy. Use with caution during lactation. This medicine is not approved for use in children. The elderly may be more susceptible to GI and CNS side effects. Tasks that require mental alertness or motor skills should also be avoided until drug effects are known.

CBC, hepatic and renal function test results, and pattern of daily bowel activity and stool consistency should be assessed before and during therapy. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness; improved grip strength; and increased joint mobility, should be evaluated. **Storage** 

Store at controlled room temperature; protect from moisture.

#### Administration

Do not crush or break capsules. Take piroxicam with food, milk, or antacids if GI distress occurs.

# Pitavastatin

pit′a-vah′stat-in ★ Livalo

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

## Classification:

Antihyperlipidemics, HMG-CoA reductase inhibitors

# **MECHANISM OF ACTION**

An antihyperlipidemic "statin" that interferes with cholesterol biosynthesis by inhibiting the conversion of the enzyme HMG-CoA to mevalonate, a precursor to cholesterol. *Therapeutic Effect:* Decreases LDL cholesterol, VLDL, and plasma triglyceride levels, increases HDL concentration.

## PHARMACOKINETICS

Well absorbed, even in presence of food. Protein binding: 99% protein bound in human plasma, mainly to albumin and  $\alpha$ -1-acid glycoprotein. The principal route of pitavastatin metabolism is glucuronidation via liver UDP-glucuronosyltransferases with subsequent formation of pitavastatin lactone. There is only minimal metabolism by CYP2C9 and 2C8. Primarily eliminated in the feces; about 15% eliminated via the urine. *Half-life:* 12 h (increased in patients with severe renal dysfunction).

# AVAILABILITY

Tablets: 1 mg, 2 mg, 4 mg.

## INDICATIONS AND DOSAGES • Hyperlipidemia, dyslipidemia PO

Adults, Elderly. Initially 1-2 mg/day. With 1-mg adjustments based on lipid levels at intervals of 4 wks until desired level is achieved. Maximum: 4 mg/day.

# Renal impairment (creatinine clearance < 30 mL/min)</li>

Adults, Elderly. Patients with CrCl 30-59 mL/min and those with end-stage renal disease receiving hemodialysis should receive a starting dose of 1 mg once daily and a maximum dose of 2 mg/day. Do not use in those with severe renal impairment (CrCl < 30 mL/min) not yet on hemodialysis.

## Concurrent erythromycin use PO

Adults, Elderly. Do not exceed 1 mg/ day.

#### Concurrent rifampin use PO

*Adults, Elderly.* Do not exceed 2 mg/day.

# CONTRAINDICATIONS

Hypersensitivity, active hepatic disease, breastfeeding, pregnancy, unexplained persistent elevations of serum transaminase levels; use with cyclosporine contraindicated; also do not use with protease inhibitors for HIV (not studied with these drugs) or in patients with CrCl < 30 mL/min not yet on hemodialysis.

# INTERACTIONS

## Drug

**Cyclosporine or protease inhibitors:** Increase the risk of myopathy. Do not give cyclosporine or protease inhibitors with pitavastatin.

**Gemfibrozil, niacin:** Increase the risk of myopathy. Use together with caution.

**Erythromycin:** Reduces pitavastatin clearance; reduce usual dose.

**Rifampin:** Increases pitavastatin exposure; reduce usual dose.
Warfarin: Enhances anticoagulant effect. Monitor INR.

#### Herbal

None known.

#### Food

Alcohol: Limit; may increase risk for hepatic effects.

**Grapefruit juice:** May increase exposure and increase risk for myopathy; manufacturer does not specifically recommend avoidance.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum creatinine kinase and liver transaminases.

## SIDE EFFECTS

Generally well tolerated. Side effects are usually mild and transient.

#### Occasional (≥ 2%)

Myalgia, back pain, diarrhea, constipation, and pain in extremity. **Rare** (< 2%)

Asthenia or unusual fatigue and weakness, headache, arthralgia, nasopharyngitis, urticaria, rash, pruritus. Reversible cognitive impairment or depression, hair loss; may worsen glucose tolerance and increase HbA1C.

#### SERIOUS REACTIONS

• Myopathy and rhabdomyolysis (rare).

• Hypersensitivity, such as bullous rash or anaphylaxis, reported rarely.

- · Rare reports of hepatotoxicity.
- · Cataracts may develop.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of hepatic disease, hypotension, severe acute infection; severe electrolyte, endocrine, metabolic imbalances or disorders; trauma; and uncontrolled seizures. Caution should also be used in those who consume a substantial amount of alcohol and those who have had recent major surgery. Pitavastatin use is contraindicated in pregnancy because the suppression of cholesterol biosynthesis may cause fetal toxicity. Also is contraindicated during lactation because it carries the risk of serious adverse reactions in breastfeeding infants. Safety and efficacy have not been established in children. No age-related precautions have been noted in elderly patients.

Notify the physician of headache, sore throat, muscle weakness and aches, severe gastric upset, or rash. Pattern of daily bowel activity and stool consistency should be assessed. Serum lipid cholesterol and triglyceride levels and hepatic function should be checked at baseline and periodically during treatment. At initiation of pitavastatin therapy, a standard cholesterollowering diet should be practiced and continued throughout therapy.

#### Storage

Store at room temperature and protect from light.

## Administration

Take pitavastatin without regard to meals and at any time of day.

## **Podofilox**

po-doe-fil'ox Condyline, Condylox

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Dermatologic, antimitotic agent

## **MECHANISM OF ACTION**

An active component of podophyllin resin that binds to tubulin to prevent formation of microtubules, resulting in mitotic arrest. Many biological effects, such as it damages endothelium of small blood vessels, attenuates nucleoside transport, suppresses immune responses, inhibits macrophage metabolism, induces interleukin-1 and interleukin-2, decreases lymphocyte response to mitogens, and enhances macrophage growth. *Therapeutic Effect:* Removes genital warts.

## PHARMACOKINETICS

Time to peak occurs in 1-2 h. Some degree of absorption. *Half-life:* 1-4.5 h.

## AVAILABILITY

Gel: 0.5% (Condylox). Solution: 0.5% (Condylox).

## INDICATIONS AND DOSAGES Anogenital warts

TOPICAL Adults. Apply 0.5% gel twice daily for 3 days, then withhold for 4 days. Repeat cycle up to 4 times.

## Genital warts (condylomata acuminate)

TOPICAL

*Adults*. Apply 0.5% solution or gel q12h in the morning and evening for 3 days, then withhold for 4 days. Repeat cycle up to 4 times.

## **OFF-LABEL USES**

Common warts (nonbleeding) on the outside of skin.

## CONTRAINDICATIONS

Hypersensitivity to podofilox or any component of its formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Occasional Erosion, inflammation, itching, pain, burning. Rare Nausea, vomiting.

## SERIOUS REACTIONS

 Nausea and vomiting occur rarely and usually after cumulative doses.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is necessary with mucous membrane warts, bleeding warts, moles, birthmarks, or warts with hair; in patients with poor circulation or diabetes. Avoid use during prognancy; may be harmful to fetus. It is unknown whether podofilox is distributed in breast milk. Safety and efficacy of podofilox have not been established in children or elderly. Nausea, vomiting, blood in urine, or dizziness should be reported immediately.

Genital warts are contagious. Make sure sexual partner has been examined. Condoms help protect spread. Patients should not engage in sexual activity during treatment. Storage

Store at room temperature, tightly closed. Avoid excessive heat and do not freeze.

#### Administration

Apply on warts with supplied cottontip applicator. Allow to dry completely before putting legs together. Use no more than  $10 \text{ cm}^2/\text{day}$  and no more than 0.5 g/day of topical gel. Use no more than 10 cm²/day and no more than 0.5 mL/day of topical solution. Remember that a treatment week cycle is twice a day for 3 days, then 4 days with no treatment. Can be used during menses.

## **Polycarbophil**

polly-car'bow-fill ★ Fibercon ➡ Fiber-on-Tablet, Prodiem Bulk Fibre Therapy

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: OTC

## **MECHANISM OF ACTION**

A bulk-forming laxative and antidiarrheal. As a laxative, retains water in the intestine and opposes dehydrating forces of the bowel. *Therapeutic Effect:* Promotes wellformed stools. As an antidiarrheal, absorbs fecal-free water, restores normal moisture level, and provides bulk. *Therapeutic Effect:* Forms gel and produces formed stool.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	12-72 h	NA	NA

Acts in small and large intestines.

## AVAILABILITY

Tablets: 500 mg, 625 mg. Tablets (Chewable): 500 mg.

## INDICATIONS AND DOSAGES Constipation, diarrhea

PO Adults, Elderly, Children 12 yr and older. 1 g 1-4 times a day, or as needed. Maximum: 4 g/24 h. Children aged 6-11 yr. 500 mg 1-4 times a day or as needed. Maximum: 2 g/24 h. Children younger than 6 yr. Consult product labeling. CONTRAINDICATIONS

Abdominal pain, dysphagia, nausea, partial bowel obstruction, symptoms of appendicitis, vomiting, hypercalcemia, hypercalciuria, esophageal stricture.

## INTERACTIONS

#### Drug

Digoxin, oral anticoagulants, salicylates, tetracyclines: May decrease the effects of digoxin, salicylates, and tetracyclines. Potassium-sparing diuretics, potassium supplements: May interfere with the effects of potassium-sparing diuretics and potassium supplements. Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose level. May decrease serum potassium levels.

## SIDE EFFECTS

#### Rare

Some degree of abdominal discomfort, nausea, mild cramps, flatulence, bloating, syncope or near syncope.

## SERIOUS REACTIONS

• Esophageal or bowel obstruction may occur if administered with < 250 mL or 1 full glass of liquid.

## PRECAUTIONS & CONSIDERATIONS

This drug may be used safely in pregnancy. Polycarbophil use is not recommended in children younger than 6 yr of age. No age-related precautions have been noted in elderly patients.

Pattern of daily bowel activity and stool consistency and serum electrolyte levels should be

Polycarbophil (Generic Name), Fibercon (Brand Name)

monitored. Adequate fluid intake should be maintained.

## Administration

For severe diarrhea, give every half hour up to maximum daily dosage; for constipation, give with 8 oz liquid, as prescribed.

Drink 6-8 glasses of water a day to aid in stool softening. To promote defecation, increase fluid intake, exercise, and eat a high-fiber diet.

## Polyethylene Glycol-Electrolyte Solution

pol-ee-eth'ill-een ★ GoLYTELY, MiraLax (OTC), Moviprep, NuLytely, TriLyte ▲ Colyte, Klean-Prep

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Laxatives, osmotic, stool softening, bowel evacuant

## **MECHANISM OF ACTION**

A laxative that has an osmotic effect. *Therapeutic Effect:* Induces diarrhea and cleanses bowel without depleting electrolytes. OTC form for constipation acts as stool softener without inducing diarrhea.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1-2 h	NA	NA (bowel cleansing)
PO	2-4 days	NA	NA (constipa- tion)

## AVAILABILITY

Powder for Oral Solution. Oral Solution.

# INDICATIONS AND DOSAGES Bowel cleansing PO

Adults, Elderly. Before GI examination: 240 mL (8 oz) q10min until 4 L consumed or rectal effluent clear. Nasogastric tube: 20-30 mL/min until 4 L given.

*Children.* 25 mL/kg/h until rectal effluent clear.

Constipation

PO (MIRALAX) *Adults.* 17 g or 1 heaping tbsp a day dissolved into water or juice.

## CONTRAINDICATIONS

Bowel perforation, gastric retention, GI obstruction, megacolon, toxic colitis, toxic ileus.

## INTERACTIONS

#### Drug

**Oral medications:** May decrease the absorption of oral medications if given within 1 h because they may be flushed from GI tract.

#### Herbal

None known. Food None known

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent (50%)

Some degree of abdominal fullness, nausea, bloating.

Occasional (1%-10%)

Abdominal cramping, vomiting, anal irritation.

Rare (<1%)

Urticaria, rhinorrhea, dermatitis.

## SERIOUS REACTIONS

• Rare reports of hypersensitivity, including anaphylaxis, rash, dyspnea.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with ulcerative colitis. It is unknown whether polyethylene glycol crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children or elderly patients.

Notify the physician if severe abdominal pain or bloating occurs. Blood glucose, BUN, serum electrolyte levels, urine osmolality, and pattern of daily bowel activity and stool consistency should be monitored.

#### Storage

Refrigerate reconstituted solutions; use within 48 h.

#### Administration

For bowel evacuant formulas: May use tap water to prepare solution. Shake vigorously for several minutes to ensure complete dissolution of powder. Take nothing by mouth 3 h or more before ingestion of solution. Give only clear liquids after administration. May give via nasogastric tube. Rapid drinking preferred. Chilled solution is more palatable.

For OTC formulas without electrolytes for constipation: Can be taken without regard to food. Mix dosage (17 g for adults) well in full glass (4-8 oz) of water, juice, soda, coffee, or tea prior to administration. Do not exceed recommended doses.

Polymyxin B pol-i-mix'in B

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (injection); B (topical)

**Classification:** Antibiotics, polymyxins

## **MECHANISM OF ACTION**

An antibiotic that alters cell membrane permeability in susceptible microorganisms. *Therapeutic Effect:* Bactericidal activity.

#### PHARMACOKINETICS

Most often administered topically; rarely administered IV. Does not penetrate into the CSF, synovial fluid, aqueous humor, or across the placenta. Minimal binding to plasma protein. Roughly 60% of a dose is excreted by the kidneys, but excretion is delayed with binding of the drug to phospholipids in kidney cells. Poor removal by hemodialysis. *Half-life:* 4-6 h (prolonged in renal impairment).

## AVAILABILITY

Powder: 500,000 units (Aerosporin).

# INDICATIONS AND DOSAGES Mild to moderate infections

IV

Adults, Elderly, Children 2 yr and older. 15,000-25,000 units/kg/day in divided doses q12hr. Infants. 15,000-40,000 units/kg/day in divided doses q12h.

IM

Adults, Elderly, Children 2 yr and older: 25,000-30,000 units/kg/day in divided doses q4-6h. Infants. 25,000-40,000 units/kg/day

in divided doses q4-6h.

• Usual irrigation dosage CONTINUOUS BLADDER IRRIGATION Adults, Children > 2 yr of age. 200,000-400,000 units/day as a continuous bladder irrigation.

#### Usual ophthalmic dosage OPHTHALMIC

*Adults, Elderly, Children.* 1-3 drops containing 10,000-20,000 units/mL/ hr until a favorable response occurs.

Maximum: 25,000 units/kg/day or 2 million units/day.

## IV INCOMPATIBILITIES

Cefoxitin, diazepam, cefoperazone, furosemide, heparin, hydrocortisone, regular insulin, oxacillin, pantoprazole, penicillin-class antibiotics.

## CONTRAINDICATIONS

Hypersensitivity to polymyxin B or any component of the formulation, neuromuscular disease.

## INTERACTIONS

#### Drug

Aminoglycosides, other nephrotoxic drugs: May increase nephrotoxicity. Neuromuscular blocking agents or anesthetics: May produce muscle paralysis and prolonged or increased skeletal muscle relaxation. Watch for respiratory depression.

#### Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known with topical use. With parenteral use, may increase serum creatinine and cause proteinuria. Serum concentrations > 5 mcg/mL are toxic in adults.

## SIDE EFFECTS

#### Frequent

Severe pain, irritation at IM injection sites, phlebitis, thrombophlebitis with IV administration. Occasional

Fever, urticaria.

## SERIOUS REACTIONS

• Nephrotoxicity, especially with concurrent/sequential use of other nephrotoxic drugs, renal impairment, concurrent/sequential use of muscle relaxants.

• Superinfection, especially with fungi, may occur.

• Neurotoxic reactions may be manifested by drowsiness, irritability, blurred vision, weakness, ataxia, and numbness of the extremities.

• Intrathecal administration may cause irritated meninges and meningitis-like symptoms.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with impaired renal function. Safety and efficacy of polymyxin B have not been established in pregnant women or children younger than 2 yr. No age-related precautions have been noted in elderly patients.

Renal function should be carefully monitored. Neurotoxic reactions may be manifested by drowsiness, irritability, blurred vision, weakness, ataxia, and numbness of the extremities.

#### Storage

Store at room temperature before reconstitution and protect from light. After reconstitution, store under refrigeration. Discard any unused solution after 72 h.

#### Administration

For IV use, dissolve 500,000 units in 300-500 mL D5W for continuous IV infusion.

For IM injection, dissolve 500,000 units in 2 mL water for injection, 0.9% NaCl, or 1% procaine solution. IM injection is not routinely recommended because of severe pain at the injection sites.

For intrathecal administration, dissolve 500,000 units in 10 mL preservative-free 0.9% NaCl. Administer once daily for 3-4 days, then every other day for at least 2 wks after cerebrospinal fluid (CSF) cultures are negative. For ophthalmic use, 500,000 units in 20-50 mL sterile water for injection or 0.9% NaCl. Instill drops and close the eye gently for 1-2 min. Remove excess solution around the eye with a tissue.

## Polymyxin B Sulfate, Trimethoprim Sulfate

pol-i-mix'in b sul'fate, trye-meth'oh-prim sul'fate ★ ♪ Polytrim

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Ophthalmics, anti-infectives

## **MECHANISM OF ACTION**

Polymyxin B damages bacterial cytoplasmic membrane, which causes leakage of intracellular components. Trimethoprim is a folate antagonist that blocks bacterial biosynthesis of nucleic acids and proteins by interfering with metabolism of folinic acid. *Therapeutic Effect:* Produces antibacterial activity.

#### PHARMACOKINETICS

Absorption through intact skin and mucous membranes is insignificant.

## AVAILABILITY

*Ophthalmic Drops, Solution:* 10,000 units/mL.

## INDICATIONS AND DOSAGES

 Treatment of surface ocular bacterial conjunctivitis and blepharoconjunctivitis OPHTHALMIC

*Adults, Elderly, Children.* Instill 1 drop in affected eye(s) every 3 h for 7-10 days. Maximum: 6 doses/day.

## CONTRAINDICATIONS

Polymyxin or trimethoprim hypersensitivity.

## INTERACTIONS

Drug None reported. Herbal None known. Food None known.

## SIDE EFFECTS

Occasional

Local irritation, redness, burning, stinging, itching.

## SERIOUS REACTIONS

 Prolonged use may result in overgrowth of nonsusceptible organisms, including superinfection.

• Hypersensitivity reactions consisting of lid edema, itching, increased redness, tearing, and/ or circumocular rash have been reported.

• Photosensitivity has been reported in patients taking oral trimethoprim.

#### **PRECAUTIONS & CONSIDERATIONS**

Avoid wearing contact lenses during treatment. Effectiveness and safety have not been established in infants < 2 mo of age. Use with caution in pregnancy and lactation. Monitor patient for signs of ocular improvement; notify prescriber if eye inflammation or discharge increases, or eye is unusually reddened rather than improving.

#### Storage

Store at controlled room temperature and protect from light.

## Administration

Wash hands before and after use. Tilt head back and pull lower eyelid down to form a pouch. Squeeze the prescribed number of drops into pouch and gently close eyes for 1-2 min.

## **Posaconazole**

poe-sah-kone′ah-zole 🗙 Noxafil ★ Posanol

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antifungals, azole antifungals

## **MECHANISM OF ACTION**

A tirazole antifungal that blocks the synthesis of ergosterol, a key component of fungal cell membrane, through the inhibition of the enzyme lanosterol 14 $\alpha$ -demethylase and accumulation of methylated sterol precursors. *Therapeutic Effect:* Inhibits fungal cell membrane formation.

## PHARMACOKINETICS

Food increases absorption; must take orally with food. Protein binding: > 98%. Not significantly metabolized; undergoes glucuronidation into metabolites. Primarily eliminated in feces (71%, 66% unchanged); partial excretion in urine (13%, < 0.2% unchanged). *Half-life:* 35 h.

## AVAILABILITY

Oral Suspension: 40 mg/mL.

INDICATIONS AND DOSAGES > Prophylaxis of invasive Aspergillus and Candida fungal infections in patients who are severely immunocompromised PO

Adults, Children 13 yr and older. 200 mg (5 mL) 3 times/day.

#### • Oropharyngeal candidiasis PO

Adults, Children 13 yr and older. 100 mg (2.5 mL) twice a day on the first day, then 100 mg (2.5 mL) once a day for 13 days.

#### Oropharyngeal candidiasis, refractory to itraconazole and/or fluconazole

PO Adults, Children 13 yr and older. 400 mg (10 mL) twice a day.

## CONTRAINDICATIONS

Hypersensitivity to azole antifungals, posaconazole or its components; avoid coadministration with ergot alkaloids, sirolimus, simvastatin, or QTc-prolonging CYP3A4 substrates (pimozide, cisapride, quinidine).

## INTERACTIONS

#### Drug

Atazanavir, ritonavir: Increased levels of posaconazole. Avoid if possible.

**Calcium channel blockers:** May increase the levels and effects of calcium channel blockers.

**Cimetidine:** May decrease the levels and effects of posaconazole; avoid concurrent use.

**Cyclosporine:** May increase the levels and effects of cyclosporine. **CYP3A4 substrates:** May

increase the levels and effects of CYP3A4 substrates.

Contraindicated with QTcprolonging substrates (e.g.,

pinorging substrates (e.g., pimozide, cisapride, quinidine). Ergot alkaloids: Contraindicated. May increase the levels and effects of

ergot alkaloids. HMG-CoA reductase inhibitors:

May increase the levels and risk of myopathy; contraindicated with simvastatin.

**Midazolam:** May increase the levels and effects of midazolam.

**Phenytoin:** May increase the levels and effects of phenytoin; avoid concurrent use. QT-prolonging agents: Increased risk of arrhythmia (torsades de pointes). Contraindicated. **Rifabutin:** May increase the levels and effects of rifabutin; avoid

concurrent use.

**Sirolimus:** May increase the levels and effects of these drugs.

Vinca alkaloids: May increase the levels and effects of vinca alkaloids.

## Herbal

None known.

#### Food

**Grapefruit juice:** May increase posaconazole levels; avoid.

## DIAGNOSTIC TEST EFFECTS

May decrease serum potassium. May increase LFTs, serum alkaline phosphatase, serum creatinine.

#### SIDE EFFECTS

Frequent Diarrhea.

#### Occasional

Nausea, neutropenia, headache, vomiting, abdominal pain, flatulence, QTc prolongation, rash, hypokalemia, anemia, fever, dizziness, weakness, anorexia, fatigue, insomnia, mucositis, thrombocytopenia, myalgia, pruritus, dyspepsia, xerostoma.

#### Rare

Hypertension, blurred vision, tremor, hepatocellular damage, taste perversion, constipation, somnolence.

#### SERIOUS REACTIONS

· Hepatic dysfunction may occur.

• Arrhythmia (torsades de pointes) has been reported.

## **PRECAUTIONS & CONSIDERATIONS**

Caution in patients with severe renal impairment, hepatic impairment, arrhythmia risk, electrolyte abnormalities, severe diarrhea or vomiting. Safety and efficacy not established in children less than 13 yr of age. No unique precautions in the elderly. Teratogenic in animal studies; use in pregnancy only if benefit to mother justifies risk to fetus. Do not breastfeed.

#### Storage

Store at room temperature. Administration

Shake well before each use. Dose with a full meal or liquid nutritional supplement. If patients cannot tolerate PO nutrition, alternative antifungal therapy should be considered or closely monitor for lack of efficacy. Use dosing spoon provided with product. Rinse spoon with water after each use.

## **Potassium lodide**

poe-tas'ee-um eye'oh-dide ★ Losat, Lugol's solution, Pima, SSKI

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D OTC (tablets)

**Classification:** Antithyroid agents, hormones/hormone modifiers

## **MECHANISM OF ACTION**

An agent that reduces viscosity of mucus by increasing respiratory tract secretions. Inhibits secretion of thyroid hormone, fosters colloid accumulation in thyroid follicles. *Therapeutic Effect:* Blocks thyroid radioiodine uptake.

#### PHARMACOKINETICS

Oral onset 24-48 h, peak 10-15 days, duration 6 wks. Primarily excreted in the urine.

#### AVAILABILITY

Solution: 1 mg/mL (SSKI), 100 mg/mL (Lugol's solution). Syrup: 325/5 mL (Pima). Tablets: 130 mg (Iosat).

# INDICATIONS AND DOSAGES Expectorant

#### РО

Adults, Elderly, Children 3 yr and older: 325-650 mg q8h (Pima); 300-600 mg 3-4 times/day (SSKI). Children younger than 3 yr. 162 mg q8h.

#### Preoperative thyroidectomy PO

Adults, Elderly, Children. 0.1-0.3 mL (3-5 drops of Lugol's solution) q8h or 50-250 mg (1-5 drops of SSKI) q8h. Administer 10 days before surgery.

## Radiation protectant to radioactive isotopes of iodine

PO

Adults, Elderly. 195 mg/day (Pima) for 10 days. Start 24 h before exposure. Children more than 1 yr: 130 mg/day for 10 days. Start 24 h before exposure. Children < 1 yr: 65 mg/day for 10 days. Start 24 h before exposure.

## Reduce risk of thyroid cancer following nuclear accident PO

Adults, Elderly, Children weighing > 68 kg. 130 mg/day.

Children aged 3-18 yr. 65 mg/day. Children aged 1 mo to 3 yr. 32 mg/day. Children 1 mo and younger. 16 mg/ day.

## Šporotrichosis

PO

*Adults, Elderly.* Initally, 5 drops (SSKI) q8h and increase to 40-50 drops q8h as tolerated for 3-6 mo.

## Thyrotoxic crisis

#### PO

Adults, Elderly. 300-500 mg (6-19 drops SSKI) q8h or 1 mL (Lugol's solution) q8h.

## CONTRAINDICATIONS

Hypersensitivity to potassium, iodine compounds, or any of its components, pulmonary edema, hyperkalemia, impaired renal function, hyperthyroidism, iodineinduced goiter, pregnancy.

#### INTERACTIONS Drug

ACE inhibitors: May increase risk of hyperkalemia, cardiac arrhythmias, or cardiac arrest. Diuretics, potassium-sparing: May increase risk of hyperkalemia, cardiac arrhythmias, or cardiac arrest. Lithium: May increase the hypothyroid effects. Potassium (and potassiumcontaining products): May increase risk of hyperkalemia, cardiac arrhythmias, or cardiac arrest. Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May alter thyroid function tests.

#### SIDE EFFECTS Occasional

Irregular heartbeat, confusion, drowsiness, fever, rash, diarrhea, GI bleeding, metallic taste, nausea, stomach pain, vomiting, numbness, tingling, weakness.

#### Rare

Goiter, salivary gland swelling and tenderness, thyroid adenoma, swelling of the throat and neck, myxedema, lymph node swelling.

## SERIOUS REACTIONS

 Hypersensitivity symptoms include angioedema, muscle weakness, paralysis, peaked T-waves, flattened P-waves, prolongation of QRS complex, ventricular arrhythmias.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with congestive heart failure (CHF), hypertension, and pulmonary edema.

Potassium iodide crosses the placenta in amounts sufficient enough to cause fetal goiter and/

or hypothyroidism. Prolonged use during pregnancy is not advised; is sometimes used short term to manage thyroid conditions in pregnancy. Excreted in breast milk; do not breastfeed while taking this drug.

CBC (particularly blood hematocrit and hemoglobin level), serum acid-base balance, and serum creatinine should be monitored. ECG and urinary pH should be assessed in those with cardiac disease.

Any indications of swelling in the throat or neck or salivary glands should be reported immediately. **Storage** 

#### Storage

Store at room temperature. Protect from light.

#### Administration

Take after meals with food or milk to minimize GI side effects. Mix SSKI dose in water, juice, milk, or broth.

## Potassium Salts: Potassium Acetate/ Potassium Bicarbonate-Citrate/ Potassium Chloride/ Potassium Gluconate

poe-tah'see-um Potassium acetate: No brands Citric acid-Potassium bicarbonate: ★ Effer-K, Klor-Con/EF, K-Vescent Potassium chloride: ★ K-Tab, Klor-Con, Micro-K ★ K-Dur, Slow-K Potassium gluconate: No brands

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (A for potassium chloride)

**Classification:** Electrolyte replacements, minerals, potassium supplements

#### **MECHANISM OF ACTION**

An electrolyte that is necessary for multiple cellular metabolic processes. Primary action is intracellular. *Therapeutic Effect:* Is necessary for nerve impulse conduction and contraction of cardiac, skeletal, and smooth muscle; maintains normal renal function and acid-base balance.

## PHARMACOKINETICS

Well absorbed from the GI tract. Enters cells by active transport from extracellular fluid. Primarily excreted in urine.

## AVAILABILITY

Potassium Acetate

Injection: 2 mEq/mL. Potassium Bicarbonate and Citric Acid

*Tablet for Solution (Klor-Con/EF, Effer-K):* 25 mEq.

#### **Potassium Chloride**

Capsules (Extended Release [Micro-K]): 8 mEq, 10 mEq. Potassium Chloride Injection: 2 mEg/mL. Premixed IVPB Infusion (central line only): 20 mEq/50 mL, 40 mEq/100mL. Tablets (Extended Release [Klor-Con M10, Klor-Con M15, Klor-Con M20]): 10 mEq, 15 mEq, 20 mEq. Tablets (Extended Release Wax-Matrix [K-Tab]): 8 mEq, 10 mEq. Oral Solution: 20 mEq/15 mL, 40 mEg/15 mL. Powder for Oral Solution: 20 mEq. **Potassium Gluconate** 

Tablets (Extended Release): 95 mg.

## INDICATIONS AND DOSAGES

 Prevention of hypokalemia (in patients on diuretic therapy)
 PO Adults, Elderly. 20-40 mEq/day in 1-2 divided doses.

*Children*. 1-2 mEq/kg/day in 1-2 divided doses.

## Treatment of hypokalemia PO

*Adults, Elderly.* 40-100 mEq/day given in 2-4 doses; further doses based on laboratory values. *Children.* 2-5 mEq/day; further doses based on laboratory values. IV

*Adults, Elderly*: For acute hypokalemia, usual IV dose is 20-40 mEq IVPB, followed by repeat laboratory monitoring. Maximum: 400 mEq/day. *Children.* 2-5 mEq/kg/day usual rate 0.3-0.5 mEq 11g/hr. Maximum rate: 1 mEq/kg/hr.

## CONTRAINDICATIONS

Concurrent use of potassium-sparing diuretics, digitalis toxicity, heat cramps, hyperkalemia, postoperative oliguria, severe burns, severe renal impairment, shock with dehydration or hemolytic reaction, untreated Addison's disease.

## INTERACTIONS

#### Drug

ACE inhibitors, β-adrenergic blockers, cyclosporine, drospirenone, eplerenone, heparin, NSAIDs, potassium-containing medications, potassium-sparing diuretics, salt substitutes:

May increase potassium blood concentration.

Anticholinergics : May increase the risk of GI lesions or side effects from oral sustained-release potassium products.

**Corticosteroids:** May decrease potassium requirement.

Iodine and iodine-containing products: Do not use. Herbal

None known.

#### Food

Iodine-containing shellfish: Contraindicated.

## DIAGNOSTIC TEST EFFECTS

Increases serum potassium.

## IV INCOMPATIBILITIES

NOTE: Incompatibilities depend on the salt form of potassium utilized. Consult specialized resources. Some incompatibilities for potassium chloride include amphotericin B complex (Abelcet, AmBisome, Amphotec), methylprednisolone (Solu-Medrol), phenytoin (Dilantin).

## SIDE EFFECTS

Frequent Skin rash

Occasional

Nausea, vomiting, diarrhea, flatulence, abdominal discomfort with distention, phlebitis with IV administration (particularly when potassium concentration of > 40mEq/L is infused).

## Rare

Rash

## SERIOUS REACTIONS

 Hyperkalemia (more common in elderly patients and those with impaired renal function) may be manifested as paresthesia, feeling of heaviness in the lower extremities, cold skin, grayish pallor, hypotension, confusion, irritability, flaccid paralysis, and cardiac arrhythmias.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac disease and concurrent use of potassium-sparing diuretics, digitalis toxicity, systemic acidosis, renal impairment, and tartrazine sensitivity (most common in those with aspirin hypersensitivity). It is unknown whether potassium crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children. Elderly patients may be at increased risk for hyperkalemia because of an impaired ability to excrete potassium. Consuming potassium-rich foods, including apricots, avocados, bananas, beans, beef, broccoli, brussels sprouts, cantaloupe, chicken, dates, fish, ham, lentils, milk, molasses, potatoes, prunes, raisins, spinach, turkey, watermelon, yeal, and yams, is encouraged.

Notify the physician of a feeling of heaviness in the lower extremities and paresthesia. Serum potassium levels should be obtained before and throughout therapy. Intake and output, pattern of daily bowel activity, and stool consistency should also be monitored. Be alert for signs and symptoms of hyperkalemia, including cold skin, feeling of heaviness in lower extremities, paresthesia, and skin pallor.

Hypersensitivity to seafood, iodine, or iodine-containing products should be noted and if present, should not use this drug. **Storage** 

Store all products at room temperature.

#### Administration

Potassium dosage must be individualized.

Give oral potassium with or after meals and with a full glass of water to decrease GI upset. Mix effervescent tablets, liquids, and powder with juice or water, and let them dissolve before administering. Swallow the tablets whole, and do not chew or crush them.

Dilute the drug to a concentration of no more than 40 mEq/L for peripheral lines, and mix it well before IV infusion. Do not add potassium to a hanging IV line. Usual infusion rate is 10 mEq/h. Rate should not exceed 1 mEq/min for adults. Maximum and recommended rates of infusion differ according to the institution and patient care setting (e.g., ICU vs. medical floor). Check the IV site closely during the infusion for evidence of phlebitis (hardness of veir, heat, pain, and red streaking of skin over vein) and extravasation (cool skin, little or no blood return, pain, and swelling).

#### Pralidoxime

pra-li-doks'eem Protopam Chloride

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antidotes, cholinergic agonists

#### MECHANISM OF ACTION

Reactivates cholinesterase activity by 2-formyl-1-methylpyridinium ion. *Therapeutic Effect:* Restores cholinesterase activity following organophosphate anticholinesterase poisoning.

#### PHARMACOKINETICS

Onset of activity is 1 h and duration of action is short, which may require readministration. Not protein bound. Excreted in urine. *Half-life*: 1.2-2.6 h.

#### AVAILABILITY

*Injection, Powder for Reconstitution:* 1 g (Protopam Chloride).

# INDICATIONS AND DOSAGES Anticholinesterase overdosage IV

## **Pralatrexate**

pral'a-trex'ate Folotyn Do not confuse pralatrexate with pemetrexed, or Folotyn with Folacin, Follistim, or Foltrin.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

*Classification:* Antineoplastics, folic acid antagonist

## **MECHANISM OF ACTION**

An antimetabolite that disrupts folate-dependent enzymes essential for cell replication. *Therapeutic Effect:* Inhibits the growth of malignant cell lines.

## PHARMACOKINETICS

Protein binding: 67%. Most (69%) of drug is eliminated in the urine as unchanged drug isomers. Clearance is tied to glomerular filtration. Not known if dialyzed. *Half-life*: 12-18 h (prolonged in renal impairment).

## AVAILABILITY

Injection: 20 mg/mL, 40 mg/2 mL.

## INDICATIONS AND DOSAGES

Patients should take low-dose (1-1.25 mg PO) folic acid daily beginning the 10 days preceding the first dose; during the full course of therapy; and for 30 days after the last dose. Also give vitamin  $B_{12}$  (1000 mcg IM single dose) no more than 10 wks prior to the first dose and q8-10wk thereafter; the maintenance doses may be given the same day as pralatrexate.

 Refractory peripheral T-cell lymphoma Adults. 30 mg/m<sup>2</sup> IV push once weekly for 6 wks in 7-wk cycles.

• Dosage adjustment for toxicities Expect treatment interruption or dose reduction to 20 mg/m<sup>2</sup> to manage adverse drug reactions, such as stomatitis or neutropenia. See manufacturer recommendations for specific details.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

Nephrotoxic agents, cisplatin, probenecid, sulfamethoxazoletrimethoprim: May delay pralatrexate clearance and increase risk of toxicity.

**NSAIDs:** Reduce renal clearance or pralatrexate and potential increase in GI, renal side effects.

**Live vaccines:** Avoid vaccination with live vaccines during treatment.

Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May decrease platelet, RBC, and WBC counts. May increase LFTs or serum creatinine.

## IV INCOMPATIBILITIES

Use only 0.9% NaCl to reconstitute; flush the line before and after. Do not add any other medications to the IV solution. Known incompatibilities include calcium-containing solutions such as lactated Ringer's injection.

#### SIDE EFFECTS Frequent

Mucositis/stomatitis, thrombocytopenia, nausea, and fatigue.

#### 1305.e2 Pralatrexate

#### Occasional

Vomiting, constipation, anorexia, pharyngitis, diarrhea, neutropenia, leukopenia, anemia, rash, desquamation, mood alteration or depression, dyspnea.

#### Rare

Febrile neutropenia, renal failure, esophagitis, odynophagia, dysphagia, allergic reaction/hypersensitivity, dehydration, creatinine elevation, infection.

## SERIOUS REACTIONS

• Expect stomatitis; may be severe and require dose adjustment or withholding treatment.

 Myelosuppression, manifested as neutropenia, thrombocytopenia, or anemia, may occur, with resultant risk of opportunistic or serious infection.

Renal or liver dysfunction.

• Hypersensitivity, including toxic epidermal necrolysis (TEN).

## **PRECAUTIONS & CONSIDERATIONS**

CBC with differential platelet count should be assessed before starting therapy and again during each cycle and before starting a new cycle. New cycles should not be started with ANC <1500 mm<sup>3</sup>, platelet count  $\leq$ 100,000 mm<sup>3</sup>.

Caution is warranted in patients with liver and renal impairment as well as concurrent therapy with NSAIDs. Pralatrexate may be harmful to a fetus, and it is unknown whether pralatrexate is distributed in breast milk. Do not breastfeed once treatment has been initiated. Contraceptive measures should be used during therapy. Safety and efficacy have not been established in children. Be aware that elderly patients may have higher incidence of fatigue, leukopenia, neutropenia, and thrombocytopenia.

Fastidious oral hygiene should be maintained. Do not have immunizations without physician's approval (drug lowers body's resistance). Crowds and those with infection should be avoided. Report fever, sore throat, signs of local infection, easy bruising, and unusual bleeding from any site immediately.

#### Storage

Store unopened injection vial refrigerated and protected from light in the original carton. Do not freeze. Unopened vial(s) are stable if in the original carton at room temperature for 72 h. Any vials left at room temperature for greater than 72 h should be discarded.

#### Administration

CAUTION: Observe and exercise usual cautions for handling, preparing, administering, and disposing of cytotoxic drugs.

Be aware that treatment with folic acid and vitamin  $B_{12}$  will help reduce risk of side effects.

For intravenous use only. Do not dilute the injection. Withdraw the required dose into the proper syringe and administer as IV push over 3-5 min via the side port of a free-flowing 0.9% NaCl injection. Adults, Elderly. 1-2 g initially, followed by increments of 250 mg q5min until response is observed. > Organophosphate poisoning

## Virganophosphate poisoning IV

Adults, Elderly. 1-2 g initially in 100 mL 0.9% NaCl infused over 15-30 min or 5% solution in sterile water for injection over not < 5 min. Repeat 1-2 g in 1 h if muscle weakness persists. New evidence suggests that a loading dose followed by continuous IV infusion may maintain therapeutic levels longer in adults than traditional intermittent infusion therapy (see manufacturer literature). Children. There are several different protocols for IV continuous infusion, IV intermittent infusion, and IM dosing in children. See specific toxicologic references for most current dosing recommendations based on symptom severity.

## CONTRAINDICATIONS

Hypersensitivity to pralidoxime or any of its components.

## INTERACTIONS

#### Drug

#### Aminophylline, caffeine,

**theophylline:** May exacerbate effects of organophosphate poisoning; avoid use of these drugs when treating overdose.

Atropine: May decrease effects of pralidoxime.

**Barbiturates:** May increase effect of pralidoxime.

Reserpine, phenothiazines: May exacerbate effects of organophosphate poisoning. Succinylcholine: May prolong respiratory paralysis due to organophosphate poisoning. Thiamine: May delay excretion of pralidoxime due to competition at renal excretory site.

## Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase SGOT (AST) and creatine kinase levels.

## SIDE EFFECTS

#### Occasional

Blurred vision, dizziness, headache, laryngospasm, hyperventilation, nausea, tachycardia, hypertension, pain at injection site.

#### Rare

Rash, muscle rigidity, decreased renal function.

## SERIOUS REACTIONS

• Excessive doses may cause blurred vision, nausea, tachycardia, and dizziness.

## **PRECAUTIONS & CONSIDERATIONS**

NOTE: Pralidoxime is not effective in the treatment of poisoning due to phosphorus, inorganic phosphates, or organophosphates not having anticholinesterase activity. The drug is not indicated as an antidote for intoxication by pesticides of the carbamate class since it may increase the toxicity of carbaryl.

Caution is warranted with myasthenia gravis and renal impairment as well as in elderly patients. It is unknown whether pralidoxime crosses the placenta and is distributed in breast milk. Safety and efficacy of pralidoxime have not been established in children. Age-related renal impairment may require dosage adjustment in elderly patients. Avoid consuming an excessive amount of caffeine derivatives such as chocolate, cocoa, coffee, cola, or tea.

Resolution of clinical symptoms (muscle weakness, respiratory

difficulty, muscarinic effects such as salivation, lacrimation, urination, and defecation) should be assessed.

#### Storage

Store vials for injection at room temperature.

## Administration

Do NOT delay initiation of therapy, even if still awaiting test results. Dilute 1 g with 20 mL of sterile water for injection. Solution may be further diluted and administered as 1-2 g in 100 mL 0.9% NaCl. Usually given over 15-30 min; rate should not exceed 200 mg/min. Slow IV infusion prevents tachycardia, laryngospasm, and muscle rigidity. Do not use if solution appears discolored or contains a precipitate. Expect concomitant use of atropine to treat the symptoms of overdose.

## Pramipexole

pram-eh-pex'ol Mirapex, Mirapex ER Do not confuse Mirapex with Mifeprex or MiraLax.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, dopaminergics

#### **MECHANISM OF ACTION**

An antiparkinsonian agent that stimulates dopamine receptors in the striatum. *Therapeutic Effect:* Relieves signs and symptoms of Parkinson's disease.

#### PHARMACOKINETICS

Rapidly and extensively absorbed after PO administration. Protein binding: 15%. Widely distributed. Steady-state concentrations achieved within 2 days. Primarily eliminated in urine. Not removed by hemodialysis. *Half-life*: 8 h (12 h in patients older than 65 yr).

## AVAILABILITY

*Tablets:* 0.125 mg, 0.25 mg, 0.5 mg, 1 mg, 1.5 mg. *Tablets, Extended Release:* 0.375 mg, 0.75 mg, 1.5 mg, 3 mg, 4.5 mg.

## INDICATIONS AND DOSAGES Parkinson's disease

PO (IMMEDIATE RELEASE) Adults, Elderly. Initially, 0.375 mg/ day in 3 divided doses. Do not increase dosage more frequently than every 5-7 days. Maintenance: 1.5-4.5 mg/day in 3 equally divided doses. PO (EXTENDED RELEASE) Adults, Elderly. Initially, 0.375 mg once daily. Increase no more frequently than every 5-7 days. Maintenance: 1.5-4.5 mg/day.

## Restless legs syndrome PO

Adults, Elderly. 0.125 mg once daily 2-3 h before bedtime. May increase after 4-7 days to 0.25 mg 2-3 h before bedtime if needed. Maximum of 0.5 mg 2-3 h before bedtime. Higher doses do not provide additional benefit. Slower titration if renally impaired.

## Dosage in renal impairment

Dosage and frequency of immediaterelease tablets for Parkinson's disease are modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Initial Dose (mg/day)	Maximum Dose
> 60	0.125	1.5 mg 3×/day
35-59	0.125	1.5 mg 2×/day
15-34	0.125	1.5 mg 1×/day

Dosage of extended-release tablets also adjusted to CrCl:

CrCl 30-50 mL/min: 0.375 mg PO q48h; do not exceed 2.25 mg/day.

Pramipexole (Generic Name)

CrCl < 30 mL/min: Do not use extended release.

## CONTRAINDICATIONS

History of hypersensitivity to pramipexole.

## INTERACTIONS

#### Drug

Carbidopa and levodopa,

**levodopa:** May increase plasma level of levodopa.

**Cimetidine:** Increases pramipexole plasma concentration and half-life. **Cimetidine, diltiazem, quinidine, quinine, ranitidine, triamterene, verapamil:** May decrease

pramipexole clearance.

**Central nervous system (CNS) depressants:** May increase CNS depressive effects.

**Phenothiazines, butyrophenones, thioxanthenes, metoclopramide:** May decrease effectiveness.

#### Herbal

None known.

#### Food

**All foods:** Delay peak drug plasma levels by 1 h but do not affect drug absorption.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Early Parkinson's disease (10%-28%): Nausea, asthenia, dizziness, somnolence, insomnia, constipation. Advanced Parkinson's disease (17%-53%): Orthostatic hypotension, extrapyramidal reactions, insomnia, dizziness, hallucinations. **Occasional** 

Early Parkinson's disease (2%-5%): Edema, malaise, confusion, amnesia, akathisia, anorexia, dysphagia, peripheral edema, vision changes, impotence.

Advanced Parkinson's disease (7%-10%): Asthenia, somnolence, confusion, constipation, abnormal gait, dry mouth.

## Rare

Advanced Parkinson's disease (2%-6%): General edema, malaise, chest pain, amnesia, tremor, urinary frequency or incontinence, dyspnea, rhinitis, vision changes.

## SERIOUS REACTIONS

• Excessive daytime drowsiness may result in falling asleep while engaged in activities, including the operation of motor vehicles, which sometimes results in accidents.

 Hallucinations; new or emergent compulsive actions (gambling, eating, shopping, etc.).

Retroperitoneal fibrosis, pulmonary infiltrates, pleural effusion, pleural thickening, pericarditis, and cardiac valvulopathy have been reported with ergotderived dopaminergic agents.
Possible increased risk skin melanoma.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hallucinations, syncope, renal impairment, history of orthostatic hypotension, and in those using central nervous system (CNS) depressants concurrently. It is unknown whether pramipexole is distributed in breast milk. The safety and efficacy of pramipexole have not been established in children. Elderly patients are at increased risk for hallucinations.

Dizziness, drowsiness, lightheadedness, and constipation may occur. Alcohol and tasks that require mental alertness or motor skills should be avoided. Change positions slowly to prevent orthostatic hypotension. Vital signs and renal function should be assessed at baseline. Relief of symptoms, such as improvement of mask-like facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should be assessed during treatment.

#### Storage

Store at room temperature.

#### Administration

Take pramipexole without regard to food. Take with food if nausea is a problem. Do not abruptly discontinue pramipexole.

## Pramlintide

pram'lin-tide Symlin, SymlinPen

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, amylin analogs

#### MECHANISM OF ACTION

An analog of amylin, a neuroendocrine hormone secreted by pancreatic  $\beta$  cells that works along with insulin to regulate postprandial glucose concentrations; endogenous amylin is stored with insulin in secretory granules and secreted with insulin. By acting as an amylinomimetic agent, pramlintide (1) slows gastric emptying, (2) prevents postprandial rise in plasma glucagon and lowering postprandial glucose, and (3) modulates centrally mediated appetite satiety leading to decreased caloric intake and potential weight loss. Therapeutic Effect: Lowers blood glucose concentration and HbA1C over time, improving diabetic control.

#### PHARMACOKINETICS

Bioavailability is 30%-40% after subcutaneous (SC) injection into the abdominal area. Maximum plasma concentration occurs 20 min after SC injection. Protein binding: 40%. Pramlintide is extensively metabolized by the kidneys; the primary metabolite has a similar half-life and is biologically active both in vitro and in vivo. *Half-life:* 48 min.

#### AVAILABILITY

Injection Pens (1000 mcg/mL): SymlinPen 60 allows for 15-, 30-, 45-, and 60-mcg doses; SymlinPen 120 allows for 60- and 120-mcg doses.

Vials: Contain 600 mcg/mL solution in 5-mL vial.

## INDICATIONS AND DOSAGES Diabetes mellitus for type 1 DM in patients who use mealtime insulin therapy

SC

Adults. 15 mcg SC immediately prior to each major meal (≥ 250 kcal or 30 g of carbohydrates). Titrate upward in 15-mcg increments every 3 days to 60 mcg prior to each major meal; only if no significant nausea. If nausea or vomiting persists, reduce the dose. Reduce preprandial rapid or short-acting insulin and fixed-mix insulin dose by 50% when pramlintide is initiated. Adjust to achieve optimal glycemic control.

 Diabetes mellitus for type 2 DM in patients who use mealtime insulin therapy with or without a sulfonylurea and/or metformin SC

Adults. 60 mcg SC immediately prior to each major meal ( $\geq$  250 kcal or 30 g of carbohydrates); increase to 120 mcg prior to each major meal if no significant nausea for 3-7 days. If nausea or vomiting persists, reduce the dose. Reduce preprandial rapid or short-acting insulin or fixed-mix insulin dose by 50% when pramlintide is initiated. Adjust insulin to achieve optimal glycemic control.

## CONTRAINDICATIONS

Hypersensitivity to pramlintide or product components, such as metacresol. Gastroparesis. Not for diabetic ketoacidosis. Not for patients with hypoglycemic unawareness.

## INTERACTIONS

#### Drug

**Insulin:** While indicated to be coadministered with insulin therapy, pramlintide increases the risk of insulin-induced severe hypoglycemia, particularly in patients with type 1 diabetes and usually within the first 3 h following a pramlintide dose. Provide frequent pre- and post-meal glucose monitoring and an initial 50% reduction in pre-meal doses of shortacting insulin.

Acarbose, miglitol: Due to its effects on gastric emptying, pramlintide therapy should not be used with agents that slow the intestinal absorption of nutrients (e.g.,  $\alpha$ -glucosidase inhibitors).

Anticholinergics or prokinetic agents: Due to its effects on gastric emptying, do not use in patients taking these GI drugs due to lack of safety data.

**β-Blockers:** May mask signs of hypoglycemia.

Oral medications (e.g., oral contraceptives, antibiotics):

Pramlintide slows GI transit times. For oral medications dependent on normal transit times efficacy, such as contraceptives and antibiotics, patients should be advised to take those drugs at least 1 h before pramlintide, or at a meal or snack when pramlintide is not administered.

Corticosteroids: May increase blood sugar.

**Sulfonylureas:** May increase risk of hypoglycemia; lower sulfonylurea dose may be needed.

Warfarin: May increase the effects of warfarin, resulting in increased INR. Monitor INR closely.

## Herbal

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle: May enhance hypoglycemic effects. Food

Alcohol: Hypoglycemia is more likely to occur if alcohol is ingested. High and chronic alcohol use may increase risk for pancreatitis.

## **DIAGNOSTIC TEST EFFECTS**

Lowers blood sugar. May increase serum creatinine, amylase, or lipase.

## SIDE EFFECTS

Frequent

Nausea is expected and can be reduced with slow titration. Decreased appetite, tiredness, dizziness, or indigestion. Nausea subsides with time.

## Occasional

Hypoglycemia, stomach pain, vomiting, tiredness, diarrhea, dizziness, dyspepsia. Gastroesophageal reflux (GERD), asthenia, hyperhidrosis, headache. **Rare** 

Injection site reaction (redness, bruising) or lipodystrophy, eructation, flatulence, taste disturbance, pruritus, urticaria, rash.

#### SERIOUS REACTIONS

 Overdose may produce severe hypoglycemia, along with severe GI symptoms and vomiting.

 Rare reports of serious allergic reactions, including angioedema and rashes.

Use with insulinmay result in severe hypoglycemia.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with end-stage renal disease, hepatic dysfunction, and patients with significant GI disease where slowing of GI transit time may aggravate the condition. Be alert to conditions that alter blood glucose requirements or dietary intake, such as fever, increased activity, stress, or a surgical procedure. There are no data regarding pramlintide use during pregnancy. It is unknown whether the drug is distributed in breast milk; caution is recommended. The drug may alter the efficacy of oral hormonal contraceptives and the choice of an additional or alternate contraceptive may be desirable. Safety and efficacy of pramlintide have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store unopened pens and vials in the original carton in a refrigerator. Do not freeze. Once opened and set up for first use, the pen or vial can be kept at a temperature not to exceed 86° F for up to 30 days; they may be kept refrigerated. Always protect from light and keep pen dry. Do not store the pen with the needle attached, as this will cause leakage from the pen and air bubbles may form in the cartridge.

#### Administration

Pramlintide and insulin should always be administered as separate injections and never be mixed.

For subcutaneous injection only; doses are given any time within the 60 min prior to the start of a main meal.

To administer from vials, use a U-100 insulin syringe (preferably a 0.3-mL size). If using a syringe calibrated for use with U-100 insulin using units, use the manufacturer's chart to convert the microgram dosage in unit increments.

If using pen, make sure you have prepared the pen for routine use. For routine use, wash hands. Check that the right pen is selected. Pull off pen cap. The cartridge liquid should be clear, colorless, and free of particles. Attach the needle and dial in the pen dose as the manufacturer directs. Inject the dose SC as directed in the upper thigh or abdomen; rotate injection sites with each use. After injection, reset the pen, remove and dispose of the used needle properly, and store the pen for next use by replacing the pen cap.

## **Prasugrel**

pra'soo-grel ★ ● Effient Do not confuse Effient with Effexor or prasugrel with pravachol.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Platelet aggregation inhibitor

## **MECHANISM OF ACTION**

A thienopyridine derivative that inhibits binding of the enzyme adenosine phosphate (ADP) to its platelet receptor and subsequent ADP-mediated activation of platelet aggregation. *Therapeutic Effect:* Inhibits platelet aggregation and reduces thrombotic cardiovascular events (including stent thrombosis) in those with acute coronary syndromes managed with percutaneous coronary intervention (PCI).

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	30 min	> 3 days

Rapidly and well absorbed orally. Prasugrel is a prodrug and is quickly metabolized to a pharmacologically active metabolite via hydrolysis in the intestine to a thiolactone that is then actively converted in the liver by a single step, primarily by CYP3A4 and CYP2B6 and to a lesser extent by CYP2C9 and CYP2C19. The active metabolite is metabolized to 2 inactive compounds by S-methylation or conjugation with cysteine. Approximately 68% of the prasugrel dose is excreted in the urine and 27% in the feces as inactive metabolites. Active metabolite not dialyzable. *Halflife:* 7 h (mean half-life of active metabolite).

## AVAILABILITY

Tablets: 5 mg, 10 mg.

## INDICATIONS AND DOSAGES

 Unstable angina; non-ST-elevation myocardial infarction (NSTEMI) or ST-elevation MI (STEMI) managed with PCI

PO

Adults, Elderly < 75 yr of age. Initially 60 mg loading dose. Then, 10 mg once daily. Consider 5 mg once daily if weight < 60 kg. Patients should also take aspirin (75-325 mg) daily unless allergic.

## CONTRAINDICATIONS

Hypersensitivity, active bleeding, prior transient ischemic attack or stroke.

## INTERACTIONS

Drug

Anticoagulants (including warfarin and heparins); NSAIDS: May increase the risk of bleeding. Herbal

Ginger, ginkgo biloba, white willow bark: May increase the risk of bleeding. Food None known.

## DIAGNOSTIC TEST EFFECTS

Prolongs bleeding time. Be aware that abrupt discontinuation of prasugrel produces a return to normal aggregation of platelets within 5-9 days.

Prasugrel (Generic Name), Effient (Brand Name)

## SIDE EFFECTS

#### Frequent (> 7%)

Bleeding, both minor (such as easy bruising or epistaxis) and major. **Occasional (3%-7%)** 

Headache, dizziness, arthralgia or back pain, nausea, dyspnea, cough, fatigue. Infrequent (1%-3%)

Non-cardiac chest pain, leukopenia, rash, pyrexia, peripheral edema, pain in extremity, diarrhea.

#### Rare (<1%)

Severe thrombocytopenia, anemia, abnormal hepatic function, allergic reactions.

#### SERIOUS REACTIONS

 Rare allergic reactions may include angioedema.

• Thrombotic thrombocytopenic purpura.

• Significant, sometimes fatal bleeding, such as GI hemorrhage or CNS bleeding.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hematologic disorders, history of bleeding, hypertension, severe hepatic or renal impairment, and in preoperative persons. Do not use in patients with a history of transient ischemic attack or stroke. In elderly patients  $\geq$  75 yr of age, prasugrel is not recommended due to increased risk of serious bleeding and uncertain benefit, except in high-risk patients (diabetes or prior MI), where its benefit may be considered. Do not start prasugrel in patients likely to undergo urgent coronary artery bypass graft (CABG) surgery. When possible, discontinue at least 7 days prior to any surgery; abrupt discontinuation may increase clot and MI risk. Adult patients of low body weight (< 132 lb) may have a higher bleeding risk; use with caution and consider lower dosage. There are no data in human

pregnancy, and it is not known if the drug is excreted in human milk. The safety and efficacy of prasugrel have not been established in children.

Be aware that it may take longer to stop bleeding during drug therapy. Notify the physician of unusual bleeding, particularly purple patches on the skin. Also, notify dentists and other physicians before surgery is scheduled or when new drugs are prescribed. Platelet count for thrombocytopenia, hemoglobin level, WBC count, and BUN, serum bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels should be monitored. Platelet count should be obtained before prasugrel therapy, every 2 days during the first week of treatment, and weekly thereafter until therapeutic maintenance dose is reached.

#### Storage

Store tablets at room temperature. Administration

Take prasugrel without regard to food, at the same time each day. Do not crush coated tablets.

Inform patient of need for adherence to treatment. Those who have had PCI and have a stent and stop the drug too soon have a higher risk of blood clot, heart attack, and death.

## Pravastatin

prav-i-sta'tin Pravachol Do not confuse pravastatin with Prevacid, or Pravachol with propranolol.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: X

#### Classification:

Antihyperlipidemics, HMG-CoA reductase inhibitors ("statins")

Pravastatin (Generic Name)

## **MECHANISM OF ACTION**

An HMG-CoA reductase inhibitor that interferes with cholesterol biosynthesis by preventing the conversion of HMG-CoA reductase to mevalonate, a precursor to cholesterol. *Therapeutic Effect:* Lowers serum low density lipoprotein (LDL) and very low density lipoprotein (VLDL) cholesterol and plasma triglyceride levels; increases serum high density lipoprotein (HDL) concentration.

## PHARMACOKINETICS

Poorly absorbed from the GI tract. Protein binding: 50%. Metabolized in the liver (minimal active metabolites). Primarily excreted in feces via the biliary system. Not removed by hemodialysis. *Half-life:* 2.7 h.

## AVAILABILITY

Tablets: 10 mg, 20 mg, 40 mg, 80 mg.

## INDICATIONS AND DOSAGES

 Hyperlipidemia, primary and secondary prevention of cardiovascular events in patient with elevated cholesterol levels PO

*Adults, Elderly.* Initially, 40 mg/day. Titrate to desired response. Range: 10-80 mg/day.

*Children 14-18 yr.* 40 mg/day. *Children 8-13 yr.* 20 mg/day.

#### Dosage in hepatic and renal impairment

For adults, give 10 mg/day initially. Titrate to desired response.

## CONTRAINDICATIONS

Hypersensitivity; active liver disease or unexplained, persistent elevations of serum transaminases; pregnancy; breastfeeding.

## INTERACTIONS

Drug Colchicine, cyclosporine, erythromycin, itraconazole: Increases the risk of acute renal failure and rhabdomyolysis or myopathy. Due to lack of CYP3A4 metabolism, these interactions are not as significant for pravastatin as with other "statins." **Herbal** 

None known.

Food

None known. Alcohol should be avoided during therapy.

## DIAGNOSTIC TEST EFFECTS

May increase serum CK and transaminase concentrations. Transient increases in eosinophil counts. Rare decreases in platelets, WBC, and RBC indices.

## SIDE EFFECTS

Pravastatin is generally well tolerated. Side effects are usually mild and transient.

## Occasional (4%-7%)

Nausea, vomiting, diarrhea, constipation, abdominal pain, headache, rhinitis, rash, pruritus. **Rare (2%-3%)** 

Heartburn, myalgia, dizziness, cough, fatigue, flu-like symptoms. Reversible cognitive impairment or depression, hair loss, may worsen glucose tolerance and increase HbA1C.

## SERIOUS REACTIONS

• Hypersensitivity, such as bullous rash or anaphylaxis, reported rarely.

- Rhabdomyolysis (rare).
- Hepatotoxicity (rare).
- · Cataracts may develop.

## **PRECAUTIONS & CONSIDERATIONS**

Additional caution is warranted in patients with past liver disease; severe acute infection; trauma; severe metabolic or seizure disorders; severe electrolyte, endocrine, and metabolic disorders; and in any patient who consumes a substantial amount of alcohol. Withholding or discontinuing pravastatin may be necessary when the person is at risk for renal failure secondary to rhabdomyolysis. Pravastatin is contraindicated in pregnancy (category X) and may cause fetal harm. It is unknown whether pravastatin is distributed in breast milk; because there is risk of serious adverse reactions in breastfeeding infants, pravastatin is contraindicated during lactation. Safety and efficacy of pravastatin have not been established in children under 8 yr of age. No agerelated precautions have been noted in elderly patients.

Dizziness and headache may occur. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established. Notify the physician of muscle weakness, myalgia, severe gastric upset, or rash. Pattern of daily bowel activity and stool consistency should be assessed. Serum lipid cholesterol and triglyceride levels and hepatic function should be checked at baseline and periodically during treatment. Be aware that diet is an important part of treatment. Storage

Store at room temperature.

#### Administration

May administer without regard to meals and may give at any time of day. Often given at bedtime.

Praziquantel pray'zih-kwon'tel

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Antihelmintics

## **MECHANISM OF ACTION**

An antihelmintic that increases cell permeability in susceptible helminths resulting in loss of intracellular calcium, massive contractions, and paralysis of their musculature, followed by attachment of phagocytes to the parasites. *Therapeutic Effect:* Vermicidal. Dislodges the dead and dying worms.

## PHARMACOKINETICS

Well absorbed from GI tract. Protein binding: 80%. Widely distributed, including cerebrospinal fluid (CSF). Metabolized in liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 4-5 h.

## AVAILABILITY

Tablets: 600 mg (Biltricide).

#### 

#### PO

Adults, Elderly, Children > 4 yr of age. 3 doses of 20 mg/kg as 1-day treatment. Do not give doses < 4 h or > 6 h apart.

#### Clonorchiasis/opisthorchiasis PO

Adults, Elderly, Children > 4 yr of age. 3 doses of 25 mg/kg as 1-day treatment.

## CONTRAINDICATIONS

Ocular cysticercosis, hypersensitivity to praziquantel or any component of the formulation. Use with rifampin.

#### INTERACTIONS Drug

Albendazole: May increase risk of albendazole adverse effects.

**Carbamazepine**, **phenytoin**, **fosphenytoin**: May decrease praziquantel effectiveness.

Praziquantel (Generic Name), Biltricide (Brand Name)

#### 1316 Prazosin Hydrochloride

**Cimetidine:** May increase praziquantel concentrations. **Rifampin:** Strong CYP450 inducers,

such as rifampin, are contraindicated since therapeutically effective blood levels of praziquantel may not be achieved. Consider different drug for parasites. Stop rifampin 4 wks before use; may restart the day after treatment is complete.

#### Herbal

**St. John's wort:** Avoid. Effective blood levels of praziquantel may not be achieved.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Headache, dizziness, malaise, abdominal pain.

## Occasional

Anorexia, vomiting, diarrhea, severe cramping and abdominal pain may occur within 1 h of administration with fever, sweating, bloody stools. **Rare** 

Dizziness, urticaria.

#### SERIOUS REACTIONS

- · Seizures.
- · Hypersensitivity reactions.
- · Cardiac arrhythmia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with severe liver impairment and cardiac irregularities. It is unknown whether praziquantel is distributed in breast milk. Safety and efficacy have not been established in children. No age-related precautions have been noted in elderly patients. Symptoms of giddiness or urticaria may indicate a hypersensitivity reaction and should be reported. Patients should be warned not to drive or perform hazardous tasks on the day of treatment and the following day. When schistosomiasis or fluke infection is found to be associated with cerebral cysticerosis, it is advised to hospitalize the patient for the duration of praziquantel treatment.

#### Storage

Store at room temperature. Administration

Doses should be spaced not < 4 h and not > 6 h apart. Tablets are scored and may be broken for dosage adjustment. If iron supplements are ordered, continue as directed, which may be up to 6 mo post therapy.

#### Prazosin Hydrochloride

pra'zoe-sin high-droh-klor'eyed

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antihypertensives, α-adrenergic antagonist

#### **MECHANISM OF ACTION**

An antidote, antihypertensive, and vasodilator that selectively blocks  $\alpha_i$ -adrenergic receptors, decreasing peripheral vascular resistance. *Therapeutic Effect:* Produces vasodilation of veins and arterioles, decreases total peripheral resistance, and relaxes smooth muscle in bladder neck and prostate.

## PHARMACOKINETICS

PO: Onset 2 h, peak 1-3 h, duration 6-12 h. *Half-life*: 2-4 h; metabolized in liver, excreted in bile, feces (> 90%), in urine (< 10%).

Prazosin Hydrochloride (Generic Name)

## AVAILABILITY

Capsules: 1 mg, 2 mg, 5 mg.

## INDICATIONS AND DOSAGES

#### Mild to moderate hypertension PO

*Adults, Elderly.* Initially, 1 mg 2-3 times a day. Maintenance: 6-15 mg/ day in divided doses. Maximum: 20 mg/day.

## **OFF-LABEL USES**

Treatment of post-traumatic stress disorder (PTSD), urinary retention in benign prostatic hypertrophy, ergot alkaloid induced peripheral ischemia, pheochromocytoma, Raynaud's phenomenon, treatment of hypertension in children.

## CONTRAINDICATIONS

Hypersensitivity to prazosin or to quinazolines.

## INTERACTIONS

#### Drug

Hypotension-producing medications, such as antihypertensives, phosphodiesterase-5 (PDE-5) inhibitors (e.g., vardenafil, sildenafil, tadalafil), and diuretics: May increase the effects of prazosin. MAOIs: Additive hypotensive effect. NSAIDs and sympathomimetics: May decrease the effects of prazosin. Herbal

Licorice: Causes sodium and water retention and potassium loss. Food

Alcohol: Additive hypotensive effect.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (7%-10%)

Dizziness, somnolence, headache, asthenia (loss of strength, energy).

#### Occasional (4%-5%)

Palpitations, nausea, dry mouth, nervousness.

Rare (< 1%) Angina, urinary urgency.

## SERIOUS REACTIONS

 First-dose syncope (hypotension with sudden loss of consciousness) may occur 30-90 min following initial dose of more than 2 mg, a toorapid increase in dosage, or addition of another antihypertensive agent to therapy. First-dose syncope may be preceded by tachycardia (pulse rate of 120-160 beats/min).

· Priapism (rare).

 Intraoperative floppy iris syndrome (IFIS) during cataract surgery (rare).

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with chronic renal failure. Caution should be used when driving or operating machinery. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established. Use with caution in pregnancy; the drug is also excreted in breast milk in small amounts. Safety and efficacy not established in children. The elderly may be more sensitive to orthostasis.

Dizziness, light-headedness, and fainting may occur. Rise slowly from a lying to a sitting position, and permit legs to dangle momentarily before standing to avoid the hypotensive effect. Notify the physician if dizziness or palpitations become bothersome. BP and pulse should be obtained immediately before each dose, and every 15-30 min thereafter until BP is stabilized. Be alert for fluctuations in BP. Pattern of daily bowel activity and stool consistency should also be assessed. Assess patient's tolerance to stress, which could compromise cardiovascular function.

#### Storage

Store at room temperature. Administration

Take prazosin without regard to food. Take the first dose at bedtime to minimize the risk of fainting from first-dose syncope.

## Prednisolone

pred-niss'oh-lone Systemic: ☆ Millipred, Orapred, Pediapred, Prednoral, Prelone Ophthalmic: ☆ Econopred, OmniPred, Pred Forte, Pred Mild Do not confuse prednisolone with prednisone or Primidone.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in first trimester)

Classification: Hormones

and hormone modifiers, adrenal agents, corticosteroids, ophthalmic anti-inflammatory

## **MECHANISM OF ACTION**

An adrenocortical steroid that inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release and synthesis, and release of mediators of inflammation. *Therapeutic Effect:* Prevents or suppresses cell-mediated immune reactions. Decreases or prevents tissue response to inflammatory process.

#### PHARMACOKINETICS

PO: Peak 1-2 h, duration 2 days.

## AVAILABILITY

Oral Solution (Pediapred): 5 mg/5 mL. Oral Solution (Orapred): 15 mg/5 mL. Tablets: 5 mg. Orally Disintegrating Tablets (Orapred ODT): 10 mg, 15 mg, 30 mg. Syrup (Prelone): 15 mg/5 mL. Ophthalmic Solution: 1%. Ophthalmic Suspension (Pred Mild): 0.12%. Ophthalmic Suspension (Pred Forte, Econopred, Omnipred): 1%.

## INDICATIONS AND DOSAGES

Substitution therapy for deficiency states: acute or chronic adrenal insufficiency, congenital adrenal hyperplasia, and adrenal insufficiency secondary to pituitary insufficiency; nonendocrine disorders: arthritis; rheumatic carditis; allergic, collagen, intestinal tract, liver, ocular, renal, skin diseases; bronchial asthma; cerebral edema; malignancies PO

Adults, Elderly. 5-60 mg/day in divided doses. Children. 0.1-2 mg/kg/day in 3-4 divided doses.

## Treatment of conjuctivitis and corneal injury

OPHTHALMIC *Adults, Elderly.* 1-2 drops every hour during day and q2h during night. After response, decrease dosage to 1 drop q4h, then 1 drop 3-4 times a day.

## CONTRAINDICATIONS

Hypersensitivity, acute superficial herpes simplex keratitis, systemic fungal infections, varicella, Cushing's syndrome.

## INTERACTIONS

#### Drug

Acetaminophen (chronic use or high dose, alone or in combination products): May increase risk of hepatotoxicity.

Alcohol, salicylates, NSAIDs: May increase GI side effects.

Amphotericin B, diuretics: May increase hypokalemia.

Barbiturates, rifampin, rifabutin: May result in decreased glucocorticoid activity. Digoxin: May increase the risk of digoxin toxicity caused by hypokalemia. Insulin, oral hypoglycemics: May decrease the effects of these drugs.

Ketoconazole, macrolide antibiotics (erythromycin, clarithromycin): May result in

increased glucocorticoid activity. Live-virus vaccines: May decrease the patient's antibody response to vaccine, increase vaccine side effects, and potentiate virus replication.

#### Herbal

None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose and serum lipid, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

May decrease response to antigenic skin tests.

## SIDE EFFECTS

#### Frequent

Insomnia, heartburn, nervousness, abdominal distention, increased sweating, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea or constipation.

#### Occasional

Headache, edema, change in skin color, frequent urination.

#### Rare

Tachycardia, allergic reaction (such as rash and hives), psychological changes, hallucinations, depression. Ophthalmic: Stinging or burning, posterior subcapsular cataracts.

#### SERIOUS REACTIONS

• Long-term therapy may cause hypocalcemia, hypokalemia, muscle wasting (especially in the arms and legs), osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, and congestive heart failure (CHF).

 Hypothalamic-pituitary adrenal (HPA) axis suppression, immunosupression, Cushing's syndrome.

• Prolonged therapy in children may retard bone growth.

 Abruptly withdrawing the drug after long-term therapy may cause anorexia, nausea, fever, headache, severe or sudden joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

• Suddenly discontinuing prednisolone may be fatal.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cirrhosis, CHF, diabetes mellitus, hypertension, hypothyroidism, myasthenia gravis, ocular herpes simplex, osteoporosis, peptic ulcer disease, thromboembolic disorders, and ulcerative colitis. Monitor the growth and development of children receiving long-term steroid therapy. Avoid alcohol and limit caffeine intake during therapy.

May cause changes in blood glucose levels; levels should be monitored closely during therapy.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. The mouth should be assessed daily for signs and symptoms of candidal infection, such as white patches and painful mucous membranes and tongue. Blood glucose level, intake and output, BP, serum electrolyte levels, pattern of daily bowel activity, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms, as normal infection symptoms may be masked.

#### Storage

Store ophthalmic upright. Store all products at room temperature; do not freeze. Protect ODT form from moisture.

#### Administration

Shake ophthalmic preparation well before using. Instill drops into conjunctival sac, as prescribed. Avoid touching the applicator tip to any surface to avoid contamination. Do not abruptly discontinue the drug without physician approval.

Oral medication doses should be taken with a light meal or milk. For oral solution, confirm correct product selection against dose ordered due to various concentrations available. For ODT form, keep in original package until time of use; remove with dry hands. Let dissolve on tongue, with or without water.

## **Prednisone**

pred'ni-sone ★ Prednisone Intensol, Deltasone, Sterapred Winpred Do not confuse prednisone with prednisolone or Primidone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in first trimester)

*Classification:* Hormones/ hormone modifiers, adrenal agents, corticosteroids, anti-inflammatory

## **MECHANISM OF ACTION**

An adrenocortical steroid that inhibits accumulation of inflammatory cells at inflammation sites, phagocytosis, lysosomal enzyme release and synthesis, and release of mediators of inflammation. *Therapeutic Effect:* Prevents or suppresses cell-mediated immune reactions. Decreases or prevents tissue response to inflammatory process.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 70%-90%. Widely distributed. Metabolized in the liver and converted to prednisolone. Conversion to prednisolone impaired in severe liver disease. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 3.4-3.8 h.

## AVAILABILITY

Oral Concentrate (Prednisone Intensol): 5 mg/mL. Oral Solution: 5 mg/5 mL. Tablets: 1 mg, 2.5 mg, 5 mg, 10 mg, 20 mg, 50 mg.

## INDICATIONS AND DOSAGES

Substitution therapy in deficiency states: acute or chronic adrenal insufficiency, congenital adrenal hyperplasia, and adrenal insufficiency secondary to pituitary insufficiency; nonendocrine disorders: arthritis; rheumatic carditis; allergic, collagen, intestinal tract, liver, ocular, renal, skin diseases; bronchial asthma; cerebral edema; malignancies PO

Adults, Elderly. 5-60 mg/day in divided doses. Children. 0.05-2 mg/kg/day in 1-4 divided doses.

 Immunosuppression or anti-inflammation

PO

Adults, Elderly. 5-60 mg/day divided into 1-4 doses.

Prednisone (Generic Name)

## CONTRAINDICATIONS

Hypersensitivity, acute superficial herpes simplex keratitis, systemic fungal infections, varicella.

## INTERACTIONS

#### Drug

Acetaminophen (chronic longterm or high-dose, alone or in combination products): May increase risk of hepatotoxicity. Alcohol, salicylates, NSAIDs: May cause increased GI side effects. Amphotericin B diuretics: May increase hypokalemia.

Barbiturates, rifampin, rifabutin: May decrease glucocorticoid activity. Digoxin: May increase the risk of digoxin toxicity caused by hypokalemia.

**Insulin, oral hypoglycemics:** May decrease the effects of these drugs.

Ketoconazole, macrolide antibiotics (erythromycin,

**clarithromycin):** May increase glucocorticoid activity.

**Live-virus vaccines:** May decrease the patient's antibody response to vaccine, increase vaccine side effects, and potentiate virus replication.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose and serum lipid, amylase, and sodium levels. May decrease serum calcium, potassium, and thyroxine levels.

May decrease response to antigenic skin tests.

## SIDE EFFECTS

#### Frequent

Insomnia, heartburn, nervousness, abdominal distention, increased sweating, acne, mood swings, increased appetite, facial flushing, delayed wound healing, increased susceptibility to infection, diarrhea or constipation; pain at injection site.

#### Occasional

Headache, edema, change in skin color, frequent urination.

#### Rare

Tachycardia, allergic reaction (including rash and hives), psychological changes, hallucinations, depression.

## SERIOUS REACTIONS

• Long-term therapy may cause muscle wasting in the arms and legs, osteoporosis, spontaneous fractures, amenorrhea, cataracts, glaucoma, peptic ulcer disease, and CHF.

 Hypothalamic-pituitary-adrenal (HPA) axis suppression, immunosupression, Cushing's syndrome.

• Prolonged therapy in children may retard bone growth.

 Abruptly withdrawing the drug following long-term therapy may cause anorexia, nausea, fever, headache, sudden or severe joint pain, rebound inflammation, fatigue, weakness, lethargy, dizziness, and orthostatic hypotension.

• Suddenly discontinuing prednisone may be fatal.

## **PRECAUTIONS & CONSIDERATIONS**

Prednisone therapy is contraindicated in cases of acute superficial herpes simplex keratitis, systemic fungal infections, varicella. Caution is warranted in patients with CHF, cirrhosis, diabetes mellitus, glaucoma, hypertension, hyperthyroidism, myasthenia gravis, ocular herpes simplex, osteoporosis, renal disease, and esophagitis. Prednisone crosses the placenta and is distributed in breast milk. Prolonged prednisone use

in the first trimester of pregnancy causes cleft palate in the neonate. Prolonged treatment or high dosages may decrease the cortisol secretion and short-term growth rate in children. Elderly patients may be more susceptible to developing hypertension or osteoporosis. Never give prednisone with live-virus vaccines, such as smallpox vaccine; avoid exposure to chickenpox or measles. A dentist or other physician should be informed of prednisone therapy if taken within the past 12 mo. May cause changes in blood glucose levels and levels should be monitored closely during therapy.

Mood swings, ranging from euphoria to depression, may occur. Notify the physician of fever, muscle aches, sore throat, and sudden weight gain or swelling. Initially, tuberculosis skin test, radiographs, and ECG should be checked. Blood glucose level, intake and output, BP, serum electrolyte levels, height, and weight should be monitored before and during therapy. Be alert to signs and symptoms of infection caused by reduced immune response, including fever, sore throat, and vague symptoms. The mouth should be assessed daily for signs and symptoms of candidal infection, such as white patches and painful mucous membranes and tongue.

#### Storage

Store at room temperature. Do not freeze oral solutions.

#### Administration

Take prednisone without regard to meals; give with food if GI upset occurs. Take single doses before 9 AM; give multiple doses at evenly spaced intervals. Do not abruptly discontinue prednisone without physician approval. Expect to taper therapy prior to discontinuation after more than a week of use.

## Pregabalin

pre-gab'a-lyn ★ ▲ Lyrica Do not confuse Lyrica with Cymbalta or pregabalin with gabapentin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C Controlled Substance Schedule: V

**Classification:** Neurologic agents, anticonvulsant

#### **MECHANISM OF ACTION**

Exact mechanism of pregabalin's antinociceptive and antiseizure action is unknown. Effects may be related to high-affinity binding to  $\alpha_2$ -delta site, an auxiliary subunit of voltage-gated calcium channels in CNS tissue. *Therapeutic Effect:* Alleviation of fibromyalgia, postherpetic neuralgia, and partial-onset seizure symptoms.

#### PHARMACOLOGY

Well absorbed after oral administration; bioavailability is more than 90%. Steady state achieved within 24-48 h. Distributed across the blood-brain barrier; negligible metabolism. Largely eliminated through renal excretion, 90% unchanged. *Half-life:* 6 h. In renal impairment, clearance is proportional to CrC1.

#### AVAILABILITY

*Capsules:* 25 mg, 50 mg, 75 mg, 100 mg, 150 mg, 200 mg, 225 mg, 300 mg.

#### INDICATIONS AND DOSAGES

 Neuropathic pain associated with diabetic peripheral neuropathy PO

Pregabalin (Generic Name), Lyrica (Brand Name)

*Adults, Elderly.* Initially, 50 mg 3 times/day increasing to 100 mg 3 times/day within 1 wk based on efficacy and tolerability. Do not exceed 300 mg/day.

#### Partial-onset seizures PO

Adults, Elderly. Initially, 75 mg 2 times/day or 50 mg 3 times/day increased to a maximum dose of 300 mg 2 times/day or 200 mg 3 times/day.

## Postherpetic neuralgia PO

Adults, Elderly. Initially, 75 mg 2 times/day or 50 mg 3 times/day, increasing to 300 mg/day within 1 wk based on efficacy and tolerability. Dosage may be increased to 300 mg 2 times/day or 200 mg 3 times/day not to exceed 600 mg/day.

#### Fibromyalgia PO

Adults, Elderly. Initially, 75 mg 2 times/day increasing to 150 mg 2 times/day within 1 wk based on efficacy and tolerability. May further increase dose to 225 mg 2 times/day not to exceed 450 mg/day.

## Dosage adjustment for renal function impairment adults

CrCl 30-60 mL/min: 75-300 mg/day PO given in 2 or 3 divided doses. CrCl 15-30 mL/min: 25-150 mg/day PO given in 1 or 2 divided doses. CrCl < 15 mL/min: 25-75 mg PO once daily.

## Treatment for patients on hemodialysis

#### PO

Adults, Elderly. Maintenance based on CrCl as recommended plus supplemental posthemodialysis dose administered after each 4 h of hemodialysis as follows: If maintenance dose is 25 mg/day,

postdialysis dose is 25-50 mg.

If maintenance dose is 25-50 mg/day, postdialysis dose is 50-75 mg. If maintenance dose is 50-75 mg/day, postdialysis dose is 75-100 mg. If maintenance dose is 75 mg/day, postdialysis dose is 100-150 mg.

## **OFF-LABEL USES**

Treatment of generalized anxiety disorder.

## CONTRAINDICATIONS

Alcohol, hypersensitivity to pregabalin or any of its components.

## INTERACTIONS

#### Drug

**ACE inhibitors:** May increase risk of angioedema.

- All CNS depressants, alcohol, lorazepam, oxycodone, and other
- **opiates:** May have additive cognitive and gross motor function effects; may increase CNS depressant effects.

**Immunosuppressants:** May increase risk of infection developing.

**Thiazolidinedione antidiabetic agents:** May cause peripheral edema; use caution in concurrent use.

Herbal

None known.

Food

Alcohol: Increases sedative effects.

## **DIAGNOSTIC TEST EFFECTS**

May increase creatinine kinase levels; significant decreases in platelet counts (20% below baseline or  $< 150 \times 10^3$ /mcL) have been documented in about 2%-3% of patients. PR interval of the ECG may be prolonged by about 3-6 msec.

## SIDE EFFECTS

## Frequent

Dizziness, somnolence, ataxia, headache, tremor, blurred vision, peripheral edema, weight gain.

#### Occasional

Abnormal gait, fatigue, asthenia, confusion, euphoria, increased appetite, speech disorder, vertigo, myoclonus, anxiety, depression, disorientation, lethargy, nervousness, dry mouth, constipation, increased appetite, GI effects.

## Other

Reductions in visual acuity, visual field changes, and funduscopic changes are sometimes noted. Rare reports of breast enlargement.

#### SERIOUS REACTIONS

• Unexplained muscle pain, tenderness, weakness, especially if accompanied by general body discomfort or fever.

• A severe hypersensitivity reaction, including anaphylaxis, occurs rarely.

• Unusual changes in mood or behaviors, or suicidal ideation.

Thrombocytopenia.

• Visual changes should be promptly evaluated.

#### **PRECAUTIONS & CONSIDERATIONS**

May increase the risk of suicidal thoughts or behavior in patients taking this drug for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, and any unusual changes in mood or behavior.

It is unknown whether pregabalin crosses the placenta or is excreted in breast milk; caution in pregnancy and lactation is warranted. Many anticonvulsants can cause fetal harm. Males should also use adequate contraception, as malemediated teratogenicity may occur. Safety and efficacy are not established in children. Because of possible renal function impairment, dosage adjustment may be needed in the elderly. Caution warranted in patients with New York Heart Association class III or IV cardiac status.

Drug may cause drowsiness and dizziness; use caution when driving or performing other activities that require mental or physical acuity.

Symptoms of unexplained muscle pain, tenderness, or weakness, especially if accompanied by general body discomfort or fever, should be reported immediately.

#### Storage

Store at room temperature.

## Administration

Drug may be taken without regard to food; however, if GI effects occur, it can be taken with a meal. Advise the patient to take medication as directed; if medication needs to be discontinued, it should be tapered over a 1-wk period unless safety concerns (hypersensitivity, rash) dictate a more rapid withdrawal. Patients taking antiepileptic medications should continue to take these medications unless otherwise advised by their healthcare practitioner.

#### **Primaguine**

prim'a-kween
Do not confuse with primidone.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiprotozoals

#### **MECHANISM OF ACTION**

An antimalarial and antirheumatic that eliminates tissue exoerythrocytic forms of *Plasmodium falciparum*. Disrupts mitochondria and binds to DNA. *Therapeutic Effect*: Inhibits parasite growth.

Primaquine (Generic Name)

## PHARMACOKINETICS

Well absorbed. Metabolized in the liver to the active metabolite, carboxyprimaquine. Excreted in the urine in small amounts as unchanged drug. *Half-life*: 4-6 h.

## AVAILABILITY

*Tablets:* 26.3 mg (primaquine phosphate).

## INDICATIONS AND DOSAGES

## Treatment of malaria (caused by Plasmodium vivax)

PO

Adults, Elderly. 15-mg base daily for 14 days.

*Children*. 0.5-0.6 mg base/kg/day once daily for 14 days.

• Malaria prophylaxis (off-label use) Adults, Elderly. 30-mg base daily. Begin 1 day before departure and continue for 7 days after leaving malarious area.

## **OFF-LABEL USES**

With clindamycin in treatment of *Pneumocystis carinii* in AIDS.

## CONTRAINDICATIONS

Concomitant medications that cause bone marrow suppression, rheumatoid arthritis, lupus erythematosus, glucose-6-phosphate dehydrogenase (G6PD) deficiency, pregnancy, hypersensitivity to primaquine or any of its components.

Use with quinacrine or recent use of quinacrine.

## INTERACTIONS

#### Drug

**Aurothioglucose:** May increase risk of blood dyscrasias.

Levomethadyl: May increase risk of cardiotoxicity (QT prolongation, torsades de pointes, cardiac arrest). **Quinacrine:** Potentiates toxicities of primaquine; contraindicated for use together.

## Herbal

None known.

**Grapefruit juice:** May increase primaquine exposure; avoid if possible.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent

Abdominal pain, nausea, vomiting, pruritus, dyspepsia.

#### Rare

Leukopenia, hemolytic anemia, methemoglobinemia.

## SERIOUS REACTIONS

• Leukopenia, hemolytic anemia, methemoglobinemia occur rarely.

 Overdosage includes symptoms of abdominal cramps, vomiting, burning epigastric distress, central nervous system and cardiovascular disturbances, cyanosis, methemoglobinemia, moderate leukocytosis or leukopenia, and anemia.

- Acute hemolysis occurs, but patients recover completely if the dosage is discontinued.
- · Cardiac arrhythmias.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with erythrocytic G6PD deficiency or nicotinamide adenine dinucleotide (NADH) methemoglobin reductase deficiency, a family or personal history of favism, and a previous idiosyncrasy to primaquine phosphate (as manifested by hemolytic anemia, methemoglobinemia, or leukopenia). Primaquine crosses the placenta, but it is unknown whether it is distributed in breast milk. In general, primaquine use is avoided during pregnancy. Children are especially susceptible to primaquine's fatal effects.

Signs suggestive of hemolytic anemia such as darkening of urine, marked fall of hemoglobin or erythrocytic count, should be reported and primaquine should be discontinued promptly.

#### Storage

Store at room temperature. Administration

26.3 mg primaquine = 15 mg base. The adult dose of 1 tablet (15 mg base) daily for 14 days should not be exceeded. Take dose with food.

### Primidone

pri'mi-done Mysoline Do not confuse primidone with prednisone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Anticonvulsant, barbiturate derivative

## **MECHANISM OF ACTION**

A barbiturate that decreases motor activity from electrical and chemical stimulation and stabilizes the seizure threshold against hyperexcitability. *Therapeutic Effect:* Reduces seizure activity.

#### PHARMACOKINETICS

Extensive distribution after oral administration. Metabolism of

primidone in the liver produces phenobarbital (15%-25%) and PEMA. Phenobarbital and primidone induce hepatic enzymes (e.g., UGT, CYP2C, CYP3A, and CYP1A2). Excretion is primarily renal, roughly 40%-60% as primidone, with smaller amounts as PEMA and phenobarbital. Phenobarbital is inactivated by the liver before renal excretion of the metabolites. *Half-life:* 10-12 h (primidone), 53-118 h (phenobarbital).

#### AVAILABILITY

Tablets: 50 mg, 250 mg.

## INDICATIONS AND DOSAGES

 Seizure control (general tonicclonic [grand mal], complex partial psychomotor seizures)

Adults, Elderly, Children 8 yr and older. 125-250 mg/day at bedtime. May increase by 125-250 mg/day every 3-7 days. Maximum: 2 g/day. Children younger than 8 yr. Initially, 50-125 mg/day at bedtime. May increase by 50-125 mg/day every 3-7 days. Usual dose: 10-25 mg/kg/day in divided doses. Maximum: 1 g/day. Neonates. 12-20 mg/kg/day in divided doses.

#### **OFF-LABEL USES**

Treatment of essential tremor.

### CONTRAINDICATIONS

Porphyria, hypersensitivity to primidone or phenobarbital.

#### INTERACTIONS Drug

NOTE: Primidone and metabolites induce the metabolism of many important drugs.

Acetaminophen, corticosteroids: May decrease effects of these drugs.

Primidone (Generic Name)

Alcohol, other central nervous system (CNS) depressants: May increase the effects of primidone.

Antiretroviral protease

**inhibitors:** May decrease PI blood concentrations, leading to loss of antiviral effect against HIV.

**Carbamazepine:** May increase the metabolism of carbamazepine causing lower blood concentration.

**Digoxin, glucocorticoids, metronidazole, quinidine, tricyclic antidepressants:** May decrease the effects of these drugs.

Halothane, halogenated hydrocarbon inhalation anesthetics, haloperidol, phenothiazines: May cause increased metabolism and hepatotoxicity.

Hormonal contraceptives: May decrease blood concentrations, leading to loss of contraceptive efficacy. Higher-dose regimens or alternative or additional methods may be needed.

**Phenobarbital:** May raise serum levels and risk of toxicity.

**Phenytoin:** Variable effects on serum concentrations; monitor closely.

**Theophylline:** May reduce theophylline concentrations.

**Valproic acid:** Increases the blood concentration and risk of toxicity of primidone.

**Warfarin:** May reduce anticoagulant effect. Monitor INR.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum bilirubin level. Therapeutic serum level is 5-12 mcg/ mL; toxic serum level is > 12 mcg/mL.

#### SIDE EFFECTS

**Frequent** Ataxia, dizziness.

#### Occasional

Anorexia, drowsiness, mental changes, nausea, vomiting, paradoxical excitement. Rare

Rash.

#### SERIOUS REACTIONS

 Abrupt withdrawal after prolonged therapy may produce effects ranging from increased dreaming, nightmares, insomnia, tremor, diaphoresis, and vomiting to hallucinations, delirium, seizures, and status epilepticus.

• Skin eruptions or mouth sores may be a sign of a hypersensitivity reaction.

• Blood dyscrasias, hepatic disease, or hypocalcemia occur rarely.

• Overdose produces cold or clammy skin, hypothermia, and severe CNS depression, followed by high fever and coma.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic and renal impairment. Antiepileptic drugs (AEDs) may increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, and any unusual changes in mood or behavior. Primidone and metabolites readily cross the placenta and are distributed in breast milk. May cause fetal harm during pregnancy. Produces respiratory depression in neonates during labor, and may increase the risk of maternal bleeding and neonatal hemorrhage during delivery. Neonates may also experience withdrawal symptoms. Primidone use may cause paradoxical excitement in children. Elderly patients may exhibit confusion, excitement, and mental depression.

Dizziness may occur, so change positions slowly—from recumbent to sitting position before standing. Alcohol and tasks requiring mental alertness or motor skills should be avoided. CBC, neurologic status (including duration, frequency, and severity of seizures), and serum concentrations of primidone should be assessed before and during treatment.

#### Storage

Store at room temperature in a well-closed container protected from light.

#### Administration

Administer primidone at the same time each day. Do not abruptly discontinue primidone after longterm use because this may precipitate seizures. Strict maintenance of drug therapy is essential for seizure control. May take with food. For patients with difficulty swallowing, the tablets may be crushed and mixed with foods or fluids prior to administration.

## Probenecid

proe-ben'e-sid Benuryl Do not confuse probenecid with procainamide.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antigout agents, uricosurics

## **MECHANISM OF ACTION**

A uricosuric that competitively inhibits reabsorption of uric acid at the proximal convoluted tubule. Also inhibits renal tubular secretion of weak organic acids, such as penicillins. *Therapeutic Effect:* Promotes uric acid excretion, reduces serum uric acid level, and increases plasma levels of penicillins and cephalosporins.

#### AVAILABILITY

Tablets: 500 mg.

# INDICATIONS AND DOSAGES Gout

PO

Adults, Elderly. Initially, 250 mg twice a day for 1 wk; then 500 mg twice a day. May increase by 500 mg q4wk. Maximum: 2 g/day. Maintenance: Dosage that maintains normal uric acid level.

## As an adjunct to penicillin or cephalosporin therapy to prolong antibiotic plasma levels

Adults, Elderly. 2 g/day in divided doses.

*Children weighing* >50 kg. Receive adult dosage.

*Children aged 2-14 yr.* Initially, 25 mg/kg. Maintenance:

40 mg/kg/day in 4 divided doses.

#### Gonorrhea PO

*Adults, Elderly.* 1 g 30 min before procaine, penicillin G, ampicillin, amoxicillin, or cefoxitin.

## CONTRAINDICATIONS

Hypersensitivity to probenecid, children under 2 yr of age, known blood dyscrasias, uric acid kidney stones. Not recommended in severe renal impairment as efficacy is lost due to mechanism of action. Do not use probenecid until an acute gouty attack has subsided. Use of salicylates is contraindicated because they antagonize the uricosuric action of probenecid.

Probenecid (Generic Name)

## INTERACTIONS

#### Drug

Alcohol, salicylates and

**pyrazinamide:** May increase serum urate level, decrease uricosuric activity. Salicylates are contraindicated, no matter if low or high dose.

**Antineoplastics:** May increase the risk of uric acid nephropathy. May prolong the levels of cisplatin.

**Cephalosporins and penicillins:** Increased levels and prolongation of antibiotics used for therapeutic effect. Monitor for CNS reactions. **Heparin:** May increase and prolong the effects of heparin.

Ketorolac, other NSAIDs: May result in increased toxicity. Do not use ketorolac with probenecid due to bleeding risk if levels increase.

Methotrexate: Increases plasma concentrations of methotrexate and toxicity risk. Reduce dose of methotrexate and monitor serum levels.

**Sulfonamides:** Significant increase in total sulfonamide plasma levels and decreases the renal excretion of conjugated sulfonamides.

**Sulfonylureas:** Reduced clearance and increased antidiabetic effects; may require dose reduction.

Thiopental, ketamine: Prolongs anesthetic effects.

**Topiramate:** May alter topiramate concentrations and efficacy.

Zalcitabine: May increase antiviral concentrations and toxicity; may need reduced dose.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Falsely high readings for theophylline using the Schack

and Waxler technique on human plasma. Also, a reducing substance may appear in the urine and will disappear on discontinuation. Suspected glycosuria should be confirmed by using a test specific for glucose.

## SIDE EFFECTS

Frequent (6%-10%)

Headache, anorexia, nausea, vomiting.

Occasional (1%-5%)

Lower back or side pain, rash, hives, itching, dizziness, flushed face, frequent urge to urinate, gingivitis.

## SERIOUS REACTIONS

 Severe hypersensitivity reactions, including anaphylaxis, occur rarely and usually within a few hours after administration following previous use. If severe hypersensitivity reactions develop, discontinue the drug immediately and contact the physician.

• Pruritic maculopapular rash, possibly accompanied by malaise, fever, chills, arthralgia, nausea, vomiting, leukopenia, and aplastic anemias, should be considered a toxic reaction.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hematuria, peptic ulcer disease, and renal colic. Avoid alcohol and large doses of aspirin or other salicylates. Limit intake of high purine foods, such as fish and organ meats.

High fluid intake (3000 mL/day) should be encouraged; intake and output should be monitored; output should be at least 2000 mL/day. CBC, serum uric acid level, and urine for cloudiness, odor, and unusual color should also be monitored. Signs and symptoms of a therapeutic response, including improved joint range of motion and reduced joint tenderness, redness, and swelling, should be evaluated.

#### Storage

Store at room temperature. Administration

! Do not start giving probenecid until acute gouty attack has subsided; continue drug if acute attack occurs during therapy.

Give probenecid orally with or immediately after meals or milk. Drink at least 6-8 eight-oz. glasses of fluid each day to prevent renal calculi. Some patients will receive alkalization of the urine concurrently (e.g., potassium citrate) to limit nephropathy. It may take more than 1 wk for the full therapeutic effect of the drug to be evident.

## Procainamide Hydrochloride

proe-kane'a-mide Procan SR **Do not confuse procainamide** with procaine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, Group IA

#### **MECHANISM OF ACTION**

Increases the effective refractory period of atria, bundle of His-Purkinje system and ventricles of the heart. *Therapeutic Effect:* Reduces conduction velocity in the atria and resolves ventricular arrhythmia.

## PHARMACOKINETICS

IV administration produces therapeutic level within minutes. Distributes widely throughout the body. Protein binding: 15%-20%. Undergoes acetylation in the liver to N-acetylprocainamide (NAPA), which is also cardioactive. Metabolic clearance is greater in patients who are rapid acetylators. Significant amounts of both unchanged procainamide and N-acetylprocainamide (NAPA) are eliminated renally by glomerular filtration and active tubular secretion. Removed by hemodialysis. *Half-life:* 3 h (increased in congestive heart failure, hepatic impairment, and renal dysfunction).

## AVAILABILITY

Injection Solution: 100 mg/mL, 500 mg/mL.

## INDICATIONS AND DOSAGES

#### Treat ventricular arrhythmias IV

Adults. 15-17 mg/kg at a rate or 20-30 mg/min load. Or 100 mg IV q5min by slow IV push until arrhythmia resolves, up to 1000 mg. Children. 3-6 mg/kg over 5 min. Do not exceed 100 mg as a single dose. May repeat q5-10min to a maximum dose of 15 mg/kg.

## CONTRAINDICATIONS

Complete heart block due to possible asystole, idiosyncratic hypersensitivity to procainamide or sulfites, lupus erythromatosus, torsades de pointes.

Contraindicated for use with many medications, including but not limited to, cisapride, dofetilide, dronedarone, pimozide, propafenone, saquinavir boosted with ritonavir, thioridazine, due to proarrhythmic effects.

#### INTERACTIONS

#### Drug Astemizole, cisapride, dofetilide, phenothiazines, type 5 photodiesterase inhibitors

## (e.g., sildenafil, vardenafil), terfenadine, ziprasidone, and other drugs that increase QT

interval: Many are contraindicated for concurrent use. May cause potent vasodilation, increased irregular heartbeat, and increased side effects.

**Cimetidine, ranitidine, trimethoprim:** Reduce tubular secretion of procainamide and NAPA.

**Diltiazem, verapamil:** Additive effects on heart conduction.

Macrolide antibiotics (erythromycin, clarithromycin, azithromycin), ketolide antibiotics (telithromycin): May increase side effects and risk of irregular

heartbeat. **Quinidine:** Additive effects on heart conduction; quinidine raises procainamide concentrations.

#### Succinvlcholine and

**neuromuscular blockers:** Potential for prolonged neuromuscular blockade.

#### Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

Therapeutic serum level is up to 10 mcg/mL; toxic serum level is > 12 mcg/mL. Monitoring of NAPA levels is indicated with impaired renal function. Do not exceed combined total concentrations of 25 mcg/mL (NAPA + PA). May cause positive antinuclear antibody (ANA) test. Elevated liver enzymes, alkaline phosphatase (ALT, SGOT), and bilirubin.

## IV INCOMPATIBILITIES

Include acyclovir, ceftizoxime, diazepam, hydralazine, imipenemcilastatin (Primaxin), lansoprazole (Prevacid), metronidazole (Flagyl), milrinone, phenytoin.

#### SIDE EFFECTS Frequent

Ataxia, dizziness. GI effects also common (anorexia, nausea, vomiting, abdominal pain, diarrhea, or bitter taste).

#### Occasional

Dizziness, giddiness, weakness, mental depression, psychosis with hallucinations.

#### Rare

Neutropenia, thrombocytopenia, hemolytic anemia.

## SERIOUS REACTIONS

 Neutropenia, thrombocytopenia, and hemolytic anemia may develop over time; usually reverses upon discontinuation of drug therapy.

• Skin eruptions may be a sign of a hypersensitivity reaction.

• Blood dyscrasias, hepatic disease, and hypocalcemia occur rarely.

• Particularly with IV administration, proarrhythmia, QT prolongation, AV block, and torsades de pointes. Watch for excessive hypotension.

• Lupus-like syndrome occurs in up to 50% of patients on long-term treatment.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with myasthenia gravis, bundlebranch block, congestive heart failure (CHF), liver and renal impairment, marked AV-conduction disturbances, severe digoxin toxicity, and supraventricular tachyarrhythmias. Be aware that procainamide crosses the placenta and that procainamide is distributed in breast milk. No age-related precautions have been noted in children. Elderly patients are more susceptible to the drug's hypotensive

#### 1332 Procarbazine Hydrochloride

effect. In elderly patients, agerelated renal impairment may require dosage adjustment.

GI upset, headache, dizziness, and joint pain may occur. Notify the physician if fever, joint pain or stiffness, and signs of upper respiratory infection occur. ECG for cardiac changes, particularly widening of QRS and prolongation of PR and QT intervals, should be monitored. Pulse, pattern of daily bowel activity and stool consistency, skin for hypertensive reaction, intake and output, serum electrolyte levels, and BP should be assessed during therapy.

Driving, operating machinery, and engaging in exercises requiring mental acuity or alertness should be avoided until the patient knows how he/she reacts to the drug.

Most hematologic events occur during the first 12 wks of therapy; monitor CBC at weekly intervals for the first 3 mo of therapy, and periodically thereafter. Report any signs of infection (such as fever, chills, sore throat, or stomatitis), bruising, or bleeding. Blood counts usually return to normal within 1 mo of discontinuation.

#### Storage

Store unopened vials at room temperature. When diluted with D5W, solution is stable for up to 24 h at room temperature or for 7 days if refrigerated. Solutions darker than light amber in color should be discarded. Administration:

! Know that procainamide dosage and the interval of administration are individualized based on age, clinical response, renal function, and

underlying myocardial disease.

May give procainamide by IM injection, IV push, or IV infusion. IM injection may be painful and is rarely used. For IV push, dilute with 5-10 mL D5W. For IV push, with patient in the supine position, administer at a rate not exceeding 25-50 mg/min. For initial loading IV infusion, add 1 g to 50 mL D5W to provide a concentration of 20 mg/mL. For IV infusion, add 1 g to 250-500 mL D5W to provide concentration of 2-4 mg/ mL. Know that the maximum concentration is 4 g/250 mL. For initial loading infusion, infuse 1 mL/min for up to 25-30 min. For maintenance IV infusion, infuse at 2-6 mg/min. If a fall in BP exceeds 15 mm Hg, discontinue drug and contact physician. Continuously monitor BP and ECG during IV administration.

#### Procarbazine Hydrochloride

pro-kar'ba-zeen Matulane Do not confuse procarbazine with dacarbazine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, alkylating agents

### **MECHANISM OF ACTION**

A methylhydrazine derivative that inhibits DNA, RNA, and protein synthesis. May also directly damage DNA. Cell cycle–phase specific for S phase of cell division. Has weak MAO-inhibiting activity. *Therapeutic Effect:* Causes cell death.

## PHARMACOKINETICS

PO: Peak levels 1 h; concentrates in liver, kidney, skin; metabolized in liver, excreted in urine.

Procarbazine Hydrochloride (Generic Name), Matulane (Brand Name)

## AVAILABILITY

Capsules: 50 mg.

## INDICATIONS AND DOSAGES

#### Advanced Hodgkin's disease PO

*Adults, Elderly.* Initially, 2-4 mg/ kg/day as a single dose or in divided doses for 1 wk, then 4-6 mg/kg/day. Continue until maximum response occurs, leukocyte count falls below 4000/mm<sup>3</sup>, or platelet count falls below 100,000/mm<sup>3</sup>. Maintenance: 1-2 mg/kg/day. *Children.* 50-100 mg/m<sup>2</sup>/day for 10-14 days of a 28-day cycle. Maintenance: 50 mg/m<sup>2</sup>/day.

## **OFF-LABEL USES**

Treatment of lung carcinoma, malignant melanoma, multiple myeloma, non-Hodgkin's lymphoma, polycythemia vera, primary brain tumors.

## CONTRAINDICATIONS

Known hypersensitivity to the drug. Myelosuppression, breastfeeding, MAOI therapy.

## INTERACTIONS

#### Drug

**Alcohol:** May cause a disulfiramlike reaction.

Antihistamines, barbiturates, narcotics: May increase CNS depressive effects.

**Bone marrow depressants:** May increase myelosuppression.

Insulin, oral antidiabetics: May increase the effects of these drugs.

Linezolid, other MAOIs, sympathomimetic drugs, tricyclic antidepressants: Should be avoided due to the MAO-inhibiting activity of procarbazine; could result in significant hypertension, or tyramine, pressor, or serotonin-type reactions.

#### Herbal

**Tobacco:** Use associated with a risk of secondary lung cancer. Stop smoking.

Food

Foods with high tyramine content (e.g., wine, yogurt, ripe cheese, and bananas), as well as excessive caffeine: Avoid and limit due to potential MAOI activity of procarbazine.

## **DIAGNOSTIC TEST EFFECTS**

Decreased WBC, platelets, RBC indices.

#### SIDE EFFECTS Frequent

Severe nausea, vomiting, respiratory disorders (cough, effusion), myalgia, arthralgia, drowsiness, nervousness, insomnia, nightmares, diaphoresis, hallucinations, seizures.

#### Occasional

Hoarseness, tachycardia, nystagmus, retinal hemorrhage, photophobia, photosensitivity, urinary frequency, nocturia, hypotension, diarrhea, stomatitis, paresthesia, unsteadiness, confusion, decreased reflexes, foot drop. Azoospermia and infertility. **Rare** 

Hypersensitivity reaction (dermatitis, pruritus, rash, urticaria), hyperpigmentation, alopecia.

## SERIOUS REACTIONS

• Procarbazine's major toxic effects are myelosuppression manifested as hematologic toxicity (mainly leukopenia, thrombocytopenia, and anemia) and hepatotoxicity manifested as jaundice and ascites.

• Infections may occur secondary to leukopenia.

• Bleeding (e.g., purpura, petechiae, epistaxis, hemoptysis).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic and renal impairment. Alcohol should be avoided. Procarbazine is a known teratogen and carcinogen and should not be used during pregnancy or breastfeeding.

Caution is warranted if general anesthesia or sedation is required because of the increased risk for hypotensive episode.

Notify the physician if bleeding, easy bruising, fever, or sore throat occurs. CBC with differential, bone marrow test, urinalysis, BUN level, and LFTs should be monitored periodically. Good oral hygiene should be practiced. Procarbazine should be discontinued if stomatitis, diarrhea, paresthesia, neuropathy, confusion, or a hypersensitivity reaction occurs. **Storage** 

Store at room temperature.

#### Administration

Administer procarbazine with food or fluids if the patient has severe GI side effects or difficulty swallowing.

## **Prochlorperazine**

proe-klor-per'a-zeen Compazine, Compro Nu-Prochlor Do not confuse prochlorperazine with chlorpromazine, or Compazine with Copaxone.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiemetics, phenothiazines

## **MECHANISM OF ACTION**

A phenothiazine that acts centrally to inhibit or block dopamine

receptors in the chemoreceptor trigger zone and peripherally to block the vagus nerve in the GI tract. *Therapeutic Effect:* Relieves nausea and vomiting and improves psychotic conditions.

## PHARMACOKINETICS

Route	Onset <sup>*</sup> (min)	Peak	Duration (h)
Tablets, oral solution	30-40	NA	3-4
Capsules (extended release)	30-40	NA	10-12
Rectal	60	NA	3-4

\*As an antiemetic.

Variably absorbed after PO administration. Widely distributed. Metabolized in the liver and GI mucosa. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 23 h.

## AVAILABILITY

Tablets: 5 mg, 10 mg. Suppositories (Compro): 25 mg. Injection: 5 mg/mL.

# INDICATIONS AND DOSAGES Nausea and vomiting

PO Adults, Elderly. 5-10 mg 3-4 times a day. Children weighing 18-39 kg. 2.5 mg 3 times/day or 5 mg 2 times/day. Children weighing 14-17 kg. 2.5 mg 2-3 times/day. Children weighing 9-13 kg. 2.5 mg 1-2 times/day. IM or IV Adults, Elderly. 5-10 mg. May repeat q3-4h. Children. 0.132 mg/kg/dose q6-8h. RECTAL Adults, Elderly. 25 mg twice a day.

Prochlorperazine (Generic Name)

## Psychosis

#### PO

*Adults, Elderly.* 5-10 mg 3-4 times a day. Maximum: 150 mg/day. *Children.* 2.5 mg 2-3 times a day. Maximum: 25 mg for children aged 6-12 yr; 20 mg for children aged 2-5 yr.

## CONTRAINDICATIONS

Hypersensitivity to phenothiazines. Do not use in comatose states or in the presence of large amounts of CNS depressants (alcohol, barbiturates, narcotics, etc.). Do not use in children < 2 yr or < 9 kg, or during pediatric surgery.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants, barbiturate anesthetics, opioid analgesics: May increase CNS and respiratory depression and the hypotensive effects of prochlorperazine.

Anticholinergics: May increase anticholinergic effects.

Antihypertensives: May increase hypotension.

Antithyroid agents: May increase the risk of agranulocytosis.

**Epinephrine:** Possible risk of hypotension, tachycardia.

Levodopa: May decrease the effects of levodopa.

**Lithium:** May decrease the absorption of prochlorperazine and produce adverse neurologic effects.

**MAOIs, tricyclic antidepressants:** May increase the anticholinergic and sedative effects of prochlorperazine.

Phenothiazines and related drugs (haloperidol, droperidol),

**metoclopramide:** May increase extrapyramidal symptoms.

Tetracyclines: Possible additive photosensitization.

## Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May elevate prolactin levels. May cause false-positive phenylketonuria (PKU) test results.

## IV INCOMPATIBILITIES

Manufacturer recommends that drug not be mixed with other agents in the syringe. For IV infusion, the drug is incompatible with many drugs; refer to specialty references to check compatibilities.

#### SIDE EFFECTS Frequent

Somnolence, hypotension, dizziness, fainting (commonly occurring after first dose, occasionally after subsequent doses, and rarely with oral form).

#### Occasional

Dry mouth, blurred vision, lethargy, constipation, diarrhea, myalgia, nasal congestion, peripheral edema, urine retention.

## SERIOUS REACTIONS

• Extrapyramidal symptoms appear to be dose-related and are divided into three categories: akathisia (marked by inability to sit still, tapping of feet), parkinsonian symptoms (including mask-like face, tremors, shuffling gait, hypersalivation), and acute dystonias (such as torticollis, opisthotonos, and oculogyric crisis). A dystonic reaction may also produce diaphoresis or pallor.

• Tardive dyskinesia, manifested as tongue protrusion, puffing of the cheeks, and puckering of the mouth, is a rare reaction that may be irreversible.

• Abrupt withdrawal after long-term therapy may precipitate nausea,

vomiting, gastritis, dizziness, and tremors.

 Blood dyscrasias, particularly agranulocytosis and mild leukopenia, may occur.

• Prochlorperazine use may lower the seizure threshold.

QT prolongation, cardiac

arrhythmias, cardiac arrest are all rare.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with Parkinson's disease or seizures.

Prochlorperazine crosses the placenta and is distributed in breast milk. The safety and efficacy of this drug have not been established in children younger than 2 yr or weighing < 9 kg. A decreased prochlorperazine dosage is recommended for elderly patients, who are more susceptible to the drug's sedative, anticholinergic, extrapyramidal, and hypotensive effects. Elderly patients with dementia-related psychosis have a significantly higher incidence of cerebrovascular adverse events (e.g., stroke, TIA) and increased risk of mortality. Alcohol, barbiturates, and tasks that require mental alertness or motor skills should be avoided until the drug's effects are known. Orthostatic hypotension may occur; avoid rapid postural changes.

BP, CBC for blood dyscrasias, and hydration status should be monitored. Be alert for extrapyramidal symptoms such as rapid tongue movement.

Signs of tardive dyskinesia or akathisia need to be immediately reported to the health care provider. Storage

Store prochlorperazine at room temperature and protect from light. Solution should be clear or slightly yellow. Store tablets at room temperature. Store suppositories in a cool place at room temperature.

#### Administration

Take oral prochlorperazine without regard to food. Avoid skin contact with prochlorperazine oral solution because it may cause contact dermatitis.

For IV use, keep the person recumbent—head low and legs raised—for 30-60 min after drug administration to minimize the drug's hypotensive effect. May give by IV push slowly over 5-10 min. May give by IV infusion over 30 min after proper dilution in 0.9% NaCl injection. IM injection should be made deeply into the dorsogluteal muscle.

For rectal use, moisten the suppository with cold water before inserting it well into the rectum.

#### Progesterone

proe-jess'ter-one ★ Crinone, Endometrin, First-Progesterone VGS, Prochieve, Prometrium ▲ Crinone, Evometrin, Prometrium

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Hormones, progestins, fertility agents

## **MECHANISM OF ACTION**

A natural steroid hormone that promotes mammary gland development and relaxes uterine smooth muscle. *Therapeutic Effect:* Decreases abnormal uterine bleeding; transforms endometrium from proliferative to secretory in an estrogen-primed endometrium, supports early pregnancy during reproductive assistance.

### PHARMACOKINETICS

IM, rectal, vaginal: Duration 24 h; excreted in urine, feces; metabolized in liver.

## AVAILABILITY

Capsules (Prometrium): 100 mg, 200 mg. Injection in Oil: 50 mg/mL. Vaginal Gel (Crinone, Prochieve): 4% (45 mg), 8% (90 mg). Vaginal Insert (Endometrin): 100 mg. Vaginal Suppository (First-Progesterone, Compounded): 25 mg, 100 mg.

## INDICATIONS AND DOSAGES

## Amenorrhea

#### PO

*Adults.* 400 mg daily in evening for 10 days.

IM

*Adults.* 5-10 mg for 6-8 days. Withdrawal bleeding expected in 48-72 h if ovarian activity produced proliferative endometrium.

VAGINAL

*Adults*. Apply 45 mg (4% gel) every other day for 6 or fewer doses.

#### Abnormal uterine bleeding IM

*Adults.* 5-10 mg for 6 days. When estrogen given concomitantly, begin progesterone after 2 wks of estrogen therapy; discontinue when menstrual flow begins.

## Prevention of endometrial hyperplasia

PO Adults. 200 mg in evening for 12 days per 28-day cycle in combination with daily conjugated

## estrogen.Infertility

VAGINAL

*Adults.* 90 mg (8% gel) once a day (twice a day in women with partial or complete ovarian failure).

## **OFF-LABEL USES**

Premenstrual syndrome, preterm delivery prophylaxis.

## CONTRAINDICATIONS

Breast cancer; history of active cerebral apoplexy; thromboembolic disorders or thrombophlebitis; missed abortion; severe hepatic dysfunction; undiagnosed vaginal bleeding; use as a pregnancy test. Assess for allergy to peanuts and sesame seed as some formulations (Prometrium, Injection in Oil) include these oils and should be avoided in hypersensitive individuals.

## INTERACTIONS

#### Drug

Bromocriptine: May interfere with the effects of bromocriptine. Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum LDL and serum alkaline phosphatase levels. May decrease glucose tolerance and HDL concentrations. May cause abnormal serum thyroid, metapyrone, hepatic, and endocrine function test results.

#### SIDE EFFECTS Frequent

Breakthrough bleeding or spotting at beginning of therapy, amenorrhea, change in menstrual flow, breast tenderness.

Gel: Drowsiness.

#### Occasional

Edema, weight gain or loss, rash, pruritus, photosensitivity, skin pigmentation, acne.

#### Rare

Pain or swelling at injection site, acne, depression, alopecia, hirsutism.

## SERIOUS REACTIONS

• Thrombophlebitis, cerebrovascular disorders, retinal

thrombosis, and pulmonary embolism occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with conditions aggravated by fluid retention, diabetes mellitus, and history of depression. Use with caution in those with a history of hormonally responsive cancers. Progesterone use should be avoided during pregnancy. Progesterone is distributed in breast milk. Safety and efficacy of progesterone have not been established in children. No agerelated precautions have been noted in elderly patients. Women using progesterone vaginal gel form should avoid performing tasks that require mental alertness or motor skills until response to the drug has been established. Use sunscreen and wear protective clothing until tolerance to sunlight and ultraviolet light has been determined. Avoid smoking because of the increased risk of blood clot formation and myocardial infarction (MI). Some patients experience drowsiness; do not drive or perform other tasks requiring mental alertness.

Notify the physician of chest pain, migraine headache, peripheral paresthesia, sudden decrease in vision, sudden shortness of breath, pain, redness, swelling, warmth in the calf, abnormal vaginal bleeding, or other symptoms. BP and weight should be monitored.

#### Storage

Store progesterone at room temperature. Avoid exposure to high heat.

#### Administration

Take the daily dose of oral progesterone in the evening to minimize the effects of dizziness and drowsiness. May take with food. Insert vaginal forms as directed; if patient is at high altitude, there are special instructions for the use of the gel applicators.

Shake vial well before withdrawing dose. Administer deep IM injection only in the upper arm or outer quadrant of gluteal muscle. Rarely, a residual lump, change in skin color, or sterile abscess occurs at the injection site. Rotate injection sites. *Never* give intravenously.

## Promethazine Hydrochloride

proe-meth'a-zeen high-droh-clor'ide ★ Phenadoz, Phenergan ↓ Histanil Do not confuse promethazine with promazine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antiemetics/ antivertigo, antihistamines, H<sub>1</sub> receptor antagonist, phenothiazines

#### **MECHANISM OF ACTION**

A phenothiazine that acts as an antihistamine, antiemetic, and sedative-hypnotic. As an antihistamine, inhibits histamine at histamine receptor sites. As an antiemetic, diminishes vestibular stimulation, depresses labyrinth function, and acts on the chemoreceptor trigger zone. As a sedative-hypnotic, produces central nervous system (CNS) depression by decreasing stimulation to the brain stem reticular formation. Therapeutic Effect: Prevents allergic responses mediated by histamine, such as rhinitis, urticaria, and pruritus. Prevents and relieves nausea and vomiting.

Promethazine Hydrochloride (Generic Name)

### PHARMACOKINETICS

Route	Onset (min)	Peak	Duration (h)
PO	20	NA	2-8
IV	3-5	NA	2-8
IM	20	NA	2-8
Rectal	20	NA	2-8

Well absorbed from the GI tract after IM administration. Widely distributed. Metabolized in the liver. Excreted primarily in urine. Not removed by hemodialysis. *Half-life*: 16-19 h.

## AVAILABILITY

Syrup: 6.25 mg/mL.

Tablets: 12.5 mg, 25 mg, 50 mg. Injection: 25 mg/mL, 50 mg/mL. Suppositories: 12.5 mg, 25 mg, 50 mg. Suppositories (Phenadoz): 12.5 mg, 25 mg.

## INDICATIONS AND DOSAGES

## Allergic symptoms

PO

Adults, Elderly. 12.5 mg 3 times a day and at bedtime. Children  $\ge 2$  yr. 6.25-12.5 mg 3 times/day as needed. IV, IM Adults, Elderly. 25 mg. May repeat in 2 h.

#### Motion sickness PO

*Adults, Elderly.* 25 mg 30-60 min before departure; may repeat q12h as needed.

*Children*  $\ge 2$  yr: 12.5-25 mg twice daily as needed, with first dose given 30-60 min before departure.

## • Prevention of nausea and vomiting PO, IV, IM, RECTAL

Adults, Elderly. 12.5-25 mg q4-6h as needed.

Children  $\ge 2$  yr: 0.5 mg/lb every 4-6h as needed.

#### Preoperative and postoperative sedation; adjunct to analgesics IV. IM

Adults, Elderly. 25-50 mg as a single dose.

Children  $\ge 2$  yr: 0.25-0.5 mg/lb mg as a single dose.

## Sedative

PO, IV, IM, RECTAL Adults, Elderly. 25-50 mg at bedtime. Children  $\geq 2$  yr. 0.5 mg/lb at bedtime. Maximum: 25 mg/dose.

## CONTRAINDICATIONS

Comatose states, hypersensitive or idiosyncratic reaction to promethazine or other phenothiazines. Do not use for lower respiratory tract symptoms of asthma. Not for children < 2 yr of age.

#### INTERACTIONS Drug

Alcohol, other CNS depressants: May increase CNS depressant effects.

Anticholinergics: May increase anticholinergic effects.

**General anesthetics:** May cause hypotensive effects.

MAOIs: May intensify and prolong the anticholinergic and CNS depressant effects of promethazine. Herbal

Herbal

None known.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

May suppress wheal and flare reactions to antigen skin testing unless the drug is discontinued 4 days before testing.

## IV INCOMPATIBILITIES

Allopurinol (Aloprim), amphotericin B complex (Abelcet, AmBisome, Amphotec), most cephalosporins,

### 1340 Promethazine Hydrochloride

clindamycin, dexamethasone, diazepam, ertapenem (Invanz), furosemide, heparin, ketorolac (Toradol), lansoprazole (Prevacid), methylprednisolone (Solu-Medrol), nalbuphine (Nubain), pantoprazole (Protonix), phenobarbital, phenytoin, piperacillin and tazobactam (Zosyn), sodium bicarbonate.

## **IV COMPATIBILITIES**

Atropine, diphenhydramine (Benadryl), glycopyrrolate (Robinul), hydromorphone (Dilaudid), hydroxyzine (Vistaril), meperidine (Demerol), midazolam (Versed), morphine, nalbuphine (Nubain), prochlorperazine (Compazine).

## SIDE EFFECTS

#### Expected

Somnolence, disorientation; in elderly, hypotension, confusion, syncope.

#### Frequent

Dry mouth, nose, or throat; urine retention; thickening of bronchial secretions.

#### Occasional

Epigastric distress, flushing, visual disturbances, hearing disturbances, wheezing, paresthesia, diaphoresis, chills.

#### Rare

Dizziness, urticaria, photosensitivity, nightmares.

#### SERIOUS REACTIONS

 Children may experience paradoxical reactions, such as excitation, nervousness, tremor, hallucinations, hyperactive reflexes, and seizures. Infants and young children have experienced CNS depression manifested as respiratory depression, sleep apnea, and sudden infant death syndrome.  Long-term therapy may produce extrapyramidal symptoms, such as dystonia (abnormal movements), pronounced motor restlessness (most frequently in children), and parkinsonism (elderly patients).

- Blood dyscrasias, particularly agranulocytosis, occur rarely.
- Cholestatic jaundice is considered a hypersensitivity reaction.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with asthma, history of seizures, cardiovascular disease, hepatic impairment, sleep apnea, and possible Reve's syndrome. Use with caution in narrow-angle glaucoma, prostatic hypertrophy, stenosing peptic ulcer, pyloric obstruction, and bladder-neck obstruction due to anticholinergic effects. Promethazine readily crosses the placenta and may produce extrapyramidal symptoms and jaundice in neonates if taken during pregnancy. It is unknown whether the drug is excreted in breast milk. Children are more likely to experience adverse reactions. Promethazine is not recommended for children younger than 2 yr. Elderly patients are more sensitive to the drug's anticholinergic effects, such as dry mouth, confusion, dizziness, hypotension, syncope, and sedation. Avoid CNS depressants, drinking alcoholic beverages, and tasks that require alertness or motor skills until response to the drug is established.

Drowsiness and dry mouth may occur. Pulse rate, electrolytes, BP, and therapeutic response should be monitored. Assess vital signs 30 min after dosing if used as a sedative. Storage

Store most products at room temperature. Refrigerate rectal suppositories.

#### Administration

Take promethazine without regard to food. Crush scored tablets as needed.

For IV use, promethazine may be given undiluted or diluted with 0.9% NaCl; final dilution should not exceed 25 mg/mL. Inject the drug at a rate of 25 mg/min through the tubing of an infusing IV solution, as prescribed. Injecting the drug too rapidly may cause a transient drop in BP, resulting in orthostatic hypotension and reflex tachycardia. Avoid giving subcutaneously because significant tissue necrosis may occur. Inject the drug carefully because inadvertent intra-arterial injection may produce severe arteriospasm, possibly resulting in gangrene.

The IM route is preferred for injection because IV may cause chemical irritation or tissue damage. For IM use, inject deep into a large muscle mass.

For rectal use, unwrap and moisten the suppository with cold water before inserting it well into the rectum.

#### Propafenone Hydrochloride

proe-pa-fen'one high-droh-clor'ide

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, class IC

## **MECHANISM OF ACTION**

An antiarrhythmic that decreases the fast sodium current in Purkinje or myocardial cells. Decreases excitability and automaticity; prolongs conduction velocity and the refractory period. *Therapeutic Effect:* Suppresses arrhythmias.

### PHARMACOKINETICS

Peak 3-5 h. *Half-life:* 2-10 h. Metabolized in liver; excreted in urine (metabolite).

## AVAILABILITY

Tablets (Rythmol): 150 mg, 225 mg, 300 mg. Capsules (Extended Release [Rythmol SR]): 225 mg, 325 mg, 425 mg.

#### INDICATIONS AND DOSAGES

Maintenance of sinus rhythm for refractory paroxysmal or chronic AFib and documented lifethreatening ventricular arrhythmias, such as sustained ventricular tachycardia

PO (PROMPT RELEASE) Adults, Elderly. Initially, 150 mg q8h; may increase at 3- to 4-day intervals to 225 mg q8h, then to 300 mg q8h. Maximum: 900 mg/day. PO (EXTENDED RELEASE) Adults, Elderly. Initially, 225 mg q12h. May increase at 5-day intervals. Maximum: 425 mg q12h.

 Dose adjustment, moderate to severe hepatic impairment
 Give approximately 20%-30% of the

usual dose (immediate release). Do not use extended release form for dosing.

## **OFF-LABEL USES**

Treatment of supraventricular arrhythmias. Wolff-Parkinson-White syndrome.

## CONTRAINDICATIONS

Known hypersensitivity; bradycardia; bronchospastic disorders; cardiogenic shock; electrolyte imbalance; sinoatrial, AV, and intraventricular impulse generation or conduction

Propafenone Hydrochloride (Generic Name)

## 1342 Propafenone Hydrochloride

disorders, such as sick sinus syndrome or AV block, without the presence of a pacemaker; uncontrolled congestive heart failure (CHF).

#### INTERACTIONS

#### Drug

**Cyclosporine:** Cyclosporine levels may increase.

**Digoxin:** Propafenone produces dose-related increases in serum digoxin levels. Digoxin dosage should be reduced by roughly 50%; monitor closely.

**Local anesthetics:** Potentiated effects. **Propranolol:** Propafenone increases propranolol concentrations.

**QT-prolonging drugs:** May have additive effect on QT interval. **Quinidine, procainamide:** Should

not be used at the same time as propafenone.

**Rifampin:** Induces propafenone metabolism.

**Theophylline:** Propafenone increases theophylline levels. Monitor closely.

Warfarin: Propafenone increases warfarin levels. Monitor INR closely. Herbal

#### None known.

Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Therapeutic serum level is generally in the range of 0.5-2 mcg/mL but clinical level monitoring is rarely used. May cause ECG changes, such as QRS widening and PR interval prolongation, and positive ANA titers.

#### SIDE EFFECTS

#### Frequent (7%-13%)

Dizziness, nausea, vomiting, altered taste, constipation.

#### Occasional (3%-6%)

Headache, dyspnea, blurred vision, dyspepsia (heartburn, indigestion, epigastric pain).

#### Rare (< 2%)

Rash, weakness, dry mouth, diarrhea, edema, hot flashes.

#### SERIOUS REACTIONS

• Propafenone may produce or worsen existing arrhythmias.

• Overdose may produce hypotension, somnolence,

bradycardia, and atrioventricular conduction disturbances.

 Agranulocytosis (fever, chills, weakness, and neutropenia).
 Generally, occurs in the first 2 mo and will normalize with discontinuation.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with CHF, conduction disturbances, impaired hepatic or renal function, and recent MI.

Notify the physician if blurred vision, GI upset, dizziness, or headache occurs. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established. Electrolyte imbalances should be corrected before beginning propafenone therapy. Pulse rate for quality and irregularity, pattern of daily bowel activity and stool consistency, serum electrolyte levels, and hepatic enzymes should be assessed. Patient should be assessed for stress responses that can have adverse cardiovascular effects. Storage

#### Store at room temperature. Administration

Take without regard to meals. Do not skip doses. Extended-release capsules may also be taken without regard to food. Do not crush or divide.

## Propantheline

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anticholinergics

## **MECHANISM OF ACTION**

A quaternary ammonium compound that has anticholinergic properties and that inhibits action of acetylcholine at postganglionic parasympathetic sites. *Therapeutic Effect:* Reduces gastric secretions and urinary frequency, urgency, and urge incontinence.

## PHARMACOKINETICS

Onset occurs within 90 min but < 50% is absorbed from the GI tract. Extensive hepatic metabolism. Excreted in the urine and feces. *Half-life:* 2.9 h.

## AVAILABILITY

Tablets: 7.5 mg, 15 mg.

# INDICATIONS AND DOSAGES Peptic ulcer (historic use) PO

*Adults, Elderly.* 15 mg 3 times/day 30 min before meals and 30 mg at bedtime.

Children. 1-2 mg/kg/day in 3-4 divided doses.

## **OFF-LABEL USES**

For neurogenic bladder and related urinary incontinence.

## CONTRAINDICATIONS

GI or genitourinary (GU) obstruction, myasthenia gravis, narrow-angle glaucoma, autonomic neuropathy, toxic megacolon, severe ulcerative colitis, unstable cardiovascular adjustment in acute hemorrhage, hypersensitivity to propantheline or other anticholinergics.

## INTERACTIONS

#### Drug

**Digoxin:** May increase serum digoxin levels by increasing absorption due to decreased gastrointestinal motility.

#### Herbal

None known. Food None known.

## SIDE EFFECTS

#### Frequent

Dry mouth, decreased sweating, constipation.

#### Occasional

Blurred vision, intolerance to light, urinary hesitancy, drowsiness, agitation, excitement.

#### Rare

Confusion, increased intraocular pressure, orthostatic hypotension, tachycardia.

## SERIOUS REACTIONS

 Overdosage may produce temporary paralysis of ciliary muscle, pupillary dilation, tachycardia, palpitations, hot, dry, or flushed skin, absence of bowel sounds, hyperthermia, increased respiratory rate, ECG abnormalities, nausea, vomiting, rash over face or upper trunk, central nervous system stimulation, and psychosis, marked by agitation, restlessness, rambling speech, visual hallucinations, paranoid behavior, and delusions, followed by depression.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with chronic obstructive pulmonary disease (COPD), CHF, coronary artery disease, esophageal reflux

Propantheline (Generic Name)

or hiatal hernia associated with reflux esophagitis, gastric ulcer, hyperthyroidism, hypertension, liver or renal disease, tachyarrhythmias, autonomic neuropathy, prostatic hypertrophy, glaucoma, diarrhea, known or suspected GI infections, and mild to moderate ulcerative colitis. It is unknown whether propantheline crosses the placenta or is distributed in breast milk. Infants and young children are more susceptible to the drug's toxic effects. Propantheline use in elderly patients may cause agitation, confusion, drowsiness, or excitement. Hot baths and saunas should be avoided.

Tasks that require mental alertness or motor skills should be avoided until effects of the drug are known.

Dry mouth may be experienced during therapy. Good oral hygiene should be practiced. Physicians should be alerted to any significant xerostomic side effects such as increased caries, sore tongue, problems eating or swallowing, difficulty wearing prosthesis, as a medication change may need to be considered. **Storage** 

Store at room temperature. Administration

Give propantheline 30 min before meals and at bedtime.

Propofol pro'poe-fall Diprivan, Fresenius Propoven

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anesthetics, general

## **MECHANISM OF ACTION**

A rapidly acting general anesthetic that inhibits sympathetic vasoconstrictor nerve activity and decreases vascular resistance. *Therapeutic Effect:* Produces hypnosis rapidly.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	40 seconds	N/A	3-10 min

Rapidly and extensively distributed. Protein binding: 97%-99%. Metabolized in the liver. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 3-12 h.

## AVAILABILITY

Injection: 10 mg/mL.

## INDICATIONS AND DOSAGES

## Intensive care unit sedation IV

Adults, Elderly. Initially, 0.3 mg/ kg/h. May increase by 0.3-0.6 mg/ kg/h q5-10min until desired effect is obtained. Maintenance: 0.3-3 mg/kg/h.

#### Anesthesia IV

Adults, American Society of Anesthesiologists (ASA) I and II patients. 2-2.5 mg/kg (about 40 mg q10 seconds until onset of anesthesia). Maintenance: 0.1-0.2 mg/kg/min. Elderly, Debilitated, Hypovolemic, ASA III or IV patients. 1-1.5 mg/kg (about 20 mg q10 seconds until onset

of anesthesia). Maintenance:

0.05-0.1 mg/kg/min.

Children aged 3 yr and older, ASA I or II patients. 2.5-3.5 mg/kg (lower dosage for ASA III or IV patients). Children aged 2 mo to 16 yr. Maintenance dose: 0.125-0.3 mg/kg/min.

## CONTRAINDICATIONS

Known hypersensitivity to propofol emulsion or any of its components, including allergies to eggs, egg products, soybeans, or soy products.

#### INTERACTIONS

#### Drug

Alcohol, narcotics, sedativehypnotics, antipsychotics, skeletal muscle relaxants, inhalational anesthetics, other CNS depressants: May increase hypotensive and CNS and

respiratory depressant effects of propofol.

## Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Increased triglycerides.

## IV INCOMPATIBILITIES

Amikacin (Amikin), amphotericin B complex (Abelcet, AmBisome, Amphotec), bretylium (Bretylol), calcium chloride, ciprofloxacin (Cipro), diazepam (Valium), digoxin (Lanoxin), doxorubicin (Adriamycin), gentamicin (Garamycin), methylprednisolone (Solu-Medrol), minocycline (Minocin), phenytoin (Dilantin), tobramycin (Nebcin), verapamil (Isoptin).

## **IV COMPATIBILITIES**

Acyclovir (Zovirax), bumetanide (Bumex), calcium gluconate, ceftazidime (Fortaz), dobutamine (Dobutrex), dopamine (Intropin), enalapril (Vasotec), fentanyl, heparin, insulin, labetalol (Normodyne, Trandate), lidocaine, lorazepam (Ativan), magnesium, milrinone (Primacor), nitroglycerin, norepinephrine (Levophed), potassium chloride, vancomycin (Vancocin).

## SIDE EFFECTS

#### Frequent

Involuntary muscle movements, apnea (common during induction; lasts longer than 60 seconds), hypotension, nausea, vomiting, IV site burning or stinging or phlebitis.

#### Occasional

Twitching, bucking, jerking, thrashing, headache, dizziness, bradycardia, hypertension, fever, abdominal cramps, paresthesia, coldness, cough, hiccups, facial flushing, greenish-colored urine. **Rare** 

Rash, dry mouth, agitation, confusion, myalgia, thrombophlebitis, hyperlipidemia.

## SERIOUS REACTIONS

 Propofol infusion syndrome, may result in death (severe metabolic acidosis, hyperkalemia, lipemia, rhabdomyolysis, hepatomegaly, cardiac and renal failure). Associated with prolonged high-dose infusions.

Pancreatitis.

• Too-rapid infusion in those with increased intracranial pressure/ neurosurgical needs may cause hypotension and sudden drops in intracranial perfusion. Avoid.

• Too-rapid IV administration may produce severe hypotension, respiratory depression, and involuntary muscle movements.

 The patient may experience an acute allergic reaction, characterized by abdominal pain, anxiety, restlessness, dyspnea, erythema, hypotension, pruritus, rhinitis, and urticaria.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with circulatory, hepatic, lipid metabolism,

#### 1346 **Propranolol Hydrochloride**

renal, or respiratory disorder, history of pancreatitis, history of epilepsy, and in debilitated patients. Propofol crosses the placenta and is not recommended for obstetric use. Propofol is distributed in breast milk and is not recommended for breastfeeding women. The safety and efficacy of propofol have not been established in children. However, the Food and Drug Administration has approved the drug for use in children older than 3 yr. Lower propofol dosages are recommended for elderly patients.

Drug should be administered only by qualified personnel trained in anesthesia; resuscitative equipment should be available. Changes in PVC, PAC, ST segment may be evidenced; frequent monitoring of ECG is recommended. Physician should be notified if patient's respirations are < 10/min for possible CNS changes or respiratory dysfunction.

Be aware that urine may turn green. Vital signs should be obtained before propofol administration. ABG levels, BP, heart and respiratory rates, oxygen saturation, depth of sedation, and lipid and triglyceride levels should be monitored if propofol is given for longer than 24 h.

Overdosage is treated by discontinuing the drug, using artificial ventilation, vasopressor agents, or anticholinergics. Storage

Store propofol at room temperature at or below 77° F. Do not freeze. Do not use propofol if the emulsion separates.

#### Administration

Don't give propofol through the same IV line as blood or plasma.

Shake well before using. Propofol may be given undiluted, or it may be diluted only with D5W to a

concentration of no < 2 mg/mL(4 mL D5W to 1 mL propofol yields 2 mg/mL). Discard any unused portions of the drug. Too-rapid IV administration of propofol may produce irregular muscle movements, respiratory depression, and severe hypotension. Observe for signs of inadvertent intra-arterial injection, such as delayed onset of drug action, pain or discolored skin near the injection site, or blue or white discoloration of the hand if a hand or arm IV site is used.

Use controlled infusion pump for prolonged infusions. To limit infection risk, administration must be completed within 12 h of spiking the vial; discard tubing and any unused portion after 12 h.

## **Propranolol** Hydrochloride

proe-pran'oh-lole high-droh-chlor'ride ★ Inderal, Inderal LA, InnoPran XL 🔛 Inderal LA Do not confuse Inderal with Adderall, or Isordil, Indocin, or propranolol with Pravachol.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used in second or third trimester)

Classification: Antihypertensives, antiarrythmics, class II B-adrenergic blockers

#### MECHANISM OF ACTION

An antihypertensive, antianginal, antiarrhythmic, and antimigraine agent that blocks  $\beta_1$ - and  $\beta_2$ adrenergic receptors. Decreases oxygen requirements. Slows

Propranolol Hydrochloride (Generic Name)

AV conduction and increases refractory period in AV node. Large doses increase airway resistance. *Therapeutic Effect:* Slows sinus heart rate; decreases cardiac output, BP, and myocardial ischemia severity. Exhibits antiarrhythmic activity.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1-2 h	N/A	6 h

Well absorbed from the GI tract. Protein binding: 93%. Widely distributed. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 3-5 h.

## AVAILABILITY

Tablets (Inderal): 10 mg, 20 mg, 60 mg, 80 mg. Capsules (Extended Release [Inderal LA]): 60 mg, 80 mg, 120 mg, 160 mg. Capsules (Extended Release [InnoPran XL]): 80 mg, 120 mg. Oral Solution (Inderal): 20 mg/5 mL, 40 mg/5 mL. Injection (Inderal): 1 mg/mL.

## INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults, Elderly.* Initially, 40 mg twice a day. May increase dose every 3-7 days. Range: Up to 480 mg/day in divided doses. Maximum: 640 mg/day. *Children.* Initially, 0.5-1 mg/kg/day in 4 divided doses. Usual dose: 1-5 mg/kg/day. Maximum: 8 mg/kg/day.

## Angina

PO

Adults, Elderly. Initially, 10-20 mg 2-4 times per day. Titrate to 160-320 mg/day in divided doses. (Long acting): Initially, 80 mg/day. Maximum: 320 mg/day.

## Arrhythmias

#### IV

*Adults, Elderly.* Usual dose is 1-3 mg IV. Second dose can be give after 2-3 min if needed. Subsequent doses can be given every 4-6 h if needed. PO

*Adults, Elderly.* Initially, 10-30 mg q6-8h. May gradually increase dose. Range: 80-320 mg/day.

#### Life-threatening arrhythmias IV

*Adults, Elderly.* Usual dose is 1-3 mg IV. Second dose can be give after 2-3 min if needed. Subsequent doses can be given every 4-6 h if needed.

#### Hypertrophic subaortic stenosis IV

*Adults, Elderly.* Usual dose is 1-3 mg IV. Second dose can be give after 2-3 min if needed. Subsequent doses can be given every 4-6 h if needed.

## Adjunct to α-blocking agents to treat pheochromocytoma PO

Adults, Elderly. 60 mg/day in divided doses with  $\alpha$ -blocker for 3 days before surgery. Maintenance (inoperable tumor): 30 mg/day with  $\alpha$ -blocker.

## Migraine headache prophylaxis PO

*Adults, Elderly.* 80 mg/day in divided doses. Or 80 mg once daily as extended-release capsule. Increase up to 160-240 mg/day in divided doses.

#### Reduction of cardiovascular mortality and reinfarction in patients with previous myocardial infarction (MI)

PO

Adults, Elderly. 180-240 mg/day in divided doses.

## • Essential tremor

*Adults, Elderly.* Initially, 40 mg twice a day increased up to 120-320 mg/ day in 2-3 divided doses.

## **OFF-LABEL USES**

Treatment adjunct for anxiety, mitral valve prolapse syndrome, thyrotoxicosis, acute myocardial infarction, esophageal varices, hemangioma, portal hypertension, scleroderma renal crisis, unstable aneurysm, variceal bleeding prophylaxis, lithium-induced tremor.

## CONTRAINDICATIONS

Asthma, bradycardia, cardiogenic shock, heart block, uncompensated congestive heart failure (CHF) known hypersensitivity to propranolol.

## INTERACTIONS

#### Drug

Didanosine: Possible decreased hypotensive effects. Diphenhydramine: Suspected plasma level increases. **Diuretics, other antihypertensives:** May increase hypotensive effect. Epinephrine, ephedrine, OTC and Rx combination cold products, other sympathomimetics: Possible hypertensive effects or bradycardia. Halogen, hydrocarbon inhalation anesthetics: May increase hypotensive effects and risk of myocardial depression. Indomethacin, NSAIDs: May decrease hypotensive effect. Insulin, oral hypoglycemics: May mask symptoms of hypoglycemia and prolong the hypoglycemic effect of insulin and oral hypoglycemics. IV phenytoin: May increase cardiac depressant effect. Lidocaine: Possible slower metabolism of lidocaine. NSAIDs: May decrease antihypertensive effect. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum antinuclear antibody titer and BUN, serum LDH, serum lipoprotein, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, serum uric acid, AST (SGOT), ALT (SGPT), and serum triglyceride levels.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec).

## **IV COMPATIBILITIES**

Alteplase (Activase), heparin, milrinone (Primacor), potassium chloride, propofol (Diprivan).

## SIDE EFFECTS

#### Frequent

Diminished sexual ability, drowsiness, difficulty sleeping, unusual fatigue or weakness.

#### Occasional

Bradycardia, depression, sensation of coldness in extremities, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting. Rare

Altered taste, dry eyes, pruritus, paresthesia, myopathy, myotonia.

## SERIOUS REACTIONS

• Overdose may produce profound bradycardia and hypotension.

• Abrupt withdrawal may result in sweating, palpitations, headache, and tremors.

 Propranolol administration may precipitate CHF and myocardial infarction (MI) in patients with cardiac disease and in children; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.

• Hypoglycemia may occur in patients with previously controlled diabetes.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes and hepatic and renal impairment, and patients with myasthenia gravis. Propranolol crosses the placenta and is distributed in breast milk. Propranolol use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, hypothermia during childbirth. In elderly patients, age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval. Tasks that require mental alertness or motor skills should be avoided.

Notify the physician of behavioral changes, fatigue, rash, dizziness, excessively slow pulse rate (< 60 beats/min), or peripheral numbness. BP for hypotension; respiratory status for shortness of breath; pattern of daily bowel activity and stool consistency, ECG for arrhythmias, and pulse for quality, rate, and rhythm should be monitored during treatment. If pulse rate is 60 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. In those receiving propranolol for treatment of angina, the onset, type (sharp, dull, squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, including exertion and emotional stress, should be recorded. Signs and symptoms of CHF, such as decreased urine output, distended neck veins, dyspnea (particularly on exertion or lying down), night cough, peripheral edema, and weight gain should also be assessed.

Abrupt withdrawal is contraindicated because it can result in palpitations, headache, tremors, and sweating. Blood glucose levels should be monitored regularly after initiating therapy in patients with diabetes mellitus because propranolol can cause hyperglycemic effects. Rapid postural changes should be avoided because orthostatic hypotensive effects may occur. **Storage** 

Store at room temperature. Administration

For oral use, crush scored tablets if necessary. Take at same time each day. Do not abruptly discontinue the drug. Compliance with the therapy regimen is essential to control anginal pain, arrhythmias, and hypertension. Take extended-release capsules once daily (InnoPran XL is designed for bedtime administration). Do not crush, chew, or divide.

For IV use, give undiluted for IV push. For IV infusion, may dilute each 1 mg in 10 mL D5W. Do not exceed 1 mg/min injection rate. For IV infusion, give 1 mg over 10-15 min.

## Propylthiouracil proe-pill-thye-oh-yoor'a-sill

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: D

**Classification:** Thyroid hormone antagonist

#### **MECHANISM OF ACTION**

A thiourea derivative that blocks oxidation of iodine in the thyroid gland and blocks synthesis of thyroxine and tri-iodothyronine. *Therapeutic Effect:* Inhibits synthesis of thyroid hormone.

Propylthiouracil (Generic Name)

## PHARMACOKINETICS

Onset 30-40 min, duration 2-4 h. *Half-life:* 1-2 h; excreted in urine, bile, and breast milk; crosses placental barrier.

## AVAILABILITY

Tablets: 50 mg.

## INDICATIONS AND DOSAGES Hyperthyroidism

PO

*Adults, Elderly.* Initially, 300-450 mg/day in divided doses q8h. Maintenance: 100-150 mg/day in divided doses q8-12h. *Children 6 yr and older.* When no other options available. Initially, 50 mg/day PO divided q8h. For children 6-10 yr, the usual doses are 50-150 mg/day in divided doses. For 10 yr and over, initially 150-300 mg/day, divided. Titrate up or down based on clinical response and TSH and free T4 levels.

Neonates. 5-10 mg/kg/day in divided doses q8h.

## CONTRAINDICATIONS

Hypersensitivity to the drug; use in breastfeeding.

## INTERACTIONS

## Drug

Amiodarone, iodinated glycerol, iodine, potassium iodide: May decrease response of propylthiouracil. Anticholinergics, sympathomimetics: May increase side effects in uncontrolled patients. Central nervous system (CNS) depressants: May be more responsive to depressant effects in uncontrolled hypothyroidism. Digoxin: May increase digoxin blood concentration as patient becomes euthyroid. I<sup>31</sup>: May decrease thyroid uptake of 1<sup>131</sup>. Oral anticoagulants: May decrease the effects of oral anticoagulants. Vasoconstrictors: May increase risk in patients with uncontrolled hypothyroidism. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase LDH, serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels and prothrombin time.

## SIDE EFFECTS

#### Frequent

Urticaria, rash, pruritus, nausea, skin pigmentation, hair loss, headache, paresthesia.

#### Occasional

Somnolence, lymphadenopathy, vertigo.

Rare

Drug fever, lupus-like syndrome.

## SERIOUS REACTIONS

• Agranulocytosis as long as 4 mo after therapy, pancytopenia, and fatal hepatitis have occurred.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with concurrent use of other agranulocytosisinducing drugs and in persons older than 40 yr. Propylthiouracil crosses the placenta and should be avoided during pregnancy. Breastfeeding is contraindicated because the drug readily crosses to breast milk. Use cautiously in children because of the risk of hepatic dysfunction. Safety and effectiveness in children below the age of 6 have not been established. Restrict the consumption of iodine products and seafood.

Notify the physician of somnolence, jaundice, nausea,

vomiting, illness, unusual bleeding or bruising, rash, itching, swollen lymph glands, or a pulse rate < 60 beats/min. Weight, pulse, prothrombin time, LDH, serum alkaline phosphatase, bilirubin, AST, and ALT levels should be monitored. Prolonged therapy may cause blood dyscrasias, evidenced by bleeding, infection, and poor healing.

Report immediately any evidence of sore throat, skin eruptions, fever, headache, or general malaise.

#### Storage

Store at room temperature. Keep tightly closed and protected from light.

#### Administration

Space doses evenly around the clock.

Give consistently with regard to food.

## **Protamine Sulfate**

★ proe'ta-meen sull'fate Do not confuse protamine with ProAmatine, Protopam, or Protropin.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Heparin antagonist

#### **MECHANISM OF ACTION**

A protein that complexes with heparin to form a stable salt. *Therapeutic Effect:* Reduces anticoagulant activity of heparin.

#### PHARMACOKINETICS

IV: Onset 5 min; duration 2 h.

**AVAILABILITY** *Injection:* 10 mg/mL.

## INDICATIONS AND DOSAGES • Heparin overdose (antidote and treatment), hemorrhage

IV

*Adults, Elderly.* 1 mg protamine sulfate neutralizes 90-115 units of heparin. Heparin disappears rapidly from circulation, reducing the dosage demand for protamine as time elapses.

## For, low-molecular weight heparin toxicity/hemorrhage with enoxaparin

Adults. If enoxaparin was in previous 8 h, give 1 mg IV for every 1 mg of enoxaparin. If it has been > 8 h since enoxaparin or if a second dose needed, give 0.5 mg IV for every 1 mg of enoxaparin. May give another dose if the aPTT measured at 2-4 h after the initial infusion remains prolonged. In all cases, the anti-Xa activity is never completely neutralized (maximum 60%-75%).

#### For LMWH toxicity/hemorrhage with dalteparin or tinzaparin IV

*Adults.* 1 mg IV for every 100 anti-Xa international units of dalteparin or tinzaparin. A second dose (0.5 mg IV for every 100 anti-Xa international units) may be administered if the aPTT measured at 2-4 h after the initial infusion remains prolonged. In all cases, the anti-Xa activity is never completely neutralized (maximum 60%-75%).

#### CONTRAINDICATIONS

None known.

## INTERACTIONS Drug

**Oral anticoagulants, including aspirin and NSAIDs:** May increase anticoagulant effects, possible hemorrhage and should be avoided.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known. Assessment of PPT, PT or INR, and CBC should be performed periodically to assess effectiveness.

#### SIDE EFFECTS

#### Frequent

Decreased BP, dyspnea. Occasional

Hypersensitivity reaction (urticaria, angioedema); nausea and vomiting, which generally occur in those sensitive to fish and seafood, vasectomized men, infertile men, those on isophane (NPH) insulin, or those previously on protamine therapy. **Rare** 

Back pain.

#### SERIOUS REACTIONS

Too-rapid IV administration may produce acute hypotension, bradycardia, pulmonary hypertension, dyspnea, transient flushing, and feeling of warmth.
Heparin rebound may occur several hours after heparin has been neutralized (usually 8-9 h after protamine administration). Heparin rebound occurs most often after arterial or cardiac surgery.

#### PRECAUTIONS & CONSIDERATIONS

This drug is intended for use only in acute care situations in hospitals and emergency rooms. Caution is warranted in patients with a history of allergy to fish and seafood, in those previously on protamine therapy because of a propensity to hypersensitivity reaction, and in infertile or vasectomized men and those on isophane (NPH) or insulin therapy. An electric razor or soft toothbrush should be used to prevent bleeding until coagulation studies normalize.

Notify the physician of black or red stool, coffee-ground vomitus, dark or red urine, or red-speckled mucus from cough. Activated clotting time, aPTT, BP, cardiac function, and other coagulation tests should be monitored.

#### Storage

Store vials at room temperature. Administration

May give intravenously (IV) undiluted over 10 min or may further dilute in 0.9% NaCl or D5W injection prior to IV infusion. Solutions are stable for 24 h when refrigerated. Do not exceed 5 mg/min or 50 mg in any 10-min period. Make sure the patient is supine while protamine is being administered to prevent injury from a hypotensive episode or other complication.

## Protriptyline proe-trip'ti-leen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antidepressants, tricyclic

## **MECHANISM OF ACTION**

A tricyclic antidepressant that increases synaptic concentration of norepinephrine and serotonin by inhibiting their reuptake by presynaptic membranes. *Therapeutic Effect:* Produces antidepressant effect.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 92%. Widely

Protriptyline (Generic Name)

distributed. Extensively metabolized in liver. Excreted in urine. Not removed by hemodialysis. *Half-life*: 54-92 h.

## AVAILABILITY

Tablets: 5 mg, 10 mg (Vivactil).

## INDICATIONS AND DOSAGES

## Depression

PO

*Adults.* 15-40 mg/day divided into 3-4 doses/day. Maximum: 60 mg/day. *Elderly.* 5 mg 3 times/day. May increase gradually. Maximum: 30 mg/day.

## **OFF-LABEL USES**

Narcolepsy, sleep apnea.

## CONTRAINDICATIONS

Acute recovery period after myocardial infarction, coadministration with cisapride, use of MAOIs within 14 days, hypersensitivity to protriptyline or any component of the formulation, QT prolongation.

## INTERACTIONS

#### Drug

Alcohol, barbiturates, benzodiazepines and other central nervous system (CNS) depressants: May increase CNS and respiratory depression and the hypotensive effects of protriptyline. Cimetidine, quinidine, and inhibitors of CYP2D6 (e.g., phenothiazines, fluoxetine, sertraline, paroxetine, propafenone, and flecainide): May increase protriptyline blood concentration and risk of toxicity. Clonidine, guanadrel, guanethidine: May decrease the effects of clonidine and guanadrel. **Direct-acting sympathomimetics**, epinephrine, levonordefrin: Possible increased cardiac sympathomimetic effects.

**MAOIs:** May increase the risk of hyperpyrexia, hypertensive crisis, and seizures.

**Phenothiazines, muscarinic blockers, antihistamines:** May increase the anticholinergic and sedative effects of protriptyline.

Phenytoin: May decrease

protriptyline blood concentration. **Tramadol:** May increase seizure risk.

#### Herbal

**St. John's wort:** May have additive effects.

Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

Therapeutic serum level for protriptyline is 70-250 ng/mL. However, plasma levels should not guide management of the patient.

## SIDE EFFECTS

#### Frequent

Drowsiness, fatigue, dry mouth, blurred vision, constipation, delayed micturition, postural hypotension, diaphoresis, disturbed concentration, increased appetite, urinary retention, weight loss.

#### Occasional

GI disturbances, such as nausea, diarrhea, GI distress, metallic taste sensation.

#### Rare

Paradoxical reaction, marked by agitation, restlessness, nightmares, insomnia, extrapyramidal symptoms, particularly fine hand tremor.

## SERIOUS REACTIONS

• High dosage may produce confusion, seizures, severe drowsiness, arrhythmias, fever, hallucinations, agitation, shortness of breath, vomiting, and unusual tiredness or weakness.

• Abrupt withdrawal from prolonged therapy may produce severe

headache, malaise, nausea, vomiting, and vivid dreams.

• ECG changes, including QT prolongation.

· Agranulocytosis (rare).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with increased intraocular pressure, overactive or agitated patients, seizure disorder, bipolar disorder, suicidal ideation, cardiovascular disease, hyperthyroidism, urinary retention, and concurrent use of guanethidine or other peripherally acting antihypertensives. Be aware that protriptyline crosses the placenta and is minimally distributed in breast milk. Safety and efficacy have not been established in children. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. Patients should be closely monitored for clinical worsening, suicidality, or unusual changes in behavior, particularly during the initial 1-2 mo of therapy or following dosage adjustments. Expect to use lower dosages in elderly patients. Higher dosages are not tolerated well and increase the risk of toxicity in elderly patients.

Significant xerostomic side effects such as sore tongue or problems eating or swallowing should be reported as medication change may be needed.

Anticholinergic, sedative effects and postural hypotension usually develop during early therapy. Avoid unnecessary exposure to sunlight.

#### Storage

Store at room temperature.

#### Administration

May be taken with food to decrease GI distress. Dose increases should occur during the morning dose. Avoid taking the last dose of the day in the evening, as protriptyline is more stimulating than other TCAs.

## **Pseudoephedrine**

soo-doe-e-fed'rin Sudafed Children's, Sudafed Congestion, Sudogest, Sudogest Children's, Wal-phed

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Restricted OTC due to U.S. Combat Methamphetamine Epidemic Act of 2005. Products are kept behind counters prior to purchase, logs are maintained of product purchases, amounts, and consumer IDs, ensuring daily and monthly allowable limits are not exceeded.

**Classification:** Direct-acting  $\alpha$ -adrenergic and  $\beta$ -adrenergic sympathomimetic, decongestant

#### **MECHANISM OF ACTION**

A sympathomimetic that directly stimulates  $\alpha$ -adrenergic and  $\beta$ -adrenergic receptors. *Therapeutic Effect:* Produces vasoconstriction of respiratory tract mucosa; shrinks nasal mucous membranes; reduces edema, and nasal congestion.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration (h)
PO	15-30 min	NA	4-6 (tablets, syrup)
PO	NA	NA	8-12 (extended release)

Pseudoephedrine (Generic Name)

Well absorbed from the GI tract. Partially metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 9-16 h (children, 3.1 h).

## AVAILABILITY

Tablets: 30 mg. Oral Solution: 15 mg/5mL, 30 mg/5mL

## INDICATIONS AND DOSAGES Decongestant

PO

Adults, Children 12 yr and older. 60 mg q4-6h. Maximum: 240 mg/day. Children aged 6-11 yr. 30 mg q4-6h. Maximum: 120 mg/day. Children 2-5 yr. 15 mg q4-6h. Maximum: 60 mg/day. Children younger than 2 yr. Safety and effective use have not been established. Elderly. 30-60 mg q6h as needed. PO (EXTENDED RELEASE)

Adults, Children 12 yr and older. 120 mg q12h.

## CONTRAINDICATIONS

Breastfeeding women, coronary artery disease, severe hypertension, acute recovery phase of MI, use within 14 days of MAOIs.

## INTERACTIONS

#### Drug

Antihypertensive, β-blockers, diuretics: May decrease the effects of these drugs.

**Hydrocarbon inhalation anesthetics:** May cause dysrhythmias.

**MAOIs:** May increase cardiac stimulant and vasopressor effects. **Sympathomimetics:** Possible increased CNS, cardiovascular effects.

#### Herbal

None known.

#### Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Occasional (5%-10%)

Nervousness, restlessness, insomnia, tremor, headache.

Rare (1%-4%)

Diaphoresis, weakness.

## SERIOUS REACTIONS

• Large doses may produce tachycardia, palpitations (particularly in patients with cardiac disease), light-headedness, nausea, and vomiting.

• Overdose in patients older than 60 yr may result in hallucinations, CNS depression, and seizures.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes, heart disease, hyperthyroidism, benign prostatic hyperplasia, and in elderly patients. Pseudoephedrine crosses the placenta and is distributed in breast milk. The safety and efficacy of pseudoephedrine have not been established in children younger than 2 yr. Age-related benign prostatic hyperplasia may require a dosage adjustment in elderly patients.

BP should be monitored for increases.

Storage

Store products at room temperature. Administration

Do not crush extended-release tablets; swallow them whole. Discontinue therapy and notify the physician if dizziness, insomnia, irregular or rapid heartbeat, tremors, or other side effects occur.

## **Psyllium**

sill'ee-yum Hydrocil, Metamucil, Reguloid

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC

*Classification:* Laxative, natural fiber, bulk forming.

## **MECHANISM OF ACTION**

A bulk-forming laxative that dissolves and swells in water providing increased bulk and moisture content in stool. *Therapeutic Effect:* Promotes peristalsis and bowel motility.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	12-24 h	2-3 days	NA

Acts in small and large intestines.

## AVAILABILITY

Powder (Hydrocil, Metamucil). Wafer (Metamucil): 3.4 g/dose. Capsules (Metamucil): 0.52 g.

## INDICATIONS AND DOSAGES Constipation, irritable bowel syndrome

## PO

**!** 3.4 g powder equals 1 rounded tsp, 1 packet, or 1 wafer. *Adults, Elderly.* 2-5 capsules/dose 1-3 times a day. 1 rounded tsp or 1 tbsp of powder 1-3 times a day. 2 wafers 1-3 times a day.

*Children 6-11 yr*: ½-1 tsp powder in water 1-3 times a day.

## CONTRAINDICATIONS

Fecal impaction, GI obstruction, appendicitis, dysphagia.

## INTERACTIONS

#### Drug

**Digoxin, oral anticoagulants, salicylates:** May decrease the effects of digoxin, oral anticoagulants, and salicylates by decreasing absorption.

Potassium-sparing diuretics, potassium supplements: May interfere with the effects of potassium-sparing diuretics and potassium supplements.

## Herbal

None known.

#### Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose level. May decrease serum potassium level.

#### SIDE EFFECTS Rare

Some degree of abdominal discomfort, nausea, mild abdominal cramps, griping, faintness.

## SERIOUS REACTIONS

• Esophageal or bowel obstruction may occur if administered with < 250 mL of liquid.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with esophageal strictures, intestinal adhesions, stenosis, and ulcers. This drug may be used safely in pregnancy. Safety and efficacy of psyllium have not been established in children younger than 6 yr of age. No age-related precautions have been noted in elderly patients.

Pattern of daily bowel activity and stool consistency and serum electrolyte levels should be monitored. Adequate fluid intake should be maintained.

#### Storage

Store products at room tempeature. Keep tightly closed to protect from moisture.

#### Administration

Administer at least 2 h before or after other medication administration. Drink 6-8 glasses of water a day to aid in stool softening. Powder should not be swallowed in dry form but should be mixed with at least 1 full glass (8 oz) of liquid and then followed by 8 oz of liquid; inadequate amount of fluid may cause GI obstruction. To promote defecation, increase fluid intake, exercise, and eat a high-fiber diet.

## **Pyrantel Pamoate**

pi-ran'tel pam'oh-ate ★ Pin-X, Reese's Pinworm, Pronto Plus Pinworm ★ Combantrin Suspension

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

**Classification:** Pyrimidine derivative, antihelmintic

## **MECHANISM OF ACTION**

A depolarizing neuromuscular blocking agent that causes the release of acetylcholine and inhibits cholinesterase. *Therapeutic Effect:* Results in a spastic paralysis of the worm and consequent expulsion from the host's intestinal tract.

## PHARMACOKINETICS

Poorly absorbed through GI tract. Time to peak occurs in 1-3 h. Partially metabolized in liver. Primarily excreted in feces; minimal elimination in urine.

#### AVAILABILITY

*Caplets:* 180 mg (62.5 mg pyrantel base) (Reese's Pinworm Caplets). *Oral Liquid or Suspension:* 50 mg/ mL of pyrantel base (Pronto Plus Pinworm, Pin-X, Reese's Pinworm Liquid).

#### INDICATIONS AND DOSAGES • Enterobiasis vermicularis (pinworm)

PO

*Adults, Elderly, Children older than* 2 yr: 11 mg base/kg once. Repeat in 2 wks. Maximum: 1 g/day.

#### Weight-based liquid dosage (taken as a single dose of 50 mg/mL base solution)

Less than 25 1b or under 2 yr old: Do not use unless directed by doctor

Weight (lb)	Dosage
25-37	½ tsp (2.5 mL)
38-62	1 tsp (5 mL)
63-87	1½ tsp (7.5 mL)
88-112	2 tsp (10 mL)
113-137	2 <sup>1</sup> / <sub>2</sub> tsp (12.5 mL)
138-162	3 tsp (15 mL)
163-187	3½ tsp (17.5 mL)
188	over 4 tsp (20 mL)

## CONTRAINDICATIONS

Hypersensitivity to pyrantel or any of its components.

## INTERACTIONS

#### Drug Piperazine: May decrease effects of pyrantel. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Occasional

Nausea, vomiting, headache, dizziness, drowsiness, GI distress, weakness, abdominal cramps.

## SERIOUS REACTIONS

 Overdosage includes symptoms of anorexia, nausea, abdominal cramps, vomiting, diarrhea, and ataxia.

#### PRECAUTIONS & CONSIDERATIONS

Some products contain aspartame and should be used cautiously in patients with phenylketonuria. Caution is necessary in pregnancy and in patients with liver disease. Pyrantel should not be used concurrently with piperazines. It is unknown whether pyrantel is distributed in breast milk. No agerelated precautions have been noted in children or elderly. The entire family should be treated for pinworms. Wash bedding and clothes in hot, soapy water to avoid being reinfected. Tactful discussion regarding proper toileting techniques should be

discussed to avoid transmission of infection or reinfection.

#### Storage

Store all products at room temperature.

#### Administration

May be taken with or without food. Shake suspension well before using.

## **Pyrazinamide**

pye-ra-zin'a-mide

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antitubercular agent

## **MECHANISM OF ACTION**

An antitubercular whose exact mechanism of action is unknown. *Therapeutic Effect:* Either bacteriostatic or bactericidal, depending on the drug's concentration at the infection site and the susceptibility of infecting bacteria.

## PHARMACOKINETICS

PO: Peak 2 h. *Half-life:* 9-10 h. Metabolized in liver, excreted in urine (metabolites and unchanged drug).

## AVAILABILITY

Tablets: 500 mg.

## INDICATIONS AND DOSAGES

 Tuberculosis (in combination with other antituberculars)

Adults. 15-30 mg/kg/daily. Maximum: 3 g/day. Children. 15-30 mg/kg/day. Maximum: 3 g/day.

#### Twice-weekly regimen PO

Adults, Children. 50-75 mg/kg twice weekly based on lean body weight. (Doses may exceed maximum 3 g/day dose. However, these higher doses have been well tolerated when given only twice per week.) Twice weekly regimen not for HIV patients with low CD4 counts.

## CONTRAINDICATIONS

Severe hepatic dysfunction, hypersensitivity, acute gout.

#### INTERACTIONS

Drug Allopurinol, colchicine, probenecid, sulfinpyrazone: May decrease the effects of these drugs. Herbal None known. Food None known.

Pyrazinamide (Generic Name)

## DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT), ALT (SGPT), and serum uric acid concentrations.

## SIDE EFFECTS

#### Frequent

Arthralgia, myalgia (usually mild and self-limiting).

#### Rare

Hypersensitivity reaction (rash, pruritus, urticaria), photosensitivity, gouty arthritis.

#### SERIOUS REACTIONS

• Hepatotoxicity, gouty arthritis, thrombocytopenia, and anemia occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, a history of gout, and renal impairment. Caution should be used with possible cross-sensitivity to ethionamide, isoniazid, and niacin. Use with caution in pregnancy as there are not adequate data. Small amounts of pyrazinamide are excreted into breast milk. There are no particular cautions in children. Liver function test results should be monitored. Side effects such as anorexia, fever, jaundice, liver tenderness, malaise, nausea, and vomiting may occur. If any liver reactions occur, stop the drug and notify the physician promptly. Serum uric acid levels should be monitored and signs and symptoms of gout, such as hot, painful, swollen joints, especially the ankle, big toe, or knee, should be assessed. Blood glucose levels should be evaluated, especially in persons with diabetes mellitus, because pyrazinamide administration may make diabetic management difficult. Skin should be assessed for rash or eruptions.

It is important to test for noninfectious status by ensuring that compliance with anti-TB for 3 wks or longer has occurred; that culture has confirmed TB susceptibility to anti-infectives; patient has 3 consecutive negative sputum smears; and patient is not coughing.

#### Storage

Store at room temperature, well closed.

#### Administration

Take pyrazinamide with food to reduce GI upset.

## Pyridostigmine Bromide

peer-id-oh-stig'meen brom'ide
Mestinon, Mestinon Timespan
Mestinon, Mestinon-SR
Do not confuse pyridostigmine
with physostigmine or Mesitonin
with Mesantoin or Metatensin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Cholinergic, cholinesterase inhibitor

## **MECHANISM OF ACTION**

A cholinergic that prevents destruction of acetylcholine by inhibiting the enzyme acetylcholinesterase, thus enhancing impulse transmission across the myoneural junction. *Therapeutic Effect:* Produces miosis; increases tone of intestinal, skeletal muscle tone; stimulates salivary and sweat gland secretions.

## PHARMACOKINETICS

PO: Onset 20-30 min, duration 3-6 h.

IV/IM/SC: Onset 2-15 min, duration 2.5-4 h.

Metabolized in liver, excreted in urine.

Pyridostigmine bromide (Generic Name)

## AVAILABILITY

Syrup (Mestinon): 60 mg/5 mL. Tablets (Mestinon): 60 mg. Tablets (Extended Release [Mestinon Timespan]): 180 mg. Injection (Mestinon): 5 mg/mL.

## INDICATIONS AND DOSAGES Myasthenia gravis

#### PO

*Adults, Elderly.* Initially, 60 mg 3 times a day. Dosage increased at 48-h intervals. Maintenance: 60 mg to 1.5 g a day.

PO (EXTENDED RELEASE) Adults, Elderly. 180-540 mg once or twice a day with at least a 6-h interval between doses. IV. IM

Adults, Elderly. 2 mg q2-3h. Children, Neonates. 0.05-0.15 mg/kg/ dose. Maximum single dose: 10 mg.

## Reversal of nondepolarizing neuromuscular blockade

Adults, Elderly. 0.1-0.25 mg/kg with, or shortly after, 0.6-1.2 mg atropine sulfate or an equipotent dose of glycopyrrolate. *Children*. 0.25 mg/kg.

## CONTRAINDICATIONS

Mechanical GI or urinary tract obstruction, cholinesterase inhibitor toxicity.

## INTERACTIONS

#### Drug

Atropine and other anticholinergics: Counteract effects of cholinesterase inhibitors. Use care when giving to counteract cholinesterase inhibitor side effects, as cholinergic crisis may be induced. Cholinesterase inhibitors: May increase the risk of toxicity. Neuromuscular blockers: May prolong the action of succinylcholine and other related medicines. Quinine: May antagonize the action of pyridostigmine. Herbal None known. Food None known

## **DIAGNOSTIC TEST EFFECTS**

None known.

## IV INCOMPATIBILITIES

Do not mix pyridostigmine with any other medications.

## SIDE EFFECTS

#### Frequent

Miosis, increased GI and skeletal muscle tone, bradycardia, constriction of bronchi and ureters, diaphoresis, increased salivation.

#### Occasional

Headache, rash, temporary decrease in diastolic BP with mild reflex tachycardia, short periods of atrial fibrillation (in hyperthyroid patients), marked drop in BP (in hypertensive patients), urinary urgency, lacrimation.

## SERIOUS REACTIONS

· Overdose may produce a cholinergic crisis, manifested as increasingly severe muscle weakness that appears first in muscles involving chewing and swallowing and is followed by muscle weakness of the shoulder girdle and upper extremities, respiratory muscle paralysis, and pelvis girdle and leg muscle paralysis. If overdose occurs, stop all cholinergic drugs and immediately administer 1-4 mg atropine sulfate IV for adults or 0.01 mg/kg for infants and children younger than 12 yr.

· Cardiac arrhythmias.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bradycardia, bronchial asthma, cardiac arrhythmias, epilepsy, hyperthyroidism, peptic ulcer disease, recent coronary occlusion, and vagotonia. Keep a log of energy level and muscle strength to help guide drug dosing.

Notify the physician of diarrhea, difficulty breathing, profuse salivation or sweating, irregular heartbeat, muscle weakness, severe abdominal pain, or nausea and vomiting. Therapeutic response to the drug, such as decreased fatigue, improved chewing and swallowing, and increased muscle strength, should be monitored. Respirations should be closely assessed.

Caution is warranted with postural changes because of possible orthostatic hypotensive effects.

#### Storage

Store products at room temperature, tightly closed and protected from light. Keep silica gel pack in with all tablets in original container.

#### Administration

! Drug dosage and frequency of administration are dependent on the daily clinical response, including exacerbations, physical and emotional stress, and remissions.

Crush tablets as needed. Take larger doses at times of increased fatigue, for example 30-45 min before meals. May break extendedrelease tablets but do not chew or crush them.

For IV and IM use, give large doses concurrently with 0.6-1.2 mg atropine sulfate IV, as prescribed, to minimize side effects.

## Pyridoxine Hydrochloride (Vitamin B<sub>6</sub>)

peer-i-dox'een high-droh-chlor'ride Neuro-K 500 Do not confuse pyridoxine with paroxetine, pralidoxime, or Pyridium.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A OTC (tablets, capsules), Rx (injectible)

*Classification:* Vitamins, water soluble, vitamin B<sub>6</sub>

## **MECHANISM OF ACTION**

Acts as a coenzyme for various metabolic functions, including metabolism of proteins, carbohydrates, and fats. Aids in the breakdown of glycogen and in the synthesis of  $\gamma$ -aminobutyric acid (GABA) in the central nervous system (CNS). *Therapeutic Effect:* Prevents pyridoxine deficiency. Protects against neurotoxicity of certain drugs that are pyridoxine antagonists.

#### PHARMACOKINETICS

Readily absorbed primarily in jejunum. Stored in the liver, muscle, and brain. Metabolized in the liver. Primarily excreted in urine. Removed by hemodialysis. *Half-life*: 15-20 days.

#### AVAILABILITY

*Tablets:* 20 mg, 25 mg, 50 mg, 100 mg, 250 mg, 500 mg. *Injection:* 100 mg/mL.

# INDICATIONS AND DOSAGES Pyridoxine deficiency PO

Pyridoxine Hydrochloride (Vitamin B<sub>6</sub>) (Generic Name)

## 1362 Pyridoxine Hydrochloride (Vitamin B<sub>6</sub>)

*Adults, Elderly.* Initially, 2.5-10 mg/ day; then 2-5 mg/day when clinical signs are corrected.

*Children*. Initially, 5-25 mg/day for 3 wks, then 1.5-2.5 mg/day.

▶ Pyridoxine-dependent seizures PO, IV, IM Infants. Initially, 10-100 mg/day.

Maintenance: PO: 50-100 mg/day.

Drug-induced neuritis PO (TREATMENT) Adults, Elderly. 100-200 mg/day in divided doses. Children. 10-50 mg/day. PO (PROPHYLAXIS) Adults, Elderly. 25-100 mg/day. Children. 1-2 mg/kg/day.

#### CONTRAINDICATIONS

Hypersensitivity to pyridoxine or any of its components.

#### INTERACTIONS

Drug

Immunosuppressants, isoniazid, penicillamine: May antagonize pyridoxine, causing anemia or peripheral neuritis. Levodopa: Reverses the effects of levodopa. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## IV INCOMPATIBILITIES

Consult current compatibility resources for known incompatibilities.

#### SIDE EFFECTS

Occasional

Stinging at IM injection site. Rare

Headache, nausea, somnolence; sensory neuropathy (paresthesia, unstable gait, clumsiness of hands) with high doses.

#### SERIOUS REACTIONS

 Long-term megadoses (2-6 g over > 2 mo) may produce sensory neuropathy (reduced deep tendon reflexes, profound impairment of sense of position in distal limbs, gradual sensory ataxia). Toxic symptoms subside when drug is discontinued.

 Seizures have occurred after IV megadoses.

#### **PRECAUTIONS & CONSIDERATIONS**

Pyridoxine crosses the placenta and is excreted in breast milk. High doses of pyridoxine in pregnancy may produce seizures in neonates. No age-related precautions have been noted in children or elderly patients. Foods rich in pyridoxine, including avocados, bananas, bran, carrots, eggs, organ meats, tuna, shrimp, hazelnuts, legumes, soybeans, sunflower seeds, and wheat germ, are encouraged.

Improvement of deficiency symptoms, including CNS abnormalities (anxiety, depression, insomnia, motor difficulty, paresthesia, and tremors) and skin lesions (glossitis, seborrhea-like lesions around eyes, mouth, nose), should be monitored.

#### Storage

Store vials for parenteral use and oral forms at room temperature. Use the solution immediately if reconstituted. Administration

Scored tablets may be crushed. I Give pyridoxine orally unless malabsorption, nausea, or vomiting occurs. Avoid IV use in cardiac patients.

Take extended-release capsules and tablets whole without crushing or breaking them. Have the patient avoid chewing the capsule or tablet. For IV use, pyridoxine may be given undiluted or may be added to IV solutions and given as an infusion.

IM injections may cause discomfort.

## **Pyrimethamine**

pye-ri-meth'a-meen ★ 
Daraprim Do not confuse Daraprim with Dantrium or Daranide.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiprotozoals, antimalarial

#### **MECHANISM OF ACTION**

An antiprotozoal with blood and some tissue schizonticidal activity. Inhibits tetrahydrofolic acid synthesis. *Therapeutic Effect:* Highly selective activity against plasmodia and *Toxoplasma gondii* infections.

#### PHARMACOKINETICS

Well absorbed, peak levels occurring between 2 and 6 h following administration. Protein binding: 87%. Eliminated slowly. *Half-life:* Approximately 96 h.

#### AVAILABILITY

Tablets: 25 mg (Daraprim).

#### INDICATIONS AND DOSAGES > Toxoplasmosis

#### PO

*Adults.* Initially, 50-75 mg daily, with 1-4 g daily of a sulfonamide of the sulfapyrimidine type (e.g., sulfadoxine). Continue for 1-3 wks, depending on response and tolerance, then reduce dose to one-half that previously given for each drug and continue for additional 4-5 wks. *Children.* 1 mg/kg/day divided into 2 equal daily doses; after 2-4 days reduce to one-half and continue for approximately 1 mo. The usual pediatric sulfonamide dosage is used.

#### Acute malaria PO

Adults (in combination with sulfonamide). 25 mg daily for 2 days.

Adults (without concomitant sulfonamide). 50 mg daily for 2 days.

*Children aged 4-10 yr.* 25 mg daily for 2 days.

## Chemoprophylaxis of malaria PO

Adults and Children > 10 yr. 25 mg once weekly.

*Children aged 4-10 yr.* 12.5 mg once weekly.

*Infants and Children under 4 yr.* 6.25 mg once weekly.

## **OFF-LABEL USES**

Prophylaxis for *Pneumocystis* pneumonia (PCP) and *Toxoplasma gondii* in HIV-infected patients.

## CONTRAINDICATIONS

Hypersensitivity to pyrimethamine, megaloblastic anemia due to folate deficiency, monotherapy for treatment of acute malaria, breastfeeding.

## INTERACTIONS

#### Drug

Antifolic drugs: Pyrimethamine may be used with sulfonamides, quinine, and other antimalarials, and with other antibiotics. However, concomitant use may increase the risk of bone marrow suppression. **Benzodiazepines:** Mild hepatotoxicity has been reported with lorazepam.

Herbal and Food

None known.

Pyrimethamine (Generic Name), Daraprim (Brand Name)

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Frequent

Anorexia, vomiting. Occasional

Atrophic glossitis, hematuria, lowered blood counts.

#### Rare

Pulmonary eosinophilia, cardiac rhythm changes.

## SERIOUS REACTIONS

• Megaloblastic anemia, leukopenia, thrombocytopenia, pancytopenia. May be severe and require leucovorin rescue or prophylaxis, depending on the indication for use.

• Pulmonary eosinphilia (rare).

 Serious hypersensitivity, Stevens-Johnson syndrome and other serious skin reactions.

· Cardiac arrhythmias (rare).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with megaloblastic anemia resulting from folate deficiency, seizures or epilepsy, kidney disease, and liver disease. It is unknown whether pyrimethamine crosses the placenta. It passes through the breast milk and may be harmful to the infant. No age-related precautions have been noted in elderly patients.

#### Storage

Store at room temperature away from heat and moisture.

#### Administration

Take with food and a full glass of water to decrease stomach upset.

## Quazepam

kwaz′ze-pam ★ Doral

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: IV

**Classification:** Benzodiazepines, sedatives/hypnotics

## MECHANISM OF ACTION

BZ-1 receptor-selective benzodiazepine with sedative properties. *Therapeutic Effect:* Produces sedative effect from its central nervous system (CNS) depressant action.

## PHARMACOKINETICS

Rapidly absorbed from GI tract. Protein binding: 95%. Extensively metabolized in liver. Excreted in urine and feces. Unknown whether removed by hemodialysis. *Half-life:* 39-73 h (terminal).

## AVAILABILITY

Tablets: 7.5 mg, 15 mg (Doral).

## INDICATIONS AND DOSAGES Insomnia

#### PO

*Adults.* Initially, 15 mg at bedtime. Adjust from 7.5 mg to 15 mg at bedtime, depending on initial response. Optimal effective dose is thought to be 15 mg.

*Elderly, debilitated, liver disease.* Initially, 7.5 mg at bedtime. If needed, can increase to 15 mg if lower dose not effective after 1-2 nights.

## CONTRAINDICATIONS

Pregnancy, sleep apnea, hypersensitivity to quazepam or any component of the formulation.

## INTERACTIONS

## Drug

Alcohol, CNS depressants, antihistamines, psychotropic medications: Potentiate effects of quazepam.

**Azole antifungals:** May inhibit liver metabolism and increase quazepam blood serum concentrations.

**CYP2B5 substrate (e.g., efavirenz, bupropion):** Quazepam is a CYP2B6 inhibitor and may increase plasma concentrations of these drugs; monitor.

Theophylline: May decrease quazepam effectiveness. Herbal

#### Dong quai, kava kava, magnolia, passionflower, skullcap, tan-shen, valerian: May increase CNSdepressant effect of quazepam. Food

**Caffeine:** May decrease sedative and anxiolytic effects of quazepam.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

## Frequent

Headache, mild daytime drowsiness most common. Muscular incoordination (ataxia), light-headedness, slurred speech (particularly in elderly or debilitated patients).

## Occasional

Confusion, blurred vision, dry mouth, dyspepsia.

## Rare

Behavioral problems such as anger, impaired memory, paradoxical reactions such as insomnia, nervousness, or irritability.

## SERIOUS REACTIONS

- · Anaphylaxis or angioedema.
- Abrupt or too-rapid withdrawal may result in pronounced

Quazepam (Generic Name), Doral (Brand Name)

restlessness, irritability, insomnia, hand tremors, abdominal and muscle cramps, sweating, vomiting, and seizures.

• Overdosage results in somnolence, confusion, diminished reflexes, and coma.

• "Sleep driving" and other complex behaviors reported while not fully awake, with no memory of event. If such an event reported, discontinue drug.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with impaired renal or hepatic function, and smaller initial doses should be used. Quazepam crosses the placenta and is distributed in breast milk. Chronic ingestion of quazepam during pregnancy may produce withdrawal symptoms in women and CNS depression in neonates; therefore, the benefit of taking in patients who desire to become pregnant should be weighed against the risk to the fetus and neonate. Safety and efficacy of quazepam have not been established in children. In elderly patients, use small initial doses and gradually increase them to avoid excessive sedation or ataxia as evidenced by muscular incoordination.

Drowsiness and dizziness are expected side effects. Avoid tasks that require mental alertness or motor skills. Concomitant use with alcohol should also be avoided.

#### Storage

Store at room temperature. Administration Best taken on an empty stomach.

Take quazepam at bedtime. Tablets may be crushed. Do not abruptly stop quazepam.

## Quetiapine

kwe-tye'a-peen Seroquel, Seroquel XR Do not confuse Seroquel with Serzone.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

#### **MECHANISM OF ACTION**

A dibenzepine derivative that antagonizes dopamine, serotonin, histamine, and  $\alpha_1$ -adrenergic receptors. *Therapeutic Effect:* Diminishes manifestations of psychotic disorders. Produces moderate sedation, few extrapyramidal effects, and no anticholinergic effects.

#### PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 83%. Widely distributed in tissues; central nervous system (CNS) concentration exceeds plasma concentration. Undergoes extensive first-pass metabolism in the liver. Primarily excreted in urine. *Half-life:* 6-7 h.

## AVAILABILITY

*Tablets:* 25 mg, 50 mg, 100 mg, 200 mg, 300 mg, 400 mg. *Extended-Release Tablets:* 50 mg, 150 mg, 200 mg, 300 mg, 400 mg.

#### INDICATIONS AND DOSAGES Management of manifestations of psychotic disorders and schizophrenia

PO (IMMEDIATE RELEASE) *Adults, Elderly.* Initially, 25 mg twice a day, then 25-50 mg 2-3 times a day

Quetiapine (Generic Name), Seroquel (Brand Name)

on the second and third days, up to 300-400 mg/day in divided doses 2-3 times a day by the fourth day. Further adjustments of 25-50 mg twice a day may be made at intervals of 2 days of longer. *Maintenance:* 300-800 mg/day administered in 2-3 divided doses (adults).

PO (EXTENDED RELEASE) Adults. Initially, 300 mg once daily, increasing by up to 300 mg/day. Maintenance: 400-800 mg/day as one daily dose.

*Elderly.* Initially, 50 mg once daily, increasing by up to 50 mg/day. *Maintenance:* 50-200 mg/day as one daily dose.

## Adjunctive treatment to antidepressants for depression PO (EXTENDED-RELEASE

TABLETS)

*Adults*. Initially, 50 mg once per day in evening; increase on day 3 up to 150 mg/day. Effective range 150-300 mg/day.

#### Bipolar mania

PO (EXTENDED-RELEASE TABLETS)

Adults. Initially, 300 mg once per day in evening; increase to 600 mg/day on day 2. Effective maintenance range 400-800 mg/day. Used as monotherapy or adjunct to lithium or divalproex.

#### Depressive episodes associated with bipolar disorder

PO (EXTENDED-RELEASE TABLETS)

Adults. Initially, 50 mg once per day in evening; titrate to reach 300 mg/ day by day 4. Effective maintenance range 400-800 mg/day.

#### Dosage in hepatic impairment, elderly or debilitated patients, and those predisposed to hypotensive reactions

These patients should receive a lower initial dose and lower dosage increases.

#### CONTRAINDICATIONS

Hypersensitivity to quetiapine.

#### INTERACTIONS Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS depression. Antihypertensives: May increase the hypotensive effects of these drugs. Hepatic enzyme inducers (such as carbamazepine, rifampin phenytoin): May increase quetiapine clearance. Strong CYP3A4 inhibitors (e.g.,

## ketoconazole, clarithromycin, nefazodone, protease inhibitors): May decrease the clearance

of quetiapine. Lower doses of quetiapine may be required.

Herbal

None known.

Food

**High-fat meals:** Increase the effects of quetiapine.

## DIAGNOSTIC TEST EFFECTS

May decrease serum total and free thyroxine  $(T_4)$  serum levels. May increase serum cholesterol, triglyceride, AST (SGOT), and ALT (SGPT) levels. May produce a falsepositive pregnancy test result.

## SIDE EFFECTS

Frequent (10%-19%)

Headache, somnolence, dizziness. Occasional (3%-9%)

Constipation, orthostatic hypotension, tachycardia, dry mouth, dyspepsia, rash, asthenia, abdominal pain, rhinitis. **Rare (2%)** 

Back pain, fever, weight gain.

## SERIOUS REACTIONS

• Overdosage may produce heart block, hypotension, hypokalemia, and tachycardia.

#### PRECAUTIONS & CONSIDERATIONS

Elderly patients with dementiarelated psychosis have an increased risk of death when treated with atypical antipsychotics vs. placebo. Caution is warranted in patients with Alzheimer's disease, cardiovascular disease (such as congestive heart failure or history of myocardial infarction), cerebrovascular disease, diabetes mellitus, seizures, hepatic impairment, dehydration, hypothyroidism, hypovolemia, a history of breast cancer, and a history of drug abuse or dependence. It is unknown whether quetiapine is distributed in breast milk. However, this drug is not recommended for breastfeeding women. The safety and efficacy of quetiapine have not been established in children. As with other drugs used for mood disorders, this drug may increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr) with major depressive disorder and other psychiatric disorders. All patients should be monitored for suicidal thoughts, mood changes, or unusual behaviors. For elderly patients, lower initial and target dosages may be necessary.

Drowsiness and dizziness may occur but generally subside with continued therapy. Tasks requiring mental alertness or motor skills should be avoided. Dehydration, particularly during exercise, exposure to extreme heat, and concurrent use of medications that cause dry mouth or other drying effects, should also be avoided. BP, pulse rate, weight, pattern of daily bowel activity, and stool consistency should be assessed. **Storage** 

Store at room temperature.

#### Administration

Take quetiapine without food or with a light meal. With immediaterelease quetiapine, dosage adjustments should occur at 2-day intervals. With extended-release quetiapine, do not crush, cut, or chew; dosage adjustments may occur daily. When restarting therapy for persons who have been off quetiapine for longer than 1 wk, follow the initial titration schedule, as prescribed. When restarting therapy for persons who have been off quetiapine for < 1 wk, titration is not required and the maintenance dose can be reinstituted. Do not abruptly discontinue.

#### Quinapril

kwin'a-pril Accupril Do not confuse Accupril with Accolate or Accutane.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

#### Classification:

Antihypertensives, angiotensinconverting enzyme (ACE) inhibitors

#### MECHANISM OF ACTION

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system and prevents the conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. *Therapeutic Effect:* Reduces peripheral arterial resistance, BP, and pulmonary capillary wedge pressure; improves cardiac output.

Quinapril (Generic Name)

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	2 h	24 h

Readily absorbed from the GI tract. Protein binding: 97%. Metabolized in the liver, GI tract, and extravascular tissue to active metabolite. Excreted primarily in urine. Minimal removal by hemodialysis. *Half-life*: 1-2 h; metabolite, 3 h (increased in those with impaired renal function).

## AVAILABILITY

Tablets: 5 mg, 10 mg, 20 mg, 40 mg.

# INDICATIONS AND DOSAGES Hypertension (monotherapy) PO

*Adults.* Initially, 10-20 mg/day. May adjust dosage at intervals of at least 2 wks or longer. Maintenance: 20-80 mg/day as single dose or 2 divided doses. Maximum: 80 mg/day. *Elderly.* Initially, 10 mg/day. May increase by 2.5-5 mg q1-2wk.

## Hypertension (combination therapy) PO

*Adults*. Initially, 5 mg/day titrated to patient's needs.

*Elderly.* Initially, 5 mg/day. May increase by 2.5-5 mg q1-2wk.

#### Adjunct to manage heart failure PO

*Adults, Elderly.* Initially, 5 mg twice a day. Range: 20-40 mg/day divided into 2 doses.

#### Dosage in renal impairment

Dosage is titrated to the patient's clinical response after the following initial doses:

Creatinine Clearance (mL/min)	Initial Dose (mg/day)
> 60	10
30-60	5
10-29	2.5

#### **OFF-LABEL USES**

Treatment of hypertension and renal crisis in scleroderma, diabetic nephropathy, valvular regurgitation.

## CONTRAINDICATIONS

Bilateral renal artery stenosis; angioedema related to this or another ACE inhibitor or hereditary angioedema.

## INTERACTIONS

Drug

Alcohol, antihypertensives, diuretics: May increase the effects of quinapril. Lithium: May increase lithium blood concentration and risk of lithium toxicity. NSAIDs: May decrease the effects of quinapril. Potassium-sparing diuretics, drospirenone, potassium supplements: Increased risk of hyperkalemia. Tetracycline, quinolones: May reduce the absorption of these medications due to magnesium content in quinapril tablets. Herbal Garlic: May increase antihypertensive effect. Ginseng, yohimbe: May worsen hypertension. Food High-fat meals: Decrease

absorption moderately.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer.

## SIDE EFFECTS

Frequent (5%-7%) Headache, dizziness.

#### Occasional (3%-4%)

Fatigue, vomiting, nausea, hypotension, chest pain, dry cough, syncope, hyperkalemia.

Rare (< 2%)

Diarrhea, dyspnea, rash, palpitations, impotence, insomnia, malaise.

#### SERIOUS REACTIONS

 Excessive hypotension (first-dose syncope) may occur in patients with congestive heart failure (CHF) and in those who are severely salt or volume depleted.

· Angioedema occurs rarely.

 Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in those with history of renal disease.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with CHF, collagen vascular disease, hyperkalemia, hypovolemia, renal impairment, and renal stenosis. Quinapril crosses the placenta, and it is unknown whether it is distributed in breast milk. Quinapril may cause fetal or neonatal morbidity or mortality, so it should be avoided in pregnancy. Safety and efficacy of quinapril have not been established in children. Elderly patients may be more sensitive to the hypotensive effect of quinapril.

Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the patient in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning quinapril therapy, then every 2 wks for the next 3 mo, and periodically thereafter in patients with autoimmune disease, or renal impairment, and in those who are taking drugs that affect immune response or leukocyte count. BUN, serum creatinine, serum potassium levels are important indicators.

Storage

Store at room temperature; protect from light.

#### Administration

Take quinapril without regard to food. Crush tablets as desired.

#### Quinidine

kwin'i-deen Do not confuse quinidine with clonidine or quinine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiarrhythmics, class IA

## **MECHANISM OF ACTION**

An antiarrhythmic that decreases sodium influx during depolarization, decreases potassium efflux during repolarization, and reduces calcium transport across the myocardial cell membrane. Decreases myocardial excitability, conduction velocity, and contractility. *Therapeutic Effect:* Suppresses arrhythmias.

## AVAILABILITY

Injection: 80 mg/mL. Tablets: 200 mg, 300 mg. Tablets (Extended Release): 300 mg. Tablets (Extended Release): 324 mg.

#### INDICATIONS AND DOSAGES

 Conversion and reduction of relapse for atrial fib/flutter and suppression of ventricular arrhythmias

Adults, Elderly. 200-600 mg q6-8h (long acting): 324-648 mg q8-12h.

Quinidine (Generic Name)
*Children.* 15-60 mg/kg/day in divided doses q6h. IV INFUSION

Adults, Elderly. 5-10 mg/kg as a slow IV infusion as a single dose. Most respond at ≤ 5 mg/kg; discontinue use if no response after 10 mg/kg total.

▶ **Treatment of severe malaria (rare)** *Adults.* See manufacturer's prescribing information for the use of IV and PO quinidine for the treatment of susceptible *P. falciparum* malaria.

## CONTRAINDICATIONS

Complete AV block, intraventricular conduction defects (widening of QRS complex). Known quinidine allergy or a history of thrombocytopenia or thrombocytic purpura during quinidine or quinine therapy. In patients adversely affected by an anticholinergic agent (e.g., myasthenia gravis).

## INTERACTIONS

#### Drug

Antimyasthenics: May decrease effects of these drugs on skeletal muscle.

**Digoxin:** May increase digoxin serum concentration.

**Drugs metabolized by CYP2D6:** Quinidine inhibits metabolism (e.g., mexilitene, phenothiazines, tricyclic antidepressants) or active conversion (e.g., codeine) of these drugs.

Haloperidol: Serum levels increased when quinidine coadministered. Neuromuscular blockers, oral

**anticoagulants:** May increase effects of these drugs.

Other antiarrhythmics, pimozide, and other drugs prolonging QT interval: May increase cardiac effects.

#### Urinary alkalizers such as

antacids: May decrease quinidine renal excretion. Verapamil: Decreases quinidine clearance and raises serum levels. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

Therapeutic serum level is 2-5 mcg/ mL; toxic serum level is > 5 mcg/mL.

## IV INCOMPATIBILITIES

Acyclovir, aminophylline, amphotericin B, ampicillin, ampicillin-sulbactam (Unasyn), azathioprine (Imuran), aztreonam (Azactam), bretylium, cephalosporin class antibiotics, clindamycin (Cleocin), dexamethasone, diazepam, ertapenem (Invanz), furosemide (Lasix), heparin, inamrinone, insulin, methylprednisolone (Solu-Medrol), penicillin antibiotics, nitroprusside, pantoprazole (Protonix), phenobarbital, phenytoin, sodium bicarbonate.

## **IV COMPATIBILITIES**

Milrinone (Primacor).

## SIDE EFFECTS

## Frequent

Abdominal pain and cramps, nausea, diarrhea, vomiting (can be immediate, intense).

#### Occasional

Mild cinchonism (ringing in ears, blurred vision, hearing loss) or severe cinchonism (headache, vertigo, diaphoresis, lightheadedness, photophobia, confusion, delirium).

#### Rare

Hypotension (particularly with IV administration), hypersensitivity

reaction (fever, anaphylaxis, photosensitivity reaction), syncope.

#### SERIOUS REACTIONS

 Cardiotoxic effects occur most commonly with IV administration and are observed as conduction changes (50% widening of QRS complex, prolonged QT interval, flattened T waves, and disappearance of P wave), ventricular tachycardia or flutter, frequent premature ventricular contractions (PVCs), or complete AV block.

 Quinidine-induced syncope and hypotension may occur with the usual dosage.

• Patients with atrial flutter and fibrillation may experience a paradoxical, extremely rapid ventricular rate that may be prevented by prior digitalization.

• Hepatotoxicity with jaundice due to drug hypersensitivity may occur.

#### **PRECAUTIONS & CONSIDERATIONS**

Quinidine has not been shown to enhance survival when treating arrhythmias; may increase mortality in the treatment of atrial arrhythmias. Caution is warranted in patients with digoxin toxicity, incomplete AV block, hepatic and renal impairment, myasthenia gravis, myocardial depression, and sick sinus syndrome. Direct sunlight and artificial light should be avoided.

Monitor BP and pulse rate before giving quinidine unless the person is on a continuous cardiac monitor. Notify the physician if fever, ringing in the ears, or visual disturbances occur. CBC; BUN; serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels; intake and output; pattern of bowel activity and stool consistency; and serum potassium should be monitored in those receiving long-term therapy. ECG for cardiac changes, particularly prolongation of PR or QT interval and widening of the QRS complex, should also be assessed; notify the physician of significant ECG changes.

#### Storage

Store oral forms and unopened vials at room temperature.

Diluted infusion is stable for 24 h at room temperature when diluted with D5W.

#### Administration

Do not crush or chew sustainedrelease tablets. Take quinidine with food to reduce GI upset.

! Continuously monitor BP and ECG during IV administration; adjust the rate of the infusion as appropriate and as ordered to minimize arrhythmias and hypotension.

For IV infusion, dilute 800 mg with 50 mL D5W to provide concentration of 16 mg/mL. Give at rate of 1 mL (16 mg)/min or less because a rapid rate may markedly decrease arterial pressure. Administer with patient in supine position.

## Quinine

kwye'nine ★ Qualaquin Do not confuse with quinidine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antiprotozoals

#### **MECHANISM OF ACTION**

A cinchona alkaloid that relaxes skeletal muscle by increasing the refractory period, decreasing excitability of motor endplates (curare-like), and affecting distribution of calcium with muscle fiber. Antimalaria: Depresses oxygen uptake and carbohydrate metabolism, elevates pH in intracellular organelles of parasites. *Therapeutic Effect:* Relaxes skeletal muscle; produces parasite death.

## PHARMACOKINETICS

Rapidly absorbed mainly from upper small intestine. Protein binding: 70%-95%. Metabolized in liver. Excreted in feces, saliva, and urine. *Half-life:* 8-14 h (adults), 6-12 h (children).

## AVAILABILITY

Capsules: 324 mg (Qualaquin).

## INDICATIONS AND DOSAGES

Treatment of malaria

PO

Adults, Elderly, Children  $\geq 16$  yr. 648 mg PO q8h for 7 days.

#### Dosage in renal impairment

In patients with severe chronic renal failure, the following modified dosage is recommended: Give 1 dose of 648 mg; then 12 h after, begin maintenance dose of 324 mg q12h for 7 days.

#### CONTRAINDICATIONS

Known hypersensitivity to quinine or to mefloquine or quinidine because of cross-sensitivity, reactions include thrombocytopenia, thrombotic thrombocytopenic purpura or hemolytic uremic syndrome; prolonged QT intervals, G6PD deficiency; myasthenia gravis, blackwater fever, optic neuritis.

#### INTERACTIONS

#### Drug

Alkalinizing agents, cimetidine, ranitidine: May increase quinine serum concentrations. Antacids: Decrease quinine absorption; do not give concomitantly. **CYP3A4 inhibitors:** Decrease quinine metabolism.

**Digoxin:** May increase blood concentration of digoxin.

**Drugs metabolized by CYP3A4** and CYP2D6: Quinine inhibits these enzymes.

Halofantrine, mefloquine: May increase risk of seizures and ECG abnormalities. Avoid concomitant use. Neuromuscular blockers: May increase effects of these drugs.

**Phenobarbital, phenytoin, rifampin:** May decrease quinine serum concentrations.

**Ritonavir:** Avoid ritonavir use with quinine, as quinine toxicity may occur.

Warfarin: May increase anticoagulant effect.

Herbal

St. John's wort: May decrease quinine levels. Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

May interfere with 17-OH steroid determinations. May result in positive Coombs' test.

#### SIDE EFFECTS Frequent

A cluster of symptoms occur to some degree in almost all patients: headache, vasodilation and sweating, nausea, tinnitus, vertigo or dizziness, blurred vision, disturbance in color perception, vomiting, diarrhea, abdominal pain (mild cinchonism). May cause hypoglycemia.

#### Occasional

Extreme flushing of skin with intense generalized pruritus is most typical hypersensitivity reaction; also rash, wheezing, dyspnea. Prolonged therapy: cardiac conduction disturbances, decreased hearing, optic neuritis.

## SERIOUS REACTIONS

 Overdosage (severe cinchonism) may result in cardiovascular effects, severe headache, intestinal cramps with vomiting and diarrhea, apprehension, confusion, seizures, blindness, deafness, and respiratory depression.

 Serious hypersensitivity reactions: anaphylactoid reactions, serious skin rashes, Stevens-Johnson syndrome and TENS, angioedema, bronchospasm, thrombotic or immune thrombocytopenic purpura (TTP or ITP) and hemolytic-uremic syndrome (HUS), thrombocytopenia, blackwater fever, granulomatous hepatitis, and acute interstitial nephritis.

• Cardiotoxic effects (widening of QRS complex, prolonged QT interval), ventricular tachycardia.

#### PRECAUTIONS & CONSIDERATIONS

Though once widely used off-label, quinine is not approved to treat nocturnal leg cramps due to lack of data for efficacy, and potential risk of serious and potentially life-threatening reactions. Caution is warranted in patients with cardiovascular disease, myasthenia gravis, and asthma. Be aware that quinine is contraindicated in pregnant women. Quinine readily crosses the placenta and is distributed in breast milk. Be aware that quinine may cause congenital malformations such as deafness, limb abnormalities, visceral defects, visual changes, and stillbirths. Reliable contraception should be used. Safety and efficacy not established in children < 16 yr. In elderly patients, age-related renal impairment may require dosage adjustment.

Fasting blood sugar should be checked. Watch for signs of

hypoglycemia such as cold sweating, tremors, tachycardia, hunger, and anxiety. Visual or hearing difficulties, shortness of breath, rash, itching, and nausea should be reported.

#### Storage

Store at room temperature. Administration

Take quinine with food. To avoid bitter taste, do not crush. Do not administer with aluminum- or magnesium-containing antacids.

#### Quinupristin/ Dalfopristin

quin-u'pris-tin; dal-foe'pris-tin

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Anti-infective, streptogramins

## **MECHANISM OF ACTION**

The site of action is the bacterial ribosome. Dalfopristin inhibits the early phase of protein synthesis and quinupristin inhibits the late phase of protein synthesis. The actions are synergistic. Active against gram-positive aerobic organisms. *Therapeutic Effect:* Bacteriostatic against *Enterococcus faecium* (including vancomycin-resistant strains) and bactericidal against strains of methicillin-susceptible staphylococci (e.g., MSSA) and *Streptococcus pyogenes*.

## PHARMACOKINETICS

Maximum concentration for dalfopristin is roughly 8 mcg/mL and for quinupristin roughly 3 mcg/mL after q8h dosing. Drugs penetrate well into blister fluid. Primary route of elimination is biliary and fecal excretion, accounting for roughly 80% of a dose. *Elimination half-life:* Less than 1 h for both components; however, action at infection much longer due to post-antibiotic effect.

## AVAILABILITY

*Powder for Injection:* 500-mg vials (containing 150 mg quinupristin with 350 mg dalfopristin).

## INDICATIONS AND DOSAGES

 Serious or life-threatening infections (e.g., bacteremia, endocarditis) associated with vancomycinresistant *E. faecium* (VREF) IV

Adults, Children  $\ge 16$  yr. 7.5 mg/kg q8h.

#### Complicated skin or skin-structure infections due to methicillin-sensitive Staph aureus or Strep pyogenes IV

Adults, Children  $\ge 16$  yr. 7.5 mg/kg q12h.

 Pediatric dosage (emergency use) IV

*Children under 15 yr.* Limited numbers of children treated with a dose of 7.5 mg/kg q8h or q12h.

## CONTRAINDICATIONS

Known hypersensitivity to the drug, or prior hypersensitivity to other streptogramins (e.g., pristinamycin or virginiamycin).

## INTERACTIONS

#### Drug

#### Drugs metabolized by CYP3A4:

Quinupristin/dalfopristin inhibits CYP3A4 significantly and can decrease metabolism of these drugs. Medications include protease inhibitors, cisapride, diltiazem, midazolam, vinca alkaloids, taxanes, cyclosporine, HMG-CoA reductase inhibitors (statins), nifedipine, tacrolimus, quinidine, verapamil, and many others. Use particular caution with those narrow therapeutic index drugs metabolized by CYP3A4.

## DIAGNOSTIC TEST EFFECTS

May increase total and conjugated bilirubin levels.

## **IV INCOMPATIBILITIES**

NaCl (saline) solutions (e.g., NS injection) or any drugs mixed in a saline solution.

## 🗏 IV COMPATIBILITIES

NOTE: Only compatible with the following if mixed in dextrose solutions; if any of these IV drugs are mixed in saline solutions, they will not be compatible. Aztreonam (Azactam), ciprofloxacin (Cipro), haloperidol, metoclopramide, potassium chloride.

## SIDE EFFECTS

#### Frequent (>10%)

Venous irritation, hyperbilirubinemia, erythema, edema, infusion site reactions (edema, inflammation, pain).

#### Occasional (2%-5%)

Nausea, diarrhea, vomiting, headache, pruritus, thrombophlebitis. Rare

Maculopapular rash, sweating, urticaria, arthralgia, myalgia.

## SERIOUS REACTIONS

• Rare reactions include hypersensitivity reactions such as angioedema and anaphylaxis.

• Possible risk for pseudomembranous colitis and superinfection.

• If myalgia or arthralgias are severe, decreasing medication frequency to q12h may alleviate. • Hyperbilirubinemia, jaundice, hemolysis or hemolytic anemia, pancytopenia, hepatitis, tachycardia, syncope, tremor, ventricular arrhythmia have also been rarely reported.

#### **PRECAUTIONS & CONSIDERATIONS**

Venous irritation is common: use suggested techniques to reduce risk (see Administration). Episodes of arthralgia and myalgia, some severe, have been reported; use caution in patients taking other medications that may cause myalgia. Should superinfection occur during therapy, appropriate measures should be taken. The drug may compete with bilirubin for excretion; use with caution in patients with diseases that may be exacerbated if bilirubin levels increase. Use with caution in pregnancy and lactation; there are no adequate data in pregnancy and it is not know if the drug is excreted in breast milk. While the drug's safety and efficacy is not established in children < 16 yr of age, emergency protocols have utilized the drug in limited numbers of pediatric patients (see Indications and Dosages).

Sometimes after starting treatment with antibiotics, patients can develop watery and bloody stools (with or without stomach cramps and fever) even as late as two or more months after having taken the last dose of the antibiotic. If this occurs, patients should contact their physician as soon as possible.

#### Storage

Refrigerate unopened vials. Do not freeze. Reconstituted, diluted product is stable up to 5 h at room temperature or up to 54 h if stored under refrigeration.

#### Administration

For IV infusion use only. Reconstitute the 500-mg single-dose vial by slowly adding 5 mL of D5W or SWI. Do not use saline solutions. Gently swirl; do not shake. Allow foam to disappear. The resulting solution should be clear and will have a concentration of 100 mg/mL. Dilute further before infusion. Add proper weight-based dose to 250 mL of D5W. An infusion volume of 100 mL may be used for central line infusions. If moderate to severe venous irritation occurs following peripheral administration of a 250mL dilution, consider increasing the dilution volume to 500 or 750 mL, changing the infusion site, or infusing by a peripherally inserted central catheter (PICC) or a central venous catheter. Administer by IV infusion over 60 min. I Following completion of a peripheral infusion, the vein should be flushed with D5W to minimize venous irritation. Do not flush with saline or heparin because of incompatibility concerns.

## Rabeprazole

rah-bep<sup>r</sup>rah-zole ★ Aciphex Do not confuse Aciphex with Accupril or Aricept.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

*Classification:* Gastrointestinals, antiulcer agents, proton-pump inhibitors (PPI)

## **MECHANISM OF ACTION**

A proton-pump inhibitor that converts to active metabolites that irreversibly bind to and inhibit hydrogenpotassium adenosine triphosphate, an enzyme on the surface of gastric parietal cells. Actively secretes hydrogen ions for potassium ions, resulting in an accumulation of hydrogen ions in gastric lumen. *Therapeutic Effect:* Increases gastric pH, reducing gastric acid production.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract after passing through the stomach relatively intact. Protein binding: 96%. Metabolized extensively in the liver to inactive metabolites. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life*: 1-2 h is dose-dependent (increased with hepatic impairment).

## AVAILABILITY

Tablets (Delayed Release): 20 mg.

## INDICATIONS AND DOSAGES

 Erosive/ulcerative or symptomatic gastroesophageal reflux disease (GERD) *Adults, Elderly.* 20 mg/day for 4-8 wks. Maintenance: 20 mg/day. *Children 12 yr and older.* 20 mg/day for up to 8 wks.

#### Duodenal ulcer PO

*Adults, Elderly.* 20 mg/day before morning meal for 4 wks. Some patients may require an additional 4 wks of therapy.

#### Pathologic hypersecretory conditions, including Zollinger-Ellison syndrome PO

*Adults, Elderly.* Initially, 60 mg once a day. May increase to 100 mg once a day or 60 mg twice a day. Continue as long as necessary.

## Helicobacter pylori infection PO

*Adults, Elderly.* 20 mg twice a day for 7 days administered with amoxicillin 1000 mg twice daily for 7 days and clarithromycin 500 mg twice daily for 7 days.

## CONTRAINDICATIONS

Hypersensitivity to rabeprazole or any other proton-pump inhibitor. If treating *H. pylori*, then must consider contraindications to other medications in the eradication regimen.

## INTERACTIONS

#### Drug

Atazanavir, nelfinavir, delavirdine: Avoid coadministration due to

decreased concentrations.

**Clopidogrel:** Avoid use of PPI with clopidogrel, as PPI may prevent formation of active moiety by inhibiting CYP2C19, negating efficacy of clopidogrel.

**Cyclosporine:** May increase plasma level of cyclosporine. Monitor.

**Dasatinib**, gefitinib: Decreases antineoplastic absorption. Avoid.

Rabeprazole (Generic Name), Aciphex (Brand Name)

**Digoxin:** May increase the plasma concentration of digoxin.

**Iron salts:** May interfere with absorption of iron salts.

**Ketoconazole, itraconazole:** May decrease the blood concentration of ketoconazole and itraconazole.

Methotrexate: May increase risk of methotrexate toxicity.

**Rifampin:** May decrease rabeprazole levels and efficacy.

Warfarin: May increase effect of warfarin. Monitor PT/INR closely. Herbal

**St. John's wort:** May decrease the levels of rabeprazole.

#### Food

Alcohol: Avoid because of increased GI irritation.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

Rare (< 2%)

Headache, nausea, dizziness, rash, diarrhea, malaise.

R

## SERIOUS REACTIONS

 Serious hypersensitivity/ dermatologic reactions (rare), such as angioedema, anaphylaxis, Stevens-Johnson syndrome.

• In chronic use, may cause hypomagnesemia.

• In chronic use, may increase risk of bone fracture.

 Possible alteration of GI microflora which increases risk of *Clostridium dificile*-associated diarrhea (CDAD).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with severely impaired hepatic function. It is unknown whether rabeprazole crosses the placenta or is distributed in breast milk. Safety and efficacy of rabeprazole have been established in children 12 yr and older. No age-related precautions have been noted in elderly patients.

Notify the physician if diarrhea, GI discomfort, headache, nausea, or skin rash occurs. Laboratory values, especially serum chemistries and liver function test results, should be assessed before therapy.

#### Administration

Take rabeprazole without regard to meals. Do not crush, chew, or split tablet; swallow it whole.

## Raloxifene

ra-lox'i-feen Evista Do not confuse raloxifene with propoxyphene or Evista with Avinza.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Estrogen-receptor modulators, selective, hormones/ hormone modifiers

## **MECHANISM OF ACTION**

A selective estrogen receptor modulator that affects some receptors like estrogen. *Therapeutic Effect:* Like estrogen, prevents bone loss and improves lipid profiles, reduces breast cancer risk in postmenopausal women.

## PHARMACOKINETICS

Rapidly absorbed after PO administration. Highly bound to plasma proteins (95%) and albumin. Undergoes extensive first-pass metabolism in liver. Excreted mainly in feces and, to a lesser extent, in

Raloxifene (Generic Name), Evista (Brand Name)

urine. Unknown whether removed by hemodialysis. *Half-life:* 28-33 h.

## AVAILABILITY

Tablets: 60 mg.

## INDICATIONS AND DOSAGES

 Prevention or treatment of osteoporosis

Adults, Elderly: 60 mg once per day. For invasive breast cancer prophylaxis in postmenopausal women with osteoporosis or in postmenopausal women who are at high risk for developing the disease

PO

*Adults, Elderly.* 60 mg once per day. Duration of treatment is 5 years.

## CONTRAINDICATIONS

Active or history of venous thromboembolic events, such as deep vein thrombosis, pulmonary embolism, and retinal vein thrombosis; women who are at risk for stroke; women who are or may become pregnant or are breastfeeding.

## INTERACTIONS

#### Drug

Cholestyramine: Reduces raloxifene absorption and enterohepatic recycling; do not use together. Drugs highly protein-bound (i.e., diazepam, lidocaine): Use with caution because raloxifene may affect protein binding of other drugs.

Hormone replacement therapy, systemic estrogen: Do not use raloxifene concurrently with these drugs.

Levothyroxine: May decrease levothyroxine's absorption. Warfarin: May decrease INR and the effects of warfarin.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Lowers serum total cholesterol and LDL levels but does not affect HDL or triglyceride levels. Slightly decreases platelet count and serum inorganic phosphate, albumin, calcium, and protein levels.

## SIDE EFFECTS

#### Frequent (10%-25%)

Hot flashes, flu-like symptoms, arthralgia, sinusitis. Hot flashes subside with time.

#### Occasional (5%-9%)

Weight gain, nausea, myalgia, pharyngitis, cough, dyspepsia, leg cramps, rash, depression. **Rare (3%-4%)** 

Vaginitis, urinary tract infection, peripheral edema, flatulence, vomiting, fever, migraine, diaphoresis.

## SERIOUS REACTIONS

• Deep vein thrombosis (DVT), pulmonary embolism, coronary events or stroke.

## **PRECAUTIONS & CONSIDERATIONS**

Consider risk vs. benefit for women with existing cardiovascular disease or at risk of stroke. Caution is warranted in patients with hypertriglyceridemia, unexplained uterine bleeding, hepatic or renal impairment, and a history of cervical or uterine cancer. It is unknown whether raloxifene is distributed in breast milk; however, this drug is not recommended for breastfeeding women. Raloxifene may cause fetal harm and is contraindicated during pregnancy. Raloxifene is not used in children. No age-related precautions have been noted in elderly patients. Avoid alcohol consumption and cigarette smoking during raloxifene therapy. Also avoid prolonged immobility during travel because limited movement increases the risk of venous thromboembolic events. Discontinue use 72 h prior to and during any prolonged immobilization (such as postsurgical recovery). Exercise is encouraged.

Bone mineral density, platelet count, serum levels of inorganic phosphate, calcium, total and LDL cholesterol, and protein should be monitored.

#### Storage

Store at room temperature.

## Administration

Take raloxifene without regard to food at any time of day. Take supplemental calcium and vitamin D if daily dietary intake is inadequate.

#### Raltegravir

ral-teg'ra-vir

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiretrovirals, HIV integrase strand transfer inhibitors

#### **MECHANISM OF ACTION**

An integrase strand transfer inhibitor that inhibits catalytic activity of HIV integrase, an HIV encoded enzyme needed for viral replication. Directly impacts the formation of the HIV provirus, which is needed for viral progeny. *Therapeutic Effect:* Impairs HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Efficacy not affected by food. Protein binding: 83%. Eliminated mainly by metabolism via a UGT1A1-mediated glucuronidation pathway. There is biliary secretion. Excreted mostly in urine (32%, raltegravir and metabolites) and feces (51%, mostly as raltegravir). Unknown if removed by hemodialysis. *Half-life:* 9 h.

## AVAILABILITY

*Tablets, film coated:* 400 mg. *Tablets, chewable:* 25 mg, 100 mg.

#### INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals) PO

*Adults, Elderly.* 400 mg twice daily. During coadministration with rifampin, dose should be 800 mg twice daily.

*Children 12 years of age and older.* One 400-mg film-coated tablet twice daily, as long as the patient weighs at least 25 kg. Otherwise, follow dosing as per younger children according to weight (kg).

*Children 2 years up to 12 years.* The chewable tablet dosage is based on weight at approximately 6 mg/kg/ does given twice daily.

10 to 13.9 kg: 75 mg twice daily. 14 to 19.9 kg: 100 mg twice daily. 20 to 27.9 kg: 150 mg twice daily. 28 to 39.9 kg: 200 mg twice daily. 40 kg and above: 300 mg twice daily.

> Dosage in hepatic impairment No dosage adjustments recommended for mild-moderate hepatic disease; use normal dose. There is no experience in severe hepatic disease.

#### CONTRAINDICATIONS

Hypersensitivity.

Raltegravir (Generic Name), Insentress (Brand Name)

## INTERACTIONS

## Drug

HMG-CoA reductase inhibitors ("statins"): Use caution; increased risk for myopathy and

rhabdomyolysis. Strong inducers of UGT1A1 (rifampin, phenobarbital,

**phenytoin):** May result in reduced plasma concentrations of raltegravir. When given with rifampin, an increased dose of raltegravir is necessary.

Mild UGT1A1 inducers (e.g., efavirenz, etravirine, tipranavir):

Decreases the concentration of raltegravir, but no dose adjustment has been recommended.

Strong UGT1A1 inhibitors (e.g., atazanavir): Increases the concentration of raltegravir, but no dose adjustment has been recommended.

**Omeprazole and other PPIs:** Increases the concentration of raltegravir due to increased solubility at higher stomach acid pH, but no dose adjustment recommended.

## Herbal

**St. John's wort:** Decreases the concentration of antiretroviral medications and may lead to loss of efficacy. Avoid.

## Food

None known. High-fat food increases absorption slightly but does not affect final efficacy.

## **DIAGNOSTIC TEST EFFECTS**

May elevate AST (SGOT) and ALT (SGPT) levels. Increased serum cholesterol and triglycerides. May increase serum amylase, blood glucose. May decrease blood hemoglobin levels, platelet count, and WBC count. May cause elevations in creatine phosphokinase.

## SIDE EFFECTS

Frequent ( $\geq 2\%$ )

Insomnia, headache, diarrhea. Occasional (< 2%)

Asthenia, fatigue, dizziness, depression (particularly in subjects with a preexisting history of psychiatric illness), changes in mood or behavior, abdominal pain, gastritis, dyspepsia, vomiting, nausea, myalgia, reactivation of herpes zoster or herpes simplex.

#### Rare

Lowered blood counts, altered fat distribution, nephrolithiasis, anxiety, paranoia, depression, suicidal ideation, or unusual behaviors.

## SERIOUS REACTIONS

· Hepatotoxicity; hepatitis.

 Neutropenia, thrombocytopenia, and anemia may increase risk of bleeding or opportunistic infection.

· Rhabdomyolysis.

Hypersensitivity reactions;
 Stevens-Johnson syndrome has been reported.

• Cardiovascular events including myocardial ischemia and/or infarction have been reported.

• Nephrotoxicity; including renal tubular necrosis, oliguria, renal failure.

## PRECAUTIONS & CONSIDERATIONS

Raltegravir is never used as monotherapy, but is always combined with other medications against HIV. Caution is warranted in patients with liver function impairment and in those coinfected with hepatitis B, as well as those with a history of depression or mood disorders. No dose adjustment needed in renal impairment. Carefully screen for drug interactions. There are no adequate data in human pregnancy. Breastfeeding is not recommended in this patient population because of the possibility of HIV transmission. Be aware that safety and efficacy have not been established in children < 2 yr. Use with caution in patients with phenylketonuria as the chewable tablets contain phenylalanine. No age-related precautions have been noted in elderly patients. During initial treatment, patients responding to antiretroviral therapy may develop an inflammatory response to indolent or residual opportunistic infections (an immune reconstitution syndrome), which may necessitate further evaluation and treatment.

Raltegravir is not a cure for HIV infection, nor does it reduce risk of transmission to others. Expect to obtain baseline laboratory testing, especially CBC, liver function, and renal function before starting therapy and at periodic intervals. Assess for hypersensitivity reaction, skin reactions, fatigue or nausea, myalgia, unusual changes in moods or behavior. Have patient report sore throat, fever, and other signs of infection promptly. **Storage** 

Store at room temperature. Administration

Tablets may be taken without regard to food or meals; give with a full glass of liquid.

Chewable tablets cannot be substituted for adult tablets; maximum dose of chewable tablets is 300 mg. The chewable tablets may be chewed or swallowed whole, and taken with or without food. The 100-mg chewable tablet may be split in half to individualize dose based on weight. Take the medication as prescribed. Do not discontinue without first notifying the physican.

## Ramelteon

rah-mel′tee-on ★ Rozerem

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Sedatives/ hypnotics, melatonin receptor agonist

## **MECHANISM OF ACTION**

A nonbenzodiazepine that binds to melatonin receptors in the CNS, which helps regulate circardian rhythm and normal sleep/wake cycles. *Therapeutic Effect:* Induces sleep in those with difficulty with sleep onset.

## PHARMACOKINETICS

Total absorption of ramelteon is around 84%, but absolute oral bioavailability is only 1.8% due to extensive first-pass metabolism. Protein binding: 82%; extensive tissue distribution. Metabolism to metabolites via CYP1A2 (major) and the CYP2C and CYP3A4 families (minor). Overall mean systemic exposure of M-II, one of the metabolites, is approximately 20- to 100-fold higher than that of the parent drug. Elimination of metabolites occurs 84% in urine and only 4% in feces. Less than 0.1% excreted as the parent compound. Not removed by hemodialysis. Half-life: 1-2.6 h; M-II metabolite: 2-6 h

#### AVAILABILITY

Tablet: 8 mg.

Ramelteon (Generic Name), Rozerem (Brand Name)

## INDICATIONS AND DOSAGES

Insomnia PO

Adults, Elderly. 8 mg within 30 min of bedtime.

#### Hepatic impairment

Do not use in severe hepatic impairment due to increased concentrations.

## CONTRAINDICATIONS

Hypersensitivity (angioedema); use with fluvoxamine.

## INTERACTIONS

#### Drug

Alcohol: May lead to increased risk of abnormal behaviors and amnesia. Avoid.

CYP1A2 inhibitors (e.g.,

fluvoxamine, atazanavir, mexiletine, norfloxacin, tacrine, zileuton): May increase the blood level and effects of ramelteon. Contraindicated with fluvoxamine due to large increases in ramelteon exposure and maximum concentration.

Ketoconazole, fluconazole, and other CYP3A4 or 2C9 inhibitors: May increase ramelteon exposure and adverse effects, especially strong CYP2C9 inhibitors.

CYP1A2 inducers (e.g., rifampin): May decrease the blood level and effects of ramelteon.

## Herbal

Melatonin: Duplication of treatment; do not take together due to increased risk of side effects. Valerian, kava kava: Potential for additive CNS effects.

Food

Heavy meals: May reduce onset of ramelteon action if taken with or immediately after a heavy meal.

## DIAGNOSTIC TEST EFFECTS

May reduce blood cortisol levels. May decrease testosterone levels and increase prolactin levels.

## SIDE EFFECTS

#### Frequent

Drowsiness, dizziness, fatigue. Occasional (4%-10%) Somnolence, dry mouth, dyspepsia, nausea.

## Rare (2%-3%)

Hallucinations, anxiety, confusion, abnormal dreams, mood changes, neuralgia, dysmenorrhea, gynecomastia, amenorrhea, galactorrhea, decreased libido, or problems with fertility.

## SERIOUS REACTIONS

 Severe allergic reactions (e.g., angioedema) occur occasionally, usually with first doses.

· Hallucinations, bizarre behaviors, "sleep driving" (i.e., driving while not fully awake after ingestion of a hypnotic) and other complex behaviors with amnesia are possible with hypnotic use.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with clinical depression or other psychiatric illness, mildmoderate hepatic impairment, and compromised respiratory function, such as sleep apnea or COPD. Use cautiously in elderly patients. Safety and efficacy have not been evaluated in children. Be aware that melatonin is involved in hormonal regulation, which may have complex effects on fertility and other hormonal processes. The drug is likely excreted in breast milk. Use during pregnancy and lactation is not recommended.

Do not ingest alcohol as this may increase the risk of unusual behaviors. Only take ramelteon when going to bed; otherwise, may be at risk if hazardous tasks such as driving are performed. Confine any activities to those necessary to prepare for sleep. Be aware that allergic reactions are most likely

to occur with the first several drug doses. Monitor for dyspnea, throat closing, swelling of the tongue, nausea, vomiting. Notify prescriber if insomnia not responsive within 1 wk, as further evaluation is necessary. Storage

Keep tightly closed at cool room temperature.

#### Administration

Take within the 30 min prior to bedtime, at approximately the same time each night. Do not take with, or immediately following, a high-fat meal. Do not crush or break tablets. Patients should be able to devote time for a full night's rest.

## **Ramipril**

ram'i-pril ★ 🍁 Altace Do not confuse Altace with Alteplase or Artane.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C (D if used in second or third trimester)

Classification: Antihypertensives, angiotensin-converting enzyme (ACE) inhibitors

#### MECHANISM OF ACTION

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system. Decreases plasma angiotensin II, increases plasma renin activity, and decreases aldosterone secretion. Therapeutic Effect: Reduces peripheral arterial resistance and BP.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1-2 h	3-6 h	24 h

Well absorbed from the GI tract. Protein binding: 73%. Metabolized in the liver to active metabolite. Primarily excreted in urine (60%). Not removed by hemodialysis. Half-life: 2-17 h.

#### AVAILABILITY

Capsules: 1.25 mg, 2.5 mg, 5 mg, 10 mg.

#### INDICATIONS AND DOSAGES Hypertension (monotherapy) PO

Adults, Elderly. Initially, 2.5 mg/ day. Maintenance: 2.5-20 mg/day as single dose or in 2 divided doses.

#### Hypertension (in combination with other antihypertensives) PO

Adults, Elderly. Initially, 1.25-5 mg/ day titrated to patient's needs.

#### Congestive heart failure (CHF) postmyocardial infarction (MI) PO

Adults, Elderly. Initially, 1.25-2.5 mg twice a day. Maximum: 5 mg twice a day; doses should be increased about 3 wks apart.

#### Risk reduction for MI. stroke. and death from cardiovascular causes PO

Adults, Elderly. Initially, 2.5 mg twice a day. If hypotensive, decrease to 1.25 mg twice a day, and after 1 wk at starting dose, dose can be titrated to 5 mg twice a day.

## Dosage in renal impairment

*Creatinine clearance*  $\leq$  40 mL/min. 25% of normal dose.

Renal failure and hypertension. Initially, 1.25 mg/day titrated upward to a maximum daily dose of 5 mg. Renal failure and CHF. Initially, 1.25 mg/day, titrated up to 2.5 mg twice a day.

#### **OFF-LABEL USES**

Treatment of hypertension and renal crisis in scleroderma, diabetic nephropathy.

Ramipril (Generic Name)

## CONTRAINDICATIONS

Hypersensitivity or history of angioedema from previous treatment with ACE inhibitors, idiopathic or hereditary angioedema, bilateral renal artery stenosis.

#### INTERACTIONS

#### Drug

Alcohol, antihypertensives, diuretics: May increase the effects of ramipril.

Angiotensin II receptor blockers, potassium-sparing diuretics drospirenone, eplerenone, salt substitutes, potassium supplements: May cause hyperkalemia.

**Lithium:** May increase lithium blood concentration and risk of lithium toxicity.

NSAIDs: May decrease the effects of ramipril and decrease renal function. Herbal

Garlic: May increase antihypertensive effect.

Ephedra, ginseng, yohimbe: May worsen hypertension. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer.

## SIDE EFFECTS

Frequent (5%-12%)

Cough, headache.

Occasional (2%-4%)

Dizziness, fatigue, nausea, asthenia (loss of strength).

#### Rare (< 2%)

Palpitations, insomnia, nervousness, malaise, abdominal pain, myalgia, hyperkalemia.

## SERIOUS REACTIONS

• Excessive hypotension (first-dose syncope) may occur in patients with CHF and in those who are severely salt or volume depleted.

· Angioedema occurs rarely.

• Agranulocytosis and neutropenia may be noted in those with collagen vascular disease, including scleroderma and systemic lupus erythematosus, and impaired renal function.

• Nephrotic syndrome may be noted in those with history of renal disease.

• Hyperkalemia may occur, especially with concomitant potassium-sparing agents.

• Cholestatic jaundice, which may progress to hepatic necrosis. Discontinue if abnormal liver function tests.

• Renal dysfunction may occur. Increases in serum creatinine may occur after initiation of therapy. Monitor serum creatinine and discontinue if progressive or severe decline in function.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with CHF, collagen vascular disease, hyperkalemia, hypovolemia, renal impairment, and renal artery stenosis. Ramipril crosses the placenta, is distributed in breast milk, and may cause fetal or neonatal morbidity or mortality. If pregnacy is detected, ramipril should be discontinued as soon as possible. Safety and efficacy of ramipril have not been established in children. Elderly patients may be more sensitive to the hypotensive effect of ramipril.

Dizziness and light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided until effects of drug are known. Notify the physician if chest pain, cough, or palpitations occur. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the patient in the supine position with legs elevated. CBC and blood chemistry, including BUN and serum creatinine, should be obtained before beginning ramipril therapy, then every 2 wks for the next 3 mo, and periodically thereafter in patients with autoimmune disease or renal impairment and in those who are taking drugs that affect immune response or leukocyte count. BUN, serum creatinine, serum potassium levels, and WBC count should also be monitored. Crackles and wheezing should be assessed in persons with CHF.

#### Storage

Store at room temperature. Administration

Take ramipril without regard to food. Swallow the capsules whole, and do not chew or break them. The capsule can be opened and the contents sprinkled on a small amount (about 4 oz) of applesauce or mixed in 120 mL of water or apple juice if needed. Be sure to have patient consume entire dose.

Ranitidine

ra-ni'ti-deen ★ Zantac, Zantac 75, Zantac 150, Zantac EFFERdose Do not confuse Zantac with Xanax, Zarontin, Ziac, Zofran, or Zyrtec.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC (tablets, 75 mg, 150 mg)

*Classification:* Antihistamines, H<sub>2</sub>, gastrointestinals

## **MECHANISM OF ACTION**

An antiulcer agent that inhibits histamine action at  $H_2$  receptors of gastric parietal cells. *Therapeutic Effect*: Inhibits gastric acid secretion when fasting, at night, or when stimulated by food, caffeine, or insulin. Reduces volume and hydrogen ion concentration of gastric acid.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: 15%. Widely distributed. Metabolized in the liver. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 2.5 h (increased with impaired renal function).

## AVAILABILITY

Tablets (Effervescent [Zantac EFFERdose]): 25 mg. Granules (Zantac EFFERdose): 150 mg. Syrup (Zantac): 15 mg/mL. Tablets (Zantac 75): 75 mg (OTC). Tablets (Zantac 150): 150 mg (OTC). Tablets (Zantac): 150 mg, 300 mg. Infusion, Premixed: 50 mL (Zantac 50 mg). Injection (Zantac): 25 mg/mL.

#### INDICATIONS AND DOSAGES Duodenal ulcers, gastric ulcers,

#### Duodenal ulcers, gastric ulcers, gastroesophageal reflux disease (GERD)

PO

*Adults, Elderly.* 150 mg twice a day or 300 mg after evening meal or at bedtime. Maintenance: 150 mg at bedtime.

*Children aged 1 mo to 16 yr.* 2-4 mg/ kg/day in divided doses twice a day. Maximum: 300 mg/day. Maintenance maximum: 150 mg/day.

Erosive esophagitis PO

Ranitidine (Generic Name)

Adults, Elderly. 150 mg 4 times a day. Maintenance: 150 mg 2 times/ day or 300 mg at bedtime. *Children.* 5-10 mg/kg/day in 2 divided doses.

# Hypersecretory conditions PO

*Adults, Elderly.* 150 mg twice a day. May increase up to 6 g/day.

#### Usual parenteral dosage IV, IM

*Adults, Elderly.* 50 mg/dose q6-8h. Maximum: 400 mg/day.

*Children.* 2-4 mg/kg/day in divided doses q6-8h. Maximum: 200 mg/day.

#### Helicobacter pylori eradication PO

*Adults, Elderly.* 150 mg twice daily in combination with antibiotics. Used as alternative to PPIs.

#### Prevention of heartburn PO

*Adults, Elderly.* 75-150 mg before meals that cause heartburn. Maximum: 150 mg/day. Do not use

more than 14 days. *Children older than 12 yr.* 75 mg before meals that cause heartburn.

Maximum: 150 mg/day. Do not use more than 14 days.

#### Usual neonatal dosage PO

Neonates. 2 mg/kg/day in divided doses q12-24h.

IV

*Neonates.* Initially, 1.5 mg/kg/dose; then 1.5-2 mg/kg/day in divided doses q12-24h.

## Dosage in renal impairment

For patients with creatinine clearance < 50 mL/min, give 150 mg PO q24h or 50 mg IV or IM q18-24h.

## **OFF-LABEL USES**

Stress gastritis prophylaxis in critically ill patients.

## CONTRAINDICATIONS

Hypersensitivity or history of acute porphyria.

#### INTERACTIONS Drug

# Antacids: May decrease the absorption of ranitidine.

#### Atazanavir, cyanocobalamin:

Ranitidine may decrease absorption of these medications.

#### Cefuroxime, cefpodoxime:

Rantidine may decrease the absorption so separate

administration by 2 h. Cyclosporine: Increased effect/

toxicity of cyclosporine.

Ketoconazole: May decrease the absorption of ketoconazole. Warfarin: Variable effects on warfarin require monitoring of

#### PT/INR. Herbal

None known.

Food

Alcohol: Avoid since may worsen gastric irritation.

## **DIAGNOSTIC TEST EFFECTS**

Interferes with skin tests using allergen extracts. May increase hepatic function enzyme,  $\gamma$ -glutamyl transpeptidase, and serum creatinine levels.

## IV INCOMPATIBILITIES

Amphotericin B (Abelcet, AmBisome, Amphotec), caspofungin, diazepam, lansoprazole, pantoprazole, phenytoin.

## **IV COMPATIBILITIES**

Diltiazem (Cardizem), dobutamine, dopamine, heparin, hydromorphone (Dilaudid), insulin, lidocaine, lorazepam (Ativan), morphine, norepinephrine (Levophed), potassium chloride, propofol (Diprivan).

#### SIDE EFFECTS

**Occasional (2%)** 

Diarrhea. Rare (1%)

Constipation, headache (may be severe).

#### SERIOUS REACTIONS

• Reversible hepatitis and blood dyscrasias occur rarely.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired hepatic or renal function and in elderly patients. Ranitidine does cross the placenta and is distributed in breast milk; use with caution. No age-related precautions have been noted in children. Elderly patients are more likely to experience confusion, especially those with hepatic or renal impairment. Smoking should be avoided. Also avoid alcohol, aspirin, and coffee, all of which may cause GI distress, during ranitidine therapy.

Notify the physician if headache occurs. Blood chemistry laboratory test results, including BUN, serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels to assess hepatic and renal function, should be obtained before and during therapy. **Storage** 

#### storage

Store all products at room temperature. Protect injection from light. IV infusion (piggyback) is stable for 48 h at room temperature. Discard if discolored or precipitate forms. Administration

Take oral ranitidine without regard to meals; however, it is best given after meals or at bedtime. Give 2 h after ketoconazole, cefuroxime, or cefpodoxime administration.

Effervescent dose should be dissolved in at least 5 mL (1 tsp of water) and administered once

completely dissolved. Effervescent dose should not be chewed, swallowed whole, or dissolved on the tongue.

IV solutions normally appear clear and are colorless to yellow; slight darkening does not affect potency. For IV push, dilute each 50 mg with 20 mL 0.9% NaCl or D5W. For intermittent IV infusion (piggyback), dilute each 50 mg with 50 mL 0.9% NaCl or D5W. For IV infusion, dilute with 250-1000 mL 0.9% NaCl or D5W. Administer IV push over minimum of 5 min to prevent arrhythmias and hypotension. Infuse IV piggyback over 15-20 min. May give as continuous IV infusion over 24 h.

For IM use, ranitidine may be given undiluted. Give deep IM into large muscle mass, such as the gluteus maximus.

## Ranolazine

rah-nole'a-zine 🗙 🔛 Ranexa

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Cardiovascular agents, antianginals

#### **MECHANISM OF ACTION**

A piperazine compound that belongs in a group known as partial fattyacid oxidation (PFox) inhibitors. The exact mechanism of action is not clear. The drug may inhibit the late sodium current and reduce intracellular sodium and calcium overload in ischemic cardiac myocytes. No negative chronotropic or inotropic effects; minimal effects on heart rate and blood pressure. May prolong QT interval. *Therapeutic Effect:* Stabilizes angina, reducing pain and improving exercise tolerance. May be used with other antianginal agents.

## PHARMACOKINETICS

Variable absorption. Protein binding: 62%. Extensively metabolized in the liver by CYP3A4 and CYP2D6; drug and metabolites primarily (75%) excreted in the urine, excretion in feces (25%). Not known if removed by hemodialysis. *Half-life*: 7 h (prolonged in severe hepatic impairment).

## AVAILABILITY

*Tablets, Extended Release:* 500 mg, 1000 mg.

#### INDICATIONS AND DOSAGES

• Chronic stable angina PO

*Adults, Elderly.* 500 mg twice daily. May increase to 1000 mg twice daily based on clinical response.

#### Use with moderate inhibitors of CYP3A4

Limit maximal dose to 500 mg PO twice daily.

#### Hepatic impairment

Do not use in severe hepatic impairment.

• Severe renal impairment Avoid use.

## CONTRAINDICATIONS

Hypersensitivity to ranolazine, concurrent use of strong inhibitors or inducers of CYP3A4, severe hepatic disease including cirrhosis.

#### INTERACTIONS

#### Drug

**Alcohol:** May lead to decreased psychomotor function.

**Digoxin:** Ranolazine causes an increase in digoxin concentrations; digoxin dose may need adjustment. Monitor.

Strong CYP3A4 inducers (e.g., rifampin, rifabutin, rifapentine, phenobarbital, phenytoin, carbamazepine): May decrease the blood level and effects of ranolazine. Contraindicated. Strong CYP3A4 inhibitors (ketoconazole, itraconazole, clarithromycin, nefazodone, most protease inhibitors): Contraindicated. Likely to increase the blood level and effects of ranolazine and risk of OT prolongation. Moderate CYP3A4 inhibitors (cyclosporine, diltiazem, verapamil, aprepitant, ervthromycin, fluconazole): May increase the blood level and effects of ranolazine and risk of OT prolongation; use lower dose of ranolazine. CYP2D6 substrates (e.g., phenothiazines, TCAs): Ranolazine may decrease metabolism of these drugs. Drugs that prolong OTc interval: May have additive effects on EKG. Herbal St. John's wort: May decrease the blood level and effects of ranolazine.

Food Grapefruit juice: May increase ranolazine exposure. Avoid.

## DIAGNOSTIC TEST EFFECTS

Small reductions in hemoglobin A1c, but not efficacious for diabetes. Increases serum creatinine by 0.1 mg/dL, regardless of previous renal function; the increases in creatinine stabilize and do not progress.

## SIDE EFFECTS

Contraindicated.

#### Frequent (>4%)

Dizziness, headache, constipation, and nausea.

#### **Occasional (0.5%-2%)**

Asthenia, bradycardia, palpitations, tinnitus, vertigo, abdominal pain, dry mouth, vomiting, peripheral edema, dyspnea, hypotension.

#### Rare (< 0.5%)

Renal failure, eosinophilia, blurred vision, confusion, hematuria, hypoesthesia, paresthesia, tremor, pulmonary fibrosis, thrombocytopenia, leukopenia, and pancytopenia.

#### SERIOUS REACTIONS

Severe allergic reactions (e.g., angioedema) occur occasionally.
QT prolongation and proarrhythmia.

#### **PRECAUTIONS & CONSIDERATIONS**

There is no role for ranolazine in treating acute coronary syndromes; the drug is no more effective than placebo for these conditions. Caution is warranted in patients with a history of familial QT prolongation or with risks for OT interval prolongation, such as taking other drugs that may prolong the OT interval. Electrolyte imbalances should be corrected before use. Use cautiously in patients with mild to moderate hepatic or renal disease. Use in pregnancy only when clearly needed; no data. It is not known if the drug is excreted in breast milk. Safety and efficacy have not been evaluated in children. Use cautiously in elderly patients.

Ranolazine may cause dizziness, so patients should avoid hazardous tasks until the effects of the drug are known. Patients should check with prescriber prior to OTC medication use. Compliance is important to avoid angina. Assess therapeutic response, including BP, regularity of pulse, decrease in anginal pain, and improvement in exercise tolerance.

#### Storage

Keep tightly closed at cool room temperature.

#### Administration

May take ranolazine without regard to meals. Do not administer with grapefruit juice. Swallow whole; do not break, crush, or chew extended-release tablets. Commonly used with drugs like  $\beta$ -blockers, nitrates, calcium channel blockers, anti-platelet therapy, lipid-lowering therapy, ACE inhibitors, or angiotensin receptor blockers.

## **Rasagiline**

ra-sa'ji-leen Azilect Do not confuse rasagiline with selegiline.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, dopaminergics, selective MAO-B inhibitors

#### MECHANISM OF ACTION

An antiparkinsonian agent that irreversibly and selectively inhibits the activity of monoamine oxidase type B, the enzyme that breaks down dopamine, thereby increasing dopaminergic action in the brain. *Therapeutic Effect*: Relieves signs and symptoms of Parkinson's disease.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract; AUC not significantly affected by food; bioavailability 36%. Crosses the blood-brain barrier. Metabolized in the liver, primarily by CYP1A2, prior to excretion. Excreted primarily in urine (62%)

Rasagiline (Generic Name), Azilect (Brand Name)

and feces (7%) as metabolites. *Half-life*: 3 h; little correlation between half-life and duration of MAO-B inhibition.

## AVAILABILITY

Tablets: 0.5 mg, 1 mg.

# INDICATIONS AND DOSAGES Monotherapy for Parkinson's disease

PO Adults, Elderly. 1 mg once daily.

#### Parkinson's disease with levodopa/carbidopa therapy PO

*Adults, Elderly.* Initially, 0.5 mg once daily. If sufficient response not attained, may increase to 1 mg once daily. Levodopa therapy may also require dose adjustments when added.

## Patients taking concomitant CYP1A2 inhibitors or with mild hepatic impairment

*Adults, Elderly.* Do not exceed 0.5 mg once daily.

## CONTRAINDICATIONS

Hypersensitivity to rasagiline. Concomitant use of meperidine, dextromethorphan, tramadol, methadone, or propoxyphene. Also, do not give with linezolid, selegiline, and other MAOIs (whether selective or nonselective) within 14 days, as well as cyclobenzaprine or St. John's wort.

#### INTERACTIONS

#### Drug

CYP1A2 inhibitors (e.g., ciprofloxacin, amiodarone, mexiletine, norfloxacin, tacrine, tizanidine, zileuton): Use lower dose of rasagiline since metabolism is decreased.

**Buspirone:** Manufacturer of buspirone contraindicates use of MAOIs.

#### SSRIs, SNRIs, other

antidepressants: May cause serotonin syndrome. Fluoxetine and fluvoxamine should not be used concurrently. Manufacturer recommends 14 days of wash-out between use of any antidepressant and use of rasagiline.

**Dextromethorphan:** Psychosis and bizarre behavior reported. Contraindicated.

Meperidine, tramadol,

propoxyphene, methadone: May cause diaphoresis, excitation, hypertension or hypotension, coma, and even death. Contraindicated. Linezolid, selegiline, and other

MAOIs (selective or nonselective): May cause additive MAOI effects and hypertensive crisis. Contraindicated. Sympathomimetic medications (e.g., pseudoephedrine): May cause hypertensive crisis; use not recommended.

#### Herbal

Ma huang: Contains ephedra (see sympathomimetic interactions). Avoid. St. John's wort: Contraindicated; may cause serotonin syndrome or hypertensive crisis.

Tryptophan: May cause hypertensive crisis. Avoid. Food

Tyramine-rich foods: Dietary tyramine restriction is not ordinarily required. However, certain foods (e.g., aged cheeses, such as Stilton cheese, or certain wines) may contain very high amounts (i.e., > 150 mg) of tyramine and could potentially cause a hypertensive "cheese" reaction.

#### DIAGNOSTIC TEST EFFECTS None known.

None known

## SIDE EFFECTS

## Frequent (> 3%)

Dyskinesia, weight loss, orthostatic hypotension, vomiting, anorexia,

headache, arthralgia, abdominal pain, nausea, dyspepsia, constipation, dry mouth, rash, abnormal dreams, falls/ accidents.

#### Occasional (2%-3%)

Depression, confusion, fever, gastroenteritis, arthritis, ecchymosis, malaise, paresthesia, vertigo.

#### Rare (1%)

Headache, myalgia, anxiety, hallucinations, diarrhea, insomnia, increased libido.

## SERIOUS REACTIONS

 Symptoms of overdose may vary from CNS depression, characterized by sedation, apnea, cardiovascular collapse, and death, to severe paradoxical reactions, such as hallucinations, tremor, and seizures.

• Other serious effects may include involuntary movements, psychosis, delusions, and hostility.

• Syndrome of hyperpyrexia similar to neuroleptic malignant syndrome.

 Impulse control problems, such as hypersexuality, pathological gambling, shopping, or other compulsive behaviors.

• Increased rate of melanoma in Parkinson's patients, cause unknown.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac disease, hypertension, dementia, history of peptic ulcer disease, profound tremor, psychosis, and tardive dyskinesia. It is unknown whether rasagiline crosses the placenta or is distributed in breast milk. The safety and efficacy of rasagiline have not been established in children. No age-related precautions have been noted in elderly patients. Monitor for melanomas on a regular basis.

Dizziness, drowsiness, lightheadedness, and dry mouth are common side effects of the drug but will diminish or disappear with continued treatment. Alcohol and tasks that require mental alertness or motor skills should be avoided. Change positions slowly to prevent orthostatic hypotension. Notify the physician if agitation, headache, increased BP, hyperpyrexia, lethargy, or confusion occurs. Baseline vital signs should be assessed. Relief of symptoms, such as improvement of masklike facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should be assessed during treatment.

#### Storage

Store at room temperature. Administration

May administer with or without food. Be aware that tyramine-rich foods, such as certain alcoholic beverages and aged cheese, should be limited to prevent a hypertensive reaction.

#### Rasburicase rass-bur'e-case

Elitek 🍨 Fasturtec

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Antihyperuricemic, uricase enzyme

## **MECHANISM OF ACTION**

A recombinant form of urate oxidase, an enzyme not endogenous to humans that catalyzes enzymatic oxidation of uric acid into a readily excreted metabolite, allantoin, thus lowering high serum uric acid levels. *Therapeutic Effect:* Reduces uric acid concentrations in both serum and urine.

## PHARMACOKINETICS

No significant accumulation occurs over 5 days of IV infusion dosing. The enzyme is cleared metabolically. Pharmacokinetic parameters are similar in adult and pediatric patients. *Half-life*: 16-20 h.

## AVAILABILITY

*Powder for Injection (Elitek):* 1.5 mg, 7.5 mg.

# INDICATIONS AND DOSAGES To prevent uric acid nephropathy during chemotherapy

IV INFUSION

Adults and Children 2 yr and older. 0.2 mg/kg IV over 30 min given once daily for up to 5 days. Only a single course is given.

## CONTRAINDICATIONS

History of the following reactions to rasburicase: anaphylaxis, severe hypersensitivity, hemolysis, methemoglobinemia. Mannitol hypersensitivity. Glucose-6-phosphate dehydrogenase (G6PD) deficiency.

## INTERACTIONS

#### Drug

Allopurinol: Rasburicase cannot break down xanthine and hypoxanthine, and the increased renal load can result in xanthine nephropathy and renal calculi.

## Herbal

None known.

#### Food

None known.

## DIAGNOSTIC TEST EFFECTS

! Interference with uric acid measurements: Rasburicase enzymatically degrades uric acid in blood samples left at room temperature. Collect blood sample in a prechilled tube containing heparin and immediately immerse and maintain sample in an ice water bath. Assay plasma sample within 4 h of collection. These directions are important since treatment is based on uric acid measurements.

Rasburicase may cause methemoglobinemia, hemolysis, or lowered WBC count. Increases serum phosphorus.

## IV INCOMPATIBILITIES

Do not mix or infuse rasburicase with any other medications.

## SIDE EFFECTS

#### Frequent

Vomiting, nausea, pyrexia, peripheral edema, anxiety, headache, abdominal pain, constipation, and diarrhea.

#### Occasional

Rash, inflammation of mucous membranes.

## SERIOUS REACTIONS

• Severe hypersensitivity, including anaphylaxis.

Methemoglobinemia.

· Hemolysis or neutropenia (rare).

• Hyperphosphatemia occurs in 9%-10% of patients.

## **PRECAUTIONS & CONSIDERATIONS**

Hydrogen peroxide, one of the by-products of breakdown of uric acid to allantoin, can induce hemolytic anemia or methemoglobinemia, especially in patients with G6PD deficiency or methemoglobin reductase deficiency. Appropriate patient monitoring and support measures such as transfusions or methyleneblue administration in the case of methemoglobinemia should be initiated. Use with caution

in bone marrow suppression or neutropenia. Pregnant women should receive rasburicase only if clearly needed. It is unknown whether rasburicase crosses the placenta. Rasburicase is excreted in breast milk; use with caution in nursing women. No age-related precautions have been noted in children or in elderly patients. Children < 2 yr were more likely not to achieve target uric acid concentrations at 48 h. There are insufficient data to determine the efficacy and safety of rasburicase in neonates and infants; only seven infants between 1 and 6 mo of age were included in clinical trials. Young children may be more susceptible to side effects.

High fluid intake (3000 mL/ day) should be encouraged; intake and output should be monitored. Urine output should be at least 2000 mL/day; check urine for cloudiness and unusual color and odor. CBC, hepatic enzyme test results, and serum uric acid levels should also be assessed. Be sure to follow recommended methods for samples and processing. The drug should be discontinued if rash or other evidence of allergic reaction appears. Avoid tasks that require mental alertness or motor skills until response to the drug has been established.

#### Storage

Refrigerate unreconstituted vials, protect from light, and do not freeze. Once diluted as an infusion, may refrigerate and use within 24 h of preparation. Do not use if precipitate forms or solution is discolored.

#### Administration

For intravenous (IV) infusion use only. Reconstitute only with the diluent provided. Reconstitute with 1 mL of diluent (1.5 mg vial) or 5 mL of diluent (7.5 mg vial). Gently swirl the vial to mix; do not shake. Must be further diluted. Withdraw the needed dosage and mix with 0.9% NaCl for injection to achieve a final volume of 50 mL.

Infuse IV over 30 min. No filters should be used for the infusion. Use a different line than the one used for other medications. If use of a separate line is not possible, the line should be flushed with at least 15 mL of 0.9% NaCl prior to and after infusion with rasburicase.

## Repaglinide

re-pagʻlih-nide Prandin 🍁 GlucoNorm

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, meglitinides

#### MECHANISM OF ACTION

An antihyperglycemic that stimulates release of insulin from  $\beta$ -cells of the pancreas by depolarizing  $\beta$ -cells, leading to an opening of calcium channels. Resulting calcium influx induces insulin secretion. *Therapeutic Effect:* Lowers blood glucose concentration.

#### PHARMACOKINETICS

Rapidly, completely absorbed from the GI tract. Protein binding: > 98%. Metabolized in the liver to inactive metabolites. Excreted primarily in feces with a small amount in urine. Unknown whether removed by hemodialysis. *Half-life:* 1 h.

Repaglinide (Generic Name), Prandin (Brand Name)

## AVAILABILITY

Tablets: 0.5 mg, 1 mg, 2 mg.

## INDICATIONS AND DOSAGES Diabetes mellitus type 2

PO

Adults, Elderly. 0.5-4 mg with each meal, up to 4 times/day. Maximum: 16 mg/day. NOTE: The starting dose for patients not previously treated or with HbA1C < 8% is 0.5 mg taken with meals. For patients previously treated or with HbA1C  $\geq$  8.0%, the initial dose is 1-2 mg taken with each meal.

If patient has CrCl < 40 mL/min, begin with the 0.5 mg dose and carefully titrate.

## CONTRAINDICATIONS

Diabetic ketoacidosis, type 1 diabetes mellitus, coadministration of gemfibrozil, known hypersensitivity.

## INTERACTIONS

#### Drug

Agents inhibiting CYP2C8 (e.g., gemfibrozil, montelukast, trimethoprim): Increase repaglinide concentrations. Dose adjustment of repaglinide may be necessary. Gemfibrozil is contraindicated. Agents inhibiting CYP3A4 (e.g., azole antifungals, macrolide antibiotics, nefazodone, protease inhibitors): May increase the effects of repaglinide. Dose adjustment of repaglinide may be necessary. β-Blockers, MAOIs, NSAIDs, probenecid, salicylates, sulfonamides, warfarin: May promote hypoglycemia β-blockers; may additionally mask signs of hypoglycemia. Carbamazepine, phenobarbital,

Carbamazepine, phenobarbital, phenytoin, rifampin, nevirapine, rifamycins: May decrease the effects of repaglinide.

## **Corticosteroids, estrogens, phenothiazines, and others:** May promote hyperglycemia.

## Herbal

**Gymenma, garlic:** May cause hypoglycemia. **St. John's wort:** May decrease repaglinide levels.

## **DIAGNOSTIC TEST EFFECTS**

Expect lowered blood glucose and also lowered HbAIC over time. Rarely, increases in liver enzymes occur.

## SIDE EFFECTS

#### Frequent (6%-16%)

Hypoglycemia, upper respiratory tract infection, headache, rhinitis, bronchitis, back pain.

## Occasional (3%-5%)

Diarrhea, dyspepsia, sinusitis, nausea, arthralgia, urinary tract infection.

#### Rare (2%)

Constipation, vomiting, paresthesia, allergy.

## SERIOUS REACTIONS

• Hypoglycemia occurs in 16% to 31% of patients.

• Chest pain occurs rarely, but risk of myocardial ischemia may increase with use with NPH insulin. Avoid.

• Other rare serious reactions have included pancreatitis, Stevens-Johnson syndrome, and jaundice with hepatitis.

## **PRECAUTIONS & CONSIDERATIONS**

Repaglinide is not indicated for use in combination with NPH insulin (increases risk of myocardial ischemia), but may be used along with metformin or a thiazolidinedione. There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction. Caution is warranted in patients with hepatic or moderate to severe renal impairment. It is unknown whether repaglinide is distributed in breast milk. The safety of repaglinide use during prenancy or lactation has not been established. Safety and efficacy of repaglinide have not been established in children. No age-related precautions have been noted in the elderly, but hypoglycemia may be more difficult to recognize in this patient population.

Food intake and blood glucose should be monitored before and during therapy. Be aware of the signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store tablets at room temperature. Administration

Ideally, take repaglinide within 15 min of a meal 2-4 times/ day; however, it may be taken immediately or as long as 30 min before a meal. Allow at least 1 wk to elapse to assess response to the drug before new dosage adjustment is made.

#### Reserpine

★ reh-zer'peen Do not confuse with Risperdal, risperidone.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Antihypertensives, Rauwolfia alkaloid, antiadrenergics, peripheral

#### **MECHANISM OF ACTION**

An antihypertensive that depletes stores of catecholamines and 5-hydroxytryptamine in many organs, including the brain and adrenal medulla. Depression of sympathetic nerve function results in a decreased heart rate and a lowering of arterial BP. Depletion of catecholamines and 5-hydroxytryptamine from the brain is thought to be the mechanism of the sedative and tranquilizing properties. *Therapeutic Effects:* Decrease BP and heart rate; sedation.

## PHARMACOKINETICS

Characterized by slow onset of action and sustained effects. Both cardiovascular and central nervous system (CNS) effects may persist for a period following withdrawal of the drug. Mean maximum plasma levels attained after a median of 3.5 h. Bioavailability approximately 50% of that of a corresponding intravenous dose. Protein binding: 96%. *Half life*: 33 h.

## AVAILABILITY

Tablets: 0.25 mg, 0.1 mg.

Reserpine (Generic Name)

# INDICATIONS AND DOSAGES Hypertension

#### PO

*Adults*. Usual initial dosage 0.5 mg daily for 1 or 2 wks. For maintenance, reduce to 0.1-0.25 mg daily.

*Children*. Reserpine is not recommended for use in children.

#### Psychiatric disorders PO

*Adults.* Initial dosage, 0.5 mg daily; may range from 0.1 to 1 mg. Adjust dosage upward (in increments of 0.1-0.25 mg) or downward according to response.

## CONTRAINDICATIONS

Hypersensitivity, mental depression or history of mental depression (especially with suicidal tendencies), active peptic ulcer, ulcerative colitis, patients receiving electroconvulsive therapy.

## INTERACTIONS

#### Drug

**β-Blockers:** Reserpine may increase effect.

CNS depressants/alcohol: Reserpine may increase CNS effects. Levodopa, quinidine,

## procainamide, digitalis glycosides: Reserpine may increase effects/

toxicity, causing cardiac rhythm disturbance. Use caution.

MAO inhibitors: May cause hypertensive reactions. Avoid. Sympathomimetics: Action of direct-acting amines (epinephrine, isoproterenol, phenylephrine, metaraminol) is prolonged and action of indirect-acting amines (ephedrine, tyramine, amphetamines) is inhibited. Tricyclic antidepressants: May

increase antihypertensive effects. Herbal

**Ephedra/yohimbe:** May worsen hypertension.

### Valerian, St. John's wort, kava

kava, gotu kola: May increase CNS depression. Garlic: May have increased antihypertensive effects. Food

Alcohol: May increase CNS depression.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Occasional

Burning in the stomach, nausea, vomiting, diarrhea, dry mouth, nosebleed, stuffy nose, dizziness, headache, nervousness, nightmares, drowsiness, muscle aches, weight gain, redness of the eyes.

## Rare

Difficulty breathing, swelling, gynecomastia, decreased libido.

## SERIOUS REACTIONS

- · Irregular heartbeat.
- · Heart problems.
- · Feeling faint.
- · Severe mental depression.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of peptic ulcer, ulcerative colitis, or gallstones (biliary colic may be precipitated and GI secretions and motility increased). Use caution in renal impairment since reserpine can lower glomerular filtration. If patient will receive surgery, preoperative withdrawal of reserpine does not ensure against circulatory instability; alert anesthesiologist of hypotensive risk. Anticholinergic and/or adrenergic drugs (e.g., metaraminol, norepinephrine) have been employed to treat adverse effects. Be aware that reserpine is excreted in the breast milk. Not a drug of choice
in children, as they are susceptible to the side effects; usually lastline treatment; see manufacturer information. Elderly patients may be more susceptible to the hypotensive effects of reserpine. A low-salt diet should be followed. Change positions slowly to avoid orthostatic hypotension.

Dizziness, loss of appetite, diarrhea, upset stomach, vomiting, headache, dry mouth, and decreased sexual ability may occur. Notify physician immediately if depression, nightmares, fainting, slow heartbeat, chest pain, or swollen ankles and feet occur. Watch for the emergence of depressive symptoms, and alert physician for evaluation if they occur.

#### Storage

Store at room temperature. Administration

Take with food or milk to avoid GI irritation. Take at the same time each day.

## Retapamulin

Re-tap'a-muel'in ALTABAX Do not confuse ALTABAX with Bactroban.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Topical antiinfective, pleuromutilin

#### **MECHANISM OF ACTION**

A pleuromutilin antibacterial agent that selectively inhibits bacterial protein synthesis by interacting at a site on the 50S subunit of the bacterial ribosome through an interaction that is different from that of other antibiotics. Effective against *Staphylococcus aureus* (only methicillin-susceptible strains) or *Streptococcus pyogenes. Therapeutic Effect:* Prevents bacterial growth and replication.

## PHARMACOKINETICS

Systemic exposure through intact and abraded skin is low. Roughly 11% of patients will have a measurable level just above the lower limit of quantitation 0.5 ng/mL. The liver metabolizes any drug absorbed, via CYP3A4. Excretion pathways have not been determined due to low clinical significance of absorption.

## AVAILABILITY

Ointment: 1% (ALTABAX).

# INDICATIONS AND DOSAGES Impetigo due to susceptible isolates

TOPICAL Adults, Elderly, Children over 9 mo. Apply a thin layer to the affected area (up to 100  $\text{cm}^2$  in adults or 2% total BSA in children) twice daily for 5 days.

## **OFF-LABEL USES**

Treatment of infected eczema, folliculitis, minor bacterial skin infections.

## CONTRAINDICATIONS

Severe sensitivity to retapamulin.

## INTERACTIONS

Drug, Herbal, and Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Occasional

Application site irritation or pruritus.

#### Rare

Rash, contact dermatitis. Epistaxis if inadvertently applied to nasal mucosa.

## SERIOUS REACTIONS

• Superinfection may result in bacterial or fungal infections, especially with prolonged or repeated therapy.

• Discontinue in the event of sensitization or severe local irritation (rare).

#### PRECAUTIONS & CONSIDERATIONS

It is unknown whether retapamulin crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in children over 9 mo of age or elderly patients. Isolation precautions should be in effect for those with highly communicable conditions or resistant organisms.

Keep linens and clothing clean and dry; change frequently. Avoid contact of personal items with others. Watch for improvement in lesions (size of area affected, number of lesions, drying of lesions) and improvements in skin symptoms (e.g., itching).

#### Storage

Store at room temperature.

#### Administration

For external use on the skin only. Not for intranasal use. Impetigo is spread by direct contact with moist discharges. Apply to affected areas; glove and gown if facility requires. Cover affected areas with gauze dressing if desired. Concurrent use of other topical products on the same application site has not been studied and is not recommended.

#### **Reteplase**

reh'te-place Retavase Do not confuse reteplase or Retavase with Restasis.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

Classification: Thrombolytics

## **MECHANISM OF ACTION**

A tissue plasminogen activator that activates the fibrinolytic system by directly cleaving plasminogen to generate plasmin, an enzyme that degrades the fibrin of the thrombus. *Therapeutic Effect:* Exerts thrombolytic action.

#### PHARMACOKINETICS

Rapidly cleared from plasma. Eliminated primarily in the feces and urine. *Half-life:* 13-16 min.

#### AVAILABILITY

*Powder for Injection:* 10.4 units (18.1 mg).

## INDICATIONS AND DOSAGES Acute myocardial infarction (MI)

IV BOLUS *Adults, Elderly.* 10 units over 2 min; repeat in 30 min.

## CONTRAINDICATIONS

Active internal bleeding, AV malformation or aneurysm, bleeding diathesis, history of cerebrovascular accident, intracranial neoplasm, recent intracranial or intraspinal surgery, or trauma, severe uncontrolled hypertension.

## INTERACTIONS

#### Drug

Aminocaproic acid: May decrease the effectiveness of reteplase.

Clopidogrel, heparin, lowmolecular-weight heparin, nonsteroidal anti-inflammatory agents (NSAIDs), platelet aggregation antagonists (such as abciximab, aspirin, dipyridamole), ticlopidine, warfarin: Increase the risk of bleeding.

#### Herbal

**Ginkgo biloba:** May increase the risk of bleeding.

None known.

## DIAGNOSTIC TEST EFFECTS

May decrease fibrinogen and serum plasminogen levels.

## IV INCOMPATIBILITIES

Do not mix with other medications.

#### SIDE EFFECTS

#### Frequent

Bleeding at superficial sites, such as venous injection sites, catheter insertion sites, venous cutdowns, arterial punctures, and sites of recent surgical procedures, gingival bleeding.

## R

#### SERIOUS REACTIONS

 Rare hypersensitivity, such as anaphylaxis.

• Bleeding at internal sites may occur, including intracranial, retroperitoneal, GI, genitourinary, and respiratory sites.

• Lysis or coronary thrombi may produce atrial or ventricular arrhythmias and stroke.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted with recent (within past 10 days) major surgery or GI bleeding, organ biopsy, trauma, cerebrovascular disease, cardiopulmonary resuscitation, diabetic retinopathy, endocarditis, left heart thrombus, occluded AV cannula at infected site, severe hepatic or renal disease, thrombophlebitis, in elderly patients, and in pregnant women or within the first 10 postpartum days. It is unknown whether reteplase is distributed in breast milk. Safety and efficacy of reteplase have not been established in children. Elderly patients are more susceptible to bleeding. Use reteplase cautiously in this population. An electric razor and a soft toothbrush should be used to reduce the risk of bleeding.

Notify the physician of black or red stool, coffee-ground vomitus, dark or red urine, redspeckled mucus from cough, chest pain, headache, palpitations, or shortness of breath. Continuous cardiac monitoring should be performed. BP and pulse and respiration rates should be checked every 15 min until stable; then check hourly. Serum creatine kinase (CK), and CK-MB concentrations, 12-lead ECG, electrolyte levels, hematocrit, platelet count, aTT, aPTT, PT, and fibrinogen level should be evaluated before therapy starts. Storage

Unopened kits are stored at room temperature in original carton sealed to protect from light.

Use within 4 h of reconstitution. Discard any unused portion.

#### Administration

Reconstitute only with sterile water for injection immediately before use. Reconstituted solution contains 1 unit/mL. Do not shake the vial. Slight foaming may occur; let stand for a few minutes to allow bubbles to dissipate. Give through a dedicated IV line. If injected through an IV line containing heparin, use a 0.9% NaCL or D5W solution flush prior to and following the reteplase injection. Give as a 10-unit plus 10-unit double bolus, with each IV bolus administered over 2 min. Give the second bolus 30 min after the first bolus injection. Do not add other medications to the bolus injection solution. Do not give second IV bolus if serious bleeding occurs after first bolus.

## Ribavirin

rye-ba-vye'rin Copegus, Rebetol, RibaPak, Ribasphere, Virazole Virazole Do not confuse ribavirin with riboflavin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

Classification: Antivirals

#### **MECHANISM OF ACTION**

A synthetic nucleoside that inhibits replication of RNA and DNA viruses, inhibits influenza virus RNA polymerase activity, and interferes with expression of messenger RNA. *Therapeutic Effect*: Inhibits viral protein synthesis and replication of viral RNA and DNA.

#### PHARMACOKINETICS

Readily absorbed from the respiratory tract or GI tract. Protein binding: None. Widely distributed into erythrocytes. Metabolized in the liver and intracellularly. Excreted in urine and feces. Unknown whether removed by hemodialysis. *Half-life:* Inhalation 6.5-11 h (children), oral capsules 44-298 h, oral tablets 120-170 h.

## AVAILABILITY

Capsules (Rebetol, Ribasphere): 200 mg. Tablets (Copegus): 200 mg. Tablet (dose pack) (RibaPak): 400 mg, 600 mg and RibaPak 400/600: 400 mg, 600 mg. Powder for Nebulizer Solution (Aerosol [Virazole]): 6 g. Oral Solution (Rebetol): 40 mg/mL.

#### INDICATIONS AND DOSAGES • Chronic hepatitis C

NOTE: Dose based on weight and genotype status. See prescribing information for details. PO (COPEGUS WITH PEGASYS) Adults. Monoinfection, genotype 1, 4: < 75 kg: 1000 mg/day in 2 divided doses,  $\geq$  75 kg: 1200 mg/day in 2 divided doses; Monoinfection, genotype 2, 3: 800 mg/day in 2 divided doses; Coinfection with HIV: 800 mg/day. PO (REBETROL WITH INTRONA) Adults  $\leq$  75 kg. 400 mg in AM, 600 mg in рм. Adults > 75 kg. 600 mg in AM, 600 mg in рм. PO (REBETROL WITH PEGINTRON) Adults. Range is 800-1400 mg/day (given in divided doses AM and PM). Exact daily amount is based on body weight. See manufacturer's prescribing literature. USUAL PEDIATRIC DOSE (REBETROL WITH PEGINTRON OR INTRON A) Children 3-17 years and  $\leq 61$  kg. 15 mg/kg/day (divided doses AM and PM). See adult Rebetrol dose if > 61 kg.

Ribavirin (Generic Name)

## Severe lower respiratory tract infection caused by respiratory syncytial virus (RSV)

INHALATION

*Children, Infants.* Use with Viratek small-particle aerosol generator at a concentration of 20 mg/mL (6 g reconstituted with 300 mL sterile water) over 12-18 h/day for 3-7 days.

## **OFF-LABEL USES**

Treatment of influenza A or B and West Nile virus, IV available from CDC for severe acute respiratory syndrome (SARS).

#### CONTRAINDICATIONS

Pregnant women and men whose female partners are pregnant; known hypersensitivity reactions to ribavirin; autoimmune hepatitis; hemoglobinopathies; renal impairment with CrCl < 50 mL/ min; significant uncompensated cardiac disease; active pancreatitis; coadministration with didanosine. Monotherapy with ribavirin is not effective for chronic hepatitis C; must use with interferon. Do not use at all in cirrhotic chronic hepatitis C with hepatic decompensation (Child-Pugh score > 6) before or during treatment, or in cirrhotic patients coinfected with HIV.

#### INTERACTIONS

#### Drug

**Didanosine:** May increase the risk of pancreatitis and peripheral neuropathy and decrease the effects of didanosine.

Interferons, alpha: May increase the risk of hemolytic anemia. Live influenza vaccine: May diminish the effects of the vaccine. Nucleoside analogs (including adefovir, didanosine, emtricitabine, entecavir, lamivudine, stavudine, zalcitabine, zidovudine): May increase the risk of lactic acidosis. Stavudine: May decrease effect of stavudine. Herbal None known.

Food None known.

.....

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Frequent (> 10%)

Dizziness, headache, fatigue, fever, insomnia, irritability, depression, emotional lability, impaired concentration, alopecia, rash, pruritus, nausea, anorexia, dyspepsia, vomiting, decreased hemoglobin, hemolysis, arthralgia, musculoskeletal pain, dyspnea, sinusitis, flu-like symptoms. Occasional (1%-10%)

Nervousness, altered taste, weakness.

## SERIOUS REACTIONS

 Cardiac arrest, apnea, ventilator dependence, bacterial pneumonia, pneumonia, and pneumothorax occur rarely.

• Anemia usually occurs in 1-2 wks of starting treatment.

 When used with interferon: severe depression and suicidal ideation, hemolytic anemia, bone marrow suppression, autoimmune and infectious disorders, pulmonary dysfunction, pancreatitis, and diabetes.

#### PRECAUTIONS & CONSIDERATIONS

Use inhaled ribavirin cautiously with asthma, chronic obstructive pulmonary disease (COPD), and those requiring mechanical ventilation. Caution should be used with oral ribavirin in the elderly and with cardiac or pulmonary disease, renal impairment, or a history of psychiatric disorders.

Report any difficulty breathing or itching, redness, or swelling of the eyes. Respiratory tract secretions should be obtained for diagnostic testing before giving the first dose of ribavirin or at least during the first 24 h of therapy. Complete blood count (CBC) with differential should be obtained. Pretreat and test women of childbearing age monthly for pregnancy. Adequate contraception must be practiced by males and females during treatment. Hematology reports should be assessed for anemia at wks 2 and 4 and periodically thereafter as needed. Storage

Nebulizer solution is stable for 24 h at room temperature. Discard solution for nebulization after 24 h. Discard solution if discolored or cloudy. Oral solution may be stored at room temperature or refrigerated. Capsules and tablets are stored at room temperature.

#### Administration

Ribavirin may be given via nasal or oral inhalation. Add 50-100 mL sterile water for injection or inhalation to 6-g vial. Transfer to a flask, serving as reservoir for aerosol generator. Further dilute to final volume of 300 mL, giving a solution concentration of 20 mg/mL. Use only aerosol generator available from the drug manufacturer. Do not give at the same time with other drug solutions for nebulization. Discard reservoir solution when fluid levels are low and at least every 24 h. Be aware that there is controversy over the safety of administering ribavirin to ventilator-dependent patients; only experienced personnel should administer the drug. Precipitation of the drug in respiratory equipment may occur.

! Health care workers who are pregnant or trying to get pregnant

should avoid contact with aerosolized ribavirin.

Capsules should not be opened, crushed, chewed, or broken. Capsules or oral solution may be taken without regard to food. Tablets should be given with food.

#### Rifabutin

rif'a-byoo'ten Mycobutin **Do not confuse rifabutin with** rifampin.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: B

#### Classification:

Antimycobacterials, rifamycins

#### **MECHANISM OF ACTION**

An antitubercular agent that inhibits DNA-dependent RNA polymerase. Broad spectrum of antimicrobial activity, including activity against mycobacteria such as *Mycobacterium avium* complex (MAC). *Therapeutic Effect:* Prevents MAC disease.

### PHARMACOKINETICS

Readily absorbed from the GI tract (high-fat meals delay absorption). Protein binding: 85%. Widely distributed. Crosses the blood-brain barrier. Extensive intracellular tissue uptake. Metabolized in the liver to active and inactive metabolites. Excreted in urine; eliminated in feces. Unknown if removed by hemodialysis. *Half-life:* 16-69 h.

#### AVAILABILITY

Capsules: 150 mg.

Rifabutin (Generic Name), Mycobutin (Brand Name)

## INDICATIONS AND DOSAGES

#### Prevention of MAC disease (first episode or recurrent episodes) in HIV-infected patients with < 50 CD4+ cells/mm<sup>3</sup>

PO

*Adults, Elderly.* 300 mg once daily or in 2 divided doses if GI upset occurs.

Children  $\ge 6$  yr of age: 5 mg/kg (maximum: 300 mg) once daily per CDC.

#### Dosage in renal impairment

Dosage is modified based on creatinine clearance. If creatinine clearance is < 30 mL/min, reduce dosage by 50%.

## **OFF LABEL USES**

Alternative treatment for tuberculosis or active MAC infection in adults and children.

#### CONTRAINDICATIONS

Active tuberculosis; hypersensitivity to other rifamycins, including rifampin.

## INTERACTIONS

NOTE: Rifabutin may decrease the effects of numerous drugs, including CYP3A4 substrates.

#### Drug

Antiretroviral protease inhibitors for HIV: May increase rifabutin concentrations and many labels suggest rifabutin dosage decrease with concurrent use.

#### Clarithromycin, itraconazole, fluconazole: May increase rifabutin

concentrations. Clopidogrel: May increase

therapeutic effect of clopidogrel.

#### CYP3A4 inducers (carbamazepines, phenobarbital,

phenytoin): May decrease effects of rifabutin.

**Isoniazid:** May increase the risk of hepatotoxicity.

Oral contraceptives: May decrease contraceptive effectiveness. Zidovudine: May decrease blood concentration of zidovudine but does not affect the drug's inhibition of HIV. Herbal None known.

#### Food

**High-fat meals:** May decrease the rate of absorption.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

### Frequent (30%)

Red-orange or red-brown discoloration of urine, feces, saliva, skin, sputum, sweat, or tears. Soft contact lenses may be permanently stained.

#### Occasional (3%-11%)

Rash, nausea, abdominal pain, diarrhea, dyspepsia, belching, headache, altered taste, uveitis, corneal deposits.

## Rare (< 2%)

Anorexia, flatulence, fever, myalgia, vomiting, insomnia.

## SERIOUS REACTIONS

 Hepatitis and thrombocytopenia occur rarely. Anemia and neutropenia may also occur.

• Uveitis may cause visual impairment.

• Potential for superinfection, such as *Clostridium difficile*-associated diarrhea.

## **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with liver or renal impairment. The safety of this drug for use in children is not established. Be aware that it is unknown whether rifabutin crosses the placenta or is excreted in breast milk. No age-related precautions have been noted in elderly patients. Avoid crowds and those with known infection.

Feces, perspiration, saliva, skin, sputum, tears, and urine may be discolored red-brown or red-orange during drug therapy. Soft contact lenses may be permanently discolored. Rifabutin may decrease the effectiveness of oral contraceptives. Alternative methods of contraception should be used. Expect to perform a biopsy of suspicious nodes, if present. Also, expect to obtain blood or sputum cultures and a chest x-ray to rule out active tuberculosis. If ordered, obtain baseline complete blood count (CBC) and liver function test results. Storage

Store at room temperature. Administration

Should take on an empty stomach. Take with food if GI irritation occurs. May mix capsule contents with applesauce if unable to swallow capsules whole.

## Rifampin

rye'fam-pin Rifadin M Rofact Do not confuse rifampin with rifabutin, Rifamate, rifapentine, or Ritalin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification:

Antimycobacterials, rifamycins

## **MECHANISM OF ACTION**

An antitubercular agent that interferes with bacterial RNA synthesis by binding to DNA-dependent RNA polymerase, thus preventing its attachment to DNA and blocking RNA transcription. *Therapeutic Effect:* Bactericidal in susceptible microorganisms.

## PHARMACOKINETICS

Well absorbed from the GI tract (food delays absorption). Protein binding: 80%. Widely distributed. Metabolized in the liver to active metabolite. Eliminated primarily by the biliary system. Not removed by hemodialysis. *Halflife*: 3-4 h (increased in hepatic impairment).

## AVAILABILITY

*Capsules (Rifadin):* 150 mg, 300 mg. *Injection, Powder for Reconstitution (Rifadin):* 600 mg.

## INDICATIONS AND DOSAGES Tuberculosis

PO, IV Adults, Elderly. 10 mg/kg/day in divided doses q12-24h. Maximum: 600 mg/day. Children. 10-20 mg/kg/day in divided doses q12-24h. > Prevention of meningococcal infections PO, IV

*Adults, Elderly.* 600 mg q12h for 2 days.

Children 1 mo and older.

10 mg/kg given q12h for 2 days.

Maximum: 600 mg/dose.

Infants younger than 1 mo. 10 mg/kg/day in divided doses q12h for 2 days.

#### Staphylococcal infections PO, IV

Adults, Elderly. 600 mg once a day.

*Children*. 15 mg/kg/day in divided doses q12h.

Rifampin (Generic Name)

#### Staphylococcus aureus infections (in combination with other anti-infectives)

#### PO

Adults, Elderly. 300-600 mg twice a day.

## Prevention of Haemophilus influenzae infection

Adults, Elderly. 600 mg/day for 4 days.

*Children 1 mo and older*: 20 mg/kg/ day in divided doses q12h for 5-10 days.

*Children younger than 1 mo.* 10 mg/ kg/day in divided doses q12h for 2 days.

## **OFF-LABEL USES**

Treatment of atypical mycobacterial infection, select cases of endocarditis, refractory sinusitis, leprosy, Legionnaires' disease.

## CONTRAINDICATIONS

Hypersensitivity to rifampin or any other rifamycins. Contraindicated with protease inhibitors for HIV infection, as rifampin causes loss of antiviral efficacy and promotes HIV resistance.

## INTERACTIONS

NOTE: Rifampin may decrease the effects of numerous drugs, including CYP1A2, 2A6, 2B6, 2C8, 2C9, 2C19, 3A4 substrates.

#### Drug

Alcohol, hepatotoxic medications: May increase the risk of hepatotoxicity.

Aminophylline, theophylline: May increase clearance of these drugs. Amiodarone, chloramphenicol, digoxin, disopyramide, fluconazole, methadone, mexiletine, oral anticoagulants, oral antidiabetics, phenytoin, quinidine, tocainide, verapamil: May decrease the effects of these drugs. **Antacids:** Reduce the absorption of rifampin. Give rifampin at least 1 h before an antacid.

Antiretroviral protease inhibitors (PIs): Markedly decreased PI concentrations; HIV treatment failure and resistance expected. Choose alternative to rifampin. Clopidogrel: May increase the

therapeutic effects.

**Macrolide antibiotics:** May increase levels/toxicity of rifampin.

**Oral contraceptives:** May decrease oral contraceptive effectiveness. **Herbal** 

St. John's wort: May decrease rifampin levels.

All foods: Food may decrease rifampin concentrations.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, uric acid, AST (SGOT), and ALT (SGPT) levels.

Cross-reactivity and false-positive urine screening tests for opiates using the KIMS method. Inhibits standard microbiological assays for serum folate and vitamin B<sub>12</sub>; use alternate assays. Reduced biliary excretion of contrast media used for visualization of the gallbladder; perform before the morning dose of rifampin.

## IV INCOMPATIBILITIES

Diltiazem (Cardizem), amiodarone, minocycline, tramadol.

## SIDE EFFECTS

#### Expected

Red-orange or red-brown discoloration of urine, feces, saliva, skin, sputum, sweat, or tears.

#### Occasional (2%-5%)

Hypersensitivity reaction (such as flushing, pruritus, or rash).

#### Rare (1%-2%)

Diarrhea, dyspepsia, nausea, candida as evidenced by sore mouth or tongue.

#### SERIOUS REACTIONS

 Rare reactions include hepatotoxicity (risk is increased when rifampin is taken with isoniazid), hepatitis, blood dyscrasias, Stevens-Johnson syndrome, and antibioticassociated colitis.

• Intermittent dose regimens have been associated with inducing a flulike syndrome.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with active alcoholism, a history of alcohol abuse, or liver dysfunction. May exacerbate porphyria. Be aware that rifampin crosses the placenta and is distributed in breast milk. No age-related precautions have been noted or in children or in elderly patients. Avoid alcohol and any other medications, including antacids, without consulting with the physician. The reliability of oral contraceptives may be affected by rifampin, so alternative methods of contraception should be used.

Feces, sputum, sweat, tears, or urine may become red-orange or red-brown, and soft contact lenses may be permanently stained. Notify the physician of any new symptoms or if fatigue, fever, flu, nausea, unusual bleeding or bruising, vomiting, weakness, or yellow eyes and skin occurs. CBC results should be evaluated for blood dyscrasias, and bleeding, bruising, infection manifested as a fever or sore throat, and unusual tiredness and weakness should be assessed.

#### Storage

Store capsules and unopened vials at room temperature.

Extemporaneous oral suspension stable for 4 wks at room temperature or refrigerated.

Reconstituted vial is stable for 24 h. Once the reconstituted vial is further diluted, it is stable for 4 h in D5W or 24 h in 0.9% NaCl.

#### Administration

Preferably give oral rifampin 1 h before or 2 h after meals with 8 oz of water. Rifampin may be given with food to decrease GI upset, but this will delay the drug's absorption. For those unable to swallow capsules, rifampin's contents may be mixed with applesauce or jelly. Alternatively, the manufacturer provides instruction for compounding a suspension; shake well before each use. Give rifampin at least 1 h before administering antacids.

! Administer rifampin by IV infusion only. Avoid IM and SC administration. Reconstitute 600-mg vial with 10 mL sterile water for injection to provide a concentration of 60 mg/mL. Withdraw the desired dose and further dilute with 500 mL D5W. Evaluate periodically for extravasation as evidenced by local inflammation and irritation. Infuse over 3 h (may dilute with 100 mL D5W and infuse over 30 min).

## Rifapentine

rif-a-pen'teen Priftin Do not confuse with rifampin or rifabutin.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

#### Classification:

Antimycobacterials, rifamycins

## **MECHANISM OF ACTION**

An antitubercular agent that inhibits bacterial RNA synthesis by binding to DNA-dependent RNA polymerase in *Mycobacterium tuberculosis*. This action prevents the enzyme from attaching to DNA, thereby blocking RNA transcription. *Therapeutic Effect*: Bactericidal.

## AVAILABILITY

Tablets: 150 mg.

## INDICATIONS AND DOSAGES

 Tuberculosis (in combination with at least one other antituberculosis agent)

#### PO

*Adults, Elderly.* Intensive phase: 600 mg twice weekly for 2 mo (interval between doses not < 3 days). Continuation phase: 600 mg weekly for 4 mo.

#### CONTRAINDICATIONS

Hypersensitivity to rifapentine, rifampin, rifabutin.

#### INTERACTIONS

NOTE: Rifapentine may decrease the effects of numerous drugs, including CYP2C8, 2C9, and 3A4 substrates.

#### Drug

Amiodarone, chloramphenicol, digoxin, disopyramide, fluconazole, methadone, mexiletine, oral anticoagulants, oral antidiabetics, phenytoin, quinidine, tocainide, verapamil: May decrease the effects of these drugs.

Antiretrovial protease inhibitors (PIs): Markedly decreased PI concentrations; HIV treatment failure and resistance expected. Saquinavir or fosamprenavir contraindicate use of rifapentine. Other HIV medicines are not recommended; choose alternative to rifapentine when possible. Clopidogrel: May increase the therapeutic effects. Isoniazid: May increase the risk of hepatoxocity. Herbal None known. Food All foods: Increases maximum serum concentrations.

## **DIAGNOSTIC TEST EFFECTS**

May increase serum AST (SGOT), ALT (SGPT), and bilirubin levels. May inhibit standard microbiological assays for serum folate and vitamin  $B_{12}$ ; choose alternative methods.

## SIDE EFFECTS

### Rare (< 4%)

Red-orange or red-brown discoloration of urine, feces, saliva, skin, sputum, sweat, or tears; arthralgia, pain, nausea, vomiting, headache, dyspepsia, hypertension, dizziness, diarrhea.

## SERIOUS REACTIONS

• Hyperuricemia, neutropenia, proteinuria, hematuria, antibiotic associated colitis, and hepatitis occur rarely.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in alcoholic patients and in those with liver function impairment. May exacerbate porphyria. Feces, sputum, sweat, tears, and urine may become red-orange or redbrown, and soft contact lenses may be permanently stained. The reliability of oral contraceptives may be affected by rifapentine, so alternative methods of contraception should be used. Initial complete blood count (CBC) and liver function test results should be evaluated. Evaluate for diarrhea, GI upset, nausea, or vomiting as well as pattern of daily bowel activity and stool consistency.

#### Storage

Store at room temperature protected from heat and humidity.

#### Administration

May give with or without food; administration with food reduces GI irritation. Be aware that rifapentine is used only in combination with another antituberculosis agent.

## Rifaximin

rye-faks'eh-men Xifaxan

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antibiotics, miscellaneous

## **MECHANISM OF ACTION**

An anti-infective that inhibits bacterial RNA synthesis by binding to a subunit of bacterial DNAdependent RNA polymerase. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

< 0.4% absorbed after PO administration. Widely distributed in the GI tract. *Half-life:* 6 h. Excreted primarily in feces as unchanged drug.

#### AVAILABILITY

Tablets: 200 mg, 550 mg.

# INDICATIONS AND DOSAGES Reduce recurrence of hepatic encephalopathy

PO

Adults, Elderly. 550 mg twice per day.

#### Traveler's diarrhea PO

*Adults, Elderly, Children 12 yr and older.* 200 mg 3 times a day for 3 days.

## **OFF-LABEL USES**

Diarrhea-predominant irritable bowel syndrome (IBS).

#### CONTRAINDICATIONS

Hypersensitivity to rifaximin or other rifamycin antibiotics or diarrhea with fever or blood in the stool.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Occasional (5%-11%)

Flatulence, headache, abdominal discomfort, rectal tenesmus, defecation urgency, nausea.

## Rare (2%-4%)

Constipation, fever, vomiting, edema, fatigue, dizziness.

## SERIOUS REACTIONS

 Hypersensitivity reactions, including dermatitis, angioneurotic edema, pruritus, rash, and urticaria, may occur.
 Superinfection occurs rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with diarrhea complicated by fever and/or blood in the stool, or diarrhea due to pathogens other than *Escherichia coli*. Due to lack of efficacy, do not use where *Campylobacter jejuni*, *Shigella* spp., or *Salmonella* spp. are suspected as causative pathogens. Caution

Rifaximin (Generic Name), Xifaxan (Brand Name)

should be used with severe hepatic impairment (Child-Pugh class C). It is unknown if rifaximin is distributed in breast milk. Safety and efficacy of rifaximin have not been established in children younger than 12 yr. In elderly patients with normal renal function, no age-related precautions are noted.

Notify physician if diarrhea worsens within 48 h, fever develops, or blood is in stool.

#### Storage

Store tablets at room temperature. Administration

Take rifaximin with or without food. Do not break or crush film-coated tablets.

## **Rilpivirine**

ril'pi-vir'een Edurant Do not confuse Edurant with Edular, or rilpivirine with ribavirin or etravirine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antiretroviral, nonnucleoside reverse transcriptase inhibitor

## **MECHANISM OF ACTION**

A nonnucleoside reverse transcriptase inhibitor that inhibits HIV-1 replication by noncompetitive inhibition of HIV-1 reverse transcriptase. *Therapeutic Effect*: Interrupts HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Absolute oral bioavailability unknown; fasting decreases absorption by 40% so the drug should be taken with a meal. Protein binding: 99.7% (primarily albumin). Metabolized in the liver (85%) via CYP3A enzymes. Eliminated mostly in the feces; only trace unchanged drug found in urine. Not removed by hemodialysis. *Half-life:* 50 h.

## AVAILABILITY

Tablets, Film Coated: 25 mg.

## INDICATIONS AND DOSAGES

 HIV infection (in combination with other antiretrovirals):

PO

Adults (treatment naïve). 25 mg once daily with a meal.

## CONTRAINDICATIONS

Rilpivirine as monotherapy; hypersensitivity to rilpivirine. Contraindicated for use with certain potent CYP3A4 inducers and proton-pump inhibitors, which negate drug efficacy and increase the risk for antiviral resistance via increases in rilpivirine metabolism or via reductions in GI absorption (see Drug Interactions).

#### INTERACTIONS

NOTE: Rilpivirine is affected by many drugs that may alter its metabolism via CYP3A4. Please see detailed manufacturers information for management of drug interactions. In some cases, the choice of an alternate agent is recommended. Drug

Antacids and H<sub>2</sub>-blockers (e.g., famotidine, ranitidine): Reduce rilpivirine absorption; antacids should only be administered either 2 h before or 4 h after rilpivirine. H<sub>2</sub>-blockers should be administered at least 12 h before or 4 h after rilpivirine. Potent CYP3A4 inhibitors (e.g., clarithromycin, erythromycins, ketoconazole, itraconazole): May significantly increase rilpivirine concentrations. Use caution. In some cases consider alternate therapy, like azithromycin. Carbamazepine, dexamethasone, oxcarbazepine, phenobarbital, phenytoin, rifabutin, rifampin, rifapentine: Lower rilpivirine plasma concentration. Contraindicated. Proton-pump inhibitors (PPIs; e.g., omeprazole, lansoprazole, pantoprazole, rabeprazole, others): Reduce rilpivirine absorption and efficacy via gastric acid reduction. Contraindicated.

#### QT-prolonging medications (e.g., class Ia or class III antiarrhythmics, other

**medications):** Additive risk for arrhythmia, torsades de pointes. Use with caution.

#### Herbal

St. Johns wort: Decreases rilpivirine concentration. Contraindicated. Food

**Meals:** Increase drug absorption; rilpivirine should be taken with food.

## **DIAGNOSTIC TEST EFFECTS**

May increase total cholesterol, AST (SGOT), ALT (SGPT), and serum triglyceride levels. May increase serum creatinine or blood glucose.

## SIDE EFFECTS

#### Frequent (≥2%)

Depression, insomnia, headache, and rash.

#### Occasional (1%-2%)

Nausea, vomiting, fatigue, abnormal dreams, sleep disorders, dizziness.

#### Rare

Fat redistribution syndrome with buffalo hump, diarrhea, decreased appetite, anxiety, somnolence, hyperglycemia, gallbladder disorders, glomerulonephritis.

## SERIOUS REACTIONS

- · Immune reconstitution syndrome.
- Depression or mood disorders may be severe.
- Serious skin rashes or hypersensitivity.

### **PRECAUTIONS & CONSIDERATIONS**

Rilpivirine is never used as monotherapy; it is always combined with other medications against HIV. Caution is warranted in patients with severe liver impairment or end-stage renal disease; no dose adjustments are needed for mild to moderate liver disease or renal impairment. Use with caution in patients with a history of depression or other psychiatric illness. Severe depressive disorders (depressed mood, depression, dysphoria, major depression, mood altered, negative thoughts, suicide attempt, suicidal ideation) have been reported. Breastfeeding is not recommended for mothers with HIV infection due to the risk of transmission of the virus. There are no adequate data of rilpivirine use during pregnancy. Safety and efficacy have not been established in children. Rilpivirine is not a cure for HIV infection, nor does it reduce risk of transmission to others.

During initial treatment, patients responding to therapy may develop an inflammatory response to indolent or residual opportunistic infections (an immune reconstitution syndrome), which may necessitate further evaluation and treatment. Expect to regularly obtain a history of all prescription and nonprescription medications because rilpivirine may interact with multiple drugs. Monitor for signs and symptoms of serious skin rashes, liver dysfunction, and adverse CNS side effects. Patients should report skin rashes or unusual mood changes or behaviors promptly for evaluation. Avoid tasks that require mental alertness or motor skills until response to the drug is established. Storage

Store rilpivirine at room temperature in the original bottle to protect it from light.

#### Administration

Administer once daily with a meal. Must take with food. Do not give with antacids or acid-reducers (see Interactions). Take the medication every day as prescribed. Do not discontinue the medication without first notifying the physician.

## **Riluzole**

rye'loo-zole ★ 🐏 Rilutek

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Neuroprotectives, glutamate inhibitor

## **MECHANISM OF ACTION**

An amyotrophic lateral sclerosis (ALS) agent that inhibits presynaptic glutamate release in the central nervous system (CNS) and interferes postsynaptically with the effects of excitatory amino acids. *Therapeutic Effect:* Extends survival of ALS patients.

## PHARMACOKINETICS

Well absorbed from the GI tract (high-fat meal decreases absorption). Protein binding: 96%. Metabolized extensively in the liver to major and minor metabolites via CYP1A2. Primarily eliminated in the urine as metabolites. *Half-life*: 12 h.

## AVAILABILITY

Tablets: 50 mg.

## INDICATIONS AND DOSAGES > ALS

PO *Adults, Elderly.* 50 mg q12h.

## CONTRAINDICATIONS

Severe hypersensitivity reactions to riluzole.

## INTERACTIONS

#### Drug

Amiodarone, amitriptyline, fluvoxamine, ketoconazole, quinolones, theophylline: May increase the effects and risk of toxicity of riluzole. Carbamazepine, omeprazole, phenobarbital, rifampin, tobacco smoking: May decrease the effects of riluzole. Herbal None known. Food Alcohol: May increase CNS depression. Caffeine: May increase the effects and risk of toxicity of riluzole. High-fat meals: May decrease the absorption and effects of riluzole.

## **DIAGNOSTIC TEST EFFECTS**

May increase liver function test results. May decrease WBC count.

## SIDE EFFECTS

#### Frequent (> 10%)

Nausea, asthenia, reduced respiratory function.

## Occasional (1%-10%)

Edema, tachycardia, headache, dizziness, somnolence, depression, vertigo, tremor, pruritus, alopecia, abdominal pain, diarrhea, anorexia, dyspepsia, vomiting, stomatitis, increased cough.

## SERIOUS REACTIONS

• Hepatic insufficiency and potential for hepatic failure.

• Marked neutropenia and resultant opportunistic infection risk.

• Hypersensitivity pneumonitis and interstitial lung disease.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal or hepatic impairment. Alcohol should be avoided as well

Riluzole (Generic Name), Rilutek (Brand Name)

as tasks requiring mental alertness or motor skills until response to the medication has been established.

Notify the physician of fever. Blood chemistry tests to evaluate hepatic function should be obtained before and during therapy. The drug should be discontinued if the ALT level exceeds 10 times the upper normal limit.

#### Storage

Store at room temperature protected from bright light.

#### Administration

Take riluzole at least 1 h before or 2 h after a meal at the same time each day.

#### Rimabotulinumtoxin B (formerly Botulinum Toxin Type B)

rye'ma-bot'yoo-lin-num toks'in type b ★ Myobloc

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Miscellaneous skeletal muscle relaxants

## **MECHANISM OF ACTION**

A neurotoxin that inhibits acetylcholine release at the neuromuscular junction. *Therapeutic Effect:* Produces flaccid paralysis.

#### AVAILABILITY

*Injection:* 2500 units/0.5 mL, 5000 units/mL, 10,000 units/2 mL.

## INDICATIONS AND DOSAGES

 To reduce the severity of symptoms in patients with cervical dystonia who have previously tolerated rimabotulinumtoxin B IM *Adults, Elderly.* 2500-5000 units divided among the affected muscles.

 To reduce the severity of symptoms in patients with cervical dystonia who have not previously been treated with rimabotulinumtoxin B IM

*Adults, Elderly.* Administer at lower dosage than for patients who have previously tolerated the drug.

#### CONTRAINDICATIONS

Infection at proposed injection site, hypersensitivity to albumin, any botulinum toxin or any component of the formulation.

## INTERACTIONS

#### Drug

Aminoglycoside antibiotics, other drugs that interfere with neuromuscular transmission (such as curare-like compounds): May potentiate the effects of rimabotulinumtoxin B. Herbal

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (12%-19%)

Infection, neck pain, headache, injection site pain, dry mouth. Occasional (4%-10%)

Flu-like symptoms, generalized pain, increased cough, back pain, myasthenia.

#### Rare

Dizziness, nausea, rhinitis, headache, vomiting, edema, allergic reaction.

#### SERIOUS REACTIONS

• Mild to moderate dysphagia occurs in approximately 10% of patients.

Rimabotulinumtoxin B (Generic Name)

• Arrhythmias and severe dysphagia (manifested as aspiration, pneumonia, and dyspnea) occur rarely, but may cause death.

• Overdose produces systemic weakness and muscle paralysis, respiratory failure, death.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with neuromuscular junctional disorders, such as amyotrophic lateral sclerosis, Lambert-Eaton syndrome, motor neuropathy, and myasthenia gravis, because they may experience significant systemic effects, including respiratory compromise and severe dysphagia. Be aware of signs of dysphagia and aspiration pneumonia, including fever, sputum production, and adventitious breath sounds after treatment. Safety and effectiveness have not been established for use in children.

Resume normal activity slowly and carefully. Seek medical attention immediately if respiratory, speech, or swallowing difficulties occur.

#### Storage

Store unopened vials under refrigeration. Do not freeze. Do not shake. May be diluted with 0.9% NaCl for use. If diluted, the product must be used within 4 h.

#### Administration

Plan to have a physician inject the drug into the affected muscle.

Dilute drug with 0.9% NaCl. Slowly and gently inject the diluent into the vial to avoid producing bubbles. Then rotate the vial gently to mix the drug. If a vacuum does not pull the diluent into the vial, discard it. For IM use, assist the physician as necessary while he or she injects the drug into the affected muscles using a 25-, 27-, or 30-gauge needle for superficial muscles and a 22-gauge needle for deeper muscles. Know that drug's effect lasts for 12-16 wks at doses of 5000 or 10,000 units.

## Risedronate

rye-se-droe'nate ★ ▲ Actonel, Atelvia Do not confuse Actonel with Actos, or Altevia with Altoprev.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Bisphosphonates

#### **MECHANISM OF ACTION**

A bisphosphonate that binds to bone hydroxyapatite and inhibits osteoclasts. *Therapeutic Effect:* Reduces bone turnover (the number of sites at which bone is remodeled) and bone resorption.

#### AVAILABILITY

Tablets: 5 mg, 30 mg (Actonel) Once-Weekly Tablet, Immediate Release: 35 mg (Actonel) Once-Weekly Tablet, Delayed Release: 35 mg (Atelvia). Once-Monthly Tablet: 150 mg (Actonel)

## INDICATIONS AND DOSAGES Paget's disease

PO

*Adults, Elderly.* 30 mg/day for 2 mo. Retreatment may occur after for 2-mo post-treatment observation period.

## Prevention and treatment of postmenopausal osteoporosis PO

Adults, Elderly. 5 mg/day or 35 mg once weekly or 150 mg once monthly on the same day each month.

Risedronate (Generic Name), Actonel (Brand Name)

## Glucocorticoid-induced osteoporosis

Adults, Elderly. 5 mg/day.

#### • Treatment of male osteoporosis. PO

Adults, Elderly. 35 mg once weekly.

## CONTRAINDICATIONS

Hypersensitivity to other bisphosphonates, including etidronate, ibandronate, tiludronate, risedronate, and alendronate; hypocalcemia; inability to stand or sit upright for at least 30 min; renal impairment when serum creatinine clearance is < 30 mL/min, or esophageal abnormality delaying emptying (e.g., stricture).

## INTERACTIONS

#### Drug

Antacids or supplements containing aluminum, calcium, magnesium; oral calcium, iron, and magnesium salts; vitamin D: May decrease the absorption of risedronate. Separate administration by at least 2 h. NSAIDs: May enhance GI toxic effects. Phosphate supplements: May enhance hypocalcemic effects. Herbal None known. Food

## All food: Reduces absorption.

## DIAGNOSTIC TEST EFFECTS

May interfere with diagnostic imaging, technetium-99mdiphosphonate in bone scans.

#### SIDE EFFECTS

Frequent (30%) Arthralgia, myalgia.

## Occasional (8%-12%)

Rash, flu-like symptoms, peripheral edema.

#### Rare (3%-5%)

Bone pain, sinusitis, asthenia, dry eye, tinnitus.

## SERIOUS REACTIONS

• Overdose causes hypocalcemia, hypophosphatemia, and significant GI disturbances.

• Esophageal irritation occurs if administration instructions are not followed.

· Osteonecrosis of the jaw.

· Atypical femur fractures.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac failure or renal impairment. Because there are no adequate and well-controlled studies in pregnant women, it is unknown whether risedronate causes fetal harm or is excreted in breast milk. Safety and efficacy have not been established in children. Elderly patients require careful monitoring of fluid and electrolytes. Consider beginning weight-bearing exercises and modifying behavioral factors.

Hypocalcemia and vitamin D deficiency, if present, should be corrected before beginning risedronate therapy. Monitor serum eletrolytes and renal function before and during treatment. Thigh or groin pain should be investigated.

Because of concern about osteonecrosis, preventive dental care is important, and invasive dental procedures should be avoided while on therapy.

#### Storage

Store at room temperature. Administration

For all immediate-release products: Take the drug with a full glass (6-8 oz) of plain water first thing in the morning and at least 30 min before first beverage, food, or medication of the day. Taking risedronate with other beverages, including coffee, mineral water, and orange juice, significantly reduces the absorption of the drug. Avoid lying down or bending over for at least 30 min after taking risedronate to potentiate delivery to the stomach and reduce the risk of esophageal irritation. Do not crush or chew the tablet.

For delayed-release tablets (Atelvia): Administer immediately after breakfast with at least 4 oz of plain water. Swallow tablets whole; do not chew, cut, or crush. Avoid lying down for at least 30 min after taking this medicine.

## **Risperidone**

ris-per'i-done Risperdal, Risperdal Consta, Risperdal M-Tabs Do not confuse risperidone with reserpine, or Risperdal with Restoril.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antipsychotics, atypical

#### **MECHANISM OF ACTION**

A benzisoxazole derivative that may antagonize dopamine and serotonin receptors. *Therapeutic Effect:* Suppresses psychotic behavior.

## PHARMACOKINETICS

Oral form is well absorbed from the GI tract; unaffected by food. Protein binding: 90%. Extensively metabolized in the liver to active metabolite. Excreted primarily in urine. *Half-life:* Oral, 3-20 h; metabolite, 21-30 h (increased in elderly); injection, 3-6 days. Excreted primarily in urine and feces.

## AVAILABILITY

Oral Solution (Risperdal): 1 mg/mL. Tablets (Risperdal): 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. Tablets (Orally Disintegrating [Risperdal M-Tabs]): 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg. Injection Long-Acting (Risperdal Consta): 12.5 mg, 25 mg, 37.5 mg, 50 mg.

# INDICATIONS AND DOSAGES Schizophrenia PO

*Adults.* Initially, 1 mg twice a day. May increase dosage slowly, 1-2 mg/ day on a weekly basis. Maintenance range: 2-8 mg/day.

*Elderly.* Initially, 0.5 mg twice a day. May increase dosage slowly. Range: 2-6 mg/day.

Adolescents aged 13-17 yr. Initially, 0.5 mg once a day, adjusted in increments of 0.5-1 mg/day. Range: 1-6 mg/day, but doses > 3 mg/day do not yield additional benefits. IM

*Adults, Elderly.* 25 mg q2wk. Maximum: 50 mg q2wk.

#### Mania, bipolar PO

*Adults, Elderly.* Initially, 2-3 mg as a single daily dose. May increase at 24-h intervals of 1 mg/day. Range: 1-6 mg/day.

*Children aged 10-17 yr.* Initially 0.5 mg/day. May increase at 24-h intervals of 0.5-1 mg/day, up to a maximum of 2.5 mg/day. IM

*Adults, Elderly*. 25 mg q2wk. Maximum: 50 mg q2wk.

 Irritability associated with autistic disorder

PO

Risperidone (Generic Name)

*Children 5 yr and older.* < 15 kg, use with caution. < 20 kg, 0.25 mg/ day. After 4 days, may increase to 0.5 mg/day. Maintain dose for at least 14 days, then increase dose by 0.25 mg/ day q2wk. Clinical response peaks at 1 mg/day. > 20 kg, 0.5 mg/day. After 4 days, may increase to 1 mg/day. Maintain dose for at least 14 days, then increase dose by 0.5 mg/day q2wk. Clinical response peaks at 2.5 mg/day. **b** Dosage in renal impairment

Initial oral dosage for adults and elderly patients is 0.25-0.5 mg twice a day. Dosage is titrated slowly to desired effect.

## **OFF-LABEL USES**

Behavioral symptoms associated with dementia, pervasive developmental disorder, Tourette's disorder.

## CONTRAINDICATIONS

Known hypersensitivity to risperidone.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Carbamazepine: May decrease the risperidone blood concentration. Clozapine: May increase the risperidone blood concentration. CYP2D6 inhibitors: May increase the levels/effects of risperidone. Dopamine agonists, levodopa: May decrease the effects of these drugs. Fluoxetine, paroxetine: May increase the risperidone blood concentration and the risk of extrapyramidal symptoms. Valproic acid: May increase the adverse effects/toxicity of risperidone.

#### Verapamil, SSRIs, and lithium: May increase the levels/effects of

risperidone.

#### Herbal

Kava kava, gotu kola, St. John's wort, valerian: May increase central nervous system (CNS) depression. Food

Alcohol: Avoid; may increase CNS depression.

## DIAGNOSTIC TEST EFFECTS

May increase serum prolactin, creatinine, alkaline phosphatase, uric acid, AST (SGOT), ALT (SGPT), and triglyceride levels. May decrease blood glucose and serum potassium, protein, and sodium levels. May cause ECG changes.

## SIDE EFFECTS

#### Frequent (13%-26%)

Agitation, anxiety, insomnia, headache, constipation.

## Occasional (4%-10%)

Dyspepsia, rhinitis, somnolence, dizziness, nausea, vomiting, rash, abdominal pain, dry skin, tachycardia. **Rare (2%-3%)** 

Visual disturbances, fever, back pain, pharyngitis, cough, epistaxis, edema, tinnitus, akinesia, hyperglycemia and hyperlipidemia, arthralgia, angina, aggressive behavior, orthostatic hypotension, breast swelling, weight gain.

## SERIOUS REACTIONS

• Rare reactions include tardive dyskinesia (characterized by tongue protrusion, puffing of the cheeks, and chewing or puckering of the mouth) and neuroleptic malignant syndrome (marked by hyperpyrexia, muscle rigidity, change in mental status, irregular pulse or BP, tachycardia, diaphoresis, cardiac arrhythmias, rhabdomyolysis, and acute renal failure).

- Priapism.
- Neutropenia/agranulocytosis (rare).
- · Seizures or heart arrhythmias (rare).
- New-onset diabetes mellitus.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac disease, diabetes, breast cancer, hepatic or renal impairment, seizure disorders, recent MI, those at risk for aspiration pneumonia, suicidal tendencies. Be aware that risperidone may increase the risk of hyperglycemia and other metabolic changes (dyslipidemia, weight gain) that may increase cardiovascular risks. It is unknown whether risperidone crosses the placenta or is excreted in breast milk. Breastfeeding is not recommended for patients taking this drug. Elderly patients are more susceptible to orthostatic hypotension and may require a dosage adjustment because of age-related renal or hepatic impairment. Elderly patients with dementia-related psychosis have a significantly higher incidence of cerebrovascular adverse events (e.g., stroke, TIA) and increased risk of mortality.

Drowsiness and dizziness may occur but generally subside with continued therapy. Tasks requiring mental alertness or motor skills should be avoided. Notify the physician if altered gait, difficulty breathing, palpitations, pain or swelling in breasts, severe dizziness or fainting, trembling fingers, unusual movements, rash, fever, or visual changes occur. BP, heart rate, liver function test results, ECG, and weight should be assessed. **Storage** 

Store tablets at room temperature; protect M-Tabs from moisture and keep in blister pack until time of use. The IM injection may be given up to 6 h after reconstitution, but immediate administration is recommended. If 2 min pass before the injection, reconstitute the solution by shaking the upright vial vigorously back and forth for as long as it takes to resuspend the microspheres. Store the drug below 77° F (25° C) once it is in suspension. Administration

Take risperidone without regard to food. Mix the oral solution with water, orange juice, coffee, or low-fat milk, but not with cola or tea.

For M-Tabs, once removed from blister pack, place immediately on tongue. Do not split or chew tablet because it will dissolve within seconds and may be swallowed with or without liquid.

For IM administration, use only the diluent and needle supplied in the dose pack. All the components in the dose pack will be required for administration. Do not substitute any components. Prepare the suspension according to the manufacturer's directions. Inject the drug intramuscularly into the upper outer quadrant of the gluteus maximus. Do not administer the drug by the IV route.

## Ritonavir

ri-tone'a-veer Norvir Do not confuse ritonavir with, Retrovir, or Norvir with Norvasc.

#### **CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

Classification: Antiretrovirals.

protease inhibitors

#### MECHANISM OF ACTION

Inhibits HIV-1 and HIV-2 proteases, rendering these enzymes incapable of processing the polypeptide precursors; this results in the production of noninfectious, immature HIV particles. *Therapeutic Effect:* Impedes HIV replication,

Ritonavir (Generic Name), Norvir (Brand Name)

slowing the progression of HIV infection.

## PHARMACOKINETICS

Well absorbed after PO administration (absorption increased with food). Protein binding: 98%-99%. Extensively metabolized in the liver to active metabolite. Eliminated primarily in feces. Unknown whether removed by hemodialysis. *Half-life*: 3-5 h.

## AVAILABILITY

*Oral Solution:* 80 mg/mL. *Soft Gelatin Capsules:* 100 mg. *Tablets:* 100 mg.

# INDICATIONS AND DOSAGES HIV infection PO

Adults, Children 12 yr and older. 600 mg twice a day. If nausea occurs at this dosage, give 300 mg twice a day for 1 day, 400 mg twice a day for 2 days, 500 mg twice a day for 1 day, then 600 mg twice a day thereafter. Children vounger than 12 vr. Initially, 250 mg/m<sup>2</sup> twice a day. Increase by 50 mg/m<sup>2</sup> up to 400 mg/m<sup>2</sup>. Maximum: 600 mg twice a day. NOTE: Ritonavir is also used in lower dosages (100-400 mg/day PO in adults, for example) to "boost" the levels of other antiretroviral treatments for HIV as part of other FDA-approved regimens for HIV.

## CONTRAINDICATIONS

Known hypersensitivity to ritonavir or any of its ingredients. Ritonavir is contraindicated with many drugs (see Drug Interactions) because ritonavir-mediated CYP3A inhibition can result in serious and/ or life-threatening reactions, or there is reduced efficacy of ritonavir or the interacting drug when given together.

### INTERACTIONS

NOTE: Please see detailed manufacturer's information for management of drug interactions. In some cases, dosage adjustment for the agent or choice of an alternate agent is recommended. Drug

rug

Alfuzosin, cisapride, pimozide, voriconazole: Ritonavir increases levels and risk of cardiovascular adverse outcomes. Contraindicated.

Antacids, buffered didanosine:

Reduce ritonavir absorption, separate administration times.

Antiarrhythmics (i.e., amiodarone, flecainide, propafenone,

**quinidine):** Ritonavir increases levels and risk of proarrhythmia. Contraindicated.

Antidepressants: May increase the blood concentration of these drugs. Cancer treatments (e.g., dasatinib, nilotinib, vincristine, vinblastine):

Ritonavir increases levels of these chemotherapies and risk of side effects; many require dose adjustments.

Cyclosporine, other

immunosuppressants: Ritonavir may increase blood concentrations; monitor closely.

Disulfiram, drugs causing disulfiram-like reaction (such as metronidazole): May produce a disulfiram-like reaction.

Enzyme inducers (including carbamazepine, dexamethasone, nevirapine, phenobarbital, phenytoin, rifabutin, rifampin): May increase the metabolism and decrease the efficacy of ritonavir. Consider alternative to rifampin; increases liver toxicity risk if taken with saquinavir-ritonavir.

Ergot derivatives (e.g., dihydroergotamine, ergonovine, ergotamine, methylergonovine): Ritonavir increases levels and risk of ergot toxicity. Contraindicated.

Lovastatin, simvastatin: Ritonavir increases levels and risk of myopathy and rhabdomyolysis. Contraindicated.

**Oral contraceptives, theophylline:** May decrease the effectiveness of these drugs.

**Oral midazolam, triazolam:** Ritonavir increases levels causing benzodiazepine toxicity and respiratory depression risk.

Phosphodiesterase-5 inhibitors (e.g., sildenafil, vardenafil,

tadalafil): Increases PDE-5 inhibitor blood levels and risk of hypotension. Contraindicated for use with sildenafil for pulmonary HTN.

#### Herbal

**St. John's wort:** May decrease the blood concentration and effect of ritonavir. Contraindicated.

Food

All food: Enhances absorption; take with food.

## DIAGNOSTIC TEST EFFECTS

May alter serum CK, GGT, triglyceride, uric acid, AST (SGOT), and ALT (SGPT) levels as well as creatinine clearance. Increases total cholesterol and triglycerides.

## SIDE EFFECTS

#### Frequent

GI disturbances (abdominal pain, anorexia, diarrhea, nausea, vomiting), circumoral and peripheral paresthesias, altered taste, headache, dizziness, fatigue, asthenia.

#### Occasional

Allergic reaction, flu-like symptoms, hypotension, fat redistribution/ accumulation of body fat including central obesity, "buffalo hump," hypercholesterolemia.

### Rare

Diabetes mellitus, hyperglycemia.

## SERIOUS REACTIONS

 Serious hypersensitivity reactions have included erythema multiforme, Stevens-Johnson Syndrome, toxic epidermal necrolysis, or anaphylactoid reactions.

- · Hepatitis.
- · Pancreatitis.
- Spontaneous bleeding in patients with hemophilia.
- PR interval prolongation.

## **PRECAUTIONS & CONSIDERATIONS**

Drug interactions with ritonavir can place the patient at great risk for serious ADRs or mortality; always review the patient's drug regimen carefully to avoid significant drug interactions.

Caution should be used in patients with impaired hepatic function. Be aware that breastfeeding is not recommended in this population because of the possibility of HIV transmission. No age-related precautions have been noted in children older than 2 yr. There are no known effects of this drug's use in elderly patients.

When beginning combination therapy with ritonavir and nucleosides, it may promote GI tolerance by first beginning ritonavir alone and then by adding nucleosides before completing 2 wks of ritonavir monotherapy. Check baseline laboratory test results, if ordered, especially liver function tests and serum triglycerides, before beginning ritonavir therapy and at periodic intervals during therapy. Monitor for signs and symptoms of GI disturbances or neurologic abnormalities, particularly paresthesias.

When used as "booster" in combination with other protease inhibitors, be sure to consult specific dosage recommendations of both agents.

#### Storage

Store capsules or solution in the refrigerator, always in the original container. Protect the drug from light. Refrigerate the oral solution unless it is used within 30 days and stored below 77° F.

#### Administration

Administer with food. May improve the taste of the oral solution by mixing it with Advera, chocolate milk, or Ensure within 1 h of dosing. Continue therapy for the full length of treatment, and evenly space drug doses around the clock. Separate administration from buffered didanosine or antacids by 2.5 h.

## Rituximab

rye-tuck'ih-mab Rituxan Do not confuse Rituxan with Remicade or rituximab with infliximab.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antineoplastics, disease-modifying antirheumatic drugs (DMARDs), monoclonal antibodies

#### **MECHANISM OF ACTION**

Binds to CD20, the antigen found on the surface of B lymphocytes and B-cell non-Hodgkin's lymphomas. *Therapeutic Effect:* Produces cytotoxicity, reducing tumor size. Immunomodulatory activity reduces joint destruction in RA.

## PHARMACOKINETICS

Rapidly depletes B cells. Excretion: uncertain. *Half-life* proportional to dose: 3.2 days after first infusion and 8.6 days after fourth infusion.

#### AVAILABILITY

Injection: 10 mg/mL.

## INDICATIONS AND DOSAGES

 Non-Hodgkin's lymphoma: different treatment protocols depending on type

IV INFUSION

*Adults.* 375 mg/m<sup>2</sup> once weekly for 4 wks. May administer a second 4-wk course; refer to specific protocol utilized.

#### CD20+ chronic lymphocytic leukemia

IV INFUSION

Adults. 375 mg/m2 on day 1 in cycle 1 and 500 mg/m2 in cycles 2-6, used in combination with cyclophosphamide/fludarabine, administered q 28 days. NOTE: PCP prophylaxis and herpes viral prophylaxis are recommended during treatment and for up to 12 mo following as appropriate.

Rheumatoid arthritis IV INFUSION

*Adults.* 1000 mg on days 1 and 15 in combination with methotrexate. Give q24 wk or based on response, but not sooner than q16 wk.

#### Wegener's granulomatosis (WG) and microscopic polyangiitis (MPA)

IV INFUSION Adults. 375 mg/m<sup>2</sup> IV infusion once weekly for 4 weeks. (Glucocorticoids methylprednisolone 1000 mg/day IV for 1-3 days and then prednisone 1 mg/kg/day PO (not to exceed 80 mg/day—are given to treat severe vasculitis symptoms. Steroids begin within 14 days prior to or with rituximab and may continue during and after the 4-week course.)

## CONTRAINDICATIONS

Hypersensitivity to murine proteins. Hold use in severe, active infections.

## INTERACTIONS

#### Drug

Antihypertensives: May intensify hypotensive effects; hold for 12 h prior to treatment.

**Cisplatin:** May increase risk of renal toxicity.

Live-virus vaccines: May have reduced response to vaccination; immunosuppression may increase risk of viral disease. Avoid use of such vaccines.

#### Herbal and Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Reduces lymphocyte, WBC, RBC, platelet counts.

## IV INCOMPATIBILITIES

Do not mix rituximab with any other medications. Specific incompatibilities include aldesleukin, amphotericin B, ciprofloxacin, cyclosporine, daunorubicin, doxorubicin, furosemide, levofloxacin, ondansetron, quinupristindalfopristin, sodium bicarbonate, topotecan, vancomycin.

## SIDE EFFECTS

#### Frequent

Fever (49%), chills (32%), asthenia (16%), headache (14%), angioedema (13%), hypotension (10%), nausea (18%), rash or pruritus (10%).

## Occasional (<10%)

Myalgia, dizziness, abdominal pain, throat irritation, vomiting, neutropenia, rhinitis, bronchospasm, urticaria.

## SERIOUS REACTIONS

 Arrhythmias may occur, particularly in those with a history of preexisting cardiac conditions.

• Progressive multifocal leukoencephalopathy (PML) due to latent JC virus has been reported with use; can be fatal.

• Tumor lysis syndrome leading to acute renal failure requiring dialysis may occur 12-24 h following a dose.

• Severe, sometimes fatal mucocutaneous reactions have been reported.

• A hypersensitivity reaction marked by hypotension, bronchopasm, and angioedema may occur. Fatal infusion reactions with 24 h of infusion; 80% of these occur with the first infusion.

 Resultant immunosuppression may place at risk for serious opportunistic infections or reactivation of hepatitis B with fulminant hepatitis.

· Bowel obstruction and perforation.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with a history of cardiac disease and the elderly. Be aware that rituximab may cause fetal B-cell depletion. Women with childbearing potential should use reliable contraceptive methods during treatment and for up to 12 mo afterward. It is unknown whether rituximab is distributed in breast milk. The safety and efficacy of rituximab have not been established in children.

Administer aggressive intravenous hydration, antihyperuricemic agents, and monitor renal function if hyperuricemia and tumor lysis syndrome occur. Monitor neurologic function. Monitor cardiac function and BP and evaluate complaints of chest or abdominal pain promptly. Obtain CBC with differential prior to each dose and at regular intervals. Patients should avoid crowds, persons with illness, and vaccinations during treatment. Report any signs of infection promptly. Treat and withhold rituximab if serious infection occurs.

Infusion-related reactions, including chills, fever, hypotension, and rigors, which usually occur 30 min to 2 h after beginning the first rituximab infusion, should be monitored; slowing the infusion resolves these symptoms. CBC should be obtained before and regularly during therapy.

#### Storage

Refrigerate unopened vials. The diluted solution is stable for up to 24 h if refrigerated and at room temperature for an additional 24 hr.

#### Administration

Expect to pretreat the patient with acetaminophen and diphenhydramine before each infusion to help minimize infusion-related reactions. With rheumatoid arthritis, pretreat with a corticosteoid before each rituximab dose. Do not give rituximab by IV push or bolus.

For IV infusion only. Withdraw the needed amount into an infusion bag, and dilute it with 0.9% NaCl or D5W to a final concentration of 1-4 mg/mL. For the initial infusion, infuse the drug at 50 mg/h. The infusion rate may be increased, as necessary, in increments of 50 mg/h every 30 min to a maximum rate of 400 mg/h. For subsequent infusions, the drug may be administered initially at 100 mg/h and increased in increments of 100 mg/h every 30 min to a maximum rate of 400 mg/h.

Always carefully monitor for serious infusion reactions.

#### **Rivaroxaban**

riv-va-rox'a-ban 🛨 👾 Xarelto Do not confuse rivaroxaban with Argatroban or dabigatran.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Oral anticoagulant (direct Factor Xa inhibitor)

#### MECHANISM OF ACTION

Rivaroxaban is a direct inhibitor of Factor Xa, thus interrupting intrinsic and extrinsic components of the clotting cascade. It inhibits thrombin formation and the development of a thrombus. Therapeutic Effect: Prevents new clot formation

## PHARMACOKINETICS

Good oral absorption, maximum concentrations reached in 2-4 h. The drug is primarily metabolized in the liver and is a P-glycoprotein and CYP3A4 substrate. Metabolites primarily eliminated in the urine. roughly 1/3 of drug excreted in urine unchanged via active tubular secretion. Not removed by hemodialysis. Half-life: 5-9 h (increased in renal impairment; not studied in hepatic impairment).

#### AVAILABILITY

Tablets: 10 mg, 15 mg, 20 mg.

#### INDICATIONS AND DOSAGES Prevention of deep vein thrombosis (DVT) in patients undergoing knee or hip replacement PO

Adults, Elderly. 10 mg once daily with or without food. Give initial dose at least 6-10 h after surgery once hemostasis has been established. For hip replacement surgery, treatment duration is 35 days. For knee replacement surgery, treatment duration is 12 days.

## Dosage in renal impairment (joint replacement only)

CrCl 30-50 mL/min: Monitor closely. Promptly evaluate signs or symptoms of blood loss.

CrCl < 30 mL/min: Avoid use. If a patient develops acute renal failure while on rivaroxaban, discontinue the drug.

#### Stroke and systemic embolism prophylaxis in nonvalvular atrial fibrillation

PO

*Adults, Elderly.* 20 mg once daily with the evening meal.

## Dosage in renal impairment (atrial fibrillation only)

CrCl > 50 mL/min: 20 mg once daily with the PM meal.

CrCl 15-50 mL/min: 15 mg once daily with the PM meal.

CrCl < 15 mL/min: Do not use. If a patient develops acute renal failure while on rivaroxaban, discontinue the drug.

• Hepatic impairment (all uses) Avoid in moderate and severe (Child-Pugh Class B and C) impairment or with any hepatic disease associated with coagulopathy.

## CONTRAINDICATIONS

Known hypersensitivity to rivaroxaban; active pathological bleeding.

## INTERACTIONS

#### Drug

Amiodarone, dronedarone: Use with caution; dronedarone increases dabigatran exposure and potential for over-anticoagulation.

**Clopidogrel:** May increase bleeding times and risk for bleeding. Use caution.

Dabigatran: Do not use together due to duplicative action. Duplicate treatment may cause bleeding. NSAIDs, salicylates (aspirin): Monitor patient due to increased risk factor for GI bleeding. Parenteral anticoagulants (e.g., argatroban, heparins, lepirudan, platelet inhibitors): May increase risk for bleeding. When initiating a parenteral anticoagulant; discontinue rivaroxaban. See manufacturer labeling for recommendations. P-glycoprotein inhibitors and strong inhibitors of CYP3A4 (e.g., clarithromycin, conivaptan, cyclosporine, itraconazole, ketoconazole, quinidine, ritonavir): Avoid use when possible (and especially in patients with renal impairment) as these drugs increase rivaroxaban exposure and may cause over-anticoagulation and bleeding. In patients with renal impairment, avoid even moderate inhibitors of these pathways.

## Rifampin, carbamazepine, phenytoin, or other CYP3A4

inducers: Decreases effectiveness of rivaroxaban. Avoid co-use. Warfarin: Would increase risk for bleeding. Do not use at same time. Manufacturing label contains instructions for switching from warfarin to rivaroxaban when INR is < 3.0.

#### Herbal

Cranberry, dong quai, evening primrose oil, feverfew, garlic, ginger, ginkgo, glucosamine, green tea, omega-3-acids, SAM-e: May increase the risk of bleeding. St. Johns wort: Decreases effectiveness of rivaroxaban. Avoid co-use.

#### Food

Alcohol: Alcoholism may increase risk for GI bleeding. Limit alcohol use.
#### **DIAGNOSTIC TEST EFFECTS**

May increase the PT and aPTT in dosedependent manner, so be aware of this. However, these tests and the INR are *not* used for rivaroxaban monitoring.

#### SIDE EFFECTS

Common Bleeding occurs in > 5%. Occasional

Pruritus, wound seepage, feeling faint, pain in extremity, muscle spasm. GI distress, such as nausea, dyspepsia, also extremity edema. **Rare** 

Syncope, jaundice or cholestasis, fever, skin rash, blister, urticaria.

#### SERIOUS REACTIONS

 Bleeding complications ranging from local ecchymoses to major hemorrhage. Unlike Coumadin or heparin anticoagulants, there is no antidote and patient is managed clinically.

 Serious hypersensitivity, such as anaphylactoid reactions, angioedema, or Stevens-Johnson syndrome, are rare.

#### **PRECAUTIONS & CONSIDERATIONS**

Anticoagulation is contraindicated in any circumstance in which the risk of hemorrhage is greater than the potential benefit. Identification of risk factors for bleeding in a patient warrants frequent monitoring. Use caution in patients with renal impairment, mild hepatic disease, history of GI bleeding, peptic ulcer disease, and those with risk factors for intracranial bleeding. The effect of rivaroxaban on the fetus during pregnancy or on the infant during breastfeeding is unknown. Safety and efficacy in children have not been established. The elderly have a higher risk for bleeding in general when taking oral anticoagulants. Discontinuing the drug in the absence of adequate alternative

anticoagulation increases the risk of thrombotic events, such as stroke, in patients with atrial fibrillation. If rivaroxaban must be discontinued for a reason other than pathological bleeding, consider administering another anticoagulant. When spinal/epidural anesthesia or spinal puncture is employed, patients treated with anticoagulants are at risk of developing an epidural or spinal hematoma, which can result in long-term or permanent paralysis. The manufacturer provides explicit instructions on how to handle patients with such catheters. Nonessential medications, including OTC drugs, should be avoided. An electric razor and soft toothbrush may be advisable. Avoid dangerous recreational sports. Notify the physician before having dental work or surgery, as the drug should be discontinued several days prior to major surgery for most patients. However, minimize lapses in treatment to maintain stroke and clot prophylaxis. Monitor clinically for signs of bleeding, or for symptoms of clotting. Promptly evaluate for bleeding if drop in hemoglobin or hematocrit is sudden. Carefully assess for new medicines (prescription and OTC), as well as supplement use, at every appointment.

#### Storage

Store in the original container or blister package. Keep tightly closed. Protect from moisture. Store at room temperature.

#### Administration

Patient should take rivaroxaban exactly as prescribed. Adherence to the prescription is essential to minimize the risk of clots and stroke.

For joint replacement: Give once daily either with or without food.

For atrial fibrillation: Take once daily with the evening meal.

#### Rivastigmine

riv'a-stig'mine

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Alzheimer's agents, cholinesterase inhibitors

#### **MECHANISM OF ACTION**

A carbamate cholinesterase inhibitor that inhibits the enzyme acetylcholinesterase, thus increasing the concentration of acetylcholine (ACh) at cholinergic synapses and enhancing cholinergic function in the central nervous system (CNS). *Therapeutic Effect:* Slows the progression of Alzheimer's disease and Parkinson's dementia.

#### PHARMACOKINETICS

Well absorbed after PO and transdermal administration. Rapidly and extensively metabolized at CNS receptor sites via cholinesterase, which mediates hydrolysis to the decarbamylated phenolic metabolite. The metabolite is metabolized in the liver, but is of no therapeutic consequence. No interactions with CYP450 are observed. The metabolite is 90% excreted in the urine in 24 h post-dose. Half-life: Plasma: 1-2 h; however, CNS cholinesterase inhibition lasts much longer (~ 10 h). A carbamate moiety remains at the CNS acetylcholinesterase receptor for up to 10 h, preventing the hydrolysis of ACh.

#### AVAILABILITY

Capsules: 1.5 mg, 3 mg, 4.5 mg, 6 mg. Oral Solution: 2 mg/mL. Transdermal Patch: 4.6 mg/24 h, 9.5 mg/24 h.

#### INDICATIONS AND DOSAGES

#### Alzheimer's disease or Parkinson's dementia PO

Adults, Elderly, Initially, 1.5 mg twice daily with food. After 2 wks (Alzheimer's disease) or 4 wks (Parkinson's dementia), may increase to 3 mg twice daily if tolerated. Subsequently, increase dose by 1.5 mg twice daily, at intervals of 2 wks (Alzheimer's disease) or 4 wks (Parkinson's dementia) or more. Maximum: 6 mg twice daily. If GI adverse effects occur, discontinue for several doses, and then restart at lower dose. If interrupted for several days, reinitiate with the lowest daily dose (1.5 mg twice daily) and slowly retitrate.

#### TRANSDERMAL

Adults, Elderly. Initially, one 4.6 mg/24 h patch applied once daily. After 4 wks, may increase to the 9.5 mg/24 h patch if tolerated. If treatment is interrupted for > 3 days, begin with initial titration. To switch from oral to patch: For patients receiving less than 6 mg/day of oral rivastigmine, use the 4.6 mg/24 h patch. For patients receiving 6-12 mg/day of oral rivastigmine, use the 9.5 mg/24 h patch. Apply the first patch on the day following the last oral dose.

#### CONTRAINDICATIONS

History of hypersensitivity to rivastigmine or carbamate derivatives, acute jaundice, active GI bleeding.

Rivastigmine (Generic Name), Exelon (Brand Name)

#### **INTERACTIONS**

Drug

Anticholinergics: May decrease the effect of rivastigmine. Cholinergic agonists, neuromuscular blockers, succinylcholine: May increase cholinergic effects. NSAIDs: Increase GI irritation. Monitor for GI bleeding. Herbal Tobacco smoking: May decrease cholinergic effects.

Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Infrequent increased liver function enzymes.

#### SIDE EFFECTS

#### Frequent

Significant nausea and weight loss; slow titration improves GI tolerance. Dizziness, headache, and diarrhea are also common.

#### Occasional

Insomnia, urinary tract infection, gastritis, gastroesophageal reflux, hematochezia, peptic ulcer, hematemesis, salivary hypersecretion, vomiting, abdominal pain, fatigue.

#### Rare

Asthenia, flu-like symptoms, hypertension, anxiety, hallucinations, increase in aggression, rhinitis, somnolence, syncope, dyspepsia, constipation, flatulence. Parkinson's tremor may be worsened.

#### SERIOUS REACTIONS

• Vagotonic effects may include bradycardia, heart block, and syncopal episodes.

• May induce extrapyramidal symptoms.

• GI ulcer or bleeding; pancreatitis (rare).

 Overdose may result in cholinergic crisis, characterized by severe nausea, increased salivation, diaphoresis, bradycardia, hypotension, flushed skin, abdominal pain, respiratory depression, seizures, and cardiorespiratory collapse. Increasing muscle weakness may result in death if respiratory muscles are involved.

The antidote is 1-2 mg IV atropine sulfate with subsequent doses based on therapeutic response.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with asthma; bladder outflow obstruction; prostatic hypertrophy; asthma or chronic obstructive pulmonary disease (COPD); peptic ulcer disease; history of seizures, sick sinus syndrome, or other supraventricular conduction disturbances (bradycardia); and concurrent use of NSAIDs. There is no role for rivastigmine during pregnancy or lactation. Rivastigmine is not prescribed for children. Be aware that rivastigmine is not a cure for dementia but may slow the progression of its symptoms.

Notify the physician if abdominal pain, diarrhea, excessive sweating or salivation, dizziness, or nausea and vomiting occur or if hypertension is present. Baseline vital signs should be assessed. Cholinergic reactions, such as diaphoresis, dizziness, excessive salivation, facial warmth, abdominal cramps or discomfort, lacrimation, pallor, and urinary urgency, should be monitored. Storage

Store at room temperature. Keep patch in original closed foil pouch until time of use.

#### Administration

Take oral rivastigmine with food to increase GI tolerance.

Measure oral solution with the supplied oral syringe. Give undiluted, or it may be diluted in a small glass of water, cold fruit juice, or soda; stir well. Patient should drink entire glass to ensure proper dose. Stable for up to 4 h mixed with these beverages.

Apply transdermal patch once daily to clean, dry, hairless, intact healthy skin in an area not rubbed by tight clothing or elastic. Application to the upper or lower back may be preferable to avoid removal by the patient; however, the chest or upper arm may also be used. Do not apply to red, irritated, or damaged skin. Do not use on areas with recent application of lotions, creams, or powder. Rotate application sites daily. Do not apply to the same site more than once every 14 days. Always remove the old patch before applying a new patch so that overdose does not occur.

#### Rizatriptan

rize-a-trip'tan Maxalt, Maxalt-MLT

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antimigraine agent; 5HT<sub>1</sub>-receptor agonist; serotonin receptor agonists

#### **MECHANISM OF ACTION**

A serotonin receptor agonist that binds selectively to vascular receptors, producing a vasoconstrictive effect on cranial blood vessels. *Therapeutic Effect:* Relieves migraine headache.

#### PHARMACOKINETICS

Well absorbed after PO administration. Protein binding: 14%. Crosses the blood-brain barrier. Metabolized by the liver to inactive metabolite. Eliminated primarily in urine and, to a lesser extent, in feces. *Half-life*: 2-3 h.

#### AVAILABILITY

Tablets (Maxalt): 5 mg, 10 mg. Oral Disintegrating Tablets (Maxalt-MLT): 5 mg, 10 mg.

#### INDICATIONS AND DOSAGES

#### Acute migraine attack

PO (TABLETS OR ODT) Adults, Elderly. 5-10 mg. If headache improves, but then returns, dose may be repeated after 2 h. Maximum: 30 mg/24 h.

#### CONTRAINDICATIONS

Basilar or hemiplegic migraine, coronary artery disease, ischemic heart disease (including angina pectoris, history of myocardial infarction [MI], silent ischemia, and Prinzmetal angina), uncontrolled hypertension, use within 24 h of ergotamine-containing preparations or another serotonin receptor agonist; use within 14 days of MAOIs, hypersensitivity to rizatriptan.

#### INTERACTIONS

#### Drug

**Dextromethorphan, fluoxetine, fluvoxamine, paroxetine, sertraline, tramadol:** May produce hyperreflexia, incoordination, and weakness. **Selective 5-HT**<sub>1</sub> **antagonist, ergotamine-containing** 

**medications:** May produce a vasospastic reaction.

**MAOIs:** Increase plasma concentration of rizatriptan, and increase risk of serotonergic crisis.

Rizatriptan (Generic Name), Maxalt (Brand Name)

Propranolol: Increases rizatriptan levels. Maximum rizatriptan 5 mg/dose and 15 mg/24 h. Herbal None known. Food

All foods: Delays peak drug concentration by 1 h.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent (7%-9%)

Dizziness, somnolence, paresthesia, fatigue.

#### Occasional (3%-6%)

Nausea, chest pressure, dry mouth, flushing, palpitations, dyspnea. **Rare (2%)** 

Headache; neck, throat, or jaw pressure; photosensitivity.

#### SERIOUS REACTIONS

 Cardiac reactions (such as ischemia, ECG changes, coronary artery vasospasm, and MI) and noncardiac vasospasm-related reactions (including hemorrhage and cerebrovascular accident) occur rarely, particularly in patients with hypertension, diabetes, or a strong family history of coronary artery disease; obese patients; smokers; males older than 40 yr; and postmenopausal women.

· Ischemic colitis reported rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with mild to moderate hepatic or renal impairment and cardiovascular risk factors. It is unknown whether rizatriptan is excreted in breast milk. The safety and efficacy of rizatriptan have not been established in children. Rizatriptan is not recommended for elderly patients. Smoking, exposure to sunlight and ultraviolet rays, and tasks that require mental alertness or motor skills should be avoided. Dizziness may occur. Notify the physician immediately if anxiety, chest pain, palpitations, or tightness in the throat occurs. BUN level and serum alkaline phosphatase, bilirubin, creatinine AST (SGOT), and ALT (SGPT) levels should be obtained before treatment to assess renal and hepatic function. ECG should also be obtained at baseline. Migraines and associated symptoms, including nausea and vomiting, photophobia, and phonophobia (sound sensitivity), should be assessed before and during treatment.

#### Storage

Store tablets at room temperature. ODT form should be kept in original sealed blister pack until time of use; protect from moisture.

#### Administration

Do not crush, chew, or split tablets. Preferably take without food. Do not remove the orally disintegrating tablet from the blister pack until just before taking it. Open packet with dry hands, and place ODT on the tongue to dissolve. Then swallow it. Do not administer ODT with water.

### Roflumilast roe-flue'mi-last

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Respiratory agents, phosphodiesterase-4 inhibitor

#### **MECHANISM OF ACTION**

Selective inhibitor of phosphodiesterase 4 (PDE4). Roflumilast and roflumilast N-oxide inhibit PDE4 (a major cyclic AMPmetabolizing enzyme in lung tissue). This activity leads to accumulation of increased intracellular cyclic AMP in lung cells. *Therapeutic Effect:* Reduces the rate of occurrence of COPD exacerbations, improves lung capacity and breathing.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Protein binding: close to 99%. Extensively metabolized in the liver with N-oxidation of roflumilast to roflumilast N-oxide (active) by CYP3A4 and CYP1A2. Dose excreted 70% in urine. Not removed by hemodialysis. *Half-life*: 17 h (roflumilast); 30 h (active metabolite) (increased in hepatic impairment).

#### AVAILABILITY

Tablets: 500 mcg.

#### INDICATIONS AND DOSAGES

COPD (exacerbation prevention): PO

Adults, Elderly. 500 mcg once daily.

#### CONTRAINDICATIONS

Hypersensitivity to roflumilast; moderate to severe hepatic impairment (Child-Pugh class B or C). Not a bronchodilator, and thus should not be used for acute bronchospasm or asthma.

#### INTERACTIONS

Drug

CYP3A4 inhibitors or drugs inhibiting both CYP3A4 and CYP1A2 (e.g., erythromycin, ketoconazole, fluvoxamine, enoxacin, cimetidine): May increase roflumilast systemic exposure and side effects.

Oral contraceptives: OCs containing gestodene or ethinyl estradiol may increase roflumilast concentrations or side effects.

Rifampin, carbamazepine, phenobarbital, phenytoin, and other potent CYP3A4 inducers: Increase metabolism and reduce serum concentrations of roflumilast. Avoid if possible.

#### Herbal

St. John's wort: May decrease efficacy of roflumilast. Avoid. Food

None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase AST (SGOT) and ALT (SGPT) levels.

#### SIDE EFFECTS

Frequent (> 2%)

Weight loss (5%-10% of body weight, occurs in 7%-8% of patients), nausea, diarrhea, headache, back pain, flu-like symptoms, insomnia, dizziness, decreased appetite.

#### Infrequent (1%-2%)

Abdominal pain, dyspepsia, gastritis, vomiting, rhinitis, sinusitis, urinary tract infection, muscle spasms, tremor, anxiety, depression.

#### SERIOUS REACTIONS

• Psychiatric disturbances such as depression, suicidal thoughts, confusion (disorientation), hallucinations, unusual mood or behaviors, suicidal ideation.

• Weight loss can be significant and compromise health.

#### **PRECAUTIONS & CONSIDERATIONS**

Be aware roflumilast is not intended to treat acute breathing attacks. Caution is warranted in patients with mild hepatic impairment. Use during pregnancy not recommended. It is unknown whether roflumilast is excreted in breast milk; do not breastfeed while using the drug. Roflumilast is not approved for use in children.

Drink plenty of fluids to decrease the thickness of lung secretions. Pulse rate and quality, as well as respiratory depth, rate, rhythm, and type, should be monitored. Fingernails and lips should also be assessed for a blue or dusky color in light-skinned patients and a gray color in dark-skinned patients, which may be signs of hypoxemia. Monitor weight and nutrition; discontinuation of the drug may be considered if weight loss is significant. Be alert for the emergence or worsening of depression, suicidal thoughts, or other unusual mood changes; if such changes occur the health care provider should be contacted.

#### Storage

Store tablets at room temperature protected from light and moisture.

#### Administration

Take roflumilast tablets once daily without regard to food. Take as prescribed, continuing even during symptom-free periods and exacerbations. Do not alter the dosage or abruptly discontinue other COPD medications.

#### Ropinirole

ro-pin'i-role 📩 酔 Requip, Requip XL

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, dopaminergics

#### **MECHANISM OF ACTION**

An antiparkinsonian agent that stimulates dopamine receptors in the striatum. *Therapeutic Effect:* Relieves signs and symptoms of Parkinson's disease.

Reduces uncomfortable leg sensations, movement, and sleep disturbance in restless leg syndrome (RLS).

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Food does not alter efficacy. Protein binding: 40%. Extensively distributed throughout the body. Extensively metabolized. Steady-state concentrations achieved within 2 days. Eliminated in urine. Unknown whether removed by hemodialysis. *Half-life:* 6 h.

#### AVAILABILITY

*Tablets:* 0.25 mg, 0.5 mg, 1 mg, 2 mg, 3 mg, 4 mg, 5 mg. *Extended Release Tablets:* 2 mg, 4 mg, 6 mg, 8 mg, 12 mg.

#### INDICATIONS AND DOSAGES

#### Parkinson's disease PO (IMMEDIATE-RELEASE TABLETS)

*Adults, Elderly.* Initially, 0.25 mg 3 times a day. May increase dosage every 7 days. Titrate gradually, as follows: wk 2, 0.5 mg 3 times a day; wk 3, 0.75 mg 3 times a day. After wk 4, dosage may be increased every week, if needed, by 1.5-3 mg/day to a maximum dose of 24 mg/day.

#### PO (EXTENDED RELEASE) Adults, Elderly. Initially, 2 mg once daily for 1-2 wks, followed by increases of 2 mg/day at 1 wk or longer intervals as appropriate. Maximum: 24 mg/day.

#### Restless legs syndrome PO

Adults, Elderly. Initially, 0.25 mg daily 1-3 h before bedtime. May increase dosage after 2 days to 0.5 mg daily then 1 mg daily after 7 days. May titrate dose 0.5 mg/wk every 7 days. Maximum: 4 mg/day.

#### CONTRAINDICATIONS

Hypersensitivity to ropinirole.

Ropinirole (Generic Name)

#### INTERACTIONS

#### Drug

Antipsychotics, butyrophenones, carbamazepine, cigarette smoking, phenobarbibital, metoclopramide, phenothiazines, rifampin, thioxanthenes: Decrease the effectiveness of ropinirole. Central nervous system (CNS) depressants: May increase CNS depressant effects. Cimetidine, diltiazem, enoxacin, erythromycin, fluvoxamine, mexiletine, norfloxacin, tacrine:

Increase ropinirole blood concentration. Estrogens: Reduce the clearance of ropinirole.

Levodopa: Increases the blood concentration of levodopa.

**Quinolones:** Increase ropinirole blood concentration.

#### Herbal

Kava kava, gotu kola, valerian, St. John's wort: May increase CNS depression.

#### Food

Alcohol: May increase CNS depression.

#### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase level.

#### SIDE EFFECTS

#### Frequent (40%-60%)

Nausea, dizziness, somnolence. Occasional (4%-12%)

Syncope, vomiting, fatigue, viral infection, dyspepsia, diaphoresis, asthenia, orthostatic hypotension, abdominal discomfort, pharyngitis, abnormal vision, dry mouth, hypertension, hallucinations, confusion.

#### Rare (< 4%)

Anorexia, peripheral edema, memory loss, rhinitis, sinusitis, palpitations, impotence.

#### SERIOUS REACTIONS

• Excessive daytime drowsiness may result in falling asleep while engaged in activities, including the operation of motor vehicles.

• Hallucinations; new or emergent compulsive actions (gambling, eating, shopping, etc.).

 Retroperitoneal fibrosis, pulmonary infiltrates, pleural effusion, pleural thickening, pericarditis, and cardiac valvulopathy have been reported with ergotderived dopaminergic agents.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hallucinations (especially elderly), renal or hepatic impairment, syncope, history of orthostatic hypotension, and those who take CNS depressants concurrently. Because ropinirole is distributed in breast milk, it may cause drugrelated effects in the breastfeeding infant. The safety and efficacy of ropinirole have not been established in children. No age-related precautions have been noted in elderly patients, but they are more likely than other age groups to experience hallucinations.

Dizziness, drowsiness, and orthostatic hypotension are common initial responses to the drug. Alcohol and tasks that require mental alertness or motor skills should be avoided until the effects of the drug are known. Change positions slowly to prevent orthostatic hypotension. Vital signs and serum alkaline phosphatase levels should be assessed at baseline. Relief of symptoms, such as improvement of mask-like facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should be assessed during treatment.

#### Storage

Store at controlled room temperature. Administration

Taking ropinirole with food may decrease risk of nausea. Extendedrelease tablets should be swallowed whole; do not cut, crush, or chew. Patients taking the drug for RLS should take it within 1-3 h of their expected bedtime.

For Parkinson's disease, plan to discontinue the drug gradually at 7-day intervals, as follows: first decrease the frequency from 3 times a day to twice a day for 4 days; for the remaining 3 days, decrease the frequency to once a day before complete withdrawal, as prescribed. For restless legs syndrome, doses up to 4 mg/day may be discontinued without tapering.

#### Rosiglitazone

roz-ih-gli'ta-zone Avandia Do not confuse Avandia with Avalide, Avinza, Coumadin, or Prandin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidiabetic agents, thiazolidinediones

#### **MECHANISM OF ACTION**

Thiazolidinedione that improves target-cell response to insulin without increasing pancreatic insulin secretion. Decreases hepatic glucose output and increases insulindependent glucose utilization in skeletal muscle. *Therapeutic Effect:* Lowers blood glucose concentration.

#### PHARMACOKINETICS

Rapidly absorbed. Protein binding: 99.8%. Metabolized in the liver. Excreted primarily in urine, with a lesser amount in feces. Not removed by hemodialysis. *Half-life:* 3-4 h.

#### AVAILABILITY

Tablets: 2 mg, 4 mg, 8 mg.

#### INDICATIONS AND DOSAGES

NOTE: In September 2010, the FDA placed rosiglitazone in a restricted access program due to CV events. Only those currently treated with rosiglitazone and benefiting are to continue treatment. New patients receive *only* if not achieving control with other drugs and unable to take pioglitazone (Actos).

#### Diabetes mellitus type 2, monotherapy, or combination therapy

PO

*Adults, Elderly.* Initially, 4 mg as single daily dose or in divided doses twice a day. May increase to 8 mg/day after 12 wks of therapy if fasting glucose level is not adequately controlled.

#### CONTRAINDICATIONS

Hypersensitivity to rosiglitazone, active hepatic disease, diabetic ketoacidosis, increased serum transaminase levels, including ALT (SGPT) > 2.5 times the normal serum level, type 1 diabetes mellitus, New York Heart Association (NYHA) class III/IV heart failure before initiation. Should not be used in any patient with symptomatic heart failure.

#### INTERACTIONS Drug

Ji ug Amiada

Amiodarone, paclitaxel, pioglitazone, repaglinide: May have increased levels.

Atazanavir, gemfibrozil, ritonovir, trimethoprim: Levels and effects of rosiglitazone may be increased.

Bile acid sequestrants,

carbamazepine, corticosteroids, lutenizing hormone-releasing hormone, phenobarbital,

Rosiglitazone (Generic Name)

#### phenytoin, rifampin, rifapentine:

Levels and effects of rosiglitazone may be decreased.

**Insulin, pregabalin:** May exacerbate fluid retention.

#### Herbal

Hypoglycemic herbs (alfalfa, bilberry, bitter melon, burdock, celery, daminana, fenugreek, garcinia, garlic, ginger, ginseng, symnema, marshmallow, and stinging nettle: May enhance hypoglycemic effects. Food

Alcohol: Avoid; may cause hypoglycemia.

#### DIAGNOSTIC TEST EFFECTS

May decrease hematocrit and hemoglobin and serum alkaline phosphatase, bilirubin, and AST (SGOT) levels. < 1% of patients experience ALT values that are 3 times the normal level.

#### SIDE EFFECTS

#### Frequent (9%)

Upper respiratory tract infection. Occasional (2%-4%)

Headache, edema, back pain, fatigue, sinusitis, diarrhea.

#### SERIOUS REACTIONS

• Increase risk of myocardial ischemic events such as angina or MI.

• New onset or exacerbation of congestive heart failure.

· Macular edema (rare).

• Hepatic impairment and jaundice (rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Becuse of the potential association of rosiglitazone with myocardial infarction, the drug is only available via the Avandia-Rosiglitazone Medicines Access Program. Patients and prescribers must be enrolled in the program. Caution is warranted in patients with mild CHF, edema, hepatic impairment, and coronary artery disease or other cardiac disease. May cause or exacerbate heart failure or cause ischemic heart events in some patients (see Contraindications). Monitor for signs and symptoms of heart failure, including excessive, rapid weight gain; dyspnea; or edema. It is unknown whether rosiglitazone crosses the placenta or is distributed in breast milk. Rosiglitazone use is not recommended in pregnant or breastfeeding women.

Rosiglitazone use may result in ovulation in some previously anovulatory women, increasing pregnancy risk. Reliable contraception is recommended. Safety and efficacy of rosiglitazone have not been established in children. No age-related precautions have been noted in elderly patients.

Food intake, blood glucose, and hemoglobin A1c (HbA1c) should be monitored before and during therapy. Hepatic enzyme levels should also be obtained before beginning rosiglitazone therapy and periodically thereafter. Notify the physician of abdominal or chest pain, dark urine or light stool, hypoglycemic reactions, fever, nausea, palpitations, rash, vomiting, or yellowing of the eyes or skin. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia. Consult the physician

when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store at room temperature. Administration

Take rosiglitazone without regard to meals.

#### Rosuvastatin

row-soo-vah-stah'tin ★ 🍁 Crestor

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

Classification: Antihyperlipidemics, HMG-CoA reductase inhibitors ("statins")

#### MECHANISM OF ACTION

An antihyperlipidemic that interferes with cholesterol biosynthesis by inhibiting the conversion of the enzyme HMG-CoA to mevalonate, a precursor to cholesterol. Therapeutic Effect: Decreases LDL cholesterol, VLDL, and plasma triglyceride levels, increases HDL concentration.

#### PHARMACOKINETICS

Protein binding: 88%. Minimal hepatic metabolism. Primarily eliminated in the feces. Half-life: 19 h (increased in patients with severe renal dysfunction).

#### **AVAILABILITY**

Tablets: 5 mg, 10 mg, 20 mg, 40 mg.

#### INDICATIONS AND DOSAGES Hyperlipidemia, dyslipidemia PO

Adults, Elderly, 5-40 mg/day. Consider lower initial dose of 5 mg/day if of Asian descent. Usual starting dosage is 10 mg/day, with adjustments based on lipid levels at intervals of 2-4 wks until desired level is achieved. Doses may be increased by 5-10 mg once daily. Maximum: 40 mg/day. Children 10 vr and older. 5-20

mg/day.

#### Renal impairment (creatinine) clearance < 30 mL/min)

PO

Adults, Elderly. 5 mg/day; do not exceed 10 mg/day.

Concurrent lopinavir-ritonavir use PO

Adults, Elderly. 10 mg/day.

#### Concurrent cyclosporine use PO

Adults, Elderly. 5 mg/day.

Concurrent lipid-lowering therapy PO

Adults, Elderly. 10 mg/day.

#### CONTRAINDICATIONS

Active hepatic disease; breastfeeding; pregnancy; unexplained, persistent elevations of serum transaminase levels.

#### INTERACTIONS

#### Drug

Antiretroviral protease inhibitors (e.g., fosamprenavir, ritonavir, nelfinavir, darunavir, others), colchicine: Decrease rosuvastatin clearance, increasing levels. Use lowest effective dose of rosuvastatin to avoid myopathy. Do not exceed 10 mg/day. Cyclosporine, gemfibrozil, niacin: Increase the risk of myopathy. Use lowest effective dose of rosuvastatin to avoid myopathy. Do not exceed 5 mg/day in those taking cyclosporine.

Rosuvastatin (Generic Name), Crestor (Brand Name)

**Erythromycin:** Reduces the plasma concentration of rosuvastatin slightly; relevance unknown.

#### Ethinyl estradiol, norgestrel:

Increase the plasma concentrations of ethinyl estradiol and norgestrel. **Warfarin:** Enhances anticoagulant effect. Monitor INR.

#### Herbal

None known.

#### Food

Alcohol: Avoid; may increase hepatic effects.

#### DIAGNOSTIC TEST EFFECTS

May increase serum creatine phosphokinase and transaminase concentrations. May produce hematuria and proteinuria.

#### SIDE EFFECTS

Rosuvastatin is generally well tolerated. Side effects are usually mild and transient.

#### Occasional (3%-9%)

Pharyngitis; headache; diarrhea; dyspepsia, including heartburn and epigastric distress; nausea.

#### Rare (< 3%)

Myalgia, asthenia or unusual fatigue and weakness, back pain. Reversible cognitive impairment or depression, hair loss, may worsen glucose tolerance and increase HbA1C.

#### SERIOUS REACTIONS

• Hypersensitivity, such as bullous rash or anaphylaxis, reported rarely.

- · Cataracts may develop.
- · Severe myopathy and

rhabdomyolysis.

• Rare cases of hepatic impairment, jaundice, or pancreatitis.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with a history of hepatic disease, hypotension, severe acute infection; severe electrolyte, endocrine, metabolic imbalances or disorders; trauma; and uncontrolled seizures. Caution should also be used in those who consume a substantial amount of alcohol and those who have had recent major surgery. Rosuvastatin use is contraindicated in pregnancy because the suppression of cholesterol biosynthesis may cause fetal toxicity. Rosuvastatin is contraindicated during lactation because it carries the risk of serious adverse reactions in breastfeeding infants. Safety and efficacy of rosuvastatin have not been established in children < 10 yr. No age-related precautions have been noted in elderly patients.

Notify the physician of headache, sore throat, muscle weakness and aches, severe gastric upset, or rash. Pattern of daily bowel activity and stool consistency should be assessed. Serum lipid cholesterol and triglyceride levels and hepatic function should be checked at baseline and periodically during treatment. At initiation of rosuvastatin therapy, a standard cholesterol-lowering diet should be practiced and continued throughout rosuvastatin therapy.

#### Storage Store at room temperature. Administration

Take rosuvastatin without regard to meals and administer at any time of day.

#### Rufinamide

roo-fin′a-mide ★ Banzel

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Anticonvulsants

#### **MECHANISM OF ACTION**

A unique anticonvulsant whose exact mechanism is unknown. Data suggest modulation of sodium channels, primarily through prolongation of the inactive state of the channel. Slows sodium channel recovery and limits sustained repetitive firing of sodium-dependent action potentials. Reduces the QTc interval of the ECG. *Therapeutic Effect:* Reduces seizure frequency.

#### PHARMACOKINETICS

Well absorbed after PO administration with food. Protein binding: 34%. Extensively metabolized in the liver, primarily to an inactive carboxylic acid metabolite produced via enzymatic hydrolysis. Rufinamide is not metabolized through CYP450; however, it is a weak inhibitor of CYP2E1 and a weak inducer of CYP2E1 and a weak inducer of CYP3A4. Most of the metabolites are excreted in the urine. Some removal by hemodialysis. *Half-life:* 6-10 h.

#### AVAILABILITY

Tablets: 200 mg, 400 mg. Oral suspension: 40 mg/ml.

## INDICATIONS AND DOSAGES Lennox-Gastaut syndrome

#### PO

Adults, Elderly. Initially, 400-800 mg/day given in 2 equally divided doses. Increase by 400-800 mg/ day every 2 days until the target and maximum daily dose of 3200 mg/ day, given in 2 equally divided doses, is reached.

Children 4 yr and older. Initially, approximately 10 mg/kg/day given in 2 equally divided doses. Increase dose by approximately 10-mg/kg increments every other day to a target dose of 45 mg/kg/day or 3200 mg/day, whichever is less, given in 2 equally divided doses.

Dosage in hepatic impairment Use caution in mild to moderate impairment; do not use if severe impairment.

#### CONTRAINDICATIONS

History of hypersensitivity to rufinamide, familial short QT syndrome.

#### INTERACTIONS Drug

#### Divalproex or valproic acid:

Increases rufinamide levels. Patients stabilized on rufinamide before prescribed valproate should begin valproate therapy at a low dose, and titrate. Similarly, patients on valproate should begin rufinamide at a dose lower than 400 mg, then titrate.

#### Oral and other hormonal

**contraceptives:** May decrease contraceptive levels and efficacy. **Mexilitene:** Additive effect on QTc interval on ECG.

**Phenytoin or phenobarbital:** May decrease rufinamide levels.

#### Herbal

None known.

#### Food

All food: Increases absorption; take with food.

#### DIAGNOSTIC TEST EFFECTS

Decreased WBC or platelet counts, shortening of QTc interval of ECG occurs in 46%-65% and is dose related.

#### SIDE EFFECTS

#### Frequent

Somnolence is most common. Others include headache, fatigue, nausea, gait disturbance, dizziness, ataxia.

#### Occasional

Diplopia, nasopharyngitis, tremor, nystagmus, blurred vision, and vomiting.

#### Rare

Flu-like symptoms, bronchitis, psychomotor hyperactivity, aggression, inattention, ear infection, pruritus, rash.

#### SERIOUS REACTIONS

• Cardiac effects may include bradycardia, heart block, and syncopal episodes (infrequent).

· New-onset convulsions.

• Neutropenia, thrombocytopenia (infrequent).

• Multiorgan hypersensitivity syndrome (rash, urticaria, facial edema, fever, eosinophilia, stuporous state, and severe hepatitis).

#### PRECAUTIONS & CONSIDERATIONS

Antiepileptic drugs increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for depression, suicidal thoughts, or any unusual changes in mood or behavior. Caution should be used with other drugs that shorten the QT interval, or in patients with known cardiac arrhythmias or short QT syndrome. Use caution in hepatic impairment. It is not known if the drug crosses the placenta or is excreted in breast milk. Rufinamide reduces the efficacy of hormonal contraceptives; alternative methods of reliable contraception are advised. Safety and efficacy not established in children under 4 yr of age.

Notify the physician if rash associated with fever occurs, as this could be indicative of a serious hypersensitivity reaction. Baseline vital signs should be assessed. Notify physician if change in heart rate or regularity occurs. Monitor for change in frequency of seizure activity.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Rufinamide tablets are scored on both sides and can be cut in half for dosing flexibility. Tablets can be administered whole, as half-tablets, or crushed. The tablets should be given with food.

Shake oral suspension well before each use. Use calibrated oral syringe and adapter provided with the bottle to measure the dose. Give the dose with food.

As with all antiepileptic drugs, rufinamide dosage should be gradually tapered to minimize the risk of precipitating seizures, seizure exacerbation, or status epilepticus.

# INDIVIDUAL DRUG MONOGRAPHS

#### **Salicylic Acid**

sal-i-sill'ik as'id ★ Clearasil, Compound W, Compound W One Step, Dr. Scholl's Clear Away, Dermarest, DuoFilm, Gordofilm, Ionil Plus Shampoo, Keralyt, Mosco Corn and Callus Remover, Neutrogena Acne Wash, Neutrogena On The Spot Acne Patch, Salac, Salactic, Salvax, Stridex, Tinamed, Trans-Ver-Sal

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC, Rx

**Classification:** Antipsoriatics, dermatologics, keratolytics, salicylates

#### MECHANISM OF ACTION

A keratolytic agent that produces desquamation of hyperkeratotic epithelium by dissolution of intercellular cement and causes the cornified tissue to swell, soften, macerate, and desquamate. *Therapeutic Effect:* Decreases acne, psoriasis, and promotes wart removal.

#### PHARMACOKINETICS

Minimal systemic absorption. Protein binding: 50%-80%. Bound to serum albumin. Metabolized to salicylate glucoronides and salicyluric acid. Excreted in urine.

#### AVAILABILITY

Salicylic acid is available in a variety of branded products OTC. The following list represents commonly found products:

## Products for acne or psoriasis treatment

Cream: 2% (Clearasil). Gel: 2% (Clearasil), 3% (Keralyt), 6% (Keralyt). Topical Foam: 2% (Neutrogena Acne Wash, Salac, Clearasil Foaming Cleanser), 6% (Salvax). Topical Lotion: 2%, 3%, 6% (Dermarest Psoriasis). Scalp Solution: 3% (Dermarest Scalp). Shampoos: 2% (Lonil Plus Therapeutic Shampoo). Patch: 2% (Neutrogena On The Spot Acne Patch).

## Products for wart or callus removal

*Liquid:* 17% (Compound W, DuoFilm, Gordoflm, Mosco Corn and Callus Remover, Salactic, Tinamed). *Patch:* 15% (Trans-Ver-Sal Plantar Wart Removal Patch, Compound W One Step Pads; Dr Scholl's Clear Away).

## INDICATIONS AND DOSAGES Acne

TOPICAL

Adults, Elderly, Children. Apply cream, foam, gel, liquid, pads, patch, or soap 1-3 times/day.

• Callus, corn, wart removal TOPICAL

Adults, Elderly, Children. Apply gel, liquid, plaster, or patch to wart 1-2 times/day.

#### Dandruff, psoriasis, seborrheic dermatitis

TOPICAL Adults, Elderly, Children. Apply cream, ointment, or shampoo 3-4 times/day.

#### CONTRAINDICATIONS

Children younger than 2 yr, diabetes, impaired circulation, hypersensitivity to salicylic acid or any of its components.

#### INTERACTIONS

#### Drug

Ammonium sulfate: May increase plasma salicylate levels. Corticosteroids: May decrease plasma salicylate levels. Heparin: May decrease platelet adhesiveness and interfere with hemostasis in heparin-treated patients. Methotrexate: May increase risk of methotrexate toxicity. Pyranzinamide: May inhibit pyrazinamide-induced hyperuricemia. Tolbutamide: May increase risk of hypoglycemia. Uricosuric agents: May decrease the effects of probenecid, sulfinpyrazone, and phenylbutazone. Varicella virus vaccine: May

increase risk of developing Reye's syndrome.

#### Herbal

Tamarind: May increase risk of salicylate toxicity. Food

None known.

#### DIAGNOSTIC TEST EFFECTS

None expected with usual topical use. Elevated salicylate level from topical use occurs rarely.

#### SIDE EFFECTS

#### Occasional

Burning, erythema, irritation, pruritus, stinging.

#### Rare

Dizziness, nausea, vomiting, diarrhea, hypoglycemia.

#### SERIOUS REACTIONS

• Symptoms of salicylate toxicity include lethargy, hyperpnea, diarrhea, and psychic disturbances.

#### PRECAUTIONS & CONSIDERATIONS

Salicylic acid should not be applied to areas that are irritated, infected, or reddened; birthmarks; genital or facial warts; or mucous membranes. It is unknown whether salicylic acid crosses the placenta or is distributed in breast milk. Salicylic acid is not recommended for use in children younger than 2 yr. Some products are not approved for use in children. No age-related precautions have been noted in elderly patients. Use of abrasive soaps and cleansers, alcohol-containing preparations, other topical acne preparations, cosmetic soaps that dry skin, and medicated cosmetics should be avoided.

#### Administration

Use cream, pads, foam, or liquid cleansers for acne by cleansing the skin 1-2 times/day. Massage gently into skin, work into lather, and rinse thoroughly. Pads should be wet with water before using and disposed of after use. Do not flush pads.

Use gel for acne by applying a small amount to clean, dry skin on the face in the morning or evening. If peeling or drying occurs, use every other day. Some products may be used up to 3-4 times/day.

Use patches for acne by washing face, and allow skin to dry for at least 5 min. Apply patch directly over pimple being treated at bedtime. Remove in the morning.

When using shower/bath gels or soap (2%), use once daily in shower or bath. Massage over skin prone to acne. Rinse well.

Use gel or liquid (17%) for callus, corns, or warts by cleaning and drying the area. Apply to each wart and allow to dry. Repeat 1-2 times/day for up to 12 wks as needed.

Use patch (15%) for callus, corns, or warts by applying directly over affected area at bedtime. Leave in place overnight and remove in the morning. Repeat daily for up to 12 wks as needed. May trim patch to fit area.

Use cream for dandruff, psoriasis, or seborrheic dermatitis by cleaning and drying skin. Apply to affected area 3-4 times/day. Apply to clean, dry skin. Some products may remain overnight.

Massage shampoo (1.8%-3%) for dandruff, psoriasis, or seborrheic dermatitis into wet hair. Leave in place for several minutes and rinse thoroughly. Some products may be used 2-3 times/wk.

#### Salmeterol

sal-me'te-rol

Serevent Diskus Serevent Diskhaler, Serevent Diskus Do not confuse Serevent with Serentil.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Respiratory agents; bronchodilators, long-acting  $\beta_2$ -agonists (LABA)

#### **MECHANISM OF ACTION**

An adrenergic agonist that stimulates  $\beta_2$ -adrenergic receptors in the lungs, resulting in relaxation of bronchial smooth muscle. *Therapeutic Effect:* Relieves bronchospasm and reduces airway resistance.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	30-48 min	2-4 h	12 h

Low systemic absorption; acts primarily in the lungs. Protein

binding: 96%. Metabolized by hydroxylation. Primarily eliminated in feces. *Half-life:* 5.5 h.

#### AVAILABILITY

*Powder for Oral Inhalation (Serevent Diskus):* 50 mcg/actuation.

#### INDICATIONS AND DOSAGES

## Prevention and maintenance treatment of asthma

INHALATION (DISKUS) Adults, Elderly, Children 4 yr and older. 1 inhalation (50 mcg) q12h.

 Prevention of exercise-induced bronchospasm

INHALATION (DISKUS) Adults, Elderly, Children 4 yr and older: 1 inhalation (50 mcg) at least 30 min before exercise. Not for patients already on a regular dose of salmeterol.

#### Chronic obstructive pulmonary disease (COPD)

INHALATION *Adults, Elderly.* 1 inhalation q12h.

#### CONTRAINDICATIONS

History of hypersensitivity to salmeterol; not to be used as monotherapy for asthma; not for acute bronchospasm treatment.

#### INTERACTIONS Drug

β-Blockers: May antagonize salmeterol's bronchodilating effects. Drugs that can prolong QT interval (including erythromycin, quinidine, and thioridazine): May potentiate cardiovascular effects.

**Diuretics, xanthine derivatives:** May increase the risk of

hypokalemia.

MAOIs, tricyclic antidepressants: May potentiate cardiovascular effects.

**Sympathomimetics:** Additive effects of salmeterol.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level.

#### SIDE EFFECTS

Frequent (28%)

Headache.

#### Occasional (3%-7%)

Cough, tremor, dizziness, vertigo, throat dryness or irritation, pharyngitis.

#### Rare (3%)

Palpitations, tachycardia, tremors, nausea, heartburn, GI distress, diarrhea.

#### SERIOUS REACTIONS

At high doses, salmeterol may prolong the QT interval, which may precipitate ventricular arrhythmias.
Hypokalemia and hyperglycemia may occur.

• Long-acting  $\beta_2$ -agonists may increase the risk of asthma-related deaths.

#### PRECAUTIONS & CONSIDERATIONS

NOTE: This drug is not for the relief of acute bronchospasm.

Salmeterol use may increase risk of asthma-related events, such as hospitalization or mortality. Use with caution in patients with cardiovascular disorders including ischemic cardiac disease, arrhythmias or QT prolongation. Avoid in patients with congenital long QT syndrome. Caution is also warranted in patients with hypertension, a seizure disorder, and thyrotoxicosis, cirrhosis, pheochromocytoma, glaucoma, hyperthyroidism, diabetes. It is unknown whether salmeterol crosses the placenta or is distributed in breast milk. In children, prolonged treatment and high doses may decrease cortisol secretion and short-term growth rate. Do not use in children < 4 yr of age. Elderly patients may be more prone to tachycardia and tremor because of increased sensitivity to sympathomimetics. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea.

Notify the physician of chest pain or dizziness. Pulse rate and quality; respiratory rate, depth, rhythm, and type; BP; and serum potassium levels should be monitored. Evidence of cyanosis, a blue or a dusky color in light-skinned patients or a gray color in dark-skinned patients, should also be assessed.

#### Storage

Keep the drug canister at room temperature because cold decreases the drug's effects.

#### Administration

Instruct the patient to open and prepare mouthpiece of Diskus device and slide device lever to activate the first dose (see package instructions). Do not advance the lever more than once at any one time as this will release further doses that will be wasted. Holding the Diskus mouthpiece level to, but away from, the mouth, exhale. Then, put the mouthpiece to the lips and breathe in the dose deeply and slowly. Remove the Diskus from the mouth, hold breath for at least 10 sec, and then exhale slowly. Instruct patient to close the Diskus, which will also reset the dose lever for the next scheduled dose. After administration, instruct patient to rinse mouth with water to minimize dry mouth. The Diskus device and mouthpiece should be kept dry; do not wash.

To prevent exercise-induced bronchospasm, administer the dose at least 30-60 min before exercising.

#### Salmeterol; Fluticasone

sal-me'te-rol; flu-tic'a-zone Advair Diskus, Advair HFA Do not confuse Advair with Advicor.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Respiratory agents; corticosteroids, long-acting  $\beta_2$ -agonists (LABA)

#### **MECHANISM OF ACTION**

A glucocorticoid that inhibits the tissue response to the inflammatory process. Used with a long-acting bronchodilator that stimulates  $\beta_2$ -adrenergic receptors in the lungs, resulting in relaxation of bronchial smooth muscle. *Therapeutic Effect:* Relieves symptoms of asthma and reduces airway resistance.

#### PHARMACOKINETICS

Peak concentrations of both drugs occur usually within 15-30 min of dosing. Peak effects occur 2-4 h following oral inhalation. Some systemic absorption does occur. Systemically absorbed drug amounts are primarily metabolized in the liver and excreted in feces. Duration of effect is roughly 12 h. Improvement in breathing control can occur within 15 min of use, although maximum overall benefit may not be achieved for 2 wks or longer. *Half-life:* 3-7 h (fluticasone); 5.5 h (salmeterol).

#### AVAILABILITY

## Powder for Oral Inhalation (Advair Diskus):

Advair Diskus 100/50 (fluticasone 100 mcg and salmeterol 50 mcg per inhalation).

Advair Diskus 250/50 (fluticasone 250 mcg and salmeterol 50 mcg per inhalation).

Advair Diskus 500/50 (fluticasone 500 mcg and salmeterol 50 mcg per inhalation).

Inhalation Aerosol (Advair HFA): Advair HFA 45/21 (fluticasone 45 mcg and salmeterol 21 mcg per inhalation).

Advair HFA 115/21 (fluticasone 115 mcg and salmeterol 21 mcg per inhalation).

Advair HFA 230/21 (fluticasone 230 mcg and salmeterol 21 mcg per inhalation).

## INDICATIONS AND DOSAGES Bronchial asthma

INHALATION (HFA)

Adults, Elderly, Children 12 yr and older. 2 inhalations twice daily in the morning and at night, 12 h apart. Starting dose is based on asthma severity and whether or not patient has been on oral steroids. Maximum: 2 inhalations of Advair HFA 230/21 twice daily.

INHALATION (DISKUS)

Adults, Elderly, Children 12 yr and older. 1 inhalation twice daily in the morning and at night, 12 h apart. Starting dose is based on asthma severity and whether or not patient has been on oral steroids. Maximum: 1 inhalation of Advair Diskus 500/50 twice daily.

#### COPD

INHALATION (DISKUS) Adults, Elderly. 1 inhalation of Advair Diskus 250/50 twice daily in the morning and at night, 12 h apart. Higher doses (500/50) are *not* recommended due to lack of further benefit and increased risk of side effects.

#### CONTRAINDICATIONS

History of hypersensitivity to any of the drugs or components; not

#### 1444 Salmeterol; Fluticasone

for acute bronchospasm or status asthmaticus treatment. Advair Diskus contains lactose and milk protein and is contraindicated in severe milk protein hypersensitivity.

#### INTERACTIONS

#### Drug

β-Blockers: May antagonize salmeterols bronchodilating effects. Drugs that can prolong QT interval (including erythromycin, quinidine, and thioridazine): May potentiate cardiovascular effects. Diuretics, xanthine derivatives: May increase the risk of hypokalemia. MAOIs, tricyclic antidepressants: May potentiate cardiovascular effects.

Strong CYP3A4 inhibitors (e.g., ritonavir, atazanavir, clarithromycin, indinavir, itraconazole, nefazodone, nelfinavir, saquinavir, ketoconazole, telithromycin): Not recommended; salmeterol and fluticasone levels increase, and increased corticosteroid and cardiovascular adverse effects may occur.

**Sympathomimetics:** Additive effects to salmeterol.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May decrease serum potassium level. May increase blood glucose level.

#### SIDE EFFECTS

#### Frequent (> 3%)

Headache, pharyngitis, upper respiratory infection occur in > 12%. Musculoskeletal pain, nausea, sinusitis, viral infection.

#### Occasional (1%-3%)

Hoarseness, dysphonia, cough, muscle cramps, dry mouth.

#### Rare (<1%)

Oral candidiasis, tremor, palpitations, restlessness, hyperglycemia.

#### SERIOUS REACTIONS

 An acute hypersensitivity reaction marked by urticaria, angioedema, and severe bronchospasm; occurs rarely.

• Excessive sympathomimetic stimulation may produce palpitations, QT prolongation, extrasystole, and chest pain.

• A transfer from oral steroid therapy may unmask previously suppressed bronchial asthma condition

• Potential adrenal insufficiency if used to replace systemic corticosteroid use.

• Signs and symptoms of hypercorticism.

Infection such as candidiasis or pneumonia.

#### **PRECAUTIONS & CONSIDERATIONS**

NOTE: This drug is not for the relief of acute bronchospasm.

Salmeterol use may increase risk of asthma-related events, such as hospitalization or mortality; only use in patients whose asthma is not adequately controlled by other long-term controller medications. Use with caution in patients with cardiovascular disorders including ischemic cardiac disease, arrhythmias, or QT prolongation. Avoid in patients with congenital long OT syndrome. Caution is also warranted in patients with hypertension, a seizure disorder, and thyrotoxicosis, adrenal insufficiency, cirrhosis, pheochromocytoma, glaucoma, hyperthyroidism, diabetes, osteoporosis, tuberculosis, and untreated infection. No adequate data available for use in pregnancy or lactation. In children, prolonged

treatment and high doses may decrease cortisol secretion and short-term growth rate. Do not use in children < 12 years of age. Elderly patients may be more prone to tachycardia and tremor because of increased sensitivity to sympathomimetics.

Drink plenty of fluids to decrease the thickness of lung secretions. Monitor patients for signs and symptoms of pneumonia and other potential lung infections. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Pulse rate and quality; ECG; respiratory rate, depth, rhythm, and type; ABG; and serum potassium levels should be monitored. Keep a log of measurements of peak flow readings.

#### Storage

Keep the HFA inhaler and Diskus at room temperature. Keep dry. Never immerse HFA canisters into water. Store the HFA inhaler with mouthpiece down. HFA contents are under pressure; do not expose to heat, flame, or temperatures above 120 F (may cause bursting).

#### Administration

Diskus: Instruct the patient to open and prepare mouthpiece of Diskus device and slide device lever to activate the first dose (see package instructions). Do not advance the lever more than once at any one time as this will release further doses that will be wasted. Holding the Diskus mouthpiece level to, but away from, the mouth, exhale. Then, put the mouthpiece to the lips and breathe in the dose deeply and slowly. Remove the Diskus from the mouth, hold breath for at least 10 seconds, and then exhale slowly. Instruct patient to close the Diskus, which will also reset the dose lever for the next scheduled dose. Rinse mouth with

water immediately after inhalation to prevent oral dryness and candidiasis. The Diskus device and mouthpiece should be kept dry; do not wash. HFA aerosol: Shake the canister well for 5 seconds before each spray. Prime the inhaler prior to first use with 4 test sprays away from face. Prime the inhaler with 2 test sprays if not used for > 4 wks, or after dropping. A spacer or valved holding chamber can be used. Exhale completely and place the mouthpiece between the lips. Inhale and hold the breath for as long as possible before exhaling. Allow 1 min between inhalations to promote deeper bronchial penetration. Rinse mouth with water immediately after inhalation to prevent oral dryness and candidiasis. Clean mouthpiece once weekly. Discard inhaler after 120 sprays or when the counter reads 000.

#### Sapropterin sap'rop-ter'in

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Metabolic agents, enzyme adjunct

#### **MECHANISM OF ACTION**

A synthetic form of BH4, the cofactor for the enzyme phenylalanine hydroxylase (PAH). PAH hydroxylates phenylalanine (Phe) through an oxidative reaction to form tyrosine. In patients with PKU, PAH activity is absent or deficient. Treatment with BH4 activates the PAH enzyme, improves oxidative metabolism of Phe, and

#### 1446 Sapropterin

decreases Phe levels. *Therapeutic Effect*: Diminishes manifestations of phenylketonuria. Blood Phe levels decrease within 24 h after a single administration, although maximal effect may take up to a month.

#### PHARMACOKINETICS

Best absorption occurs when taken with food. Eliminated via normal metabolic processes for BH4. Halflife: Roughly 6.7 h.

#### AVAILABILITY

Tablets (Kuvan): 100 mg.

## INDICATIONS AND DOSAGES Phenylketonuria

PO

Adults, Children 4 yr and older. Initially, give 10 mg/kg once daily. Adjust as needed. Range 5-20 mg/ kg once daily. Blood Phe must be monitored regularly.

#### CONTRAINDICATIONS

None.

#### INTERACTIONS

#### Drug

**Levodopa:** May increase irritability, overstimulation, or convulsions.

Methotrexate and other folate antagonists: These drugs can decrease BH4 levels by inhibiting the enzyme dihydropteridine reductase (DHPR).

**PDE-5 inhibitors (sildenafil, vardenafil, tadalafil):** May cause excessive hypotension.

#### Herbal

None known.

#### Food

All foods: Food increases drug absorption for maximal effectiveness.

#### DIAGNOSTIC TEST EFFECTS

Expected to reduce phenylalanine (PHE) levels.

#### SIDE EFFECTS

#### Frequent (≥ 4%)

Headache, diarrhea, abdominal pain, upper respiratory tract infection, pharyngolaryngeal pain, vomiting, and nausea.

#### Occasional (3%)

Rhinorrhea, nasal congestion, dizziness.

#### Rare (≤ 2%)

Increased catabolism, leukopenia, potential for rash or allergy.

#### SERIOUS REACTIONS

• Overstimulation and other neurologic changes.

- Seizures occur rarely.
- · Bleeding or gastritis.

#### PRECAUTIONS & CONSIDERATIONS

Some patients may not respond adequately to treatment. Response to treatment cannot be predetermined by laboratory testing (e.g., genetic testing) and can only be determined by a therapeutic trial of the drug. Caution is warranted with hepatic or renal impairment, history of seizures or conditions that may lower the seizure threshold. It is unknown whether the drug crosses the placenta or is excreted in breast milk. The safety and efficacy have not been established in children less than 4 yr of age. No age-related precautions are known for other age groups.

Growth, blood pressure, adherence to low phenylalanine diet, and compliance should be assessed regularly during treatment. Monitor Phe levels at baseline, after 1 wk, and periodically for up to 1 mo, and during continued treatment. Monitor for signs of allergy or intolerance. Symptoms including sore tongue, convulsions, problems eating or swallowing, fever, or infection need to be reported immediately.

#### Storage

Store at room temperature. Keep tightly closed and protect from moisture until time of use.

#### Administration

To be used in conjunction with a Pherestricted diet. Take orally with food to increase absorption. Dissolve tablets in 4-8 oz (120-240 mL) of water or apple juice and take within 15 min. Full dissolution may not occur. Patient may swallow any small tablet fragments that do not dissolve. If fragments remain in dose cup, rinse and have patient swallow remnants to ensure entire dose taken.

#### Saquinavir

sa-kwin'a-veer invirase Do not confuse saquinavir with Sinequan.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Antiretrovirals, protease inhibitors

#### **MECHANISM OF ACTION**

Inhibits HIV protease, rendering the enzyme incapable of processing the polyprotein precursors needed to generate functional proteins in HIVinfected cells. *Therapeutic Effect:* Intereferes with HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Poorly absorbed after PO administration (absorption increased with high-calorie and high-fat meals). Protein binding: 98%. Metabolized in the liver to inactive metabolite. Eliminated primarily in feces. Unknown whether removed by hemodialysis. *Half-life:* 13 h.

#### AVAILABILITY

Capsules: 200 mg. Tablet: 500 mg.

#### INDICATIONS AND DOSAGES

 HIV infection in combination with other antiretrovirals

*Adults, Elderly.* 1000 mg twice a day within 2 h after a full meal. Should be given only in combination with ritonavir 100 mg twice a day.

#### Dosage for severe hepatic impairment

The use of saquinavir "boosted" with ritonavir is contraindicated. Use saquinavir without ritonavir.

#### Dosage adjustments when given in combination therapy

*Lopinavir/ritonavir*. 1000 mg 2 times a day.

#### CONTRAINDICATIONS

Significant hypersensitivity to saquinavir, ritonavir, severe hepatic impairment or use with rifampin due to the risk of severe hepatotoxicity; congential or documented OT prolongation, refractory hypokalemia or hypomagnesemia, those treated with OT-prolonging medications; complete AV block without pacemaker or those at high risk of complete AV block. Coadministration with CYP3A substrates for which increased plasma levels may result in serious of life-threatening reactions (see Drug Interactions for contraindicated drugs).

#### INTERACTIONS

#### Drug

NOTE: Please see detailed manufacturer's information for management of additional drug interactions other than those listed.

Saquinavir (Generic Name), Invirase (Brand Name)

In some cases, dosage adjustment for the agent or choice of an alternate agent is recommended.

Alfuzosin, cisapride, pimozide, trazodone: Increases levels of these drugs and risk of cardiovascular adverse outcomes. Contraindicated. Antiarrhythmics (e.g., class 1A and class III agents, amiodarone, flecainide, propafenone, quinidine), certain macrolides, phenothiazines, certain atypical neuroleptics, and other QT-prolonging drugs: Increases levels and risk of proarrhythmia. Contraindicated. Carbamazepine, dexamethasone, phenobarbital, phenytoin: May reduce saquinavir plasma concentration. Colchicine: Increased risk of colchicine toxicity. Cyclosporine, fluticasone, other immunosuppressants: May increase immunosuppressant blood concentrations; monitor closely. Digoxin, calcium channel blockers, ibutilide, sotalol: Increased heart med concentrations. Monitor. Ergot derivatives (e.g.,

ergot derivatives (e.g., dihydroergotamine, ergonovine, ergotamine, methylergonovine):

Increases levels and risk of ergot toxicity. Contraindicated Lovastatin, simvastatin: Increases

levels and risk of myopathy and rhabdomyolysis. Contraindicated. **Omeprazole:** Increases saquinavir concentrations. Avoid.

Oral midazolam, triazolam: Ritonavir increases levels causing benzodiazepine toxicity and respiratory depression risk. Phosphodiesterase-5 inhibitors

(e.g., sildenafil, vardenafil, tadalafil): Increases PDE-5 inhibitor blood levels and risk of hypotension. Contraindicated for use with sildenafil for pulmonary HTN. **Rifampin:** Decreases antiretroviral effective concentrations and increases risk of hepatotoxicity. Contraindicated.

Warfarin: May increase warfarin levels. Monitor INR. Herbal

Garlic, St. John's wort: May decrease the plasma concentration and effect of saquinavir. Food

High-fat meal: Maximally increases saquinavir's bioavailability. Grapefruit juice: May increase saquinavir plasma concentration.

#### DIAGNOSTIC TEST EFFECTS

May alter serum CK levels, elevate liver function test results and blood glucose levels.

#### SIDE EFFECTS

#### Frequent (≥ 5%)

Appetite loss, headaches, malaise, diarrhea, nausea, vomiting; usually improve over time.

#### Occasional

Abdominal discomfort and pain; photosensitivity; stomatitis; accumulation of fat in waist, abdomen, or back of neck.

#### Rare

Confusion, ataxia, asthenia, rash, hyperglycemia.

#### SERIOUS REACTIONS

- · Pancreatitis.
- Stevens-Johnson syndrome and other serious skin rashes.
- · Hepatitis/liver failure.
- Reports of bleeding in patients with hemophilia.

· New-onset diabetes mellitus.

#### **PRECAUTIONS & CONSIDERATIONS**

Avoid saquinavir in patients with long QT syndrome. ECG monitoring is recommended if used in patients with congestive heart failure, bradyarrhythmias, hepatic impairment, and electrolyte abnormalities. Do not use in combination with drugs that both increase saquinavir plasma concentrations and prolong the QT interval.

Caution is warranted in patients with diabetes mellitus or liver impairment. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Be aware that the safety and efficacy of saquinavir have not been established in children. There is no information on the effects of this drug's use in elderly patients, so it should be used with caution. Avoid exposure to sunlight. Saquinavir is not a cure for HIV infection, nor does it reduce the risk of transmission to others; illnesses associated with advanced HIV infection may occur.

Check the baseline laboratory and diagnostic test results, especially liver function test results, if ordered, before beginning saquinavir therapy and at periodic intervals during therapy. Closely monitor for signs and symptoms of GI discomfort. Correct hypokalemia or hypomagnesemia prior to initiating therapy and monitor these electrolytes periodically.

Assess the patient's pattern of daily bowel activity and stool consistency. Inspect the mouth for signs of mucosal ulceration. Notify the physician if nausea, numbness, persistent abdominal pain, tingling, or vomiting occurs.

#### Storage

Store at room temperature.

#### Administration

Give within 2 h after a full meal. Keep in mind that if saquinavir is taken on an empty stomach, the drug might not produce antiviral activity. When used with ritonavir, saquinavir should be administered at the same time. Continue therapy for the full length of treatment and evenly space drug doses around the clock.

#### Sargramostim (Granulocyte Macrophage Colony-Stimulating Factor, GM-CSF)

sar-gram'oh-stim Leukine Do not confuse Leukine with Leukeran.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Hematopoietic agents, recombinant DNA origin, colony-stimulating factors

#### MECHANISM OF ACTION

A colony-stimulating factor that stimulates proliferation and differentiation of hematopoietic cells to activate mature granulocytes and macrophages. *Therapeutic Effect:* Assists bone marrow in making new WBCs and increases their chemotactic, antifungal, and antiparasitic activity. Increases cytoneoplastic cells and activates neutrophils to inhibit tumor cell growth.

#### PHARMACOKINETICS

Effect	Onset	Peak	Duration
Increase WBCs	7-14 days	NA	1 wk

Detected in serum within 15 min after SC administration. *Half-life:* IV, 1 h; SC, 2.7 h.

#### AVAILABILITY

*Injection Solution:* 500 mcg/mL. *Injection Powder for Reconstitution:* 250 mcg.

# INDICATIONS AND DOSAGES Myeloid recovery following bone marrow transplant (BMT)

IV INFUSION

Adults, Elderly. Usual parenteral dosage: 250 mcg/m<sup>2</sup>/day (as 2-h infusion) beginning 2-4 h after autologous bone marrow infusion and not < 24 h after the last dose of chemotherapy or radiation treatment. Discontinue if blast cells appear or underlying disease progresses.

#### Bone marrow transplant failure, engraftment delay

IV INFUSION

Adults, Elderly. 250 mcg/m<sup>2</sup>/day for 14 days. Infuse over 2 h. May repeat after 7 days off therapy if engraftment has not occurred with 500 mcg/m<sup>2</sup>/day for 14 days. Then, if needed, a third course of 500 mcg/ m<sup>2</sup>/day for 14 days may be tried after 7 days off treatment. If still no improvement, unlikely to have benefit from further dosing.

#### • Stem cell transplant IV, SC

Adults. 250 mcg/m<sup>2</sup>/day.

#### Mobilization of peripheral blood progenitor cells (PBPCs) IV, SC

Adults. 250 mcg/m<sup>2</sup>/day IV over 24 h or SC once daily continued through the period of PBPCs, according to protocol.

#### Postperipheral blood progenitor cell transplantation

IV, SC Adults. 250 mcg/m<sup>2</sup>/day IV over 24 h or SC once daily, continuing until ANC > 1500 cells/mm<sup>3</sup> for 3 consecutive days.

#### Neutrophil recovery following chemotherapy in acute myelogenic leukemia (AML)

IV

*Adults.* 250 mcg/m<sup>2</sup>/day IV over 4 h starting 4 days after completion of induction chemotherapy, continuing until ANC > 1500 cells/mm<sup>3</sup> for 3 consecutive days. Maximum: 42 days.

#### **OFF-LABEL USES**

Treatment of AIDS-related neutropenia; chronic, severe neutropenia; drug-induced neutropenia; myelodysplastic syndrome.

#### CONTRAINDICATIONS

Within the 24 h before or after chemotherapy or radiotherapy; excessive leukemic myeloid blasts in bone marrow or peripheral blood (> 10%); known hypersensitivity to GM-CSF, yeast-derived products, or components of drug.

#### INTERACTIONS

Drug

Lithium, steroids: May increase the effects of sargramostim.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Increased WBC (expected). May increase serum bilirubin, creatinine, and hepatic enzyme levels.

#### IV INCOMPATIBILITIES

Acyclovir, amphotericin B complex (Abelcet, AmBisome, Amphotec), ampicillin, ampicillin-sulbactam (Unasyn), ganciclovir, haloperidol, hydrocortisone (Solu-Cortef), hydromorphone (Dilaudid), hydroxyzine, imipenem-cilastatin (Primaxin), lorazepam (Ativan), methylprednisolone (Solu-Medrol), morphine, sodium bicarbonate, tobramycin.

#### IV COMPATIBILITIES

Calcium gluconate, dopamine, heparin, magnesium, potassium chloride.

#### SIDE EFFECTS

#### Frequent

GI disturbances, including nausea, diarrhea, vomiting, stomatitis, anorexia, and abdominal pain; arthralgia or myalgia; headache; malaise; rash; pruritus.

#### Occasional

Peripheral edema, hypertension, weight gain, dyspnea, asthenia, fever, leukocytosis, capillary leak syndrome (such as fluid retention, irritation at local injection site, and peripheral edema).

#### Rare

Rapid or irregular heartbeat, thrombophlebitis.

#### SERIOUS REACTIONS

 Pleural or pericardial effusion occurs rarely after infusion.

· Rare anaphylactoid reactions.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with congestive heart failure (CHF), hypoxia, impaired hepatic or renal function, preexisting cardiac disease, preexisting fluid retention, and pulmonary infiltrates. It is unknown whether sargramostim crosses the placenta or is distributed in breast milk. Safety and efficacy of this drug have not been established in children. Neonates should not receive the drug reconstituted with preservatives such as benzyl alcohol, which may cause a gasping syndrome. No

age-related precautions have been noted in elderly patients. Avoid situations that might place risk for contracting an infectious disease such as influenza.

Notify the physician of chest pain, chills, fever, palpitations, or dyspnea. Follow-up blood tests should be maintained to evaluate the effectiveness of drug therapy. CBC, pulmonary, liver, and kidney function test results, platelet count, vital signs, and weight should be monitored. Storage

Refrigerate powder, reconstituted solution, and diluted solution for injection. Do not shake. Do not use past expiration date. Reconstituted solution is normally clear and colorless. Use reconstituted solution within 6 h; discard unused portion. Use one dose/vial; do not reenter vial. Administration

The subcutaneous (SC) route is preferred, as it allows for increased exposure of sargramostim to hematopoietic cells. When given SC, rotate injection sites.

For IV use, to reconstitute, add 1 mL preservative-free sterile water for injection to 250-mcg vial. Direct sterile water for injection to side of vial, and gently swirl contents to avoid foaming. Do not shake or vigorously agitate. After reconstitution, further dilute with 0.9% NaCl. If final concentration is < 10 mcg/mL, add 1 mg albumin per mL 0.9% NaCl to provide a final albumin concentration of 0.1%. Albumin is added before sargramostim to prevent drug adsorption to components of drug delivery system. Give each single dose over 2, 4, or 24 h, as directed by physician. Consider administration with analgesics and antipyretics.

Expect to discontinue or decrease dose by 50% if a rapid increase in blood counts occurs.

#### Saxagliptin

sax'a-glip'tin ★ ♥ Onglyza Do not confuse with sitagliptin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antidiabetic agents, dipeptidyl peptidase-4 (DPP-4) inhibitor

#### **MECHANISM OF ACTION**

A "gliptin," or dipeptidyl peptidase-4 inhibitor (DPP-4), that decreases the breakdown of glucagon-like peptide-1 (GLP-1), resulting in more prompt and appropriate secretion of insulin and suppression of glucagon in response to blood sugar increases following meals or snacks, improving glucose tolerance. *Therapeutic Effect*: Inhibits DPP-4 enzyme activity for a 24-h period. Lowers blood glucose concentration and also HbA1C over time.

#### PHARMACOKINETICS

May administer with or without food. Protein binding is negligible. Median time to maximal plasma concentration occurs 2 h (saxagliptin) and 4 h (active metabolite) after dosing. Liver metabolism is mediated by CYP3A4/5. The major metabolite is also a DPP-4 inhibitor, which is 50% as potent as saxagliptin. Strong CYP3A4/5 inhibitors and inducers will alter the pharmacokinetics of both. Renal (60%) and fecal (22%) excretion. Removed by hemodialysis. Half-life: 2.5 h (saxagliptin); 3 h (active metabolite).

#### AVAILABILITY

Tablets: 2.5 mg, 5 mg.

## INDICATIONS AND DOSAGES Type 2 diabetes mellitus PO

Adults, Elderly. 2.5 mg or 5 mg once daily. May be given with sulfonylureas, metformin, or a thiazolidinedione. When therapy is given with insulin or a sulfonylurea, a lower dose of these agents may be necessary when saxagliptin is added.

#### Dosage in renal impairment (CrCl < 50 mL/min) or taking strong CYP3A4 inhibitors

No more than 2.5 mg once daily. If on hemodialysis, give the daily dose after dialysis.

#### CONTRAINDICATIONS

Hypersensitivity to saxagliptin. Not for type 1 diabetes mellitus or diabetic ketoacidosis. Not studied with insulin.

#### INTERACTIONS

#### Drug

**β-Blockers:** May mask signs of hypoglycemia.

Strong CYP3A4/5 inhibitors (e.g., ketoconazole, protease inhibitors for HIV, clarithromycin, itraconazole, nefazodone, and telithromycin): Increase saxagliptin levels. Lower dose recommended. Rifampin, other CYP3A4

inducers: May reduce saxagliptin levels.

Corticosteroids: May increase blood sugar.

Sulfonylureas or insulin: May increase risk of hypoglycemia; lower sulfonylurea dose may be needed. Warfarin: May increase the effects of warfarin, resulting in increased INR. Monitor INR closely. Herbal

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema,

Saxagliptin (Generic Name), Onglyza (Brand Name)

#### marshmallow, stinging nettle: May

enhance hypoglycemic effects. **St. John's wort:** May reduce saxagliptin levels.

#### Food

**Grapefruit juice:** May increase saxagliptin levels. Do not significantly alter intake.

#### DIAGNOSTIC TEST EFFECTS

Lowers blood sugar. May reduce lymphocyte count.

#### SIDE EFFECTS

#### Frequent

Headache, nasopharyngitis, hypoglycemia.

#### Occasional

Decreased appetite, nausea, abdominal pain.

#### Rare

Hypoglycemia (hypoglycemia more common in renally impaired patients.) Peripheral edema when used with thiazolidinedione.

#### SERIOUS REACTIONS

• Overdose may produce severe hypoglycemia.

 Rare reports of serious allergic reactions, including angioedema and exfoliative skin rashes, such as Stevens-Johnson syndrome.

• Rare reports of pancreatitis with this class of drugs.

#### PRECAUTIONS & CONSIDERATIONS

There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with saxagliptin. Caution is warranted in patients with impaired renal function or who are taking potentially interacting medications. Be alert to conditions that alter blood glucose requirements or dietary intake, such as fever, increased activity, stress, or a surgical procedure. There are no data regarding saxagliptin use during pregnancy. It is unknown whether the drug is distributed in breast milk; caution is recommended. Safety and efficacy of saxagliptin have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients.

Food intake, renal function, and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia.

Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy.

#### Storage

Store tablets at room temperature. Administration

May take saxagliptin without regard to food or the timing of meals or snacks. The tablets should be swallowed whole; do not cut, crush, or chew.

#### Scopolamine

skoe-pol'a-meen ★ Isopto Hyoscine, Maldemar, Trans-Derm Scop, Scopace

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

*Classification:* Anticholinergics, antiemetics/antivertigo, cycloplegics, gastrointestinals, mydriatics, ophthalmics, preanesthetics, sedatives/ hypnotics
## **MECHANISM OF ACTION**

An anticholinergic that reduces excitability of labyrinthine receptors, depressing conduction in the vestibular cerebellar pathway. *Therapeutic Effect:* Prevents motioninduced nausea and vomiting.

## AVAILABILITY

Tablet: 0.4 mg. Transdermal System: 1.5 mg. Ophthalmic Solution: 0.25%. Injection: 0.4 mg/mL.

## INDICATIONS AND DOSAGES

 Postoperative nausea or vomiting TRANSDERMAL

*Adults, Elderly.* 1 patch no sooner than 1 h before surgery and removed 24 h after surgery.

#### Motion sickness

*Adults, Elderly.* 1 patch at least 4 h (ideally 12 h) before exposure, reapplying every 3 days as needed.

• Excessive motility of the GI tract PO

Adults. 0.4-0.8 mg every 8 h.

 Aspiration prophylaxis, sedation induction prior to intubation or for bradycardia during surgery SUBCUTANEOUS/IV/IM

Adults. 0.3-0.6 mg as a single dose.

 For cycloplegia or mydriasis induction during eye examination OPHTHALMIC

Adults. Instill 1-2 drops in eye(s) 1 h before refraction.

*Children*. Instill 1 drop in eye(s) 1 h before refraction.

#### For iritis or uveitis

OPHTHALMIC *Adults.* Instill 1-2 drops in affected eye(s) up to 4 times daily. *Children.* Instill 1 drop in affected eye(s) 1, 2, or 3 times daily.

## CONTRAINDICATIONS

Hypersensitivity to scopolamine or other belladonna alkaloids. Angle-closure glaucoma, GI or genitourinary obstruction, myasthenia gravis, paralytic ileus, tachycardia, thyrotoxicosis.

#### INTERACTIONS Drug

Antihistamines, tricyclic antidepressants: May increase the anticholinergic effects of scopolamine. Central nervous system (CNS) depressants: May increase CNS depression. Pramlintide: May enhance GI effects of scopolamine. Herbal None known. Food Alcohol: May increase CNS depression.

## **DIAGNOSTIC TEST EFFECTS**

May interfere with gastric secretion test.

## SIDE EFFECTS

Frequent (>15%)

Dry mouth, somnolence, blurred vision.

Rare (1%-5%)

Dizziness, restlessness, hallucinations, confusion, difficulty urinating, rash.

## SERIOUS REACTIONS

· Rare hypersensitivity reactions.

• Idiosyncratic psychiatric reactions, such as confusion, agitation, hallucinations, or delirium.

• Overdose: lethargy, coma, confusion, hallucinations, convulsion, vision changes, dry flushed skin, decreased bowel sounds, urinary retention, tachycardia, hypertension, and supraventricular arrhythmias.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac disease, renal or hepatic impairment, glaucoma, bladder obstruction, prostatic hypertrophy, or risk for GI ileus, psychoses, and seizures. Tasks that require mental alertness or motor skills should be avoided. Children and the elderly are more susceptible to the anticholinergic effects. Scopolamine is not used in pregnancy except for obstetric delivery by C-section.

Scopolamine is excreted in breast milk.

Patients who participate in underwater sports should be aware of the potentially disorienting effects.

#### Storage

Store all products at room temperature. Keep patches in protective foil until time of use.

## Administration

Wash hands. Apply transdermal patch to the hairless area behind one ear. Replace the patch after 72 h or if it becomes dislodged. Wash hands after applying the patch. Use only one patch at a time and do not cut it.

If patient will undergo MRI procedure, remove patch prior to the MRI to avoid burns.

For oral use, it is most common to administer scopolamine on an empty stomach, 30 min before meals and at bedtime.

The injection may be administered subcutaneously, intramuscularly, or intravenously. For IV use, dilute injection with an equal volume of sterile water for injection. Inject slowly IV over 2-3 min.

For ophthalmic use, instill the dosage of eyedrops, then apply gentle pressure to the lacrimal sac for 1-2 min to limit systemic absorption. To avoid contamination, do not touch the dropper tip to any surface.

#### **Secobarbital**

see-koe-bar'bi-tal

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D Controlled Substance Schedule: II

**Classification:** Barbiturates, preanesthetics, sedatives/hypnotics

#### **MECHANISM OF ACTION**

A barbiturate that depresses the central nervous system (CNS) activity by binding to barbiturate site at the GABA-receptor complex enhancing GABA activity and depressing reticular activity system. *Therapeutic Effect:* Produces hypnotic effect as a result of central nervous system (CNS) depression.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 52%-57%. Crosses blood-brain barrier. Widely distributed. Metabolized in liver by microsomal enzyme system to inactive and active metabolites. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 15-40 h.

#### AVAILABILITY

Capsules: 100 mg (Seconal sodium).

## INDICATIONS AND DOSAGES Insomnia

#### PO Adults. 100 mg at bedtime, range 100-200 mg.

#### Preoperative sedation

PO

*Adults*. 100-300 mg 1-2 h before procedure.

Secobarbital (Generic Name), Seconal (Brand Name)

*Children.* 2-6 mg/kg 1-2 h before procedure. Maximum: 100 mg/dose.

## CONTRAINDICATIONS

History of manifest or latent porphyria, marked liver dysfunction, marked respiratory disease in which dyspnea or obstruction is evident, and hypersensitivity to secobarbital or barbiturates.

## INTERACTIONS

#### Drug

Alcohol, CNS depressants: May increase the CNS depressant effects.

Anticoagulants: May decrease anticoagulant activity. **Corticosteroids:** May increase metabolism of corticosteroids. **Doxycycline:** May shorten the halflife of doxycycline.

Estradiol, estrone, progesterone, other steroidal hormones:

May decrease the effect of these hormones by increasing their metabolism.

**Griseofulvin:** May decrease levels of griseofulvin by interfering with its metabolism.

**MAOIs:** May prolong the effects of secobarbital by inhibiting its metabolism.

Phenytoin, sodium valproate, valproic acid: May decrease the metabolism and increase the concentration and risk of toxicity with secobarbital.

#### Herbal

**St. John's wort, kava kava, gotu kola, valerian:** May increase CNS depressant effects.

### Food

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent

Somnolence. Occasional

Agitation, confusion, hyperkinesia, ataxia, CNS depression, nightmares, nervousness, psychiatric disturbance, hallucinations, insomnia, anxiety, dizziness, abnormality in thinking, hypoventilation, apnea, bradycardia, hypotension, syncope, nausea, vomiting, constipation, headache. **Rare** 

#### Hypersensitivity reactions, fever, liver damage, megaloblastic anemia.

## SERIOUS REACTIONS

Agranulocytosis, megaloblastic anemia, apnea, hypoventilation, bradycardia, hypotension, syncope, hepatic damage, and Stevens-Johnson syndrome rarely occur.
Tolerance and physical dependence may occur with repeated use.

## **PRECAUTIONS & CONSIDERATIONS**

Secobarbital crosses the placenta and is distributed in breast milk. Its use may cause paradoxical excitement in children. Elderly patients taking secobarbital may exhibit confusion, excitement, and mental depression. Alcohol consumption and caffeine intake should be limited while taking secobarbital. Avoid tasks that require mental alertness or motor skills because this drug may cause dizziness and drowsiness.

#### Storage

Store at controlled room temperature, tightly closed.

#### Administration

Give secobarbital without regard to meals.

As a hypnotic, administer at bedtime. Preoperatively, given 1 to 2 h before surgery.

## **Selegiline**

seh-leg'ill-ene Eldepryl, Emsam, Zelapar Apo-Selegiline Do not confuse selegiline with Stelazine, or Eldepryl with enalapril.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, dopaminergics

## **MECHANISM OF ACTION**

An antiparkinsonian agent that irreversibly inhibits the activity of monoamine oxidase type B, the enzyme that breaks down dopamine, thereby increasing dopaminergic action. *Therapeutic Effect:* Relieves signs and symptoms of Parkinson's disease.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract. Crosses the blood-brain barrier. Metabolized in the liver to the active metabolites. Excreted primarily in urine. *Halflife*: 17 h (amphetamine), 20 h (methamphetamine).

## AVAILABILITY

Capsules: 5 mg. Tablets: 5 mg. Tablets, Oral Disintegrating (Zelapar): 1.25 mg. Transdermal System (Emsam): 6 mg, 9 mg, 12 mg per 24 h patch.

#### INDICATIONS AND DOSAGES Adjunctive treatment for parkinsonism PO

Adults. 10 mg/day in divided doses, such as 5 mg at breakfast and lunch,

given concomitantly with each dose of carbidopa and levodopa. *Elderly*: Initially, 5 mg in the morning. May increase up to 10 mg/day. ORAL DISINTEGRATING TABLETS *Adults*. Initially, 1.25 mg daily for 6 wks. May increase to 2.5 mg daily. **> Depression** TRANSDERMAL *Adults*. Initially 6 mg/24 h applied once a day. May increase by 3 mg/ day every 2 wks. Maximum of 12 mg/24 h.

Elderly. 6 mg/24 h.

## CONTRAINDICATIONS

Hypersensitivity to selegiline. Pheochromocytoma. Concomitant use of dextromethorphan, meperidine, methadone, propoxyphene, tramadol, other MAOIs. Other drugs that should be avoided include carbamazepine and oxcarbazepine, sympathomimetic amines, general anesthesia, cocaine, sympathomimetic vasoconstrictors, SSRIs, SNRIs, and tricyclic antidepressants. Hypertensive crises caused by the ingestion of foods containing high amounts of tyramine are possible at higher daily doses of selegiline.

## INTERACTIONS

#### Drug

Amphetamine, ephedrine, sympathomimetics, methylphenidate, cocaine: Increased pressor effects. Buspirone: May increase BP. Caffeine-containing medications: May increase the risk of cardiac arrhythmias and hypertension. Carbamazepine, cyclobenzaprine, maprotiline, other MAOIs: May precipitate hypertensive crisis, convulsions, hyperpyretic crisis.

Selegiline (Generic Name)

Fluoxetine, other SSRIs, SNRIs, trazodone, tricyclic antidepressants: May cause serotonin syndrome.

Insulin, oral antidiabetics: May increase the effects of these drugs. Meperidine, other opioid analgesics: May produce diaphoresis, immediate excitation, rigidity, and severe hypertension or hypotension, sometimes leading to severe respiratory distress, vascular collapse, seizures, coma, and death.

#### Herbal

Trytophan: May cause sudden, severe hypertension. St. John's wort: May cause

serotonin syndrome.

#### Food

**Tyramine-rich foods:** May produce a severe hypertensive reaction.

DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (4%-10%)

Headache, insomnia, nausea, dizziness, light-headedness, syncope, abdominal discomfort.

#### Occasional (2%-3%)

Confusion, hallucinations, dry mouth, vivid dreams, dyskinesia. Rare (1%)

Headache, myalgia, anxiety, diarrhea, insomnia.

#### SERIOUS REACTIONS

 Symptoms of overdose may vary from CNS depression, characterized by sedation, apnea, cardiovascular collapse, and death, to severe paradoxical reactions, such as hallucinations, tremor, and seizures.
 Other serious effects may include involuntary movements, impaired motor coordination, loss of balance, blepharospasm, facial grimaces, feeling of heaviness in the lower extremities, depression, nightmares, delusions, overstimulation, sleep disturbance, and anger.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac arrhythmias, dementia, history of peptic ulcer disease, profound tremor, psychosis, and tardive dyskinesia. It is unknown whether selegiline crosses the placenta or is distributed in breast milk. The safety and efficacy of selegiline have not been established in children. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (aged 18-24 yr) with major depressive disorder and other psychiatric disorders. Monitor any patient closely for suicidal thoughts, mood changes, or unusual behaviors. Selegiline is not approved for treating bipolar depression. No age-related precautions have been noted in elderly patients. Be aware that tyramine-rich foods, such as wine and aged cheese, should be avoided to prevent a hypertensive reaction.

Dizziness, drowsiness, lightheadedness, and dry mouth are common side effects of the drug but will diminish or disappear with continued treatment. Alcohol and tasks that require mental alertness or motor skills should be avoided. Change positions slowly to prevent orthostatic hypotension. Notify the physician if agitation, headache, lethargy, or confusion occurs. Baseline vital signs should be assessed. Relief of symptoms, such as improvement of masklike facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should be assessed during treatment.

#### Administration

Keep in mind that therapy should begin with the lowest dosage, then

increase gradually over 3-4 wks. With oral disintegrating tablets, administer in the morning before breakfast allowing tablet to dissolve. Food or drink should be avoided 5 min before and after administration.

Transdermal patches should be applied to clean, dry, hairless area of skin on upper torso, thigh, or arm at the same time every day. Application area should not be exposed to heat. Application sites should be rotated. Hands should be washed before and after patch application.

## Senna

sen'na

Black Draught, Fletchers Laxative Liquid, Ex-Lax, Ex-Lax Maximum Strength, Perdiem, SennaGen, SenaLax, Senexon, Senokot, Senosol, Senosol-X

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC

**Classification:** Laxatives, stimulant, anthraquinone derivative

#### **MECHANISM OF ACTION**

A GI stimulant that has a direct effect on intestinal smooth musculature by stimulating the intramural nerve plexi. *Therapeutic Effect:* Increases peristalsis and promotes laxative effect.

### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	6-12 h	NA	NA
Rectal	0.5-2 h	NA	NA

Minimal absorption after oral administration. Hydrolyzed to active

form by enzymes of colonic flora. Absorbed drug metabolized in the liver. Eliminated in feces via biliary system.

#### AVAILABILITY

(Dosage expressed in sennosides) Granules (Senokot): 15 mg/tsp. Liquid: 8.8 mg/5 mL. Tablets: 8.6 mg, 10 mg, 15 mg, 17 mg, 25 mg.

## INDICATIONS AND DOSAGES Constipation

PO (TABLETS) Adults, Elderly. 2 tablets at bedtime. Maximum: 4 tablets (34.4 mg sennosides) twice a day. Children >27 kg. 1 tablet at bedtime. Maximum: 17.2 mg sennosides twice a day. SYRUP Adults, Elderly. 10-15 mL at bedtime. Maximum: 15 mL twice a day. Children aged 5-15 yr. 5-10 mL at bedtime. Maximum: 10 mL twice a day. Children aged 1-5 yr. 2.5-5 mL at

bedtime. Maximum: 1 tsp twice a day. Infants 1-12 mo > 27 kg. 1.25-2.5 mL at bedtime. Maximum: 2.5 mL twice daily.

PO (GRANULES)

Adults, Elderly. 1 tsp at bedtime. Maximum: 2 tsp twice a day. Children weighing > 27 kg. Half ( $\frac{1}{2}$ ) teaspoon at bedtime up to 1 tsp twice/day.

#### Bowel evacuation PO

Adults, Elderly. 1-2 tablets or 1-2 tsp 12-14 hr before examination. 75 mL between 2 and 4 PM on day before procedure.

## CONTRAINDICATIONS

Abdominal pain, appendicitis, intestinal obstruction, nausea, vomiting.

#### INTERACTIONS

#### Drug

**Oral medications:** May decrease transit time of concurrently administered oral medications.

#### Herbal

None known. Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose level. May decrease serum potassium level.

## SIDE EFFECTS

#### Frequent

Pink-red, red-violet, red-brown, or yellow-brown discoloration of urine.

# Some degree of abdominal discomfort, nausea, mild cramps, griping, faintness.

#### SERIOUS REACTIONS

• Long-term use may result in laxative dependence, chronic constipation, and loss of normal bowel function.

 Prolonged use or overdose may result in electrolyte and metabolic disturbances (such as hypokalemia, hypocalcemia, and metabolic acidosis or alkalosis), vomiting, muscle weakness, persistent diarrhea, malabsorption, and weight loss.

#### PRECAUTIONS & CONSIDERATIONS

Senna should be used cautiously for extended periods (> 1 wk). It is unknown whether senna is distributed in breast milk. Not a first-line agent for constipation in pregnancy; stimulant laxatives may induce premature labor. Safety and efficacy of senna have not been established in children younger than 2 yr. No age-related precautions have been noted in elderly patients, but this population should be monitored for signs and symptoms of dehydration and electrolyte loss.

Pattern of daily bowel activity and stool consistency and serum electrolyte levels should be monitored. Adequate fluid intake should be maintained.

#### Storage

Store at room temperature. Keep granules tightly closed. Protect chocolate chews from high temperatures.

#### Administration

Take senna on an empty stomach for faster results. Drink at least 6-8 glasses of water a day to aid in stool softening. Avoid giving within 1 h of other oral medications because drug absorption is decreased. To promote defecation, increase fluid intake, exercise, and eat a high-fiber diet. Oral senna generally produces a laxative effect in 6-12 h, but it can take 24 h.

## Sertaconazole sir-tah-con'ah-zole

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antifungals, topical, dermatologics

#### **MECHANISM OF ACTION**

An imidazole derivative that inhibits synthesis of ergosterol, a vital component of fungal cell formation. *Therapeutic Effect:* Damages the fungal cell membrane, altering its function.

### AVAILABILITY

Cream: 2%.

#### INDICATIONS AND DOSAGES

#### Tinea pedis

TOPICAL Adults, Elderly, Children 12 yr and older. Apply to affected area twice a day for 4 wks.

## CONTRAINDICATIONS

Known sensitivity to sertaconazole nitrate or any of its components or to other imidazoles.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Rare (2%)

Burning, tenderness, erythema, dryness, pruritus, hyperpigmentation, and contact dermatitis at application site.

## SERIOUS REACTIONS

None known.

#### PRECAUTIONS & CONSIDERATIONS

It is unknown whether sertaconazole is excreted in breast milk. No age-related precautions have been noted. Skin should be assessed for dermatitis, dryness, erythema, hyperpigmentation, burning sensation, or pruritus.

#### Storage

Store at room temperature.

#### Administration

Rub gently into affected, surrounding areas. Avoid contact with eyes,

nose, and mouth. Keep the affected area clean and dry. Continue sertaconazole treatment for the full length of therapy.

## **Sertraline**

sir'trall-een Zoloft Apo-Sertraline, Novo-Sertraline, PMS-Sertraline, Zoloft Do not confuse sertraline with Serentil.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antidepressants, serotonin selective reuptake inhibitors (SSRIs)

## **MECHANISM OF ACTION**

An antidepressant, anxiolytic, and obsessive-compulsive disorder agent that blocks the reuptake of the neurotransmitter serotonin at central nervous system (CNS) neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression, reduces obsessive-compulsive behavior, decreases anxiety.

#### PHARMACOKINETICS

Incompletely and slowly absorbed from the GI tract; food increases absorption. Protein binding: 98%. Widely distributed. Undergoes extensive first-pass metabolism in the liver to active compound. Excreted in urine and feces. Not removed by hemodialysis. *Half-life:* 26 h.

#### AVAILABILITY

Oral Concentrate: 20 mg/mL. Tablets: 25 mg, 50 mg, 100 mg.

Sertraline (Generic Name)

# INDICATIONS AND DOSAGES Depression, obsessive-compulsive disorder (OCD)

#### PO

Adults, Children aged 13-17 yr. Initially, 50 mg/day with morning or evening meal. May increase by 50 mg/day at 7-day intervals. *Elderly, Children 6-12 yr.* Initially, 25 mg/day. May increase by 25-50 mg/ day at 7-day intervals. Maximum: 200 mg/day.

## Panic disorder, post traumatic stress disorder, social anxiety disorder PO

Adults, Elderly. Initially, 25 mg/day. May increase by 50 mg/day at 7-day intervals. Range: 50-200 mg/day. Maximum: 200 mg/day.

#### Premenstrual dysphoric disorder PO

Adults. Initially, 50 mg/day either every day or during the luteal phase of menstrual cycle. May increase up to 100-150 mg/day in 50-mg increments.

## **OFF-LABEL USES**

Hot flashes, cholestatic pruritus.

#### CONTRAINDICATIONS

Hypersensitivity; use within 14 days of MAOIs; concurrent use of pimozide. The oral concentrate is contraindicated with disulfiram due to the alcohol content of the concentrate. Avoid use with linezolid (Zyvox) and IV methylene blue due to risk of serotonin syndrome.

#### INTERACTIONS

#### Drug

CY2D6 substrates (benzodiazepines, phenothiazines, β-blockers, TCAs, bupropion):

Sertraline may increase blood levels and risk of side effects.

**Disulfiram, metronidazole:** May interact with alcohol in oral concentrate. Avoid.

## Highly protein-bound medications (such as digoxin and warfarin):

May increase the blood concentration and risk of toxicity of these drugs. **MAOIs**, **amphetamines**, **busipirone**,

linezolid, meperidine, nefazodone, sumatriptan, ritonavir, tramadol, venlafaxine: May cause serotonin syndrome, hypertensive crisis, hyperpyrexia, seizures, and serotonin syndrome (marked by diaphoresis, diarrhea, fever, mental changes, restlessness, and shivering). MAOIs contraindicated.

NSAIDS, aspirin, other drugs affecting coagulation: May increase bleeding risk.

**Pimozide:** Increased pimozide levels may increase risk of serious ventricular arrhythmias. Contraindicated.

**Thioridazine, mesoridazine:** May increase risk of serious ventricular arrhythmias.

Herbal

Gotu kola, kava kava, St. John's wort, valerian: May increase CNS depression.

#### Food

Alcohol: May increase CNS depression.

## DIAGNOSTIC TEST EFFECTS

May increase serum total cholesterol, triglyceride, AST (SGOT), and ALT (SGPT) levels. May decrease serum uric acid level. May cause false positive urine screen for benzodiazepines; use confirmatory tests to distinguish.

## SIDE EFFECTS

#### Frequent (12%-26%)

Headache, nausea, diarrhea, insomnia, somnolence, dizziness, fatigue, rash, dry mouth.

#### Occasional (4%-6%)

Anxiety, nervousness, agitation, tremor, dyspepsia, diaphoresis, vomiting, constipation, abnormal ejaculation, visual disturbances, altered taste.

#### Rare (< 3%)

Flatulence, urinary frequency, paresthesia, hot flashes, chills.

#### SERIOUS REACTIONS

 Overdose (serotonin syndrome) symptoms may include nausea, vomiting, sedation, dizziness, sweating, facial flushing, mental status changes, myoclonia, restlessness, shivering, and hypertension.

 SIADH and hyponatremia have been reported rarely, most commonly in elderly patients.

· Bleeding from platelet dysfunction.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac disease, hepatic impairment, seizure disorders, those who have had a recent myocardial infarction (MI), and in those with suicidal tendency. Sertraline is not recommended in pregnancy due to a potential for teratogenic and nonteratogenic adverse effects and neonatal withdrawal. It is unknown whether sertraline is distributed in breast milk. Notify the physician if pregnancy occurs. Sertraline is not approved for use in children with major depressive disorder but is approved for the treatment of OCD in children aged 6 yr and older. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr) with major depressive disorder and other psychiatric disorders. All patients should be monitored for suicidal thoughts, mood changes, or unusual behaviors. Sertraline is not approved for treating bipolar depression. Lower initial sertraline dosages are recommended for elderly patients, although no agerelated precautions have been noted in this age group.

Dizziness may occur, so alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician if fatigue, headache, sexual dysfunction, or tremor occurs. CBC and liver and renal function tests should be performed before and periodically during therapy, especially with long-term use. Storage

#### Store at room temperature. Administration

! Make sure at least 14 days elapse between the use of MAOIs and sertraline.

Take sertraline with food or milk if GI distress occurs. Oral solution must be diluted immediately before use with 4 oz of *only* water, orange juice, ginger ale, lemon/lime soda, or lemonade. Solution may appear hazy. Once diluted the oral solution must be taken immediately.

#### Sevelamer

seh-vel'a-mer Renagel, Renvela **Do not confuse Renagel with Reglan or Regonol.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Renal agents, phosphate binders

#### **MECHANISM OF ACTION**

An antihyperphosphatemia agent that binds with dietary phosphorus in the GI tract, thus allowing phosphorus to be eliminated through the normal digestive process and decreasing the serum phosphorus level. *Therapeutic Effect*: Decreases incidence of hypercalcemic episodes

Sevelamer (Generic Name), Renagel (Brand Name)

in patients receiving calcium acetate treatment.

Decreases serum phosphate in patients with end-stage renal disease without the risk of increasing serum calcium levels.

## PHARMACOKINETICS

Not absorbed systemically. Unknown whether removed by hemodialysis. Excreted in feces.

## **AVAILABILITY**

Tablets: 400 mg, 800 mg. Powder for Oral Suspension: 0.8 g, 2.4 g.

#### INDICATIONS AND DOSAGES Hyperphosphatemia PO

Adults, Elderly. 800-1600 mg with each meal, depending on severity of hyperphosphatemia. Maintenance dose is based on goal of lowering serum phosphate to < 5.5 mg/dL.

## CONTRAINDICATIONS

Hypersensitivity to any ingredients, bowel obstruction.

## INTERACTIONS

#### Drug

S

Ciprofloxacin, antiarrhythmics, antiseizure medications, thyroid horomones, mycophenolate:

Binding may result in decreased absorption. Administer these drugs at least 1 h before or 3 h after sevelamer.

**Herbal and Food** None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (11%-20%)

Infection, pain, hypotension, diarrhea, dyspepsia, nausea, vomiting.

## Occasional (1%-10%)

Headache, constipation, hypertension, thrombosis, increased cough.

## SERIOUS REACTIONS

· Fecal impaction, ileus (rare), bowel obstruction or perforation (rare) have been reported.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with dysphagia, severe GI tract motility disorders, swallowing disorders, and in those who have undergone major GI tract surgery. Sevelamer is not distributed in breast milk. The safety and efficacy of sevelamer have not been established in children. No age-related precautions have been noted in elderly patients.

Serum bicarbonate, chloride, calcium, and phosphorus levels should be monitored. With chronic use may cause lowered vitamins A, D, K, and folate parameters. Notify the physician of diarrhea, signs of hypotension (such as lightheadedness), nausea or vomiting, or a persistent headache.

## Storage

Store at room temperature; protect from moisture.

#### Administration

Take sevelamer with food. Do not break, crush, or chew tablets because the contents expand in water. Take other medications at least 1 h before or 3 h after sevelamer.

For the oral suspension powder, each 0.8 g powder should be mixed in 30 mL of water. Each 2.4 g should be mixed in 60 mL of water. Stir vigorously right before administration, as the powder does not dissolve.

When administering an oral medication where a reduction in absorption would have a clinically significant effect on efficacy, the drug should be administered at least 1 h before or 3 hr after sevelamer; monitor closely.

## Sildenafil

sill-den'a-fill Contemporation viagra Contemporation viagra with Vaniqa.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

#### Classification: Erectile

dysfunction (ED) agents, pulmonary vasodilators, phosphodiesterase-5 enzyme inhibitors

## **MECHANISM OF ACTION**

An agent that inhibits phosphodiesterase type 5, the enzyme responsible for degrading cyclic guanosine monophosphate (cGMP) in the corpus cavernosum of the penis or the smooth muscle of pulmonary vasculature, resulting in smooth muscle relaxation and increased blood flow. *Therapeutic Effect*: Facilitates an erection in ED. In PAH, results in vasodilation in pulmonary vasculature.

## AVAILABILITY

Tablets (Viagra): 25 mg, 50 mg, 100 mg. Tablets (Revatio): 20 mg. Injection Solution (Revatio): 10 mg/12.5 mL.

# INDICATIONS AND DOSAGES Frectile dysfunction PO

*Adults.* 50 mg (30 min-4 h before sexual activity). Range: 25-100 mg. Maximum dosing frequency is once daily.

*Elderly (> 65 yr)*. Consider starting dose of 25 mg.

#### Pulmonary arterial hypertension (PAH)

PO (REVATIO) Adults, Elderly. 20 mg 3 times daily, administered 4-6 h apart. IV (REVATIO) Adults, Elderly. 10 mg 3 times daily, administered 4-6 h apart.

## **OFF-LABEL USES**

Treatment of sexual dysfunction associated with the use of selective serotonin reuptake inhibitors (SSRIs), Raynaud's phenomenon, PAH in children.

## CONTRAINDICATIONS

Concurrent use of nitrates in any form, known hypersensitivity; use in PAH contraindicated with certain protease inhibitors for HIV.

## INTERACTIONS

#### Drug

**α-Blockers, nitrates:** Potentiates the hypotensive effects of nitrates. Sildenafil contraindicated in patients receiving nitrates.

Azole antifungals, cimetidine, erythromycin, itraconazole, ketoconazole, protease inhibitors, other CYP3A4 inhibitors: May increase the effects of sildenafil. Select drugs (e.g., ritonavir) are not recommended for use with sildenafil.

#### Herbal

**St. John's wort:** May decrease sildenafil levels.

Food

**Grapefruit juice:** May increase sildenafil levels.

**High-fat meals:** Delay drug's maximum effectiveness by 1 h.

## **DIAGNOSTIC TEST EFFECTS**

None known.

Sildenafil (Generic Name), Revatio, Viagra (Brand Name)

## SIDE EFFECTS

Frequent

Headache (16%), flushing (10%). Occasional (3%-7%) Dyspepsia, nasal congestion, UTI, abnormal vision, diarrhea. Rare (2%)

Dizziness, rash.

## SERIOUS REACTIONS

· Severe or sudden hypotension.

• Prolonged erections (lasting over 4 h) and priapism (painful erections lasting > 6 h) occur rarely.

• Decreased eyesight or loss of sight.

· Sudden decrease or loss of hearing.

• Heart attack, stroke, irregular heartbeats.

• Vaso-occlusive crises in patients with sickle cell disease treated for pulmonary hypertension.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with an anatomic deformity of the penis; cardiac, hepatic, or renal impairment; and conditions that increase the risk of priapism, including leukemia, multiple myeloma, and sickle cell anemia. Seek treatment immediately if an erection lasts longer than 4 h. Storage

Storage Store at room temperature.

#### Administration

Sildenafil is usually taken 1 h before sexual activity, but it may be taken anywhere from 4 h to 30 min beforehand.

When sildenafil (Revatio) is used for PAH, administer doses at least 4-6 h apart. High-fat meals may affect the drug's absorption rate and effectiveness.

Given IV as an IV bolus injection.

## Silodosin

sil'oh-doe'sin Rapaflo Do not confuse Rapaflo with Rapamune.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (Not indicated for use in women)

#### Classification:

Urinary tract agents, antiadrenergics, specific peripheral α-blockers

## **MECHANISM OF ACTION**

A selective antagonist of postsynaptic adrenergic  $\alpha$ -1 receptors of subtype 1-A, which are located in the human prostate, bladder base, bladder neck, prostatic capsule, and prostatic urethra. *Therapeutic Effect:* Causes smooth muscle in these tissues to relax, resulting in an improvement in urine flow and a reduction in benign prostatic hyperplasis (BPH) symptoms.

## PHARMACOKINETICS

Well absorbed when taken with a meal, and widely distributed. Protein binding: 94%-99%. Extensive metabolism via glucuronidation, alcohol and aldehyde dehydrogenase, and CYP3A4. Metabolites excreted in the urine and feces. Unknown whether it is removed by hemodialysis. *Half-life*: Mean 13.3 h (increased in renal impairment).

## AVAILABILITY

Hard Gelatin Capsules: 4 mg, 8 mg.

#### INDICATIONS AND DOSAGES • Benign prostatic hyperplasia PO

*Adults, Elderly.* 8 mg once a day with the same meal each day.

Silodosin (Generic Name), Rapaflo (Brand Name)

#### Dosage for renal impairment

CrCl 30-50 mL/min: limit dosage to 4 mg once daily.

CrCl < 30 mL/min: contraindicated.

Severe hepatic impairment

Contraindicated with severe hepatic impairment (Child-Pugh score  $\geq 10$ ).

## **OFF-LABEL USES**

Adjunct to medical management of kidney stones, to assist passage.

## CONTRAINDICATIONS

History of sensitivity to silodosin. Severe renal or hepatic impairment. Concomitant administration with strong CYP3A4 inhibitors (e.g., ketoconazole, clarithromycin, itraconazole, ritonavir).

## INTERACTIONS

#### Drug

Antihypertensive agents, nitrates: Increased potential for hypotension. CYP3A4 inducers: May reduce silodosin levels, decrease effect. CYP3A4 inhibitors: May increase silodosin levels and increase side effects such as hypotension risk; potent inhibitors (e.g., itraconazole, ketoconazole, ritonavir) are contraindicated.

**Cyclosporine and other strong Pg-inhibitors:** Increase silodosin exposure. Avoid.

Other α-blockers, such as alfuzosin, doxazosin, prazosin, tamsulosin, and terazosin: May increase the

α-blockade effects of both drugs. **Phosphodiesterase (PDE5)** 

inhibitors (e.g., sildenafil, vardenafil, tadalafil): May result in symptomatic hypotension; use caution.

## Herbal

nerbai Nono linou

None known.

## Food

**Grapefruit juice:** May increase silodosin exposure. Avoid increases in intake.

## DIAGNOSTIC TEST EFFECTS

None expected.

## SIDE EFFECTS

Frequent (≥ 3%)

Dizziness, retrograde ejaculation. Occasional (1%-3%)

Diarrhea, headache, orthostatic hypotension.

Rare (<1%)

Nasal congestion, pharyngitis, rhinitis, abdominal pain, asthenia, nausea, vertigo, impotence.

## SERIOUS REACTIONS

 Severe orthostatic hypotension with syncope may be preceded by tachycardia and usually occurs with increased exposure.

• Rare reports of jaundice, impaired hepatic function, and increased transaminases.

 α-blockers associated with intraoperative floppy iris syndrome during cataract surgery.

- Priapism (very rare).
- Toxic skin eruptions (very rare).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment or moderate hepatic impairment, and in those taking antihypertensive therapy. Silodosin is not indicated for use in women or children. No age-related precautions have been noted in elderly patients.

Dizziness and light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established. Caution should be used when getting up from a sitting or lying position. BP and renal function should be monitored. Fully evaluate prostate symptoms to rule out carcinoma. If a patient will have eye surgery, inform the ophthalmologist of the use of this drug.

#### 1468 Silver Sulfadiazine

#### Storage

Store capsules at room temperature; protect from light and moisture.

Take silodosin with the same meal each day. Do not crush or chew capsules.

## Silver Sulfadiazine

sil'ver sul-fa-dye'a-zeen ★ SSD, SSD AF, Silvadene, Thermazene ➡ Dermazin, Flamazine

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D, if near-term pregnancy)

*Classification:* Anti-infectives, topical, dermatologics

#### **MECHANISM OF ACTION**

An anti-infective that acts on cell wall and cell membrane. Releases silver slowly in concentrations selectively toxic to bacteria. *Therapeutic Effect:* Produces bactericidal effect.

#### PHARMACOKINETICS

Variably absorbed. Significant systemic absorption may occur if applied to extensive burns. Absorbed medication excreted unchanged in urine. *Half-life*: 10 h (half-life increased with impaired renal function).

## AVAILABILITY

Cream: 1% (Silvadene, SSD, SSD AF).

# INDICATIONS AND DOSAGES Burns

TOPICAL

Adults, Elderly, Children. Apply topically to a thickness of approximately 1.66 mu (1/16 inch) 2 times daily.

#### **OFF-LABEL USES**

Treatment of minor bacterial skin infection, dermal ulcer.

#### CONTRAINDICATIONS

Hypersensitivity to silver sulfadiazine, sulfonamides, or any component of the formulation; do not use in infants < 2 mo of age.

#### INTERACTIONS

Drug Collagenase, papain, sutilains: May be inactivated. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Side effects characteristic of all sulfonamides may occur when systemically absorbed such as with extensive burn areas, anorexia, nausea, vomiting, headache, diarrhea, dizziness, photosensitivity, joint pain.

## Frequent

Burning feeling at treatment site. **Occasional** 

Brown-gray skin discoloration, rash, itching.

#### Rare

Increased sensitivity of skin to sunlight.

#### SERIOUS REACTIONS

 If significant systemic absorption occurs, serious reactions such as hemolytic anemia, hypoglycemia, diuresis, peripheral neuropathy, Stevens-Johnson syndrome, agranulocytosis, disseminated lupus erythematosus, anaphylaxis, hepatitis, and toxic nephrosis may occur.

- Fungal superinfections may occur.
- · Interstitial nephritis occurs rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired renal or hepatic function or G6PD deficiency. Be aware that silver sulfadiazine is not recommended during pregnancy unless burn area is > 20% of body surface. Be aware that it is unknown whether silver sulfadiazine is distributed in breast milk. There is a risk of kernicterus in neonates; do not use in infants younger than 2 mo. No age-related precautions have been noted in children or elderly patients.

Skin should be assessed for burns, surrounding areas for pain, burning, itching, and rash. Antihistamines may provide relief. Silver sulfadiazine therapy should continue unless reactions are severe.

#### Storage

Store at room temperature. Cream will occasionally darken either in the jar or after application to the skin. This color change results from a light-catalyzed reaction, which is a common characteristic of all silver salts. The antimicrobial activity of the product is not substantially diminished because the color change reaction involves such a small amount of the active drug.

#### Administration

Apply topical preparation to cleansed and debrided burns using sterile glove. Keep burn areas covered with silver sulfadiazine cream at all times. Reapply to areas where removed by activity. Dressings may be ordered on individual basis.

## Simethicone

si-meth'i-kone ▲ Alka-Seltzer Gas Relief, Gas-X, Genasym, Infants' Mylicon, Mylanta Gas, Phazyme ▲ Gax-X, Infacol, Ovol, Pediacol, Phazyme

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C OTC

**Classification:** Siloxane polymer, antiflatulent

### **MECHANISM OF ACTION**

An antiflatulent that changes surface tension of gas bubbles, allowing easier elimination of gas. *Therapeutic Effect:* Drug dispersal, prevents formation of gas pockets in the GI tract.

#### PHARMACOKINETICS

Does not appear to be absorbed from GI tract. Excreted unchanged in feces.

#### AVAILABILITY

Oral Drops (Infants' Mylicon): 40 mg/0.6 mL. Softgel (Alka-Seltzer Gas Relief, Gas-X, Mylanta Gas): 125 mg. Softgel (Phazyme): 180 mg. Tablets (Chewable [Gas-X, Mylanta Gas]): 80 mg, 125 mg.

# INDICATIONS AND DOSAGES Antiflatulent PO

Adults, Elderly, Children 12 yr and older. 40-360 mg after meals and at bedtime. Maximum: 500 mg/day. Children aged 2-11 yr. 40 mg 4 times a day. *Children younger than 2 yr.* 20 mg 4 times a day.

#### **OFF-LABEL USES**

Adjunct to bowel radiography and gastroscopy.

### CONTRAINDICATIONS

None known.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

None known.

#### SERIOUS REACTIONS

None known.

## PRECAUTIONS & CONSIDERATIONS

It is unknown whether simethicone crosses the placenta or is distributed in breast milk. Simethicone may be used safely in children and elderly patients. Before simethicone administration, the abdomen should be assessed for signs of tenderness, rigidity, and the presence of bowel sounds. Do not give if bowel obstruction or perforation is suspected. Avoid carbonated beverages during simethicone therapy.

#### Storage

Store at room temperature; protect chewable tablets from moisture.

#### Administration

Take simethicone after meals and at bedtime, as needed. Chew tablets thoroughly before swallowing. Shake suspension well before using.

## Simvastatin

sim'va-sta-tin ★ Zocor ▲ Apo-Simvastatin, Zocor Do not confuse Zocor with Cozaar.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: X

#### Classification:

Antihyperlipidemics, HMG-CoA reductase inhibitors, "statins"

#### **MECHANISM OF ACTION**

An HMG-CoA reductase inhibitor that interferes with cholesterol biosynthesis by inhibiting the conversion of the enzyme HMG-CoA to mevalonate. *Therapeutic Effect:* Decreases serum LDL, cholesterol, VLDL, and plasma triglyceride levels; slightly increases serum HDL concentration.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 95%. Undergoes extensive first-pass metabolism. Hydrolyzed to active metabolite. Eliminated primarily in feces. Unknown whether removed by hemodialysis. *Half-life*: < 3 h.

#### AVAILABILITY

*Tablets:* 5 mg, 10 mg, 20 mg, 40 mg, 80 mg.

## INDICATIONS AND DOSAGES

To decrease elevated total and LDL cholesterol in hypercholesterolemia (types IIa and IIb), lower triglyceride levels, and increase HDL levels; to reduce the risk of death and prevent myocardial infarction (MI) in patients with heart disease and

Simvastatin (Generic Name)

#### elevated cholesterol level; to reduce risk of revascularization procedures; to decrease risk of stroke or transient ischemic attack; to prevent cardiovascular events PO

Adults. Initially, 10-20 mg/day in evening. Dosage adjusted at 4-wk intervals. Range: 5-40 mg/day. Only patients who have been previously receiving an 80 mg/day dose without issue should receive that level of dosing. Any patient requiring > 40 mg/day should be switched to an alternate agent.

*Children aged 10-17 yr.* 10 mg/day in evening. Range: 10-40 mg/day. Maximum: 40 mg/day.

#### Dose adjustments for adults taking select drugs concurrently

With diltiazem or verapamil. Maximum: 10 mg/day. Use no more than 240 mg/day of diltiazem. With amiodarone, amlodipine or ranolazine. Maximum: 20 mg/day.

#### Dose adjustment for Asian patients (Chinese) taking niacin

Dose should usually not exceed 40 mg/day due to myopathy risk. Consider no more than 20 mg/day. > **Dosage in renal impairment (adults)** If CrCl < 20 mL/min: Initiate with 5 mg/day and monitor closely.

## CONTRAINDICATIONS

Hypersensitivity, active hepatic disease or unexplained, persistent elevations of liver function test results, pregnancy, breastfeeding. Contraindicated with strong CYP3A4 inhibitors (e.g., itraconazole, ketoconazole, posaconazole, HIV protease inhibitors, boceprevir, teleprevir, erythromycin, clarithromycin, telithromycin and nefadozone). Concomitant administration of gemfibrozil, cyclosporine, or danazol is also contraindicated.

## INTERACTIONS

#### Drug

Strong CYP3A4 inhibitors (e.g., itraconazole, ketoconazole, posaconazole, HIV protease inhibitors, boceprevir, teleprevir, erythromycin, clarithromycin, telithromycin and nefadozone): Increased simvastatin levels and risk of rhabdomyolysis; contraindicated.

Cyclosporine, danazol,

**gemfi brozil:** Increased simvastatin levels and risk of myopathy; contraindicated.

Immunosuppressants, niacin, and moderate CYP3A4 inhibitors (e.g., amiodarone, amlodipine, diltiazem, verapamil): Increases the risk of acute renal failure and rhabdomyolysis. Lowered

simvastatin dose recommended.

Warfarin: May increase anticoagulant effects.

Herbal

terbar

St. John's wort: May reduce simvastatin levels. Food

**Grapefruit juice:** Avoid large changes in intake, as can increase simvastatin levels. Do not consume > 1 quart of grapefruit juice per day.

## DIAGNOSTIC TEST EFFECTS

May increase serum CK and serum transaminase concentrations.

## SIDE EFFECTS

Simvastatin is generally well tolerated. Side effects are usually mild and transient.

Occasional (2%-3%)

Headache, abdominal pain or cramps, constipation, upper respiratory tract infection.

#### Rare (< 2%)

Diarrhea, flatulence, asthenia (loss of strength and energy), nausea, or vomiting. Reversible cognitive impairment of depression, hair loss, may worsen glucose tolerance and increase HbA1C.

#### SERIOUS REACTIONS

 Hypersensitivity, such as bullous rash or anaphylaxis, reported rarely.

- · Cataracts may develop.
- Severe myopathy and

rhabdomyolysis.

• Rare cases of hepatic impairment, jaundice, or pancreatitis.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic disease; severe electrolyte, endocrine, or metabolic disorders; and who consume substantial amounts of alcohol or who are of Asian descent. Withholding or discontinuing simvastatin may be necessary when the person is at risk for renal failure secondary to rhabdomyolysis. Simvastatin use is contraindicated in pregnancy because suppression of cholesterol biosynthesis may cause fetal toxicity. Simvastatin is contraindicated in lactation because there is a risk of serious adverse reactions in breastfeeding infants. Safety and efficacy of simvastatin have not been established in children less than 10 yr of age. No age-related precautions have been noted in elderly patients.

Notify the physician of headache or muscle weakness and aches. Pattern of daily bowel activity and stool consistency should be assessed. Serum lipid cholesterol and triglyceride levels and hepatic function should be checked at baseline and periodically during treatment. Before beginning therapy, a standard cholesterollowering diet for a minimum of 3-6 mo should be practiced and then continued throughout simvastatin therapy. If a contraindicated drug is necessary, temporary discontinuation of simvastatin or using an alternate agent may be necessary. Do not exceed maximum doses due to dose-dependent risk of myopathy and rhabdomyolysis.

## Storage

Store at room temperature. Administration

Take simvastatin without regard to meals and administer in the evening.

#### Sirolimus sir-oh-leem'us

Rapamune

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

#### Classification:

Immunosuppressives

#### **MECHANISM OF ACTION**

An immunosuppressant that inhibits T-lymphocyte proliferation induced by stimulation of cell-surface receptors, mitogens, alloantigens, and lymphokines. Prevents activation of the enzyme target of rapamycin, a key regulatory kinase in cell-cycle progression. *Therapeutic Effect:* Inhibits proliferation of T and B cells, essential components of the immune response; prevents organ transplant rejection.

#### AVAILABILITY

Oral Solution: 1 mg/mL. Tablets: 1 mg, 2 mg.

#### INDICATIONS AND DOSAGES

NOTE: Dosing is by body weight and depends on whether patient is low-moderate risk or high risk.

Sirolimus (Generic Name), Rapamune (Brand Name)

## Prevention of organ transplant rejection

#### PO

Adults and Children  $\geq 13$  yr and  $\geq 40$  kg. Loading dose: 6 mg. Maintenance: 2 mg/day. Children 13 yr and older weighing < 40 kg. Loading dose: 3 mg/m<sup>2</sup>. Maintenance: 1 mg/m<sup>2</sup>/day.

## Dosage in hepatic impairment

Expect reductions (33%-50%) in dose in accordance with degree of impairment.

#### CONTRAINDICATIONS

Hypersensitivity to sirolimus, malignancy.

## INTERACTIONS

#### Drug

Strong CYP3A4 inhibitors (e.g., cyclosporine, diltiazem, ketoconazole, protease inhibitors, quinidine, verapamil): May

increase the blood concentration and risk of toxicity of sirolimus.

#### Strong CYP3A4 inducers (e.g., carbamazepine, phenobarbital, phenytoin, rifampin): May decrease the blood concentration and effects of sirolimus.

#### Herbal

**St. John's wort:** Avoid, as may lower sirolimus concentrations and increase risk of rejection.

#### Food

#### Grapefruit, grapefruit juice:

May decrease the metabolism of sirolimus. Avoid.

## DIAGNOSTIC TEST EFFECTS

May decrease blood hemoglobin level, hematocrit, and platelet count. May increase serum cholesterol, creatinine, and triglyceride levels.

Following cyclosporine withdrawal, target sirolimus trough concentrations are 16-24 ng/mL the first year after transplantation. Then, the target troughs should be 12-20 ng/mL.

## SIDE EFFECTS

#### Frequent

Peripheral edema, hypertriglyceridemia, hypertension, hypercholesterolemia, increased serum creatinine, abdominal pain, diarrhea, headache, fever, urinary tract infection, anemia, nausea, arthralgia, pain, and thrombocytopenia.

#### Occasional

Acne, rash.

## SERIOUS REACTIONS

- Angioedema.
- Sirolimus increases the risk of infection.
- Fluid accumulation and wound healing.
- Proteinuria.
- Interstitial lung disease
- (pneumonitis).
- Hemolytic uremic syndrome/ thrombocytopenic purpura/ thrombotic microangiopathy (HUS/ TTP/TMA).

• Increased risk for malignancy, including skin cancers.

## PRECAUTIONS & CONSIDERATIONS

Sirolimus is not recommended for patients with lung or liver transplants. Caution is warrented in patients with immunosuppression and hepatic impairment. Sirolimus crosses the placenta and is distributed in breast milk. Women taking this drug should not breastfeed. Safety and efficacy have not been established in children < 13 yr. Avoid crowds and people with infection, particularly infections like chickenpox and herpes. Also avoid exposure to sunlight and artificial light because these may cause a photosensitivity reaction. Notify the

physician of change in mental status, dizziness, headache, decreased urination, rash, respiratory infection, or other unusual complaints. CBC, sirolimus levels, liver function test results, and serum creatinine should be regularly monitored.

#### Storage

Store tablets at room temperature, tightly closed and protected from light. The oral solution should be refrigerated; do not freeze and protect from light. Once opened, a bottle is stable for only 30 days. After oral solution is drawn into oral syringe, may keep a maximum of 24 h at room temperature or under refrigeration.

#### Administration

Take the drug at the same time each day. Notify the physician if a dose is missed.

Administer consistently with or without food. Administer 4 h after cyclosporine. Do not administer with grapefruit juice.

Do not crush, chew, or split sirolimus tablets.

Sirolimus oral solution may develop a slight haze when refrigerated. Allow the product to stand at room temperature and shake gently until the haze disappears. The presence of a haze does not affect the product quality. Assemble the bottle with the adapter for the oral syringe as directed. Always keep the bottle upright. Use the supplied amber oral syringe to withdraw the dosage. Empty into a glass or plastic container holding at least 2 oz (60 mL) of water or orange juice. Do not dilute in any other juice, especially not grapefruit juice. Use only plastic or glass containers. Stir vigorously for 1 min and drink at once. Refill the container with 120 mL of water or orange juice, stir vigorously, and drink at once. Be careful not to get the solution on the skin, as it is irritating.

#### Sitagliptin

si'ta-glip-tin Januvia Do not confuse sitagliptin with saxagliptin, or Januvia with Jantoven or Janumet.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

#### Classification:

Antidiabetic agents, dipeptidyl peptidase-4 (DPP-4) inhibitor

#### **MECHANISM OF ACTION**

A "gliptin," or dipeptidyl peptidase-4 inhibitor (DPP-4), that decreases the breakdown of glucagon-like peptide-1 (GLP-1), resulting in more prompt and appropriate secretion of insulin and suppression of glucagon in response to blood sugar increases following meals or snacks, improving glucose tolerance. Therapeutic Effect: Inhibits DPP-4 enzyme activity for a 24-h period. Lowers blood glucose concentration and also HbA1C over time; works well with other antidiabetic medications.

### PHARMACOKINETICS

Rapidly and well absorbed. May administer with or without food. Protein binding: Low, 38%. Median time to maximal plasma concentration occurs 2 h after dosing. Roughly 79% of sitagliptin is excreted unchanged in the urine with metabolism being a minor pathway. Metabolites are excreted in the urine and feces. *Half-life:* 12.4 h (increased in renal insufficiency).

#### AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg.

Sitagliptin (Generic Name), Januvia (Brand Name)

## INDICATIONS AND DOSAGES Type 2 diabetes mellitus

PO

*Adults, Elderly.* 100 mg once daily. May be given with sulfonylureas or insulin.

#### Dosage in renal impairment

CrCl 30-49 mL/min: 50 mg once daily.

CrCl < 30 mL/min: 25 mg once daily. If on hemodialysis, give the daily dose after dialysis.

## CONTRAINDICATIONS

Hypersensitivity to sitagliptin. Not for type 1 diabetes mellitus or diabetic ketoacidosis. Not studied or recommended in patients with a history of pancreatitis.

## INTERACTIONS

#### Drug

**β-Blockers:** May mask signs of hypoglycemia.

**Digoxin:** Slight increase in digoxin exposure; monitor clinically.

Corticosteroids: May increase blood sugar.

**Sulfonylureas or insulin:** May increase risk of hypoglycemia; lower sulfonylurea or insulin dose may be needed.

#### Herbal

Alfalfa, aloe, bilberry, bitter melon, burdock, celery, damiana, fenugreek, garcinia, garlic, ginger, ginseng (American), gymnema, marshmallow, stinging nettle: May enhance hypoglycemic effects.

Food

None significant known.

## DIAGNOSTIC TEST EFFECTS

Lowers blood sugar. Slight increases in serum creatinine or WBC count. Elevations in hepatic enzymes or serum amylase may occur.

## SIDE EFFECTS

#### Frequent

Headache, nasopharyngitis, upper respiratory tract infection, hypoglycemia.

#### Occasional

Decreased appetite, nausea, constipation, abdominal pain, peripheral edema.

#### Rare

Rash, vasculitis.

## SERIOUS REACTIONS

• Overdose may produce severe hypoglycemia.

• Pancreatitis, including fatal hemorrhagic and nonhemorrhagic and necrotizing.

• Rare reports of serious allergic reactions, including anaphylaxis, angioedema, and serious rashes (Stevens Johnson syndrome).

#### **PRECAUTIONS & CONSIDERATIONS**

There have been no clinical studies establishing conclusive evidence of macrovascular risk reduction with sitagliptin. Caution is warranted in patients with impaired renal function. Be alert to conditions that alter blood glucose requirements or dietary intake, such as fever, increased activity, stress, or a surgical procedure. There are no data regarding sitagliptin use during pregnancy. It is unknown whether the drug is distributed in breast milk; caution is recommended. Safety and efficacy of sitagliptin have not been established in children. Hypoglycemia may be difficult to recognize in elderly patients.

Food intake and blood glucose should be monitored before and during therapy. Be aware of signs and symptoms of hypoglycemia (anxiety, cool wet skin, diplopia, dizziness, headache, hunger, numbness in the mouth, tachycardia, tremors) or hyperglycemia (deep rapid breathing, dim vision, fatigue, nausea, polydipsia, polyphagia, polyuria, vomiting); carry candy, sugar packets, or other sugar supplements for immediate response to hypoglycemia.

Consult the physician when glucose demands are altered (such as with fever, heavy physical activity, infection, stress, trauma). Exercise, good personal hygiene (including foot care), not smoking, and weight control are essential parts of therapy. Storage

Store tablets at room temperature. Administration

May take orally without regard to food or the timing of meals or snacks.

#### Sodium Bicarbonate 🖈 so'dee-um by-car'bon-ate

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Alkalinizing agents, electrolyte replacements

## S

## MECHANISM OF ACTION

An alkalinizing agent that dissociates to provide bicarbonate ion. Therapeutic Effect: Neutralizes hydrogen ion concentration, raises blood and urinary pH.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15 min	NA	1-3 h
IV	Immediate	NA	8-10 min

After administration, sodium bicarbonate dissociates to sodium and bicarbonate ions. With increased hydrogen ion concentrations, bicarbonate ions combine with hydrogen ions to form carbonic acid, which then dissociates to CO2, which is excreted by the lungs.

#### AVAILABILITY

Tablets: 325 mg, 650 mg. Injection: 0.5 mEq/mL (4.2%), 0.6 mEq/mL (5%), 0.9 mEq/mL (7.5%), 1 mEq/mL (8.4%).

#### INDICATIONS AND DOSAGES Cardiac arrest IV

Adults, Elderly. Initially, 1 mEq/kg (as 7.5%-8.4% solution). May repeat with 0.5 mEq/kg q10min during continued cardiopulmonary arrest. Use in the postresuscitation phase is based on arterial blood pH, partial pressure of carbon dioxide in arterial blood (Paco2), and base deficit calculation.

Children, Infants. Initially, 1 mEq/kg. To limit the risk of hypernatremia and serious adverse events, the rate of administration in children and infants under the age of 2 yr should therefore be limited to no more than 8 mEq/kg/day. A 4.2% solution may be preferred for such slow administration.

#### Metabolic acidosis (not severe) IV

Adults, Elderly, Children. 2-5 mEq/kg over 4-8 h. May repeat based on laboratory values.

#### Metabolic acidosis (associated with chronic renal failure) PO

Adults, Elderly. Initially, 20-36 mEq/day in divided doses.

#### Renal tubular acidosis (distal) PO

Adults, Elderly. 0.5-2 mEq/kg/day in 4-5 divided doses.

Children. 2-3 mEq/kg/day in 4-5 divided doses.

Sodium Bicarbonate (Generic Name)

#### Renal tubular acidosis (proximal) PO

Adults, Elderly, Children. 5-10 mEq/ kg/day in 4-5 divided doses.

## Urine alkalinization

PO

*Adults, Elderly.* Initially, 4 g, then 1-2 g q4h. Maximum: 16 g/day. *Children.* 84-840 mg/kg/day in 4-6 divided doses.

#### Antacid

PO Adults, Elderly. 300 mg-2 g 1-4 times a day.

#### Hyperkalemia

IV Adults, Elderly. 44.6-50 mEq over 5 min.

## CONTRAINDICATIONS

Excessive chloride loss due to diarrhea, vomiting, or GI suctioning; hypocalcemia; metabolic or respiratory alkalosis.

#### INTERACTIONS

#### Drug

**Calcium-containing products:** May result in milk-alkali syndrome. **Corticosteroids:** May cause edema and hypertension.

**Lithium, salicylates:** May increase the excretion of these drugs.

Methenamine: May decrease the effects of methenamine.

## Herbal

None known.

#### Food

Milk, other dairy products: May result in milk-alkali syndrome.

## DIAGNOSTIC TEST EFFECTS

May increase serum and urinary pH.

## IV INCOMPATIBILITIES

NOTE: Many injectable drugs and infusions are incompatible with sodium bicarbonate, due to the alkaline pH. Always refer to specialized references when checking compatibility. Some incompatibilities include ascorbic acid, diltiazem (Cardizem), dobutamine (Dobutrex), dopamine (Intropin), hydromorphone (Dilaudid), magnesium sulfate, midazolam (Versed), morphine, norepinephrine (Levophed).

## **IV COMPATIBILITIES**

Aminophylline, furosemide (Lasix), heparin, insulin, mannitol, milrinone (Primacor), phenylephrine (Neo-Synephrine), potassium chloride, propofol (Diprivan).

## SIDE EFFECTS

#### Frequent

Abdominal distention, flatulence, belching with oral use; with IV use, edema, fluid overload, worsening heart failure.

#### SERIOUS REACTIONS

• Excessive or chronic use may produce metabolic alkalosis (characterized by irritability, twitching, paresthesias, cyanosis, slow or shallow respirations, headache, thirst, and nausea).

• Fluid overload results in headache, weakness, blurred vision, behavioral changes, incoordination, muscle twitching, elevated BP, bradycardia, tachypnea, wheezing, coughing, and distended neck veins.

• Extravasation may occur at the IV site, resulting in tissue necrosis and ulceration.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with congestive heart failure (CHF), renal insufficiency, edema, and concurrent corticosteroid therapy. Sodium bicarbonate use may produce hypernatremia and

increased deep tendon reflexes in the neonate or fetus whose mother is administered chronically high doses. Sodium bicarbonate may be distributed in breast milk. No age-related precautions have been noted in children; however, sodium bicarbonate should not be used as an antacid in children younger than 6 yr. In elderly patients, age-related renal impairment may require cautious use. Check with the physician before taking any OTC drugs because they may contain sodium.

Serum calcium, phosphate and uric acid levels, blood and urinary pH, Paco<sub>2</sub> and CO<sub>2</sub>, plasma bicarbonate, and serum electrolyte levels should be monitored. Pattern of daily bowel activity and stool consistency and clinical improvement of metabolic acidosis, including relief from disorientation, hyperventilation, and weakness, should also be assessed.

#### Storage

Store vials at room temperature. Administration

! Sodium bicarbonate may be given by IV push, IV infusion, or orally. Dosage is individualized based on age, weight, clinical conditions, and laboratory values and on the severity of acidosis. Metabolic alkalosis may result if the bicarbonate deficit is fully corrected during the first 24 h.

Take oral sodium bicarbonate 1-3 h after meals. Do not take other oral drugs within 2 h of sodium bicarbonate administration.

Sodium bicarbonate may be given undiluted. For IV push, give up to 1 mEq/kg over 1-3 min for cardiac arrest. Do not exceed an infusion rate of 1 mEq/kg/h.

## **Sodium Chloride**

so'dee-um klor'ide Muro 128, Nasal Mist, Nasal Moist, Ocean, SalineX, SeaMist, Slo-Salt

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C OTC (tablets, nasal solution, ophthalmic solution, ophthalmic ointment)

**Classification:** Electrolyte replacements, vitamins/minerals

#### **MECHANISM OF ACTION**

Sodium is a major cation of extracellular fluid that controls water distribution, fluid and electrolyte balance, and osmotic pressure of body fluids; it also maintains acid-base balance.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Widely distributed. Excreted primarily in urine.

## AVAILABILITY

Tablets: 1 g. Injection (Concentrate): 23.4% (4 mEq/mL). Injection, infusions: 0.45%, 0.9%, 3%. Irrigation: 0.45%, 0.9%. Nasal Gel (Nasal Moist): 0.65%. Nasal Solution (OTC [SalineX]): 0.4%. Nasal Solution (OTC [Nasal Moist, SeaMist]): 0.65%. Ophthalmic Solution (OTC [Muro 128]): 5%. Ophthalmic Ointment (OTC [Muro 128]): 5%.

#### INDICATIONS AND DOSAGES

 Prevention and treatment of sodium and chloride deficiencies; source of hydration *Adults, Elderly.* 1-2 L/day 0.9% or 0.45%. Assess serum electrolyte levels before giving additional fluid.

#### Prevention of heat prostration and muscle cramps from excessive perspiration

#### PO

Adults, Elderly. 1-2 g 3 times a day. • Relief of dry and inflamed nasal membranes

INTRANASAL Adults, Elderly. Use as needed.
Diagnostic aid in ophthalmoscopic exam, treatment of corneal edema OPHTHALMIC SOLUTION Adults, Elderly. Apply 1-2 drops q3-4h.
OPHTHALMIC OINTMENT Adults, Elderly. Apply once a day or as directed.

#### CONTRAINDICATIONS

Fluid retention, hypernatremia.

#### INTERACTIONS

#### Drug

**Corticosteroids:** May increase fluid retention.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent Facial flushing.

#### Occasional

Fever; irritation, phlebitis, or extravasation at injection site. Ophthalmic: Temporary burning or irritation.

## SERIOUS REACTIONS

 Too-rapid administration may produce peripheral edema, congestive heart failure (CHF), and pulmonary edema. • Excessive dosage may cause hypokalemia, hypervolemia, and hypernatremia.

• Too-rapid correction of hyponatremia with hypertonic saline (e.g., 3%) may produce cerebral edema.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cirrhosis, CHF, hypertension, and renal impairment. Do not administer sodium and chloride preserved with benzyl alcohol to neonates. No agerelated precautions have been noted in children or elderly patients.

Notify the physician of acute redness of eyes, floating spots, severe eye pain or pain on exposure to light, a rapid change in vision (side and straight ahead), or headache after ophthalmic administration. Fluid balance, weight, acid-base balance, BP, and serum electrolyte levels should be monitored. Be alert for signs and symptoms of hypernatremia (edema, hypertension, and weight gain) and hyponatremia (dry mucous membranes, muscle cramps, nausea, and vomiting). **Storage** 

Store vials at room temperature. Administration

! Dosage is based on acid-base status, age, weight, clinical condition, and fluid and electrolyte status.

Do not crush or break entericcoated or slow-release tablets. Take tablets with a full glass of water.

For IV use, administer hypertonic solutions (3% or 5%) through a large vein at a rate not exceeding 1 mEq/kg/h. Avoid infiltration. Dilute vials containing 2.5-4 mEq/mL (concentrated NaCl) with D5W or D<sub>10</sub>W before administration.

For nasal use, inhale slowly just before releasing the drug into nose. Then release air gently through the mouth. Continue this technique for 20-30 seconds.
#### 1480 Sodium Ferric Gluconate Complex

For ophthalmic use, place a finger on the lower eyelid, and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket and instill the prescribed number of drops (or apply a thin strip of ointment) in the pocket. Close the eyes gently so that the drug is not squeezed out of the sac. After administering the solution, apply gentle finger pressure to the lacrimal sac for 1-2 min to reduce systemic absorption.

# Sodium Ferric Gluconate Complex

so'dee-um fer'ick glue'koe-nate calm'plex Ferrlecit

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Hematinics, minerals, iron replacements

## **MECHANISM OF ACTION**

A trace element that repletes total iron content in body. Replaces iron found in hemoglobin, myoglobin, and specific enzymes; allows oxygen transport via hemoglobin. *Therapeutic Effect*: Prevents and corrects iron deficiency.

#### AVAILABILITY

Solution for Injection: 12.5 mg/mL elemental iron.

#### INDICATIONS AND DOSAGES Iron deficiency anemia IV INFUSION

Adults, Elderly. 125 mg in 100 mL 0.9% NaCl infused over 1 h. May administer undiluted, at a rate 12.5 mg/min. Minimum cumulative dose 1 g elemental iron given over 8 sessions at sequential dialysis treatments. May be given during dialysis session.

Children older than 6 yr. 1.5 mg/kg elemental iron diluted in 25 mL 0.9% NaCl infused over 1 h. Maximum 125 mg/dose given over 8 sessions at sequential dialysis treatments. May be given during dialysis session.

#### CONTRAINDICATIONS

Hypersensitivity, evidence of iron overload, and all anemias not associated with iron deficiency.

#### INTERACTIONS Drug

ACE inhibitors: May increase risk of infusion/sensitivity infusion reactions.

Iron preparations: Do not give concurrently with oral iron or other injectable irons because excessive iron intake may produce excessive iron storage (hemosiderosis).

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

Expect increases in hemoglobin, hematocrit, and other indices of RBC production.

# IV INCOMPATIBILITIES

Do not mix with other medications.

#### SIDE EFFECTS

Frequent (> 3%) Flushing, hypotension, hypersensitivity reaction. Occasional (1%-3%)

Injection-site reaction, headache, abdominal pain, chills, flu-like syndrome, dizziness, leg cramps, dyspnea, nausea, vomiting, diarrhea, myalgia, pruritus, edema.

#### SERIOUS REACTIONS

• A potentially fatal hypersensitivity reaction occurs rarely, characterized by cardiovascular collapse, cardiac arrest, dyspnea, bronchospasm, angioedema, and urticaria.

 Rapid administration may cause hypotension associated with flushing, light-headedness, fatigue, weakness, or severe pain in the chest, back, or groin.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with asthma, hepatic impairment, rheumatoid arthritis, and significant allergies. It is unknown whether sodium ferric gluconate complex is distributed in breast milk. No age-related precautions have been noted in elderly patients. However, lower initial dosages of sodium ferric gluconate complex are recommended in elderly patients. Safety and efficacy are not established in children less than 6 yr of age.

Stools may become black during iron therapy, but this effect is harmless unless accompanied by abdominal cramping or pain and red streaking and sticky consistency of stool. Notify the physician of abdominal cramping or pain or red streaking or sticky consistency of stool. Laboratory test results, especially CBC, serum iron concentrations, and vital signs, should be monitored. Test results may not be meaningful for 3 wks after beginning sodium ferric gluconate complex therapy. Patients with rheumatoid arthritis or iron deficiency anemia should be assessed for acute exacerbation of joint pain and swelling. Storage

Store at room temperature. If diluted in 0.9% NaCl, use infusion immediately after preparation.

#### Administration

! May give undiluted as slow IV injection or IV infusion without test dose. Administration as an infusion may limit the risk of significant hypotension. Avoid rapid administration.

The standard recommended dilution is 125 mg (10 mL) diluted with 100 mL 0.9% NaCl. Infuse over 1 h. The drug may be administered during dialysis treatments.

#### Sodium Oxybate

sew-dee'um ox'ee-bate

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B Controlled Substance Schedule: III

**Classification:** Depressants, central nervous system (CNS)

#### MECHANISM OF ACTION

A naturally occurring inhibitory neurotransmitter that binds to  $\gamma$ -aminobutyric acid (GABA)-B receptors and sodium oxybate specific receptors with its highest concentrations in the basal ganglia, which meditates sleep cycles, temperature regulation, cerebral glucose metabolism and blood flow, memory, and emotion control. *Therapeutic Effect:* Reduces the number of sleep episodes.

#### PHARMACOKINETICS

Rapidly and incompletely absorbed. Absorption is delayed and decreased by a high-fat meal. Protein binding: < 1%. Widely distributed, including cerebrospinal fluid (CSF). Metabolized in liver. Excretion is < 5% in the urine and negligible in feces. Unknown whether removed by hemodialysis. *Half-life:* 20-53 min.

### AVAILABILITY

Oral Solution: 500 mg/mL (Xyrem).

# INDICATIONS AND DOSAGES Cataplexy of narcolepsy PO

Adults, Elderly, Children aged 16 yr or older: 4.5 g/day in 2 equal doses of 2.25 g, the first taken at bedtime while in bed and the second 2.5-4 h later. Maximum: 9 g/day in 2-wk increments of 1.5 g/day. Maximum dose: 9 g/day.

#### CONTRAINDICATIONS

Metabolic/respiratory alkalosis, current treatment with sedative hypnotics, succinic semialdehyde dehydrogenase deficient, history of substance abuse including active alcoholism, hypersensitivity to sodium oxybate or any component of the formulation.

#### INTERACTIONS

Drug

Alcohol, barbiturates, benzodiazepines, centrally acting muscle relaxants, opioid analgesics: May increase CNS and respiratory depressant effects. Do not use with other sedatives or hypnotics. Methamphetamine: May increase risk of unconsciousness and seizurelike tremor. Herbal None known.

Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

May increase sodium and glucose level. May cause positive antinuclear antibody (ANA) test (without symptoms).

# SIDE EFFECTS

#### Frequent

Mild bradycardia.

#### Occasional

Headache, vertigo, dizziness, restless legs, abdominal pain, muscle weakness.

#### Rare

Dream-like state of confusion.

#### SERIOUS REACTIONS

• Agitation, excitation, increased BP, and insomnia may occur on abrupt discontinuation of sodium oxybate.

 Abuse potential. Abuse of drug may cause seizure, respiratory depression, and profound decreases in level of consciousness, possible coma, and death. Other neuropsychiatric events: psychosis, paranoia, hallucinations, and agitation.

 Sleepwalking with amnesia and unusual behaviors, including participating in hazardous activities (e.g., smoking, driving). If occurs, discontinue the drug.

#### PRECAUTIONS & CONSIDERATIONS

Only available through the Xyrem Success Program to ensure proper use and monitoring of risks. Patients and prescribers must enroll, then the drug is sent to the patient. Caution is warranted in patients with a history of depression, hypertension, pregnancy, concurrent ingestion of alcohol, other CNS depressants, and renal or liver impairment. It is unknown whether sodium oxybate is excreted in breast milk. Use caution if giving sodium oxybate to pregnant women. Safety and efficacy of this drug have not been established in children or the elderly. Age-related liver or renal impairment may require decreased dosage in elderly patients. High-fat meals should be avoided because they will delay absorption of the drug.

Dizziness and light-headedness may occur. Avoid alcohol and tasks that require mental alertness or motor skills. Notify physician of signs of metabolic alkalosis or irritability, twitching, numbness or tingling of extremities, cyanosis, slow or shallow respiration, headache, thirst, nausea.

#### Storage

Store at room temperature. The diluted oral solution should be consumed within 24 h.

#### Administration

Be aware that sodium oxybate is available only through restricted distribution. Food significantly reduces bioavailability, so allow at least 2 h after eating before giving the first dose of sodium oxybate. Mix this medicine with 2 oz (¼ cup) of water before using. Mix both doses of medicine before going to bed, and store the second dose close to the bed. Take the second dose  $2\frac{1}{2}$ to 4 h after taking the first dose. Set an alarm clock to wake up to take the second dose on time.

#### Sodium Polystyrene Sulfonate

so'dee-um pol-ee-stye'reen sul'foe-nate ★ Kayexalate, Kionex, Marlexate, SPS ▲ Kayexylate, PMS-Sodium Polystyrene Sulfonate

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Resins

#### **MECHANISM OF ACTION**

An ion exchange resin that releases sodium ions in exchange primarily for potassium ions. *Therapeutic*  *Effect:* Moves potassium from the blood into the intestine so it can be expelled from the body.

#### PHARMACOKINETICS

Onset 2-24 h. Not absorbed. Excreted in feces.

### AVAILABILITY

Suspension (SPS): 15 g/60 mL. Powder for Suspension (Kayexalate, Kionex): 15 g/60 mL.

#### INDICATIONS AND DOSAGES Hyperkalemia

#### PO Adults, Elderly. 60 mL (15 g) 1-4 times a day. Children. 1 g/kg/dose q6h. RECTAL Adults, Elderly. 30-50 g q1-2h initially, as needed to correct hyperkalemia, then q6h. Children. 1 g/kg q2-6h.

#### CONTRAINDICATIONS

Hypokalemia, hypocalcemia, intestinal obstruction, or perforation.

Do not give orally in neonates; do not use in neonates with reduced gut motility.

#### INTERACTIONS

#### Drug

Cation-donating antacids, laxatives (such as magnesium hydroxide):

May decrease effect of sodium polystyrene sulfonate and cause systemic alkalosis in patients with renal impairment.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May decrease serum calcium and magnesium levels.

#### SIDE EFFECTS

#### Frequent

High dosage: Anorexia, nausea, vomiting, constipation. High dosage in elderly: Fecal impaction characterized by severe stomach pain with nausea or vomiting.

#### Occasional

Diarrhea, sodium retention marked by decreased urination, peripheral edema, and increased weight.

#### SERIOUS REACTIONS

 Potassium deficiency may occur. Early signs of hypokalemia include confusion, delayed thought processes, extreme weakness, irritability, and ECG changes (including prolonged QT interval; widening, flattening, or inversion of T wave; and prominent U waves).

 Hypocalcemia, manifested by abdominal or muscle cramps, occurs occasionally.

• Arrhythmias and severe muscle weakness may be noted.

• Resin impaction, possible colonic necrosis, colitis or perforation.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with edema, hypertension, and severe CHF. It is unknown whether sodium polystyrene sulfonate crosses the placenta or is distributed in breast milk. Use caution in neonates, and only give rectally. Rectal administration may cause impaction in young infants/ neonates. Elderly patients may be at increased risk for fecal impaction. Foods rich in potassium should be consumed.

Because sodium polystyrene sulfonate does not rapidly correct severe hyperkalemia (it may take hours to days), consider other measures, such as dialysis, IV glucose and insulin, IV calcium, and IV sodium bicarbonate to correct severe hyperkalemia in a medical emergency. Serum potassium levels, calcium and magnesium, and pattern of daily bowel activity and stool consistency should be assessed. Clinical condition and ECG are valuable in determining when treatment should be discontinued.

#### Storage

Store at room temperature. Once suspension is prepared, use within 24 h.

#### Administration

Once suspension is prepared, shake suspension well prior to use. Give oral sodium polystyrene sulfonate with 20-100 mL of water to aid in potassium removal, facilitate passage of resin through the intestinal tract, and prevent constipation. The amount of fluid needed may be simply determined by allowing 3 mL to 4 mL per g of resin. Do not mix this drug with foods or liquids containing potassium. Drink the entire amount of the resin for best results. Chilling oral suspension will help improve the taste.

For rectal use, after initial cleansing enema, insert large rubber tube well into sigmoid colon and tape in place. Introduce suspension with 100 mL sorbitol or water by gravity. Flush with 50-100 mL fluid and clamp. Retain for several hours, if possible. Irrigate colon with a non-sodium-containing solution to remove resin.

# Solifenacin

sohl-e-fen'ah-sin VESIcare Do not confuse VESIcare with Viscol.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Anticholinergics, urinary incontinence agents, bladder antispasmodics

# **MECHANISM OF ACTION**

A urinary antispasmodic that acts as a direct antagonist at muscarinic acetylcholine receptors in cholinergically innervated organs. Reduces tonus (elastic tension) of smooth muscle in the bladder and slows parasympathetic contractions. *Therapeutic Effect:* Decreases urinary bladder contractions, increases residual urine volume, and decreases detrusor muscle pressure.

# PHARMACOKINETICS

Well absorbed. Protein binding: 99%. Solifenacin is extensively metabolized in the liver by CYP3A4; but alternate metabolic pathways exist. Excreted mostly in urine (69%) and some in feces. *Half-life*: 45-68 h (increased in renal and liver dysfunction).

# AVAILABILITY

Tablets: 5 mg, 10 mg.

# INDICATIONS AND DOSAGES

Overactive bladder PO

Adults, Elderly. 5 mg/day; if tolerated, may increase to 10 mg/day. **Dosage in renal or hepatic impairment or taking CYP3A4 inhibitors** For patients with severe renal impairment, moderate hepatic impairment, or concomitant use of CYP3A4 inhibitors, maximum dosage is 5 mg/day.

# CONTRAINDICATIONS

GI or gastrourinary obstruction, paralytic ileus, severe hepatic impairment, uncontrolled angleclosure glaucoma, urinary retention.

#### INTERACTIONS Drug

Aminoglutethimide, carbamazepine, nafcillin, nevirapine, phenobarbital, phenytoin: May decrease the effects and serum level of solifenacin. Azole antifungals, potent CYP3A4 inhibitors (e.g., clarithromycin, erythromycin, imatinib, isoniazid, nefazodone, protease inhibitors, verapamil): May increase the effects and serum level of solifenacin. Maximum dose 5 mg daily with potent CYP3A4 inhibitors. Herbal

# lerbal

**St. John's wort:** May decrease the effects and serum level of solifenacin.

Food

**Grapefruit, grapefruit juice:** May increase the effects and serum level of solifenacin.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent (5%-11%)

Dry mouth, constipation, blurred vision.

Occasional (3%-5%)

Urinary tract infection, dyspepsia, nausea.

#### Rare (1%-2%)

Dizziness, dry eyes, fatigue, depression, edema, hypertension, upper abdominal pain, vomiting, urinary retention.

Solifenacin (Generic Name), VESIcare (Brand Name)

#### SERIOUS REACTIONS

GI obstruction occurs rarely.

• Overdose can result in severe central anticholinergic effects.

• Acute urinary retention requiring treatment.

• Rare cases of hypersensitivity, such as angioedema, and severe cutaneous reactions (e.g., erythema multiforme).

· Rare cases of QT prolongation.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bladder outflow obstruction, congenital or acquired prolonged QT interval, controlled angle-closure glaucoma, decreased GI motility, GI obstructive disorders, hepatic or renal impairment, and in pregnant women.

#### Storage

Store at room temperature; protect from light.

#### Administration

Take solifenacin without regard to food but with liquid; swallow tablets whole.

# Somatropin, rh-GH

soe-ma-troe'pin Genotropin, Humatrope, Neutropin, Neutropin AQ, Norditropin, Omnitrope, Saizen, Tev-Tropin, Zorbtive

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Hormones, growth hormone analogs

#### **MECHANISM OF ACTION**

Endogenous growth hormone is responsible for stimulating normal skeletal, connective tissue, muscle, and organ growth in children and adolescents. It also plays an important role in metabolism. Somatropin mimics these actions. Somatropin is converted to insulin-like growth factors (IGFs) in the liver and other tissues. IGFs antagonize peripheral insulin and stimulate insulin output; stimulate hydrolysis of triglycerides in fat tissue; stimulate hepatic glucose output; induce a positive calcium balance; and promote retention of sodium and potassium. Anabolic actions stimulate DNA, RNA, and protein synthesis, and induce cell proliferation and growth. Linear growth is stimulated via the cartilaginous growth areas of long bones. Growth is also stimulated by increasing the number and size of skeletal muscle, organs, and increasing red cell mass via erythropoietin. Therapeutic Effect: Helps restore proper growth rates, and attainment of natural height in children with short stature.

# PHARMACOKINETICS

After subcutaneous administration, about 80% bioavailability. Widely distributed. Somatropin undergoes protein catabolism in both liver and kidneys. *Half-life:* 3-10 h (reports vary depending on product label).

#### AVAILABILITY

The various products are available in a variety of vial and pen cartridges, and a variety of concentrations. Because these products are constantly being supplied in new ways, it is recommended the provider consult information for the specific product brand at the time of prescribing.

# INDICATIONS AND DOSAGES

NOTE: Somatropin, rh-GH doses are individualized and are highly variable depending on the nature and severity of the disease, the formulation being used, and patient response. The following represents common dosage ranges for many injection solutions; injection suspensions and some products recommend different dosing schedules. Consult the specific product for more information.

#### Usual dosage, children

In children, somatropin is used for growth failure due to inadequate secretion of endogenous growth hormone (GH) and for short stature due to Noonan syndrome or Turner syndrome, or in children born small for gestational age (SGA) with no catch-up growth by age 2-4 yr. SUBCUTANEOUS

Children. Initial dosages range from 0.03 mg/kg/day to 0.067 mg/kg/day. Recent literature has recommended initial treatment with larger doses of somatropin (e.g., 0.067 mg/kg/ day), especially in very short children (i.e., height standard deviation score (HSDS) < 3) and/or older/pubertal children. A reduction in dosage (e.g., gradually toward 0.033 mg/kg/day) should be considered if substantial catch-up growth is observed during the first few years of therapy. On the other hand, in younger SGA children (e.g., approximately < 4 years) with less severe short stature (i.e., baseline HSDS values between 2 and 3), consider a lower initial dose (e.g., 0.033 mg/kg/day), and titrating as needed over time. In all children, clinicians should carefully monitor the growth response, and adjust the dose as necessary.

#### Usual dosage, adults with growth hormone deficiency

In adults, somatropin is used for growth hormone deficiency, either alone or associated with multiple hormone deficiencies (hypopituitarism), as a result of pituitary disease, hypothalamic disease, surgery, radiation therapy, or trauma; or in adults who were GH deficient during childhood as a result of congenital, genetic, acquired, or idiopathic causes.

#### SUBCUTANEOUS

Adults. Initial dosages range from 0.004 mg/kg/day to 0.006 mg/kg/day. Titrate to effect. Usual maximum is approximately 0.016 mg/kg/day.

 Short bowel syndrome in patients on specialized nutrition support SUBCUTANEOUS (ZORBTIVE

PRODUCT ONLY)

Adults. 0.1 mg/kg SC once daily for 4 wks. Do not exceed a maximum of 8 mg/day. Discontinue for up to 5 days to reduce severe toxicities, if needed. Upon resolution of side effects, resume at 50% of the original dose. Permanently discontinue if severe toxicity recurs or does not disappear within 5 days.

#### HIV or AIDS-associated wasting syndrome or failure to thrive, cachexia

SUBCUTANEOUS (SEROSTIM PRODUCT ONLY)

Adults > 55 kg. 6 mg once daily at bedtime.

*Adults 45-55 kg.* 5 mg once daily at bedtime.

*Adults 35-45 kg.* 4 mg once daily at bedtime.

Adults < 35 kg. 0.1 mg/kg/day once daily at bedtime.

*Children 8 yr and older.* 0.04 mg/kg/day SC for 26 weeks or 0.07 mg/kg/day SC for 4 wks was used in manufacturer studies.

#### CONTRAINDICATIONS

Hypersensitivity to any somatropin product, m-cresol hypersensitivity (Genotropin); do not use in times of acute critical illness or active malignancy (e.g., open heart surgery, abdominal surgery or multiple accidental trauma, brain tumor, pituitary tumor, or those with acute respiratory failure) due to increases in mortality. Do not use in children with Prader-Willi syndrome who are severely obese, have a history of upper airway obstruction or sleep apnea, or have severe respiratory impairment due to reports of sudden death. Do not use in patients with diabetic retinopathy or in children with closed epiphyses.

#### INTERACTIONS

#### Drug

**Corticosteroids:** Requirements for prednisone or other glucocorticoid dose may increase during somatropin treatment. Monitor.

CYP-metabolized drugs with narrow therapeutic ranges (e.g., anticonvulsants, cyclosporine, other sex steroids, theophylline, warfarin): Somatropin may increase drug metabolism. Monitor levels or laboratory tests closely.

Diabetic medications: Blood glucose alterations during somatropin treatment may require dosage adjustments in medicines for diabetes. Monitor.

**Estrogens:** Girls and women receiving estrogen may require greater somatropin dosage for therapeutic effect.

# Herbal

None known. Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase blood glucose. Serum IGF-1 concentrations may be helpful to guide dosing.

#### SIDE EFFECTS

#### Frequent

Injection site reactions, local injection site rashes and lipoatrophy, headaches, arthralgia (especially in adults). Occasional

Flu-like symptoms, fluid retention, back pain, muscle pain, hyperglycemia, glycosuria.

#### Rare (<1%)

Hypothyroidism, peripheral edema, gynecomastia, dry skin or other

changes, eczema, hypersensitivity (urticaria, etc.).

#### SERIOUS REACTIONS

 Increased intracranial pressure with papilledema, visual changes, headache, and nausea and/or vomiting. Dose reduce or discontinue use.

• Adrenal insufficiency may worsen or develop.

· Pancreatitis.

 Potential for existing tumor growth or secondary malignancy.

· Increased risk of mortality.

#### **PRECAUTIONS & CONSIDERATIONS**

In a child with acute illness, the benefit of continuing growth hormone should be weighed against the potential risk; use with caution in patients with history of or current neoplasms and monitor closely for growth or recurrence of cancer. The drug may cause impaired glucose tolerance; monitor glucose levels in all patients and especially in those with diabetes mellitus. Use with caution in hypothyroidism as condition may worsen. Pancreatitis has occurred; evaluate patients with severe persistent abdominal pain. There are no specific data for use in pregnancy or breastfeeding. The elderly may be more sensitive to the effects of somatotropin.

Monitor linear growth, weight, blood sugar, and serum chemistries. Watch for fluid retention and edema, and for signs of adrenal insufficiency or thyroid disease, which may require hormone replacement. Evaluate product tolerance and compliance. If papilledema develops, dose reduction or discontinuation of the drug may be necessary to reduce intracranial hypertension. Evaluate children with the onset of a limp or hip/knee pain for a slipped femoral epiphyses, and for the presence of scoliosis. Vision changes or difficulty in breathing should be promptly reported and evaluated. Discontinue treatment when final height is achieved or epiphyseal fusion occurs.

#### Storage

Follow the directions for the specific product to be used. Directions for storage vary depending on brand of product and how supplied (e.g., vials vs. prefilled pens, etc.). Many products are preferably refrigerated before opened, but some products allow for storage at  $< 77^{\circ}$  F at room temperature for a select amount of time. Do not freeze.

#### Administration

Inspect visually for particulate matter and discoloration prior to administration, whenever solution and container permit. Do not inject if the solution is cloudy or contains particulate matter. Each product brand and type has specific administration instructions, which should be followed carefully for proper use and dosing. Most products are administered subcutaneously. Do not give intravenously. Allow the product to come to room temperature before injection. Subcutaneous injections may be given in the thigh, buttocks, or abdomen. Injection sites should always be rotated to avoid lipoatrophy.

# Sorafenib

sore-a-fen'ib Mexavar **Do not confuse sorafenib with** sunitinib.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastics, biologic agents, signal transduction inhibitor

#### **MECHANISM OF ACTION**

An oral multikinase inhibitor. The drug inhibits multiple intracellular (CRAF, BRAF, and mutant BRAF) and cell surface kinases (KIT, FLT-3, RET, VEGFR-1, VEGFR-2, VEGFR-3, and PDGFR-β). Several of these kinases are thought to be involved in tumor cell signaling, angiogenesis, and apoptosis. *Therapeutic Effect:* Inhibits tumor growth.

#### PHARMACOKINETICS

Food decreases oral absorption. Protein binding: 99.5%. Sorafenib is metabolized in the liver by oxidative metabolism, mediated by CYP3A4, and UGT1A9 mediates glucuronidation. A total of 8 metabolites have been identified. The major active metabolite, pyridine N-oxide, shows in vitro potency similar to that of sorafenib. Most of the dose was recovered within 14 days, with 77% excreted in the feces and 19% excreted in the urine as glucuronidated metabolites. Unchanged sorafenib is found in the feces but not in the urine. Half-life: 25-48 h.

#### AVAILABILITY

Tablet: 200 mg.

# INDICATIONS AND DOSAGES Advanced renal cell or

hepatocellular cancer
PO
Adults, Elderly. 400 mg twice daily
on an empty stomach.
> Dosage adjustment if strong

CYP3A4 inducers used

May consider dose increase, with caution.

Dosage adjustment for toxicity
 Management of side effects may
 require temporary interruption and/

or dose reduction. Dose may be reduced to 400 mg once daily or to 400 mg every other day. See manufacturer's information for full recommendations.

### CONTRAINDICATIONS

Hypersensitivity. Do not use with carboplatin and paclitaxel for squamous cell lung cancer, due to an increase in mortality with the addition of sorafenib. Avoid in patients with congenital QT syndrome.

#### **INTERACTIONS**

#### Drug

#### Carboplatin and paclitaxel:

Increased mortality in patients with squamous cell lung cancer. Do not use sorafenib.

**UGT1A1 and UGT1A9 substrates** (e.g., irinotecan): Sorafenib inhibits UGT and may increase toxicity of these drugs.

**Docetaxel:** Sorafenib increases docetaxel exposure.

**Doxorubicin:** Increase in doxorubicin exposure.

**Fluorouracil:** Both increases and decreases in the AUC of fluorouracil were observed.

CYP2B6 and CYP2C8 substrates: Sorafenib inhibits these enzymes; use caution with drugs such as bupropion. Strong CYP inducers (e.g., rifampin, phenytoin, carbamazepine,

**phenobarbital**, **dexamethasone**): May increase metabolism of sorafenib and thus decrease sorafenib concentrations; may need dose increase.

QT-prolonging drugs like Class IA and III antiarrhythmics, cisapride, clarithromycin, droperidol, erythromycin, haloperidol, certain phenothiazines (chlorpromazine, mesoridazine, and thioridazine), **pimozide, ziprasidone:** Additive QT effects; use caution and monitor. **Warfarin:** Sorafenib is a competitive inhibitor of CYP2C9 and could possibly alter warfarin response; also independently increases INR; monitor INR.

#### Herbal

**St. John's wort:** May increase metabolism of sorafenib and thus decrease sorafenib concentrations; avoid.

#### Food

All foods: Decreases absorption; administer on empty stomach.

# DIAGNOSTIC TEST EFFECTS

Decreased WBC, platelets. Increased INR, liver enzymes, serum amylase, lipase. Hypoalbuminemia. Electrolyte abnormalities (hypophosphatemia).

# SIDE EFFECTS

#### **Frequent (> 20%)**

Fatigue, weight loss, rash/skin desquamation, hand-foot syndrome, alopecia, diarrhea, anorexia, nausea, hypophosphatemia, and abdominal pain.

#### Occasional

Chest pain, hypertension, dysgeusia (altered taste), dyspepsia, mouth ulcers, facial edema, proteinuria, arthralgia or myalgia, depression, hoarseness, skin erythema.

#### Rare

Difficult wound healing, renal impairment, erectile dysfunction, tinnitus.

#### SERIOUS REACTIONS

• Serious hypersensitivity reactions occur rarely, and may include angioedema.

· Leukopenia, thrombocytopenia.

Severe and fatal hepatotoxicity, or pancreatitis.

• Serious bleeding (CNS, gastrointestinal, hemoptysis, etc.) or GI perforations.

• Chest pain may indicate cardiac ischemia or infarction and requires prompt evaluation.

• Prolonged QT interval may lead to torsades de pointes, ventricular arrhythmias.

· Arterial thrombotic events.

#### **PRECAUTIONS & CONSIDERATIONS**

Sorafenib may cause QT prolongation which may lead to arrhythmia. Monitor patients with heart failure, bradyarrhythmias, those taking drugs known to prolong the OT interval, or those with electrolyte abnormalities with on-treatment ECGs and electrolytes (magnesium, potassium, calcium). Use with caution in patients with hepatic disease, high blood pressure, a history of stroke, GI disease with GI bleeding in the past 6 months or a history of GI perforation or fistula, thyroid disease, had recent surgery or scheduled for surgery. Do not use in patients who are pregnant or planning to become pregnant; the drug can cause fetal harm. Women of childbearing potential should be advised to avoid becoming pregnant, and both males and females should use adequate birth control during treatment. It is not known if sorafenib passes into breast milk; do not breastfeed while taking this medication. This drug has not been approved for use in children. Storage

Store tablets at room temperature; protect from moisture.

#### Administration

Administer sorafenib orally without food (at least 1 h before or 2 h after a meal). Treatment is continued until clinical benefit no longer realized, or unacceptable toxicity occurs.

#### Sotalol

soe'ta-lole Betapace, Betapace AF, Sorine Do not confuse sotalol with Stadol.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (D if used in second or third trimester)

**Classification:** Cardiovascular agents; antiarrhythmics, class III; adrenergic β-blockers

#### **MECHANISM OF ACTION**

A  $\beta$ -adrenergic blocking agent that prolongs action potential, effective refractory period, and QT interval. Decreases heart rate and AV node conduction; increases AV node refractoriness. *Therapeutic Effect:* Produces antiarrhythmic activity.

#### PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: None. Widely distributed. Excreted primarily unchanged in urine. Removed by hemodialysis. *Half-life:* 12 h (increased in elderly patients and in patients with impaired renal function).

#### AVAILABILITY

*Tablets (Betapace, Sorine):* 80 mg, 120 mg, 160 mg, 240 mg. *Tablets (Betapace AF):* 80 mg, 120 mg, 160 mg. *Solution for Injection:* 150 mg/10 mL.

#### INDICATIONS AND DOSAGES > Documented, life-threatening ventricular arrhythmias PO

*Adults, Elderly.* Initially, 80 mg twice a day. May increase gradually at 2- to

Sotalol (Generic Name)

3-day intervals. Range: 240-320 mg/day in 2 divided doses. *Children, Infants.* The manufacturer provides detailed dosing instructions based on BSA to individualize dosing.

# Maintenance (delay in time to recurrence) for A Fib/A Flutter currently in sinus rhythm PO (BETAPACE AF)

*Adults, Elderly.* Initially, 80 mg twice a day. This dose may be all that is needed in many patients. If needed, may increase up to 120 mg twice daily after 3 days. Maximum: 160 mg twice daily.

#### Conversion from oral to IV dosing if needed

IV Adult, Elderlv.

PO Dose	IV Dose
80 mg	75 mg
120 mg	112.5 mg
160 mg	150 mg

#### Dosage in renal impairment

Dosage interval is modified based on creatinine clearance and formulation used. See manufacturer specific recommendations.

Creatinine Clearance (mL/min)	Dosage Interval	
30-59	24 h	
10-29*	36-48 h	
< 10	Individualized	

\* If afib, do not use if < 40 mL/min

#### **OFF-LABEL USES**

Maintenance of normal heart rhythm in chronic or recurring atrial fibrillation or flutter.

#### CONTRAINDICATIONS

Hypersensitivity, sinus bradycardia (< 50 bpm), sick sinus syndrome or 2nd- and 3rd-degree AV block (unless functioning pacemaker present), congenital or acquired long QT syndrome, QT interval > 450 msec, cardiogenic shock, uncontrolled CHF, hypokalemia (< 4 mEq/L), bronchial asthma.

# INTERACTIONS

#### Drug

**Calcium channel blockers:** May increase effect on AV conduction and BP.

**Clonidine:** May potentiate rebound hypertension after clonidine is discontinued.

**Digoxin:** May increase risk of proarrhythmias.

**Insulin, oral hypoglycemics:** May mask signs of hypoglycemia and prolong the effects of insulin and oral hypoglycemics.

Other  $\beta$ -blockers: Additive effects on cardiac conduction; avoid.

QT-prolonging agents e.g., [Class IA and Class III antiarrhythmics (amiodarone, flecainide, propafenone) previously mentioned, alfuzosin, cisapride, clarithromycin, droperidol, erythromycin, haloperidol, methadone, certain phenothiazines (chlorpromazine, mesoridazine, and thioridazine), pimozide, tricyclic antidepressants, ziprasidone]

Additive QT effects; some drugs are contraindicated.

**Sympathomimetics:** May inhibit the effects of sympathomimetics.

Herbal

Ephedra: May worsen arrhythmias. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood glucose, serum alkaline phosphatase, serum LDH, serum lipoprotein, AST (SGOT), ALT (SGPT), and serum triglyceride levels.

#### SIDE EFFECTS

#### Frequent

Diminished sexual function, drowsiness, insomnia, unusual fatigue or weakness.

#### Occasional

Depression, cold hands or feet, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting.

#### Rare

Altered taste; dry eyes; itching; numbness of fingers, toes, or scalp.

#### SERIOUS REACTIONS

• Bradycardia, congestive heart failure (CHF), hypotension, bronchospasm, hypoglycemia, prolonged QT interval, torsades de pointes, ventricular tachycardia, and premature ventricular complexes may occur.

#### **PRECAUTIONS & CONSIDERATIONS**

Note the differences in indications and usage of Betapace and Sorine versus Betapace AF.

Because sotalol can cause OT prolongation and thus ventricular arrhythmias, do not initiate in patients with QT prolongation. Correct electrolyte imbalances prior to treatment and avoid use with drugs that may also prolong the QT interval. Caution is warranted with cardiomegaly, CHF, diabetes mellitus, history of ventricular tachycardia, hypokalemia, hypomagnesemia, severe and prolonged diarrhea, and those at risk for developing thyrotoxicosis. Sotalol crosses the placenta and is excreted in breast milk. The safety and efficacy of sotalol have not been established in children with organ dysfunction. In elderly patients, age-related peripheral vascular disease may increase susceptibility to decreased peripheral circulation. Tasks that require mental alertness or motor skills should be avoided.

Monitor BP for hypotension and pulse for bradycardia during treatment. If pulse rate is 55 beats/min or lower or systolic BP is < 90 mm Hg, withhold the medication and contact the physician. Continuous cardiac monitoring should be performed when beginning sotalol therapy. Signs and symptoms of CHF should also be assessed. Serum electrolytes should be routinely monitored.

#### Storage

Store tablets at room temperature protected from humidity. The compounded oral solution is stable for 3 mo when stored at controlled room temperature.

#### Administration

Take sotalol without regard to food. Do not abruptly discontinue the drug.

The manufacturer provides for an oral solution that may be extemporaneously prepared. Shake well prior to each use.

For IV use, see manufacturer's literature. Must dilute as an IV infusion and dose is infused using an infusion pump over 5 h. Appropriate diluents are 0.9% NaCl, D5W, or Lactated Ringer's injection.

# Spinosad

spi'noh-sad ★ 👾 Natroba

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Anti-infectives, topical, pediculicides

#### **MECHANISM OF ACTION**

Spinosad causes neuronal excitation in insects. This hyperexcitation leads to paralysis and death of lice. *Therapeutic Effect:* Pediculocidal.

# PHARMACOKINETICS

There is minimal absorption after topical application; spinosad levels are below detectable sample limits. Topical absorption may be increased over areas of damaged skin.

# AVAILABILITY

Topical Suspension: 0.9% (Natroba).

# INDICATIONS AND DOSAGES Head lice

TOPICAL

Adults, Children 4 yr and older. Apply a sufficient amount to cover scalp and hair. Leave on for 10 min and then rinse off. May repeat application in 7 days after initial treatment if live lice are still present.

#### CONTRAINDICATIONS

Do not use in infants younger than 6 months or neonates as there is potential for benzyl alcohol toxicity (benzyl alcohol is a formulation component). Hypersensitivity to any component of the formulation.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent to Occasional (>1%)

Skin irritation (itching, redness/ hyperemia); eye stinging or redness. Rare (< 1%)

Application site dryness, skin exfoliation, skin dryness, rash.

#### SERIOUS REACTIONS

• Toxicity usually only occurs significant oral ingestions. Seek medical attention if ingested.

#### **PRECAUTIONS & CONSIDERATIONS**

No age-related precautions have been noted for suspension or topical use in children over 4 yr of age. Do not use in infants, especially in neonates, who are susceptible to benzyl alcohol, which may cause a gasping syndrome and other toxicities. Other agents are usually preferred during pregnancy and lactation. Keep out of reach of children; children receiving treatment should be in supervision of an adult during each treatment application period. Use care to avoid eye exposure during use. If the eyes come in contact with the suspension, flush the eyes immediately for several minutes with water. If irritation persists, contact physician. Watch for signs of contact/allergy during applications. Because lice are contagious, use caution to avoid infecting others. To help prevent the spread of lice from one patient to another: Avoid headto-head contact at school (e.g., on the playground, in physical education or sports activities, and any play with other children). Avoid sleepovers. Do not share combs, brushes, hats, towels, pillows, bedding, helmets, or other hair-related personal items with anyone else, whether they have lice or not. After finishing treatment, check everyone in the family for lice after 1 wk. Family members or close contacts may also require treatment. Machine wash any bedding and clothing used by anyone having lice or thought to have been exposed to lice. Machine wash at high temperatures (150° F) and tumble in a hot dryer for 20 min. Storage

Store in a dry place at room temperature; do not freeze.

#### Administration

For external use only. Shake well before use. Caregivers may wish to wear gloves for application. Patient should cover face and eyes with a towel and keep eyes tightly closed during application. Scalp and hair should be dry prior to application. Apply a sufficient amount to adequately cover scalp and hair. Use care to avoid contact with eyes and mucous membranes. Pay particular attention to the back of the head and neck. Leave on for 10 min then thoroughly rinse off with warm water. Wash hands immediately after the application process is complete. Use a fine-tooth (nit) comb to remove dead lice and eggs. If lice are still present after 7 days, repeat with a second application. Further treatment is generally not necessary. Other family members should be evaluated by a physician to determine if infested, and if so, receive treatment.

# Spironolactone

speer-on-oh-lak'tone ★ Aldactone ♪ Novo-Spiroton Do not confuse Aldactone with Aldactazide.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in pregnancy-induced hypertension)

**Classification:** Diuretics, potassium sparing

# **MECHANISM OF ACTION**

A potassium-sparing diuretic that interferes with sodium reabsorption by competitively inhibiting the action of aldosterone in the distal tubule, thus promoting sodium and water excretion and increasing potassium retention. *Therapeutic Effect:* Produces diuresis; lowers BP; diagnostic aid for primary aldosteronism.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	24-48 h	48-72 h	48-72 h

Well absorbed from the GI tract (absorption increased with food). Protein binding: 91%-98%. Metabolized in the liver to active metabolite. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 1.3-2 h (metabolite, 10-35 h).

# AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg.

#### INDICATIONS AND DOSAGES • Edema or the treatment of ascites

 Edema or the treatment of ascites due to cirrhosis
 PO

Adults, Elderly. 25-200 mg/day as a single dose or in 2 divided doses. Children (unlabeled use).

1.5-3.3 mg/kg/day once daily or in 2-4 divided doses.

*Neonates (unlabeled use).* 1-3 mg/ kg/day in 1-2 divided doses once daily or in 2-4 divided doses.

#### CHF, severe with ACEI and loop diuretic

Adults. 12.5-25 mg/day. Maximum: 50 mg/day.

#### Hypertension PO

*Adults, Elderly.* 50-100 mg/day in 1-2 doses/day. After 2 wks, may be titrated to 200 mg/day in 2-4 divided doses.

Children. 1.5-3.3 mg/kg/day in divided doses.

#### Hypokalemia PO

Adults, Elderly. 25-100 mg/day as a single dose or in 2 divided doses.

#### Primary aldosteronism PO

*Adults, Elderly.* 100-400 mg/day as a single dose or in 2 divided doses.

Spironolactone (Generic Name)

#### Dosage in renal impairment

Dosage interval is modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Dosage Interval	
10-50	Usual dose q24h	
< 10	Avoid use	

# **OFF-LABEL USES**

Treatment of female hirsutism, polycystic ovary disease, indications in children.

#### CONTRAINDICATIONS

Acute renal insufficiency, anuria, BUN and serum creatinine levels more than twice normal values, hyperkalemia.

#### INTERACTIONS

#### Drug

ACE inhibitors (such as captopril), drospirenone, eplerenone, potassium-containing medications, potassium supplements: May increase the risk of hyperkalemia. Anticoagulants, heparin: May decrease the effects of these drugs. Digoxin: May increase the half-life of digoxin.

# **Lithium:** May decrease the clearance and increase the risk of toxicity of lithium.

**NSAIDs:** May decrease the antihypertensive effect of spironolactone.

#### Herbal

Natural licorice: May increase mineralocorticoid effects of spironolactone.

#### Food

Salt substitutes or diet rich in potassium should normally be avoided.

# DIAGNOSTIC TEST EFFECTS

May increase urinary calcium excretion; BUN and blood glucose levels; serum creatinine, magnesium, potassium, and uric acid levels. May decrease serum sodium level.

Sporadic reports of interference with some digoxin assays.

# SIDE EFFECTS

#### Frequent

Hyperkalemia (in patients with renal insufficiency and those taking potassium supplements), dehydration, hyponatremia, lethargy. Occasional

Nausea, vomiting, anorexia, abdominal cramps, diarrhea, headache, ataxia, somnolence, confusion, fever. Male: Gynecomastia, impotence, decreased libido. Female: Menstrual irregularities (including amenorrhea and postmenopausal bleeding), breast tenderness.

#### Rare

Rash, urticaria, hirsutism.

# SERIOUS REACTIONS

• Severe hyperkalemia may produce arrhythmias, bradycardia, and ECG changes (tented T waves, widening QRS complex, and ST segment depression). These may proceed to cardiac standstill or ventricular fibrillation.

• Cirrhosis patients are at risk for hepatic decompensation if dehydration or hyponatremia occurs.

 Patients with primary aldosteronism may experience rapid weight loss and severe fatigue during high-dose therapy.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hyponatremia, hepatic or renal impairment, dehydration, and concurrent use of potassium supplements. An active metabolite of spironolactone is excreted in breast milk. Breastfeeding is not recommended for patients taking this drug. Safety and efficacy not established in children. Elderly patients may be more susceptible to hyperkalemia. In addition, age-related renal impairment may require cautious use in this age group. Avoid foods high in potassium, such as apricots, bananas, legumes, meat, orange juice, raisins, whole grains, including cereals, and white and sweet potatoes. Also, avoid performing tasks that require mental alertness or motor skills until response to the drug has been established.

An increase in the frequency and volume of urination may occur. Notify the physician of an irregular heartbeat, diarrhea, muscle twitching, cold and clammy skin, confusion, drowsiness, dry mouth, or excessive thirst. BP, vital signs, electrolytes, and intake and output should be monitored before and during treatment. Be especially alert for evidence of hyperkalemia, such as arrhythmias, colic, diarrhea, and muscle twitching, followed by paralysis and weakness. Also be aware signs of hyponatremia may result in cold and clammy skin, confusion, and thirst. Storage

# Store tablets at room temperature. Administration

Take spironolactone with food to enhance its absorption. Crush scored tablets as needed. The drug's therapeutic effect takes several days to begin and can last for several days once the drug is discontinued.

Stavudine (d4T) stav'yoo-deen

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Antiretrovirals, nucleoside reverse transcriptase inhibitors

#### **MECHANISM OF ACTION**

Inhibits HIV reverse transcriptase by terminating the viral DNA chain. Also inhibits RNA- and DNA-dependent DNA polymerase, an enzyme necessary for HIV replication. *Therapeutic Effect:* Impedes HIV replication, slowing the progression of HIV infection.

#### PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Undergoes minimal metabolism. Excreted in urine. *Half-life*: 1.2-1.6 h (increased in renal impairment).

#### AVAILABILITY

Capsules: 15 mg, 20 mg, 30 mg, 40 mg. Oral Solution: 1 mg/mL.

#### INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals) PO

Adults, Children weighing  $\geq 60$  kg. 40 mg twice a day. Adults weighing < 60 kg. 30 mg twice a day. Children weighing  $\geq 30-60$  kg. 30 mg twice a day. Children weighing < 30 kg. 1 mg/kg twice a day. Neonates (< 14 days old). 0.5 mg/kg every 12 h.

#### HIV infection in patients with a recent history and complete resolution of peripheral neuropathy or elevated liver function test results (50% of recommended dose)

Adults weighing  $\geq 60$  kg. 20 mg twice a day. Adults weighing < 60 kg. 15 mg twice a day.

#### Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance and patient weight.

Stavudine (d4T) (Generic Name)

Creatinine Clearance (mL/min)	Weight ≥ 60 kg	Weight < 60 kg
> 50	40 mg q12h	30 mg q12h
26-50	20 mg q12h	15 mg q12h
10-25	20 mg q24h	15 mg q24h Note: Administer after hemo- dialysis dose on day of dialysis

#### CONTRAINDICATIONS

Hypersensitivity to the drug. Do not give with didanosine due to increase in toxicity, such as serious and potentially fatal pancreatitis.

#### INTERACTIONS

#### Drug

# Ethambutol, isoniazid, lithium, phenytoin, zalcitabine: May

increase the risk of peripheral

neuropathy development.

**Hydroxyurea:** May increase the risk of hepatotoxicity.

**Doxorubicin, zidovudine:** May have antagonistic antiviral effect.

#### Herbal

None known.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Commonly increases AST (SGOT) and ALT (SGPT) levels. May decrease leukocyte or neutrophil count; may see increased mean corpuscular volume (MCV) if macrocytosis is present.

#### SIDE EFFECTS

#### Frequent

Headache (55%), diarrhea (50%), chills and fever (38%), nausea and vomiting, myalgia (35%), rash (33%), asthenia (28%), insomnia, abdominal pain (26%), anxiety (22%), arthralgia (18%), back pain (20%), diaphoresis (19%), malaise (17%), depression (14%).

#### Occasional

Anorexia, weight loss, nervousness, dizziness, conjunctivitis, dyspepsia, dyspnea, redistribution/accumulation of body fat, including "buffalo hump." **Rare** 

Constipation, vasodilation, confusion, migraine, urticaria, abnormal vision, leukopenia, lipodystrophy, macrocytosis.

# SERIOUS REACTIONS

• Peripheral neuropathy (numbness, tingling, or pain in the hands and feet) occurs in 15%-21% of patients.

 Ulcerative stomatitis (erythema or ulcers of oral mucosa, glossitis, gingivitis), pneumonia, and benign skin neoplasms occur occasionally.

 Pancreatitis and lactic acidosis occur rarely, as does hepatic steatosis, but all may result in hospitalization or death.

#### PRECAUTIONS & CONSIDERATIONS

Patients with resistance to zidovudine may also have resistance to stavudine. Stavudine is always used in conjunction with other antiretroviral drugs. Caution is warranted in patients with a history of peripheral neuropathy or liver or renal impairment, especially those with chronic active hepatitis. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. No age-related precautions have been noted in children. There is no information on the effects of this drug's use in elderly patients. Avoid taking any medications, including over-the-counter (OTC) drugs, without first notifying the physician. Stavudine is not a cure for HIV infection, nor does it reduce risk of transmission to others, and illnesses, including opportunistic infections, may develop.

Check baseline laboratory test results, if ordered, especially liver function test results, before beginning stavudine therapy and at periodic intervals during therapy. Monitor for signs and symptoms of peripheral neuropathy, which is characterized by numbness, pain, or tingling in the feet or hands. Be aware that peripheral neuropathy symptoms resolve promptly if stavudine therapy is discontinued. Also, know that symptoms may worsen temporarily after the drug is withdrawn. If symptoms resolve completely, expect to resume drug therapy at a reduced dosage. Assess for dizziness, headache, muscle or joint aches, myalgia, weight loss, conjunctivitis, nausea, and vomiting. Monitor for evidence of a rash and signs of chills or a fever. Determine sleep pattern and pattern of daily bowel activity and stool consistency. Storage

Store capsules at room temperature. Reconstitute and dispense the oral solution in original container and keep tightly closed in a refrigerator; do not freeze. Discard any unused portion after 30 days.

#### Administration

Take without regard to meals. If oral solution is used, it should be shaken vigorously before use. Continue stavudine therapy for the full length of treatment and evenly space doses around the clock.

Streptomycin strep-toe-mye'sin

CATEGORY AND SCHEDULE Pregnancy Risk Category: D

*Classification:* Antibiotics, aminoglycosides, antimycobacterials

#### **MECHANISM OF ACTION**

An aminoglycoside that binds directly to the 30S ribosomal subunits causing a faulty peptide sequence to form in the protein chain. *Therapeutic Effect:* Inhibits bacterial protein synthesis.

## AVAILABILITY

Injection: 1 g.

# INDICATIONS AND DOSAGES

#### Tuberculosis IM Adults. 15 mg/kg/day. Maximum: 1 g/day. Elderly. 10 mg/kg/day. Maximum: 750 mg/day. Children. 20-40 mg/kg/day. Maximum: 1 g/day.

NOTE: May also give as directly observed therapy 2-3 times/wk.

Other indications for adults:

Brucellosis, endocarditis, *Mycobacterium avium* complex, plague, tularemia, given every 12 h; dose and duration depends on indication.

# Dosage in renal impairment

Creatinine Clearance (mL/min)	Dosage Interval
10-50	q24-72h
< 10	q72-96h

#### **OFF-LABEL USES**

Plague, tularemia, resistant enterococcal endocarditis.

#### CONTRAINDICATIONS

Hypersensitivity to streptomycin; clinically significant hypersensitivity to other aminoglycosides may contraindicate use due to cross-sensitivity.

#### INTERACTIONS

#### Drug

#### Amphotericin, loop diuretics:

May increase the nephrotoxicity of streptomycin.

Neuromuscular blockers: May increase the effects of streptomycin. Herbal and Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

Increased BUN and serum creatinine may occur.

#### SIDE EFFECTS

#### Occasional

Hypotension, drowsiness, headache, drug fever, paresthesia, rash, nausea, vomiting, anemia, arthralgia, weakness, tremor.

#### SERIOUS REACTIONS

 Nephrotoxicity (as evidenced by increased BUN and serum creatinine levels and decreased creatinine clearance) may be reversible if the drug is stopped at the first sign of nephrotoxic symptoms.

• Irreversible ototoxicity (manifested as tinnitus, dizziness, ringing or roaring in the ears, and impaired hearing) and neurotoxicity (as evidenced by headache, dizziness, lethargy, tremor, and visual disturbances) occur occasionally.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with tinnitus, vertigo, neuromuscular disorders, and renal impairment. Before giving streptomycin, determine whether hypersensitive to aminoglycosides, pregnant, or being treated for other medical conditions such as myasthenia gravis or parkinsonism. Streptomycin can cause fetal harm (ototoxicity) when administered to a pregnant woman and readily crosses the placental barrier. Discontinuation of breastfeeding is recommended during use. Hearing, renal function, and serum concentrations of streptomycin should be monitored. If symptoms of hearing loss, dizziness, or fullness or roaring in the ears occur, notify the physician.

#### Storage

Store unopened vials at room temperature protected from light. Reconstituted infusions should also be protected from light.

#### Administration

For IM use, inject streptomycin deep into a large muscle mass. Be aware that for patients who are unable to tolerate IM injections, streptomycin may be given as an IV infusion over 30-60 min. (Dilute desired dose in at least 100 mL NS.)

#### Succimer

sux′sim-mer ★ Chemet

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antidotes, chelators

#### **MECHANISM OF ACTION**

An analog of dimercaprol that forms water-soluble chelates with heavy metals, which are excreted renally. *Therapeutic Effect:* Treats lead intoxication in children.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Extensively metabolized. Excreted in feces (39%), urine (9%-25%), and lungs (1%). Removed by hemodialysis. *Half-life:* 2 h-2 days.

Succimer (Generic Name), Chemet (Brand Name)

# AVAILABILITY

Capsules: 100 mg (Chemet).

#### INDICATIONS AND DOSAGES

 Lead poisoning, in pediatric patients with blood lead levels > 45 mcg/dL PO

*Children 12 mo and older.* 10 mg/kg q8h for 5 days, then 10 mg/kg q12h for 14 days. Maximum: 500 mg/dose. Repeat treatment may be needed. Wait 2 wks between courses.

# **OFF-LABEL USES**

Lead poisoning in adults, arsenic intoxication, mercury intoxication.

#### CONTRAINDICATIONS

Hypersensitivity to succimer or any component of its formulation.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May decrease serum creatine phosphokinase and serum uric acid measurements. May cause falsepositive results for urinary ketones using nitroprusside reagents such as Ketostix.

#### SIDE EFFECTS

#### Occasional

Anorexia, diarrhea, nausea, vomiting, rash, odor to breath and urine, increased liver function tests.

#### Rare

Neutropenia.

#### SERIOUS REACTIONS

• Elevated blood lead levels and symptoms of intoxication may occur after succimer therapy because of redistribution of lead from bone to soft tissues and blood.

• Elevated liver function tests have been reported.

### **PRECAUTIONS & CONSIDERATIONS**

Do not use for lead-induced encephalopathy. Use caution in patients with hepatic or renal impairment. It is unknown whether succimer is distributed in breast milk. Safety and efficacy have not been established in children younger than 12 mo. Plasma lead levels should be monitored and kept < 15 mcg/dL.

Sulfurous odor to breath and urine may occur but will subside when succimer is discontinued.

# Storage

Store at controlled room temperature and avoid excessive heat.

#### Administration

Keep in mind that succimer is not a substitute for effective abatement of lead exposure. Capsules may be opened and contents sprinkled onto soft food. Make sure all food is eaten. Capsule contents may also be placed on a spoon and followed by a fruit drink.

# Sucralfate

soo-kral'fate Carafate Apo-Sucralate, Novo-Sucralate, Sulcrate Do not confuse Carafate with Cafergot.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

Classification: Gastrointestinals,

mucosal protectants

#### **MECHANISM OF ACTION**

An antiulcer agent that forms an ulcer-adherent complex with proteinaceous exudate, such as

Sucralfate (Generic Name)

albumin, at the ulcer site. Also forms a viscous, adhesive barrier on the surface of intact mucosa of the stomach or duodenum. *Therapeutic Effect:* Protects damaged mucosa from further destruction by absorbing gastric acid, pepsin, and bile salts.

#### PHARMACOKINETICS

Minimally absorbed from the GI tract. Eliminated in feees, with small amount excreted in urine. Not removed by hemodialysis.

#### AVAILABILITY

Oral Suspension: 500 mg/5 mL. Tablets: 1 g.

# INDICATIONS AND DOSAGES Active duodenal ulcers

PO

*Adults, Elderly.* 1 g 4 times a day (before meals and at bedtime) for up to 8 wks.

# Maintenance therapy after healing of acute duodenal ulcers PO

Adults, Elderly. 1 g twice a day.

#### **OFF-LABEL USES**

Prevention and treatment of stressrelated mucosal damage, especially in acutely or critically ill patients; treatment of gastric ulcer and treatment of gastroesophageal reflux disease.

#### CONTRAINDICATIONS

Hypersensitivity.

#### INTERACTIONS Drug

Antacids: May interfere with binding of sucralfate. Tetracyclines, thyroid hormone replacements, digoxin, phenytoin, quinolones, such as ciprofloxacin, theophylline: May decrease the absorption of these drugs. Separate times of administration by at least 2-3 h to avoid interactions. Herbal None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

Frequent (2%) Constipation. Occasional (< 2%)

Dry mouth, backache, diarrhea, dizziness, somnolence, nausea, indigestion, rash, hives, itching, abdominal discomfort.

Reports of hyperglycemia with suspension use.

#### SERIOUS REACTIONS

• Esophageal or intestinal bezoar (very rare).

#### PRECAUTIONS & CONSIDERATIONS

Use suspension with caution in patients with diabetes since it may increase blood sugar. Use with caution in patients with renal failure due to impaired aluminium elimination. It is unknown whether sucralfate crosses the placenta or is distributed in breast milk. Safety and efficacy of sucralfate have not been established in children. No agerelated precautions have been noted in elderly patients.

Dry mouth may occur, so take sips of tepid water or suck on sour hard candy to relieve it. Before sucralfate administration, the abdomen should be assessed for signs of tenderness, rigidity, and the presence of bowel sounds. Pattern of daily bowel activity and stool consistency should be monitored throughout therapy.

#### Storage

Store at room temperature; protect tablets from moisture to avoid crumbling.

#### Administration

Take 1 h before meals on an empty stomach and at bedtime.

Shake suspension well before each use.

Tablets may be crushed or dissolved in water. Do not take antacids within 30 min of sucralfate. Make sure to seperate sucralfate dose from administration of other critical medications to eliminate interactions.

# Sulfacetamide

sul-fa-see'ta-mide Bleph-10, Carmol, Klaron, Mexar, Ovace Ak-Sulf, Bleph-10, Diosulf, Sodium Sulamyd

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Anti-infectives, ophthalmics, antibiotics, sulfonamides

#### **MECHANISM OF ACTION**

Interferes with synthesis of folic acid that bacteria require for growth. *Therapeutic Effect:* Prevents further bacterial growth. Bacteriostatic.

#### PHARMACOKINETICS

Small amounts may be absorbed into the cornea. Excreted rapidly in urine. *Half-life:* 7-13 h.

#### AVAILABILITY

Lotion: 10% (Carmol, Klaron, Ovace). Ophthalmic Ointment: 10%. Ophthalmic Solution: 10% (Bleph-10). Shampoo, Topical Gel, Topical Foam, Topical Solutions, Soaps: 10%.

# INDICATIONS AND DOSAGES

Treatment of corneal ulcers, conjunctivitis, and other superficial infections of the eye, prophylaxis after injuries to the eye/removal of foreign bodies, adjunctive therapy for trachoma and inclusion conjunctivitis

OPHTHALMIC

Adults, Elderly. Ointment: Apply small amount in lower conjunctival sac 1-4 times/day and at bedtime. Solution: 1-3 drops to lower conjunctival sac q2-3h.

 Seborrheic dermatitis, seborrheic sicca (dandruff), secondary bacterial skin infections TOPICAL

Adults, Elderly. Apply 1-4 times/day.

#### **OFF-LABEL USES**

Treatment of bacterial blepharitis, blepharoconjunctivitis, bacterial keratitis, keratoconjunctivitis.

#### CONTRAINDICATIONS

Hypersensitivity to sulfonamides or any component of preparation (some products contain sulfite), use in combination with silver-containing products.

# INTERACTIONS

Drug

#### Silver-containing preparations:

These products are incompatible together.

Herbal None known.

Food None known.

**DIAGNOSTIC TEST EFFECTS** 

None known.

#### SIDE EFFECTS

#### Frequent

Transient ophthalmic burning, stinging. Eye ointment causes temporary blurred vision.

### Occasional

Headache.

#### Rare

Hypersensitivity (erythema, rash, itching, swelling, photosensitivity).

#### SERIOUS REACTIONS

 Superinfection, drug-induced lupus erythematosus, Stevens-Johnson syndrome occur rarely; nephrotoxicity with high systemic absorption (very rare).

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with extremely dry eye. It is unknown if whether sulfacetamide crosses the placenta or is distributed in breast milk. Do not use sulfacetamide during the third trimester of pregnancy. Safety and efficacy of sulfacetamide have not been established in children 2 mo or younger. No age-related precautions have been noted in elderly patients. Be aware that sulfacetamide application of lotion to large infected, denuded, or debrided areas should be avoided.

Sulfacetamide may cause sensitivity to light. Sunglasses should be worn and avoid bright light.

#### Storage

Store at room temperature and protect from light. Discolored solution should not be used.

#### Administration

For ophthalmic use, tilt the head back. Place solution in conjunctival sac. Close eyes, and then press gently on the lacrimal sac for 1 min. Wait at least 10 min before using another eye preparation. For topical treatment, cleanse area before application to ensure direct contact with affected area. Apply at bedtime and allow to remain overnight.

# Sulfasalazine

sul-fa-sal'a-zeen Azulfidine, Azulfidine EN-tabs, Sulfazine EC Salazopyrin, Salazopyrin EN-Tabs Do not confuse Azulfidine with azathioprine, or sulfasalazine with sulfadiazine or sulfisoxazole.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: B (D if given near term)

#### Classification: Disease-

modifying antirheumatic drugs, gastrointestinals, 5-aminosalicylates

#### **MECHANISM OF ACTION**

A sulfonamide that inhibits prostaglandin synthesis, acting locally in the colon. *Therapeutic Effect*: Decreases inflammatory response, interferes with GI secretion.

#### PHARMACOKINETICS

Poorly absorbed from the GI tract. Cleaved in colon by intestinal bacteria, forming sulfapyridine and mesalamine (5-ASA). Absorbed in colon. Widely distributed. Metabolized in the liver. Primarily excreted in urine. *Half-life:* sulfapyridine, 6-14 h; 5-ASA, 0.6-1.4 h.

#### AVAILABILITY

Tablets (Azulfidine): 500 mg.

Sulfasalazine (Generic Name)

Tablets (Delayed Release [Azulfidine EN-tabs, Sulfazine EC]): 500 mg.

# INDICATIONS AND DOSAGES Ulcerative colitis

#### PO

Adults, Elderly. 1 g 3-4 times a day in divided doses q6-8h. Maintenance: 2 g/day in divided doses q6-8h. Maximum: 4 g/day. *Children > 6 yr.* 40-60 mg/kg/day in divided doses q4-6h. Maintenance: 30 mg/kg/day in divided doses q6h. Maximum: 2 g/day.

#### Rheumatoid arthritis PO

*Adults, Elderly.* Initially, 0.5-1 g/day for 1 wk. Increase by 0.5 g/wk, up to 2 g/day in divided doses.

#### Juvenile rheumatoid arthritis PO

*Children* > 6 *yr*. Initially, 10 mg/kg/ day. May increase by 10 mg/kg/day at weekly intervals. Range: 30-50 mg/kg/day. Maximum: 2 g/day.

# **OFF-LABEL USES**

Treatment of ankylosing spondylitis, Crohn's disease with colonic involvement.

#### CONTRAINDICATIONS

Intestinal or urinary obstruction; porphyria; hypersensitivity to sulfasalazine, its metabolites, other 5-aminosalicylates, sulfonamides, or salicylates.

#### INTERACTIONS

#### Drug

Anticonvulsants, methotrexate, oral anticoagulants, oral antidiabetics: May increase the effects of these drugs. Hemolytics: May increase the toxicity of sulfasalazine.

Hepatotoxic medications: May increase the risk of hepatotoxicity.

#### Thioguanine or 6-mercaptopurine:

5-Aminosalicylates may increase sensitivity to myelosuppressive effects.

Herbal

None known. Food None known.

#### **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Frequent (33%)

Anorexia, nausea, vomiting, headache, oligospermia (generally reversed by withdrawal of drug). Occasional (3%)

#### Occasional (3%)

Hypersensitivity reaction (rash, urticaria, pruritus, fever, anemia). Rare (< 1%)

Tinnitus, hypoglycemia, diuresis, photosensitivity.

#### SERIOUS REACTIONS

• Anaphylaxis, Stevens-Johnson syndrome, hematologic toxicity (leukopenia, agranulocytosis), hepatotoxicity, and nephrotoxicity occur rarely.

Rare reports of neurologic/CNS reactions.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with bronchial asthma, G6PD deficiency, blood dyscrasia, impaired hepatic or renal function, or severe allergies. Sulfasalazine may produce infertility and oligospermia in men. Sulfasalazine readily crosses the placenta and is excreted in breast milk. Lactating patients should not breastfeed premature infants or those with hyperbilirubinemia or G6PD deficiency. If given near term, sulfasalazine may produce hemolytic anemia, jaundice, and kernicterus in the newborn. No age-related precautions have been noted in children older than 6 yr or elderly patients. Avoid the sun and ultraviolet light; photosensitivity may last for months after the last dose of sulfasalazine.

Adequate hydration should be maintained (minimum output 1500 mL/24 h) and to prevent nephrotoxicity. Skin should be examined for rash; withhold the drug at the first sign of a rash. Pattern of daily bowel activity and stool consistency should be monitored; drug dosage may need to be increased if disease symptoms are not controlled. Report hematologic effects such as bleeding, ecchymosis, fever, jaundice, pallor, purpura, pharyngitis, and weakness.

#### Storage

Store at room temperature; avoid excessive heat exposure.

#### Administration

Space drug doses evenly at intervals not to exceed 8 h. Administer sulfasalazine after meals, if possible, to prolong intestinal passage. Swallow delayed-release tablets whole without chewing or crushing them. Take the drug with 8 oz of water.

# Sulindac

sul-in'dak ★ Clinoril ♪ Apo-Sulin, Novo Sundac

Do not confuse Clinoril with Clozaril.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs (NSAID)

#### **MECHANISM OF ACTION**

An NSAID that produces analgesic and anti-inflammatory effects by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces inflammatory response and intensity of pain.

#### PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	7 days	2-3	NA
(antirheu-		wks	
matic)			

Well absorbed from the GI tract. Metabolized in liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 7.8 h; metabolite: 16.4 h.

#### AVAILABILITY

Tablets: 150 mg, 200 mg.

#### INDICATIONS AND DOSAGES

# Rheumatoid arthritis, osteoarthritis, ankylosing spondylitis PO

*Adults, Elderly.* Initially, 150 mg twice a day; may increase up to maximum 400 mg/day.

# Acute shoulder pain, gouty arthritis, bursitis, tendinitis

*Adults, Elderly.* 200 mg twice a day. Usually 7-14 days.

#### CONTRAINDICATIONS

Active peptic ulcer disease, chronic inflammation of the GI tract, GI bleeding or ulceration, history of hypersensitivity to aspirin or NSAIDs, within 14 days of coronary artery bypass graft (CABG) surgery.

#### INTERACTIONS

#### Drug

Antihypertensives, diuretics: May decrease the effects of antihypertensives and diuretics.

Sulindac (Generic Name)

#### Aspirin, salicylates,

**corticosteroids:** May increase the risk of GI bleeding and side effects. NSAIDs may negate the cardioprotective effect of ASA. **Cyclosporine:** May increase risk of nephrotoxicity.

Heparin, oral anticoagulants, thrombolytics: May increase the effects of heparin, oral anticoagulants, and thrombolytics. Lithium: May increase the blood concentration and risk of toxicity of lithium.

**Methotrexate, pemetrexed:** May increase the risk of toxicity with methotrexate or pemetrexed.

SSRIs, SNRIs: Increased risk of GI bleeding.

#### Herbal

**Feverfew:** May increase the risk of bleeding.

**Ginkgo biloba:** May increase the risk of bleeding.

#### Food

Alcohol: May increase risk of dizziness, GI bleeding.

#### DIAGNOSTIC TEST EFFECTS

May increase liver function test results and serum alkaline phosphatase level.

#### SIDE EFFECTS

#### Frequent (4%-9%)

Diarrhea or constipation, indigestion, nausea, maculopapular rash, dermatitis, dizziness, headache.

# Occasional (1%-3%)

Anorexia, abdominal cramps, flatulence.

#### SERIOUS REACTIONS

• NSAID-induced peptic ulcer, GI bleeding, gastritis.

• Rare reactions include cholestatis, jaundice, nephrotoxicity, hematologic sensitivity (e.g., leukopenia).

• Severe hypersensitivity reaction (bronchopasm) possible.

#### PRECAUTIONS & CONSIDERATIONS

Cardiovascular event risk may be increased with duration of use of preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures.

Caution is warranted in patients with a history of GI tract disease, hepatic or renal impairment, a predisposition to fluid retention, and concurrent use of anticoagulant therapy. It is unknown whether sulindac is excreted in breast milk. Sulindac should not be used during the third trimester of pregnancy because it might cause adverse effects in the fetus, such as premature closure of the ductus arteriosus. Use with caution during lactation. This medicine is not approved for use in children. The elderly may be more susceptible to GI and CNS side effects. Alertness or motor skills should also be avoided until effects are known.

CBC, especially platelet count, skin for rash, and liver and renal function test results should be assessed before and periodically during therapy. Therapeutic response, such as decreased pain, stiffness, swelling, and tenderness; improved grip strength; and increased joint mobility, should be evaluated.

#### Storage

Store tablets at room temperature. Administration

Take sulindac orally with food, milk, or antacids if GI distress occurs. Therapeutic antiarthritic effect will occur 1-3 wks after therapy begins.
## **Sumatriptan**

soo-ma-trip'tan ★ Alsuma Autoinjector, Imitrex ➡ Imitrex, Imitrex DF Do not confuse sumatriptan with somatropin.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Migraine agents, serotonin receptor agonists

## **MECHANISM OF ACTION**

A serotonin receptor agonist that binds selectively to vascular receptors, producing a vasoconstrictive effect on cranial blood vessels. *Therapeutic Effect:* Relieves migraine headache.

## PHARMACOKINETICS

Route	Onset (min)	Peak (h)	Duration (h)
Nasal	15-30	NA	24-48
PO	30	2	24-48
SC	10	1	24-48

Rapidly absorbed after SC administration. Absorption after PO administration is incomplete, with significant amounts undergoing hepatic metabolism, resulting in low bioavailability (about 14%). Protein binding: 10%-21%. Widely distributed. Undergoes first-pass metabolism in the liver. Excreted in urine. *Half-life*: 2 h.

# AVAILABILITY

Tablets: 25 mg, 50 mg, 100 mg. Injection: 6 mg/0.5 mL. Nasal Spray: 5 mg/spray, 20 mg/spray.

## INDICATIONS AND DOSAGES

Acute migraine attack PO *Adults.* 25-100 mg. Dose may be repeated after at least 2 h. Maximum: 100 mg/single dose; 200 mg/24 h. SC

*Adults.* 6 mg. Maximum: Two 6-mg injections/24 h (separated by at least 1 h).

INTRANASAL

*Adults.* 5 or 10 mg (1 or 2 sprays) into 1 nostril as a single dose or 20 mg into 1 nostril as a single dose. Dose may be repeated after at least 2 h, if needed. Maximum: 40 mg/24 h.

# CONTRAINDICATIONS

Basilar or hemiplegic migraine, cerebrovascular accident, ischemic heart disease (including angina pectoris, history of myocardial infarction [MI], silent ischemia, and Prinzmetal angina), severe hepatic impairment, transient ischemic attack, peripheral vascular disease, uncontrolled hypertension, use within 14 days of MAOIs, use within 24 h of ergotamine preparations or other "triptans."

# INTERACTIONS

Drug

Ergotamine-containing medications: May produce vasospastic reaction. MAOIs: May increase sumatriptan

blood concentration and half-life. Contraindicated.

Serotonin agonists, linezolid, SSRI, or SNRI antidepressants: May increase risk of serotonin syndrome. Do not use other "triptans" or ergot preparations within 24 h.

#### Herbal

St. John's wort: May increase serotonergic effects. Avoid. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

Sumatriptan (Generic Name), Imitrex (Brand Name)

## SIDE EFFECTS

#### Frequent

Oral (5%-10%): Tingling, nasal discomfort.

SC (> 10%): Injection site reactions, tingling, warm or hot sensation, dizziness, vertigo.

Nasal (> 10%): Bad or unusual taste, nausea, vomiting.

#### Occasional

Oral (1%-5%): Flushing, asthenia, visual disturbances.

Subcutaneous (2%-10%): Burning

sensation, numbness, chest

discomfort, drowsiness, asthenia.

Nasal (1%-5%): Nasopharyngeal discomfort, dizziness.

#### Rare

Oral (< 1%): Agitation, eye irritation, dysuria.

Subcutaneous (< 2%): Anxiety, fatigue, diaphoresis, muscle cramps, myalgia.

Nasal (< 1%): Burning sensation.

## SERIOUS REACTIONS

 Excessive dosage may produce tremor, red extremities, reduced respirations, cyanosis, seizures, and paralysis.

 Peripheral vascular ischemia, colonic ischemia, or ocular ischemia with transient or significant partial vision loss occurs rarely.

Hypertensive crisis.

Rare serious hypersensitivity reactions.

 Serious arrhythmias occur rarely, especially in patients with hypertension, diabetes, or a strong family history of coronary artery disease; obese patients; and smokers.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with epilepsy, a hypersensitivity to sumatriptan, and hepatic or renal impairment. Use in pregnancy not recommended unless benefits outweigh risks. Following a single dose, females may breastfeed after 12 h have elapsed. The safety and efficacy of sumatriptan have not been established in children. Use in the elderly not recommended.

Dizziness may occur. Notify the physician immediately if palpitations, a rash, wheezing, pain or tightness in the chest or throat, or facial edema occurs. ECG should be obtained at baseline. Migraines and associated symptoms, including nausea and vomiting, photophobia, and phonophobia (sound sensitivity), should be assessed before and during treatment.

#### Storage

Store tablets, nasal spray, injections at room temperature and protect from light. Do not refrigerate injection or nasal spray.

#### Administration

Swallow oral tablets whole with a full glass of water.

Expect to administer first SC dosage in physician's office if patient has identifiable cardiovascular risk factors. Never give intravenously because this drug may precipitate coronary vasospasm. Patients using autoinjector should be thoroughly instructed in autoinjection technique.

For SC use, follow the manufacturer's instructions for using the autoinjection device. Inject the drug into an area with adequate SC tissue because the needle will penetrate the skin and adipose tissue as deeply as 6 mm. Do not administer more than 2 SC injections during any 24-h period and allow at least 1 h between injections. After injecting the medication, discard the syringe.

For nasal use, each unit contains only one spray, so do not test the spray before use. Blow the nose gently to clear nasal passages. With the head upright, close one of the nostrils with an index finger and breathe gently through the mouth. Insert the nozzle about ½ inch into the open nostril. Close mouth, then breathe through the nose while depressing the blue plunger and releasing the spray. Remove the nozzle from the nose, and gently breathe in through the nose and out through the mouth for 10-20 seconds. Do not breathe in deeply.

# Sunitinib

sue-ni'ti-nib ★ ☆ Sutent Do not confuse with sorafenib.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

### Classification:

Antineoplastics, biologic agents, signal transduction inhibitor

## **MECHANISM OF ACTION**

An oral multikinase inhibitor. The drug inhibits platelet-derived growth factor receptors (PDGFR- $\alpha$  and PDGFR- $\beta$ ), vascular endothelial growth factor receptors (VEGFR-1, VEGFR-2 and VEGFR-3), stem cell factor receptor (Kit), Fms-like tyrosine kinase-3 (FLT-3), colony-stimulating factor receptor Type 1 (CSF-1R), and the glial cell-line derived neurotrophic factor receptor (RET). Several of these kinases are thought to be involved in tumor cell signaling, angiogenesis, and apoptosis. *Therapeutic Effect:* Inhibits tumor growth.

## PHARMACOKINETICS

Food decreases oral absorption. Protein binding: 95%. Sunitinib is metabolized in the liver by CYP3A4. The active metabolite is also metabolized by CYP3A4. Most (61%) of the dose is excreted in the feces and 16% excreted in the urine. *Half-life:* 40-60 h (parent); 80-110 h (metabolite).

## AVAILABILITY

Capsules: 12.5 mg, 25 mg, 50 mg.

## INDICATIONS AND DOSAGES

 Advanced renal cell cancer or gastrointestinal stromal tumor (GIST)
 PO

*Adults, Elderly.* 50 mg once daily for 4 wks on treatment, followed by 2 wks off.

#### Advanced pancreatic neuroendocrine tumors (pNET) PO

*Adults, Elderly.* 37.5 mg once daily with no off periods.

## Dosage adjustment if strong CYP3A4 inhibitors used

Reduce dose by 12.5 mg once daily if an alternate to the CYP3A4 inhibitor cannot be chosen.

▶ Dosage adjustment for toxicity Management of side effects may require temporary interruption and/ or dose reduction. Dose may be adjusted by 12.5 mg up or down as required and tolerated.

## CONTRAINDICATIONS

Hypersensitivity.

# INTERACTIONS

## Drug

**CYP3A4 inhibitors (e.g., ketoconazole, nefazodone, clarithromycin, itraconazole, protease inhibitors for HIV):** Sunitinib levels may increase. Reduce dose if alternate treatment not available.

**CYP3A4 inducers (e.g., rifampin, phenytoin, carbamazepine, phenobarbital):** May increase metabolism of sunitinib and thus decrease sunitinib concentrations; may need dose increase. A maximum of 87.5 mg daily of sunitinib

Sunitinib (Generic Name), Sutent (Brand Name)

should be considered for GIST or a maximum of 62.5 mg daily for pNET; the patient should be monitored carefully for toxicity.

**QT-prolonging agents (e.g., class Ia and III antiarrhythmics):** May have additive effects on QT interval; use caution.

Warfarin: Sunitinib is a competitive inhibitor of CYP2C9 and could possibly alter warfarin response; also independently increases INR; monitor INR.

## Herbal

**St. John's wort:** May increase metabolism of sunitinib and thus decrease sunitinib concentrations; avoid.

## Food

**Grapefruit juice:** Might increase sunitinib levels; avoid.

# **DIAGNOSTIC TEST EFFECTS**

Decreased WBC, platelets. Increased INR, liver enzymes, serum creatinine, amylase, or lipase. Changes in TSH. Electrolyte abnormalities, QT prolongation (rare).

## SIDE EFFECTS

#### **Frequent (> 20%)**

Fatigue, asthenia, fever, diarrhea, nausea, mucositis/stomatitis, vomiting, dyspepsia, abdominal pain, constipation, hypertension, peripheral edema, rash, hand-foot syndrome, skin discoloration, dry skin, hair color changes, hypothyroidism, altered taste, headache, back pain, arthralgia, extremity pain, cough, dyspnea, anorexia, and bleeding.

### Occasional

Chest pain, proteinuria, myalgia, depression, hoarseness, skin erythema or peeling.

#### Rare

Hypertension, difficult wound healing.

## SERIOUS REACTIONS

 Serious hypersensitivity reactions occur rarely, and may include angioedema.

- · Leukopenia, thrombocytopenia.
- · Severe and fatal hepatotoxicity.
- · Adrenal toxicity.
- · Serious bleeding (CNS,

gastrointestinal, hemoptysis, etc.) or GI perforations.

 Chest pain may indicate cardiac ischemia or infarction and requires prompt evaluation.

• Heart failure and QT prolongation are other potentially serious cardiac effects.

· Arterial thrombotic events.

• Hepatotoxicity which may result in liver failure or death.

# PRECAUTIONS & CONSIDERATIONS

Use with caution in patients with hepatic disease, high blood pressure, cardiac disease, heart failure or arrhythmia, a history of stroke, GI disease with GI bleeding in the past 6 months or a history of GI perforation or fistula, thyroid disease, had recent surgery or scheduled for surgery. Do not use in patients who are pregnant or planning to become pregnant; the drug can cause fetal harm. Women of childbearing potential should be advised to avoid becoming pregnant, and both males and females should use adequate birth control during treatment. It is not known if sunitinib passes into breast milk; do not breastfeed while taking this medication. This drug has not been approved for use in children. Storage

Store at room temperature; protect from moisture.

#### Administration

Administer sunitinib orally without regard to food or timing of meals. Do not take with grapefruit juice. Treatment is continued until clinical benefit no longer realized, or unacceptable toxicity occurs.

# **Tacrolimus**

tak-roe-leem'us ★ Prograf, Protopic ▲ Advagraf, Prograf, Protopic Do not confuse Protopic with Protonix, Protopam, Protopin.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

# Classification:

Immunosuppressives, organ transplant agents, topical dermatologics

# **MECHANISM OF ACTION**

An immunologic agent that inhibits T-lymphocyte activation by binding to intracellular proteins, forming a complex, and inhibiting phosphatase activity. *Therapeutic Effect:* Suppresses the immunologically mediated inflammatory response; prevents organ transplant rejection and controls inflammatory skin disorders.

# PHARMACOKINETICS

Variably absorbed after PO administration (food reduces absorption). There is some systemic absorption with topical use, but the drug does not accumulate. Protein binding: 75%-97%. Extensively metabolized in the liver. Excreted in urine. Not removed by hemodialysis. *Half-life:* 11.7 h.

# AVAILABILITY

Capsules (Prograf): 0.5 mg, 1 mg, 5 mg. Injection (Prograf): 5 mg/mL. Ointment (Protopic): 0.03%, 0.1%.

# INDICATIONS AND DOSAGES

 Prevention of liver transplant rejection Adults, Elderly. 0.1-0.15 mg/kg/day in 2 divided doses 12 h apart. *Children*. 0.15-0.2 mg/kg/day in 2 divided doses 12 h apart. IV

*Adults, Elderly, Children.* 0.03-0.05 mg/kg/day as a continuous infusion.

# Prevention of kidney transplant rejection

PO

Adults, Elderly. 0.2 mg/kg/day in 2 divided doses 12 h apart.

Adults, Elderly. 0.03-0.05 mg/kg/day as continuous infusion.

#### • Atopic dermatitis TOPICAL

Adults, Elderly, Children 2 yr and older. Apply 0.03% ointment to affected area twice a day; 0.1% ointment may be used in adolescents >15 yr, adults, and elderly patients. Continue until 1 wk after symptoms have cleared.

# **OFF-LABEL USES**

Prevention of organ rejection in patients receiving allogeneic bone marrow, heart, pancreas, pancreatic island cell, or small-bowel transplant; treatment of autoimmune disease; severe recalcitrant psoriasis.

# CONTRAINDICATIONS

Concurrent use with cyclosporine (increases the risk of nephrotoxicity), hypersensitivity to HCO-60 polyoxyl 60 hydrogenated castor oil (used in solution for injection), hypersensitivity to tacrolimus.

# INTERACTIONS

Aminoglycosides, amphotericin B, cisplatin: Increase the risk of renal dysfunction.

Antacids: Decrease the absorption of tacrolimus.

Tacrolimus (Generic Name), Prograf (Brand Name)

Antifungals, bromocriptine, calcium channel blockers, cimetidine, clarithromycin, cyclosporine, danazol, diltiazem, erythromycin, methylprednisolone, metoclopramide, voriconazole: Increase tacrolimus blood concentration.

Carbamazepine, phenobarbital, phenytoin, rifamycin: Decrease tacrolimus blood concentration. Cyclosporine: Increases the risk of nephrotoxicity. Do not use within 24 h of each other.

**Live-virus vaccines:** May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine.

**Other immunosuppressants:** May increase the risk of infection or lymphomas.

## Herbal

St. John's wort, echinacea: May decrease the effects of tacrolimus. Food

**Grapefruit, grapefruit juice:** May alter the effects of the drug. **High-fat food:** May decrease the absorption.

## DIAGNOSTIC TEST EFFECTS

May increase blood glucose, BUN, and serum creatinine levels, as well as WBC count. May decrease serum magnesium level and RBC and thrombocyte counts. May alter serum potassium level.

# IV INCOMPATIBILITIES

Due to chemical instability of tacrolimus in alkaline media, the injection should not be mixed or co-infused with solutions of pH 9 or greater (e.g, ganciclovir or acyclovir).

# 🗏 IV COMPATIBILITIES

Calcium gluconate, dexamethasone (Decadron), diphenhydramine

(Benadryl), dobutamine (Dobutrex), dopamine (Intropin), furosemide (Lasix), heparin, hydromorphone (Dilaudid), insulin, leucovorin, lorazepam (Ativan), morphine, nitroglycerin, potassium chloride.

## SIDE EFFECTS

## Frequent (> 30%)

Headache, tremor, insomnia, paresthesia, diarrhea, nausea, constipation, vomiting, abdominal pain, hypertension.

#### Occasional (10%-29%)

Rash, pruritus, anorexia, asthenia, peripheral edema, photosensitivity.

## SERIOUS REACTIONS

 Increased risk of infection, including serious infections such as sepsis.

- Nephrotoxicity (characterized by increased serum creatinine level and decreased urine output), neurotoxicity (including tremor, headache, and mental status changes), and pleural effusion are common adverse reactions.
- Thrombocytopenia, leukocytosis, anemia, atelectasis, occasionally.

• Rare cases of malignancy (e.g., nonmelanoma skin cancers and lymphoma) have been reported, even with topical use.

· Post-transplant diabetes mellitus.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with immunosuppression and hepatic or renal impairment. Tacrolimus crosses the placenta and is distributed in breast milk. Women taking this drug should not breastfeed. Hyperkalemia and renal dysfunction have been noted in neonates. Post-transplant lymphoproliferative disorder is more common in children, especially children younger than 3 yr. Do not use topical form in children under 2 yr of age. Agerelated renal impairment may require a dosage adjustment in elderly patients. Avoid crowds and people with infection. Also avoid exposure to sunlight and artificial light because these may cause a photosensitivity reaction.

Notify the physician of change in mental status, chest pain, dizziness, headache, decreased urination, rash, respiratory infection, or unusual bleeding or bruising. CBC should be monitored weekly during the first month of therapy, twice monthly during the second and third months of treatment, then monthly for the rest of the first year. Liver function test results and serum creatinine and potassium levels should also be assessed.

#### Storage

Store capsules and unopened vials at room temperature. Avoid exposure of all products to extremes of heat or cold; do not freeze.

Store the diluted infusion in a glass or polyethylene containers and discard after 24 h. Do not store it in a polyvinyl chloride container because the container may absorb the drug or affect its stability.

### Administration

! If unable to take capsules, initiate therapy with IV infusion. Give oral dose 8-12 h after discontinuing IV infusion. Titrate dosage based on clinical assessments of rejection and tolerance. With hepatic or renal impairment, give the lowest IV and oral doses, as prescribed. Plan to delay administration for 48 h or longer with postoperative oliguria.

Take oral tacrolimus on an empty stomach at the same time each day. If GI intolerance occurs, be consistent with taking oral tacrolimus with regard to timing and type of meal. Notify the physician if a dose is missed. Do not give this drug with grapefruit or grapefruit juice or within 2 h of antacids.

Keep oxygen and an aqueous solution of epinephrine 1:1000 available at the bedside before beginning the IV infusion. Dilute the drug with 250-1000 mL 0.9% NaCl or D5W, depending on the desired dose, to provide a concentration of 4-20 mcg/ mL. Administer tacrolimus as a continuous IV infusion. Monitor continuously for the first 30 min of the infusion and at frequent intervals thereafter. Stop the infusion immediately at the first sign of a hypersensitivity reaction.

Tacrolimus ointment is for external use only. Rub the ointment gently and completely into clean, dry skin. Do not cover the treated area with an occlusive dressing.

## Tadalafil

ta-dal'a-fil 🗙 🆤 Adcirca, Cialis

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Erectile dysfunction (ED) agents, pulmonary vasodilators, phosphodiesterase-5 enzyme inhibitors

#### MECHANISM OF ACTION

An agent that inhibits phosphodiesterase type 5, the enzyme responsible for degrading cyclic guanosine monophosphate (cGMP) in the corpus cavernosum of the penis or the smooth muscle

Tadalafil (Generic Name), Cialis (Brand Name)

of pulmonary vasculature, resulting in smooth muscle relaxation and increased blood flow. *Therapeutic Effect:* Facilitates an erection in ED, relieves urinary symptoms of benign prostatic hypertrophy (BPH). In pulmonary arterial hypertension (PAH), results in vasodilation in pulmonary vasculature.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	16 min	2 h	36 h

Rapidly absorbed after PO administration. Drug has no effect on penile blood flow without sexual stimulation. Metabolized in liver to inactive metabolites. *Half-life*: 17.5 h. Excreted in feces and urine.

## AVAILABILITY

*Tablets (Cialis):* 2.5 mg, 5 mg, 10 mg. *Tablets (Adcirca):* 20 mg.

# INDICATIONS AND DOSAGES Frectile dysfunction PO

Adults, Elderly. 10 mg 30 min before sexual activity. Dose may be increased to 20 mg or decreased to 5 mg, based on patient tolerance. Daily treatment as 2.5 mg once daily is also an option. Dose may be increased to 5 mg based on patient tolerance. Maximum dosing frequency is once daily.

# Benign prostatic hypertrophy, or concurrent treatment of BPH and ED. PO.

Adults, Elderly. 5mg once daily. > Dosage for ED in renal impairment CrCl 31-50 mL/min: Initially, 5 mg before sexual activity once a day. Maximum is 10 mg no more frequently than once q48h. If taken daily for BPH, initially use 2.5 mg/day. CrCl ≤ 30 mL/min: 5 mg before sexual activity given not more than q72h. Avoid daily use for BPH.

#### Dosage for ED in mild or moderate hepatic impairment (Child-Pugh class A or B)

Limit dose to 10 mg once a day.

 Dosage for ED with concurrent inhibitors of CYP3A4

*Adults.* For use "as needed": Maximum recommended dose is 10 mg given once q72h.

For once daily use: Do not exceed 2.5 mg once daily.

## Pulmonary arterial hypertension (PAH)

PO (ADCIRCA) Adults, Elderly. 40 mg (two 20-mg tablets) once daily.

## Dosage for PAH in renal impairment

CrCl 31-80 mL/min: 20 mg/day initially, and cautiously increase to 40 mg/day if needed/tolerated. CrCl of  $\leq$  30 mL/min: Avoid use for PAH.

# Dosage for PAH in mild or moderate hepatic impairment (Child-Pugh class A or B)

Limit dose to 20 mg once a day.

# CONTRAINDICATIONS

Hypersensitivity to tadalafil, concurrent use of sodium nitroprusside or nitrates in any form, severe hepatic impairment.

# INTERACTIONS

#### Drug

α-Adrenergic blockers, nitrates:
 Potentiate the hypotensive effects of these drugs. Tadalafil contraindicated in patients receiving nitrates.
 α-Blockers (e.g., doxazosin): May produce additive hypotensive effects.
 Strong CY3A4 inhibitors
 (apenavir, atazanavir, azole antifungals, clarithromycin, delavirdine, fosamprenavir, indinavir, isoniazid, nefazodone,

## nelfinavir, ritonavir,

**troleandomycin):** May increase tadalafil blood concentration. Use requires dose adjustments for ED; do not use strong inhibitors with tadalafil for PAH.

## Strong CY3A4 inducers (e.g.,

**rifampin):** Lowers tadalafil levels. Avoid use when tadalafil prescribed for PAH.

## Herbal

**St. John's wort:** May decrease tadalafil levels. Avoid.

#### Food

Alcohol: Increases the risk of orthostatic hypotension.

## DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

### Frequent

The most common effect is headache.

# Occasional

Dyspepsia, back pain, myalgia, nasal congestion, flushing.

## Rare

Dizziness, rash.

## SERIOUS REACTIONS

• Prolonged erections (lasting over 4 h) and priapism (painful erections lasting over 6 h) occur rarely.

- · Decreased eyesight or loss of sight.
- · Sudden decrease or loss of hearing.

• Heart attack, stroke, irregular heartbeats.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with an anatomic deformity of the penis; cardiac, hepatic, or renal impairment; and conditions that increase the risk of priapism, including leukemia, multiple myeloma, and sickle cell anemia. Certain underlying conditions (e.g., cardiovascular disease, impaired autonomic control of blood pressure, aortic stenosis) could be adversely affected by vasodilatory effects of tadalafil. Not recommended in patients with pulmonary venoocclusive disease. No age-related precautions have been noted in elderly patients. This drug is not indicated for use in women and children. Seek treatment immediately if an erection lasts longer than 4 h.

## Storage

Store tablets at room temperature. Administration

Take tadalafil without regard to food. When used as needed for ED, take at least 30 min before sexual activity. When taken on a daily basis, tadalafil should be taken at the same time every day without regard to sexual activity.

When tadalafil (Adcirca) is used for PAH, administer doses once daily; do not divide dosing.

# Talc Powder, Sterile

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: B

Classification: Sclerosing agents

# **MECHANISM OF ACTION**

A sclerosing agent that induces inflammatory reaction. *Therapeutic Effect:* Obliterates the pleural space and prevents reaccumulation of pleural fluid.

# PHARMACOKINETICS

Systemic absorption after intrapleural administration has not been studied.

# AVAILABILITY

Aerosol Spray, Intrapleural: 4 g (Sclerosol).

# INDICATIONS AND DOSAGES

Pleural effusions
 AEROSOL
 Adults. 4-8 g as single treatment.

## CONTRAINDICATIONS

Sensitivity to talc powder or any component of the formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Rare Pain.

## SERIOUS REACTIONS

 Atrial arrhythmias, hypotension, cardiac arrest, chest pain, tachycardia, hypovolemia, asystolic arrest, myocardial infarction, and respiratory complications have been reported.

# PRECAUTIONS & CONSIDERATIONS

Be aware that pulmonary complications can occur with talc use. It is unknown whether talc crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children. No age-related precautions have been noted in elderly patients.

#### Storage

Store aerosol at room temperature. Protect from direct sunlight.

## Administration

Shake canister well, remove protective cap, and securely attach the actuator button with the selected delivery tube (either 15 or 25 cm long) to the valve stem. The total dose should be administered in several short bursts, given with the delivery tube pointing in different directions. Delivery depends on the extent and duration of manual compression of the actuator button. The canister should be kept in an upright position during administration. The spray valve delivers talc at a rate of approximately 0.4 g/second, but the medication is not delivered as a metered dose.

# Tamoxifen

ta-mox'i-fen ★ Nolvadex ➡ Novo-Tamoxifen, Tamofen

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, antiestrogens, selective estrogen receptor modulator (SERM)

## **MECHANISM OF ACTION**

A nonsteroidal antiestrogen that competes with estradiol for estrogenreceptor binding sites in the breasts, uterus, and vagina. The expression of estrogen-dependent genes (RNA transcription) is altered, mostly in the G2 phase of the cell cycle. Also decreases insulin-like growth factor type 1 (associated with cancer cell growth) and induces transforming growth factor  $\beta$  (TGF- $\beta$ ), which inhibits the activity of breast cancer cells. Induces the reexpression of the tumor suppressor gene maspin in breast cancer tissue. Therapeutic Effect: Cytostatic. Decreases breast cancer risk and breast cancer recurrence.

Tamoxifen (Generic Name)

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 99%. Extensively metabolized in the liver by CYP 3A (major), 2C9, and 2D6. Inhibits P-glycoprotein. The main metabolite found in plasma is N-desmethyl tamoxifen, which is active. Drug undergoes some enterohepatic circulation. Parent drug and metabolites are excreted primarily in the feces by the biliary tract, largely as conjugates. Halflife: Biphasic elimination 7-14 h (initial) and 5-7 days (terminal). Half-life of main metabolite is about 14 days.

# AVAILABILITY

Tablets: 10 mg, 20 mg.

# INDICATIONS AND DOSAGES

## Adjunctive treatment of breast cancer

PO

Adults, Elderly. 20-40 mg/day in divided doses twice daily.

## Metastatic breast cancer (males and females)

PO

Adults, Elderly. 20-40 mg/day in divided doses twice daily.

# Prevention of breast cancer in high-risk women PO

Adults, Elderly. 20 mg/day.

 Ductal carcinoma in situ (DCIS) PO Adults, Elderly. 20 mg/day for 5 yr.

## **OFF-LABEL USES**

Induction of ovulation.

# CONTRAINDICATIONS

Hypersensitivity to tamoxifen, pregnancy, concurrent warfarin therapy, history of deep vein thrombosis or pulmonary embolism.

### INTERACTIONS Drug

Anastrozole, letrozole: May decrease the effects of anastrozole. Do not use together.

**Bromocriptine:** Elevates levels of tamoxifen and active metabolite.

Carbamazepine, phenobarbital, phenytoin, rifampin: May decrease tamoxifen concentrations.

**CYP2D6 inhibitors:** May decrease tamoxifen effectiveness; use with caution.

**Estrogens:** Antagonize effects of tamoxifen.

Other cytotoxic agents: May increase thromboembolic risk. Warfarin: May enhance the anticoagulant effects of warfarin. Herbal

Black cohosh, dong quai: May increase effects in estrogendependent tumors. St. John's wort: May decrease effects of tamoxifen. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum cholesterol, calcium, and triglyceride levels. Rarely will cause decreases in platelets or WBC count. T4 elevations due to increases in thyroid-binding globulin, with no clinical hyperthyroidism. Variations in usual vaginal smears and Pap smears are infrequently seen.

# SIDE EFFECTS

#### Frequent

Women (> 10%): Hot flashes, nausea, vomiting, amenorrhea or changes in menstruation.

#### Occasional

Women (≤ 1%): Genital itching, vaginal discharge, endometrial hyperplasia or polyps. Men: Impotence, decreased libido. Men and women: Headache, nausea, vomiting, rash, bone pain, confusion, weakness, somnolence, fluid retention, weight loss, skin changes.

## SERIOUS REACTIONS

• Retinopathy, corneal opacity, and decreased visual acuity.

• Very rare reports of serious hypersensitivity (erythema multiforme, Stevens-Johnson syndrome, bullous rash, interstitial pneumonitis, or angioedema).

• Rare reports of pancreatitis associated with increased lipid levels.

• Deep venous thrombosis, pulmonary thrombosis, stroke, or cardiac thrombus.

• Potential increased risk of endometrial cancer or uterine sarcoma.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with leukopenia and thrombocytopenia. Tamoxifen use should be avoided during pregnancy, especially during the first trimester, because it can cause fetal harm. Nonhormonal contraception should be used during treatment. It is unknown whether tamoxifen is distributed in breast milk; however, breastfeeding is not recommended. Tamoxifen use has been studied in girls aged 2-10 yr with McCune-Albright syndrome and precocious puberty. No age-related precautions have been noted in elderly patients.

Initially, an increase in bone and tumor pain may occur, which indicates a good tumor response to tamoxifen. Notify the physician if nausea and vomiting, leg cramps, weakness, weight gain, or vaginal bleeding, itching, or discharge develops. Intake and output, weight, CBC, and serum calcium levels should be monitored before and periodically during tamoxifen therapy. An estrogen receptor assay test should be performed before beginning treatment. Signs and symptoms for hypercalcemia, including constipation, deep bone or flank pain, excessive thirst, hypotonicity of muscles, increased urine output, nausea and vomiting, and renal calculi, should be assessed. **Storage** 

Store at room temperature. Keep tightly closed.

### Administration

Take oral tamoxifen without regard to food.

#### Tamsulosin

tam-sool'o-sin Flomax Do not confuse Flomax with Fosamax or Volmax.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (not indicated for use in women)

**Classification:** Urinary tract agents, antiadrenergics, specific peripheral  $\alpha$ -blockers

## **MECHANISM OF ACTION**

An  $\alpha_1$  antagonist that targets receptors around the bladder neck and prostate capsule. *Therapeutic Effect:* Relaxes smooth muscle and improves urinary flow and symptoms of prostatic hyperplasia.

#### PHARMACOKINETICS

Well absorbed and widely distributed. Protein binding: 94%-99%. Metabolized in the liver primarily by CYP3A4 and CYP2D6. Excreted primarily in urine.

Tamsulosin (Generic Name)

Unknown whether it is removed by hemodialysis. *Half-life:* 9-13 h.

# AVAILABILITY

Capsules: 0.4 mg.

# INDICATIONS AND DOSAGES

Benign prostatic hyperplasia
 PO

Adults. 0.4 mg once a day, approximately 30 min after same meal each day. May increase dosage to 0.8 mg if inadequate response in 2-4 wks. If treatment interrupted, start again at lowest dose.

## Dosage with strong CYP3A4 inhibitors

Limit dosage to 0.4 mg once daily. Severe hepatic impairment Do not use.

## CONTRAINDICATIONS

History of sensitivity to tamsulosin.

# INTERACTIONS

#### Drug

 $\alpha$ -Adrenergic blocking agents (such as doxazosin, prazosin, terazosin): May increase the  $\alpha$ -blockade effects of both drugs.  $\beta$ -Blockers, calcium channel blockers, phosphodiesterase-5 inhibitors: May increase the potential for hypotension.

**CYP3A4 inducers:** May reduce tamsulosin levels, decrease effect. **CYP3A4 inhibitors:** May increase tamsulosin levels and increase side effects such as hypotension risk; tamsulosin dose adjustment required with strong inhibitors.

**Warfarin:** May alter the effects of warfarin.

#### Herbal

Herbs with hypotensive properties (black cohosh, coleus, golden seal, hawthorn, mistletoe, periwinkle, quinine): May increase the potential for hypotension. Saw palmetto: Unknown whether it will interact but it is recommended to avoid use. St. John's wort: May decrease tamsulosin's effects. Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

**Frequent (7%-9%)** Dizziness, somnolence.

Occasional (3%-5%) Headache, anxiety, insomnia,

orthostatic hypotension.

## Rare (< 2%)

Nasal congestion, pharyngitis, rhinitis, nausea, vertigo, impotence.

# SERIOUS REACTIONS

• Severe orthostatic hypotension with syncope may be preceded by tachycardia.

• Rare reports of jaundice, impaired hepatic function, and increased transaminases.

• α-Blockers associated with intraoperative floppy iris syndrome during cataract surgery.

- Priapism (very rare).
- Toxic skin eruptions (very rare).

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic impairment. Tamsulosin is not indicated for use in women or children. No agerelated precautions have been noted in elderly patients. Avoid use in patients who have cataract surgery scheduled.

Dizziness and light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established. Caution should be used when getting up from a sitting or lying position. BP should be monitored. Storage

Store capsules at room temperature. Administration

Take at the same time each day, 30 min after the same meal. Do not crush or open capsule.

## **Tapentadol**

ta-pen'ta-dol Mucynta, Nucynta ER Do not confuse tapentadol with Toradol or tramadol.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C Controlled Substance Schedule: II

**Classification:** Analgesics, opioid-like, centrally acting

#### MECHANISM OF ACTION

A potent centrally acting analgesic that binds to  $\mu$ -opioid receptors, inhibiting ascending pain pathways. Also inhibits reuptake of norepinephrine and serotonin. Reduces the intensity of pain stimuli reaching sensory nerve endings. *Therapeutic Effect:* Alters the perception of and emotional response to pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	<1h	1.25 h	4-6 h

Good absorption after PO

administration. Protein binding: Low, 20%. Extensively metabolized in the liver. The major metabolic pathway is conjugation to produce glucuronides. Roughly 70% of the dose is excreted in urine in the conjugated form. A total of 3% of drug excreted in urine as unchanged drug. No metabolites contribute to analgesic activity. Tapentadol and its metabolites are excreted almost exclusively (99%) via the kidneys. *Half-life:* 4 h.

#### AVAILABILITY

*Tablets:* 50 mg, 75 mg, 100 mg. *Extended-Release Tablets:* 50 mg, 100 mg, 150 mg, 200 mg, 250 mg.

# INDICATIONS AND DOSAGES Moderate to moderately severe pain

PO (IMMEDIATE RELEASE) Adults. Initially, 50 mg, 75 mg, or 100 mg every 4-6 h adjusted to pain intensity. On the first day, the 2nd dose may be given as soon as 1 h after the first dose, if adequate pain relief is not attained. Subsequent dosing is 50-100 mg every 4-6 h and adjusted to adequate analgesia/ tolerability. Maximum daily limits: 700 mg total on the first day, and 600 mg/day total on subsequent days. PO (EXTENDED RELEASE) Adults. Dose range: 100 mg to 250 mg twice daily approximately every 12 h. Patients not currently taking opioids should begin with 50 mg twice a day. Titrate by 50 mg twice per day no more frequently than every 3 days. Patients receiving the immediate-release formulation may be converted to ER tablets by giving half the current total daily dose every 12 h. Maximum: 500 mg/day.

 Dosage in hepatic impairment IMMEDIATE RELEASE

In moderate impairment, initially do not exceed 50 mg q8h, with a maximum of 3 doses in 24 h. If needed and tolerated, may give q6h. Increase interval if more frequent dosing not tolerated. Not recommended if hepatic impairment is severe.

# Dosage in hepatic impairment

EXTENDED RELEASE

In moderate impairment, initiate ER tablets at 50 mg q24h. If needed and tolerated, may give up to 100 mg ER PO q24h. Not recommended in severe hepatic impairment.

## CONTRAINDICATIONS

Significant respiratory depression, acute or severe bronchial asthma or hypercapnia in unmonitored settings or the absence of resuscitative equipment, paralytic ileus; use with MAOIs or within 14 days of MAOIs. Extended release tablets are not for use in acute or immediate postoperative pain.

## INTERACTIONS

#### Drug

# Alcohol, other central nervous system (CNS) depressants:

May increase CNS or respiratory depression and hypotension. Avoid. **MAOIs:** Additive effects on norepinephrine levels, which may lead to hypertensive crisis; contraindicated.

#### Serotonin agonists, SSRIs,

**SNRIs:** Possible additive effects on serotonergic actions; use caution.

#### Herbal None known.

Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase GGT, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

## Frequent (> 5%)

Dizziness, nausea, vomiting, somnolence, constipation. Occasional (2%-5%) Fatigue, dry mouth, dyspepsia,

feeling hot, decreased appetite, insomnia, pruritis, sweating.

# Rare (< 2%)

Rash, hot flash, CNS stimulation (such as nervousness, headache, anxiety, agitation, tremor, euphoria, mood swings, and hallucinations), blurred vision, urticaria, urinary retention.

# SERIOUS REACTIONS

- Hypersensitivity.
- · Respiratory or CNS depression.
- Seizures.
- Serotonin syndrome (rare).

• Increased intracranial pressure in at-risk patients (rare).

# **PRECAUTIONS & CONSIDERATIONS**

Extreme caution should be used in patients with acute abdominal conditions, biliary tract disease, severe hepatic or renal impairment (not recommended for use), increased intracranial pressure or head injury, seizure disorders, and those with potential risk for respiratory depression (e.g., hypoxia, hypercapnia, or upper airway obstruction). Opioid dependence is possible. There is a potential for drug abuse. Monitor patients closely for signs of abuse and addiction. Tapentadol crosses the placenta and may cause withdrawal in the neonate. The drug is distributed in breast milk. The safety and efficacy of this drug have not been established in children. The elderly may be more susceptible to side effects, so care should be used in initial dosing.

Blurred vision, dizziness, and drowsiness may occur, so tasks requiring mental alertness or motor skills should be avoided until the drug effects are known. Notify the physician of any chest pain, difficulty breathing, excessive sedation, muscle weakness, palpitations, seizures, severe constipation, or tremors. Liver and renal function studies should be obtained before therapy. BP, pulse rate, pattern of daily bowel activity and stool consistency, bladder for urine retention, and therapeutic response should be monitored. **Storage** 

Store the tablets at room temperature. Administration

Take tapentadol orally without regard to food. Do not abruptly discontinue; tapering is recommended. Extendedrelease tablets must be swallowed whole.

# **Tazarotene**

ta-zare'oh-teen 🗙 🐏 Tazorac, Avage

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Dermatologics, retinoids

# **MECHANISM OF ACTION**

Modulates differentiation and proliferation of epithelial tissue, binds selectively to retinoic acid receptors. *Therapeutic Effect:* Restores normal differentiation of the epidermis and reduces epidermal inflammation.

# PHARMACOKINETICS

Minimal systemic absorption occurs through the skin. Binding to plasma proteins is > 99%. Metabolism is in the skin and liver. Elimination occurs through the fecal and renal pathways. *Half-life:* 18 h.

# AVAILABILITY

*Gel:* 0.05%, 0.1% (Tazorac). *Cream:* 0.05% (Tazorac), 0.1% (Avage, Tazorac).

# INDICATIONS AND DOSAGES Psoriasis Psolati

# TOPICAL

*Adults, adolescents, children older than 12 yr.* Thin film applied once daily in the evening; only cover the lesions, and area should be dry before application.

# Acne vulgaris

# TOPICAL

Adults, adolescents, children older than 12 yr: Thin film applied to affected areas once daily in the evening after the face is gently cleansed and dried.

## Fine facial wrinkles, facial mottled hyperpigmentation (liver spots), hypopigmentation associated with photoaging

### TOPICAL

*Adults, children older than 17 yr.* Thin film applied to affected areas once daily in the evening, after face is gently cleansed and dried.

# CONTRAINDICATIONS

Should not be used in pregnant women, patients with hypersensitivity to tazarotene, benzyl alcohol, any one of its components, or other retinoid or vitamin A derivatives.

# INTERACTIONS

#### Drug

Ethanol, benzoyl peroxide, resorcinol, salicylic acid, sulfur: Increases the drying effect. Quinolones, phenothiazines, sulfonamides, sulfonylureas, tetracyclines, thiazide diuretics: Increase the risk of photosensitivity. Herbal

# None known.

Food None known.

**DIAGNOSTIC TEST EFFECTS** 

None known.

## SIDE EFFECTS

#### Frequent

Desquamation, burning or stinging, dry skin, itching, erythema, worsening of psoriasis, irritation, skin pain, pruritis, xerosis, photosensitivity.

### Occasional

Irritation, skin pain, fissuring, localized edema, skin discoloration, rash, desquamation, contact dermatitis, skin inflammation, bleeding, dry skin, hypertriglyceridemia, peripheral edema, acne vulgaris, cheilitis.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with other skin conditions such as eczema, sunburn, and undiagnosed skin lesions. Tazarotene is contraindicated during pregnancy. It is unknown whether it enters the breast milk. Safety and efficacy have not been established in children or elderly patients.

Burning or stinging after application, dryness, itching, peeling, or redness of the skin may occur during tazarotene therapy. Avoid direct exposure to UV light.

### Storage

Store at room temperature away from heat and direct light.

#### Administration

Tazarotene is for external use only. Apply only on face, once daily at bedtime, or as directed by physician. Remove any makeup, gently wash face with a mild cleanser, and pat skin dry. Wait at least 20 min to make sure face is dry before applying a small, peasized amount (about ¼-inch wide) of medication. Apply in a thin layer over wrinkles and discolored spots, avoiding eye and mouth areas. Wash hands after using the medication. In the morning, apply a moisturizing sunscreen with SPF 15 or greater.

## Telaprevir

tel-a' pre-vir

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B (drug itself); when used with ribavirin and peginterferon as indicated, Category X.

**Classification:** Antivirals, NS3/4A protease inhibitor

## **MECHANISM OF ACTION**

Inhibitor of hepatitis C virus (HCV) NS3/4A protease; thus inhibiting viral replication in HCV-infected host cells. *Therapeutic Effect:* Interrupts HCV replication, slowing the progression of or improving the clinical status of hepatitis C infection.

## PHARMACOKINETICS

Administer with non-lowfat food, as this increases oral absorption. Protein binding: 59%-76%. Widely distributed. Extensively metabolized by the liver, involving hydrolysis, oxidation, and reduction; CYP3A4 predominant enzyme involved. Multiple metabolites detected; the predominant metabolites are either 30-fold less active, or inactive. Eighty (80%) of the dose was excreted in feces; 9% via expired air, and only 1% in urine. Not known if removed by hemodialysis. *Half-life:* 9-11 h.

## AVAILABILITY

Tablets: 375 mg.

#### INDICATIONS AND DOSAGES Hepatitis C genotype 1 infection (in combination with peginterferon alfa and ribavirin): PO

Adults: 750 mg (two 375-mg tablets) three times per day (q7-9h) with non-lowfat food. Duration of treatment is determined by HCV-RNA levels and the degree of liver disease; usually telaprevir is given for 12 wks in the regimen. See manufacturer's literature for current guidelines for hepatitis C treatment based on patient virologic response.

## CONTRAINDICATIONS

Hypersensitivity; use with certain CYP3A4/5 inducers and substrates (see Drug Interactions). Because the drug is coadministered with ribavirin, the following contraindications also apply: Pregnant women and men whose female partners are pregnant; see ribavirin and peginterferon alfa monographs for additional warnings.

## INTERACTIONS

#### Drug

## Major CYP3A4/5 inducers (e.g., bosentan, carbamazepine, phenytoin, barbiturates,

rifampin): May obliterate telaprevir effectiveness: contraindicated. Alfuzosin: Increased alfuzosin levels and hypotension. Contraindicated. Antiarrhythmic drugs, amlodipine, diltiazem, verapamil: May increase levels and risk for cardiac arrhythmia; use extreme caution as not studied. Azole antifungals: May increase levels and risk for cardiac arrhythmia; avoid if possible, co-use with caution. Cisapride, pimozide: Potential for cardiac arrhythmias. Contraindicated. Colchicine: Reduce colchicine dose by half; watch for evidence of toxicity. Use with caution.

Corticosteroids: Coadministration of systemic corticosteroids not recommended due to increased levels and potential hypercorticism. Caution in use of inhaled corticosteroids. CYP3A4 inhibitors (e.g., clarithromycin, ketoconazole, itraconazole, ritonavir): watch for evidence of telaprevir toxicity. Use with caution. Cyclosporine, tacrolimus, sirolimus: Risk of increased immunosuppressant levels; monitor closely. Dihydroergotamine, ergonovine, ergotamine, methylergonovine: Risk of ergot toxicity; contraindicated. Digoxin: Risk of increased digoxin levels; monitor closely. Drosperinone: Risk for hyperkalemia. Not recommended. **HMG-CoA Reductase Inhibitors** (statins): Potential for myopathy and rhabdomyolysis. Lovastatin and simvastatin are contraindicated. Phosphodiesterase (PDE5) Inhibitors for pulmonary HTN [e.g., REVATIO (sildenafil) or ADCIRCA (tadalafil)]: Potential for visual abnormalities, hypotension, prolonged erection, and syncope. Contraindicated. Protease inhibitors and other antiviral medications for HIV: Varied effects, telaprevir efficacy likely compromised and co-use not recommended. Salmeterol: Risk of increased salmeterol levels and potential cardiac effects; co-use not recommended. Triazolam and orally administered midazolam: Increased sedation or respiratory depression. Contraindicated. Herbal St. John's wort: May obliterate telaprevir effectiveness; contraindicated.

#### Food

Drug must be taken with non-lowfat food to ensure good absorption.

## DIAGNOSTIC TEST EFFECTS

Decreases HCV-RNA levels (expected effect). May increase bilirubin levels. Decreased hemoglobin, WBC, and platelets when used in combination with ribavirin and peginterferon alfa as directed.

## SIDE EFFECTS

#### Frequent (≥26%)

Skin rash, nausea, pruritus, fatigue, anemia, diarrhea.

## Occasional (6%-13%)

Vomiting, hemorrhoids, anorectal discomfort, dysgeusia, anal pruritus. **Rare** 

Thrombocytopenia, lowered white cell counts, gout, hyperbilirubinemia.

### SERIOUS REACTIONS

 Hypersensitivity reactions occur rarely.

 Serious skin rashes may include Stevens-Johnson syndrome or drug rash with eosinophilia and systemic symptoms (DRESS). Discontinue drug immediately if serious rash occurs.

• Anemia or neutropenia may be severe enough for drug discontinuation; rare bleeding or infection risks.

• Teratogenic (ribavirin component of therapy).

#### **PRECAUTIONS & CONSIDERATIONS**

Telaprevir must be used in combination with peginterferon alfa and ribavirin. The treatments involve a risk of anemia and neutropenia. Safety and efficacy not established in patients with HIV infection, in patients co-infected with hepatitis B (HBV), in patients with organ transplant, or in those with decompensated liver disease. Therapy for HCV infection involves the use of drugs contraindicated during pregnancy. Patients (males and females) and their partners are required use 2 forms of effective contraception during treatment and for 6 months after. Females must have a negative pregnancy test prior to initiation of therapy, monthly during therapy, and for 6 months post-therapy. It is not known if telaprevir is excreted in human milk; breast-feeding during treatment is not recommended. Efficacy and safety are not established in children.

Before starting drug therapy, check baseline lab values, including HCV-RNA levels. Expect to monitor HCV-RNA, serum liver function tests, and other values at baseline and regularly during treatment. A complete blood count (CBC) with differential, as well as red blood cell indices, should be monitored prior to, at treatment weeks 4, 8, and 12, and as clinically appropriate. Any rash should be monitored for signs of progression. Assess for altered sleep patterns, dizziness, headache, nausea, and pattern of daily bowel activity and stool consistency and for signs of unusual bleeding or bruising. Avoid activities that require mental acuity if dizziness occurs until the effects of the drug are known. Patients should be advised not to stop taking the drug suddenly, as this can cause a worsening of hepatitis that may be sudden. Treatment does not reduce the risk of transmission of HCV to others through sexual contact or blood contamination. Storage

Store at room temperature at or below 77°F. Keep in original blister packaging until time of use.

## Administration

Take each dose with non-lowfat food (meal or light snack) and space doses evenly throughout the day as directed. If the patient misses a dose (and it is within 4 h of the missed dose) then the missed dose should be taken with food. *If* more than 4 h have elapsed since the missed dose, then the patient skips the missed dose and resumes the normal schedule.

# **Telavancin**

tel'a-van'sin Vibativ Do not confuse with vancomycin, Vibramycin, or vigabatrin.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antibiotics, glycopeptides

# **MECHANISM OF ACTION**

Telavancin is a semisynthetic glycopeptide antibiotic that is a derivative of vancomycin. Binds to bacterial cell walls of grampositive bacteria only, disrupting and altering cell membrane integrity and permeability and inhibiting RNA synthesis. Effective against methicillinresistant *Staph aureus* (MRSA). *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Poorly absorbed from the GI tract, so must be given intravenously by infusion. Widely distributed. Protein binding: 93%. Metabolized to 3 hydroxylated metabolites, but metabolic pathways not mediated by CYP450 system. Primarily excreted in the urine. Minimally (5%-6%) removed by hemodialysis. *Half-life:* 8-9 h (increased in impaired renal function).

## AVAILABILITY

Powder for Injection: 250 mg, 750 mg.

## INDICATIONS AND DOSAGES

# Treatment of skin and soft-tissue infections

IV INFUSION *Adults, Elderly.* 10 mg/kg once every 24 h for 7-14 days.

## Dosage for renal impairment

CrCl > 50 mL/min: No dosage adjustment needed. CrCl 30-50 mL/min: 7.5 mg/kg IV

q24h.

CrCl 10-29 mL/min: 10 mg/kg IV q48h.

CrCl < 10 mL/min: Insufficient evidence for dose recommendations, including those with end-stage renal disease or on hemodialysis. Use is not recommended.

## **OFF-LABEL USES**

Nosocomial pneumonia.

## CONTRAINDICATIONS

Hypersensitivity.

## INTERACTIONS

#### Drug

Anticoagulants, including heparins and warfarin: Telavancin interferes with certain coagulation assays, which may cause confusion in monitoring anticoagulation. Interference is limited if blood samples are collected as close as possible prior to a patient's next dose of telavancin.

Drugs with nephrotoxic or ototoxic potential, such as aminoglycosides, amphotericin B, cisplatin, cyclosporine, foscarnet: May increase the risk of toxicity of telavancin. QT-prolonging drugs (e.g., class 1A and III antiarrhythmics,

## ranolazine, some antipsychotics,

**some quinolones):** Use with caution since effect of telavancin on QT interval may be additive.

### Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN or serum creatinine level, proteinuria. Telavancin interferes with certain coagulation assays (e.g., PT, INR, aPTT, and ACT, and heparin anti-Xa). The effects dissipate over time, as plasma concentrations of telavancin decrease. Telavancin also interferes with urine qualitative dipstick protein assays and quantitative dye methods (e.g., pyrogallol red-molybdate). Microalbumin assay methods are not affected.

## IV INCOMPATIBILITIES

Do not mix with or administer other medications simultaneously through the same IV line.

## SIDE EFFECTS

#### **Frequent (≥ 10%)**

Taste disturbance, nausea, vomiting, increased serum creatinine, and foamy urine.

#### Occasional (4%-7%)

Dizziness, diarrhea, pruritus, rash, rigors, pain at infusion site.

# Rare (3% or less)

Decreased appetite, abdominal pain, phlebitis, thrombophlebitis, vertigo, tinnitus, extravasation.

## SERIOUS REACTIONS

• *Clostridium difficile*-associated diarrhea (CDAD), including pseudomembranous colitis.

- · Superinfection.
- · Nephrotoxicity and ototoxicity.

 Infusion reactions similar to the "red man" syndrome of vancomycin (redness on face, neck, arms, and back; chills; fever; tachycardia; pruritus; rash) may result from toorapid infusion.

- QT prolongation (rare).
- · Serious hypersensitivity.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with preexisting hearing impairment or renal dysfunction and in those taking other ototoxic or nephrotoxic medications concurrently. Also use with caution in patients with electrolyte disturbances or other known risks for OT prolongation. Lower clinical cure rates have been observed in patients with renal impairment. Telavancin crosses the placenta and has potential to cause fetal harm. Women of childbearing potential should have a serum pregnancy test prior to administration and should use effective contraception during treatment. It is unknown whether it is distributed in breast milk. Age-related renal impairment may increase the risk of toxicity in elderly patients. Careful dose selection is recommended.

Notify the physician if rash, tinnitus, or signs and symptoms of nephrotoxicity occur. Laboratory tests are an important part of therapy. Assess skin for rash, infusion rate tolerance, intake and output, renal function, balance, and hearing acuity; assess IV site during telavancin therapy.

#### Storage

Store unopened vials in a refrigerator; do not freeze. After reconstitution, the total time in the vial plus the time in the infusion bag should not exceed 4 h at room temperature or 72 h under refrigeration.

### Administration

Telavancin is for IV infusion use only after dilution. For reconstitution add 15 mL to the 250-mg vial or 45 mL to the 750-mg vial, respectively, using D5W, sterile water for injection, or 0.9% NaCl injection. Mix thoroughly to reconstitute; usually reconstitution takes < 2 min, but can take up to 20 min. Aseptically remove the required dose from the vial for further dilution.

For doses ranging from 150-800 mg, further dilute the appropriate volume of reconstituted solution with 100-250 mL of D5W, 0.9% NaCl, or lactated Ringer's injection. For other doses, dilute to a final concentration of 0.6-8 mg/mL with the mentioned compatible fluids.

Administer slowly via intravenous infusion over 60 min. Too-rapid IV administration can lead to infusionrelated reactions such as red man syndrome. If the same IV line is used for sequential administration of other medications, flush the line before and after each telavancin dose with D5W, 0.9% NaCl, or lactated Ringer's injection.

# Telbivudine

tell-biv′yoo-deen Tyzeka Sebivo Do not confuse telbivudine with lamivudine, or Tyzeka with Tykosyn or Tasigna.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

#### Classification:

Antiretrovirals, nucleoside reverse transcriptase inhibitors

## **MECHANISM OF ACTION**

An antiviral that inhibits hepatitis B virus (HBV) DNA polymerase, an enzyme necessary for HBV replication. *Therapeutic Effect:* Interrupts HBV replication, slowing the progression of hepatitis B infection.

## PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract; efficacy not influenced by food. Protein binding: Low, 3.3%. Widely distributed. Primarily excreted unchanged in urine. Removed by hemodialysis (23%). *Half-life*: 15 h (increased in impaired renal function).

## AVAILABILITY

*Tablets (Tyzeka):* 600 mg. *Oral Solution (Tyzeka):* 100 mg/5 mL.

# INDICATIONS AND DOSAGES Chronic hepatitis B

PO

*Adults, Children 16 yr and older.* 600 mg once per day. If after 24 wks there is insufficient suppression, pursue alternate treatment.

### Dosage in renal impairment (adult and adolescent)

Dosage and frequency are modified based on creatinine clearance.

CrCl	Tablet Dosage	Oral Solution Dosage
≥ 50 mL/min	No adjust- ment	No adjust- ment
30-49 mL/min	600 mg q48h	400 mg once daily
< 30 mL/min not on hemodialysis	600 mg q72h	200 mg once daily
Hemodialysis (HD) or peritoneal dialysis (CAPD)	600 mg q96h (given after HD)	Not established

## CONTRAINDICATIONS

Hypersensitivity. Also contraindicated for use with

Telbivudine (Generic Name), Tyzeka (Brand Name)

peginterferon  $\alpha$ -2a due to increased risk of peripheral neuropathy.

# INTERACTIONS

#### Drug

Cyclosporine, tacrolimus, and other transplant medications: Closely monitor renal function and transplant status.

HMG-CoA reductase inhibitors ("statins"): Potential for increased serious myopathy; use together with caution. Others drugs that require caution include corticosteroids, chloroquine, hydroxychloroquine, fibric acid derivatives, penicillamine, zidovudine, cyclosporine, erythromycin, niacin, and certain azole antifungals.

**Interferons:** May increase risk of peripheral neuropathy. Contraindicated with peginterferon  $\alpha$ -2a.

Metformin, cotrimoxazole: Use caution since these and other medications, like telbivudine, are substantially dependent on renal excretion and increase risk of lactic acidosis.

#### Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum amylase, AST (SGOT), and ALT (SGPT) levels. May increase creatine kinase (CK). Rarely lowers platelet, WBC, or RBC counts.

## SIDE EFFECTS

## Frequent (≥ 3%)

Fatigue, increased creatine kinase (CK), headache, cough, diarrhea, abdominal pain, nausea, pharyngolaryngeal pain, flu-like illness, arthralgia, fever, rash, back pain, dizziness, myalgia, increased liver function tests, dyspepsia, insomnia, and abdominal distention. Occasional (1%-2%) Diarrhea, myopathy, pruritus. Rare (< 1%) Paresthesia, hypoesthesia, serious reactions (see below).

# SERIOUS REACTIONS

- · Myopathy with rhabdomyolysis.
- · Peripheral neuropathy.
- · Lactic acidosis.
- · Severe hepatomegaly with steatosis.

## PRECAUTIONS & CONSIDERATIONS

Lactic acidosis and severe hepatomegaly with steatosis, including fatal cases, have been reported. Severe acute exacerbations of hepatitis B may occur if treatment is discontinued. Closely monitor patients who discontinue therapy. Caution is warranted in patients with impaired renal function, a history of peripheral neuropathy. There are inadequate efficacy data in black and Hispanic patients. Be aware that telbivudine crosses the placenta, and it is unknown whether telbivudine is distributed in breast milk. Breastfeeding is not recommended. Be aware that the safety and efficacy of this drug have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment. The oral solution contains sodium that may need to be taken into account in patients on a low-sodium diet. This drug is not a cure for hepatitis B infection and does not reduce the risk of transmission of HBV to others.

Before starting drug therapy, check the baseline lab values, especially renal function. Expect to monitor the serum amylase, BUN, and serum creatinine levels. HBV DNA is monitored at 24 wks to determine responsiveness. If continued, HBV DNA should be monitored every 6 mos to assure continued response. If patients test positive for HBV DNA at any time after initial response, use alternate treatment. Monitor for unusual weakness or fatigue, trouble breathing, or irregular pulse, which could indicate lactic acidosis. Assess for altered sleep patterns, cough, dizziness, headache, nausea, and pattern of daily bowel activity and stool consistency. Avoid activities that require mental acuity if dizziness occurs. Closely monitor for symptoms of peripheral neuropathy (tingling or burning sensations of extremities) or myopathy (muscle weakness or pain).

#### Storage

Store tablets and oral solution in the original containers at room temperature. Do not store in a damp place and do not freeze the oral solution. Oral solution expires 2 mo after opening the bottle. Keep tightly closed.

#### Administration

Give telbivudine without regard to meals, at roughly the same time each day. Take for the full length of treatment and evenly space drug doses. Use supplied dose cup for the oral solution. Do not abruptly or prematurely discontinue, as rebound, serious hepatitis may result.

# **Telithromycin**

tell-ith'roe-my-sin

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antibiotics, ketolides

## **MECHANISM OF ACTION**

A ketolide that blocks protein synthesis by binding to ribosomal receptor sites on the bacterial cell wall. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

Protein binding: 60%-70%. More of drug is concentrated in WBCs than in plasma, and drug is eliminated more slowly from WBCs than from plasma. Partially metabolized by the liver, 50% of metabolism is dependent on CYP3A4. Minimally excreted in feces and urine. *Half-life*: 10 h.

# AVAILABILITY

Tablets: 300 mg, 400 mg.

# INDICATIONS AND DOSAGES

## Community-acquired pneumonia PO

*Adults, Elderly.* 800 mg once a day for 7-10 days.

#### Dosage for severe renal impairment

For CrCl < 30 mL/min: Reduce dose to 600 mg once daily. In those on hemodialysis, give after dialysis session on dialysis days.

#### Dosage for multiple insufficiency

For severe renal (CrCl < 30 mL/min) *plus* coexisting hepatic impairment, reduce to 400 mg once daily.

# CONTRAINDICATIONS

Hypersensitivity to telithromycin or to any macrolides, including hepatic dysfunction, concurrent use of cisapride or pimozide, myasthenia gravis, congenital QT prolongation.

# INTERACTIONS

#### Drug

Antiarrhythmics: May result in additive effects, even resulting in serious arrhythmias.

Telithromycin (Generic Name), Ketek (Brand Name)

Atorvastatin, colchicine, digoxin, lovastatin, metoprolol, simvastatin, midazolam, triazolam, theophylline: May increase the blood concentration and toxicity of these drugs. Simvastatin, lovastatin, or atorvastatin should be stopped during telithromycin treatment. Carbamazepine, phenobarbital, phenytoin, rifampin: May

decrease the blood concentration of telithromycin.

**Cisapride and pimozide:** Increases blood concentration resulting in significantly increased QT interval. **Itraconazole, ketoconazole:** May increase the blood concentration of telithromycin.

**Sotalol:** Decreases the blood concentration of sotalol.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase platelet count and AST (SGOT) and ALT (SGPT) levels.

## SIDE EFFECTS

### Occasional (4%-11%)

Diarrhea, nausea, headache, dizziness.

#### Rare (2%-3%)

Vomiting, loose stools, altered taste, dry mouth, flatulence, visual disturbances.

## SERIOUS REACTIONS

 Hepatic dysfunction, severe hypersensitivity reaction, and QT prolongation arrhythmias occur rarely.
 Myasthenia gravis with life-

threatening and fatal respiratory depression occurs rarely.

• Antibiotic-associated colitis and other superinfections may result from altered bacterial balance.

• Vagal symptoms with loss of consciousness.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with uncorrected hypokalemia, hypomagnesemia, bradycardia, concomitant use of class IA or III antiarrhythmics, and patients with significant renal impairment. It is unknown whether telithromycin is distributed in breast milk. Use during pregnancy and lactation only if benefits outweight risks. Safety and efficacy of telithromycin have not been established in children. In elderly patients with normal renal function, no age-related precautions have been noted.

Be aware that there is a potential for visual disturbances or decreased cognition during treatment; minimize hazardous tasks during treatment.

## Storage

Store at room temperature. Administration

May administer without regard to meals. Do not break or crush film-coated tablets.

## Telmisartan

tel-meh-sar'tan

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antihypertensives, angiotensin II receptor antagonists

## MECHANISM OF ACTION

An angiotensin II receptor, type AT<sub>1</sub>, antagonist that blocks vasoconstrictor and aldosterone-secreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT<sub>1</sub> receptors. *Therapeutic Effect:* Causes vasodilation, decreases peripheral resistance, and decreases BP.

Telmisartan (Generic Name), Micardis (Brand Name)

# PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Protein binding: > 99.5%. Undergoes metabolism in the liver to inactive metabolite. Excreted in feces. Unknown whether removed by hemodialysis. *Half-life*: 24 h.

# AVAILABILITY

Tablets: 20 mg, 40 mg, 80 mg.

# INDICATIONS AND DOSAGES Hypertension

PO

Adults, Elderly. 40 mg once a day. Range: 20-80 mg/day.

## Cardiovascular risk reduction PO

*Adults, Elderly 55 yr and older.* Titrate to target dose of 80 mg once a day. It is not known if lower doses are effective.

# **OFF-LABEL USES**

Treatment of congestive heart failure (CHF).

## CONTRAINDICATIONS

Hypersensitivity to telmisartan.

## **INTERACTIONS**

#### Drug

**Digoxin:** Increases digoxin plasma concentration.

Potassium supplements,

potassium-sparing diuretics,

ACE inhibitors, drospirenone, eplerenone: May increase risk of hyperkalemia.

Warfarin: Slightly decreases warfarin plasma concentration. Herbal

**Dong quai, garlic:** May increase antihypertensive effect.

Ephedra, ginseng, yohimbe: May decrease antihypertensive effect. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum creatinine and potassium levels. May decrease blood hemoglobin and hematocrit levels.

# SIDE EFFECTS

### Occasional (3%-7%)

Upper respiratory tract infection, sinusitis, back or leg pain, diarrhea, skin ulcer.

## Rare (1%)

Dizziness, headache, fatigue, nausea, heartburn, myalgia, cough, peripheral edema, hyperkalemia.

# SERIOUS REACTIONS

• Overdosage may manifest as hypotension and tachycardia. Bradycardia occurs less often.

- Renal dysfunction (rare).
- · Liver problems (rare).
- · Hypersensitivity reactions.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hepatic and renal impairment, renal artery stenosis (bilateral or unilateral), and volume depletion. Telmisartan may cause fetal harm, particularly in 2nd or 3rd trimester; discontinue the drug as soon as possible after pregnancy is detected. It is unknown whether telmisartan is excreted in breast milk. Safety and efficacy of telmisartan have not been established in children. No age-related precautions have been noted in elderly patients.

Dizziness may occur. Tasks that require mental alertness or motor skills should be avoided. Notify the physician if fever or sore throat occurs. Apical pulse and BP should be assessed immediately before each dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the patient in the supine position with feet slightly elevated and notify the physician. Pulse rate and BUN, serum creatinine, and serum electrolyte levels should be assessed. Maintain adequate hydration; exercising outside during hot weather should be avoided in order to decrease the risk of dehydration and hypotension. **Storage** 

Store at room temperature. Do not remove from packaging until right before administration.

## Administration

May be given concurrently with other antihypertensives. If BP is not controlled by telmisartan alone, a diuretic may be added.

Take telmisartan without regard to meals.

## Temazepam

te-maz'e-pam ★ Restoril ▲ Apo-Temazepam, Novo-Temazepam, PMS-Temazepam, Restoril Do not confuse Restoril with Vistaril or Zestril.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: IV

# **Classification:** Benzodiazepines, sedatives/hypnotics

## **MECHANISM OF ACTION**

A benzodiazepine that enhances the action of the inhibitory neurotransmitter γ-aminobutyric acid, resulting in central nervous system (CNS) depression. *Therapeutic Effect:* Induces sleep.

## PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 96%. Widely distributed. Crosses the blood-brain barrier. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 4-18 h.

## AVAILABILITY

*Capsules:* 7.5 mg, 15 mg, 22.5 mg, 30 mg.

## INDICATIONS AND DOSAGES

# Insomnia

PO Adults, Children 18 yr and older. 15-30 mg at bedtime. Elderly, Debilitated. 7.5-15 mg at bedtime.

# CONTRAINDICATIONS

Hypersensitivity to temazepam, pregnancy.

## INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Herbal Kava kava, valerian: May increase

CNS depression.

#### Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Frequent

Somnolence, sedation, rebound insomnia (may occur for 1-2 nights after drug is discontinued), dizziness, confusion, euphoria.

#### Occasional

Asthenia, anorexia, diarrhea.

Paradoxical CNS excitement or restlessness (particularly in elderly

Temazepam (Generic Name)

or debilitated patients), impaired memory.

#### SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremor, abdominal or muscle cramps, vomiting, diaphoresis, and seizures.

Overdose results in somnolence, confusion, diminished reflexes, respiratory depression, and coma.
Complex behaviors such as "sleep-driving" (i.e., driving while not fully awake after ingestion of a sedative-hypnotic, with amnesia for the event) or other behaviors, with amnesia after the events, have been reported; consider discontinuation if they occur.

• Rare reports of angioedema or anaphylaxis.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with mental impairment and the potential for drug dependence. Temazepam is pregnancy risk category X and crosses the placenta and may be distributed in breast milk. Long-term use of temazepam during pregnancy may produce withdrawal symptoms and CNS depression in neonates. Temazepam use is not recommended for children younger than 18 yr. To avoid ataxia or excessive sedation in elderly patients, plan to administer small doses initially and to increase dosage gradually.

Avoid alcohol, CNS depressants, and tasks that require mental alertness and motor skills. BP, pulse rate, respiratory rate, rhythm, and depth should be assessed before administering temazepam. Cardiovascular, mental, and respiratory status should be monitored throughout therapy.

#### Storage

Store at room temperature. Administration

If desired, open temazepam capsules and mix the contents with food. Take temazepam 30 min before bedtime.

#### Temozolomide

tem-oh-zohl'oh-mide Temodar 🏜 Temodal

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, alkylating agents

#### **MECHANISM OF ACTION**

An imidazotetrazine derivative that acts as a prodrug and is converted to a highly active cytotoxic metabolite. Its cytotoxic effect is associated with methylation of DNA. *Therapeutic Effect*: Inhibits DNA replication, causing cell death.

#### PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Protein binding: 15%. Peak plasma concentration occurs in 1 h. Penetrates the blood-brain barrier. Eliminated primarily in urine and, to a much lesser extent, in feces. *Half-life:* 1.6-1.8 h.

#### AVAILABILITY

*Capsules:* 5 mg, 20 mg, 100 mg, 140 mg, 180 mg, 250 mg. *Powder for Injection:* 100 mg.

# INDICATIONS AND DOSAGES Newly diagnosed glioblastoma multiforme

Temozolomide (Generic Name), Temodar (Brand Name)

#### PO OR INFUSION

Adults. 75 mg/m<sup>2</sup> daily for 42 days concomitant with focal radiotherapy; then, 150 mg/m<sup>2</sup> once daily for days 1-5 of a 28-day cycle for the first maintenance cycle. Usually 6 cycles total, but dose can be escalated in cycle 2-6 up to 200 mg/m2; doses are based on tolerance and ANC and platelet counts.

# Anaplastic astrocytoma

PO OR IV INFUSION Adults, Elderly, Initially, 150 mg/m<sup>2</sup>/day on days 1-5 of a 28-day treatment cycle. Subsequent doses based on platelet count and absolute neurophil count. Maintenance: May be escalated up to a maximum of 200 mg/m<sup>2</sup>/day for 5 days q4wk. Continue until disease progression. Minimum: 100 mg/m<sup>2</sup>/ day for 5 days for subsequent cycle.

#### CONTRAINDICATIONS

Hypersensitivity to temozolomide or to DTIC, also known as dacarbazine.

# INTERACTIONS

#### Drug

Live-virus vaccines: May potentiate virus replication, increase vaccine side effects, and decrease the patient's antibody response to the vaccine. Valproic acid: Decreases the clearance of temozolomide. Herbal

None known.

#### Food

All foods: Decrease the rate of drug absorption.

#### DIAGNOSTIC TEST EFFECTS

May decrease blood hemoglobin levels and neutrophil, platelet, and WBC counts.

# IV INCOMPATIBILITIES

Do not infuse with any other medications simultaneously.

# SIDE EFFECTS

#### Frequent (33%-53%)

Nausea, vomiting, headache, fatigue, constipation.

#### Occasional (10%-16%)

Diarrhea, asthenia, fever, dizziness, peripheral edema, incoordination, insomnia.

#### Rare (5%-7%)

Paresthesia, drowsiness, anorexia, urinary incontinence, anxiety, pharyngitis, cough.

# SERIOUS REACTIONS

· Elderly patients and women are at increased risk for developing severe myelosuppression, characterized by neutropenia and thrombocytopenia and usually occurring within the first few cycles. Neutrophil and platelet counts reach their nadirs approximately 26-28 days after administration and recover within 14 days of the nadir.

 Immunosuppression causes risk for serious infection, including opportunistic infection.

Serious allergic reactions are rare.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with severe hepatic or renal impairment. Temozolomide use should be avoided during pregnancy because the drug may cause fetal harm. Although it is unknown whether temozolomide is excreted in breast milk, women taking this drug should avoid breastfeeding. The safety and efficacy of temozolomide have not been established in children. Elderly patients (i.e., older than 70 yr) have a higher risk of developing grade 4 neutropenia and grade 4 thrombocytopenia. Vaccinations and coming in contact with crowds and people

with known infections should be avoided.

Notify the physician if the patient experiences easy bruising, fever, signs of local infection, sore throat, or unusual bleeding from any site. Before administration, ANC must be  $> 1500/mm^3$  and the platelet count must be  $> 100,000/mm^3$ . To control nausea and vomiting, antiemetics should be administered. A CBC on day 22 (21 days after the first dose) or within 48 h of that day and then weekly until the ANC is  $> 1500/mm^3$  and the platelet count is  $> 100,000/mm^3$  should be ordered.

#### Storage

Store capsules at room temperature. Unopened injection vials are stored in the refrigerator and protected from light; do not freeze. Reconstituted product must be used within 14 h, including infusion time.

#### Administration

CAUTION: Observe and exercise usual cautions for handling, preparing, and administering solutions of cytotoxic drugs. Avoid exposure to capsule contents.

Administer temozolomide on an empty stomach because food reduces the rate and extent of drug absorption and increases the risk of nausea and vomiting. For best results, take temozolomide at bedtime. Swallow the capsule whole with a glass of water. If the patient cannot swallow, open the capsule and mix the contents with applesauce or apple juice.

The injection is for IV infusion only. Bring the vial to room temperature prior to reconstitution. Reconstitute each vial with 41 mL sterile water for injection; the final concentration will be 2.5 mg/ mL. Gently swirl; do not shake. Withdraw the appropriate dose and transfer into an empty 250-mL PVC infusion bag. Infuse IV using a pump over a period of exactly 90 min. Flush the lines before and after each infusion.

# Tenofovir

ten-oh'foh-veer

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: B

**Classification:** Antiretrovirals, nucleotide reverse transcriptase inhibitors

# **MECHANISM OF ACTION**

A nucleotide analog that inhibits viral reverse transcriptase by being incorporated into viral DNA, resulting in DNA chain termination. *Therapeutic Effect:* Slows HIV replication and reduces HIV RNA levels (viral load). Slows hepatitis B replication and progression of hepatitis B disease.

# PHARMACOKINETICS

Well absorbed orally. Protein binding: Negligible. Intracellularly phosphorylated to the active metabolite tenofovir diphosphate. Prolonged intravellular half-life (15-50 h). Roughly 70%-80% of the dose is recovered in the urine as unchanged drug. Dependent on glomerular filtration and active renal tubular secretion. *Half-life*: 17 h.

# AVAILABILITY

Tablets: 300 mg.

INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals) PO

Tenofovir (Generic Name), Viread (Brand Name)

# **Temsirolimus**

tem'sir-oh'li-mus

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Antineoplastics, biologic response modifiers

# **MECHANISM OF ACTION**

Prevents activation of the enzyme target of rapamycin (mTOR), a key regulatory kinase in cell-cycle progression. Results in G1 growth arrest of tumor cells. *Therapeutic Effect:* Inhibits proliferation of tumor cells.

# PHARMACOKINETICS

Extensively metabolized in the liver primarily by CYP3A4. Five temsirolimus metabolites are formed, but sirolimus is the principal and active metabolite. Temsirolimus and metabolites are primarily eliminated via the feces, and the drug exhibits a bi-exponential decline in whole blood concentrations. *Half-life:* Mean 17.3 hours (temsirolimus), and mean 54.6 h (sirolimus).

# AVAILABILITY

Injection: 25 mg/mL.

# INDICATIONS AND DOSAGES

Advanced renal cell cancer
 IV INFUSION
 Adults. 25 mg as IV infusion once weekly.

Dosage adjustments for toxicity

Expect to withhold treatment if significant neutropenia or thrombocytopenia occurs. Expect new dosage once restarted to decrease, but that a dosage will not go below 15 mg/wk.

#### Dosage adjustments for mild hepatic impairment

Reduce to 15 mg IV infusion once weekly.

#### Dosage for co-use of strong CYP3A4 inhibitor

12.5 mg as IV infusion once weekly is suggested.

#### Dosage for co-use of strong CYP3A4 inducer

Consider dose increase up to 50 mg/ wk. Monitor closely.

# CONTRAINDICATIONS

Hypersensitivity to temsirolimus; bilirubin > 1.5 times upper limit of normal.

# INTERACTIONS

#### Drug

Itraconazole, ketoconazole, clarithromycin, erythromycin, protease inhibitors, nefazodone, verapamil: May increase the blood concentration and risk of toxicity of temsirolimus.

**Carbamazepine**, **phenobarbital**, **phenytoin**, **rifampin**: May decrease the blood concentration and effects of temsirolimus.

Live vaccines: Avoid during treatment.

#### Herbal

**St. John's wort:** Avoid, as may lower temsirolimus concentrations.

Food

**Grapefruit juice:** May increase temsirolimus and sirolimus exposure; avoid.

# **DIAGNOSTIC TEST EFFECTS**

May decrease blood hemoglobin level, hematocrit, WBC, and platelet count. May increase blood glucose, serum cholesterol, creatinine, and triglyceride levels, as well as liver enzymes.

#### IV INCOMPATIBILITIES

Do not mix or infuse with other medications.

#### SIDE EFFECTS

#### **Frequent** (≥ 20%)

Rash, asthenia, mucositis, nausea, edema, and anorexia. Anemia, hyperglycemia, hyperlipemia, hypertriglyceridemia, lymphopenia, hypophosphatemia, thrombocytopenia, leukopenia, elevated hepatic enzymes.

#### Occasional (10%-20%)

Diarrhea, cough, abdominal pain, infection or sore throat, vomiting, weight loss, chest pain, headache, nail disorder/thinning, insomnia, epistaxis, dry skin.

#### Rare

Hypertension, arthralgia, hypokalemia.

#### SERIOUS REACTIONS

 Increases the risk of infection and may be associated with the development of secondary malignancy.

• Worsening of, or new, hepatic impairment.

 Hypersensitivity reactions may be extensive.

Interstitial lung disease.

Renal failure.

• Bowel perforations or poor wound healing.

• Bleeding, including intracerebral bleeding.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with chickenpox, herpes zoster, hepatic impairment, and infection. Temsirolimus can cause fetal harm. Women of childbearing potential should be advised to avoid becoming pregnant throughout treatment and for 3 mo after therapy has stopped. Men with partners of childbearing potential should use reliable contraception throughout treatment and are recommended to continue this for 3 mo after the last dose. Breastfeeding is not recommended. This drug is not approved for use in children. Elderly patients are more likely to have diarrhea, infections, and other side effects.

Avoid coming in contact with people with colds or other infections. Liver function tests, CBC should be monitored regularly. Report rash, signs or symptoms of infection, dyspnea, or any other unusual symptoms promptly for evaluation. **Storage** 

Store unopened injection kits refrigerated; do not freeze and protect from light. Once diluted, the vial solution is stable for up to 24 h at room temperature. After further dilution for infusion, complete infusion within 6 h of preparation. Administration

CAUTION: Observe and exercise usual precautions for handling, preparing, and administering solutions of cytotoxic drugs. Notify the physician if a dose is missed.

Premedicate with IV diphenhydramine (25-50 mg, or similar antihistamine) roughly 30 min before the start of each infusion.

Use only diluent provided; inject 1.8 mL into the vial. The concentration will be 10 mg/mL. Must be further diluted. Withdraw the required dosage and inject rapidly into a 250-mL container (glass, polyolefin, or polyethylene) of 0.9% NaCl injection. Mix by gentle inversion. Avoid excessive shaking as this may cause foaming.

Use an administration set of non-DEHP tubing. An in-line polyethersulfone filter with a pore size of not greater than 5 microns is recommended. Infuse IV over a 30-60 min period once a week. The use of an infusion pump is preferred. Adults, Elderly, Children 12 yr and older and weight  $\ge$  35 kg. 300 mg once a day.

#### Chronic hepatitis B infection PO

Adults, Elderly. 300 mg once a day. • Dosage adjustment for renal

# impairment (adults)

CrCl 30-49 mL/min: 300 mg q48h. CrCl 10-29 mL/min: 300 mg q72-96h.

Hemodialysis: 300 mg every 7 days or after roughly 12 h of dialysis.

# CONTRAINDICATIONS

Hypersensitivity to tenofovir, concurrent use of tenofovircontaining combinations.

# INTERACTIONS

#### Drug

Acyclovir, cidofovir, ganciclovir, valacyclovir, valganciclovir: May increase the blood concentrations of tenofovir.

Adefovir: May compete for tubular secretion; avoid use together.

Atazanavir, lopinavir, ritonavir: May increase tenofovir blood concentrations, decreases atazanavir concentrations.

**Didanosine:** May increase didanosine blood concentration.

Potentially nephrotoxic drugs (e.g., aminoglycosides, cisplatin, vancomycin, others): May increase risk for neprotoxicity; use caution.

Herbal

None known.

Food

**High-fat food:** Increases tenofovir bioavailability.

# **DIAGNOSTIC TEST EFFECTS**

May elevate liver function test results. May alter serum CK, GGT, uric acid, AST (SGOT), ALT (SGPT), and triglyceride levels as well as creatinine clearance.

#### SIDE EFFECTS Frequent

Rash, diarrhea, headache, pain, depression, asthenia, nausea.

#### Occasional

Insomnia, fever, dizziness, myalgia, sweating.

#### SERIOUS REACTIONS

• Lactic acidosis and hepatomegaly with steatosis (rare).

• Renal dysfunction, renal tubular acidosis.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with impaired liver or renal function. Use with caution during pregnancy; use is not recommended during lactation due to the risk of transmittal of the HIV virus. There is no experience in children less than 12 yr of age. Check baseline laboratory test results, if ordered, especially liver function test results and serum triglyceride levels before beginning tenofovir therapy and at periodic intervals during therapy. Tenofovir is not a cure for HIV or HBV infection. nor does it reduce risk of transmission to others.

Monitor CD4 cell count, complete blood count (CBC), hemoglobin levels, HIV RNA plasma levels, liver function test results, and reticulocyte count. Assess pattern of daily bowel activity and stool consistency. Notify the physician if nausea, persistent abdominal pain, or vomiting occurs.

#### Storage

Store at controlled room temperature.

#### Administration

May be taken without regard to food. Continue drug therapy for the full length of treatment.

# Terazosin

ter-a'zoe-sin ▲ Apo-Terazosin, Hytrin, Novo-Terazosin

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Antiadrenergics, α-blocking, peripheral

# **MECHANISM OF ACTION**

An antihypertensive and benign prostatic hyperplasia agent that blocks  $\alpha$ -adrenergic receptors. Produces vasodilation, decreases peripheral resistance, and targets receptors around bladder neck and prostate. *Therapeutic Effect:* In hypertension, decreases BP. In benign prostatic hyperplasia, relaxes smooth muscle and improves urine flow.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	15 min	1-2 h	12-24 h

Rapidly, completely absorbed from the GI tract. Protein binding: 90%-94%. Metabolized in the liver to active metabolite. Eliminated primarily in feces via the biliary system; excreted in urine. Not removed by hemodialysis. *Half-life*: 9.2-12 h.

# AVAILABILITY

Capsules: 1 mg, 2 mg, 5 mg, 10 mg.

# INDICATIONS AND DOSAGES Mild to moderate hypertension PO

*Adults, Elderly.* Initially, 1 mg at bedtime. Slowly increase dosage to desired levels. Range: 1-5 mg/day as single or 2 divided doses. Maximum: 20 mg.

# Benign prostatic hyperplasia PO

*Adults, Elderly.* Initially, 1 mg at bedtime. May increase up to 10 mg/day. Maximum: 20 mg/day.

# CONTRAINDICATIONS

Hypersensitivity to terazosin or other  $\alpha_1$ -blockers. Concurrent use with phosphodiesterase-5 inhibitors.

# INTERACTIONS

Drug Estrogen, NSAIDs, other sympathomimetics: May decrease the effects of terazosin. Hypotension-producing medications, such as antihypertensives and diuretics: May increase the effects of terazosin. Phosphodiesterase-5 inhibitors (e.g., sildenafil, tadalafil, vardenafil): May increase the hypotensive effects. Use is contraindicated. Horebal

# Herbal

**Dong quai, ginseng, garlic, yohimbe:** May decrease the effects of terazosin.

**Saw palmetto:** May interfere with effects of terazosin.

#### Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May decrease blood hemoglobin and hematocrit levels, serum albumin level, total serum protein level, and WBC count.

# SIDE EFFECTS

#### Frequent (5%-9%)

Dizziness, headache, unusual tiredness.

#### Rare (< 2%)

Peripheral edema, orthostatic hypotension, myalgia, arthralgia, blurred vision, nausea, vomiting, nasal congestion, somnolence.

Terazosin (Generic Name)

#### SERIOUS REACTIONS

• Severe orthostatic hypotension with syncope may be preceded by tachycardia and usually occurs with increased exposure or first dose.

• Rare reports of jaundice, impaired hepatic function, and increased transaminases.

 α-Blockers associated with intraoperative floppy iris syndrome during cataract surgery.

· Priapism (very rare).

• Toxic skin eruptions (very rare).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with confirmed or suspected coronary artery disease. It is unknown whether terazosin crosses the placenta or is distributed in breast milk. The safety and efficacy of terazosin have not been established in children. No age-related precautions have been noted in elderly patients, but this age group may be more sensitive to the drug's hypotensive effects. Caution should be used when driving or operating machinery. Tasks that require mental alertness or motor skills should be avoided until response to the drug is established.

Nasal congestion, dizziness, light-headedness, and fainting may occur. Rise slowly from a lying to a sitting position, and permit legs to dangle momentarily before standing to avoid the hypotensive effect. BP and pulse should be obtained immediately before each dose, and every 15-30 min thereafter until BP is stabilized. Be alert for fluctuations in BP. Genitourinary symptoms and peripheral edema should also be assessed.

#### Storage

Store at room temperature.

#### Administration

! If terazosin is discontinued for several days, restart therapy with a 1-mg dose at bedtime. Take terazosin without regard to food. Administer first dose at bedtime to minimize the risk of fainting at the first dose.

# **Terbinafine**

ter-been'a-feen Lamisil, Lamisil AT Apo-Terbinafine, Lamisil, Novo-Terbinafine Do not confuse terbinafine with terbutaline, or Lamisil with Lamictal. OTC (topical forms) Rx (tablets)

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antifungals, topical, dermatologics

#### MECHANISM OF ACTION

A fungicidal antifungal that inhibits the enzyme squalene epoxidase, thereby interfering with fungal biosynthesis. *Therapeutic Effect:* Results in death of fungal cells.

#### AVAILABILITY

Tablets (Lamisil): 250 mg. Gel or Cream (Lamisil AT): 1%. Granules (Lamisil): 125 mg/packet, 187.5 mg/packet Topical Solution (Lamisil, Lamisil AT): 1%.

#### INDICATIONS AND DOSAGES Tinea pedis

# TOPICAL

*Adults, Elderly, Children 12 yr and older.* Apply twice a day until signs and symptoms significantly improve.

• Tinea cruris, tinea corporis TOPICAL

Terbinafine (Generic Name)

Adults, Elderly, Children 12 yr and older. Apply twice a day until signs and symptoms significantly improve.

#### Onychomycosis PO

Adults, Elderly, Children 12 yr and older. 250 mg/day for 6 wks (fingernails) or 12 wks (toenails).

# Tinea versicolor

TOPICAL SOLUTION *Adults, Elderly.* Apply to the affected area twice a day at least 7 days and no longer than 4 wks.

#### CONTRAINDICATIONS

Hypersensitivity to terbinafine. Not recommended for patients with active or chronic liver disease.

#### INTERACTIONS

#### Drug

Alcohol, other hepatotoxic medications: May increase the risk of hepatotoxicity. Hepatic enzyme inducers, including rifampin: May increase terbinafine clearance. Hepatic enzyme inhibitors, including cimetidine: May decrease terbinafine clearance. Herbal None known.

Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase SGOT (AST) and SGPT (ALT) levels. Rare decreases in lymphocyte and WBC counts.

#### SIDE EFFECTS

Frequent (13%) Oral: Headache. Occasional (3%-6%)

Oral: Diarrhea, rash, dyspepsia, pruritus, taste disturbance, nausea. Rare

Oral: Abdominal pain, flatulence, urticaria, depressed mood, visual

disturbance and disturbance of smell.

Topical: Irritation, burning, pruritus, dryness.

#### SERIOUS REACTIONS

• Hepatobiliary dysfunction (including cholestatic hepatitis), serious skin reactions, and severe neutropenia occur rarely.

• Ocular lens and retinal changes have been noted.

• Lupus-like syndrome with systemic treatment (rare).

#### PRECAUTIONS & CONSIDERATIONS

As appropriate, monitor liver function when receiving treatment for longer than 6 wks. Use with caution in renal impairment due to lack of sufficient data. Patients should report depressive symptoms or any taste, smell, or visual disturbances to their physician.

Topical therapy may be used for a minimum of 1 wk and is not to exceed 4 wks. Discontinue the medication and notify the physician if a local reaction occurs. Separate personal items that come in contact with affected areas.

#### Storage

Store oral and topical products at room temperature.

#### Administration

Rub the topical form well into the affected and surrounding area. Keep affected areas clean and dry and wear light clothing to promote ventilation. Avoid contact with eyes, mouth, nose, or other mucous membranes. The treated area should not be covered with an occlusive dressing.

When taking terbinafine tablets, take without regard to food. Granules may be sprinkled on a spoonful of nonacidic food that should be swallowed without chewing.

# **Terbutaline**

ter-byoo'te-leen Bricanyl Do not confuse terbutaline with tolbutamide or terbinafine.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Adrenergic agonists, bronchodilators, short-acting  $\beta$ -agonist

# **MECHANISM OF ACTION**

An adrenergic agonist that stimulates  $\beta_2$ -adrenergic receptors, resulting in relaxation of uterine and bronchial smooth muscle. *Therapeutic Effect:* Relieves bronchospasm and reduces airway resistance. Also inhibits uterine contractions.

# PHARMACOKINETICS

Small amounts distributed across the placenta. Partial metabolism in the liver and excretion in the urine, about 60% as unchanged drug and the rest as metabolites, with a small amount excreted via the bile in the feces. *Half-life:* 3.4 h.

# AVAILABILITY

*Tablets:* 2.5 mg, 5 mg. *Injection:* 1 mg/mL.

# INDICATIONS AND DOSAGES

Bronchospasm PO

Adults, Elderly, Children 15 yr and older: Initially, 2.5 mg 3-4 times a day. Maintenance: 2.5-5 mg 3 times a day q6h while awake. Maximum: 15 mg/day.

Children aged 12-14 yr. 2.5 mg 3 times a day. Maximum: 7.5 mg/day.

*Children 6-11 yr:* Initially, 0.05 mg/ kg/dose q8h. May increase up to 0.15 mg/kg/dose. Maximum: 5 mg/day. SC

Adults, Children 12 yr and older. Initially, 0.25 mg. Repeat in 15-30 min if substantial improvement does not occur. Maximum: 0.5 mg/4 h. Children younger than 12 yr. 0.005-0.01 mg/kg/dose to a maximum of 0.25 mg q15-20min for 3 doses.

# CONTRAINDICATIONS

History of hypersensitivity to sympathomimetics.

# INTERACTIONS

#### Drug

**β-Blockers:** May decrease the effects of  $\beta$ -blockers.

**Digoxin, sympathomimetics:** May increase the risk of arrhythmias. **MAOIs:** May increase the risk of hypertensive crisis.

Tricyclic antidepressants: May increase cardiovascular effects. Herbal

Ephedra, yohimbe: May increase central nervous system (CNS) stimulation. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

May decrease serum potassium level.

# SIDE EFFECTS

Frequent (18%-23%) Tremor, anxiety, nervousness,

restlessness.

Occasional (10%-11%)

Somnolence, headache, nausea, heartburn, dizziness.

Rare (1%-3%)

Flushing, asthenia, mouth and throat dryness or irritation (with inhalation therapy).

Terbutaline (Generic Name)

# SERIOUS REACTIONS

Too-frequent or excessive use may lead to decreased drug effectiveness and severe, paradoxical bronchoconstriction.
Excessive sympathomimetic stimulation may cause palpitations, extrasystoles, tachycardia, chest pain, a slight increase in BP followed by a substantial decrease, chills, diaphoresis, and blanching of skin.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiovascular disorders, hypertension, diabetes mellitus, a history of seizures, and hyperthyroidism. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea. Terbutaline should not be used for tocolysis during pregnancy due to a risk of maternal and fetal changes in heart rate, blood sugar, and other cardiac effects. Use caution during lactation. Not approved for use in children < 12 yr of age.

Anxiety, nervousness, and shakiness may occur. Notify the physician of chest pain, difficulty breathing, dizziness, flushing, headache, muscle tremors, or palpitations. Pulse rate and quality, respiratory rate, depth, rhythm, and type, BP, ABG levels, and serum potassium levels should be monitored. Fingernails and lips should be assessed for a blue or dusky color in light-skinned patients and a gray color in darkskinned patients, which are signs of hypoxemia.

#### Storage

Store tablets and injection at room temperature. Protect injection from light.

#### Administration

Take terbutaline with food if the patient experiences GI upset. Crush tablets as needed.

The drug may be injected subcutaneously into the lateral deltoid region. Do not use solution if it appears discolored.

#### **Terconazole**

ter-kon'a-zole Terazol 3, Terazol 7, Zazole

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antifungals, topical, dermatologics

# **MECHANISM OF ACTION**

An antifungal that disrupts fungal cell membrane permeability. *Therapeutic Effect:* Produces antifungal activity.

# PHARMACOKINETICS

Extent of systemic absorption varies 5%-8% in women who have had a hysterectomy versus 12%-16% in women with a uterus.

# AVAILABILITY

Suppository: 80 mg (Terazol 3, Zazole). Cream: 0.4% (Terazol 7, Zazole), 0.8% (Terazol 3, Zazole).

# INDICATIONS AND DOSAGES Vulvovaginal candidiasis

INTRAVAGINAL Adults, Elderly. 1 suppository vaginally at bedtime for 3 days. Adults, Elderly. One applicatorful at bedtime for 7 days (0.4% cream) or for 3 days (0.8% cream).

# CONTRAINDICATIONS

Hypersensitivity to terconazole or any component of the formulation.

# INTERACTIONS

#### Drug

**Spermicides (e.g., nonoxynol-9):** Spermicide inactiviated; may lead to contraceptive failure.

#### Herbal

None known. Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Headache, vulvovaginal burning. Occasional

Dysmenorrhea, pain in female genitalia, abdominal pain, fever, itching.

#### Rare

Chills.

# SERIOUS REACTIONS

• Flu-like syndrome has been reported.

# **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in the first trimester of pregnancy. It is unknown whether terconazole crosses the placenta or is distributed in breast milk. Safety and efficacy of terconazole have not been established in children. No agerelated precautions have been noted in elderly patients.

#### Storage

Store at room temperature.

# Administration

Insert suppository or administer cream vaginally at bedtime. Complete full course of therapy. Contact physician if burning or irritation occurs.

# **Teriparatide**

ter-i-par'a-tide

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Hormones/ hormone modifiers, parathyroid hormone analog

# MECHANISM OF ACTION

A synthetic polypeptide hormone that acts on bone to mobilize calcium; also acts on kidney to reduce calcium clearance, increase phosphate excretion. *Therapeutic Effect:* Promotes an increased rate of release of calcium from bone into blood, stimulates new bone formation.

# PHARMACOKINETICS

Bioavailability following subcutaneous use about 95%. Peak serum concentrations occur 30 min after administration and decline to nonqualifiable within 3 h. There is hepatic and extra-hepatic clearance. Peripheral metabolism of teriparatide is believed to occur by nonspecific liver enzymes followed by excretion via the kidneys. *Half-life:* 1 h after SC administration.

# AVAILABILITY

*Injection:* 2.4-mL prefilled pen containing 600 mcg teriparatide (Forteo).

# INDICATIONS AND DOSAGES • Osteoporosis SC

*Adults, Elderly.* 20 mcg once daily into the thigh or abdominal wall.

# CONTRAINDICATIONS

Serum calcium above normal level, those at increased risk for osteosarcoma (Paget's disease, unexplained elevations of alkaline phosphatase, open epiphyses, prior radiation therapy that includes the skeleton), hypercalcemic disorder (e.g., hyperparathyroidism), hypersensitivity to teriparatide or any of the components of the formulation.

# INTERACTIONS

#### Drug

**Digoxin:** May increase serum digoxin concentration.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum calcium.

# SIDE EFFECTS

#### Occasional

Leg cramps, nausea, dizziness, headache, orthostatic hypotension, increased heart rate.

# SERIOUS REACTIONS

• In animal studies, teriparatide has been associated with an increase in osteosarcoma.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bone metastases, cardiovascular disease, history of skeletal malignancies, metabolic bone diseases other than osteoporosis, and concurrent therapy with digoxin. Be aware that teriparatide use for more than 2 yr is not recommended. Teriparatide should be used in women who have passed menopause and cannot become pregnant or breastfeed. Teriparatide is not indicated for children. Teriparatide may cause fast heartbeat, dizziness, lightheadedness, and fainting. Avoid alcohol and tasks that require mental alertness and change positions slowly. Signs of toxicity are rash, nausea, dizziness, and leg cramps. **Storage** 

Refrigerate and minimize the time out of the refrigerator. Do not freeze. Each pen can be used for up to 28 days after the first injection. After 28 days, discard.

#### Administration

Administer SC injection into the thigh or abdominal wall. Administration sites should be rotated. For the first administration, patients should sit or lie down to minimize hypotension.

#### Tesamorelin

tes-a-moe-rel'-in ★ ♥ Egrifta

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: X

**Classification:** Hormones, growth hormone-releasing factor

# **MECHANISM OF ACTION**

Tesamorelin stimulates growth hormone secretion, and subsequently increases IGF-1 and IGFBP-3 levels. The increase in insulin-like growth factors (IGFs) in the liver and other tissues antagonize peripheral insulin and stimulate insulin output, hydrolyze triglycerides in adipose tissue; stimulate hepatic glucose output; induce of a positive calcium balance; and promote retention of sodium and potassium. Anabolic actions stimulate of DNA, RNA, and protein synthesis, and induce cell proliferation and growth. *Therapeutic Effect:* Reduces excess abdominal fat in HIV-infected patients with lipodystrophy.

# PHARMACOKINETICS

After subcutaneous administration, < 4% bioavailability. Metabolic path unclear. *Half-life:* 26-38 mins.

# AVAILABILITY

Injection Powder for Solution: 1 mg/ vial, supplied with diluent.

#### INDICATIONS AND DOSAGES

 To reduce abdominal fat in HIVinfected persons with lipodystrophy SUBCUTANEOUS

Adults. 2 mg once daily.

# CONTRAINDICATIONS

Hypersensitivity to tesamorelin or mannitol; pregnancy; disruption of the hypothalamic-pituitary axis due to hypophysectomy; hypopituitarism or pituitary tumor/surgery; head irradiation or head trauma; any active malignancy.

# INTERACTIONS

#### Drug

Corticosteroids: Requirements for prednisone or other glucocorticoid dose may increase during tesamorelin treatment. Monitor. CYP-metabolized drugs with narrow therapeutic ranges (e.g., anticonvulsants, cyclosporine, estrogen and other sex steroids, theophylline, warfarin): Tesamorelin may alter drug metabolism through the effects on growth hormone. Monitor levels or laboratory tests closely. Diabetic medications: Blood glucose alterations during somatropin treatment may require dosage adjustments in medicines for diabetes. Monitor.

# Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase blood glucose. Monitor IGF-1, as tesamorelin stimulates GH production and increases serum IGF-1.

# SIDE EFFECTS

#### Frequent (> 5%)

Arthralgia, injection site reactions (erythema, pruritis), pain in extremity, peripheral edema, and myalgia.

#### Occasional (1-5%)

Paresthesia, hypoesthesia, depression, chest pain or palpitations, increased blood pressure, night sweats, dyspepsia, upper abdominal pain, hypersensitivity (e.g., pruritus, erythema, flushing, urticaria), carpal tunnel syndrome.

#### Rare (<1%)

Vomiting, hyperglycemia, hypothyroidism, gynecomastia, dry skin.

# SERIOUS REACTIONS

· Rarely, serious hypersensitivity.

• Increased intracranial pressure with papilledema, visual changes, headache have been reported with other products that increase growth hormone.

• Adrenal insufficiency may worsen or develop.

• Pancreatitis has been reported with products that increase growth hormone.

• Potential for existing tumor growth or secondary malignancy.

· Diabetes may occur or worsen.

# **PRECAUTIONS & CONSIDERATIONS**

In critical acute illness, consider the benefit of continuing tesamorelin

against the potential risk; use with caution in patients with history of or current neoplasms and monitor closely for growth or recurrence of cancer. The drug may cause impaired glucose tolerance; monitor glucose levels in all patients and especially in those with diabetes mellitus. Use with caution in hypothyroidism as condition may worsen. The drug, based on animal studies, may cause fetal harm; do not use in pregnancy. Non hormonal contraception is advised. HIV-1 infected mothers should not breastfeed to avoid potential postnatal transmission of HIV-1. Safety and effectiveness have not been established in children; do not use in children with open epiphyses, as excess GH and IGF-1 may result in linear growth acceleration and excessive growth. The elderly may be more sensitive to the effects of tesamorelin. Monitor IGF-1 levels, weight, blood sugar and serum chemistries. If response to treatment is not robust, may reconsider use of the drug. Watch for fluid retention and edema, and for signs of adrenal insufficiency or thyroid disease, which may require hormone replacement. Evaluate product tolerance and compliance. Vision changes or difficulty in breathing should be promptly reported and evaluated.

#### Storage

Protect unopened tesamorelin vials from light and keep in the original box in the refrigerator. The diluent (sterile water for injection, USP), syringes and needles are kept at controlled room temperature. Do not freeze. Once reconstituted, use the solution immediately.

#### Administration

Gather 2 vials (2 mg total) and a diluent vial for the dose. Inject 2.2 mL of sterile water for injection using

the provided syringe into the first vial; slowly rotate for about 30 seconds to dissolve; do not shake. Remove the resulting drug solution from this vial with the provided syringe (2.2 mL), change the mixing needle, and inject the solution into the second vial. Slowly rotate to mix; again do not shake. Withdraw the dissolved drug into the syringe (2.2 mL). Change the needle to the provided injection needle to prepare the syringe for injection. Inspect visually for particulate matter and discoloration prior to administration. The solution will be clear and colorless. Do not inject if the solution is cloudy or contains particulate matter. For subcutaneous use only. Do not give intravenously. Subcutaneous injections may be given in skin of the lower abdomen, below and away from the navel. Do not inject into any area that is scarred, bruised or red, infected or irritated. Injection sites should always be rotated.

#### **Testosterone**

tess-toss'ter-one Androderm, AndroGel, Axiron, Delatestryl, Depo-Testosterone, First Testosterone, Fortesta, Striant, Testim, Testopel **Do not confuse testosterone with testolactone.** 

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: III

**Classification:** Androgens, hormones/hormone modifiers

# **MECHANISM OF ACTION**

A primary endogenous androgen that promotes growth and development of male sex organs and maintains secondary sex characteristics in androgen-deficient males. *Therapeutic Effect:* Helps relieve androgen deficiency.

#### PHARMACOKINETICS

Well absorbed after IM administration. Protein binding: 98%. Undergoes first-pass metabolism in the liver. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life*: 10-100 min.

# AVAILABILITY

Cypionate Injection (Depo-Testosterone): 100 mg/mL, 200 mg/mL. Ethanate Injection (Delatestryl): 200 mg/mL. Kit (Prescription Compounding) (First Testosterone): 100 mg/mL mixed to cream or gel. Subcutaneous Pellets (Testopel): 75 mg. Topical Gel (Androgel 1% Packets): 25 mg/2.5 g and 50 mg/5g. Topical Gel (Androgel 1.62% Pump): 20.25 mg/pump actuation. Topical Gel (Fortesta pump): 10 mg/ pump actuation. Topical Gel (Testim): 50 mg/5 g. Topical Solution (Axiron): 30 mg/ pump actuation. Transdermal Patch (Androderm): 2 mg/day, 4 mg/day. Buccal (Striant): 30 mg.

#### INDICATIONS AND DOSAGES Male hypogonadism IM

Adults. 50-400 mg q2-4wk. Adolescents. Initially 40-50 mg/ m<sup>2</sup>/dose monthly until growth rate falls to prepubertal levels. 100 mg/m<sup>2</sup>/dose until growth ceases. Maintanence virilizing dose: 100 mg/ m<sup>2</sup>/dose twice a month. SC (PELLETS) Adults, Adolescents. 150-450 mg q3-6mo. TRANDERMAL (PATCH [ANDRODERM]) Adults, Elderly. Initiate with 4 mg/ day patch applied at night. Apply patch to abdomen, back, thighs, or upper arms. Patients previously receiving 2.5 mg/day can begin a 2 mg/day patch. Those previously receiving 7.5 mg/day can start 6 mg/day (2-mg patch plus 4-mg patch). Can titrate to desired effect. Maximum 6 mg/day. TRANSDERMAL (GEL [ANDROGEL 1%]) Adults, Elderly. Initial dose of 5 g of 1% gel delivers 50 mg testosterone and is applied once daily to the abdomen, shoulders, or upper arms. May increase to 7.5 g, then to 10 g, if necessary. TRANSDERMAL (GEL [ANDROGEL 1.62% PUMP]) NOTE: Dosing not the same as Androgel 1%. Adults, Elderly. Starting does is 40.5 mg of testosterone (2 pump actuations of 1.62% gel), applied topically once daily in the morning. Can be dose adjusted between a minimum of 20.25 mg (1 pump actuation) and a maximum of 81 mg (4 pump actuations) of testosterone. TRANSDERMAL (GEL [FORTESTA]) Adults, Elderly. Starting dose is 40 mg of testosterone (4 pump actuations), applied topically once daily in the morning. Can be dose adjusted between a minimum of 10 mg (1 pump actuation) and a maximum of 70 mg (7 pump actuations) of testosterone. TOPICAL (SOLUTION [AXIRON]) Adults, Elderly. Starting dose is 60 mg of testosterone (1 pump actuation to each axilla), applied topically once daily in the morning.

Can be dose adjusted between a minimum of 30 mg (1 pump actuation to 1 axilla only) and a maximum of 120 mg (2 pump actuations to each axilla) of testosterone.

TRANSDERMAL (GEL [TESTIM]) *Adults, Elderly.* Initial dose of 5 g delivers 50 mg testosterone and is applied once a day to the shoulders or upper arms. May increase to 10 g per day.

BUCCAL SYSTEM (STRIANT) *Adults, Elderly.* 30 mg q12h.

#### Delayed puberty

IM Adu

Adults. 50-200 mg q2-4wk. Adolescents. 40-50 mg/m<sup>2</sup>/dose every month for 6 mo. SC (PELLETS) Adults, Adolescents. 150-450 mg q3-6mo.

Breast carcinoma

IM (CYPIONATE OR ETHANATE) *Adults.* 200-400 mg q2-4wk.

# CONTRAINDICATIONS

Cardiac impairment, hypercalcemia, pregnancy, prostate or breast cancer in males, severe hepatic or renal disease.

# INTERACTIONS

#### Drug

Hepatotoxic medications: May increase the risk of hepatotoxicity. Oral anticoagulants: May increase the effects of oral anticoagulants. Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase blood hemoglobin level and hematocrit, as well as serum LDL, alkaline phosphatase, bilirubin, calcium, potassium, sodium, and AST (SGOT) levels. May decrease serum HDL level.

# SIDE EFFECTS

#### Frequent

Gynecomastia, acne. Females: Hirsutism, amenorrhea or other menstrual irregularities, deepening of voice, clitoral enlargement that may not be reversible when drug is discontinued. Occasional

Edema, nausea, insomnia, oligospermia, priapism, male pattern baldness, bladder irritability, hypercalcemia (in immobilized patients or those with breast cancer), hypercholesterolemia, inflammation and pain at IM injection site. Transdermal: Pruritus, erythema, skin irritation.

#### Rare

Polycythemia (with high dosage), hypersensitivity.

# SERIOUS REACTIONS

 Peliosis hepatitis (presence of blood-filled cysts in parenchyma of liver), hepatic neoplasms, and hepatocellular carcinoma have been associated with prolonged high-dose therapy.

• Anaphylactic reactions occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with diabetes and hepatic or renal impairment. Testosterone use is contraindicated during breastfeeding. Use testosterone with caution in children because its safety and efficacy have not been established. Testosterone use in elderly patients may increase the risk of hyperplasia or stimulate growth of occult prostate carcinoma. Avoid taking any other medications, including OTC drugs, without first consulting the physician. Consume a diet high in calories and protein; food may be better tolerated if small, frequent meals are eaten.

Notify the physician of weight gain of  $\geq$  5 lb/wk, acne, nausea, vomiting, or foot swelling. In men, doses are titrated based on serum testosterone concentrations at approximately 14 days and 28 days after initiation or after a does adjustment. Assess periodically, along with a PSA level, once target dose attained.

Females should report deepening of voice, hoarseness, or menstrual irregularities; males should report difficulty urinating, frequent erections, or gynecomastia. Blood hemoglobin and hematocrit, BP, intake and output, weight, serum cholesterol, electrolyte levels, and liver function tests should be monitored. Hand or wrist radiographs should be obtained when using the drug in prepubertal children.

#### Storage

IM formulations should be kept refrigerated. Other formulations may be kept at room temperature. Topical gels and solution are flammable; therefore, avoid fire, flame, and smoking.

#### Administration

Do not give testosterone IV. For IM use, inject testosterone deep into the gluteal muscle. Warming and shaking redissolves crystals that may form in long-acting preparations. A wet needle may cause the solution to become cloudy; this does not affect potency.

Apply Androderm transdermal patches to clean, dry skin on the back, abdomen, upper arms, or thighs. Do not apply it to the scrotum, bony prominences, such as the shoulder; or oily, damaged, or irritated skin. Do

not reapply Androderm to the same site for 7 days.

Apply the transdermal gel to clean, dry, intact skin of shoulder or upper arm, preferably in the morning. Androgel may also be applied to the abdomen. Open the packet, squeeze the entire contents into the palm of the hand, and apply at once to the affected site. Allow the gel to dry. Do not apply the gel to the genital areas.

Apply Striant to the gum area above the incisor tooth, alternating sides of the mouth with each application. Striant is not affected by consumption of alcohol or food, gum chewing, or tooth brushing. Remove Striant product before placing the new one.

Apply the Axiron topical solution to clean, dry, intact skin of the axilla using the supplied applicator, preferably in the morning. Antiperspirant or deodorant may be applied before use. Rinse applicator after use with running water and blot with dry tissue; store with bottle for repeat use.

#### Tetrabenazine

tet'ra-ben'a-zine ★ Xenazine 🍁 Nitoman Do not confuse Xenazine with Xenadrine or Xenical, or tetrabenazine with phenoxybenzamine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Neurologic agents; monoamine depletor; adrenergic inhibitor

# MECHANISM OF ACTION

A selective, reversible, centrally acting dopamine-depleting drug that works by inhibiting vesicular monoamine transporter 2 (VMAT2). Tetrabenazine depletes presynaptic dopamine, norepinephrine, and serotonin storage and antagonizes postsynaptic dopamine receptors. Weak binding affinity at the dopamine-2 receptor. *Therapeutic Effect*: Improves symptoms associated with hyperkinetic movement disorders such as Huntington's disease.

# PHARMACOKINETICS

Absorption at least 75% of PO dose. Protein binding: 85%. Nineteen identified metabolites; the major liver enzyme involved is CYP2D6. Peak plasma concentrations reached within 1.5 h. Primarily excreted in urine (major) and feces (minor) as metabolites. *Half-life:* 4-8 h (increased in hepatic impairment).

#### AVAILABILITY

Tablets: 12.5 mg, 25 mg.

#### INDICATIONS AND DOSAGES • For Huntington's chorea PO

*Adults.* Initially,12.5 mg PO each morning. After 1 wk, increase to 12.5 mg PO twice daily. May increase by 12.5 mg each week. The maximum recommended single dose is 25 mg.

Those needing > 50 mg/day should be genotyped for CYP2D6 expression first. For CYP2D6 Extensive and Intermediate Metabolizers (patients who express CYP2D6): At doses above 50 mg per day, titrate up slowly at weekly intervals by 12.5 mg. Doses above 50 mg/day should be divided and given in a three times a day regimen. The maximum recommended total daily dose is 100 mg and the maximum recommended single dose is 37.5 mg. Reduce dose if not tolerated. For CYP2D6 Poor Metabolizers (patients who do not express CYP2D6): In patients who are CYP2D6 poor metabolizers, dosing is similar except that the recommended maximum single dose is 25 mg, and the maximum recommended daily dose is 50 mg/day.

#### Dosage adjustment if receiving strong CYP2D6 inhibitors

The daily dose of tetrabenazine should be halved in patients newly receiving strong CYP2D6 inhibitors. In patients on a stable dose of a strong CYP2D6 inhibitor, follow the same dosing guidelines as those for poor metabolizers of CYP2D6.

#### Dose adjustment for adverse events

If adverse events such as akathisia, restlessness, parkinsonism, depression, insomnia, anxiety, or intolerable sedation occur, reduce the dose. If the adverse event does not resolve, consider discontinuing. Tetrabenazine may be abruptly discontinued, but chorea may occur 12-18 h after the last dose. If tetrabenazine therapy is interrupted for  $\geq$  5 days, retitrate the dose.

#### CONTRAINDICATIONS

Hypersensitivity, hepatic impairment, inadequately treated depression or current suicidality, use with MAOIs or within 14 days of MAOIs, use with reserpine or within 20 days of reserpine.

#### INTERACTIONS Drug

Alcohol or other CNS depressants: May have additive sedative effects. Any strong CYP2D6 inhibitor (e.g., fluoxetine, paroxetine, quinidine): Decreases tetrabenazine elimination, and may require reduction in tetrabenazine dosage. **MAOIs:** Contraindicated because the MAOI activity directly inhibits the action of tetrabenazine.

QT-prolonging agents (e.g., class IA and III antiarrhythmics, cisapride, pimozide, etc.): Increase the risk of QT prolongation. Avoid. **Reserpine:** Binds irreversibly to VMAT2 with a duration of several days. Using tetrabenazine concurrently may cause overdosage and major depletion of serotonin and norepinephrine in the CNS. At least 20 days should elapse after stopping reserpine before starting tetrabenazine. Contraindicated. **Herbal and Food** 

Herbal and Foo None known.

# DIAGNOSTIC TEST EFFECTS

Hyperprolactinemia. Before patients are given a daily dose > 50 mg, they should be tested for the CYP2D6 gene to determine whether they are poor metabolizers (PMs).

# SIDE EFFECTS

#### Frequent

Common adverse effects such as depression, dysphagia, nausea, fatigue, insomnia, sedation/ somnolence, parkinsonism, and akathisia/restlessness may be dose-dependent and may resolve or lessen with dosage adjustment or specific treatment.

#### Occasional

Anxiety, irritability, change in appetite, shortness of breath, headache, unsteady gait, anxiety, ecchymosis, dysuria.

#### Rare

See Serious Reactions.

#### SERIOUS REACTIONS

• Neuroleptic malignant syndrome (NMS) (rare).

• Dysphagia interfering with oral intake.

- · Increase in QT interval.
- · Tardive dyskinesia or akathisia.

#### PRECAUTIONS & CONSIDERATIONS

NOTE: Tetrabenazine is available only from a Specialty Pharmacy Network; the physician and patient must complete and sign the Xenazine Treatment Form to enroll.

This drug can increase the risk of depression and suicidal thoughts and behavior (suicidality). Close observation of patients should accompany therapy. Report unusual or worsening behaviors of concern promptly to the treating physician. Use with caution in those with a history of breast cancer, with cardiac disease such as heart failure, recent heart attack or arrhythmia, orthostasis, or electrolyte imbalances. It is not known if the drug crosses the placenta, and it is unknown if tetrabenazine is distributed in breast milk. Breastfeeding is not recommended. Be aware that the safety and efficacy of this drug have not been established in children.

Before starting drug therapy, check baseline lab values, especially hepatic function. Expect to monitor for unusual movements, behaviors, difficulty swallowing or speaking, excessive sedation, dizziness, nausea, and pattern of daily activity. Avoid activities that require mental acuity if dizziness or sedation occurs.

#### Storage

Store tablets at room temperature. Administration

Give tetrabenazine without regard to meals, at roughly the same times each day.

# **Tetracycline**

tet-ra-sye'kleen 酔 Apo-Tetra, Nu-Tetra

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Anti-infectives, tetracyclines

# **MECHANISM OF ACTION**

A tetracycline antibiotic that inhibits bacterial protein synthesis by binding to ribosomes. *Therapeutic Effect:* Bacteriostatic.

# PHARMACOKINETICS

Readily absorbed from the GI tract. Protein binding: 30%-60%. Widely distributed. Excreted in urine; eliminated in feces through biliary system. Not removed by hemodialysis. *Half-life:* 6-11 h (increased in impaired renal function).

# AVAILABILITY

Capsules: 250 mg, 500 mg.

# INDICATIONS AND DOSAGES

 Inflammatory acne vulgaris, Lyme disease, mycoplasmal disease, Legionella infections, Rocky Mountain spotted fever, chlamydial infections in patients with gonorrhea

PO

*Adults, Elderly.* 250-500 mg q6-12h. Duration of therapy and exact dose is based on indication.

*Children 8 yr and older*. 25-50 mg/kg/day in 4 divided doses. Maximum: 3 g/day.

# • Helicobacter pylori infections PO

*Adults, Elderly.* 500 mg 2-4 times a day (in combination with another antibiotic and acid suppressant therapy). Dosage in renal impairment

Dosage interval is modified based on creatinine clearance.

# Creatinine<br/>Clearance<br/>(mL/min)Dosage Interval50-80Usual dose q8-12h10-50Usual dose q12-24h<10</td>Usual dose q24h

# CONTRAINDICATIONS

Children 8 yr and younger, hypersensitivity to tetracyclines or sulfites.

# INTERACTIONS

#### Drug

Aluminum-, calcium-, or magnesium-containing antacids, iron, zinc, sodium bicarbonate, sucralfate, didanosine, quinapril: May decrease tetracycline absorption.

**Retinoic acid derivatives:** May enhance retinoic acid's adverse effects.

Carbamazepine, phenobarbital, phenytoin, rifamycin: May decrease tetracycline blood concentration. Cholestyramine, colestipol: May decrease tetracycline absorption. Oral contraceptives: May decrease the efficacy of oral contraceptives. Warfarin: May increase warfarin's anticoagulant effects.

#### Herbal

**Dong quai, St. John's wort:** May increase the risk of photosensitivity. **Food** 

**Dairy products:** Inhibit tetracycline absorption.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum alkaline phosphatase, amylase, bilirubin, AST (SGOT), and ALT (SGPT) levels.

#### SIDE EFFECTS

#### Frequent

Dizziness, light-headedness, diarrhea, nausea, vomiting, abdominal cramps, possibly severe photosensitivity.

#### Occasional

Pigmentation of skin or mucous membranes, rectal or genital pruritus, stomatitis.

#### SERIOUS REACTIONS

• Superinfection (especially fungal) may occur.

• Bulging fontanelles occur rarely in infants.

• Pseudotumor cerebri and increased intracranial pressure.

- · Hepatotoxicity (rare).
- · Hypersensitivity.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with those who cannot avoid the sun or ultraviolet exposure because such exposure can produce a severe photosensitivity reaction. Tetracycline readily crosses the placenta and is distributed in breast milk. Women in the last half of pregnancy should avoid using tetracycline because it may inhibit skeletal growth of the fetus. Tetracycline use is not recommended for children 8 yr and younger because it may cause permanent discoloration of teeth or enamel hypoplasia and may inhibit skeletal growth. No age-related precautions have been noted in elderly patients.

History of allergies, especially to tetracyclines, should be determined before drug therapy. Pattern of daily bowel activity, stool consistency, food intake and tolerance, and skin for rash should be assessed. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, diarrhea, and ulceration or changes of the oral mucosa or tongue. BP and level of consciousness should be monitored because of the potential for increased intracranial pressure. **Storage** 

Store at room temperature protected from moisture; do not keep past expiration date.

#### Administration

Space drug doses evenly around the clock. Take capsules with a full glass of water 1 h before or 2 h after a meal. Doses should be separated from antacids; administer 1-2 h before or 4 h after.

! Never use expired tetracycline, as toxic alterations occur.

# Thalidomide

thal-lid'oh-mide

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Immunomodulators, tumor necrosis factor modulators

# **MECHANISM OF ACTION**

An immunomodulator whose exact mechanism is unknown. Has sedative, anti-inflammatory, and immunosuppressive activity, which may be due to selective inhibition of the production of tumor necrosiss factor- $\alpha$ . Also is an inhibitor of angiogenesis. *Therapeutic Effect:* Improves muscle wasting in HIV patients; treats a variety of cancer syndromes.

#### AVAILABILITY

*Capsules:* 50 mg, 100 mg, 150 mg, 200 mg.

#### INDICATIONS AND DOSAGES > AIDS-related muscle wasting (unlabeled) PO

Thalidomide (Generic Name)

Adults. 100-200 mg a day.

#### Leprosy PO

Adults, Elderly. Initially, 100-300 mg/day as single bedtime dose, at least 1 h after the evening meal. Continue until active reaction subsides, then reduce dose q2-4wk in 50-mg increments.

#### Multiple myeloma PO

Adults. 200 mg a day (as a single bedtime dose, at least 1 h after the evening meal in combination with dexamethasone on specified days as determined by regimen).

# **OFF-LABEL USES**

Behçet's syndrome, discoid lupus erythematosus, treatment of Crohn's disease, recurrent aphthous ulcers in HIV patients, wasting syndrome associated with HIV or cancer.

#### CONTRAINDICATIONS

Pregnancy, neutropenia, peripheral neuropathy; sensitivity to thalidomide.

#### INTERACTIONS

Drug

Alcohol, other CNS depressants: May increase sedative effects. Medications associated with peripheral neuropathy (such as isoniazid, lithium, metronidazole, phenytoin): May increase peripheral neuropathy.

Medications that decrease effectiveness of hormonal contraceptives (such as carbamazepine, protease inhibitors, rifampin): May

decrease the effectiveness of the contraceptive; patient must use two other methods of contraception. Herbal

**Cat's claw, echinacea:** May intensify thalidomide's immunosuppressant effects.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Somnolence, dizziness, mood changes, constipation, dry mouth, peripheral neuropathy.

#### Occasional

Increased appetite, weight gain, headache, loss of libido, edema of face and limbs, nausea, alopecia, dry skin, rash, hypothyroidism.

# SERIOUS REACTIONS

Neutropenia, peripheral neuropathy, severe skin rash, and thromboembolism occur rarely.
Highly teratogenic, causing limb malformations, etc.

#### **PRECAUTIONS & CONSIDERATIONS**

Only available to practitioners and patients enrolled in the STEPS Program, to ensure appropriate prescribing and monitoring to avoid pregnancy exposure. Because thromboembolic events have been reported, patients should be monitored closely, and prophylactic anticoagulation may be considered. Risk may be greater with concomitant dexamethasone use. Caution is warranted with history of seizures, renal or hepatic impairment, cardiac disease, or constipation.

! Thalidomide is contraindicated in pregnant women. Women of childbearing age should perform a pregnancy test within 24 h before beginning thalidomide therapy and then every 2-4 wks.

Because thalidomide is a known teratogen, contraception must be used by both men and women

taking the drug 4 wks before, during treatment, and 4 wks following discontinuation.

Avoid consuming alcohol or using other drugs that cause drowsiness during thalidomide therapy. Also avoid tasks that require mental alertness or motor skills until response to the drug has been established. Notify the physician if symptoms of peripheral neuropathy occur. HIV viral load, nerve conduction studies, and WBC count should be monitored.

#### Storage

Store capsules at room temperature. Protect from light.

#### Administration

Administer thalidomide with water at least 1 h after the evening meal and, if possible, at bedtime because of the risk of developing somnolence.

# Theophylline

thee-off'i-lin Elixophyllin, Theo-24, Theochron, Uniphyl Apo-Theo-LA, Novo-Theophyl, Pulmophylline, Theolair, Uniphyl

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Bronchodilators, methylxanthines

#### **MECHANISM OF ACTION**

A methylxanthine derivative with two distinct actions in the airways of patients with reversible obstruction: smooth muscle relaxation and suppression of the response of airways to stimuli. Mechanisms of action are not known with certainty. Theophylline is known to increase the force of contraction of diaphragmatic muscles by enhancing calcium uptake through adenosinemediated channels. *Therapeutic Effect:* Causes bronchodilation.

# PHARMACOKINETICS

The pharmacokinetics of theophylline vary widely among similar patients and cannot be predicted by age, sex, body weight, or other demographic characteristics. Rapidly and completely absorbed after oral administration in solution or immediate-release solid oral dosage form. Distributed freely into fat-free tissues. Extensively metabolized in liver. *Half-life*: 4-8 h.

#### AVAILABILITY

*Elixir:* 80 mg/15 mL (Elixophyllin). *Premixed IV Infusion Solution:* 80 mg/100 mL, 200 mg/100 mL, 400 mg/100 mL, 800 mg/100 mL. *Tablet, Extended Release (BID dosing, Theocron):* 100 mg, 200 mg, 300 mg. 24-hr Controlled Release Tablet (Uniphyl): 400 mg. 24-hr Extended Release Capsule

*(Theo-24):* 100 mg, 200 mg, 300 mg, 400 mg.

#### INDICATIONS AND DOSAGES • Chronic lung diseases PO

Adults, Adolescents, Children. Acute symptoms: 5 mg/kg using immediate-release product.

#### Maintenance therapy

Adults, Children weighing > 45 kg. 10 mg/kg/day (maximum 300 mg/ day) divided q6-8h. After 3 days, increase to 400 mg/day divided q6-8h. After 3 more days, increase to 600 mg/day. Maximum: 800 mg. IV

5 mg/kg load over 20 min, maintenance 0.25 mg/kg/h (CHF, elderly), 0.4 mg/kg/h (nonsmokers), 0.7 mg/kg/h (young adult smokers).

Theophylline (Generic Name)

Slow titration: Initial dose 16 mg/ kg/day or 400 mg daily, whichever is less, doses divided every 6-8 h.

#### Dosage adjustment after serum theophylline measurement

Serum level 5-10 mcg/mL if symptoms not controlled, increase dose by 25% and recheck in 3 days. Serum level 10-20 mcg/mL, maintain dosage if tolerated, recheck level every 6-12 mo. Serum level 20-25 mcg/mL, decrease dose by 25%, recheck level in 3 days. Serum level 25-30 mcg/mL, skip next dose, decrease dose by 25%, recheck level in 3 days. Serum level > 30 mcg/mL, skip next 2 doses, decrease dose by 50%, recheck level in 3 days.

# **OFF-LABEL USES**

Apnea of prematurity.

# CONTRAINDICATIONS

Hypersensitivity to theophylline or any component of the formulation.

# INTERACTIONS

#### Drug

Adenosine: May decrease the effects of adenosine.

Cimetidine, ciprofloxacin, erythromycin, fluvoxamine, norfloxacin, tacrine: May increase theophylline blood concentration and risk of theophylline toxicity.

**Phenytoin, primidone, rifampin:** May increase theophylline metabolism.

**Smoking:** May decrease theophylline blood concentration. **Herbal** 

**St. John's wort:** May increase metabolism of theophylline. **Food** 

Charcoal-broiled foods; highprotein, low-carbohydrate diet: May decrease the theophylline blood level. **High-fat meal:** May cause "dose dumping" of Theo-24 product. Avoid.

# **DIAGNOSTIC TEST EFFECTS**

None known. Measure serum theophylline level to guide all dosage adjustments.

# **IV INCOMPATIBILITIES**

Amphotericin B, cefepime (Maxipime), diazepam, hetastarch, inamrinone, lansoprazole (Prevacid), phenytoin.

# SIDE EFFECTS

Anxiety, dizziness, headache, insomnia, light-headedness, muscle twitching, restlessness, seizures, dysrhythmias, fluid retention with tachycardia, hypotension, palpitations, pounding heartbeat, sinus tachycardia, anorexia, bitter taste, diarrhea, dyspepsia, gastroesophageal reflux, nausea, vomiting, urinary frequency, increased respiratory rate, flushing, urticaria.

# SERIOUS REACTIONS

• Overdose may result in seizures, cardiac arrhythmias, severe vomiting.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with peptic ulcer, hyperthyroidism, seizure disorders, hypertension, and cardiac arrhythmias (excluding bradyarrhythmias). Be aware that dose adjustments must be made for smokers. Be aware that theophylline crosses the placenta and is distributed in breast milk. A dose reduction should be used when starting theophylline in elderly patients. Avoid excessive amounts of caffeine as well as extremes in dietary protein and carbohydrates. Smoking may increase elimination and reduce the half-life.

Nervousness, restlessness, and increased heart rate may occur during theophylline therapy. Signs and symptoms of theophylline toxicity are persistent; serum theophylline level should be drawn and dose should be withheld.

#### Storage

Store oral products at room temperature. Premixed infusion should be kept in protective overwrap until time of use; do not freeze.

#### Administration

Take this medication with a full glass of water on an empty stomach, at least 1 h before or 2 h after a meal. Do not chew or crush the extended-release tablets; swallow them whole. Extended-release capsules may be swallowed whole or opened and the contents mixed with soft food and swallowed without chewing.

For intravenous use, use a controlled-rate infusion pump. Loading doses should not exceed 20 mg/min IV rate. Maximal concentration for infusion is 0.8 mg/mL. Measure theophylline concentrations every 12-24 h during infusion therapy.

# Thiamine (Vitamin B<sub>1</sub>)

thy'a-min Betaxin

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A (C if used in doses above recommended daily allowance) OTC (tablets)

**Classification:** Vitamins, water soluble; B-vitamins

# **MECHANISM OF ACTION**

A water-soluble vitamin that combines with adenosine

triphosphate in the liver, kidneys, and leukocytes to form thiamine diphosphate, a coenzyme that is necessary for carbohydrate metabolism. *Therapeutic Effect:* Prevents and reverses thiamine deficiency.

# PHARMACOKINETICS

Readily absorbed from the GI tract, primarily in duodenum, after IM administration. Widely distributed. Metabolized in the liver. Primarily excreted in urine.

# AVAILABILITY

*Tablets:* 50 mg, 100 mg, 250 mg, 500 mg. *Injection:* 100 mg/mL.

# INDICATIONS AND DOSAGES

# Dietary supplement (typical range within RDIs)

Adults, Elderly. 1-2 mg/day. Children. 0.5-1 mg/day. Infants. 0.2-0.3 mg/day.

# • Thiamine deficiency PO

Adults, Elderly. 5-30 mg/day, as a single dose or in 3 divided doses, for 1 mo. *Children*. 10-50 mg/day in 3 divided doses for 1 mo.

#### Thiamine deficiency in patients who are critically ill or have malabsorption syndrome

IV, IM

Adults, Elderly. 5-30 mg, 3 times a day for 1 mo. Children. 10-25 mg/day for

1 mo.

# Treatment of Wernicke-Korsakoff syndrome

*Adults, Elderly.* Initially, 100 mg, followed by 50-100 mg/day until normal dietary intake of thiamine is established.

Thiamine (Vitamin B<sub>1</sub>) (Generic Name)

# CONTRAINDICATIONS

Sensitivity to thiamine or components of formulation.

# INTERACTIONS

Drug None known. Herbal None known. Food Alcohol: Can deplete thiamine from body.

# DIAGNOSTIC TEST EFFECTS

None known.

# IV INCOMPATIBILITIES

Aminophylline, hydrocortisone (Solu-Cortef), furosemide, imipenem/cilastatin (Primaxin IV), methylprednisolone (Solu-Medrol), phenobarbital, phenytoin, sodium bicarbonate.

# 🗏 IV COMPATIBILITIES

Famotidine (Pepcid), multivitamins.

# SIDE EFFECTS

#### Frequent

Pain, induration, and tenderness at IM injection site.

# SERIOUS REACTIONS

 IV administration may result in a rare, severe hypersensitivity reaction marked by a feeling of warmth, pruritus, urticaria, weakness, diaphoresis, nausea, restlessness, tightness in throat, angioedema, cyanosis, pulmonary edema, GI tract bleeding, and cardiovascular collapse.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted with Wernicke encephalopathy. Thiamine crosses the placenta; it is unknown whether it is excreted in breast milk. No age-related precautions have been noted in children or elderly patients. Consuming foods rich in thiamine, including legumes, nuts, organ meats, pork, rice bran, seeds, wheat germ, whole-grain and enriched cereals, and yeast, is encouraged.

Urine may appear bright yellow during therapy. Before and during treatment, signs and symptoms of thiamine deficiency, including peripheral neuropathy, ataxia, hyporeflexia, muscle weakness, nystagmus, ophthalmoplegia, confusion, peripheral edema, bounding arterial pulse, and tachycardia, should be assessed. Storage

Store tablets and unopened vials at room temperature. Once diluted for infusion, use within 24 h.

#### Administration

IM and IV administration routes are used only in acutely ill patients and in those who are unresponsive to the PO route, such as those with malabsorption syndrome. The IM route is preferred over the IV route. The solution may be given by IV push or may be added to most IV solutions and given as an IV infusion.

IM injection may cause discomfort. Discomfort may be reduced by applying cool compresses.

# Thioridazine

thye-or-rid'a-zeen **Do not confuse thioridazine with thiothixene or Thorazine.** 

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antipsychotics, phenothiazines

Thioridazine (Generic Name)

## **MECHANISM OF ACTION**

A phenothiazine that blocks dopamine at postsynaptic receptor sites. Possesses strong anticholinergic and sedative effects. *Therapeutic Effect:* Suppresses behavioral response in psychosis; reduces locomotor activity and aggressiveness.

## AVAILABILITY

Tablets: 10 mg, 25 mg, 50 mg, 100 mg.

## INDICATIONS AND DOSAGES

Schizophrenia
 PO

Adults, Elderly, Children 12 yr and older: Initially, 10-50 mg 3 times a day; dosage increased gradually q4-7 days. Usual maximum dose in outpatients is 300 mg/day PO, given in 2-4 divided doses; maximum for inpatients with severe psychoses is 800 mg/day PO. For maintenance, adjust to the lowest effective dose. *Children aged 2-11 yr*. Initially, 0.5 mg/kg/day in 2-3 divided doses. Maximum: 3 mg/kg/day.

## **OFF-LABEL USES**

Treatment of behavioral problems in children, dementia, depressive neurosis.

## CONTRAINDICATIONS

Hypersensitivity; use with drugs known to prolong the QTc interval or congenital long QT syndrome or cardiac arrhythmias; CNS depression or comatose states; heart disease of extreme degree. Do not use with CYP2D6 inhibitors or in poor metabolizers (genetically) of CYP2D6.

### INTERACTIONS Drug

### Alcohol, other CNS depressants:

May increase respiratory depression and the hypotensive effects of thioridazine. Antithyroid agents: May increase the risk of agranulocytosis. CYP2D6 inhibitors (e.g., fluvoxamine, fluoxetine, paroxetine, pindolol, propranolol, others): Increase the risk of QT prolongation by decreasing thioridazine metabolism; contraindicated. Extrapyramidal symptomproducing medications: May increase the risk of extrapyramidal symptoms. Hypotension-producing agents: May increase hypotension. Levodopa: May decrease the effects of levodopa. Lithium: May decrease the absorption of thioridazine and produce adverse neurologic effects. MAOIs: May increase the anticholinergic and sedative effects of thioridazine. QT-prolonging agents (e.g., class 1A and III antiarrhythmics, cisapride, pimozide, select quinolone antibiotics, tricyclic antidepressants, macrolides, etc.): Increase the risk of OT prolongation, contraindicated. Herbal None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May cause ECG changes. Elevation of prolactin. May lower WBC count. Rare elevations in hepatic enzymes.

## SIDE EFFECTS

### Occasional

Drowsiness during early therapy, dry mouth, blurred vision, lethargy, constipation or diarrhea, nasal congestion, peripheral edema, urine retention.

### Rare

Ocular changes, altered skin pigmentation (in those taking

high doses for prolonged periods), photosensitivity, darkening of urine.

## SERIOUS REACTIONS

• Prolonged QT interval may produce torsades de pointes, a form of ventricular tachycardia, and sudden death.

Leukopenia, agranulocytosis occur rarely.

• Hepatotoxicity with jaundice and biliary stasis (rare).

• Extrapyramidal movement disorders.

• Neuroleptic malignant syndrome.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with benign prostatic hypertrophy, decreased GI motility, seizures, urinary retention, and visual problems. Elderly patients with dementia-related psychosis treated with antipsychotic drugs are at an increased risk of death. Most deaths appear to be either CV (e.g., heart failure, sudden death) or infectious (e.g., pneumonia) in nature. Urine may darken and drowsiness and dizziness may occur but generally subside with continued therapy. Alcohol, tasks requiring mental alertness or motor skills, and exposure to artificial light and sunlight should be avoided. BP, CBC, ECG, serum potassium level, and liver function test results, including serum alkaline phosphatase, bilirubin, AST (SGOT), and ALT (SGPT) levels, should be monitored. Extrapyramidal symptoms should be assessed.

## Storage

Store tablets at room temperature. Administration

Full therapeutic effect may take up to 6 wks to appear. Do not abruptly discontinue the drug after long-term use. May take tablets without regard to food.

## **Thiothixene**

thye-oh-thix'een Navane Do not confuse thiothixene with thioridazine.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Antipsychotics

## **MECHANISM OF ACTION**

An antipsychotic that blocks postsynaptic dopamine receptor sites in brain. Has *a*-adrenergic blocking effects and depresses the release of hypothalamic and hypophyseal hormones. *Therapeutic Effect:* Suppresses psychotic behavior.

## PHARMACOKINETICS

Well absorbed from the GI tract after PO administration. Widely distributed. Metabolized in the liver. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* Biphasic, 3.4 h (initial); 34 h (terminal).

## AVAILABILITY

*Capsules:* 1 mg, 2 mg, 5 mg, 10 mg, 20 mg.

# INDICATIONS AND DOSAGES Poychosis PO

Adults, Elderly, Children older than 12 yr. Initially, 2 mg 3 times a day or 5 mg twice daily. Maximum: 60 mg/day.

## CONTRAINDICATIONS

Blood dyscrasias, circulatory collapse, central nervous system (CNS) depression, coma, history of seizures.

Hypersensitivity to thiothixene; sensitivity to phenothiazines due to potential cross-sensitivity.

Thiothixene (Generic Name)

## INTERACTIONS

### Drug

Alcohol, other CNS depressants:

May increase CNS and respiratory depression and the hypotensive effects of thiothixene.

Extrapyramidal symptomproducing medications: May increase the risk of extrapyramidal symptoms.

Levodopa: May inhibit the effects of levodopa.

QT-prolonging medications: May increase cardiac effects.

### Herbal

Kava kava, St. John's wort, valerian: May increase CNS depression. Food None known.

## DIAGNOSTIC TEST EFFECTS

Elevation of prolactin. May lower WBC count. Rare elevations in hepatic enzymes (usually transient) or prolongation of QT interval.

## SIDE EFFECTS

### Expected

Hypotension, dizziness, syncope (occur frequently after first injection, occasionally after subsequent injections, and rarely with oral form). Frequent

Transient drowsiness, dry mouth, constipation, blurred vision, nasal congestion.

### Occasional

Diarrhea, peripheral edema, urine retention, nausea.

### Rare

Ocular changes, altered skin pigmentation (in those taking high doses for prolonged periods), photosensitivity.

## SERIOUS REACTIONS

· The most common extrapyramidal reaction is akathisia, characterized

by motor restlessness and anxiety. Akinesia, marked by rigidity, tremor, increased salivation, mask-like facial expression, and reduced voluntary movements, occurs less frequently. Dystonias, including torticollis, opisthotonos, and oculogyric crisis, occur rarely.

· Tardive dyskinesia, characterized by tongue protrusion, puffing of the cheeks, and chewing or puckering of the mouth, occurs rarely but may be irreversible. Elderly women have a greater risk of developing this reaction.

· Neuroleptic malignant syndrome occurs rarely.

Rare cases of leukopenia.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with alcohol withdrawal, severe cardiovascular disorders, glaucoma, benign prostatic hyperplasia, and exposure to extreme heat. Thiothixene crosses the placenta and is distributed in breast milk. Children are more prone to develop extrapyramidal and neuromuscular symptoms, especially dystonias. Safety and efficacy not established in children under 12 yr of age. Elderly patients are more prone to anticholinergic effects (such as dry mouth), extrapyramidal symptoms, orthostatic hypotension, and increased sedation.

Elderly patients with dementiarelated psychosis treated with antipsychotic drugs are at an increased risk of death. Most deaths appear to be either CV (e.g., heart failure, sudden death) or infectious (e.g., pnemonia) in nature.

Drowsiness and dizziness may occur but generally subside with continued therapy. Alcohol, tasks requiring mental alertness or motor skills, and exposure to

artificial light and sunlight should be avoided. Notify the physician if fluid retention, fever, or visual disturbances occur. Pattern of daily bowel activity and stool consistency, BP, and signs of extrapyramidal reactions should be assessed.

### Storage

Store tablets at room temperature. Administration

Take thiothixene without regard to food. The drug's full therapeutic effect may take up to 6 wks to appear.

## Thyroid

thye'roid ★ Armour Thyroid, Bio-Throid, Nature-Thyroid NT, NP-Thyroid

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: A

**Classification:** Hormones/ hormone modifiers, thyroid agents

## **MECHANISM OF ACTION**

A natural hormone derived from animal sources, usually beef or pork, that is involved in normal metabolism, growth, and development, especially the central nervous system (CNS) of infants. Possesses catabolic and anabolic effects. Provides both levothyroxine and liothyronine hormones. *Therapeutic Effect:* Increases basal metabolic rate, enhances gluconeogenesis, stimulates protein synthesis.

## PHARMACOKINETICS

Partially absorbed from the GI tract. Protein binding: 99%. Widely distributed. Metabolized in liver to

active liothyronine  $(T_3)$  and inactive, reverse triiodothyronine  $(rT_3)$ metabolites. Eliminated by biliary excretion. *Half-life:* 2-7 days.

### AVAILABILITY

*Capsules:* 15 mg, 30 mg, 60 mg, 90 mg, 120 mg, 180 mg, 240 mg (Bio-Throid). *Tablets:* 15 mg, 30 mg, 60 mg, 90 mg, 120 mg, 180 mg, 240 mg, 300 mg (Armour Thyroid). 32.5 mg, 65 mg, 130 mg, 195 mg (Nature-Thyroid NT).

# INDICATIONS AND DOSAGES Hypothyroidism PO

*Adults, Elderly.* Initially, 15-30 mg. May increase by 15 mg increments q2-4wk. Maintenance: 60-120 mg/ day. Use 15 mg initially in patients with cardiovascular disease or myxedema. *Children 12 yr and older.* 90 mg/day. *Children 6-12 yr.* 60-90 mg/day. *Children 1-5 yr.* 45-60 mg/day. *Children older than 6-12 mo.* 

30-45 mg/day.

Children 3 mo and younger. 15-30 mg/day.

## CONTRAINDICATIONS

Uncontrolled adrenal cortical insufficiency, untreated thyrotoxicosis, treatment of obesity, uncontrolled angina, uncontrolled hypertension, uncontrolled myocardial infarction, and hypersensitivity to any component of the formulations.

## INTERACTIONS

### Drug

Antidiabetic drugs: As thyroid replacement ensues, antidiabetic requirements may change; monitor. Cholestyramine, colestipol: May decrease absorption of thyroid hormones.

Thyroid (Generic Name)

**Digoxin:** May alter digoxin dose requirements as thyroid function corrected due to increased metabolic rate; monitor.

### Enteral feedings, antacids, calcium and iron supplements: May decrease the absorption of thyroid

hormones.

## **Estrogens, oral contraceptives:** May decrease effects of thyroid hormones.

**Oral anticoagulants:** May increase hypoprothrombinemic effects of oral anticoagulants

### Herbal

**Bugleweed:** May decrease effects of thyroid hormones.

### Food

Coffee, dairy foods, soybean flour (infant formula), cotton seed meal, walnuts, and dietary fiber: May decrease absorption of thyroid hormones.

## **DIAGNOSTIC TEST EFFECTS**

Dose is adjusted based on monitoring of TSH response. Changes in TBG levels must be considered when interpreting T4 and T3 values.

## SIDE EFFECTS

### Rare

Dry skin, GI intolerance, skin rash, hives, severe headache.

## SERIOUS REACTIONS

• Excessive dosage produces signs and symptoms of hyperthyroidism, including weight loss, palpitations, increased appetite, tremors, nervousness, tachycardia, hypertension, headache, insomnia, and menstrual irregularities.

Cardiac arrhythmias occur rarely.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with angina pectoris, hypertension,

or other cardiovascular disease as well as adrenal insufficiency, coronary artery disease, and diabetes mellitus. Thyroid hormone does not cross the placenta and is minimally excreted in breast milk. No age-related precautions have been noted in children. Elderly patients may be more sensitive to thyroid effects. Individualized dosages are recommended for this population.

Reversible hair loss can occur during the first few months of therapy. Notify the physician of chest pain, edema of feet or ankles, insomnia, nervousness, tremors, weight loss, or a pulse rate of 100 beats/min or more. Weight and vital signs, especially pulse rate and rhythm, should be monitored. Storage

Store tablets at room temperature; protect from moisture.

### Administration

Begin therapy with small doses and increase the dosage gradually, as prescribed. Take at the same time each day to maintain hormone levels. Take on an empty stomach.

Replacement therapy for hypothyroidism is lifelong.

## Tiagabine

ti-ah-ga'bean ★ Gabitril

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Anticonvulsants

## **MECHANISM OF ACTION**

An anticonvulsant that enhances the activity of  $\gamma$ -aminobutyric acid, the major inhibitory neurotransmitter in

Tiagabine (Generic Name), Gabitril (Brand Name)

the central nervous system (CNS). *Therapeutic Effect:* Inhibits seizures.

### PHARMACOKINETICS

Rapid and nearly complete (90%-95%) absorption orally. Meals do not change the extent of absorption. Steady state occurs in 2 days. Protein binding: 96%. Two metabolic pathways exist: (1) oxidation via the liver (forms inactive 5-oxo-tiagabine) and (2) glucuronidation. Only 2% excreted unchanged, the rest is excreted into the urine and feces as metabolites. Half-life: 7 to 9 h (healthy controls). Decreased by 50%- 65% in hepatic enzymeinduced patients compared to uninduced patients (half-life increases in hepatic disease).

## AVAILABILITY

Tablets: 2 mg, 4 mg, 12 mg, 16 mg.

### INDICATIONS AND DOSAGES Adjunctive treatment of partial seizures PO

*Adults, Elderly.* Initially, 4 mg once a day. May increase by 4-8 mg/day at weekly intervals. Maximum: 56 mg/day.

*Children aged 12-18 yr.* Initially, 4 mg once a day. May increase by 4 mg at week 2 and by 4-8 mg at weekly intervals thereafter. Maximum: 32 mg/day.

## CONTRAINDICATIONS

Hypersensitivity to tiagabine.

## INTERACTIONS

### Drug

### Carbamazepine, phenobarbital,

**phenytoin:** May increase tiagabine clearance; however, dose titration for tiagabine usually assumes patient is treated with enzyme-inducing drugs.

Valproic acid: May increase free tiagabine concentration. Tiagabine decreases (~ 10%) steady-state valproic acid levels. Monitor for any needed adjustments. Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

A therapeutic range is not definitively established. Effective trough plasma concentrations ranged from < 1 ng/mL to 234 ng/ mL (median, 23.7 ng/mL). In some instances, measurement of levels is helpful to gauge treatment.

## SIDE EFFECTS

### Frequent (20%-34%)

Dizziness, asthenia, somnolence, nervousness, confusion, headache, infection, tremor.

### Occasional

Nausea, diarrhea, abdominal pain, impaired concentration.

### SERIOUS REACTIONS

• Overdose is characterized by agitation, confusion, hostility, and weakness. Full recovery occurs within 24 h.

## **PRECAUTIONS & CONSIDERATIONS**

Antiepileptic drugs (AEDs) increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, and/ or any unusual changes in mood or behavior. Use during pregnancy and lactation only when benefits outweigh potential risks. Use in children below 12 yr has not been established. Caution is warranted in patients with hepatic impairment and in those who take other CNS depressants concurrently.

Dizziness may occur, so change positions slowly—from recumbent to sitting position before standing—and alcohol and tasks requiring mental alertness or motor skills should be avoided. History of the seizure disorder, including the duration, frequency, and intensity of seizures, should be reviewed before and during therapy. CBCs and blood chemistry tests to assess hepatic and renal function should be performed before and during treatment.

### Storage

Store tablets at room temperature. Protect from light and moisture.

### Administration

Tiagabine should be taken with food.

Do not abruptly discontinue the drug. Be aware that in patients without epilepsy, tiagibine is associated with new onset seizure risk.

## Ticagrelor

tye-ka′-grel-or ★ ♥ Brilinta

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Platelet aggregation inhibitor

## **MECHANISM OF ACTION**

Potently and reversibly inhibits the binding of the enzyme adenosine phosphate (ADP) to its platelet receptor and subsequent ADPmediated activation of a glycoprotein complex. Ticagrelor binds to the P2Y12 receptor at a site distinct from the ADP-binding site. *Therapeutic*  *Effect:* Inhibits platelet aggregation; reduces mortality due to heart attack or stroke.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	<1 h	2 h	8 h

Rapidly absorbed. Protein binding: 99.7%. Extensively metabolized by the liver (CYP3A4). Both ticagrelor and metabolite are equally active. They are weak inhibitors of P-glycoprotein. Eliminated in feces and bile. *Half-life:* 7 h (ticagrelor) and 9 h (active metabolite) (both increased in hepatic impairment).

### AVAILABILITY

Tablets: 90 mg.

## INDICATIONS AND DOSAGES

 Acute coronary syndrome (unstable angina or non-Q-wave acute MI), including those who have PCI: PO

*Adults, Elderly.* Initially, 180-mg loading dose, then 90 mg twice a day (in combination with aspirin).

## CONTRAINDICATIONS

Hypersensitivity to ticagrelor, active pathological bleeding such as peptic ulcer or intracranial hemorrhage, history of intracranial hemorrhage, severe hepatic impairment.

## INTERACTIONS

### Drug

Anticoagulants, other platelet inhibitors (clopidogrel, aspirin): May increase the risk of bleeding. Aspirin: High doses reduce ticagrelor efficacy. Keep maintenance aspirin doses to 100 mg/day or less.

### CYP3A4 inducers (e.g., rifampin, dexamethasone, carbamazepine, phenytoin, phenobarbital):

Avoid co-use as these drugs can decrease ticagrelor levels and reduce protective efficacy.

**Digoxin:** May increase digoxin levels.

**Lovastatin, simvastatin:** Limit dosage of these statins to 40 mg/day or less to avoid myopathy.

Strong CYP3A4 inhibitors (e.g., clarithromycin, itraconazole, ketoconazole, nefazodone, ritonavir and other protease inhibitors for HIV, telithromycin and

voriconazole ): Avoid co-use as these drugs can increase ticagrelor levels and may increase risk of bleeding.

### Herbal

Ginger, ginkgo biloba, white willow: May increase the risk of bleeding.

St. John's wort: May reduce ticagrelor efficacy; not recommended. Food

**Grapefruit juice:** Theoretically may increase ticagrelor levels; do not change usual intake.

## DIAGNOSTIC TEST EFFECTS

Prolongs bleeding time. Infrequently increases serum uric acid or serum creatinine; changes are not usually troublesome or lasting.

## SIDE EFFECTS

### Frequent (>10%)

Minor bleeding (ecchymosis, epistaxis, gums, etc.), dyspnea. Occasional (3% to 10%)

More serious bleeding; headache, cough, dizziness, nausea, increased blood pressure, diarrhea, fatigue, back pain, chest pain (cardiac and non-cardiac).

### Rare (< 3%)

Hypersensitivity, bradycardia, syncope, gynecomastia.

### **Serious Reactions**

• GI hemorrhage or other major bleeding (e.g. CNS hemorrhage) in about 2% of patients; rarely hemorrhagic shock.

• Dyspnea is rarely so severe as to cause drug discontinuation.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hematologic disorders, history of bleeding or stroke, lung disease, GI disease, mild or moderate hepatic impairment, in patients on dialysis, and in preoperative persons. Do not start tacagrelor in patients scheduled to undergo urgent coronary artery bypass graft surgery (CABG). When possible, discontinue the drug at least 5 days prior to any surgery. Be aware that it may take longer to stop bleeding during drug therapy. Not approved for use in children. There are no data regarding use in pregnancy or lactation; breastfeeding is not recommended. There are no particular cautions noted for the elderly, other than that they may pose more risks for bleeding due to concomitant illness.

Notify the physician of unusual bleeding. Watch for self-limiting shortness of breath in early treatment. Also, notify dentists and other physicians before surgery is scheduled or when new drugs are prescribed. Platelet count, hemoglobin level, and liver function tests (LFTs) should be monitored. Be aware that abrupt discontinuation of the drug produces an elevated platelet count within 5 days, and may place the patient at risk for thrombotic events such as MI. Avoid interruption in treatment when possible.

### Storage

Store at room temperature. Keep tablets dry.

### Administration

Take ticagrelor without regard to food.

### **Ticarcillin Disodium/** Clavulanate Potassium

tyekar-sill'in/klav'yoo-la-nate 🛨 🍟 Timentin

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

Classification: Antibiotics. penicillins, extended-spectrum penicillin and β-lactamase inhibitor

## MECHANISM OF ACTION

Ticarcillin binds to bacterial cell walls, inhibiting cell wall synthesis. Clavulanate inhibits the action of bacterial β-lactamase. Good activity against gram-negative and anaerobic organisms, including Pseudomonas spp., as well as methicillin-sensitive gram positives. Therapeutic Effect: Bactericidal.

## PHARMACOKINETICS

Widely distributed. Protein binding: ticarcillin 45%-60%, clavulanate 9%-30%. Minimally metabolized in the liver. Primarily excreted unchanged in urine. Removed by hemodialysis. Half-life: 1-1.2 h (increased in impaired renal function).

## AVAILABILITY

Powder for Injection: 3.1 g. Premixed Solution for Infusion: 3.1 g/100 mL.

## INDICATIONS AND DOSAGES

Skin and skin-structure, bone, joint, and lower respiratory

### tract infections; septicemia; endometriosis; urinary tract infection IV

Adults, Elderly  $\geq 60$  kg. 3.1 g (3 g ticarcillin) q4-6h. Maximum: 18-24 g/day. Adults, Elderly < 60 kg. 200-300 mg/ kg/day divided q4-6h.

Children 3 mo and older. Mild to moderate infections, 200 mg/kg/day (based on ticarcillin content) divided q6h; severe infections, 300 mg/kg/day (based on ticarcillin content) divided q4-6h. Maximum 18-24 g/day.

### Dosage in renal impairment

Dosage interval is modified based on creatinine clearance.

Adult CrCl 30-60 mL/min: loading dose of 3.1 g, then 2 g q4h or 3.1 g q8h. Adult CrCl 10-30 mL/min: loading dose of 3.1 g, then 2 g IV q8h or 3.1 g q12h.

*Adult* CrCl < 10 mL/min: loading dose of 3.1 g, then 2 g IV q12h. Adult CrCl < 10 mL/min with hepatic impairment: 3.1 g IV, then 2 g IV q24h.

## CONTRAINDICATIONS

Hypersensitivity to any penicillin.

## INTERACTIONS

### Drug

Anticoagulants, heparin, NSAIDs, thrombolytics: May increase the risk of hemorrhage with high dosages of ticarcillin.

Probenecid: May increase ticarcillin blood concentration and risk of toxicity. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum sodium, alkaline phosphatase, bilirubin, LDH, AST (SGOT), and ALT (SGPT) levels. May decrease serum potassium level. May cause a positive Coombs' test.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), azithromycin, caspofungin, cefamandole, diazepam, dobutamine. drotrecogin alfa (Xigris), erythromycin, ganciclovir, haloperiodol, inamrinone, lansoprazole (Prevacid IV), phenytoin, promethazine, quinupristindalfopristin (Synercid), vancomycin (Vancocin).

## 🗏 IV COMPATIBILITIES

Diltiazem (Cardizem), heparin, insulin, morphine, propofol (Diprivan).

### SIDE EFFECTS

### Frequent

Phlebitis or thrombophlebitis (with IV dose), rash, urticaria, pruritus, altered smell or taste.

### Occasional

Nausea, diarrhea, vomiting. Rare

Headache, fatigue, hallucinations, bleeding, or ecchymosis.

### SERIOUS REACTIONS

• Overdosage may produce seizures and other neurologic reactions.

• Antibiotic-associated colitis and other superinfections may result from bacterial imbalance.

• Severe hypersensitivity reactions, including anaphylaxis, occur rarely.

• Thrombocytopenia or bleeding may occur, especially in patients with renal impairment; discontinue drug if they occur.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with renal impairment. Sodium load may require caution in some patients. Ticarcillin readily crosses the placenta, appears in cord blood and amniotic fluid, and is distributed in breast milk in low concentrations. Ticarcillin may lead to allergic sensitization, candidiasis, diarrhea, and skin rash in infants. The safety and efficacy of ticarcillin have not been established in children younger than 3 mo. Age-related renal impairment may require dosage adjustment in elderly patients.

History of allergies, especially to cephalosporins or penicillins, should be determined before giving the drug. Withhold and promptly notify the physician if rash or diarrhea occurs. Severe diarrhea with abdominal pain, blood or mucus in stool, and fever may indicate antibiotic-associated colitis. Signs and symptoms of superinfection, including anal or genital pruritus, black hairy tongue, diarrhea, increased fever, sore throat, ulceration or changes of oral mucosa, and vomiting should be monitored. Food tolerance, intake and output, renal function tests, urinalysis, and the injection sites should be assessed.

### Storage

The solution normally appears colorless to pale yellow; a darker color indicates a loss of potency. The reconstituted IV infusion (piggyback) is stable for 6 h at room temperature and 3 days if refrigerated. Premixed infusion arrives frozen, and thawed solution is stable for 24 h at room temperature, or 7 days if refrigerated.

### Administration

This drug is available in readyto-use containers. For IV infusion (piggyback), reconstitute each 3.1-g vial with 13 mL sterile water for injection or 0.9% NaCl to provide a concentration of 200 mg ticarcillin and 6.7 mg clavulanic acid per milliliter. Shake the vial to assist reconstitution. Further dilute with D5W or 0.9% NaCl to a concentration between 10 and 100 mg/mL. Infuse the drug over 30 min. Because of the potential for hypersensitivity reactions such as anaphylaxis, start the initial dose at a few drops per minute, and then increase it slowly to the ordered rate. Stay with the patient for the first 10-15 min during the initial dose; then check every 10 min during the infusion for signs and symptoms of hypersensitivity or anaphylaxis.

## **Ticlopidine**

tye-klo'pa-deen

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Platelet inhibitors

## **MECHANISM OF ACTION**

An aggregation inhibitor that inhibits the release of adenosine diphosphate from activated platelets, which prevents fibrinogen from binding to glycoprotein IIb/IIIa receptors on the surface of activated platelets. *Therapeutic Effect:* Inhibits platelet aggregation and thrombus formation.

## AVAILABILITY

Tablets: 250 mg.

## INDICATIONS AND DOSAGES

• Prevention of stroke PO *Adults, Elderly.* 250 mg twice a day.

## **OFF-LABEL USES**

Treatment of intermittent claudication, sickle cell disease.

## CONTRAINDICATIONS

Active pathologic bleeding, such as bleeding peptic ulcer and intracranial bleeding; hematopoietic disorders, including neutropenia and thrombocytopenia; presence of hemostatic disorder; severe hepatic impairment; hypersensitivity to ticlopidine.

### INTERACTIONS Drug

Aspirin, heparin, oral anticoagulants, thrombolytics: May increase the risk of bleeding with these drugs. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum cholesterol, serum alkaline phosphatase, bilirubin, triglyceride, AST (SGOT), and ALT (SGPT) levels. May prolong bleeding time. May decrease neutrophil and platelet counts.

## SIDE EFFECTS

### Frequent (5%-13%)

Diarrhea, nausea, dyspepsia, including heartburn, indigestion, GI discomfort, and bloating. Rare (1%-2%)

Vomiting, flatulence, pruritus, dizziness.

## SERIOUS REACTIONS

Neutropenia occurs in approximately 2% of patients.
Thrombotic thrombocytopenia purpura, agranulocytosis, hepatitis, cholestatic jaundice, and tinnitus occur rarely.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with an increased risk of bleeding and

Ticlopidine (Generic Name)

severe hepatic or renal disease. There are no adequate data regarding use during pregnancy or breastfeeding. Safety and efficacy of ticlopidine in children have not been established. No age-related precautions have been noted in elderly patients.

Ticlopidine should be discontinued 10-14 days before surgery if antiplatelet effect is not desired. Laboratory studies, particularly hepatic enzyme tests and CBC, should be obtained. Pattern of daily bowel activity and stool consistency, BP for hypotension, and skin for rash should be monitored.

### Administration

Take ticlopidine with food or just after meals to increase bioavailability and decrease GI discomfort.

### Tigecycline

tye-gi-sye'kleen

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

## Classification:

Anti-infectives, glycylcycline

### **MECHANISM OF ACTION**

A glycylcycline antibiotic that is a derivative of minocycline, which inhibits bacterial protein synthesis by binding to the 30S ribosomal subunit. *Therapeutic Effects:* Bacteriostatic.

### PHARMACOKINETICS

Peak 2-3 h. Protein binding: 71%-89%. Widely distributed. Excreted in breast milk; crosses placenta. Not extensively metabolized. Overall, the primary route of elimination for tigecycline is biliary excretion of unchanged drug and its metabolites. Glucuronidation and renal excretion of unchanged tigecycline are secondary routes. Not removed by hemodialysis. *Half-life:* 27-42 h (increased in hepatic impairment).

### AVAILABILITY

Powder for Injection: 50 mg.

## INDICATIONS AND DOSAGES

 Community-acquired pneumonia, complicated skin and skin-structure infections, complicated intraabdominal infections

IV INFUSION

*Adults, Elderly.* Initially, 100 mg IV loading dose, then 50 mg every 12 h.

### Dosage adjustment for hepatic impairment

No dosage adjustment for mild to moderate hepatic impairment (Child-Pugh A or Child-Pugh B). For those with severe hepatic impairment (Child Pugh C), initially 100 mg IV, then 25 mg every 12 h. Monitor closely.

### CONTRAINDICATIONS

Children younger than 18 yr, hypersensitivity to tigecycline, last half of pregnancy. Not recommended for use with systemic retinoids.

## DIAGNOSTIC TEST EFFECTS

May increase serum amylase, total bilirubin, AST (SGOT), and ALT (SGPT), as well as prothrombin time.

### INTERACTIONS Drug

Hormonal contraceptives: May decrease the effects of hormonal contraceptives.

Isotretinoin: Contraindicated use. Warfarin: May increase anticoagulant response; monitor INR.

### Herbal

St. John's wort: May increase the risk of photosensitivity. Food None known.

## IV INCOMPATIBILITIES

Amiodarone, amphotericin B (all forms), diazepam, esomeprazole (Nexium), hydralazine, methylprednisolone (Solu-Medrol), nicardipine, pantoprazole (Protonix), phenytoin, quinupristin/dalfopristin (Synercid), verapamil, voriconazole (Vfend).

## **IV COMPATIBILITIES**

Amikacin, dobutamine, dopamine, gentamicin, haloperidol, lidocaine, metoclopramide, morphine, norepinephrine, piperacillin/ tazobactam (Zosyn), potassium chloride, propofol, ranitidine, theophylline, tobramycin.

## SIDE EFFECTS

### Frequent

Nausea, vomiting, diarrhea, abdominal pain, headache, and increased ALT.

### Occasional

Dizziness, possibly severe photosensitivity, drowsiness, vertigo, vaginal candidiasis, injection site pain or phlebitis. **Rare** 

Stomatitis, increased creatinine.

## SERIOUS REACTIONS

 Hypersensitivity may include anaphylaxis.

• Superinfection (especially fungal) may occur.

• Tinnitus and hearing loss have been reported.

• Benign increased intracranial pressure (pseudotumor cerebri).

• Interstitial nephritis, azotemia, metabolic acidosis, acute renal failure.

• Rare cases of acute pancreatitis, hepatitis with jaundice, eosinophilia.

• Tooth discoloration and enamel hypoplasia in children and during fetal development.

 Pseudomembranous colitis from *Clostridium difficile* infection may occur during treatment or at any time several months after therapy is discontinued.

## **PRECAUTIONS & CONSIDERATIONS**

History of allergies, especially to tetracyclines, should be determined before drug therapy, as crosssensitivity may occur.

Not considered efficacious at decreasing mortality in patients with hospital-associated pneumonia. Caution is warranted in patients with renal impairment and in those who cannot avoid sun or ultraviolet exposure because such exposure may produce a severe photosensitivity reaction. Safe and effective use not established in children under 18 yr. Do not use in children under 8 yr or in pregnancy because of the likelihood of permanent intrinsic staining in erupted permanent teeth. Caution is recommended for use during lactation.

Dizziness, drowsiness, and vertigo may occur. Avoid tasks that require mental alertness or motor skills until response to the drug is established. Pattern of daily bowel activity, stool consistency, food intake and tolerance, renal function, skin for rash should be assessed. Be alert for signs and symptoms of superinfection, such as anal or genital pruritus, diarrhea, sore tongue, fever, fatigue, and ulceration or changes of the oral mucosa or tongue; report symptoms to health care provider immediately. BP and level of consciousness should be

monitored because of the potential for increased intracranial pressure. Advise patient to report any signs or symptoms associated with frequent loose stools or bloody diarrhea. Advise patient to maintain compliance with hormonal contraceptive medications while using an additional nonhormonal form of contraception throughout the duration of therapy. **Storage** 

Store unopened vials at room temperature. Once reconstituted for infusion, may keep up to 24 h.

### Administration

Tigecycline is given by slow IV infusion only after dilution. Reconstitute each vial with 5.3 mL 0.9% NaCl, D5W, or lactated Ringer's to a concentration of 10 mg/mL. Withdraw the appropriate dose (25 mg, 50 mg, or 100 mg) and add to a 100-mL intravenous bag for infusion of either 0.9% NaCl, D5W, or lactated Ringer's. The maximum concentration in the intravenous bag should be 1 mg/mL. The reconstituted solution should be yellow to orange in color; if not, the solution should be discarded. Infuse over 30-60 min.

## Tiludronate Disodium

ti-loo'dro-nate Kelid

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Bisphosphonates

### **MECHANISM OF ACTION**

A calcium regulator that inhibits functioning osteoclasts through disruption of cytoskeletal ring structure and inhibition of osteoclastic proton pump. *Therapeutic Effect:* Inhibits bone resorption.

### PHARMACOKINETICS

Poorly absorbed after oral administration; oral bioavailability < 6%. Rapidly taken into bone, with uptake greatest at sites of active bone turnover. Excreted in urine. Half-life: 150 h from plasma (a longer terminal half-life reflects release from skeleton as bone is resorbed).

### AVAILABILITY

Tablets: 200 mg.

## INDICATIONS AND DOSAGES

### Paget's disease PO

*Adults, Elderly.* 400 mg once a day for 3 mo.

## CONTRAINDICATIONS

GI disease, such as dysphagia and gastric ulcer, biphosphonate hypersensitivity, renal impairment (CrCl < 30 mL/min).

### INTERACTIONS Drug

Antacids containing aluminum or magnesium, calcium: May interfere with the absorption of tiludronate.

Herbal None known.

Food

Beverages other than plain water, dietary supplements, food: May interfere with absorption.

### DIAGNOSTIC TEST EFFECTS

Reduces serum calcium and serum phosphate concentrations. Significantly decreases serum alkaline phosphatase level in patients with Paget's disease.

### SIDE EFFECTS

### Frequent (6%-9%)

Nausea, diarrhea, generalized body pain, back pain, headache.

### Occasional

Rash, dyspepsia, vomiting, rhinitis, sinusitis, dizziness, joint or bone pain, chest pain, edema, flatulence, hyperparathyroidism, paresthesias, pharyngitis, skin disorder, and tooth disorder.

### SERIOUS REACTIONS

• Overdose causes hypocalcemia, hypophosphatemia, and significant GI disturbances.

• Esophageal irritation occurs if not given with 6-8 oz of plain water or if the patient lies down within 30 min of drug administration.

• Severe and occasionally debilitating bone, joint, or muscle pain.

· Osteonecrosis of the jaw.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hyperparathyroidism, hypocalcemia, and vitamin D deficiency. Because there are no adequate and wellcontrolled studies in pregnant women, it is unknown whether tiludronate causes fetal harm or is excreted in breast milk. Safety and efficacy of tiludronate have not been established in children. No agerelated precautions have been noted in elderly patients.

Consider beginning weightbearing exercises and modifying behavioral factors, such as reducing alcohol consumption and stopping cigarette smoking. Plan to correct hypocalcemia and vitamin D deficiency, if present, before starting therapy. All patients must have adequate calcium and vitamin D intake daily. Serum electrolytes, including serum alkaline phosphatase and serum calcium levels, should be monitored.

### Storage

Store tablets at room temperature. Administration

! Give at least 2 h before the first food, beverage, or medication of the day. Expected benefits occur only when tiludronate is taken with a full glass (6-8 oz) of plain water first thing in the morning.

Taking with beverages other than plain water, including mineral water, orange juice, and coffee, significantly reduces absorption of the medication.

! Do not lie down for at least 30 min after taking the medication. Remaining upright helps the drug move quickly to the stomach and reduces the risk of esophageal irritation.

### Timolol

tim'oh-lole

 ★ Betimol, Blocadren, Istalol, Timoptic, Timoptic OcuDose,
 Timoptic-XE, Timoptic OcuMeter
 ★ Apo-Timop, Tim-AK,
 Timoptic, Timoptic XE
 Do not confuse timolol with
 atenolol, or Timoptic with
 Viroptic.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensives, β-adrenergic blockers

## MECHANISM OF ACTION

An antihypertensive, antimigraine, and antiglaucoma agent that blocks  $\beta_1$ - and  $\beta_2$ -adrenergic

Timolol (Generic Name)

receptors. *Therapeutic Effect:* Reduces intraocular pressure (IOP) by reducing aqueous humor production, lowers BP, slows the heart rate, and decreases myocardial contractility.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	15-45 min	0.5-2.5 h	4 h
Ophthalmic	30 min	1-2 h	12-24 h

Well absorbed from the GI tract. Protein binding: 10%. Minimal absorption after ophthalmic administration. Metabolized in the liver. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 4 h. Systemic absorption may occur with ophthalmic administration.

## AVAILABILITY

*Tablets (Blocadren):* 5 mg, 10 mg, 20 mg.

Ophthalmic Gel-forming Solution (Timoptic-XE): 0.25%, 0.5%. Ophthalmic Solution (Betimol, Istalol, Timoptic, Timoptic OccuDose): 0.25%, 0.5%.

# INDICATIONS AND DOSAGES Mild to moderate hypertension PO

*Adults, Elderly.* Initially, 10 mg twice a day, alone or in combination with other therapy. Gradually increase at intervals of not less than 1 wk. Usual dose is 10-20 mg twice daily. Maximum: 60 mg.

### Reduction of cardiovascular mortality in definite or suspected acute myocardial infarction (MI) PO

*Adults, Elderly.* 10 mg twice a day, beginning 1-4 wks after MI.

## Migraine prevention PO

*Adults, Elderly.* Initially, 10 mg twice a day. Range: 10-30 mg/day.

### Reduction of IOP in open-angle glaucoma, aphakic glaucoma, ocular hypertension, and secondary glaucoma

### OPHTHALMIC

Adults, Elderly, Children. 1 drop of 0.25% solution in affected eye(s) twice a day. May be increased to 1 drop of 0.5% solution in affected eye(s) twice a day. When IOP is controlled, dosage may be reduced to 1 drop once a day. If patient is switched to timolol from another antiglaucoma agent, administer concurrently for 1 day. Discontinue other agent on following day. OPHTHALMIC GEL SOLUTION (TIMOPTIC XE) Adults, Elderly. 1 drop of 0.25%

or 0.5% solution in affected eye(s) once a day.

## **OFF-LABEL USES**

Systemic: Treatment of chronic angina pectoris, hypertrophic cardiomyopathy, pheochromocytoma, thyrotoxicosis, tremors.

## CONTRAINDICATIONS

History of bronchial asthma or severe chronic obstructive pulmonary disease (COPD); sinus bradycardia; second-and third-degree heart block; overt cardiac failure; cardiogenic shock; hypersensitivity to timolol.

## INTERACTIONS

### Drug

**Diuretics, other antihypertensives:** May increase hypotensive effect. **Insulin, oral hypoglycemics:** May mask symptoms of hypoglycemia and prolong hypoglycemic effects of these drugs. NSAIDs: May decrease antihypertensive effect. Sympathomimetics, xanthines: May mutually inhibit effects.

### Herbal

None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum antinuclear antibody titer and BUN, glucose, serum creatinine, potassium, lipoprotein, triglyceride, and uric acid levels.

### SIDE EFFECTS

### Frequent

Diminished sexual function, drowsiness, difficulty sleeping, unusual tiredness or weakness. Ophthalmic: Eye irritation, visual disturbances.

#### Occasional

Depression, cold hands or feet, diarrhea, constipation, anxiety, nasal congestion, nausea, vomiting, bradycardia, bronchospasm.

### Rare

Altered taste; dry eyes; itching; numbness of fingers, toes, or scalp.

### SERIOUS REACTIONS

 Overdose may produce profound bradycardia, hypotension, and bronchospasm.

 Abrupt withdrawal may result in diaphoresis, palpitations, headache, and tremors.

 Timolol administration may precipitate CHF and MI in patients with cardiac disease; thyroid storm in those with thyrotoxicosis; and peripheral ischemia in those with existing peripheral vascular disease.

• Hypoglycemia may occur in patients with previously controlled diabetes.

 Ophthalmic overdose may produce bradycardia, hypotension, bronchospasm, and acute cardiac failure.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hyperthyroidism, impaired hepatic or renal function, and inadequate cardiac function. Precautions apply to both oral and ophthalmic administration because of the possible systemic absorption of ophthalmic timolol. Timolol is distributed in breast milk and is not for use in breastfeeding women because of the potential for serious adverse effects in the breastfed infant. Timolol use should be avoided in pregnant women after the first trimester because it may result in low-birth-weight infants. The drug may also produce apnea, bradycardia, hypoglycemia, or hypothermia during childbirth. The safety and efficacy of oral timolol have not been established in children. In elderly patients, age-related peripheral vascular disease increases susceptibility to decreased peripheral circulation. Be aware that salt and alcohol intake should be restricted. Nasal decongestants or OTC cold preparations (stimulants) should not be used without physician approval. Tasks that require mental alertness or motor skills should be avoided.

Notify the physician of excessive fatigue, prolonged dizziness or headache, or shortness of breath. Pattern of daily bowel activity and stool consistency, ECG for arrhythmias (particularly premature ventricular contractions), BP, heart rate, IOP (with ophthalmic preparation), and liver and renal function test results should be monitored during treatment. If pulse rate is 60 beats/min or lower or systolic BP is <90 mm Hg or lower, withhold the medication and contact the physician.

### Storage

Store tablets at room temperature. Store ophthalmic products upright and protected from light at room temperature.

### Administration

Take timolol without regard to meals. Tablets may be crushed. Do not abruptly discontinue timolol. Compliance is essential to control angina, arrhythmias, glaucoma, and hypertension.

! When administering ophthalmic gel, invert container and shake once before each use.

For ophthalmic administration, place a finger on the lower eyelid and pull it out until pocket is formed between the eye and lower lid. Hold the dropper above the pocket and place the prescribed number of drops or amount of prescribed gel into pocket. Close eyes gently so that medication will not be squeezed out of the sac. Apply gentle digital pressure to the lacrimal sac at the inner canthus for 1 min after installation to lessen the risk of systemic absorption.

## **Tinidazole**

ty-ni'da-zole 📩 Tindamax 酔 Fasigyn

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (X for first trimester)

Classification: Antiprotozoals

## **MECHANISM OF ACTION**

A nitroimidazole derivative that is converted to the active metabolite by reduction of cell extracts of *Trichomonas*. The active metabolite causes DNA damage in pathogens. Therapeutic Effect: Produces antiprotozoal effect.

## PHARMACOKINETICS

Rapidly and completely absorbed. Protein binding: 12%. Distributed in all body tissues and fluids; crosses blood-brain barrier. Significantly metabolized. Excreted primarily in urine; partially eliminated in feces. *Half-life*: 12-14 h.

## AVAILABILITY

Tablets: 250 mg, 500 mg.

## INDICATIONS AND DOSAGES Intestinal amebiasis

PO

Adults, Elderly. 2 g/day for 3 days. Children 3 yr and older. 50 mg/kg/ day (up to 2 g) for 3 days.

### Amebic hepatic abscess PO

*Adults, Elderly.* 2 g/day for 3-5 days. *Children 3 yr and older.* 50 mg/kg/ day (up to 2 g) for 3-5 days.

## Giardiasis

### PO

*Adults, Elderly.* 2 g as a single dose. *Children 3 yr and older.* 50 mg/kg (up to 2 g) as a single dose.

### Trichomoniasis PO

*Adults, Elderly.* 2 g as a single dose.**Bacterial vaginosis** 

### PO

*Adults (nonpregnant).* 2 g once daily for 2 days; or 1 g taken once daily for 5 days.

### Patients on hemodialysis

These patients should receive an extra half-dose after the end of dialysis.

## CONTRAINDICATIONS

First trimester of pregnancy, hypersensitivity to nitroimidazole derivatives or to tinidazole; do not breastfeed during, and for 3 days following, last dose.

Tinidazole (Generic Name)

### INTERACTIONS

### Drug

Alcohol: May cause a disulfiramtype reaction.

Cholestyramine, oxytetracycline: May decrease the effectiveness of tinidazole; separate dosage times. Cimetidine, ketoconazole: Decrease the metabolism of tinidazole.

Cyclosporine, fluorouracil, lithium, phenytoin, tacrolimus: May

increase blood levels of these drugs. **Disulfiram:** May increase the risk of psychotic reactions (separate dose by 2 wks).

**Warfarin:** Increase the risk of bleeding. Monitor INR closely, during and for up to a week following, end of treatment.

### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum LDH, triglyceride, AST (SGOT), and ALT (SGPT) levels. May lower WBC counts.

## SIDE EFFECTS

### Occasional (2%-4%)

Metallic or bitter taste, nausea, weakness, fatigue, or malaise. Rare (< 2%)

Epigastric distress, anorexia, vomiting, headache, dizziness, redbrown or darkened urine, vaginal candidiasis, painful urination.

## SERIOUS REACTIONS

• Peripheral neuropathy, characterized by paresthesia, is usually reversible if tinidazole treatment is stopped as soon as neurologic symptoms appear.

• Superinfection, hypersensitivity reaction, and seizures occur rarely.

 Blood dyscrasias are rare but are part of hypersensitivity reactions.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with blood dyscrasia, candidiasis (may present more prominent symptoms during tinidazole therapy), central nervous system disease (risk of seizure or peripheral neuropathy), liver impairment, and concurrent treatment with related agents such as metronidazole. Tinidazole crosses the placenta and is distributed in breast milk. Contraindicated in the first trimester of pregnancy, and breastfeeding should be avoided during and up to 72 h after the last dose of treatment. Safety and efficacy of tinidazole have not established in children younger than 3 yr. No agerelated precautions have been noted in elderly patients. Avoid alcohol while taking tinidazole and for at least 3 days after discontinuing the medication. Storage

Store at room temperature. Extemporaneously prepared oral suspension is stable for 7 days at room temperature.

### Administration

Scored tablets may be crushed. Take with meals or snack to minimize GI irritation. Do not miss a dose; complete the full length of treatment.

The manufacturer gives instructions for preparing an oral suspension, if needed. Shake well before each use.

## Tinzaparin

tin-za-pair'in ★ 🍁 Innohep

CATEGORY AND SCHEDULE Pregnancy Risk Category: B

**Classification:** Anticoagulants, low-molecular-weight heparin (LMWH)

## **MECHANISM OF ACTION**

A low-molecular-weight heparin that inhibits factor Xa. Causes less inactivation of thrombin, inhibition of platelets, and bleeding than standard heparin. Does not significantly influence bleeding time, PT, aPTT. *Therapeutic Effect:* Produces anticoagulation.

## PHARMACOKINETICS

Well absorbed after SC administration. Eliminated primarily in urine. *Half-life:* 3-4 h.

## AVAILABILITY

*Injection:* 20,000 anti-Xa international units/mL.

## INDICATIONS AND DOSAGES

## Deep vein thrombosis SC

Adults, Elderly. 175 anti-Xa international units/kg once a day. Continue for at least 6 days and until patient is sufficiently anticoagulated with warfarin (international normalizing ratio [INR] of 2 or more for 2 consecutive days).

## CONTRAINDICATIONS

Elderly with renal insufficiency; active major bleeding; concurrent heparin therapy, hypersensitivity to heparin, sulfite, benzyl alcohol, or pork products; thrombocytopenia associated with positive in vitro test for antiplatelet antibody.

## INTERACTIONS

## Drug

Anticoagulants, platelet inhibitors: May increase the risk of bleeding.

Herbal

**Ginkgo biloba:** May increase the risk of bleeding.

Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

Increases (reversible) LDH, serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

### Frequent (16%)

Injection site reaction, such as inflammation, oozing, nodules, and skin necrosis.

### Rare (< 2%)

Nausea, asthenia, constipation, epistaxis.

## SERIOUS REACTIONS

• Overdose may lead to bleeding complications ranging from local ecchymoses to major hemorrhage. Antidote: Dose of protamine sulfate (1% solution) should be equal to dose of tinzaparin injected. 1 mg protamine sulfate neutralizes 100 anti-Xa international units (IU) of tinzaparin. A second dose of 0.5 mg protamine per 100 anti-Xa IU of tinzaparin may be given if aPTT tested 2-4 h after the initial infusion remains prolonged.

Major bleeding occurs rarely.

• Epidural or spinal hematoma may cause paralysis.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with conditions associated with increased risk of hemorrhage, history of recent GI ulceration and hemorrhage, history of heparininduced thrombocytopenia, impaired renal function, uncontrolled arterial hypertension, and in elderly patients. Patients should be monitored closely for bleeding and neurologic status if tinzaparin is administered during or immediately after lumbar puncture, spinal anesthesia, or epidural anesthesia. Tinzaparin should be used with caution in pregnant women, particularly during the last trimester and immediately postpartum because it increases the risk of maternal hemorrhage. It is unknown whether tinzaparin is excreted in breast milk. Safety and efficacy of tinzaparin have not been established in children. Elderly patients may be more susceptible to bleeding.

Notify the physician of chest pain, injection site reaction, such as inflammation, nodules, oozing, numbness, pain, swelling or tingling of joints, unusual bleeding, or bruising. PT, INR, and CBC, including platelet count, should be monitored before and during therapy. Be aware of signs of bleeding, including bleeding at injection or surgical sites or from gums, blood in stool, bruising, hematuria, and petechiae.

#### Storage

Store at room temperature. Administration

#### Aummistration

! Do not mix with other injections or infusions. Do not give intramuscularly. Administer tinzaparin by subcutaneous route only.

Patient should be supine or sitting down before administering by SC injection into the abdominal wall as directed. Do not rub the injection site after administration. Rotate injection site daily.

## **Tioconazole**

tyo-con'a-zole ★ Vagistat-1

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antifungals, vaginal

### **MECHANISM OF ACTION**

An imidazole derivative that inhibits synthesis of ergosterol (vital component of fungal cell formation). *Therapeutic Effect:* Damaging fungal cell membrane. Fungistatic.

### PHARMOCOKINETICS

Negligible absorption from vaginal application.

### AVAILABILITY

Vaginal Ointment: 6.5% (Vagistat-1).

## INDICATIONS AND DOSAGES

Vulvovaginal candidiasis

INTRAVAGINAL *Adults, Elderly.* 1 applicatorful just before bedtime as a single dose.

### CONTRAINDICATIONS

Hypersensitivity to tioconazole or other imidazole antifungal agents.

### INTERACTIONS

### Drug

### Spermicides (e.g., nonoxynol-9): Spermicide inactivated; may lead to contraceptive failure. Herbal None known. Food

None known.

### DIAGNOSTIC TEST EFFECTS

None known.

### SIDE EFFECTS

Frequent (25%) Headache. Occasional (1%-6%) Burning, itching. Rare (< 1%) Irritation, abdominal pain, vaginal pain, dysuria, dryness of vaginal secretions, vulvar edema/swelling.

### SERIOUS REACTIONS

· None reported.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes and HIV or AIDS infection. It is unknown whether tioconazole is distributed in breast milk. Safety and efficacy have not been established in children. No age-related precautions have been noted in elderly patients. Separate personal items that come in contact with affected areas.

### Storage

Store at room temperature.

### Administration

Insert applicatorful high into vagina just before bedtime. Contact physician if itching or burning continues. Be aware that tioconazole base may interact with latex or rubber. Condoms or diaphragms should not be used within 72 h of administration.

## **Tiotropium**

ty-oh'tro-pee-um

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Respiratory agents, anticholinergics, bronchodilators

## **MECHANISM OF ACTION**

An anticholinergic that binds to recombinant human muscarinic receptors at the smooth muscle, resulting in long-acting bronchial smooth-muscle relaxation. *Therapeutic Effect:* Relieves bronchospasm.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
Inhalation	NA	NA	24-36 h

Binds extensively to tissue. Protein binding: 72%. Metabolized by oxidation. Excreted in urine. *Half-life:* 5-6 days.

## AVAILABILITY

*Powder for Inhalation:* 18 mcg/ capsule (in blister packs containing 6 capsules with inhaler).

# INDICATIONS AND DOSAGES Chronic obstructive pulmonary disease (COPD)

INHALATION Adults, Elderly. 18 mcg (1 capsule)/ day via HandiHaler inhalation device.

## CONTRAINDICATIONS

History of hypersensitivity to atropine or its derivatives, including ipratropium.

### INTERACTIONS

Drug Ipratropium: Concurrent administration not recommended. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

### SIDE EFFECTS

### Frequent (6%-16%)

Dry mouth, sinusitis, pharyngitis, dyspepsia, urinary tract infection, rhinitis.

### Occasional (4%-5%)

Abdominal pain, peripheral edema, constipation, epistaxis, vomiting, myalgia, rash, oral candidiasis.

### SERIOUS REACTIONS

 Angina pectoris, angiodema or hypersensitivity, paradoxical bronchospasm, and flu-like symptoms occur rarely.

Tiopronin (Generic Name)

• Inadvertent oral swallowing of capsule may cause more pronounced anticholinergic effects.

### **PRECAUTIONS & CONSIDERATIONS**

This is not a rescue medication. Caution is warranted in patients with angle-closure glaucoma, benign prostatic hyperplasia, and bladder neck obstruction. There are no adequate data regarding use in pregnancy. It is unknown whether tiotropium is distributed in breast milk. The safety and efficacy of tiotropium have not been established in children. Elderly patients are more likely to experience constipation, dry mouth, and urinary tract infection. Drink plenty of fluids to decrease the thickness of lung secretions. Avoid excessive use of caffeinated products, such as chocolate, cocoa, cola, coffee, and tea.

Pulse rate and quality; respiratory rate, depth, rhythm, and type; ABG levels; and clinical improvement should be monitored. Fingernails and lips should be assessed for cyanosis, including a blue or dusky color in light-skinned patients and a gray color in dark-skinned patients, which are signs of hypoxemia.

### Storage

Store tiotropium capsules at room temperature. Protect them from extreme temperatures and moisture. Do not store capsules in the HandiHaler device.

### Administration

! Do not swallow capsules orally. For inhalation, open the HandiHaler dustcap by pulling it up; then open the mouthpiece. Place the capsule in the center chamber and firmly close the mouthpiece until you hear a click, leaving the dustcap open. Use only 1 capsule for inhalation at a time. Holding the HandiHaler device with the mouthpiece up, press the piercing button completely once and then release it. Exhale completely before inhaling slowly and deeply, at a rate sufficient to hear the capsule vibrate. Hold breath for as long as is comfortable and then exhale slowly. Repeat this process a second time to ensure the full dose is received. Rinse mouth with water immediately after inhalation to prevent mouth and throat dryness and oral candidiasis.

### Tipranavir

tip-ran'ah-veer

### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiretrovirals, protease inhibitors

### **MECHANISM OF ACTION**

A nonpeptidic protease inhibitor that suppresses HIV protease, an enzyme necessary for splitting viral polyprotein precursors into mature and infectious viral particles. *Therapeutic Effect:* Interrupts HIV replication, slowing the progression of HIV infection; effective against some resistant strains due to chemical structure.

## PHARMACOKINETICS

Coadministration with ritonavir (100 mg twice daily) increases bioavailability and thus the drug must be given with ritonavir to attain efficacy. Roughly 99% bound to plasma proteins. Primarily metabolized in liver via CYP3A4. Most of the drug is eliminated as parent and metabolites via fecal excretion. *Half-life*: 15 h (increased in impaired hepatic function).

Tipranavir (Generic Name), Aptivus (Brand Name)

## AVAILABILITY

Capsules: 250 mg. Oral Solution: 100 mg/mL.

### INDICATIONS AND DOSAGES HIV infection (in combination with other antiretrovirals) PO

Adults. Treatment-experienced: 500 mg tipranavir (with ritonavir 200 mg) twice daily with food. Children 2 to < 18 yr: 14 mg/kg tipranavir with 6 mg/kg ritonavir (or 375 mg/m<sup>2</sup> coadministered with ritonavir 150 mg/m<sup>2</sup>) taken twice daily not to exceed the adult dose. If intolerant, consider decreasing to 12 mg/kg tipranavir with 5 mg/kg ritonavir (or tipranavir 290 mg/ m<sup>2</sup> coadministered with 115 mg/m<sup>2</sup> ritonavir) taken twice daily provided virus is not multidrug resistant.

## CONTRAINDICATIONS

Hypersensitivity to tipranavir; moderate or severe (Child-Pugh class B or C, respectively) hepatic impairment; and coadministration with alfuzosin, ergot alkaloids, cisapride, pimozide, oral midazolam, triazolam, St. John's Wort, lovastatin, simvastatin, rifampin, sildenafil, amiodarone, flecainide, propafenone, quinidine. Also, since this drug is boosted with ritonavir, review ritonavir contraindications.

## INTERACTIONS

NOTE: Please see detailed manufacturer's information for management of additional drug interactions other than those listed. In some cases, dosage adjustment for the agent or choice of an alternate agent is recommended.

### Drug

Alfuzosin: May increase alfuzosin levels. Contraindicated. Amiodarone, flecainide, propafenone, quinidine: Potential for serious and/or life-threatening cardiac arrhythmias from increased plasma concentrations. Contraindicated.

## Antifungal agents, delavirdine,

**NNRTIs:** May increase levels of tipranavir.

Calcium channel blockers:

Tipranavir may increase concentrations of calcium channel blockers.

**Clarithromycin:** May increase levels of clarithromycin.

**CYP3A4 inducers:** May decrease effects of tipranavir.

**CYP3A4 inhibitors:** May increase effects of tipranavir.

**CYP3A4 substrates:** Levels of CYP3A4 substrates may be increased by tipranavir. Contraindicated with cisapride and pimozide.

**Ergot alkaloids:** Effects of ergot alkaloids may be increased. Contraindicated.

HMG-CoA reductase inhibitors: Tipranavir may increase side effects. Use contraindicated with lovastatin, simvastatin.

**Rifamycins:** Decrease tipranavir concentrations. Avoid.

Sildenafil (when given routinely for pulmonary HTN): Levels may be increased by tipranavir. Contraindicated.

Triazolam, oral midazolam: Increases the risk of prolonged

sedation. Contraindicated.

Vitamin E: If taking tipranavir oral solution, avoid additional vitamin E, as the oral solution contains amount higher than recommended daily intake (RDI).

**Warfarin:** Increased anticoagulant effect. Monitor INR.

### Herbal

**St. John's wort:** May decrease tipranavir blood concentration and effect. Contraindicated.

### Food

All food: Enhances tipranavir blood concentration; give with food.

## DIAGNOSTIC TEST EFFECTS

May increase serum AST (SGOT) and ALT (SGPT), serum amylase, lipase, triglyceride, or cholesterol levels, blood glucose. May decrease WBC.

### SIDE EFFECTS

### Frequent (≥ 5%)

Diarrhea, nausea, pyrexia, vomiting, fatigue, headache, and abdominal pain. Rash is more common in children.

### Occasional

Insomnia; accumulation of fat in waist, abdomen, or back of neck ("buffalo hump"), hyperlipidemia.

### Rare

Abnormal taste sensation, heartburn, hyperglycemia.

## SERIOUS REACTIONS

- · Intracranial hemorrhage.
- Stevens-Johnson syndrome and other serious skin rashes.
- · Hepatitis/liver failure.
- Reports of bleeding in patients with hemophilia.

• New-onset diabetes or exacerbations of diabetes.

## **PRECAUTIONS & CONSIDERATIONS**

Tipranavir contains a sulfonamide moiety. Use with caution in patients with a known sulfonamide allergy. Caution is warranted in patients with liver function impairment, hemophilia, diabetes, or heart disease. Screen HIV patients for coexistance of hepatitis B or C before treatment; these patients are at much higher risk of hepatic enzyme elevations or hepatic decompensation. Be aware that it is unknown if tipranavir is excreted in breast milk. Breastfeeding is not recommended in this population because of the possibility of HIV transmission. Use with caution during pregnancy due to lack of data. The safety and efficacy of this drug have

not been established in children under the age of 2 yr.

Establish baseline lab values and monitor hepatic function before and during therapy. Assess the pattern of GI side effects and stool consistency. Evaluate for abdominal discomfort or headache.

### Storage

Capsules should be stored in a refrigerator prior to opening the bottle. After opening may store at room temperature; use within 60 days after first opening the bottle. The oral solution should be stored at room temperature; do not refrigerate or freeze. The solution must be used within 60 days after first opening the bottle.

### Administration

Take tipranavir with ritonavir twice daily. If taken with ritonavir capsules or solution it can be taken with or without food. If taken with ritonavir tablets then the doses *must* be taken with meals. If a dose is missed, take the next dose at the regularly scheduled time; do not double the dose.

## **Tirofiban**

tye-roe-fye′ban ★ ▲ Aggrastat **Do not confuse Aggrastat with Aggrenox.** 

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Platelet inhibitors, platelet glycoprotein IIb/IIIa inhibitors

## **MECHANISM OF ACTION**

An antiplatelet and antithrombotic agent that binds to platelet receptor

glycoprotein IIb/IIIa, preventing binding of fibrinogen. *Therapeutic Effect:* Inhibits platelet aggregation and thrombus formation.

## PHARMACOKINETICS

Poorly bound to plasma proteins; unbound fraction in plasma: 35%. Limited metabolism. Eliminated primarily in the urine (65%) and, to a lesser amount, in the feces. Removed by hemodialysis. *Halflife*: 2 h. Clearance is significantly decreased in severe renal impairment (creatinine clearance < 30 mL/min).

## AVAILABILITY

Injection Premix: 12.5 mg/250 mL, 5 mg/100 mL.

## INDICATIONS AND DOSAGES

## Acute coronary syndrome (unstable angina or non-STEMI) with intervention

IV

Adults, Elderly. Initially, 0.4 mcg/ kg/min for 30 min; then continue at 0.1 mcg/kg/min through procedure and for 12-24 h after procedure. In clinical trials, tirofiban was administered with heparin for 48-108 h.

### Severe renal insufficiency (creatinine clearance < 30 mL/min)</li>

*Adults, Elderly.* Half the usual rate of infusion.

## CONTRAINDICATIONS

Active internal bleeding or a history of bleeding diathesis within previous 30 days, arteriovenous malformation or aneurysm, coagulopathy, hemophilia, pericarditis, stroke, trauma, history of intracranial hemorrhage, history of thrombocytopenia or hypersensitivity after prior exposure to tirofiban, intracranial neoplasm, major surgical procedure within previous 30 days, severe hypertension.

### **INTERACTIONS**

### Drug

Drugs that affect hemostasis (such as aspirin, heparin, NSAIDs, and warfarin): May increase the risk of bleeding. Do not give with another GP-IIb/IIIa inhibitor. Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

Decreases hematocrit, hemoglobin, and platelet count.

## IV INCOMPATIBILITIES

Do not mix with other medications. Only heparin can go through the same IV catheter.

## SIDE EFFECTS

### Occasional (3%-6%)

Pelvic pain, bradycardia, dizziness, leg pain.

### Rare (1%-2%)

Edema and swelling, vasovagal reaction, diaphoresis, nausea, fever, headache.

## SERIOUS REACTIONS

• Signs and symptoms of overdose include generally minor mucocutaneous bleeding and bleeding at the femoral artery access site. However, major bleeding may occur at any site.

• Thrombocytopenia occurs rarely.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with hemorrhagic retinopathy, platelet counts < 150,000/mm<sup>3</sup>, renal impairment, and those who are also receiving drugs affecting hemostasis, such as warfarin. There are no data regarding use in pregnancy. It is unknown whether tirofiban is distributed in breast milk. Safety and efficacy of tirofiban have not been established in children. There is an increased risk of bleeding in elderly patients. Be aware that it may take longer to stop bleeding during tirofiban therapy.

Notify the physician of any unusual bleeding or before a surgery or new drugs are prescribed. aPTT should be monitored 6 h after the beginning of the heparin infusion. Heparin dosage should be adjusted to maintain aPTT at approximately twice control. Nasogastric tube and urinary catheter should be avoided, if possible.

### Storage

Store premixed infusion at room temperature and protect from light. Do not freeze. Use only clear solution. Discard unused solution 24 h after start of infusion.

### Administration

! Heparin and tirofiban can be administered through the same IV line.

For the premixed infusion, tear off the dust cover to open the IntraVia container. Check the IntraVia container for leaks. Do not use plastic containers in series connections because doing so may result in air embolism caused by drawing air from the first container that holds no solution. For loading dose, give 0.4 mcg/kg/min for 30 min. For continuous maintenance infusion, give 0.1 mcg/kg/min.

## MECHANISM OF ACTION

A skeletal muscle relaxant that increases presynaptic inhibition of spinal motor neurons mediated by  $\alpha_2$ -adrenergic agonists, reducing facilitation to postsynaptic motor neurons. *Therapeutic Effect:* Reduces muscle spasticity.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	NA	1-2 h	3-6 h

Metabolized in the liver. *Half-life:* 4-8 h.

## AVAILABILITY

*Capsules:* 2 mg, 4 mg, 6 mg. *Tablets:* 2 mg, 4 mg.

## INDICATIONS AND DOSAGES Muscle spasticity

### PO

*Adults, Elderly.* Initially 2-4 mg, gradually increased in 2- to 4-mg increments and repeated q6-8h. Maximum: 3 doses/day or 36 mg/24 h.

## **OFF-LABEL USES**

Spasticity associated with multiple sclerosis or spinal cord injury.

## CONTRAINDICATIONS

Hypersensitivity to tizanidine; co-use with fluvoxamine or ciprofloxacin, or other potent inhibitors of CYP1A2 is contraindicated.

## INTERACTIONS

### Drug

Alcohol, other central nervous system (CNS) depressants:

May increase CNS depressant effects.

Antihypertensives: May increase tizanidine's hypotensive potential.

## **Tizanidine**

tye-zan′i-deen ★ ₩ Zanaflex

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Relaxants, skeletal muscle

Tizanidine (Generic Name)

## CYP1A2 potent inhibitors (e.g., fluovoxamine, ciprofloxacin):

Contraindicated due to decreased tizanidine elimination and side effect risk. Other inhibitors (e.g., zileuton, other quinolone antibiotics, mexilitene, amiodarone, cimetidine, acyclovir) should be avoided if possible.

**Oral contraceptives:** May reduce tizanidine clearance.

**Phenytoin:** May increase serum levels and risk of toxicity of phenytoin.

#### Herbal

None known. Food None known.

### DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

Frequent (41%-49%)

Dry mouth, somnolence, asthenia. **Occasional (4%-16%)** 

Dizziness, urinary tract infection, constipation.

#### Rare (3%)

Nervousness, amblyopia, pharyngitis, rhinitis, vomiting, urinary frequency.

## SERIOUS REACTIONS

 Hypotension (a reduction in either diastolic or systolic BP) may be associated with bradycardia, orthostatic hypotension, and rarely syncope. The risk of hypotension increases as dosage increases; BP may decrease within 1 h after administration.

Hepatocellular liver injury, jaundice, hepatic failure (rare).
Rare reports of psychosis or hallucinations.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hypotension and cardiac, hepatic, or renal disease. There are no data in pregnancy or lactation. The safety and efficacy of tizanidine have not been established in children. In elderly patients, drug clearance is reduced and warrants cautious use.

Low BP, impaired coordination, and sedation may occur. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills until drug effects are known. Baseline liver function tests should be obtained, and periodic monitoring, particularly in the first 6 mo of treatment, is recommended. Therapeutic response, such as decreased stiffness, tenderness, and intensity of skeletal muscle pain and improved mobility, should be assessed.

#### Storage

Store capsules and tablets at room temperature; protect from moisture.

## Administration

Do not abruptly discontinue the medication.

## **Tobramycin Sulfate**

toe-bra-mye'sin ★ AK-Tob, Nebcin, PMS-Tobramycin, TOBI, Tobrex ▲ Apo-Tobramycin, PMS-Tobramycin, TOBI, Tobrex

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antibiotics, aminoglycosides

## **MECHANISM OF ACTION**

An aminoglycoside antibiotic that irreversibly binds to protein on bacterial ribosomes.

*Therapeutic Effect:* Interferes with protein synthesis of susceptible microorganisms.

## PHARMACOKINETICS

Rapid, complete absorption after IM administration. Protein binding: 30%. Widely distributed (does not cross the blood-brain barrier; low concentrations in cerebrospinal fluid). Inhaled tobramycin acts locally in lungs. Excreted unchanged in urine. Removed by hemodialysis. *Half-life:* 2-4 h (increased in impaired renal function and neonates; decreased in cystic fibrosis and febrile or burn patients).

## AVAILABILITY

Injection Solution (Nebcin): 10 mg/mL, 40 mg/mL. Premix Infusion: 60 mg/50 mL, 80 mg/50 mL. Ophthalmic Ointment (Tobrex): 0.3%. Ophthalmic Solution (AK-Tob, Tobrex): 0.3%. Nebulization Solution (TOBI): 60 mg/mL.

## INDICATIONS AND DOSAGES

NOTE: Parenteral doses determined using ideal body weight (IBW), except in obesity, where IBW is adjusted for best calculation of dose. > Skin and skin-structure, bone, joint, respiratory tract, postoperative, intra-abdominal, and burn wound infections; complicated urinary tract

infections; complicated urinary trac infection; septicemia; meningitis IV, IM

*Adults, Elderly.* 3-6 mg/kg/day in 2-3 divided doses or 5-7 mg/kg once a day. *Children 5-12 yr.* Usual dosage 2-2.5 mg/kg/dose q8h.

Children < 5 yr. Usual dosage, 2.5 mg/kg/dose q8h.

 Superficial eye infections, including blepharitis, conjunctivitis, keratitis, and corneal ulcers
 OPHTHALMIC OINTMENT *Adults, Elderly.* Apply a thin strip to conjunctiva q8-12h (q3-4h for severe infections).

OPHTHALMIC SOLUTION *Adults, Elderly.* 1-2 drops in affected eye q4h (2 drops/h for severe infections).

## Bronchopulmonary infections in patients with cystic fibrosis

INHALATION SOLUTION (TOBI) Adults, Children 6 yr and older. 300 mg (1 ampule) twice a day for 28 days, then off for 28 days.

## Dosage in renal impairment (adults)

Dosage and frequency are modified based on the degree of renal impairment and the serum drug concentration.

For traditional dosing regimens.

CrCl 40-60 mL/min. Dosage interval q12h.

CrCl 20-40 mL/min. Dosage interval q24h.

CrCl < 20 mL/min. Monitor levels to determine dosage interval.

#### "Once-daily" dose strategy IV

*Adults:* Common off-label dosing strategies use a "once daily" dose of 5-7.5 mg/kg IV, and then adjust the frequency of administration according to serum levels and medically accepted dosing nomograms.

## CONTRAINDICATIONS

Hypersensitivity to tobramycin, other aminoglycosides (cross-sensitivity), and their components.

## INTERACTIONS

#### Drug

Nephrotoxic medications, other aminoglycosides, ototoxic medications: May increase the risk of nephrotoxicity and ototoxicity. Neuromuscular blockers and botulinum toxins: May increase neuromuscular blockade.

#### **Herbal and Food**

None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, BUN, serum creatinine, serum LDH, SGOT (AST), and SGPT (ALT) levels. May decrease serum calcium, magnesium, potassium, and sodium concentrations. In traditional dose regimens, the therapeutic peak serum level is 4-12 mcg/mL and trough is 0.5-2 mcg/mL; peaks up to 20 mcg/mL may be required for some infections. For all regimens, toxic trough levels is > 2 mcg/mL.

## IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), heparin, hetastarch (Hespan), indomethacin (Indocin), propofol (Diprivan), sargramostim (Leukine, Prokine).

## 🗏 IV COMPATIBILITIES

Amiodarone (Cordarone), calcium gluconate, diltiazem (Cardizem), hydromorphone (Dilaudid), magnesium sulfate, midazolam (Versed), morphine, theophylline.

#### SIDE EFFECTS

#### Occasional

IM: Pain, induration. IV: Phlebitis, thrombophlebitis. Topical: Hypersensitivity reaction (fever, pruritus, rash, urticaria). Ophthalmic: Tearing, itching, redness, eyelid swelling. **Rare** 

#### Kare

Hypotension, nausea, vomiting.

#### SERIOUS REACTIONS

 Nephrotoxicity (as evidenced by increased BUN and serum creatinine levels and decreased creatinine clearance) may be reversible if the drug is stopped at the first sign of nephrotoxic symptoms.  Irreversible ototoxicity (manifested as tinnitus, dizziness, ringing or roaring in ears, and hearing loss) and neurotoxicity (manifested as headache, dizziness, lethargy, tremor, and visual disturbances) occur occasionally. The risk of these reactions increases with higher dosages or prolonged therapy.

 Superinfections, particularly fungal infections, may result from bacterial imbalance with any administration route.

Anaphylaxis may occur.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with concomitant use of neuromuscular blockers and in those with impaired renal function or auditory or vestibular impairment. Tobramycin readily crosses the placenta and is distributed in breast milk. Tobramycin may cause fetal nephrotoxicity. The ophthalmic form should not be used in breastfeeding mothers and only when specifically indicated in pregnant women. Immature renal function in neonates and premature infants may increase the risk of toxicity. Age-related renal impairment may require a dosage adjustment in elderly patients.

Determine the patient's history of allergies, especially to aminoglycosides, sulfites, and parabens (for topical and ophthalmic routes), before giving the drug. Intake and output and urinalysis results, as appropriate, should be monitored. To maintain adequate hydration, encourage the patient to drink fluids. Monitor urinalysis results for casts, RBCs, WBCs, and decreased specific gravity. Be alert for ototoxic and neurotoxic side effects. If giving ophthalmic tobramycin, monitor the patient's eye for burning, itching, redness,

eyelid swelling, and tearing. If giving topical tobramycin, monitor for itching and redness. Be alert for signs and symptoms of superinfection, particularly changes in the oral mucosa, diarrhea, and genital or anal pruritus. Monitor peak and trough serum drug levels.

#### Storage

Store ophthalmic preparation and solution vials for injection at room temperature. Solutions may be discolored by light or air, but discoloration does not affect drug potency.

#### Administration

! Space parenteral doses evenly around the clock. Be aware that dosages are based on ideal body weight. Expect to monitor serum drug levels.

For IV use, dilute with 50-100 mL of D5W or 0.9% NaCl. The amount of diluent for infant and children dosages depends on individual needs. Infuse over 20-60 min.

For IM use, to minimize injection site discomfort, administer the IM injection slowly and deep into the gluteus maximus rather than the lateral aspect of the thigh.

For ophthalmic use, place a gloved finger on the lower eyelid, and pull it out until a pocket is formed between the eye and lower lid. Hold the dropper above the pocket and place the correct number of drops (or 1/4-1/2 inch of ointment) into the pocket. Close the eye gently. After administering ophthalmic solution, apply digital pressure to the lacrimal sac for 1-2 min to minimize drainage into the nose and throat, thereby reducing the risk of systemic effects. After applying ophthalmic ointment, close the eye for 1-2 min. Roll the eyeball to increase the drug's contact with the eye. Use a tissue to remove excess solution or ointment around the eye.

Nebulization doses should be inhaled as close to 12 h apart as possible and not < 6 h apart. Do not mix with dornase alfa (Pulmozyme) in the nebulizer. If taking several medications, use them in the following order: bronchodilator first, then chest therapy, then other inhaled medications and, finally, nebulized tobramycin.

## **Tocilizumab**

toe-si-liz'oo-mab

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

#### Classification: Disease

modifying antirheumatic drugs, biologic response modifiers, monoclonal antibodies

### **MECHANISM OF ACTION**

A monoclonal antibody that binds to interleukin-6 receptors and inhibits IL-6 functional activity. Reduces infi ltration of inflammatory cells. *Therapeutic Effect:* Decreases synovitis and joint erosion.

#### PHARMACOKINETICS

Biphasic elimination. May inhibit multiple CYP enzyme systems. *Terminal half-life:* Roughly 6.3 days in adults, up to 23 days in children.

#### AVAILABILITY

Injection Solution, Vials: 20 mg/mL.

#### INDICATIONS AND DOSAGES • Rheumatoid arthritis (RA), moderate to severe

IV INFUSION

Adults, Elderly. 4 mg/kg IV infusion q4wk, followed by an increase to 8 mg/kg infusion q4wk based on clinical response. Maximum per infusion: 800 mg.

#### Systemic Juvenile Idiopathic Arthritis (SJIA): IV INFUSION

*Children 2 yrs and older*. Dose is weight based.

< 30 kg: Give 12 mg/kg per infusion q2wk.

 $\geq$  30 kg: Give 8 mg/kg per infusion q2wk.

#### Dosage adjustments (all uses):

Expect interruption or reduction of dosing for management of doserelated laboratory abnormalities including elevated liver enzymes, neutropenia, and thrombocytopenia.

### CONTRAINDICATIONS

Hypersensitivity to tocilizumab.

### INTERACTIONS

#### Drug

## Abatacept, rilonacept, anakinra, natalizumab, and other TNF

**modulating drugs:** May increase the risk of adverse effects such as infection risk. Concurrent use not recommended.

**Immunosuppressants:** May increase risk of serious infection.

Live vaccines: May decrease immune response to vaccine. Deferral of live vaccination may be necessary; consult CDC guidelines. Herbal

## Echinacea: In theory, may alter effect of tocilizumab.

Food

None known.

## DIAGNOSTIC TEST EFFECTS

Reduced neutrophil and platelets counts, liver transaminase elevations, increased serum cholesterol and triglycerides.

## **IV INCOMPATIBILITIES**

Do not mix tocilizumab with other medications or infuse at the same time as other medications.

## SIDE EFFECTS

#### Frequent (≥ 5%)

Upper respiratory tract infections, nasopharyngitis, headache, peripheral edema, hypertension, increased ALT/AST.

## Occasional (2%-5%)

Abdominal pain, mouth ulcer, other infections, dizziness, bronchitis. **Rare (< 2%)** 

Hypertensive infusion related reaction, gastritis, other infusion reactions (headaches, rash, pruritus, urticarial).

## SERIOUS REACTIONS

• Hypersensitivity reactions may occur, including angioedema or serum-sickness-like syndromes.

- · GI perforations reported rarely
- · Neutropenia, or thrombocytopenia.
- Reactivation of latent tuberculosis has occurred.

• Serious infections, such as bacteremia or pneumonia.

• Demyelinating disorders, like multiple sclerosis and chronic inflammatory demyelinating polyneuropathy, reported rarely.

#### PRECAUTIONS & CONSIDERATIONS

It is recommended that tocilizumab not be initiated in patients with an absolute neutrophil count (ANC) below 2000 per mm3, platelet count below 100,000 per mm<sup>3</sup>, or who have ALT or AST greater than 1.5 times the upper limit of normal (ULN). Tocilizumab should not be initiated in patients with an active infection, including clinically important localized infections. Weigh risks and benefits in patients (1) with chronic or recurrent infection; (2) who have been exposed to tuberculosis; (3) who have resided or traveled in areas of endemic TB or endemic mycoses, such as histoplasmosis, coccidioidomycosis, or blastomycosis with underlying

conditions that may predispose them to infection. A PPD and/ or chest x-ray should be obtained prior to use. Caution is warranted in patients with a history of recurrent infections and in patients on concomitant immunosuppressant agents, especially those receiving corticosteroids. Use with caution in patients with neurologic disease, such as multiple sclerosis, as well as hypertension, or other significant heart disease or in those with hepatic disease or a history of hepatitis. There are no data regarding use in pregnant women. It is unknown whether tocilizumab is distributed in breast milk; discontinuation of breastfeeding is recommended. Safety and efficacy of the drug have not been established in children younger than 2 yrs. Use cautiously in elderly patients.

Notify the physician of signs of infection, such as fever or sore throat, or if there are signs of allergic reaction. Monitor BP. CBC and LFTs should be monitored at baseline, at the time of the second infusion, and thereafter every 2-4 wks. Serum lipid panels should be monitored routinely. Persons should report increase in pain, stiffness, or swelling of joints, or any other unusual effects.

#### Storage

Refrigerate solution for injection in the original carton. Do not freeze. Protect from light. The solution will be a clear, colorless to pale yellow liquid and free from particulates; if cloudy or discolored or if it has large particles, do not use. After preparing the solutions for infusion, they may be stored refrigerated or at room temperature for up to 24 h and should be protected from light. The solutions do not contain preservatives.

#### Administration

For intravenous (IV) infusion only. The solution must be further diluted before infusion. Use a 50-mL infusion volume for treatment of JRA who are < 30 kg; use a 100 mL infusion volume for patients with rheumatoid arthritis or children 30 kg and over. Step 1: Withdraw a volume of 0.9% NaCl injection, equal to the volume of the tocilizumab solution required for the patient's dose from the infusion bag or bottle. For Step 2, slowly add the tocilizumab dose from each vial into the infusion bag or bottle. To mix the solution, gently invert the bag to avoid foaming. Do not shake

The IV infusion should be administered over 60 minutes, and must be administered with an infusion set. Do not administer as an IV push or bolus.

#### Tolcapone toll'ka-pone

★ Tasmar

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antiparkinsonian agents, COMT inhibitors

#### MECHANISM OF ACTION

An antiparkinsonian agent that inhibits the enzyme catechol-O-methyltransferase (COMT), potentiating dopamine activity and increasing the duration of action of levodopa. *Therapeutic Effect:* Relieves signs and symptoms of Parkinson's disease.

#### PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding:

Tolcapone (Generic Name), Tasmar (Brand Name)

99%. Metabolized in the liver. Eliminated primarily in urine (60%) and, to a lesser extent, in feces (40%). Unknown whether removed by hemodialysis. *Half-life:* 2-3 h.

## AVAILABILITY

Tablets: 100 mg, 200 mg.

#### INDICATIONS AND DOSAGES Adjunctive treatment of Parkinson's disease if benefit outweighs risk of hepatotoxicity PO

*Adults, Elderly.* Initially, 100 mg 3 times a day concomitantly with each dose of carbidopa and levodopa. May increase dose to 200 mg 3 times/day. Maximum: 600 mg/day.

## CONTRAINDICATIONS

Hypersensitivity (including hepatocellular injury or rhabdomyolysis or pyrexia); use within 14 days of nonselective MAOIs; hepatic disease.

#### INTERACTIONS

#### Drug

Dobutamine, dopamine, epinephrine, isoetharine, isoproterenol, epinephrine, methyldopa, norepinephrine: May increase the risk of arrhythmias and changes in BP. Nonselective MAOIs (including phenelzine): May inhibit catecholamine metabolism and increase risk of cardiovascular side

effects such as hypertensive crisis. Containdicated.

Other central nervous system (CNS) depressants: May increase CNS depression.

#### Herbal

None known. Food None significant.

### DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT) and ALT (SGPT) levels.

## SIDE EFFECTS

! Frequency of side effects increases with dosage. The following effects are based on a 200-mg dose.

## Frequent (16%-35%)

Nausea, insomnia, somnolence, anorexia, diarrhea, muscle cramps, orthostatic hypotension, excessive dreaming.

#### Occasional (4%-11%)

Headache, vomiting, confusion, hallucinations, constipation, diaphoresis, bright yellow urine, dry eyes, abdominal pain, dizziness, flatulence.

#### Rare (2%-3%)

Dyspepsia, neck pain, hypotension, fatigue, chest discomfort.

### SERIOUS REACTIONS

• Rare reports of loss of impulse control, such as urge to gamble excessively or unusual sexual urges.

 Too-rapid withdrawal from therapy may produce withdrawal-emergent hyperpyrexia, characterized by fever, muscular rigidity, and altered level of consciousness.

 Dyskinesia and dystonia occur frequently.

- Hallucinations.
- Orthostatic hypotension.
- · Hepatocellular injury.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with baseline hypotension, renal impairment, a history of hallucinations, and orthostatic hypotension. Because of a risk of acute fulminant liver failure, tolcapone should be reserved for patients not responding to other therapies. Notify the physician if a female patient is planning to become pregnant. It is unknown whether tolcapone is distributed in breast milk. Tolcapone is not used in children. Elderly patients are at increased risk for hallucinations. Typically, hallucinations in elderly patients occur within the first 2 wks of therapy.

Dizziness, drowsiness, and nausea may occur initially but will diminish or disappear with continued treatment. Alcohol and tasks that require mental alertness or motor skills should be avoided until the effects of the drug are fully known. Change positions slowly to prevent orthostatic hypotension. Also, urine may turn bright yellow. Notify the physician if dark urine, falls, fatigue, itching, loss of appetite, persistent nausea, yellowing of the skin and sclera of the eyes, or abnormal contractions of the head, neck, or trunk occur. Baseline vital signs should be assessed. AST (SGOT) and ALT (SGPT) levels should be monitored before increasing dose and then q2-4 wks for next 6 mo. Relief of symptoms, such as improvement of masklike facial expression, muscular rigidity, shuffling gait, and resting tremors of the hands and head, should also be assessed during treatment.

#### Storage

Store tablets at room temperature. Administration

! Always administer tolcapone with carbidopa and levodopa.

Take tolcapone without regard to food.

## Tolmetin

tole'met-in ★

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in third trimester or near delivery)

**Classification:** Analgesics, nonsteroidal anti-inflammatory drugs

#### **MECHANISM OF ACTION**

A nonsteroidal anti-inflammatory (NSAID) that produces analgesic and anti-inflammatory effect by inhibiting prostaglandin synthesis. *Therapeutic Effect:* Reduces inflammatory response and intensity of pain stimulus reaching sensory nerve endings.

#### PHARMACOKINETICS

Rapidly absorbed from the GI tract. Metabolized in liver. Excreted in urine. Minimally removed by hemodialysis. *Half-life*: 5 h.

#### AVAILABILITY

*Tablets:* 200 mg, 600 mg. *Capsules:* 400 mg.

#### INDICATIONS AND DOSAGES > Rheumatoid arthritis, osteoarthritis PO

Adults, Elderly: Initially, 400 mg 3 times/day (including 1 dose upon arising, 1 dose at bedtime). Adjust dose at intervals of 1-2 wks. Maintenance: 600-1800 mg/day in 3-4 divided doses.

### • Juvenile rheumatoid arthritis PO

*Children older than 2 yr.* Initially, 20 mg/kg/day in 3-4 divided doses. Maintenance: 15-30 mg/kg/day in 3-4 divided doses.

#### **OFF-LABEL USES**

Treatment of ankylosing spondylitis, psoriatic arthritis.

#### CONTRAINDICATIONS

Hypersensitivity to aspirin or other NSAIDs. Use within 14 days of CABG.

#### INTERACTIONS

#### Drug

Antihypertensive, diuretics: May decrease the effects of antihypertensives and diuretics.

Tolmetin (Generic Name)

Aspirin salicylates, corticosteroids:

May increase the risk of GI bleeding and side effects. NSAIDs may negate the cardioprotective effect of ASA.

**Cyclosporine:** May increase risk of nephrotoxicity.

Heparain, oral anticoagulants, thrombolytics: May increase the effects of heparin, oral anticoagulants, and thrombolytics. Lithium: May increase the blood concentration and risk of toxicity of lithium.

Methotrexate, pemetrexed: May increase the risk of toxicity with methotrexate or premetrexed.

**SSRIs, SNRIs:** Increased risk of GI bleeding.

## Herbal

**Feverfew:** May increase the risk of bleeding.

**Ginkgo biloba:** May increase the risk of bleeding.

Food

Alcohol: May increase risk of dizziness, GI bleeding.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, potassium, liver function tests. May decrease hemoglobin, hematocrit. May prolong bleeding time.

## SIDE EFFECTS

#### Occasional

Nausea, vomiting, diarrhea, abdominal cramping, dyspepsia (heartburn, indigestion, epigastric pain), flatulence, dizziness, visual disturbances, headache, weight decrease or increase.

#### Rare

Constipation, anorexia, rash, pruritus.

## SERIOUS REACTIONS

• NSAID-induced peptic ulcer, GI bleeding, gastritis.

- Rare reactions include cholestasis, jaundice, nephrotoxicity, hematologic sensitivity (e.g., leukopenia).
- Severe hypersensitivity reaction (bronchopasm) possible.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with impaired renal function, coagulation disorders, and history of upper GI disease. Cardiovascular event risk may be increased with duration of use or preexisting cardiovascular risk factors or disease. Use caution in patients with fluid retention, heart failure, or hypertension. Risk of myocardial infarction and stroke may be increased following CABG surgery. Do not administer within 4-6 half-lives before surgical procedures. Tolmetin should not be administered to patients with MI or in the setting of coronary artery bypass graft surgery. Tolmetin crosses the placenta. Tolmetin use should be avoided during the last trimester of pregnancy as the drug may adversely affect the fetal cardiovascular system causing premature closure of ductus arteriosus. Tolmetin is distributed to breast milk; breastfeeding is not recommended. Safety and efficacy of tolmetin have not been established in children younger than 2 yr. GI bleeding or ulceration is more likely to cause serious adverse effects in elderly patients.

#### Storage

Store at room temperature. Administration

Take with food, milk, or antacids if GI distress occurs. Therapeutic effect is noted in 1-3 wks.

## Tolnaftate

tole-naftate Absorbine Jr., Antifungal Jock Itch, Fungi-Guard, Lamisil AF Spray, Q-Naftate, Termin8, Tinactin Antifungal, Tinaderm Dr. Scholl's Athlete's Foot, Fungicure

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B OTC

**Classification:** Antifungals, topical

## **MECHANISM OF ACTION**

An antifungal that distorts hyphae and stunts mycelial growth in susceptible fungi. *Therapeutic Effect:* Fungicidal.

## AVAILABILITY

Aerosol, Liquid, Topical: 1% (Tinactin Antifungal). Aerosol, Powder, Topical: 1% (Tinactin Antifungal, Tinactin Antifungal Jock Itch). Cream: 1% (Fungi-Guard, Tinactin Antifungal, Tinactin Antifungal Jock Itch).

*Gel:* 1% (Absorbine Jr.). *Powder:* 1% (Tinactin Antifungal). *Solution, Topical:* 1% (Absorbine Jr. Tinaderm).

# INDICATIONS AND DOSAGES Tinea pedis, tinea cruris, tinea corporis

TOPICAL

*Adults, Elderly, Children 2 yr and older.* Spray aerosol or apply 1-3 drops of solution or a small amount of cream, gel, or powder 2 times daily for 2-4 wks.

## CONTRAINDICATIONS

Nail and scalp infections, hypersensitivity to tolnaftate or any component of its formulation.

## INTERACTIONS

Drug None known. Herbal None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

#### Rare

Irritation, burning, pruritus, contact dermatitis.

## SERIOUS REACTIONS

• None known.

## **PRECAUTIONS & CONSIDERATIONS**

It is unknown whether tolnaftate is excreted in breast milk. No age-related precautions have been noted in children. Age-related renal impairment may require dosage adjustment in elderly patients. Affected areas should be kept clean and dry. Light clothing should be worn to promote ventilation as well as ventilated shoes. Shoes and socks should be changed at least once a day.

#### Storage

Store at room temperature. Sprays are flammable and under pressure; do not store or use near heat, flame, or smoking.

#### Administration

Apply and rub gently into the affected and surrounding area. Wash hands before and after applying tolnaftate to the skin.

## **Tolterodine**

tol-tare'oh-deen ★ 🐏 Detrol, Detrol LA

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticholinergics, urinary antispasmodic, urinary incontinence agents

## **MECHANISM OF ACTION**

An antispasmodic that exhibits potent antimuscarinic activity by interceding via cholinergic muscarinic receptors, thereby inhibiting urinary bladder contraction. *Therapeutic Effect:* Decreases urinary frequency, urgency.

## PHARMACOKINETICS

Rapidly and well absorbed after PO administration. Protein binding: 96%. Extensively metabolized in the liver to active metabolite. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life:* 1.9-3.7 h.

## AVAILABILITY

Tablets (Detrol): 1 mg, 2 mg. Capsules (Extended Release [Detrol LA]): 2 mg, 4 mg.

#### 

PO (EXTENDED RELEASE) Adults, Elderly. 4 mg once a day. PO (IMMEDIATE RELEASE) Adults, Elderly. 1-2 mg twice a day.

## Dosage in severe renal or hepatic impairment or if taking potent inhibitors of CYP3A4

PO (IMMEDIATE RELEASE) Adults, Elderly. 1 mg twice a day. PO (EXTENDED RELEASE) Adults, Elderly. 2 mg once a day.

## CONTRAINDICATIONS

Hypersensitivity to tolterodine or to fesoterodine, urinary retention, gastric retention and other severe decreased GI motility conditions, uncontrolled narrow-angle glaucoma.

## INTERACTIONS

Drug Anticholinergics (such as antihistamines): May increase the anticholinergic effects. Alcohol, central nervous system (CNS) depressants: May increase CNS depressant effects. Clarithromycin, erythromycin, itraconazole, ketoconazole, miconazole: May increase tolterodine blood concentration. Fluoxetine: May inhibit tolterodine metabolism.

Herbal and Food None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

Frequent (40%) Dry mouth.

Occasional (4%-11%)

Headache, dizziness, fatigue, constipation, dyspepsia (heartburn, indigestion, epigastric discomfort), upper respiratory tract infection, urinary track infection, dry eyes, abnormal vision (accommodation problems), nausea, diarrhea.

Rare (3%)

Somnolence, chest or back pain, arthralgia, rash, weight gain, dry skin.

## SERIOUS REACTIONS

 Overdose can result in severe anticholinergic effects, including abdominal cramps, facial warmth, excessive salivation or lacrimation, diaphoresis, pallor, urinary urgency,

Tolterodine (Generic Name)

blurred vision, and prolonged QT interval.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment, clinically significant bladder outflow obstruction (increases risk of urine retention), GI obstructive disorders such as pyloric stenosis, myasthenia gravis, and treated angle-closure glaucoma. It is unknown whether tolterodine is distributed in breast milk. However, breastfeeding is not recommended. The safety and efficacy of this drug have not been established in children. No agerelated precautions have been noted in elderly patients.

Blurred vision, GI upset, constipation, and dry eyes and mouth may occur. Notify the physician of a change in vision. Incontinence and residual urine in the bladder should be determined.

#### Storage

Store at room temperature. Administration

Take tolterodine without regard to food. Swallow extended-release capsules whole; do not open, crush, or chew.

## Tolvaptan

toll-vap′tan ★ Samsca

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Vasopressin antagonist

#### **MECHANISM OF ACTION**

A selective vasopressin  $V_2$ -receptor antagonist with an affinity for the  $V_2$ -receptor that is 1.8 times that of native arginine vasopressin (AVP). Tolvaptan affinity for the V<sub>2</sub>-receptor is 29 times greater than for the V<sub>1a</sub>-receptor. Causes an increase in urine water excretion that increases free water clearance (aquaresis), decreases urine osmolality, and increases serum sodium. Urinary excretion of sodium and potassium is not significantly changed. *Therapeutic Effect:* Restores normal fluid and electrolyte status.

## PHARMACOKINETICS

Peak 2-4 h after oral administration; food does not influence. Protein binding: 99%. Tolvaptan is a substrate and inhibitor of P-glycoprotein (P-gp). Metabolized in liver, tolvaptan is eliminated entirely by nonrenal routes and mainly, if not exclusively, metabolized by CYP3A. Metabolites are not active. *Half-life:* 12 h.

#### AVAILABILITY

Tablets: 15 mg, 30 mg.

# INDICATIONS AND DOSAGES Hyponatremia PO

*Adults.* Initially, 15 mg once daily. May increase at 24-h intervals to 30 mg once daily, and to a maximum of 60 mg once daily as needed to raise serum sodium. Monitor serum sodium and volume status closely.

#### Renal impairment

Dose adjustments not necessary in those with CrCl > 10 mL/min. If CrCl < 10 mL/min, use is not recommended. Contraindicated in anuria.

#### CONTRAINDICATIONS

Known allergy to tolvaptan; anuria (no benefit can be expected); use

with strong CYP3A4 inhibitors (see Interactions); hypovolemic hyponatremia. Not for those requiring urgent intervention to raise serum sodium acutely or in those unable to sense or to respond appropriately to thirst.

## INTERACTIONS

#### Drug

**CYP3A4 inducers:** May decrease the levels and effects of tolvaptan. If cannot be avoided, dose increase of tolvaptan may be necessary.

## CYP3A4 inhibitors (e.g.,

erythromycin): May increase the levels and effects of tolvaptan. Reduce tolvaptan dose with use of moderate inhibitors (e.g., erythromycin, diltiazem, verapamil). Use with strong CYP3A4 inhibitors is contraindicated, including ketoconazole, itraconazole, clarithromycin, nefazodone, ritonavir, and indinavir.

**CYP3A4 substrates:** Tolvaptan may increase the levels and effects of CYP3A4 substrates, including midazolam and amlodipine, simvastatin, and other "statins." Avoid use of these agents during and for 1 wk after conclusion of treatment.

**Cyclosporine and other P-gp inhibitors:** May increase exposure to tolvaptan; dose reduction of tolvaptan may be needed.

**Digoxin:** May increase the levels of digoxin by inhibiting P-gp.

**Potassium-sparing drugs:** May increase serum potassium additively; monitor.

#### Herbal

**St. John's wort:** May reduce tolvaptan levels. Avoid.

## Food

**Grapefruit juice:** May increase tolvaptan exposure. Avoid.

## **DIAGNOSTIC TEST EFFECTS**

Increased sodium levels (serum Na<sup>+</sup>); may increase serum potassium.

## SIDE EFFECTS

#### Frequent

Thirst, dry mouth, asthenia, constipation, polyuria, and hyperglycemia.

#### **Occasional to Rare**

Hyperkalemia, vomiting, diarrhea, orthostatic hypotension, fever, confusion, dehydration, diabetic ketoacidosis, ischemic colitis, thrombosis.

## SERIOUS REACTIONS

· Worsening of heart failure.

· Dehydration.

• Increased risk of GI bleeding, especially in cirrhotic patients.

## **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with hyponatremia with underlying congestive heart failure or cirrhosis. Avoid use with hypertonic saline. Because of the potential increased risk of gastrointestinal bleeding in patients with cirrhosis, use in patients with cirrhosis only when the need to treat outweighs this risk. Based on animal data, tolvaptan may cause fetal harm and should be given in pregnancy only when benefits outweigh risks. Breastfeeding is not recommended during therapy. There are no adequate data in children of any age.

Monitor neurologic status closely to avoid overly rapid correction of serum Na<sup>+</sup> concentration (> 12 mEq/L over 24 h) during treatment. Monitor for signs of heart decompensation, orthostatic hypotension, and dehydration. Follow all instructions for fluid intake. Fluid restriction may be needed as the dose of tolvaptan is decreased.

#### Storage

Store tablets at room temperature. Administration

! Only given in settings where serum Na<sup>+</sup> concentrations, volume status, and blood pressure can be monitored closely.

Give at the same time daily, with or without food. Do not administer with grapefruit juice.

## Topiramate

toe-peer'a-mate Topamax Do not confuse with Toprol XL.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

Classification: Anticonvulsants

### **MECHANISM OF ACTION**

An anticonvulsant that blocks repetitive, sustained firing of neurons by enhancing the ability of  $\gamma$ -aminobutyric acid to induce an influx of chloride ions into the neurons; may also block sodium channels. *Therapeutic Effect:* Decreases seizure activity.

## PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 15%-41%. Not extensively metabolized. Excreted primarily unchanged in urine. Removed by

hemodialysis. *Half-life:* 21 h.

## AVAILABILITY

Capsules (Sprinkle): 15 mg, 25 mg. Tablets: 25 mg, 50 mg, 100 mg, 200 mg.

## INDICATIONS AND DOSAGES Initial monotherapy epilepsy

Adults, Children 10 yr and older. Initiate therapy at 50 mg/day in 2 divided doses. Increase by 50 mg/ day (in divided doses) weekly to a recommended maintenance dose of 400 mg/day in 2 divided doses. *Children 2 yr up to 10 yr*. Dosing is weight based. Initially, give 25 mg/day. Increase by 25 mg/ day (in divided doses) weekly to recommended maintenance dose; daily target dose is divided and administered in 2 equally divided doses.

Weight	Min Target	Max Dose
	dose	
Up to 11 kg	150 mg/day	250 mg/day
11 to 22 kg	200 mg/day	300 mg/day
23 to 31 kg	200 mg/day	350 mg/day
32 to 38 kg	250 mg/day	350 mg/day
> 38 kg	250 mg/day	400 mg/day

#### Adjunctive treatment of partial seizures, Lennox-Gastaut syndrome, generalized tonic-clonic seizures PO

Adults, Elderly, Children older than 16 yr. Initially, 25-50 mg/day for 1 wk. May increase by 25-50 mg/ day at weekly intervals. Maintenance dose is individualized. Usual range: 200-400 mg/day in 2 divided doses, dependent on seizure type. Maximum: 1600 mg/day. *Children 2-16 yr.* Initially, 1-3 mg/ kg/day (maximum 25 mg); initial dose given nightly. May increase by 1-3 mg/kg/day at weekly intervals. Maintenance: 5-9 mg/kg/day in 2 divided doses.

#### Migraine prevention PO

*Adults, Elderly.* 25 mg/day for 1 wk, followed by titration of 25 mg/wk to a target of 100 mg/day in 2 divided doses.

#### Dosage in renal impairment

For adults, expect to reduce drug dosage by 50% if CrCl < 70 mL/min.

Topiramate (Generic Name)

A supplemental dose may be required if on hemodialysis.

### **OFF-LABEL USES**

Treatment of alcohol dependence.

#### CONTRAINDICATIONS

Hypersensitivity to topiramate or other carbonic anhydrase inhibitors.

#### INTERACTIONS

#### Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS depression.

Carbamazepine, phenytoin, valproic acid: May decrease topiramate blood concentration.

**Carbonic anhydrase inhibitors:** May increase the risk of renal calculi.

**Metformin:** Possible reduced clearance of metformin. Monitor.

Oral contraceptives: May

decrease the effectiveness of oral contraceptives.

Herbal and Food None known.

None known.

## DIAGNOSTIC TEST EFFECTS

None known.

#### SIDE EFFECTS

#### Frequent (10%-30%)

Somnolence, dizziness, ataxia, nervousness, nystagmus, diplopia, paresthesia, nausea, tremor.

#### Occasional (3%-9%)

Confusion, breast pain, dysmenorrhea, dyspepsia, depression, asthenia, pharyngitis, weight loss, anorexia, rash, musculoskeletal pain, abdominal pain, difficulty with coordination, sinusitis, agitation, flu-like symptoms.

#### Rare (2%-3%)

Mood disturbances, such as irritability and depression; dry

mouth; aggressive behavior; kidney stones.

### SERIOUS REACTIONS

 Psychomotor slowing, impaired concentration, language problems (such as word-finding difficulties), and memory disturbances occur occasionally. May be mild, or may require drug discontinuation.

- Serious and potentially fatal exfoliative dermatologic reactions.
- Metabolic acidosis (rare); may also lead to kidney stones.

• Oligohydrosis and hyperthermia (rare).

#### PRECAUTIONS & CONSIDERATIONS

Antiepileptic drugs (AEDs) increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Monitor for the emergence or worsening of depression, suicidal thoughts, or unusual changes in behavior or mood. Caution is warranted in patients with impaired hepatic and renal function, a predisposition to renal calculi, and hypersensitivity to topiramate. Be aware that topiramate decreases oral contraceptive effectiveness, and an alternative means of contraception should be used during therapy. Topiramate is associated with fetal harm (e.g., cleft palate) and the drug passes into breast milk. No age-related precautions have been noted in children older than 2 yr. In elderly patients, age-related renal impairment may require dosage adjustment.

Drowsiness and dizziness may occur, so alcohol and tasks requiring mental alertness or motor skills should be avoided. Notify the physician of blurred vision or other visual changes. Seizure disorder, including the onset, duration, frequency, intensity, and type of seizures, should be assessed before and during treatment. Renal function, including BUN and serum creatinine levels, should also be monitored. Adequate hydration should be maintained to decrease the risk of kidney stones.

#### Storage

Store at room temperature. Protect all products from moisture.

## Administration

Do not break tablets because they have a bitter taste. Take topiramate without regard to food. Capsules may be swallowed whole or contents sprinkled on a teaspoonful of soft food and swallowed immediately. They should not be chewed. Do not abruptly discontinue topiramate because this may precipitate seizures. Strict maintenance of drug therapy is essential for seizure control.

#### Toremifene

tore'em-i-feen ★ Fareston

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: D

**Classification:** Antineoplastics, antiestrogens, selective estrogen receptor modulator (SERM)

T

## **MECHANISM OF ACTION**

A nonsteroidal antiestrogen and antineoplastic agent that binds to estrogen receptors on tumors, producing a complex that decreases DNA synthesis and inhibits estrogen effects. *Therapeutic Effect:* Blocks growth-stimulating effects of estrogen in breast cancer.

## PHARMACOKINETICS

Well absorbed after PO administration. Metabolized in the

liver. Eliminated in feces. *Half-life:* Approximately 5 days.

## AVAILABILITY

Tablets: 60 mg.

## INDICATIONS AND DOSAGES

Breast cancer
 PO
 Adults. 60 mg/day until disease
 progression is observed.

## **OFF-LABEL USES**

Treatment of desmoid tumors, endometrial carcinoma.

## CONTRAINDICATIONS

Hypersensitivity, pregnancy, history of thromboembolic disease. Do not use in patients with congenital/ acquired QT prolongation uncorrected hypokalemia, or uncorrected hypomagnesemia.

## INTERACTIONS

#### Drug

Carbamazepine, phenobarbital, phenytoin: May decrease toremifene blood concentration. OT-prolonging drugs (e.g., class

1A and III antiarrhythmics, ranolazine, some antipsychotics, some quinolones): Use with caution since effect of toremifene on QT interval may be additive. Thiazide diuretics: May increase risk of hypercalcemia. Warfarin: May increase PT. Herbal None known. Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase, bilirubin, calcium, and AST (SGOT) levels. Rarely lowers WBC or platelet counts.

Toremifene (Generic Name), Fareston (Brand Name)

## **Topotecan**

toe-poe-tee'kan 🖈 🍄 Hycamtin

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

*Classification:* Antineoplastics, topoisomerase inhibitors

## **MECHANISM OF ACTION**

A DNA topoisomerase inhibitor that interacts with topoisomerase I, an enzyme that allows DNA replication by producing reversible single-strand breaks in DNA that relieve torsional strain. Topotecan prevents religation of the DNA strand, resulting in damage to double-strand DNA and cell death. *Therapeutic Effect:* Destroys cancer cells.

## PHARMACOKINETICS

Hydrolyzed to active form after IV administration. Protein binding: 35%. Excreted in urine. *Half-life*: 2-3 h (increased in impaired renal function).

## AVAILABILITY

*Powder for Injection:* 4 mg (singledose vial). *Capsules:* 0.25 mg, 1 mg.

## INDICATIONS AND DOSAGES

## Ovarian cancer, small cell lung cancer (SCLC) IV

Adults, Elderly. 1.5 mg/m<sup>2</sup>/day over 30 min for 5 consecutive days, beginning on day 1 of a 21-day course. Minimum of 4 courses is recommended. If severe neutropenia (neutrophil count <  $1500/mm^2$ ) or if platelet count < 25,000 mm<sup>3</sup> occurs during treatment, reduce dose for subsequent courses by 0.25 mg/m<sup>2</sup>, or administer filgrastim (G-CSF) no sooner than 24 h after the last dose of topotecan.

PO (FOR SCLC ONLY)

*Adults, Elderly.* 2.3 mg/m<sup>2</sup>/day for 5 consecutive days, beginning on day 1 of a 21-day course. Round dose to nearest combination of capsule strengths, using the minimal number of capsules possible.

#### For stage IV-B cervical cancer IV INFUSION

*Adults, Elderly.* 0.75 mg/m<sup>2</sup> on days 1-3 in combination with cisplatin (50 mg/m<sup>2</sup> IV on day 1 only) given every 3 wks.

#### Dosage in renal impairment

For moderate renal impairment (CrCl 20-39 mL/min), dose adjustment of oral or IV dosing is required for ovarian and SCLC (see manufacturer recommendations); for cervical cancer, do not use.

#### Dosage for toxicities

Expect to withhold doses and/ or decrease dosage if significant toxicities occur.

## **OFF-LABEL USES**

Treatment of solid tumors including osteosarcoma, neuroblastoma, pediatric leukemia, rhabdomyosarcoma.

## CONTRAINDICATIONS

Baseline neutrophil count < 1500 cells/mm<sup>3</sup>, breastfeeding, pregnancy, severe myelosuppression.

## INTERACTIONS

**Cisplatin:** May increase the severity of myelosuppression.

**Live-virus vaccines:** May potentiate virus replication, increase vaccine side effects, and decrease the

patient's antibody response to the vaccine.

Other bone marrow depressants: May increase the risk of myelosuppression. Herbal and Food None known.

## DIAGNOSTIC TEST EFFECTS

May increase serum bilirubin, AST (SGOT), and ALT (SGPT) levels. May decrease RBC, leukocyte, neutrophil, and platelet counts.

### IV INCOMPATIBILITIES

Dexamethasone (Decadron), 5-fluorouracil, mitomycin (Mutamycin).

## 🗏 IV COMPATIBILITIES

Carboplatin (Paraplatin), cisplatin (Platinol AQ), cyclophosphamide (Cytoxan), doxorubicin (Adriamycin), etoposide (VePesid), gemcitabine (Gemzar), granisetron (Kytril), ondansetron (Zofran), paclitaxel (Taxol), vincristine (Oncovin).

## SIDE EFFECTS

#### Frequent

Nausea (77%), vomiting (58%), diarrhea and total alopecia (42%), headache (21%), dyspnea (21%), fatigue (up to 29%).

#### Occasional

Paresthesia (9%), constipation and abdominal pain (3%).

#### Rare

Anorexia, malaise, arthralgia, asthenia, myalgia.

#### SERIOUS REACTIONS

 Severe neutropenia (neutrophil count < 500 cells/mm<sup>3</sup>) occurs in 60% of patients, usually during the first course of therapy. The neutrophil nadir usually occurs at a median of 11 days after starting therapy.

• Thrombocytopenia (platelet count < 25,000/mm<sup>3</sup>) occurs in 26% of patients, and severe anemia (RBC count < 8 g/dL) occurs in 40% of patients. The platelet and RBC nadirs usually occur at a median of 15 days after starting the first course of therapy.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with hepatic and renal impairment and mild myelosuppression.

Because of the risk of fetal harm, pregnant women should not take topotecan, especially in the first trimester. It is unknown whether topotecan is distributed in breast milk; however, breastfeeding is not recommended. The safety and efficacy of topotecan have not been established in children. In elderly patients, age-related renal impairment may require dosage adjustment. Vaccinations and coming in contact with crowds and people with known infections should be avoided.

CBC, especially blood hemoglobin levels, and platelet count, should be assessed before each topotecan dose. Myelosuppression may precipitate life-threatening anemia, hemorrhage, and infection. If platelet count drops, minimize trauma (for example, by avoiding IM or rectal drug administration and by gently repositioning the person). Premedicate with antiemetics, if ordered, on the day of treatment, starting at least 30 min before topotecan administration. Electrolyte levels, hydration status, and intake and output should also be monitored because diarrhea and vomiting are common side effects of topotecan.

#### Storage

Store vials at room temperature in original cartons. Reconstituted vials diluted for infusion are stable at room temperature in ambient lighting for up to 24 h.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs. As prescribed, do not give topotecan if baseline neutrophil count is < 1500 cells/mm<sup>3</sup> and platelet count is < 100,000/mm<sup>3</sup>. Reconstitute each 4-mg vial with 4 mL sterile water for injection. Further dilute with 50-100 mL 0.9% NaCl or D5W. Administer the drug by IV infusion over 30 min. Be aware that extravasation is associated with only mild local reactions, such as ecchymosis and erythema.

The oral capsules may be taken without regard to food. Do not open, divide, or crush the capsules. Swallow intact.

## SIDE EFFECTS

#### Frequent

Hot flashes (35%); diaphoresis (20%); nausea (14%); vaginal discharge (13%); dizziness, dry eyes (9%).

#### Occasional (2%-5%)

Edema, vomiting, vaginal bleeding. **Rare** 

Fatigue, depression, lethargy, anorexia.

## SERIOUS REACTIONS

• Ocular toxicity (cataracts, glaucoma, decreased visual acuity) and hypercalcemia may occur.

 Very rare reports of serious hypersensitivity (erythema multiforme, Stevens-Johnson syndrome, bullous rash, interstitial pneumonitis, or angioedema).

• Deep venous thrombosis, pulmonary thrombosis, stroke, or cardiac thrombus.

• Potential increased risk of endometrial hyperplasia.

• QT prolongation and associated risk for arrhythmias occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with preexisting endometrial hyperplasia, leukopenia, and thrombocytopenia. Toremifene use should be avoided during pregnancy because this drug may cause fetal harm. Nonhormonal methods of contraception should be used during treatment. It is unknown whether toremifene is distributed in breast milk; however, breastfeeding is not recommended. Toremifene is not prescribed for children; the safety and efficacy of this drug in children have not been established. No age-related precautions have been noted in elderly patients.

Initial flare-up of symptoms, including bone pain and hot flashes, may occur but will subside with continued therapy. Notify the physician if nausea and vomiting, leg cramps, shortness of breath, weakness, weight gain, or vaginal bleeding, discharge, or itching occurs. Estrogen receptor assay test should be performed before starting therapy. CBC and serum calcium levels should be monitored before and periodically during toremifene therapy. Be aware of signs and symptoms of hypercalcemia, including constipation, deep bone or flank pain, excessive thirst, hypotonicity of muscles, increased urine output, nausea and vomiting, and renal calculi.

#### Storage

Store tablets at room temperature. Administration

Take oral toremifene without regard to food.

#### Torsemide

tor'se-mide ★ Demadex **Do not confuse torsemide with furosemide.** 

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Diuretics, loop

#### **MECHANISM OF ACTION**

A loop diuretic that enhances the excretion of sodium, chloride, potassium, and water at the ascending limb of the loop of Henle; also reduces plasma and extracellular fluid volume. *Therapeutic Effect:* Produces diuresis; lowers BP.

Torsemide (Generic Name)

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1 h	1-2 h	6-8 h
IV	10 min	1 h	6-8 h

Rapidly and well absorbed from the GI tract. Protein binding: 97%-99%. Metabolized in the liver. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 3.3 h.

## AVAILABILITY

*Tablets:* 5 mg, 10 mg, 20 mg, 100 mg. *Injection:* 10 mg/mL.

## INDICATIONS AND DOSAGES Hypertension

PO

*Adults, Elderly.* Initially, 5 mg/day. May increase to 10 mg/day if no response in 4-6 wks. Usual range: 2.5-10 mg/day. If no response, additional antihypertensive added.

## • Edema associated with congestive heart failure (CHF)

#### PO, IV

*Adults, Elderly.* Initially, 10-20 mg/ day. May increase by approximately doubling dose until desired therapeutic effect is attained. Doses > 200 mg have not been adequately studied.

## Edema associated with chronic renal failure

PO, IV

*Adults, Elderly.* Initially, 20 mg/ day. May increase by approximately doubling dose until desired therapeutic effect is attained. Doses > 200 mg have not been adequately studied.

## Hepatic cirrhosis PO, IV

*Adults, Elderly.* Initially, 5 mg/day given with aldosterone antagonist or potassium-sparing diuretic. May increase by approximately doubling dose until desired therapeutic effect is attained. Doses > 40 mg have not been adequately studied.

## CONTRAINDICATIONS

Anuria, hepatic coma, severe electrolyte depletion.

## INTERACTIONS

#### Drug

Amphotericin B, nephrotoxic medications, ototoxic medications: May increase the risk of nephrotoxicity and ototoxicity. Digoxin: May increase the risk of digoxin toxicity associated with torsemide-induced hypokalemia. Lithium: May increase the risk of lithium toxicity. NSAIDs, probenecid: May decrease the diuretic effect of torsemide. Other antihypertensives: May increase the risk of hypotension. Other hypokalemia-causing medications: May increase the risk of hypokalemia. **Herbal and Food** None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN, serum creatinine, and serum uric acid levels. May decrease serum calcium, chloride, magnesium, potassium, and sodium levels.

## IV INCOMPATIBILITIES

There are few data with other medications.

## **IV COMPATIBILITIES**

Milrinone (Primacor), nesiritide (Natrecor).

## SIDE EFFECTS

Frequent (10%-40%)

Headache, dizziness, rhinitis.

#### Occasional (1%-3%)

Asthenia, insomnia, nervousness, diarrhea, constipation, nausea, dyspepsia, edema, ECG changes, pharyngitis, cough, arthralgia, myalgia.

#### Rare (<1%)

Syncope, hypotension, arrhythmias.

#### SERIOUS REACTIONS

 Ototoxicity may occur with high doses or a too-rapid IV administration.

 Overdose produces acute, profound water loss; volume and electrolyte depletion; dehydration; decreased blood volume; and circulatory collapse.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with ascites, hepatic cirrhosis, renal impairment, systemic lupus erythematosus, history of ventricular arrhythmias, hypersensitivity to sulfonamides, with cardiac patients and elderly patients. It is unknown whether torsemide is excreted in breast milk. The safety and efficacy of this drug have not been established in children. No age-related precautions have been noted in elderly patients. Consuming foods high in potassium, such as apricots, bananas, legumes, meat, orange juice, raisins, whole grains, including cereals, and white and sweet potatoes, is encouraged. Avoid taking other medications, including OTC drugs, without first consulting the physician.

An increase in the frequency and volume of urination may occur. Notify the physician of cramps, dizziness, an irregular heartbeat, muscle weakness, nausea, or hearing abnormalities. BP, vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Less potassium is lost with torsemide than with furosemide.

#### Storage

Store torsemide at room temperature. Administration

Take torsemide with food to avoid GI upset, preferably with breakfast to prevent nocturia.

! Flush IV line with 0.9% NaCl before and after torsemide administration.

Torsemide may be given undiluted as IV push over 2 min. For continuous IV infusion, dilute with 0.9% or 0.45% NaCl or D5W and infuse over 24 h. Administer IV push slowly because too-rapid administration may cause ototoxicity.

#### Tramadol

tray'mah-doal Rybix, Ryzolt, Ultram, Ultram ER ⊇ Ralivia, Tridural, Ultram, Zytram XL Do not confuse tramadol with Toradol, or Ultram with Ultane, or Rybix with Zydis.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Analgesics, opioid-like, centrally acting

#### **MECHANISM OF ACTION**

An analgesic that binds to µ-opioid receptors and inhibits reuptake of

Tramadol (Generic Name)

norepinephrine and serotonin. Reduces the intensity of pain stimuli reaching sensory nerve endings. *Therapeutic Effect:* Alters the perception of and emotional response to pain.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	<1h	2-3 h	4-6 h

Rapidly and almost completely absorbed after PO administration. Protein binding: 20%. Extensively metabolized in the liver to active metabolite (reduced in patients with advanced cirrhosis). Primarily excreted in urine. Minimally removed by hemodialysis. *Half-life:* 6-7 h.

### AVAILABILITY

Oral Disintegrating Tablets (Rybix): 50 mg. Tablets (Ultram): 50 mg.

*Extend-Release Tablets (Ryzolt, Ultram ER):* 100 mg, 200 mg, 300 mg.

# INDICATIONS AND DOSAGES Moderate to moderately severe pain

PO (IMMEDIATE RELEASE) Adults, Elderly. 50-100 mg q4-6h. Maximum: 400 mg/day for patients younger than 75 yr; 300 mg/day for patients older than 75 yr. PO (EXTENDED RELEASE. ULTRAM ER) Adults, Elderly. Initially, 100 mg once daily; titrate in 100 mg increments every 5 days. Maximum: 300 mg/day. PO (EXTENDED RELEASE, RYZOLT) Adults, Elderly. Initially, 100 mg once daily; titrate in 100 mg increments every 2-3 days. Maximum: 300 mg/day.

#### Dosage in renal impairment

For patients with creatinine clearance of < 30 mL/min, increase dosing interval to q12h. Do not use extended-release tablets. Maximum: 200 mg/day.

Dosage in hepatic impairment

Dosage is decreased to 50 mg q12h. Do not use extended-release tablets.

## CONTRAINDICATIONS

Opiate agonist hypersensitivity, acute alcohol intoxication; concurrent use of centrally acting analgesics, hypnotics, opioids, or psychotropic drugs.

## INTERACTIONS

Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS or respiratory depression and hypotension. Carbamazepine: Decreases tramadol blood concentration. MAOIs: Increase tramadol blood concentration. Herbal and Food

None known.

## DIAGNOSTIC TEST EFFECTS

May increase GGT, AST (SGOT), and ALT (SGPT) levels.

## SIDE EFFECTS

#### Frequent (5%-15%)

Dizziness or vertigo, nausea, flushing, constipation, headache, somnolence.

#### Occasional (5%-10%)

Vomiting, pruritus, CNS stimulation (such as nervousness, anxiety, agitation, tremor, euphoria, mood swings, and hallucinations), asthenia, diaphoresis, dyspepsia, dry mouth, diarrhea.

#### Rare (< 5%)

Malaise, vasodilation, anorexia, flatulence, rash, blurred vision,

urine retention or urinary frequency, menopausal symptoms.

## SERIOUS REACTIONS

 Hypersensitivity, such as anaphylaxis.

- · Respiratory or CNS depression.
- Seizures.
- Serotonin syndrome (rate).

• Increased intracranial pressure in at-risk patients (rare).

#### PRECAUTIONS & CONSIDERATIONS

Extreme caution should be used in patients with acute abdominal conditions, hepatic or renal impairment, increased intracranial pressure, opioid dependence, and a sensitivity to opioids. Tramadol crosses the placenta and is distributed in breast milk. The safety and efficacy of tramadol have not been established in children. Age-related renal impairment may require a dosage adjustment in elderly patients. Alcohol and OTC drugs, such as analgesics and sedatives, should be avoided.

Blurred vision, dizziness, and drowsiness may occur, so tasks requiring mental alertness or motor skills should be avoided. Notify the physician of any chest pain, difficulty breathing, excessive sedation, muscle weakness, palpitations, seizures, severe constipation, or tremors. Liver and renal function studies should be obtained before therapy. BP, pulse rate, pattern of daily bowel activity and stool consistency, bladder for urine retention, and therapeutic response should be monitored during tramadol use.

#### Storage

Store at room temperature. Keep ODT form in blister pack until time of use and protected from moisture; remove with dry hands.

#### Administration

Take tramadol without regard to food. Do not abruptly discontiue;

tapering is recommended. Extendedrelease tablets should not be cut, chewed, or crushed. ODT tablets may be administered with or without water; let dissolve on tongue (do not chew).

#### Trandolapril

tran-doe'la-pril Mavik Do not confuse with tramadol.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in second or third trimester)

**Classification:** Antihypertensives, angiotensin-converting enzyme (ACE) inhibitors

## **MECHANISM OF ACTION**

An ACE inhibitor that suppresses the renin-angiotensin-aldosterone system and prevents the conversion of angiotensin I to angiotensin II, a potent vasoconstrictor; may also inhibit angiotensin II at local vascular and renal sites. Decreases plasma angiotensin II, increases plasma renin activity, and decreases aldosterone secretion. *Therapeutic Effect:* Reduces peripheral arterial resistance and pulmonary capillary wedge pressure; improves cardiac output and exercise tolerance.

#### PHARMACOKINETICS

Slowly absorbed from the GI tract. Protein binding: 80%. Metabolized in the liver and GI mucosa to active metabolite. Primarily excreted in urine. Removed by hemodialysis. *Half-life:* 24 h.

Trandolapril (Generic Name)

## AVAILABILITY

Tablets: 1 mg, 2 mg, 4 mg.

## INDICATIONS AND DOSAGES

## Hypertension (without diuretic) PO

*Adults, Elderly.* Initially, 1 mg once a day in nonblack patients, 2 mg once a day in black patients. Adjust dosage at least at 7-day intervals. Maintenance: 2-4 mg/day. Maximum: 8 mg/day.

#### Heart failure post-MI PO

Adults, Elderly. Initially, 0.5-1 mg, titrated to target dose of 4 mg/day.

## CONTRAINDICATIONS

Hypersensitivity or history of angioedema from previous treatment with ACE inhibitors, idiopathic or hereditary angioedema, bilateral renal artery stenosis.

## INTERACTIONS

#### Drug

#### Alcohol, antihypertensives,

**diuretics:** May increase the effects of trandolapril.

**Lithium:** May increase lithium blood concentration and risk of lithium toxicity.

**NSAIDs:** May decrease the effects of trandolapril.

**Potassium-sparing diuretics, drospirenone, eplerenone, potassium supplements:** May cause hyperkalemia.

#### Herbal

None known. Food None known.

## **DIAGNOSTIC TEST EFFECTS**

May increase BUN, serum alkaline phosphatase, serum bilirubin, serum creatinine, serum potassium, AST (SGOT), and ALT (SGPT) levels. May decrease serum sodium levels. May cause positive antinuclear antibody titer or decreased WBC.

## SIDE EFFECTS

Frequent (23%-35%) Dizziness, cough.

Oreceiver al (20/ 11)

Occasional (3%-11%) Hypotension, dyspepsia (heartburn, epigastric pain, indigestion), syncope, asthenia (loss of strength), tinnitus.

#### Rare (<1%)

Palpitations, insomnia, drowsiness, nausea, vomiting, constipation, flushed skin, hyperkalemia.

## SERIOUS REACTIONS

• Excessive hypotension (first-dose syncope) may occur in patients with CHF and in those who are severely salt or volume depleted.

- · Angioedema occurs rarely.
- Agranulocytosis and neutropenia may be noted in those with collagen vascular disease including scleroderma and systemic lupus erythematosus.
- Cholestatic jaundice, which may progress to hepatic necrosis. Discontinue if abnormal liver function tests.
- Renal dysfunction may occur. Increases in serum creatinine may occur after initiation of therapy. Monitor serum creatinine and discontinue if progressive or severe decline in function.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with CHF, collagen vascular disease, hyperkalemia, hypovolemia, renal impairment, and renal stenosis. Trandolapril crosses the placenta, is distributed in breast milk, and may cause fetal or neonatal morbidity or mortality. Discontinue as soon as pregnancy is detected. Safety and efficacy of trandolapril have not been established in children. No agerelated precautions have been noted in elderly patients.

Dizziness and light-headedness may occur. Tasks that require mental alertness or motor skills should be avoided. Notify the physician of chest pain, cough, diarrhea, difficulty swallowing, fever, palpitations, sore throat, swelling of the face, or vomiting. Be alert to fluctuations in BP. If an excessive reduction in BP occurs, place the person in the supine position with legs elevated. CBC and blood chemistry should be obtained before beginning trandolapril therapy, then every 2 wks for the next 3 mo, and periodically thereafter. Crackles and wheezing should be assessed in persons with CHF. BUN, serum creatinine, and serum potassium levels, WBC count, urinalysis, intake and output, and pattern of daily bowel activity and stool consistency should also be monitored.

#### Storage

Store tablets at room temperature. Administration

Take trandolapril without regard to food. Crush tablets as necessary.

#### Tranexamic acid tran-eks-am'-ik acid

Lysteda

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

Classification: Antifibrinolytic

#### MECHANISM OF ACTION

A synthetic lysine amino acid derivative, that reduces the

dissolution of hemostatic fibrin by plasmin. The resultant effect is an antifibrinolytic action. *Therapeutic Effect:* Reduces overly heavy menstrual bleeding.

#### PHARMACOKINETICS

Oral bioavailability approximately 45%. Low protein binding: 3%. Crosses placenta, CNS. Only a small fraction is metabolized. Eliminated primarily by urinary excretion via glomerular filtration with > 95% of the dose excreted unchanged. *Half-life*: 11 h (increased in renal impairment).

#### AVAILABILITY

Tablets: 650 mg.

# INDICATIONS AND DOSAGES Cyclic heavy menstrual bleeding: PO

Adult premenopausal females. 1300 mg (two x 650 mg tablets) three times a day for a maximum of 5 days during monthly menstruation.

#### Dosage in Renal Impairment:

Adjust dose if serum creatinine (SCr) is > 1.4 mg/dL.

SCr 1.41-2.8 mg/dL: 1300 mg twice daily for 5 days during menstruation.

SCr 2.81-5.7 mg/dL: 1300 mg once a day for 5 days during menstruation. SCr > 5.7 mg/dL: 650 mg once a day

for 5 days during menstruation.

#### CONTRAINDICATIONS

Hypersensitivity to tranexamic acid, active thromboembolic disease (e.g., DVT, pulmonary embolism, or cerebral thrombosis), history of thrombosis or thromboembolism, including retinal vein or artery occlusion, an intrinsic risk of thrombosis or thromboembolism (e.g., thrombogenic cardiac or valvular disease or hypercoagulopathy). Best avoided or discontinued in patients with subarachnoid hemorrhage.

## INTERACTIONS

#### Drug

Factor IX complex concentrates or anti-inhibitor coagulant concentrates: Avoid; may increase risk of thrombosis.

**Combination hormonal contraceptives:** Increased risk for thrombosis; avoid and choose alternate contraceptive methods.

#### Retinoids (e.g., ATRA):

Exacerbation of the procoagulant effect of all-trans retinoic acid.

**Tissue plasminogen activators** (thrombolytic drugs): Tranexamic acid may decrease the efficacy of these drugs.

#### Herbal

Ginger, ginkgo biloba, white willow: May increase the risk of bleeding.

#### Food

None known. Diagnostic Test Effects None known.

## SIDE EFFECTS

#### Frequent (> 6%)

Headache, nasal and sinus symptoms, back pain, abdominal pain, arthralgia, myalgia, muscle cramps and spasms.

#### Occasional (≤ 6%)

Anemia, fatigue, allergic dermatitis, hypotension with rapid IV administration.

#### Rare

Nausea, diarrhea, dizziness, ligneous conjunctivitis.

## SERIOUS REACTIONS

• Severe hypersensitivity, including allergic skin reactions, anaphylaxis, and angioedema.

• Thromboembolic events (e.g., DVT, pulmonary embolism, cerebral thrombosis, acute renal cortical necrosis, and central retinal artery and vein obstruction)

• Visual color changes and visual disturbances.

Seizures.

• Cerebral edema and cerebral infarction may occur in women with subarachnoid hemorrhage.

### **PRECAUTIONS & CONSIDERATIONS**

Must dose-adjust therapy for renal impairment. Use with caution in patients with potential increased risk for thrombosis, including obesity and smoking, peripheral vascular disease or other cardiac disease risks. The drug crosses the placenta and is excreted in breast milk; do not use during pregnancy and breast-feeding best avoided during use. Not indicated in females < 18 years of age due to lack of data.

Notify the physician immediately if signs of thrombosis occur: abdominal pain, chest pain, sudden severe headache, eye pain or visual changes, severe pain in legs, lungs or thighs. Assess for improvement in monthly menstrual bleeding patterns, as well as reports of ability to participate in usual activities. Patients should be advised not to smoke while taking the drug, to avoid increases in thrombotic risk, especially if over 35 years of age. Have patient report any visual difficulties or signs of allergic reaction, such as difficulty breathing. Storage

Store at room temperature.

#### Administration

Take tranexamic acid without regard to food. Drug is taken only during the monthly menstrual cycle, and only for 5 days of every month.
# **Tranylcypromine**

tran-ill-sip'roe-meen

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidepressants, monoamine oxidase inhibitors (MAOIs)

# **MECHANISM OF ACTION**

An MAOI that inhibits the activity of the enzyme monoamine oxidase at central nervous system (CNS) storage sites, leading to increased levels of the neurotransmitters epinephrine, norepinephrine, serotonin, and dopamine at neuronal receptor sites. *Therapeutic Effect:* Relieves depression.

# AVAILABILITY

Tablets: 10 mg.

#### INDICATIONS AND DOSAGES > Depression refractory to or intolerant of other therapy PO

*Adults, Elderly.* Initially, 10 mg twice a day. May increase by 10 mg/day at 1- to 3-wk intervals up to 60 mg/day in divided doses.

# CONTRAINDICATIONS

Hypersensitivity, cerebrovascular defects or cardiovascular disorders, coma, pheochromocytoma, elective surgery, alcohol use, liver disease. Many drugs are contraindicated for concurrent use with an MAOI; review drug interactions carefully and follow appropriate wash-out periods before prescribing tranylcypromine. Specific contraindications include other MAOIs, linezolid, COMT inhibitors, tricyclic antidepressants, cyclobenzaprine, bupropion, SSRI or SNRI antidepressants, buspirone, sympathomimetics, meperidine, dextromethorphan, foods with a high tyramine content, and caffeine.

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depressant effects.

Buspirone: May increase BP. Caffeine-containing medications: May increase the risk of cardiac arrhythmias and hypertension. Carbamazepine, cyclobenzaprine,

linezolid, maprotiline, other MAOIs: May precipitate

hypertensive crisis.

**Dopamine, tryptophan:** May cause sudden, severe hypertension.

Fluoxetine, trazodone, tricyclic antidepressants: May cause serotonin syndrome and neuroleptic malignant syndrome.

**Insulin, oral antidiabetics:** May increase the effects of these drugs.

Meperidine, other opioid analgesics: May produce diaphoresis, immediate excitation, rigidity, and severe hypertension or hypotension, sometimes leading to severe respiratory distress, vascular collapse, seizures, coma, and death. SSRI: May cause serotonin syndrome.

# Herbal

**St. John's wort:** Possible risk of serotonin syndrome. Contraindicated.

Food

Caffeine, chocolate, tyraminecontaining foods (such as aged cheese): May cause sudden, severe hypertension.

# DIAGNOSTIC TEST EFFECTS

None known.

Tranylcypromine (Generic Name)

#### SIDE EFFECTS

#### Frequent

Orthostatic hypotension, restlessness, GI upset, insomnia, dizziness, lethargy, weakness, dry mouth, peripheral edema.

# Occasional

Flushing, diaphoresis, rash, urinary frequency, increased appetite, transient impotence.

#### Rare

Visual disturbances, syncope.

#### SERIOUS REACTIONS

 Hypertensive crisis occurs rarely and is marked by severe hypertension, occipital headache radiating frontally, neck stiffness or soreness, nausea, vomiting, diaphoresis, fever or chills, clammy skin, dilated pupils, palpitations, tachycardia or bradycardia, and constricting chest pain.

• Intracranial bleeding occurs rarely in cases of severe hypertension.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with cardiac arrhythmias, epilepsy, frequent or severe headaches, hypertension, suicidal tendencies, and within several hours of ingestion of contraindicated substances, such as tyramine-containing food. Foods that require bacteria or molds for their preparation or preservation (such as yogurt and aged cheese), foods containing tyramine (such as avocados, bananas, broad beans, meat tenderizers, liver, smoked or pickled meats and fish, papayas, figs, raisins, sour cream, soy sauce, beer, wine, and yeast extracts), and excessive amounts of caffeine-containing foods or beverages (including chocolate, coffee, and tea) should be avoided.

This drug is not approved for use in children. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr) with depression. All patients should be monitored for suicidal thoughts, mood changes, or unusual behaviors.

Dizziness may occur, so change positions slowly, and alcohol and tasks that require mental alertness or motor skills should be avoided. Notify the physician if headache or neck soreness or stiffness occurs. If hypertensive crisis occurs, phentolamine 5-10 mg IV should be administered. BP, temperature, and weight should be assessed.

#### Storage

Store at room temperature. Administration

! Make sure at least 14 days elapse between the use of tranylcypromine and a selective serotonin reuptake inhibitor (5 wks for fluoxetine).

Take the second daily dose no later than 4 PM to avoid insomnia. Depression may start to lift during the first week of therapy and the drug's full therapeutic benefit will occur within 3 wks.

# Travoprost

tra'voh-prost Travatan-Z Do not confuse Travatan-Z with Xalatan.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

#### Classification:

Ophthalmic agents, prostaglandin analogs, antiglaucoma agents

#### **MECHANISM OF ACTION**

A synthetic analog of prostaglandin with ocular hypotensive activity. *Therapeutic Effect:* Reduces intraocular pressure (IOP) by increasing the outflow of aqueous humor.

# Trastuzumab

tras-too'-ze-mab

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, monoclonal antibodies, targeted signal transduction inhibitor

# **MECHANISM OF ACTION**

Binds to the HER-2 protein, which is overexpressed in 25%-30% of primary breast cancers, and certain gastric cancers, thereby inhibiting proliferation of tumor cells. *Therapeutic Effect:* Inhibits the growth of tumor cells and mediates antibody-dependent cellular cytotoxicity.

# PHARMACOKINETICS

*Half-life:* 5.8 days (range: 1-32 days).

# AVAILABILITY

*Injection, Powder for Reconstitution:* 440 mg.

# INDICATIONS AND DOSAGES

NOTE: Regimens may vary with cancer type and combination chemotherapies used. The most common doses are listed below.

# Breast cancer

IV INFUSION

*Adults, Elderly.* Initially, 4 mg/kg as an infusion of 90 min on wk 1 then 2 mg/kg weekly as at least a 30-min infusion.

#### Adjuvant treatment of HER-2 overexpressing breast cancer IV INFUSION

*Adults, Elderly.* Initial dose of 4 mg/kg over 90 min, then 2 mg/kg over 30 min weekly for 52 wks; OR, give

initial dose of 8 mg/kg over 90 min, then 6 mg/kg over 30-90 min q3wk for 52 wks.

#### Metastatic HER-2 overexpressing gastric cancer

IV INFUSION Adults, Elderly. Initial dose of 8 mg/ kg over 90 min, then 6 mg/kg over 30-90 min q3wk.

# CONTRAINDICATIONS

Preexisting cardiac disease.

# INTERACTIONS

# Drug

Cyclophosphamide, doxorubicin, epirubicin: May increase the risk of cardiac dysfunction. Herbal None known. Food

None known.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# IV INCOMPATIBILITIES

Do not mix trastuzumab with any other medications or with D5W.

# SIDE EFFECTS

#### Frequent (> 20%)

Pain, asthenia, fever, chills, headache, abdominal pain, back pain, infection, nausea, diarrhea, vomiting, cough, dyspnea.

# Occasional (5%-15%)

Tachycardia, CHF, flu-like symptoms, anorexia, edema, bone pain, arthralgia, insomnia, dizziness, paresthesia, depression, rhinitis, pharyngitis, sinusitis.

### Rare (< 5%)

Allergic reaction, anemia, leukopenia, neuropathy, herpes simplex.

# SERIOUS REACTIONS

• Cardiomyopathy, ventricular dysfunction, and CHF occur rarely.

 Pulmonary toxicity, including dyspnea, interstitial pneumonitis, pulmonary edema, hypoxia, acute respiratory distress syndrome, and pulmonary fibrosis.

• Exacerbation of chemotherapyinduced neutropenia may lead to opportunistic infection risk.

• Infusion reactions may be severe (fever and chills, nausea, vomiting, pain [in some cases at tumor sites], headache, dizziness, dyspnea, hypotension, rash, and asthenia).

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in those who have previously received cardiotoxic drug therapy or radiation therapy to the chest wall. Trastuzumab may cause fetal harm and should be avoided in pregnancy. Breastfeeding during treatment is not recommended. The safety and efficacy of trastuzumab have not been established in children. Age-related cardiac dysfunction may require cautious use in elderly patients. Vaccinations and coming in contact with crowds, people with known infections, and anyone who has recently received an oral polio vaccine should be avoided.

Notify the physician of nausea and vomiting, abdominal pain, back pain, chills, and fever. Left ventricular function and baseline ECG and multigated acquisition (MUGA) scan should be obtained before starting therapy. CBC should be monitored before and periodically during therapy. Signs and symptoms of deteriorating cardiac or lung function should also be assessed.

#### Storage

Refrigerate unopened vials. After reconstitution of the vial with bacteriostatic water for injection, the solution is stable for 28 days if refrigerated. After reconstitution of the vial with sterile water for injection without a preservative, use the solution immediately; discard unused portions. Administration

#### Administration

! Do not give trastuzumab by IV push or IV bolus. Do not use dextrose solutions for reconstitution.

Reconstitute the vial with 20 mL bacteriostatic water for injection (with benzyl alcohol) to yield a concentration of 21 mg/mL. If the patient is hypersensitive to benzyl alcohol, use sterile water for injection. Add the calculated dose from the vial to an IV solution of 250 mL 0.9% NaCl (do not use D5W). Gently mix contents in bag. The reconstituted IV solution normally appears colorless to pale vellow. IV solution reconstituted in 0.9% NaCl is stable for up to 24 h if refrigerated. Give loading dose (4 mg/kg) over 90 min. If tolerated, give maintenance infusion (2 mg/kg) over 30 min.

# PHARMACOKINETICS

Absorbed through the cornea and hydrolyzed to the active free acid form. Peak aqueous humor concentrations occur roughly 2 h after administration. Reduction in IOP starts approximately 2 h after administration and effectiveness peaks around 12 h. Plasma levels only detectable in first hour of administration. Any absorbed drug metabolized by liver and metabolites excreted primarily by the kidney. *Half-life:* 45 min.

# AVAILABILITY

Ophthalmic Solution: 0.004%.

# INDICATIONS AND DOSAGES Glaucoma, ocular hypertension OPHTHALMIC

*Adults, Elderly and Children 16 years and older.* 1 drop in affected eye(s) once daily, in the evening.

# CONTRAINDICATIONS

Hypersensitivity to travoprost or any component of the formulation.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Conjunctival hyperemia, growth of eyelashes, increased iris pigmentation, and ocular pruritus. Occasional

Ocular dryness, visual disturbance, foreign body sensation, eye pain, pigmentation of the periocular skin, blepharitis, cataract, superficial punctate keratitis, eyelid erythema, ocular irritation, and eyelash darkening.

#### Rare

Intraocular inflammation (iritis).

# SERIOUS REACTIONS

• Systemic adverse events, including infections (colds and

upper respiratory tract infections), headaches, skin rash/allergic reactions, have been reported.

#### PRECAUTIONS & CONSIDERATIONS

May permanently increase pigmentation in iris and evelid and produce changes in eye color and changes in eyelashes (color, length, shape). Use with caution in patients with uveitis or risk factors for macular edema. Effects in pregnancy and lactation not known; use with caution and only if clearly needed in women who are pregnant or breastfeeding. Safety and effectiveness have not been established in children. Remove contact lenses to apply; wait 15 min after administration to reinsert. Storage

Store bottle at room temperature. Administration

If more than 1 topical ophthalmic agent is being used, wait at least 5 min between administration of each.

Tilt the head back slightly and pull the lower eyelid down with the index finger to form a pouch. Instill drop(s) and gently close the eyes for 1-2 min. Do not blink. Do not touch the tip of the dropper to any surface to avoid contamination.

# Trazodone

tray'zoe-done ★ Desyrel, Oleptro ♣ Apo-Trazodone, Novo-Trazodone, PMS-Trazodone, Trazorel Do not confuse Desyrel with Delsym or Zestril.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antidepressants, miscellaneous

Trazodone (Generic Name)

# **MECHANISM OF ACTION**

An antidepressant that blocks the reuptake of serotonin at neuronal presynaptic membranes, increasing its availability at postsynaptic receptor sites. *Therapeutic Effect:* Relieves depression.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 85%-95%. Metabolized in the liver. Excreted primarily in urine. Unknown whether removed by hemodialysis. *Half-life*: 5-9 h.

# AVAILABILITY

Tablets: 50 mg, 100 mg, 150 mg, 300 mg. Extented-Release Tablets (Oleptro): 150 mg, 300 mg.

# INDICATIONS AND DOSAGES

#### Depression PO

*Adults.* Initially, 150 mg/day in equally divided doses. Increase by 50 mg/day at 3- to 4-day intervals until therapeutic response is achieved. Maximum: 600 mg/day. *Elderly.* Initially, 25-50 mg at bedtime. May increase by 25-50 mg every 3-7 days. Range: 75-150 mg/day. *Children 6-18 yr.* Initially, 1.5-2 mg/ kg/day in divided doses. May increase gradually to 6 mg/kg/day in 3 divided doses. Maximum: 400 mg/day.

# **OFF-LABEL USES**

Treatment of neurogenic pain.

# CONTRAINDICATIONS

Hypersensitivity; do not use within 14 days of MAOIs. Avoid use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

# INTERACTIONS

Drug Alcohol, CNS depressionproducing medications: May increase CNS depression. CYP3A4 inducers (e.g., carbamazepine, rifampin): May necessitate higher dose of trazodone. CYP3A4 inhibitors (e.g., ketoconazole, itraconazole, clarithromycin, protease inhibitors): May necessitate lower dose of trazodone. Digoxin or phenytoin: Monitor for increased serum levels of these drugs. MAOIs, linezolid: Risk of serotonin syndrome; avoid. NSAIDs, aspirin: Potential for increased risk of bleeding. Serotonergic medications: Serotonin syndrome may occur. Warfarin: Monitor for increased or decreased INR. Herbal St. John's wort: May increase the adverse effects of trazodone. Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease WBC counts.

# SIDE EFFECTS

#### Frequent (3%-9%)

Somnolence, dry mouth, lightheadedness, dizziness, headache, blurred vision, nausea, vomiting. Occasional (1%-3%)

Nervousness, fatigue, constipation, generalized aches and pains, mild hypotension.

Rare

Photosensitivity reaction.

# SERIOUS REACTIONS

• Priapism, diminished or improved libido, retrograde ejaculation, and impotence occur rarely.

• Trazodone appears to be less cardiotoxic than other antidepressants, although arrhythmias may occur in patients with preexisting cardiac disease. • Serotonin syndrome or neuroleptic malignant syndrome-like reactions (rare).

• Platelet dysfunction and bleeding risk (GI, etc.).

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with arrhythmias and cardiac disease. Trazodone crosses the placenta and is minimally distributed in breast milk. The use of trazodone in children is not FDA approved. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr) with major depressive disorder and other psychiatric disorders. All patients should be monitored for suicidal thoughts, mood changes, or unusual behaviors. Lower dosages are recommended for elderly patients, who are more likely to experience hypotensive or sedative effects.

Anticholinergic and sedative effects may occur, so avoid alcohol and tasks that require mental alertness or motor skills. Tolerance usually develops to these side effects. Notify the physician if a painful, prolonged penile erection occurs. CBC, neutrophil and WBC counts, and liver and renal function tests should be assessed during therapy. ECG should also be obtained to assess for arrhythmias.

#### Storage

Store at room temperature. Administration

Take trazodone shortly after a meal or snack to reduce the risk of dizziness or light-headedness. Crush immediate-release tablets as needed.

Take extended-release tablets at the same time every day in the late evening, preferably at bedtime, on an empty stomach. Swallow whole or break in half along the score line, and do not chew or crush. When discontinued, gradual dose reduction is recommended.

# Treprostinil

treh-prost'in-ill Remodulin, Tyvaso

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Platelet inhibitors, prostaglandins, vasodilators

#### MECHANISM OF ACTION

An antiplatelet that directly dilates pulmonary and systemic arterial vascular beds, inhibiting platelet aggregation. *Therapeutic Effect:* Reduces symptoms of pulmonary arterial hypertension (PAH) associated with exercise.

#### PHARMACOKINETICS

Rapidly, completely absorbed after subcutaneous infusion; 91% bound to plasma protein. Metabolized by the liver. Excreted mainly in the urine with a lesser amount eliminated in the feces. *Half-life:* 2-4 h.

### AVAILABILITY

Injection: 1 mg/mL, 2.5 mg/mL, 5 mg/mL, 10 mg/mL. Nebulizer Solution: 1.74 mg/2.9 mL.

# INDICATIONS AND DOSAGES Pulmonary arterial hypertension

CONTINUOUS SC OR IV INFUSION Adults, Elderly. Initially, 1.25 ng/kg/min. Reduce infusion rate to 0.625 ng/kg/min if initial dose cannot be tolerated. Increase infusion rate in increments of no more than 1.25 ng/kg/min weekly for the first 4 wks and then no more than 2.5 ng/kg/min per week for the duration of infusion.

#### Hepatic impairment (mild to moderate)

Adults, Elderly. Decrease the initial dose to 0.625 ng/kg/min based on ideal body weight and increase cautiously.

#### Inhaled dose for PAH NEBULIZER

*Adults.* Intially, 3 breaths (18 mcg) 4 times per day. May increase by 3 breaths q1-2wk to target of 9 breaths/ dose. May reduce dose as low as 1-2 breaths/dose if needed.

# CONTRAINDICATIONS

Hypersensitivity to treprostinil.

# INTERACTIONS

#### Drug

Anticoagulants, aspirin, heparin, thrombolytics: May increase the risk of bleeding.

**Drugs that alter BP, including antihypertensive agents, diuretics, vasodilators:** Reduced BP caused by treprostinil may be exacerbated by these drugs.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Infusion site pain, erythema, induration, rash.

#### Occasional

Headache, diarrhea, jaw pain, vasodilation, nausea.

#### Rare

Dizziness, hypotension, pruritus, edema.

# SERIOUS REACTIONS

 Abrupt withdrawal or sudden large reductions in dosage may result in worsening of pulmonary arterial hypertension symptoms.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with liver or renal impairment and in elderly patients. It is unknown whether treprostinil is distributed in breast milk. Safety and efficacy of treprostinil have not been established in children. In elderly patients, age-related decreased cardiac, hepatic, and renal function as well as concurrent disease or other drug therapy may require dosage adjustment. Consider dosage selection carefully in elderly patients because of the increased incidence of diminished organ function. Notify the physician of signs of increased pulmonary artery pressure, such as dyspnea, cough, or chest pain. Storage

Store at room temperature and administer without further dilution. Do not use a single vial for longer than 30 days after initial use.

#### Administration

Give as a continuous SC infusion via SC catheter, using an infusion pump designed for SC drug delivery. Calculate the infusion rate using the following formula: Infusion rate (mL/h) = Dose (ng/kg/min)multiplied by Weight (kg) multiplied by (0.00006/treprostinil dosage strength concentration [mg/mL]). To avoid potential interruptions in drug delivery, provide the patient with immediate access to a backup infusion pump and spare subcutaneous infusion sets. Abrupt withdrawal or sudden large reductions in dosage may result in worsening of pulmonary arterial hypertension symptoms.

For nebullizer use, see manufacturer's instructions for the Tyvaso inhalation system.

# **Tretinoin**

tret'i-noyn ★ Altinac, Avita, Refissa, Renova, Retin-A, Retin-A Micro, Tretin-X ▲ Rejuva-A, Stieva-A, Vesanoid

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D (oral), C (topical)

*Classification:* Antineoplastics, retinoids, dermatologics, keratolytics

# **MECHANISM OF ACTION**

A retinoid that decreases cohesiveness of follicular epithelial cells. Increases turnover of follicular epithelial cells. Bacterial skincounts are not altered. Transdermal: Exerts its effects on growth and differentiation of epithelial cells. Antineoplastic: Induces maturation, decreases proliferation of acute promyelocytic leukemia (APL) cells. Therapeutic Effect: Causes expulsion of blackheads; alleviates fine wrinkles, hyperpigmentation; causes repopulation of bone marrow and blood by normal hematopoietic cells.

# PHARMACOKINETICS

Topical: Minimally absorbed. Oral: Well absorbed following oral administration. Protein binding: 95%. Metabolized in liver. Primarily excreted in urine, minimal excretion in feces. *Half-life:* 0.5-2 h.

# AVAILABILITY

Capsules: 10 mg. Cream: 0.025% (Altinac, Avita, Retin-A), 0.02% (Renova), 0.05% (Altinac, Renova, Retin-A), 0.1% (Altinac, Retin-A). *Gel:* 0.01% (Retin-A), 0.025% (Avita, Retin-A), 0.04% (Retin-A Micro), 0.1% (Retin-A Micro). *Topical Liquid:* 0.05% (Retin-A).

# INDICATIONS AND DOSAGES Acne

TOPICAL

Adults. Apply once daily at bedtime.

 Palliation of fine facial wrinkles, hyperpigmentation, and roughness due to photoaging

TOPICAL

*Adults.* Apply a pea-sized amount of 0.02% or 0.05% product to affected area once daily before bedtime for 24-48 wks.

#### Acute promyelocytic leukemia PO

*Adults, Children > 1 yr.* 45 mg/m<sup>2</sup>/day given as 2 evenly divided doses until complete remission is documented. Discontinue therapy 30 days after complete remission or after 90 days of treatment, whichever comes first.

# CONTRAINDICATIONS

Sensitivity to retinoids or parabens (used as preservative in gelatin capsule).

# INTERACTIONS

#### Drug

TOPICAL

Keratolytic agents (e.g., sulfur, benzoyl peroxide, salicylic acid), medicated soaps, shampoos, astringents, spice or lime cologne, permanent wave solutions, hair depilatories: May increase skin irritation.

Photosensitive medication (thiazides, tetracyclines, fluoroquinolones, phenothiazines, sulfonamides): May augment phototoxicity. PO Ketoconazole: May increase

tretinoin concentration.

#### Herbal

Vitamin A: May increase risk of vitamin A toxicity. Food None known.

#### DIAGNOSTIC TEST EFFECTS PO

Leukocytosis occurs commonly (40%). May elevate liver function tests, cholesterol, triglycerides.

# SIDE EFFECTS

# Expected

TOPICAL

Temporary change in pigmentation, photosensitivity, local inflammatory reactions (peeling, dry skin, stinging, erythema, pruritus) are to be expected and are reversible with discontinuation of tretinoin.

#### Frequent

#### PO

Headache, fever, dry skin/oral mucosa, bone pain, nausea, vomiting, rash.

#### Occasional

#### PO

Mucositis, earache or feeling of fullness in ears, flushing, pruritus, increased sweating, visual disturbances, hypo/hypertension, dizziness, anxiety, insomnia, alopecia, skin changes.

#### Rare PO

Change in visual acuity, temporary hearing loss.

# SERIOUS REACTIONS

PO

· Retinoic acid syndrome (fever, dyspnea, weight gain, abnormal chest auscultatory findings, episodic hypotension) occurs commonly as does leukocytosis. Syndrome generally occurs during first month of therapy (sometimes occurs following first dose).

· Pseudo tumor cerebri may be noted, especially in children (headache, nausea, vomiting, visual disturbances).

· Possible tumorigenic potential when combined with ultraviolet radiation.

 Retinoic acid-APL (RA-APL) differentiation syndrome, which can be fatal.

TOPICAL

· Possible tumorigenic potential when combined with ultraviolet radiation.

#### PRECAUTIONS & CONSIDERATIONS

Caution should be used in patients with elevated cholesterol and/or triglycerides and considerable sun exposure in their occupation or hypersensitivity to sun. Be aware that tretinoin should be avoided in pregnant women. Be aware that it is unknown whether tretinoin is distributed in breast milk; exercise caution in nursing mother. Tretinoin may have a teratogenic and embryotoxic effect.

All women of childbearing potential should be warned of risk to fetus if pregnancy occurs. Two reliable forms of contraceptives should be used concurrently during therapy and for 1 mo after discontinuation of therapy, even in infertile, premenopausal women. A pregnancy test should be obtained within 1 wk before institution of therapy. Liver function tests and cholesterol and triglyceride levels should be monitored before and during therapy.

Avoid exposure to sunlight or sunbeds; sunscreens and protective clothing should be used. Affected areas should also be protected from wind, cold. If skin is already sunburned, do not use until fully recovered. Keep tretinoin away from eyes, mouth, angles of nose, and mucous membranes. Do not

use medicated, drying, or abrasive soaps; wash face no more than 2-3 times daily with mild soap. Avoid use of preparations containing alcohol, menthol, spice, or lime such as shaving lotions, astringents, and perfume. Mild redness, peeling are expected; decrease frequency or discontinue medication if excessive reaction occurs. Nonmedicated cosmetics may be used; however, cosmetics must be removed before tretinoin application.

#### Storage

Store at room temperature. Administration

Take oral tretinoin with food. Do not crush or break capsule.

For topical administration, thoroughly cleanse area before applying tretinoin. Lightly cover only the affected area. Liquid may be applied with fingertip, gauze, or cotton, taking care to avoid running onto unaffected skin. Keep medication away from eyes, mouth, angles of nose, mucous membranes. Wash hands immediately after application. Improvement noted during first 24 wks of therapy. Therapeutic results noted in 2-3 wks; optimal results in 6 wks.

# **Triamcinolone**

tri-am-sin'oh-lone ★ Nasacort AQ, Kenalog, Aristospan, Oralone, Triderm, Pediaderm TA ✿ Oracort, Triderm

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Corticosteroids, systemic, topical, nasal, dermatologic anti-inflammatory agents

#### **MECHANISM OF ACTION**

A corticosteroid that controls the rate of protein synthesis, depresses migration of polymorphonuclear leukocytes, reverses capillary permeability, and stabilizes lysosomal membranes. *Therapeutic Effect*: Prevents or controls inflammation.

# PHARMACOKINETICS

Intranasal or local injection: Low overall systemic absorption. Protein binding: 91%. Undergoes extensive metabolism in liver. Excreted in urine. Topical: Mostly metabolized locally in the skin. Amount systemically absorbed depends on affected area and skin condition (absorption increased with fever, hydration, inflamed or denuded skin). Use of occlusive dressings may increase percutaneous absorption.

#### AVAILABILITY

Oral Dental Paste (Oralone): 0.1%. Nasal Spray (Nasacort AQ): 55 mcg/ actuation. Triamcinolone Acetonide Injection Suspension (Kenalog): 10 mg/mL, 40 mg/mL. Triamcinolone Hexacetonide Injection Suspension (Aristospan): 5 mg/mL, 20 mg/mL. Topical Cream: 0.1%, 0.5%, 0.025%. Topical Lotion: 0.025%, 0.1%. Topical Ointment: 0.025%, 0.1%. Topical Spray: 0.147 mg/g.

# INDICATIONS AND DOSAGES Corticosteroid-responsive dermatoses

TOPICAL (OINTMENT, CREAM, LOTION, SPRAY) *Adults, Elderly*: Apply 2-4 times per day.

#### For the treatment of symptoms of seasonal and perennial allergic rhinitis

NASAL (NASACORT AQ) Adults, Elderly, Children 12 yr and older. 2 sprays into each nostril once daily. Once controlled, reduce to lowest effective dose. Children 6-11 yr. 1 spray into each nostril once daily. May give up to 2 sprays in each nostril once daily if needed. Once controlled, reduce to lowest effective dose.

*Children 2-5 yr*: No more than 1 spray into each nostril once daily.

 For ulcerative or inflammatory oral lesions

TOPICAL DENTAL PASTE *Adults, Elderly.* Apply 2-3 times per day after meals and at bedtime.

#### For the relief of joint inflammation associated with osteoarthritis or rheumatoid arthritis, or the relief of bursitis

INTRA-ARTICULAR (ACETONIDE SUSPENSION) Adults, Elderly, Children 6 yr and older. 2.5-15 mg at appropriate site. Repeat as needed. INTRA-ARTICULAR (HEXACECETONIDE SUSPENSION) Adults. 2-20 mg at appropriate site. Repeat at intervals of 3-4 wks as needed.

# CONTRAINDICATIONS

Hypersensitivity to triamcinolone or other corticosteroids. Untreated localized infection of nasal mucosa (nasal form).

#### **INTERACTIONS**

Drug, Herbal, and Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase WBC and blood glucose level, decrease potassium level with systemic use.

# SIDE EFFECTS

# Frequent

Intranasal: Mild nasopharyngeal irritation; nasal burning, stinging, or dryness; rhinorrhea; change in taste.

Topical or injectable use: Burning, dryness, stinging.

#### Occasional

Intranasal: Pharyngeal candidiasis, headache.

Topical: Pruritus.

#### Rare

Topical: Allergic contact dermatitis, purpura or blood-containing blisters, thinning of skin with easy bruising, telangiectasis or raised dark red spots on skin.

# SERIOUS REACTIONS

• Anaphylaxis, hypersensitivity reactions, and increased intraocular pressure occur rarely with use.

• Nasal septal perforation with prolonged innappropriate use of nasal form.

• Excessive use or overdosage may lead to systemic hypercorticism and adrenal suppression (HPA axis suppression).

 Inadvertent epidural or intrathecal administration of injection suspension can cause arachnoiditis, meningitis, paraparesis/paraplegia, and sensory disturbances, and even death.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with active or quiescent tuberculosis, or other untreated systemic infections (including fungal, bacterial, or viral). It is unknown whether triamcinolone crosses the placenta and is distributed in breast milk, but the drug is probably excreted in breast milk in low quantities. Be aware that the safety and efficacy of most of these products have not been established in children younger than 2-6 yr, dependent on the product prescribed. Be aware that children may absorb larger amounts of topical corticosteroids, which should be used sparingly. No age-related precautions have been noted in elderly patients. HPA axis suppression should be monitored by urinary free cortisol tests and an ACTH stimulation test.

#### Storage

Store at room temperature. Store nasal spray upright.

#### Administration

Topical: Gently cleanse area before topical application. Use occlusive dressings only as ordered. Apply sparingly, and rub into area thoroughly. Nasal: Prime nasal spray as manufacturer directs before first use. Tilt head slightly forward. Insert spray tip up into the nostril, pointing away from nasal septum. Spray the drug into the nostril while holding the other nostril closed, and at the same time inhale through the nose.

Injection: Injection suspension products are not to be given intravenously. May be given intralesionally or intra-articularly. Shake well before each use. Use of specialized injection techniques, by experienced physician, is required.

# Triamterene

try-am'ter-een Dyrenium Do not confuse triamterene with trimipramine.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C (D if used in pregnancy-induced hypertension)

**Classification:** Diuretics, potassium sparing

# **MECHANISM OF ACTION**

A potassium-sparing diuretic that inhibits sodium, potassium, ATPase. Interferes with sodium and potassium exchange in distal tubule, cortical collecting tubule, and collecting duct. Increases sodium and decreases potassium excretion. Also increases magnesium, decreases calcium loss. *Therapeutic Effect:* Produces diuresis and lowers BP.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	2-4 h	NA	7-9 h

Incompletely absorbed from the GI tract. Widely distributed. Metabolized to at least one active metabolite. About 50% of a dose is excreted in the urine. Roughly 21% is eliminated as unchanged drug. The remainder is eliminated via biliary/fecal routes. *Halflife:* 1.5-2.5 h (increased in renal impairment).

# AVAILABILITY

Capsules: 50 mg, 100 mg.

#### INDICATIONS AND DOSAGES • Edema, hypertension PO

*Adults, Elderly.* 50-100 mg/day as a single dose or in 2 divided doses. Maximum: 300 mg/day.

# **OFF-LABEL USES**

Prevention and treatment of hypokalemia.

# CONTRAINDICATIONS

Hypersensitivity, diabetic neuropathy, drug-induced or preexisting hyperkalemia, progressive or severe renal disease, anuria, severe hepatic disease.

Triamterene (Generic Name)

# INTERACTIONS

#### Drug

ACE inhibitors (such as captopril), eplerenone, drospirenone, spironolactone, potassium-containing medications, potassium supplements: May increase the risk of hyperkalemia. Dofetilide: Avoid use with dofetilide since triamterene may compete for renal elimination. Lithium: May decrease the clearance and increase the risk of toxicity of lithium. Metformin: May increase risk of lactic acidosis by competing for renal secretion. NSAIDs: May decrease the antihypertensive effect of

triamterene.

# Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase urinary calcium excretion; BUN and blood glucose levels; and serum calcium, creatinine, potassium, magnesium, and uric acid levels. May decrease serum sodium levels.

# SIDE EFFECTS

#### Occasional

Fatigue, nausea, diarrhea, abdominal pain, leg cramps, headache.

Rare

Anorexia, asthenia, rash, dizziness.

# SERIOUS REACTIONS

 Triamterene use may result in hyponatremia (somnolence, dry mouth, increased thirst, lack of energy) or severe hyperkalemia (irritability, anxiety, heaviness of legs, paresthesia, hypotension, bradycardia, ECG changes [tented T waves, widening QRS complex, ST segment depression]).

• Agranulocytosis, nephrolithiasis, and thrombocytopenia occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with diabetes mellitus, history of renal calculi, hepatic or renal impairment, and concurrent use of potassium-sparing diuretics or potassium supplements. Triamterene crosses the placenta and is distributed in breast milk. Breastfeeding is not recommended for patients taking this drug. The safety and efficacy of this drug have not been established in children. Elderly patients may be at increased risk for developing hyperkalemia. Avoid consuming salt substitutes and foods high in potassium.

An increase in the frequency and volume of urination may occur. Notify the physician of dry mouth, fever, headache, nausea and vomiting, persistent or severe weakness, sore throat, or unusual bleeding or bruising. Blood pressure (BP), vital signs, electrolytes, intake and output, and weight should be monitored before and during treatment. Be aware of signs of electrolyte disturbances such as hypokalemia or hyponatremia. Hypokalemia may cause arrhythmias, altered mental status, muscle cramps, asthenia, and tremor. Storage

Store at room temperature. Administration

Take triamterene with food if GI disturbances occur. Do not crush or break capsules. Therapeutic effect takes several days to begin and can last for several days after the drug is discontinued.

# Triazolam

trye-ay'zoe-lam Halcion Apo-Triazo Do not confuse Halcion with Haldol or Healon.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X Controlled Substance Schedule: IV

**Classification:** Benzodiazepines, sedatives/hypnotics

# **MECHANISM OF ACTION**

A benzodiazepine that enhances the action of the inhibitory neurotransmitter  $\gamma$ -aminobutyric acid, resulting in central nervous system (CNS) depression. *Therapeutic Effect:* Induces sleep.

# AVAILABILITY

Tablets: 0.125 mg, 0.25 mg.

# INDICATIONS AND DOSAGES Insomnia

#### PO

*Adults, Children older than 18 yr.* Typically, 0.25 mg at bedtime, 0.125 mg may be sufficient for some patients. Maximum: 0.5 mg. *Elderly.* 0.125-0.25 mg at bedtime. Maximum: 0.25 mg.

# CONTRAINDICATIONS

Angle-closure glaucoma; CNS depression; pregnancy or breastfeeding; severe, uncontrolled pain; sleep apnea; ethanol intoxication. Triazolam is contraindicated with ketoconazole, itraconazole, nefazodone, and other medications that potentially impair CYP3A4 metabolism.

# INTERACTIONS

#### Drug

Alcohol, other CNS depressants: May increase CNS depression. Protease inhibitors for HIV, ketoconazole, itraconazole, nefazodone: Increase triazolam concentrations, resulting in clinically significant potentiation of sedation. Contraindicated.

# Herbal

Kava kava, valerian: May increase CNS depression.

## Food

**Grapefruit, grapefruit juice:** May alter the absorption of triazolam.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

#### Frequent

Somnolence, sedation, dry mouth, headache, dizziness, nervousness, light-headedness, incoordination, nausea, rebound insomnia (may occur for 1-2 nights after drug is discontinued).

# Occasional

Euphoria, tachycardia, abdominal cramps, visual disturbances.

### Rare

Paradoxical CNS excitement or restlessness (particularly in elderly or debilitated patients), memory impairment.

# SERIOUS REACTIONS

 Abrupt or too-rapid withdrawal may result in pronounced restlessness, irritability, insomnia, hand tremors, abdominal or muscle cramps, vomiting, diaphoresis, and seizures.

• Overdose results in somnolence, confusion, diminished reflexes, respiratory depression, and coma.

• Complex behaviors such as "sleep-driving" (i.e., driving while not fully awake after ingestion of a

Triazolam (Generic Name)

sedative-hypnotic, with amnesia for the event) or other behaviors, with amnesia after the events, have been reported; consider discontinuation if they occur.

• Rare reports of angioedema or anaphylaxis.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in persons with a potential for drug abuse and in hepatic or renal impairment. Pregnancy should be determined before therapy begins. Do not give during pregnancy or breastfeeding. Drowsiness may occur. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills. Cardiovascular, mental, and respiratory status and hepatic function should be monitored throughout therapy.

#### Storage

Store at room temperature.

#### Administration

Take triazolam without regard to food. Crush tablets as needed. Do not administer the drug with grapefruit juice.

# **Trifluridine**

trye-flure'i-deen Viroptic Do not confuse with Zostrix.

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antivirals, ophthalmics

# **MECHANISM OF ACTION**

An antiviral agent that incorporates into DNA causing increased rate of mutation and errors in protein formation. *Therapeutic Effect:* Prevents viral replication.

# PHARMACOKINETICS

Intraocular solution is undetectable in serum. *Half-life:* 12 min.

# AVAILABILITY

Ophthalmic Solution: 1% (Viroptic).

# INDICATIONS AND DOSAGES

# Herpes simplex virus ocular infections

#### OPHTHALMIC

Adults, Elderly, Children older than 6 yr. 1 drop into affected eye q2h while awake. Maximum: 9 drops/ day. Continue until corneal ulcer has completely reepithelialized; then, 1 drop q4h while awake (minimum: 5 drops/day) for an additional 7 days. Do not exceed 21 days of treatment; if no improvement after 7-14 days consider another therapy.

# CONTRAINDICATIONS

Hypersensitivity to trifluridine or any component of the formulation.

#### INTERACTIONS

Drug None known. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Frequent

Transient stinging or burning with instillation.

Occasional

Edema of eyelid.

# Rare

Hypersensitivity reaction.

#### SERIOUS REACTIONS

• Ocular toxicity may occur if used longer than 21 days.

# **PRECAUTIONS & CONSIDERATIONS**

Be aware that trifluridine use should not exceed 21 days because of the potential for ocular toxicity. It may cause transient irritation of the conjunctiva and cornea. Be aware that trifluridine is not recommended during pregnancy or lactation because of its mutagenic effects in vitro. Safety and efficacy have not been established in children younger than 6 yr. No age-related precautions have been noted in elderly patients.

If no improvement occurs after 7 days or complete healing after 14, contact the physician. Report any itching, swelling, redness, or increased irritation.

# Storage

Refrigerate trifluridine; avoid freezing.

#### Administration

For ophthalmic use, do not touch applicator tip to any surface. Place finger on lower eyelid and pull out until pocket is formed between eye and lower lid. Hold dropper above pocket and place prescribed number of drops in pocket. Close eyes gently so medication will not be squeezed out of sac. Apply gentle finger pressure to the lacrimal sac at inner canthus for 1 min following instillation (lessens risk of systemic absorption). If more than 1 ophthalmic drug is being used, separate administration by at least 5-10 min.

# Trihexyphenidyl

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Anticholinergics, antiparkinsonian agents

# **MECHANISM OF ACTION**

An anticholinergic agent that blocks central cholinergic receptors (aids in balancing cholinergic and dopaminergic activity). *Therapeutic Effect:* Decreases salivation, relaxes smooth muscle.

# PHARMACOKINETICS

Well absorbed from GI tract. Primarily excreted in urine. *Half-life:* 3.3-4.1 h.

# AVAILABILITY

Elixer: 2 mg/5 mL. Tablets: 2 mg, 5 mg.

# INDICATIONS AND DOSAGES Parkinsonism

PO

*Adults, Elderly.* Initially, 1 mg on first day. May increase by 2 mg/day at intervals of 3-5 days up to 6-10 mg/ day (12-15 mg/day in patients with postencephalitic parkinsonism).

# Drug-induced extrapyramidal symptoms

PO

Adults, Elderly. Initially, 1 mg/day. Range: 5-15 mg/day.

# CONTRAINDICATIONS

Angle-closure glaucoma, GI obstruction, paralytic ileus, intestinal atony, severe ulcerative colitis, prostatic hypertrophy, myasthenia gravis, megacolon, hypersensitivity to trihexyphenidyl or any component of the formulation.

# INTERACTIONS

#### Drug

Alcohol, central nervous system (CNS) depressants: May increase sedative effect.

Amantadine, anticholinergics, MAOIs: May increase anticholinergic effects.

Trihexyphenidyl (Generic Name)

#### 1626 Trimethobenzamide

#### Antacids, antidiarrheals: May

decrease absorption and effects of trihexyphenidyl. Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Elderly (older than 60 yr) tend to develop mental confusion, disorientation, agitation, psychoticlike symptoms.

#### Frequent

Drowsiness, dry mouth.

## Occasional

Blurred vision, urinary retention, constipation, dizziness, headache, muscle cramps.

#### Rare

Seizures, depression, rash.

#### SERIOUS REACTIONS

Hypersensitivity reaction (eczema, pruritus, rash, cardiac disturbances, photosensitivity) may occur.
Overdosage may vary from CNS depression (sedation, apnea, cardiovascular collapse, death) to severe paradoxical reaction (hallucinations, tremor, seizures).

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with treated open-angle glaucoma, autonomic neuropathy, pulmonary disease, esophageal reflux, hiatal hernia, heart disease, hyperthyroidism, and hypertension. It is unknown whether trihexyphenidyl crosses the placenta or is distributed in breast milk. Safety and efficacy have not been established in children. Elderly patients are more sensitive to the effects of trihexyphenidyl as well as anxiety, confusion, and nervousness. Dry mouth, drowsiness, and dizziness are expected side effects of this drug. Avoid alcohol and do not drive, use machinery, or engage in other activities that require mental acuity if dizziness or blurred vision occurs. Storage

# Store at room temperature.

#### Administration

Be aware not to use sustained-release capsules for initial therapy. Once stabilized, may switch, on mg-for-mg basis, giving in 2 daily doses and with food. High doses may be divided into 4 doses, at mealtimes, and at bedtime.

# Trimethobenzamide

trye-meth-oh-ben'za-mide ★ Tigan

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antiemetics

#### MECHANISM OF ACTION

Trimethobenzamide acts at the medullary chemoreceptor trigger zone by centrally blocking dopamine receptors (D2 subtype). May be a weak 5-HT3 receptor antagonist. *Therapeutic Effect*: Relieves nausea and vomiting.

# PHARMACOKINETICS

Route	Onset	Duration
P0	10-40 min	3-4 h
IM	15-30 min	2-3 h

Partially absorbed from the GI tract. Distributed primarily to the liver. Metabolic fate unknown. Excreted in urine. *Half-life:* 7-9 h.

#### AVAILABILITY

Capsules: 300 mg. Injection: 100 mg/mL.

Trimethobenzamide (Generic Name)

# INDICATIONS AND DOSAGES Nausea and vomiting

### PO

a day.

Adults, Elderly. 300 mg 3-4 times a day. Children weighing 30-100 lb. 100-200 mg 3-4 times a day. IM Adults, Elderly. 200 mg 3-4 times

# CONTRAINDICATIONS

Hypersensitivity to trimethobenzamide; agranulocytosis; use of parenteral form in children.

#### INTERACTIONS

Drug CNS depressants: May increase CNS depression. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent Somnolence.

### Occasional

Blurred vision, diarrhea, dizziness, headache, muscle cramps.

# Rare

Rash, seizures, depression, opisthotonos, parkinsonian syndrome, Reye's syndrome (marked by vomiting, seizures).

# SERIOUS REACTIONS

• Extrapyramidal symptoms such as muscle rigidity and allergic skin reactions, occurs rarely.

• Children may experience paradoxical reactions, marked by restlessness, insomnia, euphoria, nervousness, and tremor.

• Overdose may produce CNS depression (manifested as sedation,

apnea, cardiovascular collapse, and death) or severe paradoxical reactions (such as hallucinations, tremor, and seizures).

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted with dehydration, electrolyte imbalances, high fever, and the debilitated or elderly. It is unknown whether trimethobenzamide crosses the placenta or is distributed in breast milk. No age-related precautions have been noted in elderly patients. Do not administer the parenteral form to children. Tasks that require mental alertness or motor skills should be avoided until response to the drug has been established.

Drowsiness may occur. Notify the physician of headache, visual disturbances, restlessness, or involuntary muscle movements. BP, intake and output, vomitus, and skin for hydration status should be assessed.

#### Administration

! Do not administer trimethobenzamide by the IV route because it produces severe hypotension.

Take oral trimethobenzamide without regard to food. Don't crush, open, or break the capsules.

For IM use, inject the drug deep into a large muscle mass, usually the upper outer gluteus maximus.

# **Trimethoprim**

trye-meth'oh-prim

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antibiotics, folate antagonists

Trimethoprim (Generic Name)

# MECHANISM OF ACTION

A folate antagonist that blocks bacterial biosynthesis of nucleic acids and proteins by interfering with the metabolism of folinic acid. Therapeutic Effect: Bacteriostatic.

# PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Protein binding: 42%-46%. Widely distributed, including to the cerebrospinal fluid (CSF). Metabolized in the liver. Primarily excreted in urine. Moderately removed by hemodialysis. Half-life: 8-10 h (increased in impaired renal function and newborns; decreased in children).

# **AVAILABILITY**

Oral Solution (Primsol): 50 mg/5 mL. Tablets (Proloprim): 100 mg, 200 mg.

# INDICATIONS AND DOSAGES

# Acute, uncomplicated urinary tract infection

PO

Adults, Elderly, Children 12 yr and older: 100 mg q12hr or 200 mg once a day for 10-14 days.

Children younger than 12 yr. 4-6 mg/ kg/day in 2 divided doses for 10 days.

#### Dosage in renal impairment

Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance	
(mL/min)	Dosage Interval
> 30	No change
15-29	Reduce dose by 50%

# **OFF-LABEL USES**

Prevention of bacterial urinary tract infection, treatment of pneumonia caused by Pneumocystis carinii.

# CONTRAINDICATIONS

Hypersensitivity, infants younger than 2 mo, megaloblastic anemia caused by folic acid deficiency.

# INTERACTIONS

Drug

ACE inhibitors, potassiumsparing agents: Increased risk of hyperkalemia. Folate antagonists (including methotrexate): May increase the risk of megaloblastic anemia. Herbal

None known.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels.

# SIDE EFFECTS

#### Occasional

Nausea, vomiting, diarrhea, decreased appetite, abdominal cramps, headache.

# Rare

Hypersensitivity reaction (pruritus, rash), methemoglobinemia (bluish fingernails, lips, or skin; fever; pale skin; sore throat; unusual tiredness), photosensitivity.

# SERIOUS REACTIONS

· Stevens-Johnson syndrome, erythema multiforme, exfoliative dermatitis, and anaphylaxis occur rarely.

- · Hyperkalemia.
- Hematologic toxicity

(thrombocytopenia, neutropenia, leukopenia, megaloblastic anemia) is more likely to occur in elderly, debilitated, or alcoholic patients; in patients with impaired renal function; and in those receiving prolonged high dosage.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with impaired hepatic or renal function or folic acid deficiency. Trimethoprim readily crosses the placenta and is distributed in breast milk. No age-related precautions have been noted in elderly patients, but they may have an increased incidence of thrombocytopenia. Avoid sun and ultraviolet light.

Report bleeding, bruising, skin discoloration, fever, pallor, rash, sore throat, and tiredness. Hematology and renal function tests should be assessed before and during therapy. **Storage** 

Store at room temperature. Administration

Take trimethoprim without regard to food (or with food if stomach upset occurs). Space drug doses evenly around the clock and complete the full course of trimethoprim therapy, which usually lasts 10-14 days.

# Trimipramine

trye-mih-prah'meen ★ Surmontil ◆ Novo-Tripramine Do not confuse with desipramine or triamterene.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antidepressants, tricyclic

#### **MECHANISM OF ACTION**

A tricyclic antibulimic, anticataplectic, antidepressant, antinarcoleptic, antineuralgic, antineuritic, and antipanic agent that blocks the reuptake of neurotransmitters, such as norepinephrine and serotonin, at presynaptic membranes, increasing their concentration at postsynaptic receptor sites. May demonstrate less autonomic toxicity than other tricyclic antidepressants. *Therapeutic Effect:* Results in antidepressant effect. Anticholinergic effect controls nocturnal enuresis.

# PHARMACOKINETICS

Rapidly, completely absorbed after PO administration and not affected by food. Protein binding: 95%. Metabolized in liver (significant first-pass effect). Primarily excreted in urine. Not removed by hemodialysis. *Half-life*: 16-40 h.

#### AVAILABILITY

*Capsules:* 25 mg, 50 mg, 100 mg (Surmontil).

# INDICATIONS AND DOSAGES Depression PO

*Adults.* 50-150 mg/day at bedtime. Maximum: 200 mg/day for outpatients, 300 mg/day for inpatients. *Elderly.* Initially, 25 mg/day at bedtime. May increase by 25 mg q3-7 days. Maximum: 100 mg/day.

# CONTRAINDICATIONS

Acute recovery period after myocardial infarction (MI), cardiac conduction defects, within 14 days of MAOI ingestion, hypersensitivity to trimipramine or any component of the formulation. Avoid use with linezolid (Zyvox) or IV methylene blue due to risk for serotonin syndrome.

# INTERACTIONS

#### Drug

Alcohol, central nervous system (CNS) depressants: May increase CNS and respiratory depression and the hypotensive effects of trimipramine.

Anticoagulants: May increase risk of bleeding.

Antipsychotics (haloperidol, risperidone, quetiapine): May

increase the cardiac effects (QT prolongation, torsades de pointes, cardiac arrest).

Antithyroid agents: May increase the risk of agranulocytosis.

Amprenavir, atazanavir: May increase serum concentrations and risk of toxicity of trimipramine.

Atomoxetine: May increase plasma concentrations of atomoxetine.

Barbiturates: May decrease trimipramine serum concentrations and possible additive adverse effects. Baclofen: May increase the risk of memory loss and/or muscle tone. Cimetidine: May increase trimipramine blood concentration and risk of toxicity.

Class 1, 1A, and III antiarrhythmic agents; cisapride; cotrimoxazole; fluconazole; gatifloxacin; gemifloxacin; grepafloxacin; sparfloxacin; telithromycin; halofantrine; halothane; sympathomimetics; vasopressin; zolmitriptan: May increase the cardiac effects.

**Clonidine, guanadrel:** May decrease the effects of clonidine and guanadrel.

**Duloxetine, fluoxetine, paroxetine, sertraline:** May increase serum concentrations and risk of toxicity. **Estrogens:** May increase the antidepressant effectiveness and risk of tricyclic toxicity.

**Linezolid:** May increase the risk of serotonin syndrome.

**MAOIs:** May increase the risk of hyperpyrexia, hypertensive crisis, and seizures.

**Phenothiazines:** May increase anticholinergic and sedative effects of trimipramine.

**Phenytoin:** May decrease trimipramine blood concentration. **Quinidine:** May increase the risk of trimipramine toxicity.

#### Herbal

Ginkgo biloba: May decrease seizure threshold. St. John's wort: May have additive effect.

# DIAGNOSTIC TEST EFFECTS

May alter blood glucose levels and ECG readings.

#### SIDE EFFECTS Frequent

Drowsiness, fatigue, dry mouth, blurred vision, constipation, delayed micturition, postural hypotension, diaphoresis, disturbed concentration, increased appetite, urinary retention, photosensitivity.

### Occasional

GI disturbances, such as nausea, and a metallic taste sensation.

#### Rare

Paradoxical reaction, marked by agitation, restlessness, nightmares, insomnia, extrapyramidal symptoms, particularly fine hand tremors.

# SERIOUS REACTIONS

High dosage may produce cardiovascular effects, such as severe postural hypotension, dizziness, tachycardia, palpitations, arrhythmias, and seizures. High dosage may also result in altered temperature regulation, including hyperpyrexia or hypothermia.
Abrupt withdrawal from prolonged

• Abrupt withdrawal from prolonged therapy may produce headache, malaise, nausea, vomiting, and vivid dreams.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with cardiac disease, diabetes mellitus, glaucoma, hiatal hernia, history of seizures, history of urinary obstruction or retention, hyperthyroidism, increased intraocular pressure (IOP) decreased GI motility, liver disease, prostatic hypertrophy, renal disease, and schizophrenia. It is unknown whether trimipramine crosses the placenta or is distributed in breast milk. Be aware that trimipramine is not recommended in children younger than 18 yr. Antidepressants increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr) with major depressive disorder and other psychiatric disorders. All patients should be monitored for suicidal thoughts, mood changes, or unusual behaviors. Dose reduction may be required in elderly patients.

Tolerance usually develops to anticholinergic effects, postural hypotension, and sedative effects during therapy. Avoid tasks that require mental alertness or motor skills until response to trimipramine is established.

#### Administration

Take with food or milk if GI distress occurs.

Triptorelin Pamoate trip'toe-rel-in

🛧 🏜 Trelstar Depot, Trelstar LA

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

**Classification:** Antineoplastics, hormones/hormone modifiers, gonadotropin-releasing hormone analogs

#### **MECHANISM OF ACTION**

A gonadotropin-releasing hormone (GnRH) analog and antineoplastic agent that inhibits gonadotropin hormone secretion through a negative feedback mechanism. Circulating levels of luteinizing hormone, follicle-stimulating hormone, testosterone, and estradiol rise initially, then subside with continued therapy. *Therapeutic Effect:* Suppresses growth of abnormal prostate tissue.

#### AVAILABILITY

Powder for Injection (Trelstar Depot): 3.75 mg. Powder for Injection (Trelstar LA): 11.25 mg. Powder for Injection (Trelstar LA): 22.5 mg.

# INDICATIONS AND DOSAGES Prostate cancer

IM Adults, Elderly. 3.75 mg once q28 days (Trelster Depot) 11.25 mg q12wk (Trelstar LA) 22.5 mg q24wk (Trelstar LA).

# CONTRAINDICATIONS

Hypersensitivity to luteinizing hormone-releasing hormone (LHRH) or LHRH agonists, pregnancy.

#### INTERACTIONS

#### Drug

Hyperprolactinemic drugs: Reduce the number of pituitary

gonadotropin-releasing hormone (GnRH) receptors.

None known.

Food

None known.

#### DIAGNOSTIC TEST EFFECTS

May alter serum pituitary-gonadal function test results. May cause transient increase in serum testosterone levels, usually during first week of treatment. May increase blood sugar.

#### SIDE EFFECTS

Frequent (> 5%)

Hot flashes, skeletal pain, headache, impotence.

#### Occasional (2%-5%)

Insomnia, vomiting, leg pain, fatigue. Rare (< 2%)

Dizziness, emotional lability, diarrhea, urinary retention, urinary tract infection, anemia, pruritus.

# SERIOUS REACTIONS

• Bladder outlet obstruction, skeletal pain, hematuria, and spinal cord compression (with weakness or paralysis of the lower extremities) may occur.

 Risk for osteoporosis with longterm use.

• Rare serious hypersensitivity (anaphylaxis).

• New-onset diabetes mellitus and associated health risks.

#### PRECAUTIONS & CONSIDERATIONS

Women who are or might be pregnant should not use this drug. Pregnancy should be determined before beginning triptorelin therapy. It is unknown whether triptorelin is excreted in breast milk. The safety and efficacy of triptorelin have not been established in children. No agerelated precautions have been noted in elderly patients.

Blood in urine, increased skeletal pain, and urine retention may occur initially, but these symptoms usually subside within 1 wk. Notify the physician if difficulty breathing, infection at the injection site, numbness of the arms or legs, breast pain or swelling, persistent nausea or vomiting, or rapid heartbeat develop. Prostatic acid phosphatase (PAP), prostate-specific antigen (PSA), and serum testosterone levels should be obtained periodically during therapy. Serum testosterone and PAP levels should increase during the first week of therapy. The testosterone level should then decrease to baseline level or less within 2 wks, and the PAP level should decrease within 4 wks.

A worsening of signs and symptoms of prostatic cancer, especially during the first week of therapy, because of a transient increase in testosterone level should be carefully assessed.

#### Storage

Store injection kits at room temperature; do not freeze.

# Administration

Administer under the supervision of a physician. Do not miss injections. For intramuscular (IM) use only; never give intravenously. The product should be reconstituted with sterile water only. Using a syringe fitted with a 21-gauge needle, withdraw 2 mL sterile water, and inject into the vial. Shake well to thoroughly disperse particles to obtain a uniform suspension. The suspension will appear milky. Withdraw the entire contents of the vial into the syringe and use immediately. Inject IM into either buttock. IM injection sites should be alternated.

#### Trospium

trose'pee-um

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticholinergics, urinary antispasmodic, urinary incontinence agents

#### MECHANISM OF ACTION

An anticholinergic that antagonizes the effect of acetylcholine on muscarinic receptors, producing parasympatholytic action. *Therapeutic Effect:* Reduces smooth muscle tone in the bladder.

# PHARMACOKINETICS

Minimally absorbed after PO administration. Protein binding: 50%-85%. Distributed in plasma. Excreted mainly in feces and, to a lesser extent, in urine. *Half life*: 20 h.

# AVAILABILITY

Tablets: 20 mg. Extended-Release Capsules: 60 mg.

#### 

PO (IMMEDIATE RELEASE) Adults. 20 mg 2 times/day. Elderly (75 yr and older). Initially, 20 mg 2 times/day. Titrate dosage down to 20 mg once a day, based on tolerance.

PO (EXTENDED RELEASE) *Adults.* 60 mg once per day in the morning.

#### Dosage in renal impairment

For patients with creatinine clearance < 30 mL/min, dosage reduced to 20 mg once a day at bedtime. Do not use XR form.

# CONTRAINDICATIONS

Hypersensitivity, urinary retention, gastric retention, or uncontrolled narrow-angle glaucoma or patients at risk for these conditions.

#### INTERACTIONS Drug

Other anticholinergic agents:

Increases the severity and frequency of side effects and may alter the absorption of other drugs because of anticholinergic effects on GI motility. **Digoxin, metformin, morphine, pancuronium, procainamide, tenofovir, vancomycin:** May increase trospium blood concentration.

#### Herbal

None known.

1000

**High-fat meal:** May reduce trospium absorption.

**Alcohol:** May increase risk of anticholinergic effects of extended release dose form.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

Frequent (20%)

Dry mouth. Occasional ( $\leq 4\%$ )

Constipation, headache.

#### Rare (< 2%)

Fatigue, upper abdominal pain, dyspepsia, flatulence, dry eyes, urine retention, tachycardia, heat intolerance.

# SERIOUS REACTIONS

• Rare reports of hypersensitivity, including angioedema.

Overdose may result in severe anticholinergic effects, such as abdominal pain, nausea and vomiting, confusion, depression, diaphoresis, facial flushing, hypertension, hypotension, respiratory depression, irritability, nervousness, and restlessness.
Supraventricular tachycardia and hallucinations occur rarely.

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal or hepatic impairment, intestinal atony, obstructive GI disorders, significant bladder obstruction, ulcerative colitis, myasthenia gravis, and angle-closure glaucoma. It is unknown whether trospium crosses the placenta or is distributed in breast milk. The safety and efficacy of trospium have not been established in children. Elderly patients (age 75 and older) have a higher incidence of constipation, dry mouth, dyspepsia, urine retention, and urinary tract infection.

Notify the physician of increased salivation or sweating, an irregular heartbeat, nausea and vomiting, or severe abdominal pain. Intake and output, pattern of daily bowel activity and stool consistency, and symptomatic relief should be assessed. **Storage** 

Store trospium at room temperature.

#### Administration

Do not break or crush the tablets. Take the drug at least 1 h before meals or on an empty stomach. Do not take trospium with highfat meals because it may reduce absorption.

Do not crush, cut, or chew extended-release capsules. Dose with water on an empty stomach, at least 1 h before a meal. Alcohol should not be consumed within 2 h of extended-release administration.

# Ursodiol

your-soo'dee-ol ★ Actigall, Urso 250, Urso Forte ★ DOM-Ursodiol C, PHL-Ursodiol C, PMS-Ursodiol C

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

**Classification:** Gallstone dissolution agent

# **MECHANISM OF ACTION**

A gallstone-solubilizing agent that suppresses the hepatic synthesis and secretion of cholesterol; inhibits the intestinal absorption of cholesterol. *Therapeutic Effect:* Changes the bile of patients with gallstones from precipitating (capable of forming crystals) to cholesterol solubilizing (capable of being dissolved).

# AVAILABILITY

Capsules: 300 mg. Tablets: 250 mg, 500 mg.

# PHARMACOKINETICS

With oral dosing, 90% is absorbed in the small bowel. Undergoes hepatic extraction; also distributed in bile and small intestine. Steady-state concentrations are reached in ~ 3 wks. Metabolized in the colon and excreted as metabolites in the feces.

# INDICATIONS AND DOSAGES

# Dissolution of radiolucent, noncalcified gallstones when cholecystectomy is not recommended

PO

Adults, Elderly. 8-10 mg/kg/day in 2-3 divided doses. Treatment may require months. Obtain ultrasound image of gallbladder at 6-mo intervals for first year. If gallstones have dissolved, continue therapy and repeat ultrasound within 1-3 mo.

#### Primary biliary cirrhosis PO

Adults, Elderly. 13-15 mg/kg/day in 2-4 divided doses with food.

Prevention of gallstones PO

Adults, Elderly. 300 mg twice a day.

# **OFF-LABEL USES**

Treatment of alcoholic cirrhosis, biliary atresia, biliary cirrhosis, cystic fibrosis, cholestatic jaundice syndrome, chronic hepatitis, congenital dilation of lobar intrahepatic duct, gallstone formation, sclerosing cholangitis, prophylaxis of liver transplant rejection.

# CONTRAINDICATIONS

Hypersensitivity to the drug or any other bile acid agents. Patients with cholelithiasis or biliary tract disease and compelling reasons for cholecystectomy, including unremitting acute cholesystitis, cholangitis, biliary obstruction, gallstone pancreatitis, or biliary-GI fistula, are *not* candidates for gallstone dissolution via use of ursodiol. The drug will not dissolve calcified cholesterol stones, radiopaque stones, or radiolucent bile pigment stones.

#### INTERACTIONS Drug

Aluminum-based antacids, cholestyramine: May decrease the absorption and effects of ursodiol. Estrogens, oral contraceptives: May decrease the effects of ursodiol. Herbal None known. Food None known.

Ursodiol (Generic Name)

# **DIAGNOSTIC TEST EFFECTS**

May improve liver function test results as the drug improves the patient's clinical condition.

# SIDE EFFECTS

All were similar to placebo.

#### Frequent

Abdominal pain, diarrhea, dyspepsia, flatulence, nausea.

#### Common

Cholecystitis, constipation, gastrointestinal disorder, vomiting.

# SERIOUS REACTIONS

· None significant.

# PRECAUTIONS & CONSIDERATIONS

Patients with ascites, hepatic encephalopathy, variceal bleeding, or in need of liver transplant should be treated for those specific causes. Use with caution in those with liver disease. There have been no adequate and well-controlled studies of the use of ursodiol in pregnant women. It is not known if the drug is excreted in breast milk; use caution during lactation. The safety and effectiveness of ursodiol have not been established in children.

Blood serum chemistry values, including BUN, serum alkaline phosphatase, bilirubin, creatinine, AST (SGOT), and ALT (SGPT) levels, should be obtained before the start of ursodiol therapy, 1 and 3 mo after therapy begins, and every 6 mo thereafter to assess response to ursodiol treatment.

#### Storage

Store at room temperature. Administration

Take with meals or a snack because the drug dissolves more readily in the presence of bile acid and pancreatic juice. Avoid taking antacids 1 h before or 2 h after taking ursodiol. Therapy with ursodiol is usually for several months.

# **Ustekinumab**

us'te-kin'you-mab

CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

# Classification:

Immunomodulators, monoclonal antibodies, antipsoriatic agents

# **MECHANISM OF ACTION**

A monoclonal antibody that binds specifically to p40 protein subunit of interleukins 12 and 23; inhibiting the interleukins' activity, decreasing inflammation and immune responses. *Therapeutic Effect:* Reduces inflammation, redness, and scaling of psoriatic plaques, improving symptoms.

# PHARMACOKINETICS

Time to peak serum concentration 7 days (90 mg) or 13.5 days (45 mg); steady state reached at roughly day 28 of treatment. *Half-life:* 15-46 days or longer.

# AVAILABILITY

Injection: 45 mg/0.5 mL, 90 mg/ mL; in single-use vials or prefilled syringes.

# INDICATIONS AND DOSAGES

#### Moderate to severe plaque psoriasis SC

Adults  $\leq 100 \text{ kg.} 45 \text{ mg}$  initially, then 45 mg 4 wk later, then 45 mg q12wk. Adults > 100 kg. 90 mg initially, then 90 mg 4 wk later, then 90 mg q12wk.

# CONTRAINDICATIONS

History of serious reaction to ustekinumab (e.g., angioedema or
anaphylaxis). Withhold in any patient with a clinically important, active, serious infection, especially active TB.

# INTERACTIONS

#### Drug

Other biologics for psoriasis and traditional immunosuppressives: Concomitant use has not been evaluated. There may be an increased risk of serious infections with combined use.

Narrow therapeutic index drugs metabolized via CYP450 enzymes:

Ustekinumab may alter metabolism; monitor such drugs closely. Vaccines, live: Avoid use. Altered immune response and increased risk of secondary transmission of infection from vaccine. Must *not* 

receive BCG vaccine for up to 1 yr after ustekinumab discontinued.

# DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

#### Frequent (3%-10%)

Headache, fatigue, nasopharyngitis, mild upper respiratory infections. Occasional (1%-2%)

Injection site erythema, antibody formation, back pain, sore throat. **Rare (< 1%)** 

Cellulitis, certain injection site reactions (pain, swelling, pruritus, induration, hemorrhage, bruising, and irritation). See Serious Reactions.

## SERIOUS REACTIONS

Rare reports of serious hypersensitivity, including anaphylaxis and angioedema.
Rare reactions include risk for malignancies (e.g., nonmelanoma skin malignancy), neurologic events, and serious infections (such as pneumonia, tuberculosis).  Reversible posterior leukoencephalopathy syndrome (RPLS) is a rare serious neurologic disorder; can present with seizures, headache, confusion, and visual disturbances; if suspected, discontinue drug. Rarely can be fatal.

## PRECAUTIONS & CONSIDERATIONS

Serious infections, sepsis, tuberculosis, and opportunistic infections have occurred during therapy. Patients should be screened for active or recent infection, tuberculosis risk factors, and latent tuberculosis infection before initiating therapy. Closely monitor patients developing infection during therapy. Caution is warranted in patients with neurologic disease, history of sensitivity to monoclonal antibodies, preexisting or recent onset of CNS disturbances, in elderly patients. Due to potential risk of malignancy, use with caution in those with past malignancy. There are no clinical data in pregnant women; animal studies do not show teratogenic effects. It is unknown if the drug is excreted in breast milk. The safety and efficacy of ustekinumab have not been established in children. Cautious use in the elderly is necessary because they may be at increased risk for serious infection and malignancy. Avoid receiving live vaccines during treatment. The needle cover on the prefilled syringe contains latex and the cover should not be handled by those with latex allergy. Storage

Refrigerate. Do not freeze. Protect from light; store in original carton until administration.

### Administration

For subcutaneous use, rotate injection sites. The solution should be colorless to slightly yellow and may contain a few small translucent/ white particles. Do not use if discolored or cloudy. Do not shake. Use a 27-gauge, 0.5-inch needle if dosing from the vial. Injection sites include the front middle thigh, gluteal or abdominal region, and the outer area of upper arm. Do not inject within 2 inches of the navel. Do not administer intralesionally, or where skin is tender, bruised, red, or indurated. Discard any unused portion. Injection site reactions generally occur in the first month of treatment and decrease with continued therapy.

# Valacyclovir

val-a-sye'kloe-veer Valtrex Do not confuse valacyclovir with valganciclovir.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: B

# Classification: Antivirals

# **MECHANISM OF ACTION**

A virustatic antiviral that is converted to acyclovir triphosphate, becoming part of the viral DNA chain. *Therapeutic Effect:* Interferes with DNA synthesis and replication of herpes simplex virus and varicella zoster virus.

# PHARMACOKINETICS

Rapidly absorbed after PO administration. Protein binding: 13%-18%. Rapidly converted by hydrolysis to the active compound acyclovir. Widely distributed to tissues and body fluids (including cerebrospinal fluid [CSF]). Eliminated primarily in urine. Removed by hemodialysis. *Half-life:* 2.5-3.3 h (increased in impaired renal function).

# AVAILABILITY

Caplets: 500 mg, 1000 mg.

# INDICATIONS AND DOSAGES

Herpes zoster (shingles)
 PO

*Adults, Elderly.* 1 g 3 times a day for 7 days.

# Herpes labialis (cold sores) PO

*Adults, Elderly, Children 12 yr and older.* 2 g twice a day for 2 doses starting at the first sign of symptom of lesions.

# Initial episode of genital herpes PO

*Adults, Elderly.* 1 g twice a day for 10 days.

# Recurrent episodes of genital herpes

PO

*Adults, Elderly.* 500 mg twice a day for 3 days.

## Prevention of genital herpes PO

*Adults, Elderly.* 500-1000 mg/day. In immunocompetent heterosexuals, this dose also reduces risk of partner transmission. If HIV-infected, the suppressive dose is 500 mg twice a day.

# Varicella (chickenpox in immunocompetent patients) PO

Children 2 to < 18 yr: 20 mg/kg/dose 3 times per day for 5 days (maximum 1 g 3 times per day). Start at first sign/symptom, preferably within 24 h of rash onset.

## Dosage in renal impairment (adults)

Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Herpes Zoster	Genital Herpes (recurrence)
30-49	1 g q12h	500 mg q12h
10-29	1 g q24h	500 mg q24h
< 10	500 mg q24h	500 mg q24h

No data available for use in children with CrCl < 50 mL/min.

# CONTRAINDICATIONS

Hypersensitivity to or intolerance of acyclovir, valacyclovir, or their components.

# INTERACTIONS

## Drug

Cimetidine, probenecid:

May increase acyclovir blood concentration.

Valacyclovir (Generic Name)

**Entecavir, tenofovir:** May increase blood concentration of these medicines by reducing renal elimination.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN and serum creatinine concentrations.

# SIDE EFFECTS

#### Frequent

Herpes zoster (10%-17%): Nausea, headache, nasopharyngitis. Genital herpes (17%): Headache.

## Occasional

Herpes zoster (3%-7%): Vomiting, diarrhea, constipation (50 yr or older), asthenia, dizziness (50 yr or older). Genital herpes (3%-8%): Nausea, diarrhea, dizziness.

### Rare

Herpes zoster (1%-3%): Abdominal pain, anorexia.

Genital herpes (1%-3%): Asthenia, abdominal pain.

# SERIOUS REACTIONS

• Thrombotic thrombocytopenic purpura/hemolytic uremic syndrome.

• Dehydration may contribute to decreased urination and renal dysfunction.

• Rare serious hypersensitivity reactions.

# PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with advanced HIV infection, bone marrow or renal transplantation, concurrent use of nephrotoxic agents, dehydration, fluid or electrolyte imbalance, neurologic abnormalities, and renal or liver impairment. Be aware that valacyclovir may cross the placenta and be distributed in breast milk. Safety and efficacy have not been established in children less than 2 yr of age. In elderly patients, age-related renal impairment may require dosage adjustment. Do not touch lesions with fingers to avoid spreading infection to new sites. Avoid sexual intercourse during the duration of lesions to prevent infecting partner.

Tissue cultures should be obtained from those with herpes simplex and herpes zoster before giving the first dose of valacyclovir. Therapy may proceed before test results are known. Complete blood count (CBC), liver or renal function tests, fluid intake, and urinalysis should be monitored. Maintain adequate fluids. Fingernails should be kept short and hands clean. Pap smears should be done at least annually because of increased risk of cervical cancer in women with genital herpes.

#### Storage

Store tablets at room temperature. Store compounded oral suspension refrigerated for up to 28 days.

# Administration

Give oral valacyclovir without regard to meals. Do not crush or break tablets. Continue therapy for the full length of treatment, and evenly space doses around the clock.

The manufacturer provides for an oral suspension that may be compounded for children. Shake well before each use.

Adequate hydration is important to reduce risk of crystallization within kidneys.

# Valganciclovir

val-gan-sye'kloh-veer Valcyte Do not confuse valganciclovir with valacyclovir.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Antivirals

# **MECHANISM OF ACTION**

A synthetic nucleoside that competes with viral DNA esterases and is incorporated directly into growing viral DNA chains. *Therapeutic Effect:* Interferes with DNA synthesis and viral replication.

## PHARMACOKINETICS

Well absorbed and rapidly converted to ganciclovir by intestinal and hepatic enzymes. Widely distributed. Slowly metabolized intracellularly. Excreted primarily unchanged in urine. Removed by hemodialysis. *Half-life:* 18 h (increased in impaired renal function).

### AVAILABILITY

Tablets: 450 mg. Oral Solution: 50 mg/mL.

### INDICATIONS AND DOSAGES

### Cytomegalovirus (CMV) retinitis in patients with normal renal function PO

*Adults*. Initially, 900 mg (two 450mg tablets) twice a day for 21 days. Maintenance: 900 mg once a day.

## Prevention of CMV after kidney, heart, or kidney-pancreas transplant PO

Adults, Elderly. 900 mg once a day beginning within 10 days of transplant and continuing until 100 days post-transplant (heart or kidneypancreas transplant) or for 200 days (kidney transplant).

Children 4 mo to 16 yr. See calculation. Dose is given once daily starting within 10 days of transplant and continuing until 100 days post-transplant (kidney or heart): Pediatric dose (mg) =  $7 \times BSA \times CrCl$  (calculated using a modified Schwartz formula). If Schwartz CrCl > 150 mL/min/1.73 m<sup>2</sup>, then a maximum value of 150 mL/min/1.73 m<sup>2</sup> is used in the dose equation. The dose equation accounts for renal impairment and may be used to calculate dose in renal dysfunction in pediatrics. Round to the nearest 25-mg increment for the actual deliverable dose; a maximum dose of 900 mg should be administered. The oral solution is the preferred formulation for children; however, the tablets may be used if the calculated doses are within 10% of the tablet strength (450 mg). For example, if the calculated dose is between 405 mg and 495 mg, one 450-mg tablet may be taken for the dose.

### Dosage in renal impairment (adults)

Dosage and frequency are modified based on creatinine clearance.

Creatinine Clearance (mL/min)	Induction Dosage (mg)	Maintenance Dosage	
40-59	450 twice/ day	450 mg once/ day	
25-39	450 once/ day	450 mg once q2 days	
10-24	450 q2 days	450 mg twice/ week	
< 10	Not recommended		

## CONTRAINDICATIONS

Hypersensitivity to acyclovir, ganciclovir, or valganciclovir.

# INTERACTIONS

## Drug

Amphotericin B, cyclosporine: May increase the risk of nephrotoxicity.

Bone marrow depressants: May increase bone marrow depression. Didanosine (DDI): May increase didanosine concentrations and related toxicity.

**Imipenem and cilastatin:** May increase the risk of seizures.

**Mycophenolate:** May increase serum concentration of valganciclovir and mycophenolate metabolites; monitor for toxicity. Interaction only occurs in presence of renal impairment.

**Probenecid:** Decreases renal clearance of valganciclovir. **Tenofovir:** May decrease excretion of tenofovir.

Zidovudine (AZT): May increase the risk of hematologic toxicity. Herbal

None known.

#### Food

All foods: Maximize drug bioavailability.

# **DIAGNOSTIC TEST EFFECTS**

May decrease blood hematocrit and hemoglobin levels, platelet count, and WBC count.

## SIDE EFFECTS

#### Frequent (9%-41%)

Diarrhea, neutropenia, headache, fever, insomnia, nausea, vomiting, abdominal pain, anemia, retinal detachment, hypertension, tremor. **Occasional (3%-8%)** 

#### Occasional (3%-8%

Thrombocytopenia, paresthesia. Rare (1%-3%) Abdominal pain, anesthenia.

# SERIOUS REACTIONS

• Hematologic toxicity, including severe neutropenia (most common), anemia, and thrombocytopenia may occur.

· Retinal detachment.

• An overdose or dehydration may result in renal toxicity.

• Valganciclovir may decrease sperm production and fertility.

# **PRECAUTIONS & CONSIDERATIONS**

Valganciclovir has not been indicated for use in patients with liver transplant. Caution should be used in patients with a history of cytopenic reactions to other drugs, preexisting cytopenias, and renal impairment and in elderly patients, who are at a greater risk of renal impairment. Patients on dialysis should not use this drug. Valganciclovir should not be used during pregnancy, and effective contraception should be used during therapy because of the mutagenic and teratogenic potential of valganciclovir. Women taking valganciclovir should avoid breastfeeding. Breastfeeding may be resumed no sooner than 72 h after the last dose of valganciclovir. Men must also use barrier contraception during and for 90 days after use of the drug. Use with caution in children because the long-term effects on fertility or carcinogenesis are not known. There is no experience in infants < 4 mo of age. In elderly patients, age-related renal impairment may require dosage adjustment.

Blood chemistry, hematologic baselines, and serum creatinine levels should be evaluated. Intake and output should be monitored, and ensure that the patient maintains adequate hydration. Ophthalmologic examinations should be obtained every 4-6 wks during treatment. Valganciclovir may temporarily or permanently inhibit sperm production in men; valganciclovir may temporarily or permanently suppress fertility in women.

#### Storage

Store tablets at room temperature. Store the compounded oral solution refrigerated for up to 49 days. Do not freeze.

#### Administration

CAUTION: Because valganciclovir shares some of the properties of antitumor agents (i.e., carcinogenicity and mutagenicity), handle and dispose according to guidelines issued for cytotoxic drugs. Do not break or crush the tablets. Avoid contact of tablets or oral solution with skin or eyes: Wash your skin well with soap and water or rinse your eyes in contact occurs.

Give valganciclovir with food. Cannot be substituted for ganciclovir on a one-to-one basis.

The manufacturer provides for an oral solution that may be compounded for children. Adults should not be dosed with the solution.

Maintain adequate hydration to reduce risk of renal cystallization.

# Valproic Acid/ Valproate Sodium/ Divalproex Sodium

val-pro'ick Valproic acid: ★ Depakene, Stavzor Valproate sodium: ★ Depacon Divalproex sodium: ★ Depakote, Depakote ER, Depakote Sprinkle ▲ Epival

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

Classification: Anticonvulsants

# **MECHANISM OF ACTION**

An anticonvulsant, mood-stabilizing, and antimigraine agent that directly increases concentration of the inhibitory neurotransmitter γ-aminobutyric acid. *Therapeutic Effect:* Reduces seizure activity.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 80%-90%. Metabolized in the liver. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 6-16 h (may be increased in patients with hepatic impairment, elderly patients, and children younger than 18 mo).

# AVAILABILITY

## Valproic Acid

Syrup (Depakene): 250 mg/5 mL. Capsules (Depakene): 250 mg. Capsules (Delayed Release [Stavzor]): 125 mg, 250 mg, 500 mg. Valproate Sodium Injection (Depacon): 100 mg/mL. Divalproex Sodium Tablets (Delayed Release [Depakote]): 125 mg, 250 mg, 500 mg. Tablets (Extended Release [Depakote ER]): 250 mg, 500 mg.

Capsules Sprinkles (Depakote Sprinkle): 125 mg.

# INDICATIONS AND DOSAGES Seizures

PO Adults

Adults, Elderly, Children 10 yr and older. Initially, 10-15 mg/kg/day in 2-3 divided doses. May increase by 5-10 mg/kg/day at weekly intervals up to 30-60 mg/kg/day. Usual adult dosage: 1000-2500 mg/day. IV

*Adults, Elderly, Children.* Same as oral dose but given q6h.

PO (EXTENDED-RELEASE TABLETS)

*Adults, Elderly, Children*. Initially, 10-15 mg/kg/day given once daily. Maximum 60 mg/kg/day.

PO (DELAYED-RELEASE TABLETS, DELAYED-RELEASE CAPSULES)

*Adults, Elderly, Children.* Initially, 10-15 mg/kg/day divided twice daily. Maximum 60 mg/kg/day.

Manic episodes

PO

Valproic Acid/ Valproate Sodium/ Divalproex Sodium (Generic Name)

## 1644 Valproic Acid/Valproate Sodium/Divalproex Sodium

*Adults, Elderly.* Initially, 750 mg/ day in divided doses twice daily. Maximum: 60 mg/kg/day.

# Prevention of migraine headaches PO (EXTENDED-RELEASE TABLETS)

Adults, Elderly. Initially, 500 mg/day for 7 days. May increase up to 1000 mg/day. PO (DELAYED-RELEASE

TABLETS, DELAYED-RELEASE CAPSULES)

Adults, Elderly. Initially, 250 mg twice a day. May increase up to 1000 mg/day.

## **OFF-LABEL USES**

Treatment of myoclonic, simple partial, and tonic-clonic seizures. Also used as adjunct in bipolar disorder.

### CONTRAINDICATIONS

Active hepatic disease or significant hepatic function impairment; hypersensitivity to the drug; known urea cycle disorders.

#### INTERACTIONS

#### Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS depressant effects. Amitriptyline, primidone: May increase the blood concentration of these drugs.

Anticoagulants, heparin, platelet aggregation inhibitors, thrombolytics: May increase the risk of bleeding.

Carbamazepine: May decrease valproic acid blood concentration.

Carbapenem antibiotics (ertapenem, imipenem,

**meropenem):** May reduce serum valproic acid concentrations to subtherapeutic levels.

Felbamate: May increase valproic acid concentration.

Hepatotoxic medications: May increase the risk of hepatotoxicity. Phenytoin: May increase the risk of phenytoin toxicity and decrease the effects of valproic acid. Topiramate: Increased risk of hyperammonemia. Herbal None known. Food None known.

None known.

# DIAGNOSTIC TEST EFFECTS

May increase serum LDH, bilirubin, AST (SGOT), and ALT (SGPT) levels, pancreatic enzymes, or ammonia levels. May alter thyroid function tests. Therapeutic serum level is 50-100 mcg/mL; toxic serum level is > 100 mcg/mL. May cause false-positive urine ketone test.

# IV INCOMPATIBILITIES

Do not mix valproic acid with any other medications; few compatibility data are available.

# SIDE EFFECTS

### Frequent

Abdominal pain, irregular menses, diarrhea, transient alopecia, indigestion, nausea, vomiting, tremors, weight gain or loss.

#### Occasional

Constipation, dizziness, drowsiness, headache, skin rash, unusual excitement, restlessness, asthenia.

## Rare

Mood changes, diplopia, nystagmus, spots before eyes, unusual bleeding or ecchymosis.

## SERIOUS REACTIONS

 Hepatotoxicity may occur, particularly in the first 6 mo of valproic acid therapy. It may be preceded by loss of seizure control, malaise, weakness, lethargy, anorexia, and vomiting rather than by abnormal serum liver function test results.

- Blood dyscrasias may occur.
- · Life-threatening pancreatitis.
- Hyperammonemia and encephalopathy.
- Multiorgan hypersensitivity reaction.
- · Hypothermia has been reported.

• Teratogen: neural tube defects, congenital abnormalities, and cognitive function defects.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with bleeding abnormalities and a history of hepatic disease. Antiepileptic drugs (AEDs) may increase the risk of suicidal thoughts or behavior. Monitor for the emergence or worsening of depression, suicidal thoughts or behavior, and/or any unusual changes in mood or behavior. Valproic acid crosses the placenta and is distributed in breast milk. Children vounger than 2 yr are at increased risk for hepatotoxicity. Lower dosages are recommended for elderly patients, although no age-related precautions have been noted for this age group. Congenital malformations and reduced cognitive development have been associated with valproate exposure during pregnancy; administer to women of childbearing potential only if essential for seizure management.

Drowsiness and dizziness may occur, so alcohol and tasks requiring mental alertness or motor skills should be avoided. Notify the physician of abdominal pain, altered mental status, bleeding, easy bruising, lethargy, loss of appetite, nausea, vomiting, weakness, or yellowing of skin. Seizure disorder, including the onset, duration, frequency, intensity, and type of seizures, should be assessed before and during treatment. CBC and serum alkaline phosphatase, ammonia, bilirubin, AST (SGOT), and ALT (SGPT) levels should also be monitored. CBC and platelet count should be obtained before beginning valproic acid therapy, 2 wks later, and again 2 wks after the maintenance dose has been established.

#### Storage

Store oral dosage forms and injection vials at room temperature. Diluted infusions are stable for 24 h; discard unused portion.

#### Administration

Take oral valproic acid without regard to food. Do not take it with carbonated drinks. Sprinkle-cap contents may be sprinkled on semisolid food (e.g., applesauce, pudding) and given immediately; however, do not break, chew, or crush the sprinkle beads. Give delayed-release or extendedrelease tablets and capsules whole. Do not abruptly discontinue valproic acid after long-term use because this may precipitate seizure. Strict maintenance of drug therapy is essential for seizure control.

For IV use, dilute each single dose with at least 50 mL D5W, 0.9% NaCl, or lactated Ringer's solution. Infuse dose over 60 min and not to exceed 20 mg/min. Faster infusion rates of up to 15 mg/kg over 5-10 min (1.5-3 mg/kg/ min) have been used; however, the incidence of adverse events may be higher.

# Valrubicin

val-rue'bih-sin ★ Valstar ➡ Valtaxin Do not confuse valrubicin with valsartan.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

**Classification:** Antineoplastic, anthracyclines

# **MECHANISM OF ACTION**

An anthracycline that inhibits incorporation of nucleosides into nucleic acids. *Therapeutic Effect:* Causes chromosomal damage, arresting cells in the G<sub>2</sub> phase of cell division, and interfering with DNA synthesis.

# PHARMACOKINETICS

Due to intravesical administration, drug is concentrated in bladder wall; minimal absorption into circulation. Voided with urine.

# AVAILABILITY

*Concentrate Solution:* 40 mg/mL for intravesical instillation.

# INDICATIONS AND DOSAGES Bladder cancer

INTRAVESICAL Adults, Elderly. 800 mg once weekly for 6 wks.

# CONTRAINDICATIONS

Perforated bladder; sensitivity to valrubicin, anthracyclines, or polyoxyl castor oil; urinary tract infection.

# INTERACTIONS

Drug None known. Herbal None known.

#### Food

None known.

# DIAGNOSTIC TEST EFFECTS

None known.

## SIDE EFFECTS

Expected Red-colored urine.

# Frequent

Local intravesical reaction: Local bladder irritation, urinary frequency or urgency, dysuria, hematuria, bladder pain, cystitis, bladder spasms. Systemic: Abdominal pain, nausea, urinary tract infection.

#### Occasional

Local intravesical reaction: Nocturia, local burning, urethral pain, pelvic pain, gross hematuria.

Systemic: Diarrhea, vomiting, urine retention, microscopic hematuria, asthenia, headache, malaise, back pain, chest pain, dizziness, rash, anemia, fever, vasodilation.

### Rare

Systemic: Flatus, peripheral edema, hyperglycemia, pneumonia, myalgia.

## SERIOUS REACTIONS

Serious systemic toxicity if bladder wall is perforated.

# PRECAUTIONS & CONSIDERATIONS

Evaluate bladder status before administration; delay administration in patients with perforated bladder or compromised mucosal integrity. Avoid in patients with a small bladder capacity (i.e., those who cannot tolerate a 75-mL instillation) and use cautiously in patients with irritable bladder symptoms (e.g., neurogenic bladder) as an increased incidence of bladder spasm and spontaneous discharge of the intravesical instillate may occur. All patients of reproductive age should be advised to use an effective contraceptive method during the treatment period. Monitor for disease recurrence or progression by using cystoscopy, biopsy, and urine cytology every 3 mo.

#### Storage

Unopened vials should be stored under refrigeration in the carton; diluted solution is stable for 12 h at temperatures up to 77° F (25° C). Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs.

Use of gloves during dose preparation and administration is recommended; avoid skin contact. Prepare and store instillation solution in glass, polypropylene, or polyolefin containers. Non-DEHP-containing administration sets are recommended for administration. For each instillation, contents of four 200 mg/5 mL vials should be allowed to warm to room temperature. 20 mL should be withdrawn from the four vials and diluted with 55 mL NaCl 0.9% injection, providing 75 mL diluted valrubicin solution. The diluted solution should be instilled in the bladder slowly via gravity flow over several minutes. Drug should be retained in the bladder for 2 h before voiding. Clamping of the urinary catheter is not advised. At the end of 2 h, patients should void. Instillation solution is red; advise patients that red-tinged urine is typical for the first 24 h after administration.

## Valsartan

val-sar'tan Diovan Do not confuse valsartan with Valstan.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D if used in second or third trimester)

## Classification:

Antihypertensives, angiotensin II receptor antagonists

# **MECHANISM OF ACTION**

An angiotensin II receptor, type AT<sub>1</sub>, antagonist that blocks vasoconstrictor and aldosterone-secreting effects of angiotensin II, inhibiting the binding of angiotensin II to the AT<sub>1</sub> receptors. *Therapeutic Effect:* Causes vasodilation, decreases peripheral resistance, and decreases BP.

# PHARMACOKINETICS

Poorly absorbed after PO administration. Food decreases peak plasma concentration. Protein binding: 95%. Metabolized in the liver. Recovered primarily in feces and, to a lesser extent, in urine. Unknown whether removed by hemodialysis. *Half-life*: 6 h.

# AVAILABILITY

*Tablets:* 40 mg, 80 mg, 160 mg, 320 mg.

# INDICATIONS AND DOSAGES Hypertension PO

*Adults, Elderly.* Initially, 80-160 mg/ day in patients who are not volume depleted, up to a maximum of 320 mg/day.

*Children 6 to 16 yr.* Initially, 1.3 mg/ kg once daily (up to 40 mg/day). Adjust to clinical response. Doses

> 2.7 mg/kg (160 mg/day) PO have not been studied.

#### Congestive heart failure (CHF) PO

*Adults, Elderly.* Initially, 40 mg twice a day. May increase up to 160 mg twice a day. Maximum: 320 mg/day.

# Post-myocardial infarction (MI) PO

*Adults, Elderly.* May be initiated as early as 12 h after an MI. Initially 20 mg twice daily. Titrate to target dose of 160 mg twice daily, as tolerated.

Dosage in renal impairment

Not for use if CrCl < 30 mL/min.

# CONTRAINDICATIONS

Hypersensitivity to the drug.

# INTERACTIONS

#### Drug

**Cyclosporine, rifampin, ritonavir:** May increase valsartan systemic exposure.

**Diuretics:** Produces additive hypotensive effects.

Eplerenone, drospirenone, potassium-sparing diuretics, potassium supplements: Increased

serum potassium. Lithium: Elevated lithium

concentrations and risk of toxic effects. Herbal

None known.

## Food

Decreases peak plasma concentration of valsartan.

# DIAGNOSTIC TEST EFFECTS

May increase AST (SGOT), ALT (SGPT), and serum bilirubin, BUN, creatinine, and potassium levels. May decrease blood hemoglobin and hematocrit levels.

# SIDE EFFECTS

#### Common

Headache, dizziness, viral infection, fatigue, abdominal pain, azotemia.

Valsartan (Generic Name), Diovan (Brand Name)

## Less frequent (1%-2%)

Insomnia, heartburn, diarrhea, nausea, vomiting, arthralgia, edema, cough, increases in serum creatinine, hyperkalemia.

## SERIOUS REACTIONS

Overdosage may manifest as hypotension and tachycardia.
Bradycardia occurs less often.
Anaphylactoid reactions, angioedema (rare).

# **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with coronary artery disease, mild to moderate hepatic impairment, renal impairment, and renal artery stenosis and in those receiving potassiumsparing diuretics or potassium supplements. For those with severe CHF, signs and symptoms of impaired renal function, which may develop during valsartan therapy. should be monitored. It is unknown whether valsartan is distributed in breast milk: it may cause fetal harm. Women should avoid valsartan during the second and third trimester of pregnancy. Discontinue as soon as possible after pregnancy is detected. Safety and efficacy of valsartan have not been established in children under 6 yr. No age-related precautions have been noted in elderly patients.

Dizziness may occur. Tasks that require mental alertness or motor skills should be avoided. Notify the physician if fever or sore throat occurs. Apical pulse and BP should be assessed immediately before each valsartan dose and regularly throughout therapy. Be alert to fluctuations in apical pulse and BP. If an excessive reduction in BP occurs, place the person in the supine position with feet slightly elevated and notify the physician. Serum electrolyte levels, liver and renal function tests, urinalysis, and pulse rate should be assessed. Maintain adequate hydration; exercising outside during hot weather should be avoided to decrease the risk of dehydration and hypotension.

#### Storage

Store at room temperature, tightly closed. Protect from moisure. An oral suspension may be compounded and stored for 30 days at room temperature or 75 days refrigerated in a glass bottle.

#### Administration

Valsartan may be given concurrently with other antihypertensives.

Take valsartan without regard to meals.

For children, the manufacturer provides directions for supplying a compounded suspension. It is more bioavailable than the tablets, so dose adjustment may be needed. Shake well before each use.

#### Vancomycin

van-koe-mye'sin

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Antibiotics, glycopeptides

# **MECHANISM OF ACTION**

A tricyclic glycopeptide antibiotic that binds to bacterial cell walls, altering cell membrane permeability and inhibiting RNA synthesis. *Therapeutic Effect:* Bactericidal.

## PHARMACOKINETICS

PO: Poorly absorbed from the GI tract. Some patients with enterocolitis may absorb effectively. Orally administered drug is primarily eliminated in feces. Parenteral: Widely distributed. Protein binding: 55%. Primarily excreted unchanged in urine. Not removed by hemodialysis. *Half-life:* 4-11 h (increased in impaired renal function).

# AVAILABILITY

*Capsules:* 125 mg, 250 mg. *Powder for Injection:* 500 mg, 1 g, 5 g, 10 g. *Infusion (Premix):* 500 mg/100 mL, 1 g/200 mL.

# INDICATIONS AND DOSAGES

Treatment of bone, respiratory tract, skin, and soft-tissue infections, endocarditis, peritonitis, and septicemia; prevention of bacterial endocarditis in those at risk (if penicillin is contraindicated) when undergoing biliary, dental, GI, genitourinary, or respiratory surgery or invasive procedures IV

Adults, Elderly. 15-18 mg/kg or 1 g q12h.

Children older than 1 mo. 40 mg/kg/ day in divided doses q6-8h. Neonates. Initially, 10-15 mg/kg q8-12h.

#### Staphylococcal enterocolitis, antibiotic-associated pseudomembranous colitis caused by Clostridium difficile PO

NOTE: Oral vancomycin is not effective for systemic infection. *Adults, Elderly.* 125-500 mg q6h for 7-10 days for *Staphylococcus enterocolitis.* For *C.difficle*associated diarrhea: 125 mg 4 times daily for 10 days.

*Children.* 40 mg/kg/day in divided doses q6h for 7-10 days. Maximum: 2 g/day.

#### Dosage in renal impairment (intravenous theraphy)

After a loading dose, subsequent dosages and frequency are modified based on creatinine clearance, the severity of the infection, and the serum concentration of the drug.

# **OFF-LABEL USES**

Treatment of brain abscess, perioperative infections, staphylococcal or streptococcal meningitis.

# CONTRAINDICATIONS

Hypersensitivity.

# INTERACTIONS

### Drug

Aminoglycosides, amphotericin B, aspirin, bumetanide, carmustine, cisplatin, cyclosporine, ethacrynic acid, furosemide, streptozocin: May increase the risk of ototoxicity and nephrotoxicity of parenteral vancomycin.

# Cholestyramine, colestipol:

May decrease the effects of oral vancomycin.

Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum creatinine, BUN. Therapeutic peak serum level is 20-40 mcg/mL; therapeutic trough serum level is 10-20 mcg/mL. Toxic peak serum level is > 80 mcg/mL; toxic trough serum level is > 20 mcg/mL.

# IV INCOMPATIBILITIES

Albumin, amphotericin B complex (Abelcet, AmBisome, Amphotec), aztreonam (Azactam), cefazolin (Ancef), cefepime (Maxipime), cefotaxime (Claforan), cefotetan (Cefotan), cefoxitin (Mefoxin), ceftazidime (Fortaz), ceftriaxone (Rocephin), cefuroxime (Zinacef), foscarnet (Foscavir), heparin, idarubicin (Idamycin), nafcillin (Nafcil), piperacillin and tazobactam (Zosyn), propofol (Diprivan), ticarcillin and clavulanate (Timentin).

# **IV COMPATIBILITIES**

Amiodarone (Cordarone), calcium gluconate, diltiazem (Cardizem), hydromorphone (Dilaudid), insulin, lorazepam (Ativan), magnesium sulfate, midazolam (Versed), morphine, potassium chloride.

## SIDE EFFECTS

#### Frequent

PO: Bitter or unpleasant taste, nausea, vomiting, mouth irritation (with oral solution). Parental: Azotemia, mild increase serum creatinine, changes in potassium levels.

#### Rare

Parenteral: Phlebitis, thrombophlebitis, or pain at peripheral IV site; dizziness; vertigo; tinnitus; chills; fever; rash; necrosis with extravasation. PO: Rash.

## SERIOUS REACTIONS

 Nephrotoxicity and ototoxicity may occur.

 "Red man" syndrome (redness on face, neck, arms, and back; chills; fever; tachycardia; nausea or vomiting; pruritus; rash; unpleasant taste) may result from too-rapid infusion.

• Rare cases of thrombocytopenia and neutropenia with parenteral use.

• Hypersensitivity is rare, but may include serious skin reactions, like Stevens-Johnson syndrome.

### **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with preexisting hearing impairment or renal dysfunction and in those taking other ototoxic or nephrotoxic medications concurrently. Vancomvcin crosses the placenta; it is unknown whether it is distributed in breast milk. Close monitoring of serum drug levels is recommended in premature neonates and young infants. Age-related renal impairment may increase the risk of ototoxicity and nephrotoxicity in elderly patients. Dosage adjustment is recommended.

Notify the physician if rash, tinnitus, or signs and symptoms of nephrotoxicity occur. Laboratory tests are an important part of therapy. Assess skin for rash, intake and output, renal function, balance, and hearing acuity; assess IV site during vancomycin therapy.

#### Storage

Store capsules and unopened vials at room temperature. Once diluted for infusion, the infusions from the vials are stable for 7 days under refrigeration. Keep premix infusions frozen until time of thawing; once thawed, they are stable for 72 h at room temperature or up to 30 days refrigerated.

#### Administration

Oral capsules may be administered without regard to food; swallow whole.

I Give vancomycin by intermittent IV infusion (piggyback). Do not give by IV push, because this may result in exaggerated hypotension. For intermittent IV infusion (piggyback), reconstitute each 500-mg or 1-g vial with 10 mL or 20 mL, respectively, of sterile water for injection to provide a concentration of 50 mg/mL. Further dilute to a final concentration of no more than 5 mg/mL. Discard the solution if a precipitate forms. Administer the solution over 60 min or longer. Monitor the patient's BP closely during the infusion. Infusion rate of no more than 10-15 mg/ min is recommended in adults. If an infusion-rate related reaction occurs, even with recommended rates,

stopping, or slowing the infusion rates (i.e.,  $\leq 10$  mg/min), may reduce the severity of the reaction and allow for infusion completion.

# Vandetanib

van-deh'-pan-ib

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastics, signal transduction inhibitor.

# **MECHANISM OF ACTION**

An oral kinase inhibitor of angiogenesis. Inhibits the epidermal growth factor receptor (EGFR) family, vascular endothelial cell growth factor (VEGF) receptors, and several other tyrosine kinases. Vandetanib inhibits EGFR-dependent cell survival, receptor tyrosine kinase phosphorylation in tumor cells, and VEGF-stimulated tyrosine kinase phosphorylation in endothelial cells. The drug reduces tumor cell-induced angiogenesis, vessel permeability, growth and metastasis. *Therapeutic Effect:* Inhibits tumor growth.

# PHARMACOKINETICS

Slow oral absorption. Protein binding: 93.7%. Hepatic metabolism via CYP3A4 (2 metabolites formed). Fecal and urinary excretion. *Halflife:* 19 days (increased in renal impairment).

AVAILABILITY Tablet: 100 mg, 300 mg.

# INDICATIONS AND DOSAGES Medullary thyroid cancer

# PO

Adults, Elderly. 300 mg once daily.

## Dosage adjustment for toxicities

Expect to halt treatment temporarily to allow resolution of toxicity, including QT prolongation. When treatment resumed, expect lowered dosage. For example, a reduction to 200 mg once daily and then to 100 mg once daily if needed to address grade 3 or greater toxicities. See manufacturer literature for full recommendations.

## Dosage adjustment for renal impairment

Doses are adjusted based on creatinine clearance. CrCl < 50 mL/min: Give 200 mg once daily.

## Dosage adjustment for hepatic impairment

Child Pugh Class B or C: No data; do not use.

# CONTRAINDICATIONS

Hypersensitivity, congenital long QT syndrome.

# INTERACTIONS

#### Drug

CYP 3A4 inducers (e.g., rifampin and other rifamycins, dexamethasone, phenytoin, carbamazepine, phenobarbital) : May increase metabolism of vandetanib; Avoid. QT-prolonging medications such as, but not limited to, Class 1a or III antiarrhythmics (e.g., amiodarone, sotalol, dofetilide) or other drugs (e.g., cisapride, cloroquine, clarithromycin, dolasetron, granisetron, haloperidol, methadone, moxifloxacin, and pimozide): Additive effect on OT interval; Avoid. Herbal

St. John's wort: Do not use with vandetanib as it will decrease efficacy. Food

None known.

## DIAGNOSTIC TEST EFFECTS

Decreased serum calcium, increased ALT, and decreased blood glucose are most common. ECG changes.

### SIDE EFFECTS

#### Frequent (>15%)

Diarrhea, rash, acne, nausea, hypertension, headache, fatigue, decreased appetite and abdominal pain. Hypothyroidism may worsen and need more replacement hormone.

# Occasional (10% to 15%)

QT-interval prolongation with ECG changes, dry skin, vomiting, asthenia, photosensitivity, insomnia, nasopharyngitis, dyspepsia, hypocalcemia, cough, pruritus.

## Infrequent (< 10%)

Depression, proteinuria, weight loss, hypokalemia and other electrolyte disturbances, bleeding.

## SERIOUS REACTIONS

· Serious hypersensitivity reactions may include Stevens Johnson Syndrome, exfoliative rashes, angioedema.

 QT prolongation or arrhythmia, including torsades de pointes, heart failure.

 Interstitial lung disease – may be severe.

- Ischemic cerebrovascular events.
- · Serious bleeding (CNS,

gastrointestinal, hemoptysis, etc.) or GI perforations.

- · Delayed wound healing.
- Reversible posterior

leukoencephalopathy syndrome (RPLS).

### PRECAUTIONS & CONSIDERATIONS

Due to the cardiac risks, vandetanib is available only through a restricted distribution program. Only prescribers and pharmacies certified with the Caprelsa program are able to prescribe and dispense

the drug. Avoid use in patients with risks for QT prolongation or who are receiving QT-prolonging medications, or in patients with uncorrected hypomagnesemia or hypokalemia. The half-life of the drug is long, so if QT prolongation occurs it may take days to resolve. Use with caution in patients with high blood pressure, cardiac disease, heart failure or arrhythmia, a history of stroke, GI disease with GI bleeding in the past 6 months or a history of GI perforation or fistula, had recent surgery or are scheduled for surgery. There are no data in patients with moderate or severe hepatic dysfunction. Vandetanib may cause bleeding; do not administer to patients with recent history of hemoptysis of > 1/2 tsp of red blood. Do not use in patients who are pregnant or planning to become pregnant; the drug can cause fetal harm. Patients of childbearing potential must use effective contraception during and for at least 4 months following their last dose of treatment. It is not known if vandetanib passes into breast milk but animal data indicate transfer; do not breastfeed while taking this medication. This drug has not been approved for use in children.

Monitor ECG and electrolyte levels (serum potassium, calcium, magnesium) and thyroid function (TSH) at baseline, 2-4 wks and 8-12 wks after starting treatment, and q3mos thereafter and following dose adjustments. Assess stool consistency for increased diarrhea, look for signs or symptoms of breathing problems, bleeding, increased blood pressure, or irregular pulse. Patients should use care in sunlight, use sunscreens, protective clothing, and avoid UV exposure due to photosensitivity; due to the

long half-life of the drug, patients must follow these UV precautions for 4 months following the last dose of treatment. Have patients report headaches with confusion, seizures or other troublesome neurologic symptoms promptly. Halt therapy and investigate any unexplained dyspnea appearing with cough and fever.

#### Storage

Store tablets at room temperature. Administration

CAUTION: Observe usual practices for handling of chemotherapy agents. Direct contact of crushed tablets with the skin or mucous membranes should be avoided. If such contact occurs, wash thoroughly. Avoid exposure to crushed tablets. Vandetanib may be taken with or without food. Do not crush tablets. If they cannot be taken whole, the tablets can be dispersed in 60 mL of non-carbonated water and stirred for approximately 10 min until dispersed (will not completely dissolve). No other liquids should be used. Swallow immediately. To ensure the full dose is received, any residues should be mixed again with an additional 4 ounces (120 mL) of non-carbonated water and swallowed. The dispersed liquid can be administered through nasogastric or gastrostomy tubes.

# Vardenafil

van-den'a-fil Levitra, Staxyn Do not confuse Levitra with Lexiva.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: B

*Classification:* Impotence agents, phosphodiesterase inhibitors

# **MECHANISM OF ACTION**

An erectile dysfunction agent that inhibits phosphodiesterase type 5, the enzyme responsible for degrading cyclic guanosine monophosphate in the corpus cavernosum of the penis, resulting in smooth muscle relaxation and increased blood flow. *Therapeutic Effect:* Facilitates an erection.

# PHARMACOKINETICS

Rapidly absorbed after PO administration. Extensive tissue distribution. Protein binding: 95%. Metabolized in the liver. Excreted primarily in feces; a lesser amount eliminated in urine. Drug has no effect on penile blood flow without sexual stimulation. *Half-life:* 4-5 h.

# AVAILABILITY

Tablets: 2.5 mg, 5 mg, 10 mg, 20 mg. Orally Disintegrating Tablets (Staxyn): 10 mg.

# INDICATIONS AND DOSAGES • Erectile dysfunction

PO (LEVITRA)

Adults. 10 mg approximately 1 h before sexual activity. Dose may be increased to 20 mg or decreased to 5 mg, based on patient tolerance. Maximum dosing frequency is once daily.

*Elderly (older than 65 yr).* 5 mg. PO (STAXYN)

NOTE: Staxyn is not interchangeable with Levitra.

*Adults.* 10 mg approximately 1 h before sexual activity. Maximum dose frequency is once daily. If lower dose is needed, choose a different product.

# Dosage in moderate hepatic impairment

For patients with Child-Pugh class B hepatic impairment, dosage is 5 mg 60 min before sexual activity.

Dosage with concurrent ritonavir PO

Vardenafil (Generic Name), Levitra (Brand Name)

## Adults. 2.5 mg in a 72-h period.

 Dosage with concurrent ketoconazole or itraconazole (at 400 mg/day), indinavir, atazanavir, saquinavir, clarithromycin, ketoconazole, or itraconazole (400 mg/day)

## PO

Adults. 2.5 mg in a 24-h period.

# Dosage with concurrent ketoconazole or itraconazole (at 200 mg/day) or erythromycin

Adults. 5 mg in a 24-h period.

 Stable α-adrenergic blocker therapy

PO Adults. 5-mg in a 24-h period.

# **OFF-LABEL USES**

Raynaud's phenomenon.

## CONTRAINDICATIONS

Concurrent use of sodium nitroprusside, or nitrates in any form.

# INTERACTIONS

#### Drug

**α-Adrenergic blockers, nitrates:** Potentiates the hypotensive effects of these drugs. Use of vardenafil with nitrates is contraindicated.

# Erythromycin, indinavir,

itraconazole, ketoconazole, ritonavir: May increase vardenafil blood concentration.

## Herbal

None known.

## Food

**High-fat meals:** Delay drug's maximum effectiveness.

# DIAGNOSTIC TEST EFFECTS

None known.

# SIDE EFFECTS

#### Occasional

Headache, flushing, rhinitis, indigestion, nausea, sinusitis.

## Rare (< 2%)

Dizziness, changes in color vision, blurred vision.

## SERIOUS REACTIONS

• Prolonged erections (lasting over 4 h) and priapism (painful erections lasting > 6 h) occur rarely.

• Hypotension.

• Vision or hearing loss with dose-related impairment of color discrimination.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with an anatomic deformity of the penis; cardiac, hepatic, or renal impairment; and conditions that increase the risk of priapism, including leukemia, multiple myeloma, and sickle cell anemia. No age-related precautions have been noted in elderly patients, but their initial dose should be 5 mg. The drug currently has no indications in females or children. Be aware that vardenafil is not effective without sexual stimulation. Seek treatment immediately if an erection lasts longer than 4 h.

#### Storage

Store at room temperature. ODT form should remain in original blister pack until just prior to use. Protect from moisture.

## Administration

Take vardenafil approximately 1 h before sexual activity. Do not crush or break film-coated tablets. High-fat meals delay the drug's maximum effectiveness.

Do not remove ODT from packaging until immediately before use. Place the ODT form (Staxyn) on the tongue, where it will disintegrate. Take without liquid. May be taken with or without food.

# Varenicline

var-en'i-kleen ★ Chantix ◆ Champix

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

Classification: Smoking deterrent

# **MECHANISM OF ACTION**

Selectively binds  $\alpha_4\beta_2$  neuronal nicotinic acetylcholine receptors; possesses agonist activity at lower level than nicotine while blocking nicotine binding to receptors, thus blocking ability of nicotine to stimulate central nervous mesolimbic dopamine system. *Therapeutic Effect*. Acts as deterrent to smoking; aids in smoking cessation.

# PHARMACOKINETICS

Extensively absorbed, peak concentration within 3-4 h of oral administration. Minimal metabolism; 92% excreted unchanged in the urine. Removed by hemodialysis. *Half-life:* 24 h (increased in renal impairment).

# AVAILABILITY

Tablets: 0.5 mg, 1 mg.

# INDICATIONS AND DOSAGES Smoking cessation aid

PO

Adults, Elderly: Days 1-3: 0.5 mg once daily; days 4-7: 0.5 mg twice daily; day 8-end of treatment: 1 mg twice daily. Administer for 12 wks; additional 12 wks may increase likelihood of long-term abstinence. If patient has considerable nausea with recommended doses, consider reduction.

Dosage in renal impairment CrCl < 30 mL/min. Titrate from 0.5 mg once daily to maximum dose of 0.5 mg twice daily. *End-stage renal disease.* Maximum dose 0.5 mg once daily.

# CONTRAINDICATIONS

History of serious hypersensitivity reactions or skin reactions to the drug.

# INTERACTIONS

### Drug

NOTE: Physiological changes resulting from smoking cessation (regardless of treatment) may alter the levels or response to certain drugs (e.g., theophylline, warfarin, insulin) for which dosage adjustment may be necessary.

Nicotine replacement: When used with nicotine, the incidence of nausea, headache, vomiting, dizziness, dyspepsia, and fatigue was greater for the combination than for using nicotine alone.

**Cimetidine:** Increases varenicline blood concentration.

Herbal None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

Abnormal liver function test results reported.

# SIDE EFFECTS

#### Frequent (> 10%)

Nausea, insomnia, headache, abnormal dreams. Effects are usually transient and attenuate after titration.

#### Occasional (5%-10%)

Constipation, flatulence, vomiting.

# SERIOUS REACTIONS

• Depressed mood, suicidal ideation, suicidal behavior.

 Serious hypersensitivity, angioedema, and serious skin rashes.

Varenicline (Generic Name), Chantix (Brand Name)

• Risk of serious cardiovascular events such as nonfatal MI and stroke may be increased.

#### PRECAUTIONS & CONSIDERATIONS

All patients should be monitored for neuropsychiatric symptoms, such as changes in behavior, agitation, depressed mood, suicidal ideation, and suicidal behavior, and worsening of preexisting psychiatric illness; varenicline therapy should be discontinued in the presence of such symptoms. The risks of varenicline should be weighed against the benefits in smokers with preexisting cardiovascular disease. Smoking is an independent and major risk factor for cardiovascular disease. Caution is warranted in patients with renal impairment. Varenicline has not been studied in pregnant women. May be excreted in human milk; use in nursing mothers is not recommended. While some pharmacokinetic studies have been performed in children 12 yr and older, no data are available regarding clinical use.

In some cases, the patients reported somnolence, dizziness, loss of consciousness, or difficulty concentrating that resulted in impairment, or concern about potential impairment, in driving or operating machinery. Use caution driving or operating machinery until the effects of the drug are known. Nicotine withdrawal symptoms may still occur.

Inform patient that the benefits of smoking cessation on health are immediate and substantial. Have patient or caregiver promptly report any unusual changes in mood or behaviors. Watch for development of skin rash or cardiac changes. If troublesome nausea continues, it may respond to dose reduction.

#### Storage

Store at room temperature. Administration

Start varenicline 1 wk before date set to stop smoking. Alternatively, the patient can begin the drug, and then quit smoking between days 8 and 35 treatment. Take after eating with a full glass of water.

#### Vasopressin

vay-soe-press'in Pitressin Pressyn Do not confuse Pitressin with Pitocin.

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

*Classification:* Hormones/ hormone modifiers, pituitary hormones, antidiuretic hormone (ADH)

#### MECHANISM OF ACTION

A posterior pituitary hormone that increases reabsorption of water by the renal tubules. Increases water permeability at the distal tubule and collecting duct. Directly stimulates smooth muscle in the GI tract. *Therapeutic Effect:* Promotes water retention and restoration of sodium/water balance; increases peripheral vascular resistance to restore BP; causes peristalsis of the GI tract; and vasoconstricts vascular bed, especially the capillaries, small arterioles, and venules.

## PHARMACOKINETICS

Route	Onset	Peak	Duration
IV	NA	NA	0.5-1 h
IM/SC	1-2 h	NA	2-8 h

# 1656 Vasopressin

Distributed throughout extracellular fluid. Metabolized and rapidly destroyed in the liver and kidneys. Roughly 5% excreted in urine unchanged. *Half-life*: 10-20 min.

# AVAILABILITY

Injection: 20 units/mL.

# INDICATIONS AND DOSAGES Cardiac arrest

Cardiac arre

IV *Adults, Elderly.* 40 units as a one-time bolus.

# Diabetes insipidus

IV INFUSION

*Adults, Children.* 0.5 milliunits/ kg/h. May double dose q30min. Maximum: 10 milliunits/kg/h.

#### IM, SC

*Adults, Elderly.* 5-10 units 2-4 times a day. Range: 5-60 units/day. *Children.* 2.5-10 units, 2-4 times a day.

### Abdominal distention, postoperative

IM, SC *Adults, Elderly.* Initially, 5 units. Subsequent doses, 10 units q3-4h.

## GI hemorrhage

IV INFUSION *Adults, Elderly.* Initially, 0.2-0.4 unit/min may titrate to maximum of 0.8 unit/min. *Children.* 0.002-0.005 unit/kg/min. Titrate as needed. Maximum:

## 0.01 unit/kg/min.

Vasodilatory shock

IV INFUSION *Adults, Elderly.* Initially, 0.01-0.04 units/min. Titrate to desired effect.

# **OFF-LABEL USES**

Treatment of esophageal variceal bleeding or GI hemorrhage due to ulceration; vasodilatory/cardiogenic shock.

# CONTRAINDICATIONS

Hypersensitivity.

# INTERACTIONS

## Drug

Alcohol, demeclocycline, lithium, norepinephrine: May decrease the effects of vasopressin.

**Carbamazepine, chlorpropamide, clofibrate:** May increase the effects of vasopressin.

Tricyclic antidepressants: May increase the effects of vasopressin; concurrent use not recommended.

# Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

None known.

# IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), diazepam (Valium), etomidate (Amidate), furosemide (Lasix), regular insulin, phenytoin, thiopentothal.

# **IV COMPATIBILITIES**

Dobutamine (Dobutrex), dopamine (Intropin), heparin, lorazepam (Ativan), midazolam (Versed), milrinone (Primacor), verapamil (Calan, Isoptin).

# SIDE EFFECTS

## Frequent

Pain at injection site (with vasopressin tannate).

# Occasional

Abdominal cramps, nausea, vomiting, diarrhea, dizziness, diaphoresis, pale skin, circumoral pallor, tremors, headache, eructation, flatulence. **Rare** 

Chest pain; confusion; allergic reaction, including rash or hives, pruritus, wheezing or difficulty breathing, facial and peripheral edema; sterile abscess (with vasopressin tannate).

### SERIOUS REACTIONS

· Anaphylaxis, MI, have occurred.

 Water intoxication may be treated with water restriction and discontinuing vasopressin until polyuria occurs. Severe symptoms may require osmotic diuresis or loop diuretics.

• IV infiltration can cause vasoconstriction, localized tissue necrosis.

• Rarely associated with gangrene, ischemic colitis.

## PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with arteriosclerosis, asthma, cardiac disease, goiter with cardiac complications, migraine, nephritis, renal disease, seizures, and vascular disease. Vasopressin should be used cautiously in breastfeeding women. Vasopressin should be used cautiously in children and in elderly patients because of the risk of water intoxication and hyponatremia in these age groups.

Notify the physician of chest pain, headache, shortness of breath, or other symptoms. BP, serum electrolyte levels, pulse rate, urine specific gravity, intake and output, and weight should be monitored before and during therapy. Be alert for early signs of water intoxication, such as somnolence, headache, and listlessness.

#### Storage

Store at room temperature. IV infusions generally stable for 24 h at room temperature. Discard any unused solution.

## Administration

For diabetes insipidus, may give intranasally on cotton pledgets

or by nasal spray; individualize dosage.

For IV use, dilute with D5W or 0.9% NaCl to concentration of 0.1-1 unit/mL. Give as IV infusion.

For resuscitation only, may give by bolus IV injection into a peripheral vein, followed by an injection of 20 mL IV fluid. Elevate the extremity to facilitate drug delivery to the central circulation.

For IM or SC, give with 1-2 glasses of water to reduce side effects.

# Vemurafenib

vem'-ue-raf'-e-nib

#### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification**: Antineoplastics, signal transduction inhibitor.

## **MECHANISM OF ACTION**

A kinase inhibitor of some mutated forms of BRAF serine-threonine kinase, including BRAF V600E. Vemurafenib also inhibits other kinases *in vitro* such as CRAF, ARAF, wild-type BRAF, SRMS, ACK1, MAP4K5, and FGR. *Therapeutic Effect:* Inhibits tumor growth in melanomas expressing BRAF V600E.

## PHARMACOKINETICS

Exact bioavailability has not been determined. Protein binding > 99%. The drug is a moderate CYP1A2 inhibitor, a weak CYP2D6 inhibitor, and a CYP3A4 inducer; it also may inhibit CYP2C9. Vemurafenib is both a substrate and inhibitor

of P-glycoprotein (Pgp) and a CYP3A4 substrate. Vemurafenib and metabolites are primarily excreted in the feces (94%); only about 1% excreted in urine. *Half-life:* mean 57 h.

# AVAILABILITY

Tables, film-coated: 240 mg.

#### INDICATIONS AND DOSAGES Metastatic melanoma with V600E mutations of BRAF PO

Adults, Elderly. 960 mg twice daily. **> Dosage adjustment for toxicities** Expect to halt treatment temporarily to allow resolution of certain types of toxicity. When treatment resumed, expect lowered dosage. Dose reductions to a dose < 480 mg twice daily are not recommended. See manufacturer literature for full recommendations.

# CONTRAINDICATIONS

Serious hypersensitivity.

# INTERACTIONS

Drug

Drugs that are substrates of CYP1A2 or CYP2D6 and have narrow therapeutic windows:

Use is not recommended. If co-use cannot be avoided, exercise caution and consider a dose reduction of the CYP1A2 (caffeine, theophylline) or CYP2D6 (e.g., dextromethorphan) substrate drug.

Drugs that are substrates of CYP3A4 that have narrow therapeutic windows (e.g., midazolam): Use is not recommended. If co-use cannot be avoided, exercise caution. Vemurafenib induces metabolism. QT-prolonging medications such as, but not limited to, Class 1a or III antiarrhythmics (e.g., amiodarone, sotalol, dofetilide) or other drugs (e.g., cisapride, cloroquine, clarithromycin, dolasetron, granisetron, haloperidol, methadone, moxifloxacin, and pimozide): Additive effect on OT interval; use caution. Strong CYP3A4 inducers (e.g., rifampin and other rifamycins, dexamethasone, phenytoin, carbamazepine, phenobarbital): May increase metabolism of vemurafenib; use with caution. Strong inhibitors of CYP3A4 inducers (e.g., ketoconazole, itraconazole, clarithromycin, nefazodone, telithromycin, ritonavir and other protease inhibitors for HIV infection, voriconazole): May decrease metabolism of vemurafenib; use with caution.

Warfarin: May decrease warfarin metabolism and thus increase INR. Use caution and monitor INR closely. Herbal

**St. John's wort:** Do not use with vemurafenib as may decrease efficacy. **Food** 

**Caffeine:** Vemurafenib may decrease metabolism, increasing caffeine-related side effects.

# DIAGNOSTIC TEST EFFECTS

Increased serum creatinine, alkaline phosphatase, or elevated hepatic enzymes, bilirubin (total) increased.

# SIDE EFFECTS

**Frequent (> 30%)** 

Arthralgia, rash, alopecia, fatigue, photosensitivity reaction, nausea, pruritus and skin papilloma. Occasional (10% to 29%)

Erythema, pain in extremity, peripheral edema, pyrexia, constipation, dysgeusia, seborrheic keratosis, sunburn.

### Infrequent (< 10%)

Dry skin, maculopapular rash, musculoskeletal or back pain, cough. Rare

Palpitations, hand-foot erythrodysaesthesia syndrome, neuropathy, visual disturbances, ocular swelling, vasculitis, atrial fibrillation.

## SERIOUS REACTIONS

 Squamous cell carcinomas (24%) or new malignant melanomas may occur.
 Serious hypersensitivity reactions and dermatologic reaction, including anaphylaxis, Stevens-Johnson syndrome, and toxic epidermal necrolysis, have been reported.

• QT prolongation or arrhythmia, including torsades de pointes.

• Elevated hepatic enzymes or liver dysfunction, jaundice.

• Serious ophthalmologic reactions, including uveitis, iritis and retinal vein occlusion.

• Poor wound healing has been reported with related agents.

## **PRECAUTIONS & CONSIDERATIONS**

There are limited data in patients with severe hepatic or renal dysfunction. Use with caution in patients with preexisting cardiac disease or potential risk factors for QT prolongation. Treatment is not recommended in patients with uncorrectable electrolyte abnormalities (hypomagnesemia, hypokalemia), long QT syndrome, or who are taking medicinal products known to prolong the QT interval. Use with caution in patients who need surgery. Do not use vemurafenib in patients who are pregnant or planning to become pregnant: the drug can cause fetal harm. Males and females taking vemurafenib should use adequate contraception during and for 2 months following the last dose of treatment. Do not breastfeed while

taking this medication. This drug has not been approved for use in children. Elderly patients may be more sensitive to developing other skin cancers and side effects from the drug. At a minimum, perform complete skin exam every 6 mos. Monitor liver function tests (LFTs) at baseline and as needed during treatment. Monitor ECG and electrolytes before treatment and after dose modification. Monitor ECGs at day 15, monthly for the first 3 mos of treatment, every 3 mos thereafter, or more often if indicated. Assess for signs or symptoms of breathing problems, skin rash, neuropathy, or irregular pulse. Patients should use care in sunlight, use sunscreens, protective clothing, and avoid UV exposure. Have patients report any visual difficulties promptly. Routine eve exams are recommended. Storage

# Store tablets at room temperature. Administration

CAUTION: Observe usual practices for handling of chemotherapy agents. Avoid exposure to crushed tablets. If such contact occurs, wash thoroughly.

Take vemurafenib with or without a meal. Swallow whole with a glass of water. Do not chew or crush tablets. Doses should be spaced evenly about 12 h apart.

# Venlafaxine

ven-la-fax'een Effexor, Effexor XR

**CATEGORY AND SCHEDULE** 

Pregnancy Risk Category: C

**Classification:** Antidepressants, serotonin and norepinephrine reuptake inhibitors

Venlafaxine (Generic Name)

# **MECHANISM OF ACTION**

A phenethylamine derivative that potentiates central nervous system (CNS) neurotransmitter activity by inhibiting the reuptake of serotonin, norepinephrine, and, to a lesser degree, dopamine. *Therapeutic Effect:* Relieves depression and anxiety.

# PHARMACOKINETICS

Well absorbed from the GI tract. Protein binding: 25%-30%. Metabolized in the liver to active metabolite. Excreted primarily in urine. Not removed by hemodialysis. *Half-life:* 3-7 h; metabolite, 9-13 h (increased in hepatic or renal impairment).

# AVAILABILITY

Capsules (Extended Release [Effexor XR]): 37.5 mg, 75 mg, 150 mg. Tablets (Effexor): 25 mg, 37.5 mg, 50 mg, 75 mg, 100 mg.

# INDICATIONS AND DOSAGES Depression

## PO

Adults, Elderly. Initially, 75 mg/day in 2-3 divided doses with food. May increase by 75 mg/day at intervals of 4 days or longer. Maximum: 375 mg/ day in 3 divided doses.

PO (EXTENDED RELEASE) Adults, Elderly. 75 mg/day as a single dose with food. May increase by 75 mg/day at intervals of 4 days or longer. Maximum: 225 mg/day.

Anxiety disorder, panic disorder PO (EXTENDED RELEASE) Adults. Initially, 37.5-75 mg/day. Dosage may be increased by 75 mg/ day at intervals ≥ 4 days. Maximum: 225 mg/day.

## Dosage in renal and hepatic impairment

Expect to decrease venlafaxine dosage by 50% in patients with moderate hepatic impairment, 25% in patients with mild to moderate renal impairment, and 50% in patients on dialysis (withhold dose until completion of dialysis).

# **OFF-LABEL USES**

Diabetic neuropathy and other neuropathic pain, premenstrual dysphoric disorder (PMDD), hot flashes, fibromyalgia.

# CONTRAINDICATIONS

Hypersensitivity; use within 14 days of MAOIs. Do not use with linezolid (Zyvox) or IV methylene blue due to risk of serotonin syndrome.

### INTERACTIONS Drug

MAOIs, serotonergic agents, linezolid, SSRIs, triptans: May cause neuroleptic malignant syndrome, autonomic instability (including rapid fluctuations of vital signs), extreme agitation, hyperthermia, mental status changes, myoclonus, rigidity, and coma. MAOI use contraindicated. Allow at least 14 days to elapse before switching from an MAOI to venlafaxine and at least 7 days switching venlafaxine to an MAOI. Do not give with desvenlafaxine or other SNRIs. Thioridazine: Use contraindicated. Venlafaxine raises serum

concentrations of thioridazine via inhibition of CYP2D6.

## Herbal

St. John's wort: May increase risk of serotonin syndrome. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase BUN level and serum alkaline phosphatase, bilirubin, cholesterol, uric acid, AST (SGOT), and ALT (SGPT) levels. May decrease serum phosphate and sodium levels. May alter blood glucose and serum potassium levels.

## SIDE EFFECTS

### Frequent (> 20%)

Nausea, somnolence, headache, dry mouth.

#### **Occasional (10%-20%)**

Dizziness, insomnia, constipation, diaphoresis, nervousness, asthenia, ejaculatory disturbance, anorexia, orgasm dysfunction.

#### Rare (< 10%)

Anxiety, blurred vision, diarrhea, vomiting, tremor, abnormal dreams, impotence, weight loss.

## SERIOUS REACTIONS

• A sustained increase in diastolic BP of 10-15 mm Hg occurs occasionally.

Serotonin syndrome.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with suicidal tendencies and those with abnormal platelet function, congestive heart failure, volume depletion, hyperthyroidism, mania, angle-closure glaucoma, hepatic and renal impairment, and seizure disorder. Notify the physician if pregnant or planning to become pregnant. Complications have been observed in neonates exposed to venlafaxine in the third trimester; consider tapering in the third trimester. It is unknown whether venlafaxine is excreted in breast milk. The safety and efficacy of venlafaxine have not been established in children. Antidepressants have been reported to increase the risk of suicidal thinking and behavior in children, adolescents, and young adults (18-24 yr of age) with major depressive disorder (MDD) and other psychiatric disorders. No age-related precautions have been noted in elderly patients.

Drowsiness, dizziness, and lightheadedness may occur, so avoid alcohol and tasks that require mental alertness or motor skills. Monitor for clinical worsening, suicidality, and unusual changes in behavior. BP, pulse rate, and weight should be assessed during therapy.

#### Storage

Store at room temperature. Administration

! When discontinuing venlafaxine, plan to taper the dosage slowly over 2 wks.

Take venlafaxine with food or milk if the patient experiences GI distress. Crush scored tablets if needed. Extended-release (ER) capsules and tablets should be administered with food at approximately the same time each day. Swallow whole with fluid and do not divide, crush, chew, or place in water. If needed, the ER capsules may be carefully opened and contents sprinkled on a spoonful of applesauce. Swallow immediately without chewing, and follow with a glass of water.

# Verapamil

ver-ap'a-mill Calan, Calan SR, Covera-HS, Isoptin SR, Verelan, Verelan PM Apo-Verap, Apo-Verap SR, Isoptin, Isoptin SR, Nu-Verap, Nu-Verap SR Do not confuse Isoptin with Intropin, or Verelan with Virilon, Vivarin, or Voltaren.

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antiarrhythmics, class IV, calcium channel blockers

### MECHANISM OF ACTION

A calcium channel blocker and antianginal, antiarrhythmic, and

Verapamil (Generic Name)

antihypertensive agent that inhibits calcium ion entry across cardiac and vascular smooth-muscle cell membranes. This action causes the dilation of coronary arteries, peripheral arteries, and arterioles. *Therapeutic Effect:* Decreases heart rate and myocardial contractility and slows SA and AV conduction. Decreases total peripheral vascular resistance by vasodilation.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
P0	30 min	1-2 h	6-8 h
PO (extended release)	30 min	NA	NA
IV	1-2 min	3-5 min	10-60 min

Well absorbed from the GI tract. Protein binding: 90% (60% in neonates). Undergoes first-pass metabolism in the liver to active metabolite. Primarily excreted in urine. Not removed by hemodialysis. *Half-life:* 2-8 h.

# AVAILABILITY

Capsules (Modified Release [Verelan PM]): 100 mg, 200 mg, 300 mg. Capsules (Extended Release [Verelan]): 120 mg, 180 mg, 240 mg, 360 mg. Tablets (Calan): 40 mg, 80 mg, 120 mg. Tablets (Sustained Release [Calan SR, Isoptin SR]): 120 mg, 180 mg, 240 mg. Tablets (Modified Release [Covera-HS]): 180 mg, 240 mg. Injection: 2.5 mg/mL.

# **INDICATIONS AND DOSAGES**

 Supraventricular tachyarrhythmias, temporary control of rapid ventricular rate with atrial fibrillation or flutter IV Adults, Elderly. Initially, 5-10 mg; repeat in 30 min with 10-mg dose. *Children 1-15 yr*. 0.1 mg/kg (up to 5-mg maximum single dose). May repeat in 30 min up to a maximum second dose of 10 mg. Not recommended in children younger than 1 yr.

Arrhythmias, including prevention of recurrent paroxysmal supraventricular tachycardia and control of ventricular resting rate in chronic atrial fibrillation or flutter

PO

Adults, Elderly. 240-480 mg/day in 3-4 divided doses.

 Vasospastic angina (Prinzmetal variant), unstable (crescendo or preinfarction) angina, chronic stable (effort-associated) angina PO

*Adults.* Initially, 80-120 mg 3 times a day. For elderly patients and those with hepatic dysfunction, 40 mg 3 times a day. Titrate to optimal dose. Maintenance: 240-480 mg/day in 3-4 divided doses.

PO (COVERA-HS)

Adults, Elderly. 180-480 mg/day at bedtime.

#### Hypertension PO

Adults, Elderly. Initially, 40-80 mg 3 Adults, Elderly. Initially, 40-80 mg 3 less a day, in divided doses. PO (SUSTAINED RELEASE) Adults, Elderly. Initially, 120 or 180 mg PO once daily in the morning. May increase to 240 mg PO twice per day. PO (COVERA-HS) Adults, Elderly. 180-480 mg/day at bedtime. PO (EXTENDED RELEASE) Adults, Elderly. 120, 240 mg/day

Adults, Elderly. 120-240 mg/day. Usually given once per day in morning. Maximum: 480 mg/day. PO (VERELAN PM) *Adults, Elderly.* Initially, 200 mg/day at bedtime. Dosage may be increased by 100 mg/day up to 400 mg/day.

Dosage in hepatic impairment

Verapamil clearance is reduced. Where possible (based on the dosage form/strength), reduce initial verapamil oral dosage. Titrate based on clinical goals.

# **OFF-LABEL USES**

Treatment of hypertrophic cardiomyopathy, vascular headaches.

## CONTRAINDICATIONS

Atrial fibrillation or flutter and an accessory bypass tract, cardiogenic shock, heart block, sinus bradycardia, ventricular tachycardia; hypersensitivity.

## INTERACTIONS

#### Drug

Amiodarone: Monitor closely for cardiotoxicity with bradycardia and decreased cardiac output. **β-Blockers:** May have additive

effect.

**Colchicine:** May increase risk of colchicine toxicity.

**Cyclosporine:** May increase cyclosporine concentration.

**Digoxin:** May increase digoxin blood concentration.

**Disopyramide:** May increase negative inotropic effect.

**Dofetilide:** Use contraindicated; significantly increases dofetilide concentrations.

**Eletriptan:** Increases eletriptan concentrations; do not use within 72 h of verapamil.

**Procainamide, quinidine:** May increase risk of QT-interval prolongation. Verapamil raises quinidine concentrations.

Statins (atorvastatin, lovastatin, simvastatin): Statin levels may be increased.

Strong inhibitors of CYP3A4 isoenzymes (erythromycin, clarithromycin, fluconazole, itraconazole, ketoconazole, metronidazole): Increase concentrations of verapamil. Herbal None known.

#### Food

**Alcohol:** Verapamil inhibits ethanol elimination and may prolong the intoxicating effects.

**Grapefruit, grapefruit juice:** May increase verapamil blood concentration.

# **DIAGNOSTIC TEST EFFECTS**

ECG waveform may show increased PR interval.

# IV INCOMPATIBILITIES

Amphotericin B complex (Abelcet, AmBisome, Amphotec), albumin, ceftazidime (Fortaz), diazepam, ertapenem (Invanz), furosemide, hydralazine, lansoprazole (Prevacid IV), nafcillin (Nafcil), pantoprazole (Protonix), phenobarbital, phenytoin, piperacillin-tazobactam (Zosyn), propofol (Diprivan), sodium bicarbonote, sodium lactate injection, sulfamethoxazole-trimethoprim, tigecycline (Tygacil).

# **IV COMPATIBILITIES**

Amiodarone (Cordarone), calcium chloride, calcium gluconate, dexamethasone (Decadron), digoxin (Lanoxin), dobutamine (Dobutrex), dopamine (Intropin), heparin, hydromorphone (Dilaudid), lidocaine, magnesium sulfate, metoclopramide (Reglan), milrinone (Primacor), morphine, multivitamins, nitroglycerin, norepinephrine (Levophed), potassium chloride, potassium phosphate, procainamide (Pronestyl), propranolol (Inderal).
#### SIDE EFFECTS

Frequent (7%) Constipation. Occasional (2%-4%)

Dizziness, light-headedness, headache, asthenia, nausea, peripheral edema, hypotension, gingival hyperplasia. Rare (< 1%) Bradycardia, dermatitis or rash.

#### SERIOUS REACTIONS

 Rapid ventricular rate in atrial flutter or fibrillation, marked hypotension, extreme bradycardia, congestive heart failure (CHF), asystole, and second- and thirddegree AV block occur rarely.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with CHF, hepatic or renal impairment, and sick sinus syndrome and in those concurrently receiving  $\beta$ -blockers or digoxin. Verapamil crosses the placenta and is distributed in breast milk. Breastfeeding is not recommended for patients taking this drug. No age-related precautions have been noted in children. In elderly patients, age-related renal impairment may require cautious use. Alcohol and tasks that require alertness and motor skills should also be avoided until the drug effects are known.

Be aware that ECG should be monitored for changes, particularly PR-interval prolongation. Notify the physician of significant PR interval or other ECG changes. BP, pulse, and stool consistency and frequency should be assessed. The onset, type (sharp, dull, or squeezing), radiation, location, intensity, and duration of anginal pain and its precipitating factors, such as exertion and emotional stress, should be recorded. Be aware that concurrent administration of sublingual nitroglycerin therapy may be used for relief of anginal pain.

#### Storage

Store at room temperature. Protect from moisture.

#### Administration

Most dosage forms may be taken without regard to food; however, it is recommended to take sustainedrelease tablets with food. Swallow extended-release or sustainedreleased preparations whole and without chewing or crushing. If needed, open extended-release capsules and sprinkle contents on applesauce. Swallow the applesauce immediately, without chewing. Do not abruptly discontinue verapamil. Compliance is essential to control anginal pain.

For IV use, give undiluted, if desired. Administer IV push over more than 2 min for adults and children and over > 3 min for elderly patients. Continuous ECG monitoring during IV injection is required for children and recommended for adults.

Monitor ECG for asystole, extreme bradycardia, heart block, PR-interval prolongation, and rapid ventricular rates. Notify the physician of significant ECG changes. Monitor BP every 5-10 min or as ordered. Keep the patient in a recumbent position for at least 1 h after IV administration.

# Vigabatrin vi-ga'ba-trin

CATEGORY AND SCHEDULE Pregnancy Risk Category: C

Classification: Anticonvulsants

# **MECHANISM OF ACTION**

An anticonvulsant that enhances the activity of  $\gamma$ -aminobutyric acid (GABA), the major inhibitory neurotransmitter in the central nervous system (CNS). Gaba-transaminase is irreversibly inhibited to increase levels of GABA in the brain. *Therapeutic Effect:* Inhibits seizures.

# PHARMACOKINETICS

Well absorbed orally. Does not bind to plasma proteins. Not metabolized by liver. Primarily eliminated through the kidney. *Half-life:* 7.5 h (in adults). Shorter in children, and increased in renal impairment and the elderly.

# AVAILABILITY

Tablets: 500 mg. Powder for Oral Solution: 50 mg/mL after reconstitution.

# INDICATIONS AND DOSAGES

# Adjunctive treatment of refractory partial seizures

PO

*Adults, Elderly*. Initially, 500 mg twice per day. May increase by 500 mg/day at weekly intervals. Recommended target dose 1.5 g twice daily.

#### Monotherapy for infantile spasms (IS) where benefits outweigh risks PO

Infants and Children aged 1 mo to 2 yr: Initially, 50 mg/kg/day divided and given twice per day. May titrate by 25 to 50 mg/kg/day every 3 days. Maximum of 150 mg/kg/day.

#### Dosage in renal impairment (adults)

CrCl 51-80 mL/min: Decrease dose by 25%.

CrCl 31-50 mL/min: Decrease dose by 50%.

CrCl 11-30 mL/min: Decrease dose by 75%.

Hemodialysis: Effect of dialysis on the drug not adequately studied.

## CONTRAINDICATIONS

None known.

# INTERACTIONS

Drug

Alcohol, other central nervous system (CNS) depressants: May increase CNS-depressant effects. Clonazepam: Increased clonazepam levels have been reported; monitor for toxicity.

**Phenytoin:** Decreased phenytoin levels have been reported; may need to adjust phenytoin dose.

# Herbal

None known.

Food

None known.

# DIAGNOSTIC TEST EFFECTS

May decrease hemoglobin, hematocrit, or alter RBC indices. Decreases ALT and AST in up to 90% of patients. In some patients, these enzyme levels become undetectable. The suppression of ALT and AST activity may preclude the use of these markers, especially ALT, to detect early hepatic injury. May increase the amount of amino acids in the urine, possibly leading to a false-positive test for certain rare genetic metabolic diseases (e.g.,  $\alpha$ aminoadipic aciduria).

# SIDE EFFECTS

#### Frequent

Visual changes and vision loss, dizziness, headache, anemia, somnolence, fatigue, edema, weight gain, peripheral neuropathy.

#### Occasional

Diarrhea, nasopharyngitis, asthenia, nausea, rash, vomiting, nystagmus,

fever, dysmenorrhea, arthralgia, irritability.

#### SERIOUS REACTIONS

 Causes progressive and permanent bilateral concentric visual field constriction in a high percentage (30% or more) of patients. May also reduce visual acuity. Risk increases with total dose and duration of use, but no exposure is known that is free of risk of vision loss.

 Neurotoxicity: Vacuolization, MRI changes (infants and young children), neuromotor impairment, peripheral neuropathy.

• Angioedema or other serious hypersenstivity reactions, associated with fevere, rash and lymphadenopathy.

#### **PRECAUTIONS & CONSIDERATIONS**

Because of the risk of permanent vision loss, the drug is available only through a special restricted distribution called the SHARE program; prescribers and pharmacies must be registered to prescribe and distribute the drug; patients must be enrolled and meet criteria for use. Periodic vision testing is required for patients, but cannot reliably prevent vision damage; the onset of visual loss is unpredictable.

Caution is warranted in patients with renal impairment and in those who take other CNS depressants concurrently. Antiepileptic drugs (AEDs), including Sabril, increase the risk of suicidal thoughts or behavior in patients taking these drugs for any indication. Patients treated with any AED for any indication should be monitored for the emergence or worsening of depression, suicidal thoughts or behavior, and/or any unusual changes in mood or behavior. The drug may cause harm in pregnancy, and it is recommended that breastfeeding be avoided, due to risk to vision and neurologic health in an infant if exposed to the drug.

Patients should not perform hazardous tasks until the effects of the drug are known. Alcohol should be avoided. Somnolence and dizziness may occur, so change positions slowly-from recumbent to sitting position before standing. History of seizure disorders, including the duration, frequency, and intensity of seizures, should be reviewed before and during therapy. CBC and blood chemistry tests to assess hepatic and renal function should be performed before and during treatment.

#### Storage

Store at room temperature. Administration

May be taken without regard to food. For the oral solution, each packet contains vigabatrin 500 mg. Reconstitute dose immediately before administration. Empty the entire contents of the appropriate number of packets into an empty clean cup. For each packet, dissolve the powder with 10 mL cold or room temperature water. The final solution concentration will be 50 mg/mL. Do not use any other liquid to reconstitute. Using a clean spoon or stirring device, carefully stir the contents of the cup until all of the powder has dissolved, producing a clear solution. Measure the appropriate dose using a calibrated orathe 1 syringe, and administer immediately. For infants and small children, place the tip of the oral syringe between the cheek and gum and administer slowly in small increments. Discard

any unused solution. Each dose must be reconstituted immediately before administration. As with all anticonvulsants, do not abruptly discontinue the drug.

# Vilazodone

vil-az'-oh-done

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification**: Antidepressants, miscellaneous

# **MECHANISM OF ACTION**

A dual-mechanism antidepressant that acts as a selective serotonin reuptake inhibitor and a 5-hydroxytryptamine (5-HT1A) partial agonist. *Therapeutic Effect:* Relieves depression.

# PHARMACOKINETICS

Well absored from the GI tract if taken with food (72% bioavailability) protein binding: 96-99%. Metabolized in the liver via CYP3A4 and non-CYP pathways. Only 1% of the dose is recovered in the urine and 2% of the dose in the feces as unchanged vilazodone. Likely not removed by hemodialysis. *Half-life*: 25h

## AVAILABILITY

Tablets, Film-Coated: 10 mg, 20 mg, 40 mg.

## INDICATIONS AND DOSAGES

Depression:

PO

*Adults, Elderly.* Initially, 10 mg once daily for 7 days, then 20 mg once daily for 7 days. Thereafter, give 40 mg once daily.

Dosage adjustment for potent CYP3A4 inhibitors:

Do not exceed 20 mg/day. For patients on moderate inhibitors who complain of intolerable side effects, a dose reduction may also be considered.

#### CONTRAINDICATIONS

Hypersensitivity; do not use within 14 days of MAOIs.

#### INTERACTIONS Drug

Alcohol, CNS depression-producing medications: May increase CNS depression. Avoid alcohol. CYP3A4 inducers (e.g., carbamazepine, rifampin): May reduce vilazodone levels. CYP3A4 inhibitors (e.g., ketoconazole, itraconazole, clarithromycin, protease inhibitors): Use lower maximum dose of vilazodone due to increased blood levels. Linezolid: Risk of serotonin syndrome. MAOIs: Risk of serotonin syndrome; avoid. Do not use within 14 days of an MAOI. Contraindicated. NSAIDs, aspirin, anticoagulants: caution due to effect of antidepressant on platelet activity. Serotonergic medications (SSRI or SNRI antidepressants, etc.): Serotonin syndrome may occur. Herbal

**St. John's wort, tryptophan:** May increase the adverse effects of vilazodone.

# DIAGNOSTIC TEST EFFECTS

May decrease platelet aggregation.

## SIDE EFFECTS

**Frequent (> 5%)** Diarrhea, dizziness, nausea, vomiting, dry mouth, and insomnia.

#### Occasional (1%-4%)

Dry mouth, dyspepsia, gas, somnolence, paresthesia, tremor, changes in libido, orgasm or ejaculation, fatigue, palpitations, arthralgia, appetite changes, sweating. **Rare** 

Bleeding, hyponatremia.

#### SERIOUS REACTIONS

· Priapism.

• Serotonin syndrome or neuroleptic malignant syndrome-like reactions (rare).

• Platelet dysfunction and bleeding risk (GI, etc.).

• Hyponatremia and syndrome of inappropriate antidiuretic hormone secretion (SIADH).

# **PRECAUTIONS & CONSIDERATIONS**

Vilazodone appears to be less cardiotoxic than other antidepressants does not usually significantly change heart rate or blood pressure. Caution is warranted in patients with severe liver disease, a history of bipolar illness or mania, or in patients with a seizure disorder, dehydration, or other volume depletion. It is not known what effect vilazodone has on human pregnancy or if the drug is distributed in breast milk. Neonatal withdrawal syndromes and other serious adverse effects may be possible from exposure in utero. The use of vilazodone in children is not FDA approved. Antidepressants increase the risk of suicidal thinking and behavior in children. adolescents, and young adults (18-24 yr) with major depressive disorder and other psychiatric disorders. All patients should be monitored for suicidal thoughts, mood changes, or unusual behaviors. Elderly patients may be more likely to experience hypotensive or sedative effects.

Dizziness or drowsiness may be present, especially in early treatment. Avoid alcohol and tasks that require mental alertness or motor skills until the effects of the drug are known. Notify the physician if a painful, prolonged penile erection occurs. CBC, neutrophil and WBC counts, and liver and renal function tests should be assessed during therapy. ECG should also be obtained to assess for arrhythmias.

#### Storage

Store at room temperature. Administration

Take vilazodone with food. When discontinued, gradual dose reduction is recommended, as withdrawal syndromes have been reported with agents with similar actions.

# **Vitamin A**

vight'ah-myn A Aquasol A, Dofsol-A Do not confuse Aquasol A with Anusol.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: A (X if used in doses above recommended daily allowance; also, injectable form is category X) OTC, Rx

*Classification:* Vitamin, fat-soluble vitamin

## **MECHANISM OF ACTION**

A fat-soluble vitamin that may act as a cofactor in biochemical reactions. *Therapeutic Effect:* Essential for normal function of retina, visual adaptation to darkness, bone growth, testicular and ovarian function, and embryonic

# **Vinblastine Sulfate**

vin-blass'teen sul'fate Do not confuse vinblastine with vincristine or vinorelbine.

#### CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastic, vinca alkaloids

## **MECHANISM OF ACTION**

A vinca alkaloid that binds to microtubular protein of mitotic spindle, causing metaphase arrest. *Therapeutic Effect*: Inhibits cell division.

#### PHARMACOKINETICS

Highly bound to blood cells and tissues; widely distributed. Does not cross the blood-brain barrier. Protein binding: 75%. Metabolized in the liver via CYP3A4. There is an active metabolite, desacetyl-vinblastine. Eliminated through the bile and faces. *Half-life*: Elimination is triphasic. The  $\alpha$  half-life is < 5 min,  $\beta$  half-life is 50-155 min, and the final elimination half-life is 23-85 h.

#### AVAILABILITY

*Powder for Injection:* 10 mg. *Injection:* 1 mg/mL.

#### INDICATIONS AND DOSAGES

NOTE: The dosing of vinblastine varies widely depending upon the protocol being used. Check doses carefully. For example, the AVBD regimen for Hodgkin's disease is 6 mg/m<sup>2</sup> IV on days 1 and 15 every 28 days along with doxorubicin, bleomycin, and dacarbazine.

 Remission induction in advanced testicular carcinoma, advanced mycosis fungoides, breast carcinoma,

# choriocarcinoma, disseminated Hodgkin's disease, non-Hodgkin's lymphoma, Kaposi's sarcoma (KS), or Letterer-Siwe disease

Adults, Elderly. Initially,  $3.7 \text{ mg/m}^2$  as a single dose. Increase dose by about 1.8 mg/m<sup>2</sup> at weekly intervals until desired therapeutic response is attained, WBC count falls below  $3000/\text{mm}^3$ , or maximum weekly dose of  $18.5 \text{ mg/m}^2$  is reached. For most, the weekly dosage is in the range of 5.5-7.4 mg/m<sup>2</sup>.

*Children*. Initially, 2.5 mg/m<sup>2</sup> as a single dose. Increase dose by about 1.25 mg/m<sup>2</sup> at weekly intervals until desired therapeutic response is attained, WBC count falls below 3000/mm<sup>3</sup>, or maximum weekly dose of 7.5-12.5 mg/m<sup>2</sup> is reached. **Maintenance dose for treatment** 

IV

Adults, Elderly, Children. Administer one increment less than dose required to produce WBC count of 3000/mm<sup>3</sup>. Each subsequent dose given only when WBC count returns to 4000/mm<sup>3</sup> and at least 7 days have elapsed since previous dose. In some cases, oncolytic activity occurs before leukopenic effect and there is no need to alter the size of subsequent doses.

#### Dose in hepatic impairment IV

Reduce dose by 50% if total bilirubin is 1.5-3 mg/dL. Reduce dose by 75% if total bilirubin > 3 mg/dL. If total bilirubin is > 5 mg/dL, do not administer.

#### **OFF-LABEL USES**

Non-small cell lung cancer, bladder cancer.

#### CONTRAINDICATIONS

Bacterial infection, severe leukopenia, significant

#### 1668.e2 Vinblastine Sulfate

granulocytopenia (unless it stems from disease being treated); intrathecal administration.

#### INTERACTIONS

#### Drug

Strong inhibitors of CYP3A4 isoenzymes (erythromycin, clarithromycin, fluconazole, itraconazole, ketoconazole, metronidazole): Increase concentrations of vinblastine. Phenytoin: Vinblastine may decrease phenytoin concentration and induce seizure activity.

#### Herbal

None known. Food None known.

## DIAGNOSTIC TEST EFFECTS

Decreases WBC.

#### IV INCOMPATIBILITIES

Do not mix with other medications.

#### SIDE EFFECTS

#### Frequent

Nausea, vomiting, alopecia. Occasional

Constipation or diarrhea, rectal bleeding, headache, paresthesia (occur 4-6 h after administration and persist for 2-10 h); malaise; asthenia; dizziness; pain at tumor site; jaw or face pain; depression; dry mouth.

#### Rare

Dermatitis, stomatitis, phototoxicity, hyperuricemia.

#### SERIOUS REACTIONS

 Hematologic toxicity is manifested as leukopenia and, less commonly, anemia. The WBC count reaches its nadir 4-10 days after initial therapy and recovers within 7-14 days (21 days with high vinblastine dosages). • Thrombocytopenia is usually mild and transient, with recovery occurring in a few days.

• Hepatic insufficiency may increase the risk of toxic drug effects.

 Acute shortness of breath or bronchospasm may occur, particularly when vinblastine is administered concurrently with mitomycin.

• Universally fatal if given intrathecally.

• Extravasation may cause cellulitis and phlebitis. Sloughing may occur.

#### PRECAUTIONS & CONSIDERATIONS

Leukopenia is common; may be more severe in older patients. Toxicity may be greater in patients with hepatic impairment.

Use with caution in patients with poor cardiac reserve or cachexia Acute shortness of breath and severe bronchospasm have been reported following the administration of vinca alkaloids Progressive dyspnea may require chronic therapy and the vinca should not be readministered if it occcurs. Vinblastine can cause fetal harm: females of childbearing potential should be advised to avoid becoming pregnant. Breastfeeding is not advised. Men may have alterations in sperm production or quality. A CBC should be done before each dose, and care should be taken to administer the dose according to recommended schedules and no more often than every 7 days. Patients should report mouth sores, sore throat, fevers, and other effects of neutropenia. Storage

#### Refrigerate unopened vials. Nonpreserved solutions should be used immediately.

Preservative-containing solutions made with 0.9% NaCl may be stored refrigerated for up to 28 days.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs. Label products as follows: "DO NOT REMOVE COVERING UNTIL MOMENT OF INJECTION. FATAL IF GIVEN INTRATHECALLY. FOR INTRAVENOUS USE ONLY."

Reconstitute powder for injection with 10 mL NS injection (with or without preservative) to a concentration of 1 mg/mL. Inject

into tubing of a running IV infusion or directly into a vein over 1 min. Do not dilute in large volumes or infuse over a prolonged period to reduce risk of vein irritation and extravasation. Vinblastine is a moderate vesicant. Carefully position IV to avoid extravasation. Rinsing the syringe and needle with venous blood before withdrawal has been suggested. If extravasation occurs, discontinue immediately and give any remaining portion of the dose into another vein. Use of hyaluronidase and applying moderate heat to the area may help disperse drug and minimize discomfort.

# Vincristine Sulfate

vin-cris'teen sul'fate Vincasar PFS Do not confuse vincristine with vinblastine.

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antineoplastic, vinca alkaloids

# **MECHANISM OF ACTION**

A vinca alkaloid that binds to microtubular protein of mitotic spindle, causing metaphase arrest. *Therapeutic Effect:* Inhibits cell division.

## PHARMACOKINETICS

Within 15-30 min of injection, most of the drug is distributed to tissues, where it is tightly bound. Does not cross the blood-brain barrier. Protein binding: 75%. Metabolized in the liver. Primarily eliminated in feces by biliary system. *Half-life:* 10-37 h.

## AVAILABILITY

Injection: 1 mg/mL.

#### INDICATIONS AND DOSAGES

NOTE: Dosing varies widely with protocol being used. Check doses carefully. The dose in children and adults does not usually exceed 2 mg/ wk. Lower doses are used in patients with hepatic disease or underlying neurologic problems. For example, the MOPP regimen for Hodgkin's disease uses vincristine 1.4 mg/m<sup>2</sup> on days 1 and 8 with mechlorethamine, procarbazine, and prednisone; cycle repeats every 28 days.

 Acute leukemia, advanced non-Hodgkin's lymphoma, disseminated

#### Hodgkin's disease, neuroblastoma, rhabdomyosarcoma, Wilms's tumor IV

Adults, Elderly. 0.4-1.4 mg/m<sup>2</sup> once a week. Children. 1-2 mg/m<sup>2</sup> once a week during induction phase. Children weighing < 10 kg or with a body surface area < 1 m<sup>2</sup>. 0.05 mg/kg once a week during induction phase. Maximum: 2 mg. ▶ Dosage in hepatic impairment Reduce dosage by 50% if total bilirubin concentration is 1.5-3 mg/dL. Reduce dosage by 75% if total bilirubin concentration > 3 mg/dL. Hold dose if bilirubin is > 5 mg/dL.

# **OFF-LABEL USES**

Idiopathic thrombocytopenic purpura (ITP), small cell lung carcinoma.

# CONTRAINDICATIONS

Patients receiving radiation therapy through ports that include the liver; patients with demyelinating form of Charcot-Marie-Tooth syndrome; intrathecal administration.

# INTERACTIONS

#### Drug

Strong inhibitors of CYP3A4 isoenzymes (erythromycin, clarithromycin, itraconazole): Increase concentrations of vincristine significantly and may cause neurotoxicity.

L-aspariginase or pegaspargase: Give vincristine 12-24 h before these drugs; giving these drugs before vincristine reduces hepatic clearance and increases toxicity of vincristine. Mitomycin: Increased risk of pulmonary reactions.

**Phenytoin:** May decrease phenytoin concentration.

#### Herbal

None known.

#### Food

None known.

#### DIAGNOSTIC TEST EFFECTS

Increased serum uric acid. Decreased WBC and platelets.

#### IV INCOMPATIBILITIES

Do not mix with other medications.

#### SIDE EFFECTS

#### Expected

Peripheral neuropathy (occurs in nearly every patient; first clinical sign is depression of Achilles tendon reflex). Alopecia.

#### Frequent

Peripheral paresthesia, constipation or obstipation (upper colon impaction with empty rectum), abdominal cramps, headache, jaw pain, hoarseness, diplopia, ptosis or drooping of eyelid, urinary tract disturbances.

#### Occasional

Nausea, vomiting, diarrhea, abdominal distention, stomatitis, fever.

#### Rare

Mild leukopenia, mild anemia, thrombocytopenia.

#### SERIOUS REACTIONS

Universally fatal if given intrathecally. There are only a few cases documented of survival.
Extravasation may cause cellulitis and phlebitis. Sloughing may occur.

• Acute shortness of breath and bronchospasm may occur, especially when vincristine is administered concurrently with mitomycin.

 Prolonged or high-dose therapy may produce foot or wrist drop, difficulty walking, slapping gait, ataxia, and muscle wasting.

 Neurotoxicity is dose-limiting, presents as sensory impairment and paresthesias in "stocking-glove" distribution. Cranial nerves and hearing and vision may be affected in severe cases.

Acute uric acid nephropathy may occur.

• Rare instances of SIADH with hyponatremia and edema.

 In patients given combo chemo regimens with vincristine and receiving mediastinal radiation, reports of coronary artery disease and myocardial infarction; causality unknown.

#### **PRECAUTIONS & CONSIDERATIONS**

If CNS leukemia is diagnosed, additional agents are required because vincristine does not penetrate in adequate amounts. Patients with preexisting neuromuscular disease or on other neurotoxic drugs may be more susceptible to neurologic toxicities. Acute shortness of breath and severe bronchospasm have been reported following the administration of vinca alkaloids. Progressive dyspnea may require chronic therapy and the vinca should not be readministered. Take care to avoid contamination of the eve as severe irritation (or corneal ulceration) may result. Vincristine sulfate can cause fetal harm; females of childbearing potential should be advised to avoid becoming pregnant. Breastfeeding is not advised. Men may have alterations in sperm production or quality. A CBC should be done before each dose, and serum uric acid should be determined frequently during early treatment. Storage

Store unopened vials under refrigeration. Protect from light; do not freeze. Diluted solution stable for 7 days under refrigeration or 2 days at room temperature. In ambulatory pumps, solution is stable for 7-10 days at room temperature.

#### 1668.e6 Vincristine Sulfate

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs. Label products: "DO NOT REMOVE COVERING UNTIL MOMENT OF INJECTION. FATAL IF GIVEN INTRATHECALLY. FOR INTRAVENOUS USE ONLY." May be diluted with normal saline or D5W. Inject into tubing of a running IV infusion or directly into a vein. May be injected over about 1 min. Carefully position IV to avoid extravasation. Vincristine is a moderate vesicant. If extravasation occurs, discontinue immediately and give any remaining portion of the dose into another vein. Use of hyaluronidase and applying moderate heat to the area may help disperse drug and minimize discomfort.

# Vinorelbine

vin-oh-rel'bean Navelbine Do not confuse vinorelbine with vinblastine.

## CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

**Classification:** Antineoplastic, vinca alkaloids

#### **MECHANISM OF ACTION**

A semisynthetic vinca alkaloid that interferes with mitotic microtubule assembly. *Therapeutic Effect:* Prevents cell division.

## PHARMACOKINETICS

Widely distributed after IV administration. Protein binding: 80%-90%. Metabolized in the liver. Active metabolite. Primarily eliminated in feces by biliary system. *Half-life:* 28-43 h.

# AVAILABILITY

Injection: 10 mg/mL.

#### INDICATIONS AND DOSAGES

 Unresectable, advanced non-small cell lung cancer (as monotherapy)
 IV

Adults, Elderly. 30 mg/m<sup>2</sup> administered q7days over 6-10 min.

# Advanced non-small cell lung cancer (in combination with cisplatin)

*Adults, Elderly.* 25 mg/m<sup>2</sup> given q7days, in combination with cisplatin (100 mg/m<sup>2</sup> given q4wk)

# • Dosage adjustment guidelines Dosage adjustments should be

based on granulocyte count

obtained on the day of treatment, as follows:

Granulocyte Count (cells/mm <sup>3</sup> ) on Day of Treatment	% of Starting Dose	
> 1500	100%	
1000-1499	50%	
< 1000	Do not administer	

Additional dosage adjustments are required for patients experiencing fever or sepsis during granulocytopenia or patients who had two consecutive doses withheld because of granulocytopenia:

Granulocyte Count (cells/mm <sup>3</sup> ) on Day of Treatment	% of Starting Dose
> 1500	75%
1000-1499	37.5%
< 1000	Do not administer

Dosage adjustments based on total bilirubin:

% of Starting Dose	
100%	
50%	
25%	

#### Dose adjustments for neurotoxicity

If Grade  $\geq 2$  neurotoxicity occurs, discontinue the drug.

# **OFF LABEL USES**

Breast cancer, cervical cancer.

# CONTRAINDICATIONS

Pretreatment granulocyte counts < 1000 cells/mm<sup>3</sup>. Intrathecal administration.

## INTERACTIONS

#### Drug

Cisplatin: Increased risk of granulocytopenia. Drugs that are potent CYP3A4 inhibitors: May reduce metabolism and increase risk of toxicity. Mitomycin: Increased risk of pulmonary toxicity. Paclitaxel: Increased risk of neurotoxicity. Herbal None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

Decreased WBC. Increased AST, bilirubin.

# IV INCOMPATIBILITIES

Do not mix with other medications.

# SIDE EFFECTS

#### Frequent

Asthenia; mild or moderate nausea; constipation; erythema, pain, or vein discoloration at injection site; fatigue; peripheral neuropathy manifested as paresthesia and hyperesthesia; diarrhea; alopecia.

#### Occasional

Phlebitis, dyspnea, loss of deep tendon reflexes.

#### Rare

Chest pain, jaw pain, myalgia, arthralgia, rash.

# SERIOUS REACTIONS

 Dose-limiting toxicity: Bone marrow depression is manifested mainly as granulocytopenia, which may be severe. Other hematologic toxicities, including neutropenia, thrombocytopenia, leukopenia, and anemia, increase the risk of infection and bleeding.

• Acute shortness of breath and severe bronchospasm occur

infrequently, particularly in patients with preexisting pulmonary dysfunction and in those receiving mitomycin concurrently. Fatal interstitial pulmonary changes and acute respiratory distress syndrome have occurred.

 Severe, sometimes fatal, constipation, paralytic ileus, intestinal obstruction, necrosis, or perforation.

• Expected to be universally fatal if given intrathecally.

• Extravasation may cause cellulitis and phlebitis. Sloughing may occur.

#### PRECAUTIONS & CONSIDERATIONS

Granulocyte count before treatment should be at least 1000 cells/ mm<sup>3</sup>. Obtain complete blood count with differentials on the day of treatment. Caution if bone marrow reserve is compromised by previous radiation therapy or chemotherapy. Use with caution in hepatic impairment.

Patients with preexisting neuropathy disease or on other neurotoxic drugs may be more susceptible to such toxicities. Acute shortness of breath and severe bronchospasm have been reported following the administration of vinca alkaloids. Take care to avoid contamination of the eye as severe irritation (or corneal ulceration) may result. Vinorelbine can cause fetal harm; females of childbearing potential should be advised to avoid becoming pregnant. Breastfeeding is not advised. Men may have alterations in sperm production or quality. Patients receiving radiation therapy may be more likely to have radiation recall type events. Patients should report mouth sores, sore throat, fevers, and other effects of neutropenia.

#### Storage

Store unopened vials in cartons under refrigeration. Protect from light; do not freeze. Unopened vials are stable at temperatures up to 77° F (25° C) for up to 72 h. Diluted solution may be used for up to 24 h under normal room light when stored in polypropylene syringes or polyvinyl chloride bags under refrigeration or at room temperature.

#### Administration

CAUTION: Observe and exercise appropriate precautions for handling, preparing, and administering cytotoxic drugs. Label syringes: "DO NOT REMOVE COVERING UNTIL MOMENT OF INJECTION. FATAL IF GIVEN INTRATHECALLY, FOR INTRAVENOUS USE ONLY."

Dilute injection solution in the syringe or IV bag. Doses in a

syringe should be diluted to 1.5-3 mg/mL with D5W or normal saline (NS). Doses diluted in an IV bag should be diluted to 0.5-2 mg/mL with D5W, normal saline (NS), 0.45% NaCl injection, 5% dextrose with 0.45% NaCl injection, Ringer's injection, or lactated Ringer's injection. Diluted solution should be administered over 6-10 min into the side port of a free-flowing IV closest to the IV bag, followed by flushing with at least 75-125 mL of a recommended dilution solution. Carefully position IV needle to minimize extravasation risk. If extravasation occurs, discontinue immediately and give any remaining portion of the dose into another vein. Use of hyaluronidase and applying moderate heat to the area may help disperse drug and minimize discomfort.

development; preserves integrity of epithelial cells.

## PHARMACOKINETICS

Rapidly absorbed from the GI tract if bile salts, pancreatic lipase, protein, and dietary fat are present. Transported in blood to the liver, where it is metabolized; stored in parenchymal hepatic cells, then transported in plasma as retinol, as needed. Excreted primarily in bile and, to a lesser extent, in urine.

# AVAILABILITY

*Soft-Gel Capsules, OTC:* 8000 units, 10,000 units, 15,000 units, 25,000 units.

*Capsules, Rx (Dofsol-A):* 50,000 units.

*Injection (Aquasol A):* 50,000 units/mL.

# INDICATIONS AND DOSAGES

#### Severe vitamin A deficiency PO

Adults, Elderly, Children 8 yr and older. 100,000 units/day for 3 days, then 50,000 units/day for 14 days, then 10,000-20,000 units/day for 2 mo. *Children 1-8 yr*. 10,000 units/kg/day for 5 days, then 5000-10,000 units/ day for 2 mo.

Children younger than 1 yr. 10,000 units/day for 5 days, then 7500-15,000 units for 10 days. IM

Adults, Elderly, Children 8 yr and older: 100,000 units/day for 3 days; then 50,000 units/day for 14 days, followed by 10,000-20,000 units/day PO for 2 mo.

*Children aged 1-8 yr.* 17,500-35,000 units/day for 10 days. *Children younger than 1 yr.* 

7500-15,000 units/day.

#### Malabsorption syndrome PO

Adults, Elderly, Children 8 yr and older: 10.000-50.000 units/day. Dietary supplement Females ≥ 14 yr. 2333 international units/day.  $Males \ge 14 \text{ yr}$ : 3000 international units/day. Pregnant Adolescent Females aged 14-18 yr: 2500 international units/ day. Pregnant Adult Females. 2566 international units/day. Lactating Adolescent Females aged 14-18 yr. 4000 international units/day during first 6 mo of breastfeeding. Lactating Adult Female's. 4333 international units during first 6 mo of breastfeeding. Children aged 9-13 yr. 2000 international units/day. Children aged 4-8 yr. 1333 international units/day. Children aged 1-3 yr. 1000 international units/day. Infants (term) aged 7-12 mo. 1666 international units/day, based on dietary intake of breast milk, formula, or other food sources. Infants (term) aged birth-6 mo. 1333 international units/day, based on dietary intake of human breast milk.

# CONTRAINDICATIONS

Hypervitaminosis A; oral use in malabsorption syndrome; hypersensitivity, IV administration.

# INTERACTIONS

Drug

Cholestyramine, colestipol, mineral oil: May decrease the absorption of vitamin A. Isotretinoin: May increase the risk of toxicity. Oral contraceptives: Increase plasma vitamin A levels. Orlistat: May decrease oral vitamin A absorption. **Retinoids:** Vitamin A should not be used concurrently in patients receiving systemic retinoids as may cause vitamin A toxicity.

**Herbal and Food** 

None known.

## DIAGNOSTIC TEST EFFECTS

May increase BUN and serum cholesterol, calcium, and triglyceride levels. May decrease blood erythrocyte and leukocyte counts.

## SIDE EFFECTS

#### Occasional (1%-10%)

Fever, headache, irritability, lethargy, malaise, vertigo, drying or cracking of the skin, hypercalcemia, weight loss, visual changes, hypervitaminosis A.

#### SERIOUS REACTIONS

• Chronic overdosage produces malaise, nausea, vomiting, drying or cracking of skin or lips, inflammation of tongue or gums, irritability, alopecia, and night sweats.

• Bulging fontanelles have occurred in infants.

• Excessive dryness of eyes may lead to corneal irritation.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with renal impairment. Vitamin A crosses the placenta and is distributed in breast milk.

The RDA in pregnancy is usually < 3000 units/day. Safety of amounts > 6000 units/day not established for any female of childbearing potential. Use caution when administering high doses of vitamin A to children and elderly patients. Consuming foods rich in vitamin A, including cod, halibut, tuna, and shark, is encouraged; naturally occurring vitamin A is found only in animal sources. Avoid taking cholestyramine (Questran), colestipol, and mineral oil during vitamin A therapy.

Before and during treatment, assess for signs and symptoms of vitamin A deficiency, including night blindness, dry and brittle nails, alopecia, and drying of corneas. Be alert for symptoms of overdose when receiving prolonged administration of > 25,000 units/day. The therapeutic serum vitamin A level is 80-300 units/mL.

#### Storage

Store oral capsules and solution in a cool place. Store injection in refrigerator and protect from light; do not freeze.

#### Administration

! IM administration is used only in acutely ill patients or patients unresponsive to the oral route, such as those with malabsorption syndrome. For adults, an IM injection dose of 1 mL (50,000 units) may be given in the deltoid muscle; a dose > 1 mL should be given in a large muscle mass, such as the gluteus maximus muscle. The anterolateral thigh is the preferred site for infants younger than 7 mo. Do not administer intravenously.

Do not crush, open, or break capsules. Take vitamin A without regard to food.

## Vitamin D (Cholecalciferol, Vitamin D<sub>3</sub>; Ergocalciferol, Vitamin D<sub>2</sub>)

vight'ah-myn D 📩 Calcidol, Calciferol, Drisdol

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: A (D if used in doses above recommended daily allowance)

*Classification:* Vitamin; fat-soluble vitamin

## **MECHANISM OF ACTION**

A fat-soluble vitamin that stimulates calcium and phosphate absorption from small intestine, promotes secretion of calcium from bone to blood, and promotes resorption of phosphate in renal tubules; also acts on bone cells to stimulate skeletal growth and on parathyroid gland to suppress hormone synthesis and secretion. Therapeutic Effect: Essential for absorption and utilization of calcium and phosphate and normal bone calcification. Reduces parathyroid hormone level. Improves phosphorus and calcium homeostasis in chronic renal failure.

## PHARMACOKINETICS

Readily absorbed from small intestine; vitamin  $D_3$  may be absorbed more rapidly and more completely than vitamin  $D_2$ . Concentrated primarily in liver and fat deposits. Activated in the liver and kidneys. Eliminated by biliary system; excreted in urine. Half-life: 14 h for cholecalciferol; 19-48 h for ergocalciferol.

#### AVAILABILITY

Capsules (Ergocalciferol, Drisdol): 50,000 units (1.25 mg). Oral Liquid Drops (Calcidol, Calciferol, Drisdol): 8000 units/mL. Tablets (Cholecalciferol, Vitamin D<sub>3</sub>): 400 units, 1000 units. Capsules (Cholecalciferol, Vitamin D<sub>3</sub>): 10,000 units.

# INDICATIONS AND DOSAGES Dietary supplement PO

Adults, Elderly. 10 mcg (400 units)/day. Children. 5 mcg. Infants. 5 mcg (400-800 units)/day. > Renal failure

# PO

Adults, Elderly. 0.5 mg/day. Children. 0.1-1 mg/day.

Hypoparathyroidism PO

Adults, Elderly. 1250-5000 mcg/day (with calcium supplements). Children. 1250-5000 mcg/day (with

calcium supplements).

# Nutritional rickets, osteomalacia PO

Adults, Elderly, Children. 25-125 mcg/day for 8-12 wks. Adults, Elderly (with malabsorption syndrome). 250-7500 mcg/day. Children (with malabsorption syndrome). 250-625 mcg/day.

# • Vitamin D-dependent rickets PO

Adults, Elderly. 250 mcg to 1.5 mg/ day.

*Children*. 75-125 mcg/day. Maximum: 1500 mcg/day.

#### Vitamin D-resistant rickets PO

Adults, Elderly. 250-1500 mcg/day (with phosphate supplements). *Children*. Initially 1000-2000 mcg/ day (with phosphate supplements).

Vitamin D (Cholecalciferol, Vitamin D<sub>3</sub>; Ergocalciferol, Vitamin D<sub>2</sub>) (Generic Name)

May increase in 250- to 600-mcg increments q3-4mo.

#### CONTRAINDICATIONS

Hypercalcemia, malabsorption syndrome, vitamin D toxicity. Drisdol capsules contain tartrazine; don't use if tartrazine allergic (use caution if aspirin allergic).

#### INTERACTIONS

#### Drug

Aluminum-containing antacids (long-term use): May increase aluminum blood concentration and risk of aluminum bone toxicity.

**Calcium-containing preparations, thiazide diuretics:** May increase the risk of hypercalcemia.

Magnesium-containing antacids: May increase magnesium blood concentration.

**Mineral oil:** Excessive use of mineral oil decreases vitamin D absorption.

**Orlistat:** Decreases vitamin D absorption.

#### Herbal

None known. Food None known.

#### DIAGNOSTIC TEST EFFECTS

May increase serum cholesterol, calcium, magnesium, and phosphate levels. May decrease serum alkaline phosphatase level.

## SIDE EFFECTS

V

None known.

#### SERIOUS REACTIONS

• Early signs and symptoms of overdose are weakness, headache, somnolence, nausea, vomiting, dry mouth, constipation, muscle and bone pain, and metallic taste.

• Later signs and symptoms of overdose include polyuria, polydipsia,

anorexia, weight loss, nocturia, photophobia, rhinorrhea, pruritus, disorientation, hallucinations, hyperthermia, hypertension, and cardiac arrhythmias.

#### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with coronary artery disease, renal calculi, and renal impairment. It is unknown whether vitamin D crosses the placenta or is distributed in breast milk. Children may be more sensitive to the effects of vitamin D. No age-related precautions have been noted in elderly patients. Those receiving chronic renal dialysis should not take magnesium-containing antacids during vitamin D therapy. Consuming foods rich in vitamin D, including milk, eggs, leafy vegetables, margarine, meats, and vegetable oils and shortening, is encouraged.

BUN, serum alkaline phosphatase, calcium, creatinine, magnesium, and phosphate levels, and urinary calcium levels should be monitored.

Depending on condition, serial bone radiographs may help assess response to treatment.

#### Storage

Store at room temperature in a cool place. Do not freeze.

#### Administration

Be aware that 1 mcg of vitamin D = 40 international units.

! Dosing alert: Overdosage is dangerous and there is a narrow index between therapeutic and toxic dosage. Always verify dosage of product against order for the patient, particularly when using concentrated ergocalciferol drops.

Begin vitamin D therapy at the lowest possible dosage. Take vitamin D without regard to food. Swallow the capsules whole and avoid crushing, chewing, or opening them.

# Vitamin E

vight'ah-myn E Aquasol E Do not confuse Aquasol E with Anusol.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: A (C if used in doses above recommended daily allowance) OTC

**Classification:** Vitamins; fatsoluble vitamin

# **MECHANISM OF ACTION**

An antioxidant that prevents oxidation of vitamins A and C, protects fatty acids from attack by free radicals, and protects RBCs from hemolysis by oxidizing agents. *Therapeutic Effect:* Prevents and treats vitamin E deficiency.

## PHARMACOKINETICS

Variably absorbed from the GI tract (requires bile salts, dietary fat, and normal pancreatic function). Concentrated primarily in adipose tissue. Metabolized in the liver. Eliminated primarily by the biliary system.

# AVAILABILITY

*Oral Drops (Aquasol-E):* 15 units/0.3 mL. *Topical Oil:* 933 IU/mL.

# INDICATIONS AND DOSAGES Vitamin E deficiency

#### PO

Adults, Elderly. 60-75 units/day. Adults with malabsorption may require 100-400 IU/day. Maximum tolerable limit considered 1000 IU/ day. Children. 1 unit/kg/day.

To moisturize the skin

TOPICAL

*Adults:* Apply to affected area of the skin as needed.

## **OFF-LABEL USES**

To decrease the severity of tardive dyskinesia, mastalgia associated with premenstrual syndrome.

#### CONTRAINDICATIONS

None known.

#### INTERACTIONS Drug

Cholestyramine, colestipol, mineral oil: May decrease the absorption of vitamin E. Iron (large doses): May increase vitamin E requirements. Oral anticoagulants: Increased anticoagulant effects with vitamin E doses exceeding 400 units/day. Orlistat: Decreases vitamin E absorption. Herbal None known. Food

None known.

## **DIAGNOSTIC TEST EFFECTS**

None known.

## SIDE EFFECTS

None known.

## SERIOUS REACTIONS

 Chronic overdose may produce fatigue, weakness, nausea, headache, blurred vision, flatulence, and diarrhea.

# **PRECAUTIONS & CONSIDERATIONS**

Vitamin E use may impair the hematologic response with iron deficiency anemia. It is unknown whether vitamin E crosses the placenta or is distributed in breast milk. No age-related precautions

Vitamin E (Generic Name)

have been noted with normal dosages in children or in elderly patients. Consuming foods high in vitamin E, including eggs, meats, milk, leafy vegetables, margarine, and vegetable oils and shortening, is encouraged.

Notify the physician of signs and symptoms of toxicity, including blurred vision, diarrhea, nausea, dizziness, flu-like symptoms, or headache.

#### Storage

Store in a cool, dry place at room temperature.

#### Administration

Do not crush, open, or break capsule. Take vitamin E without regard to food. Vitamin E drops may be dropped directly into the mouth or mixed with fruit juice, cereal, or other food. Topical oil is for external use only; do not ingest; gently massage into skin, avoiding eyes and mucous membranes.

# Voriconazole

vohr-ee-con'ah-zole ★ 🐏 Vfend, Vfend IV

## **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: D

**Classification:** Antifungals, azole antifungals

# **MECHANISM OF ACTION**

V

A triazole derivative that inhibits the synthesis of ergosterol, a vital component of fungal cell wall formation. *Therapeutic Effect:* Damages fungal cell wall membrane.

# PHARMACOKINETICS

Rapidly and completely absorbed after PO administration. Widely distributed. Protein binding: 58%.

Metabolized in the liver. Primarily excreted as a metabolite in urine. Removed by hemodialysis. *Half-life:* 6 h.

# AVAILABILITY

Tablets: 50 mg, 200 mg. Injection Powder for Reconstitution: 200 mg. Powder for Oral Suspension: 200 mg/5 mL.

# INDICATIONS AND DOSAGES

 Invasive aspergillosis, other serious fungal infections caused by Scedosporium apiospermum and Fusarium spp PO

Adults, Elderly, Children > 12 yr weighing  $\ge 40$  kg. Initially, 400 mg q12h for 2 doses on day 1. Maintenance: 200 mg q12h (may increase to 300 mg q12h). Adults, Elderly, Children > 12 yr weighing < 40 kg. Initially, 200 mg q12h for 2 doses on day 1. Maintenance: 100 mg q12h (may increase to 150 mg q12h).

#### Usual parenteral dosage IV

Adults, Elderly, Children over 12 yr. Initially, 6 mg/kg/dose q12h for 2 doses, then 4 mg/kg/dose q12h (may decrease to 3 mg/kg/dose if patient is unable to tolerate 4 mg/kg/dose).

## Candidemia in nonneutropenic patients; deep tissue Candida infections

#### PO

Adults, Elderly, Children > 12 yr weighing  $\geq$  40 kg. After initial IV loading dose, 200 mg q12h. Adults, Elderly, Children > 12 yr weighing < 40 kg. After initial IV loading dose, 100 mg q12h. IV

Adults, Elderly, Children > 12 yr. Initially, 6 mg/kg/dose q12h for 2 doses, then 3-4 mg/kg/dose q12h.

Voriconazole (Generic Name), Vfend (Brand Name)

#### Esophageal candidiasis PO

Adults, Elderly, Children > 12 yr weighing  $\ge$  40 kg. 200 mg q12h for minimum of 14 days, then at least 7 days following resolution of symptoms.

Adults, Elderly, Children > 12 yr weighing < 40 kg. 100 mg q12h for minimum 14 days, then at least 7 days following resolution of symptoms. Adults. Elderly, Children > 12 yr. Initially, 6 mg/kg/dose q12h for 2 doses, then 3 mg/kg/dose q12h.

Dosage in hepatic insufficiency Give standard loading dose but reduce maintenance dose by 50% if mild to moderate hepatic cirrhosis (Child-Pugh class A, B). Not studied in patients with severe hepatic disease.

# CONTRAINDICATIONS

Hypersensitivity to voriconazole. Many medications are contraindicated for use with Vfend. See Drug Interactions.

# INTERACTIONS

## Drug

Drugs that are substrates for CY3A4 (e.g., cyclosporine, methadone, protease inhibitors, NNRTIs, benzodiazepines, "statins," tacrolimus, vinca alkaloids) or CYP2C9 (warfarin, sulfonylureas): Risk of augmented effects/side effects of these drugs increased as voriconazole reduces their metabolism. Increased monitoring required.

Efavirenz, fosphenytoin,

**phenytoin:** Decrease voriconazole concentrations and dose increase recommended (see manufacturer's information).

**Ergot alkaloids, cisapride, pimozide, quinidine, sirolimus:** Contraindicated. Voriconazole significantly increases the levels of these drugs, resulting in risk of serious toxicity.

Rifampin, rifabutin, ritonavir, carbamazepine, phenobarbital, primidone: Contraindicated. Significantly reduce voriconazole levels. Also, rifabutin levels

significantly increased.

# Herbal

**St. John's wort:** Contraindicated. Significantly reduces voriconazole concentrations.

#### Food

Absorption reduced with high-fat meal.

# DIAGNOSTIC TEST EFFECTS

May increase serum alkaline phosphatase and SGPT (ALT) levels. Increased serum creatinine.

# **IV INCOMPATIBILITIES**

Must not be infused with any blood product or with concentrated electrolytes or with sodium bicarbonate solutions, even if in separate IV lines (or cannulas). IV solutions containing (nonconcentrated) electrolytes or TPN solutions can be infused at the same time, but must be through a separate line. If infused via a multiple-lumen catheter, TPN needs to be administered using a different port from Vend IV. Consult specialized resources for other Y-site incompatibility information.

# SIDE EFFECTS

## Frequent (5%-20%)

Abnormal vision, fever, nausea, rash, vomiting.

Occasional (2%-5%)

Headache, chills, hallucinations, photophobia, tachycardia, hypertension.

# SERIOUS REACTIONS

· Hepatotoxicity occurs rarely.

Optic neuritis, papilledema, especially with prolonged treatment.
Rare cases of QT prolongation or arrhythmias.

• Anaphylactoid-like reactions during infusion.

• Photosensitivity; if occurs, may increase risk for skin cancers later.

 Fluorosis and periostitis with longterm therapy.

 Acute renal failure, particularly with IV therapy, due to vehicle found in IV form; watch for increased serum creatinine.

#### **PRECAUTIONS & CONSIDERATIONS**

Caution should be used in patients with hypersensitivity to other azole antifungal agents, impaired renal or liver function, or proarrhythmic conditions. Correct hypocalcemia, hypokalemia, and hypomagnesemia before initiating voriconazole. Be aware that voriconazole may cause fetal harm. Use effective contraception during voriconazole treatment. Breastfeeding is not recommended during treatment. Be aware that the safety and efficacy of voriconazole have not been established in children younger than 12 yr. No age-related precautions have been noted in elderly patients. Oral suspension contains sucrose. Tablets contain lactose; do not use in those with hereditary intolerance or enzyme deficiency.

۷

Expect to monitor liver and renal function test results. Evaluate and monitor visual function, including color perception, visual acuity, and visual field, for drug therapy lasting longer than 28 days. Avoid driving at night because voriconazole may cause visual changes, such as blurred vision or photophobia. Avoid performing hazardous tasks if changes in vision occur. Because of the risk of photosensitivity, patient should follow precautions to avoid direct UV exposure; use sunscreens, hats, sunglasses, and protective clothing. Avoid tanning beds.

#### Storage

Store powder for injection at room temperature. Use reconstituted solution immediately. If not used immediately, infusion expires in 24 h under refrigeration.

Powder for oral suspension should be stored in refrigerator until reconstituted. Reconstituted oral suspension stable for 14 days at room temperature. Do not refrigerate or freeze once reconstituted.

#### Administration

Give oral voriconazole 1 h before or 1 h after a meal. Shake suspension well prior to each use; use calibrated dispenser provided to measure dose.

Injection is for IV infusion only. Reconstitute 200-mg vial with 19 mL sterile water for injection to provide a concentration of 10 mg/mL. Further dilute with 0.9% NaCl or D5W to provide a concentration not < 0.5 mg/mL or > 5 mg/mL. Infuse over 1-2 h at a rate not to exceed 3 mg/kg/h.

#### Vorinostat vor-in'o-stat

🗙 🐏 Zolinza

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

Classification: Antineoplastic

## **MECHANISM OF ACTION**

Inhibits histone deacetylase enzymes HDAC1, HDAC2, HDAC3, and HDAC6. In many different malignant cell lines, HDAC inhibitors inhibit the cell cycle and induce apoptosis. They may also stimulate the immune system and block angiogenesis.

# PHARMACOKINETICS

Well absorbed orally; 71% bound to plasma proteins. Major pathways of metabolism involve glucuronidation and hydrolysis, then  $\beta$ -oxidation. Metabolites are not active. Roughly 53% of inactive drug plus metabolites excreted in urine. *Halflife*: 2 h.

# AVAILABILITY

Capsules: 100 mg.

#### INDICATIONS AND DOSAGES • Cutaneous T-cell lymphoma PO

*Adults, Elderly.* 400 mg once daily; if not tolerated, may reduce to 300 mg once daily or 300 mg once daily 5 days/wk.

## CONTRAINDICATIONS

Severe hepatic impairment.

## INTERACTIONS

Drug Valproic acid (other HDAC inhibitors): Severe thrombocytopenia and GI bleeding. Warfarin: Prolonged INR. Herbal and Food None significant.

## **DIAGNOSTIC TEST EFFECTS**

Increased serum glucose, serum creatinine. May lower platelet count.

## SIDE EFFECTS

## Frequent (> 20%)

Fatigue, anorexia, diarrhea, dysgeusia, nausea, thrombocytopenia, anemia, weight loss.

#### Occasional (10%-20%)

Dizziness, headache, alopecia, pruritus, constipation, decreased appetite, dry mouth, vomiting, anemia, muscle spasms, cough, upper respiratory tract infection, increased serum creatinine, chills, peripheral edema, pyrexia, hyperglycemia.

#### SERIOUS REACTIONS

• Pulmonary embolism, deep vein thrombosis.

- · Squamous cell carcinoma.
- Severe thrombocytopenia with GI bleeding.
- · QT prolongation.

• Angioneurotic edema, exfoliative skin rashes, and other serious allergic events (rare).

## **PRECAUTIONS & CONSIDERATIONS**

Vorinostat is not available in most pharmacies; patients must be registered in the ACT program to receive the drug. Use caution in patients with mild or moderate hepatic or renal impairment, with diabetes, or with fluid and electrolyte disturbances. Hypokalemia or hypomagnesemia should be corrected prior to use. Vorinostat may cause fetal harm; women of childbearing potential are encouraged to use adequate contraception. It is not known if the drug is excreted in breast milk. Safety and efficacy are not established in children.

Monitor for signs and symptoms of thromboembolic disease; monitor glucose, electrolytes, CBC, serum creatinine. ECG is required at baseline and periodically during treatment. Antiemetics, antidiarrheals, and fluid and electrolyte replacement may be necessary. Patients should be instructed to drink at least 2 L of fluid per day to prevent dehydration. **Storage** 

Store at room temperature.

# Administration

CAUTION: Observe and exercise appropriate precautions for handling cytotoxic drugs.

Take with food. Swallow capsules whole. Do not open or crush capsules; avoid contact with powder.

# **Warfarin Sodium**

war'far-in soe'dee-um ★ Coumadin, Jantoven ▲ Apo-Warfarin, Coumadin, Mylan-Warfarin, Taro-Warfarin

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: X

# Classification: Oral

anticoagulant (coumarin type)

# **MECHANISM OF ACTION**

A coumarin derivative that interferes with hepatic synthesis of vitamin K-dependent clotting factors, resulting in depletion of coagulation factors II, VII, IX, and X. *Therapeutic Effect:* Prevents further extension of formed existing clot; prevents new clot formation.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	1.5-3	5-7	2-5 days
	days	days	

Well absorbed from the GI tract. Metabolized in the liver. Not removed by hemodialysis. *Halflife*: 1-2.5 days, but highly variable among individuals.

# AVAILABILITY

Tablets (Coumadin, Jantoven): 1 mg, 2 mg, 2.5 mg, 3 mg, 4 mg, 5 mg, 6 mg, 7.5 mg, 10 mg. Injection (Coumadin): 5-mg vial.

# INDICATIONS AND DOSAGES Anticoagulant

PO, IV Adults, Elderly. Initially, 5-10 mg/day for 2-5 days PO (or 2-5 mg initially IV); then adjust based on international normalized ratio (INR). Maintenance: 2-10 mg/day. *Children*. Initially, 0.1-0.2 mg/kg (maximum 10 mg). Maintenance: 0.05-0.34 mg/kg/day.

 Usual elderly dosage (maintenance)
 PO, IV
 Elderly. 2-5 mg/day, carefully adjust per INR.

# CONTRAINDICATIONS

Known hypersensitivity to warfarin. Anticoagulation is contraindicated in any circumstance in which the risk of hemorrhage is greater than the potential benefit of anticoagulation such as (1) pregnancy; (2) hemorrhagic tendencies or blood dyscrasias; (3) recent or contemplated surgery of the eye, CNS, or major trauma; (4) bleeding tendencies associated with active ulceration or overt bleeding of the GI, GU, or respiratory tracts; cerebral aneurysms, dissecting aorta; or pericarditis or pericardial effusions, and bacterial endocarditis; (5) threatened abortion, eclampsia, and preeclampsia; (6) inadequate laboratory facilities to monitor the patient; (7) unsupervised patients with senility, alcoholism, or psychosis or other lack of patient cooperation; (8) spinal puncture and other diagnostic or therapeutic procedures with potential for uncontrollable bleeding; (9) miscellaneous: including major regional or lumbar block anesthesia, malignant hypertension; alcoholism; elderly; any disease state where an increased risk of bleeding would be detrimental.

#### INTERACTIONS Drug

NOTE: Many drug products can interfere with warfarin, so caution should be used.

Warfarin Sodium (Generic Name)

Alcohol: Acute alcohol use (binge drinking) may increase PT/INR. Chronic alcohol use may decrease PT/INR.

Acetaminophen, celecoxib: Possible increase in anticoagulant effects; monitor INR.

Amiodarone, chloral hydrate, cimetidine, ciprofloxacin, clarithromycin, diflunisal, erythromycin, fluconazole, fluoroquinolones, gemfibrozil, HMG-CoA reductase inhibitors, indomethacin, itraconazole, ketoconazole, levofloxacin, metronidazole, NSAIDs, oral hypoglycemics, orlistat, phenytoin, propoxyphene, proton-pump inhibitors, salicylates, SSRIs, sulfamethoxazole/trimethoprim, sulfonamides, systemic corticosteroids, tetracyclines, thyroid products, vitamin E: Possible increase in anticoagulant effects; monitor INR.

Argatroban: Increases INR and PT, so increased monitoring is needed if warfarin is also given.

Barbiturates, carbamazepine, cholestyramine, estrogens, griseofulvin, primidone, rifampin, vitamin K: Decreased warfarin action.

**Dabigatran:** Do not use along with wafarin as this may cause serious bleeding. Discontinue one before using the other.

**NSAIDs, salicylates:** If NSAIDs must be used, monitor patient (avoid aspirin).

**Rivaroxaban:** Do not use along with wafarin as this may cause serious bleeding. Discontinue one before using the other.

#### Herbal

Herbal products (American ginseng, coenzyme  $Q_{10}$ , St. John's wort): May decrease the effectiveness of warfarin.

Cranberry, dong quai, evening primrose oil, feverfew, garlic, ginger, ginkgo, glucosamine, green tea, omega-3-acids, SAM-e: May increase the risk of bleeding by potentiating action of warfarin. Many herbal products: Can interfere with warfarin, so caution should be used.

#### Food

Foods with a high vitamin K content: Decreased effect (decreased PT/INR).

**Cranberry juice:** Increased effect (increased PT/INR).

#### DIAGNOSTIC TEST EFFECTS

Warfarin increases the PT and INR. Goal INR for most patients is 2.0-3.0.

#### SIDE EFFECTS

#### Occasional

GI distress, such as nausea, anorexia, abdominal cramps, diarrhea.

## Rare

Hypersensitivity reaction, including dermatitis and urticaria, especially in those sensitive to aspirin. Purple toe syndrome and necrosis; risk factors include known or suspected deficiency in protein C-mediated anticoagulant response.

## SERIOUS REACTIONS

 Bleeding complications ranging from local ecchymoses to major hemorrhage: the treatment depends on INR and type or presence of bleeding. Drug should be held and/or vitamin K or phytonadione administered.

Recommendations are as follows: • Adults with INR < 5 and exceeding therapeutic range but NO significant bleeding. Lower or omit a warfarin dose; monitor INR; lower warfarin dosage once reach target INR.  Adults with INR ≥ 5 and < 9 and NO significant bleeding. Omit next 1 or 2 warfarin doses; monitor INR. Lower dosage once target INR reached. Alternatively, omit warfarin dose and give 1-2.5 mg PO of vitamin K1. If more rapid reversal required (e.g, surgery) give ≤ 5 mg PO of vitamin K1; INR should decrease in 24 h. If INR still elevated, give additional 1-2 mg PO vitamin K1.

 Adults with INR ≥ 9 in the absence of significant bleeding. Hold warfarin. Give 2.5-5 mg PO vitamin K1. Monitor INR. If the INR is still elevated, may give additional vitamin K1. Lower warfarin dosage once reach target INR.

 Adults with serious bleeding at any elevation of INR. Hold warfarin. Give vitamin K1 10 mg IV slow infusion, supplemented with fresh frozen plasma or prothrombin complex concentrate, depending on urgency. Recombinant factor VIIa may be considered. Vitamin K1 can be repeated q12h.

 Adults with life-threatening bleeding. Hold warfarin. Give prothrombin complex concentrate supplemented with vitamin K1 10 mg IV slow infusion. Recombinant factor VIIa may be considered. Repeat steps as needed to reduce INR.

 Hepatotoxicity, blood dyscrasias, necrosis, vasculitis, and local thrombosis occur rarely.

#### **PRECAUTIONS & CONSIDERATIONS**

Wafarin has a narrow therapeutic range and may cause major or fatal bleeding and requires close adherence to monitoring. Identification of risk factors for bleeding and certain genetic variations (CYP2C9 and VKORC1 metabolism) in a patient warrants frequent INR monitoring and the

use of lower warfarin doses. Caution is warranted in patients at risk for hemorrhage and in those with active tuberculosis, diabetes, gangrene, heparin-induced thrombocytopenia, or necrosis. Warfarin use may cause teratogenic effect or fetal bleeding. Warfarin crosses the placenta and is distributed in breast milk. In elderly patients, a lower dose of warfarin is recommended. Other nonessential medications, including OTC drugs, should be avoided. An electric razor and soft toothbrush should be used. Avoid alcohol, drastic dietary changes, dangerous recreational sports, and salicylates.

Notify the physician before having dental work or surgery. INR should be determined before administration and daily after therapy begins until INR stabilizes. Once INR is stabilized, INR determinations should be followed every 4-6 wks. Monitor clinically for signs of bleeding. Carefully assess for new medicines (prescription and OTC), as well as supplement use, at every appointment. **Storage** 

Store at room temperature and protect from light. For injection, use reconstituted solution within 4 h; discard unused portion.

#### Administration

Remember that warfarin dosage is highly individualized based on PT, INR, and genetics.

Split scored tablets as needed. Give oral warfarin without regard to food. Take warfarin exactly as prescribed at the same time each day. Do not change from one brand of warfarin to another.

For IV use, to reconstitute, add 2.7 mL sterile water for injection to 5-mg vial to produce a final concentration of 2 mg/mL. Administer dose as a bolus injection slowly over 1-2 min, but do not administer intramuscularly.

Yohimbine yoe-him'been Frex, Yocon, Yohimbe

CATEGORY AND SCHEDULE Pregnancy Risk Category: NA Do not use during pregnancy.

*Classification:* Antiadrenergics, α-blocking, impotence agents

## **MECHANISM OF ACTION**

An herb that produces genital blood vessel dilation, improves nerve impulse transmission to genital area. Increases penile blood flow, central sympathetic excitation impulses to genital tissues. *Therapeutic Effect:* Improves sexual vigor, affects impotence; clinical studies show may not always be effective.

#### PHARMACOKINETICS

Rapidly absorbed. Extensive metabolism in liver and kidneys. Minimal excretion in urine as unchanged drug. *Half-life:* < 30 min.

#### AVAILABILITY

Tablets: 5.4 mg (Yocon).

## INDICATIONS AND DOSAGES

NOTE: There are no FDA-approved indications for Yohimbe, which is regulated as a dietary supplement, and not as a drug.

Erectile dysfunction impotence PO (YOCON, Rx ONLY) Adults, Elderly. 5.4 mg 3 times/day. Reduce dose if side effects occur. May reduce to half-tablet 3 times daily followed by gradual increases to 1 tablet 3 times daily as tolerated.

# **OFF-LABEL USES**

Raise blood pressure in autonomic failure.

## CONTRAINDICATIONS

Renal disease, hypersensitivity to yohimbine or any component of the formulation.

# INTERACTIONS

#### Drug

Antidiabetics, antihypertensives: May interfere with the effects of these drugs.

**Clonidine:** May antagonize the effects of clonidine.

#### MAOIs, linezolid,

sympathomimetics, tricyclic antidepressants: Has additive effects with these drugs. May increase the risk of hypertensive crises with MAOIs. Use with MAOIs is not recommended due to additive effect of yohimbine on MAO.

#### Herbal

**Ephedra:** May increase the risk of hypertensive crises.

**Ginkgo biloba, St. John's wort:** May have additive therapeutic and adverse effects.

#### Food

Caffeine-containing products (such as coffee, tea, and chocolate) and tyramine-containing foods (such as aged cheese and Chianti wine): May increase the risk of hypertensive crises.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

Excitement, tremors, insomnia, anxiety, hypertension, tachycardia, dizziness, headache, irritability, salivation, dilated pupils, nausea, vomiting, hypersensitivity reaction.

Yohimbine (Generic Name)

#### SERIOUS REACTIONS

 Seizures, severe hypotension, irregular heartbeats, and renal failure may occur.

· Overdose can be fatal.

## **PRECAUTIONS & CONSIDERATIONS**

Caution is warranted in patients with anxiety, heart disease, hepatic disease, diabetes mellitus, hypertension, post-traumatic stress disorder, and schizophrenia. Yohimbine is generally not used in females. Its use is contraindicated in breastfeeding and pregnant women. Safety and efficacy of yohimbine have not been established in children. Age-related liver and renal impairment may require discontinuation of yohimbine in elderly patients. Over-the-counter drugs should be avoided without first consulting with the prescriber.

#### Storage

Store at room temperature.

#### Administration

May administer without regard to meals.

## Zafirlukast

za-feer'loo-kast Accolate Do not confuse Accolate with Accupril or Aclovate.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

**Classification:** Respiratory agents, selective leukotriene receptor antagonist

# **MECHANISM OF ACTION**

Antiasthmatic that binds to leukotriene receptors, inhibiting bronchoconstriction caused by sulfur dioxide, cold air, and specific antigens, such as grass, cat dander, and ragweed. *Therapeutic Effect:* Reduces airway edema and smooth muscle constriction; alters cellular activity associated with the inflammatory process.

# PHARMACOKINETICS

Rapidly absorbed after PO administration (food reduces absorption). Protein binding: 99%. Extensively metabolized in the liver. Primarily excreted in feces. Unknown if removed by hemodialysis. *Half-life:* 10 h (terminal).

# **AVAILABILITY**

Tablets: 10 mg, 20 mg.

# INDICATIONS AND DOSAGES

# For the prevention and chronic treatment of asthma PO

Adults, Elderly, Children 12 yr and older. 20 mg twice a day. Children aged 5-11 yr. 10 mg twice a day.

# CONTRAINDICATIONS

Known hypersensitivity. Also do not use in hepatic impairment, including hepatic cirrhosis. Not to be used to treat an acute asthma attack.

#### INTERACTIONS

Drug

Aspirin: Increased plasma levels of zafirlukast. Erythromycin: Reduced plasma

levels of zafirlukast.

Drugs metabolized by CYP2C9 and CYP3A4 isoenzymes (carbamazepine, erythromycin, fluoxetine, glimepiride, glipizide, nateglinide, phenobarbital, rifampin, rifapentine, phenytoin): Inhibits CYP2C9 and CYP3A4 isoenzymes and may increase plasma

concentrations of these drugs. **Theophylline:** Rare reports of

increased theophylline levels; mechanism unknown.

**Warfarin:** Increased PT/INR; zafirlukast inhibits warfarin metabolism.

#### Herbal

None known. Food None known.

# DIAGNOSTIC TEST EFFECTS

May increase ALT (SGPT) or AST (SGOT).

# SIDE EFFECTS

Frequent

Headache. Occasional

Nausea, diarrhea, dizziness, fever, infection, myalgia, pain, vomiting, weakness, increased ALT.

#### Rare

Agranulocytosis, bleeding, eosinophilia.

# SERIOUS REACTIONS

• Rare serious allergic reactions, including angioedema.

Zafirlukast (Generic Name)
Hepatotoxicity, including hepatitis and hepatic failure reported rarely.
Systemic eosinophilia, Churg-Strauss syndrome, vasculitis.

• Reports post-market of agitation, aggressive behavior, confusion (disorientation), hallucinations, seizures, tremor, mood disorders, suicidal ideation.

### PRECAUTIONS & CONSIDERATIONS

Be aware that zafirlukast is not intended to treat acute asthma episodes. Caution is warranted in patients with impaired hepatic function, whether from prior use of zafirlukast or not. Zafirlukast is pregnancy category B and is distributed in breast milk. It is not recommended for breastfeeding women. The safety and efficacy of this drug have not been established in children younger than 5 yr. Although no specific age-related precautions have been noted in elderly patients, they may be more at risk for infection and zafirlukast exposure is increased. Drink plenty of fluids to decrease the thickness of lung secretions.

Liver function, pulse rate and quality, as well as respiratory depth, rate, rhythm, and type should be monitored. Fingernails and lips should be assessed for cyanosis, manifested as a blue or dusky color in light-skinned patients and a gray color in dark-skinned patients. Notify the physician of any abdominal pain, nausea, flu-like symptoms, jaundice, or worsening of asthma. Report any neuropsychiatric events, such as changes in mood, behavior, or sleep, promptly.

### Storage

Store at room temperature. Protect from light and moisture.

### Administration

Take zafirlukast 1 h before or 2 h after meals. Do not crush or break tablets. Take zafirlukast as prescribed, even during symptomfree periods. Do not alter the dosage or abruptly discontinue other asthma medications.

### Zaleplon

zal'eh-plon Sonata 🍁 Stamoc

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: IV

# *Classification:* Hypnotic, nonbenzodiazepine

# **MECHANISM OF ACTION**

A nonbenzodiazepine that enhances the action of the inhibitory neurotransmitter  $\gamma$ -aminobutyric acid. *Therapeutic Effect:* Induces sleep.

### AVAILABILITY

Capsules: 5 mg, 10 mg.

### PHARMACOKINETICS

PO: Rapid absorption, but heavy, high-fat meals delay absorption; peak plasma levels in 1 h; wide tissue distribution; rapid hepatic metabolism (CYP3A4 minor pathway); excretion in urine.

### INDICATIONS AND DOSAGES Insomnia PO

*Adults.* 10 mg at bedtime. Range: 5-20 mg.

Zaleplon (Generic Name)

*Elderly.* 5 mg at bedtime, with a recommended maximum of 10 mg.

# Dosage in hepatic impairment (adults)

### PO

5 mg at bedtime in mild to moderate impairment. Not recommended if impairment severe.

### CONTRAINDICATIONS

Known hypersensitivity to zaleplon. Also, Sonata contains tartrazine dye, which may cause hypersensitivity in aspirin-sensitive patients.

### INTERACTIONS

### Drug

All CNS-depressant drugs (anticonvulsants, antipsychotics, barbiturates, benzodiazepines, opioid agonists) and alcohol:

Central nervous system (CNS) depression.

Cimetidine, erythromycin, and strong CYP3A4 inhibitors:

Increased concentration of zaleplon. If taking cimetidine, decrease dose of zalepon to 5 mg.

Flumazenil: Suggested to antagonize effects of zaleplon.

### **Rifampin and rifamycin**

**derivatives:** Decreased effects of zaleplon.

### Herbal

None known.

### Food

**Heavy, high-fat meals:** Onset of sleep may be delayed by approximately 2 h.

# DIAGNIOSTIC TEST EFFECTS

Rare elevations in LFTs.

# SIDE EFFECTS

### Expected

Somnolence, sedation, mild rebound insomnia (on first night after drug is discontinued).

### Frequent

Nausea, headache, myalgia, dizziness, weakness.

## Occasional

Amnesia, abdominal pain, asthenia, dysmenorrhea, dyspepsia, eye pain, paresthesia, somnolence.

# Rare

Anaphylaxis, angioedema, bundlebranch block, cerebral ischemia, intestinal obstruction, tremors, amnesia, hyperacusis (acute sense of hearing), fever, glaucoma, abnormal liver function tests, pericardial effusion, pulmonary embolus, ventricular tachycardia, ventricular extrasystoles.

# SERIOUS REACTIONS

• Zaleplon may produce altered concentration, behavior changes, and impaired memory.

 Taking the drug while up and about may result in adverse CNS effects, such as hallucinations, impaired coordination, dizziness, and lightheadedness. There is a possibility that performance of hazardous tasks, like driving, may be affected the day after taking a hypnotic.

 Overdosage results in somnolence, confusion, diminished reflexes, and coma.

 Complex behaviors such as "sleepdriving" (i.e., driving while not fully awake after ingestion of a sedativehypnotic, with amnesia for the event) or other behaviors, with amnesia after the events, have been reported; consider discontinuation if they occur.

• Worsening of depression, including suicidal thoughts, has been reported.

### PRECAUTIONS & CONSIDERATIONS

Caution is warranted in patients with mild to moderate hepatic impairment, signs or symptoms of depression. Use is not recommended in pregnancy. Do not use during breastfeeding because zaleplon enters the breast milk. Drowsiness may occur. Avoid alcohol, CNS depressants, and tasks that require mental alertness or motor skills. Zaleplon should be administered with caution in elderly or smaller patients or those with compromised respiratory, hepatic, or renal function. Safety and efficacy in children have not been established. Disturbed sleep may occur for 1 or 2 nights after discontinuing the drug. Patients should promptly report any unusual moods or behaviors.

### Administration

For best effect, avoid administering following a heavy or high-fat meal. Best taken on empty stomach or with light snack only. Can be taken at bedtime, or later if the patient is in bed and cannot fall asleep.

# Zanamivir

za-na'mi-veer

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: B

*Classification:* Antiviral, neuraminidase inhibitor

# **MECHANISM OF ACTION**

An antiviral that appears to inhibit the influenza virus enzyme neuraminidase, which is essential for viral replication. *Therapeutic Effect:* Affects viral release from infected cells.

# AVAILABILITY

Powder for Inhalation: 5 mg/blister.

# PHARMACOKINETICS

Inhalation: 4%-17% of inhaled dose is absorbed, peak serum levels 1-2 h, low plasma protein binding (< 10%), excreted unchanged in urine.

# INDICATIONS AND DOSAGES Influenza virus infection

NOTE: Begin within 36-48 h of symptom onset.

INHALATION

*Adults, Elderly, Children aged 7 yr and older.* 2 inhalations (one 5-mg blister per inhalation for a total dose of 10 mg) twice a day (about 12 h apart) for 5 days.

### Prevention of influenza virus infection

### INHALATION

Adults, Elderly, Children aged 5 yr and older. 2 inhalations once a day for 10 days (household settings) or for 28 days (community outbreak). Not proven effective for treatment in nursing homes.

# CONTRAINDICATIONS

Do not use in those with allergy history to any ingredient of product, including lactose (contains milk proteins).

# INTERACTIONS

### Drug

### Influenza nasal vaccine, live:

Decreased effect of zanamivir: Use of zanamivir is not recommended 48 h before and up to 2 wks after the administration of the live, attentuated influenza vaccine (e.g., FluMist, nasal vaccine).

### Herbal

None known. Food None known.

# **DIAGNOSTIC TEST EFFECTS**

May increase serum creatine kinase level and liver function test results.

# SIDE EFFECTS

### Frequent

More with prophylaxis: Headache, throat or tonsil discomfort and pain, nasal signs and symptoms, cough, viral infections.

### Occasional

Diarrhea, sinusitis, nausea, bronchitis, cough, dizziness, headache, vomiting, infection, sinusitis.

More with prophylaxis: Fever or chills, cough, fatigue, malaise, anorexia or an increased or decreased appetite, muscle pain, musculoskeletal pain.

# SERIOUS REACTIONS

 Allergic or allergic-like reaction, arrhythmia, bronchospasm if a history of chronic obstructive pulmonary disease (COPD) or asthma, central nervous system (CNS) effects (confusion, delusions, altered consciousness, delirium, delusions, hallucinations), hemorrhage, serious cutaneous rash, seizure.

# **PRECAUTIONS & CONSIDERATIONS**

Use with caution in patients with a history of hypersensitivity. Caution should be used in patients with asthma or COPD; these patients should still be given the influenza vaccine. Be aware that persons requiring an inhaled bronchodilator at the same time as zanamivir should receive the bronchodilator before zanamivir. Dizziness may occur. Avoid contact with those who are at high risk for influenza. Use in pregnancy has not been well established. Use with caution in breastfeeding patients. Safety has not been established for prophylaxis in children younger than 5 yr and in treatment of patients younger than 7 yr. One concern

about children is their ability to use the Diskhaler.

### Storage

Store at controlled room temperature, in provided packaging. Do not have Diskhaler puncture blister until time of use.

### Administration

Using the Diskhaler device provided, exhale completely; then put the white mouthpiece to the lips and breathe in the dose deeply and slowly. Remove mouthpiece from mouth, hold breath for at least 10 seconds, and exhale slowly. Continue treatment for the full 5-day course, and evenly space doses around the clock (~12 h apart). For prophylactic therapy, patients should use therapy once daily for 10 or 28 days. Patients should be made aware that they should immediately report any signs or symptoms of bronchospasm or respiratory distress.

# Zidovudine

zyde-oh'vue-deen Retrovir, AZT (synonym) Apo-Zidovudine, Novo-AZT, Retrovir **Do not confuse Retrovir with** ritonavir.

### **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Antiretroviral, nucleoside reverse transcriptase inhibitor

# **MECHANISM OF ACTION**

A nucleoside reverse transcriptase inhibitor that interferes with viral RNA-dependent DNA polymerase,

Zidovudine (Generic Name)

Zileuton (Generic Name), Zyflo (Brand Name)

an enzyme necessary for viral HIV replication. *Therapeutic Effect:* Interferes with HIV replication, slowing the progression of HIV infection.

# PHARMACOKINETICS

Rapidly and completely absorbed from the GI tract. Protein binding: 25%-38%. Undergoes first-pass metabolism in the liver. Crosses the blood-brain barrier and is widely distributed, including to cerebrospinal fluid. Excreted primarily in urine. Minimal removal by hemodialysis. *Half-life*: 0.8-1.2 h (increased in impaired renal function).

# AVAILABILITY

Injection: 10 mg/mL. Capsule: 100 mg. Tablet: 300 mg. Oral Solution: 50 mg/5 mL.

# INDICATIONS AND DOSAGES HIV infection

PO

*Adults, Elderly.* 300 mg twice daily OR 200 mg three times per day.

IV

Adults, Elderly. 1 mg/kg/dose q4h. • Reducing maternal-fetal HIV transmission

PO AND IV REGIMEN Pregnant women at > 14 wks of pregnancy. 100 mg PO 5 times per day until the start of labor. During labor and delivery, give 2 mg/kg (total body weight) IV (over 1 h) followed by an IV infusion of 1 mg/kg/h (total body weight) until clamping of the umbilical cord.

# **Dose for neonate once delivered** PO

*Neonates.* 2 mg/kg q6h starting within 12 h after birth and

continuing through 6 wks of age. If unable to take PO, may give 1.5 mg/kg IV (infused over 30 min) q6h. Preterm neonates require special care (see manufacturer's literature).

# Usual dose, pediatrics with HIV infection (non-neonatal)

Adolescents, Children, and Infants > 4 wks. Weight-based dosing; the daily total dose is divided into either two or three equivalent doses (e.g., twice daily or three times per day dosing).

Weight (kg)	Total Daily Dose
4 to < 9 kg	24 mg/kg/day
9 to < 30 kg	18 mg/kg/day
≥ 30 kg	600 mg/day

### Renal failure

Dosage adjustments recommended for all patients maintained on hemodialysis or peritoneal dialysis, or those with CrCl < 15 mL/min (see manufacturer's literature).

# CONTRAINDICATIONS

Potentially life-threatening reactions (e.g., anaphylaxis, Stevens-Johnson syndrome) to the drug or formulations.

# INTERACTIONS

### Drug

Acetaminophen, clarithromycin: Decreased blood levels of zidovudine. Bone marrow suppressive agents: Additive hermatologic effects. Fluconazole, atovaquone, methadone, probenecid, valproic acid: Increased serum levels of zidovudine; consider dose reduction. Phenytoin: Alterations in oral

clearance of zidovudine.

### Stavudine, ribavirin, or

**doxorubicin:** Antagonize zidovudine action. Avoid combination.

### DIAGNOSTIC TEST EFFECTS

Reduced WBC and Hgb/Hct, may increase serum creatinine.

# IV INCOMPATIBILITIES

Lansoprazole, biologic or colloidal fluids.

# SIDE EFFECTS

Expected

Nausea, headache, malaise. Frequent

Abdominal

Abdominal pain, asthenia, rash, fever, acne, anorexia.

### Occasional

Diarrhea, myalgia, somnolence, redistribution/accumulation of body fat, including "buffalo hump." **Rare** 

Dizziness, paresthesia, vomiting, insomnia, dyspnea, altered taste.

### SERIOUS REACTIONS

 Serious reactions include anemia, which occurs most commonly after 4-6 wks of therapy, and granulocytopenia; both effects are more likely to occur in patients who have a low hemoglobin level or granulocyte count before beginning therapy.

Myopathy

• Lactic acidosis and severe hepatomegaly with steatosis, which may require hospitalization and can be fatal.

• Neurotoxicity (as evidenced by ataxia, fatigue, lethargy, nystagmus, and seizures) may occur.

• Precipitation (particularly IV use) in renal tubules may occur when the solubility (2.5 mg/mL) is exceeded in the intratubular fluid. Adequate hydration can prevent.

### **PRECAUTIONS & CONSIDERATIONS**

! May cause severe neutropenia or anemia; be alert for granulocyte count < 1000/mm<sup>3</sup> or hemoglobin < 9.5 g/dL. Dose reduction recommended for those with severe renal disease. Severe hepatic dysfunction may result from lactic acidosis with hepatomegaly and steatosis. Zidovudine is excreted in breast milk, and use during lactation not recommended due to drug excretion and risk of HIV transmission.

### Storage

Store oral products and injection at room temperature; protect from moisture. Protect injection from light. The diluted infusion is stable for 24 h at room temperature and 48 h if refrigerated.

### Administration

Oral doses may be taken without regard to meals; give with adequate fluids. Children are generally given weight-based doses using the syrup. Use calibrated oral device to measure.

Injection is administered as IV infusion; avoid rapid/bolus injection. Do not give IM or SC. Withdraw appropriate dose from injection solution vial and dilute in D5W to a concentration not to exceed 4 mg/mL; infuse over at least 60 min.

# Zinc Oxide/Zinc Sulfate

zink ox'ide/zink sul'fate ★ zinc oxide, topical: Balmex, Desitin; zinc sulfate, oral: Zincate

CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

Classification: Mineral

Zinc Oxide/Zinc Sulfate (Generic Name)

# **MECHANISM OF ACTION**

A mineral that acts as a cofactor for enzymes that are important for protein and carbohydrate metabolism. *Therapeutic Effect:* Zinc oxide acts as a mild astringent and skin protectant. Zinc sulfate helps maintain normal growth and tissue repair, as well as skin hydration.

### INDICATIONS AND DOSAGES Mild skin irritations and abrasions (such as chapped skin, diaper rash)

TOPICAL (ZINC OXIDE) Adults, Elderly, Children. Apply as needed.

### Treatment and prevention of zinc deficiency, wound healing

PO (ZINC SULFATE) Adults, Elderly. 220 mg 3 times a day.

# INTERACTIONS

# Drug

**Tetracyclines, fluoroquinolones:** Oral zinc can decrease absorption of these antibiotics; separate administration times by 2 h or more.

# SIDE EFFECTS

Altered taste with oral use, may cause mild GI upset. With topical use, dry skin may occur.

# SERIOUS REACTIONS

None known.

Ziprasidone zye-pray'za-done ★ Geodon ☆ Zeldox

**CATEGORY AND SCHEDULE** Pregnancy Risk Category: C

**Classification:** Antipsychotic, atypical

# **MECHANISM OF ACTION**

A piperazine derivative that antagonizes  $\alpha$ -adrenergic, dopamine, histamine, and serotonin receptors; also inhibits reuptake of serotonin and norepinephrine. *Therapeutic Effect:* Diminishes symptoms of schizophrenia and depression.

# AVAILABILITY

Injection: 20 mg/mL. Capsule: 20 mg, 40 mg, 60 mg, 80 mg.

# PHARMACOKINETICS

Well absorbed after PO administration. Food increases bioavailability. Protein binding: 99%. Extensively metabolized in the liver. Not removed by hemodialysis. *Half-life*: 7 h.

# INDICATIONS AND DOSAGES Schizophrenia PO

*Adults, Elderly.* Initially, 20 mg twice a day with food. Titrate at intervals of no < 2 days. Maximum: 80 mg twice a day.

IM (ACUTE AGITATION) Adults, Elderly. 10 mg q2h or 20 mg q4h. Maximum: 40 mg/day. Convert to oral therapy as soon as possible.

### Bipolar mania PO

*Adults, Elderly.* Initially, 40 mg twice a day; may increase to 60 mg twice a day after a few days if needed; maximum 80 mg twice a day.

• **Dosage in renal impairment** No adjustments needed for oral dosing. For IM dosing, the cyclodextrin excipient is cleared renally; use with caution in patients with impaired renal function.

# CONTRAINDICATIONS

Known hypersensitivity to ziprasidone, cardiac conduction

Ziprasidone (Generic Name), Geodon (Brand Name)

defects, or a known history of QT prolongation (e.g., AV block, congenital long QT syndrome); uncompensated heart failure or recent acute myocardial infarction, significant untreated electrolyte imbalance. Do not give IM injection intravenously.

# INTERACTIONS

### Drug

**Carbamazepine:** Reduced plasma levels.

Central nervous system (CNS) depressants: Increased risk of CNS depressant effects; use caution. Drugs that lower blood pressure: Increased risk of hypotension.

**Drugs that prolong the QT interval:** Avoid use of these drugs in combination with ziprasidone.

Ketoconazole and other strong inhibitors of CYP3A4 isoenzymes: Increased plasma levels of ziprasidone.

Levodopa, dopamine agonists: Ziprasidone may antagonize effects of these drugs.

Phenothiazines and related drugs (haloperidol, droperidol), metoclopramide: Increased extrapyramidal effects.

# **DIAGNOSTIC TEST EFFECTS**

May increase blood sugar and cholesterol or triglycerides. May elevate prolactin. May rarely decrease WBC or other blood cell counts.

# SIDE EFFECTS

# Frequent

Headache, somnolence, dizziness. Occasional

Rash, orthostatic hypotension, weight gain, restlessness, constipation, dyspepsia, hyperglycemia, onset of diabetes mellitus, extrapyramidal symptoms.

# SERIOUS REACTIONS

 Prolongation of QT interval may produce torsades de pointes, a form of ventricular tachycardia. Patients with bradycardia, hypokalemia, or hypomagnesemia are at increased risk.

# **PRECAUTIONS & CONSIDERATIONS**

QT prolongation and risk of sudden death; bradycardia; hypokalemia; hypomagnesemia; electrolyte depletion caused by diarrhea, diuretics, or vomiting. An increased incidence of cerebrovascular adverse events (e.g., stroke, TIA) has been seen in elderly patients with dementia-related psychoses. Metabolic changes may increase cardiovascular/cerebrovascular risk and these include hyperglycemia, dyslipidemia, and weight gain. Use cautiously in those with liver disease, hyperprolactinemia, cardiac disease or risk factors, hypotension, seizure disorders, or suicidal ideation history. Not approved for use in children; there are no data in pregnancy and use in lactation is not recommended. Monitor glucose regularly in patients with diabetes or at risk for diabetes.

Monitor weight, CBC, serum lipid profiles. Dyslipidemia has been observed in patients treated with atypical antipsychotics. Use caution when operating machinery until effects of the drug are known. Closely supervise high-risk patients for unusual changes in mood or behavior that may lead to suicide attempt or other irrational behavior.

### Storage

Store at room temperature; protect from light. After reconstitution, the IM injection may be stored between 58°-86° F for up to 24 h if protected from light.

### Administration

Administer oral capsules with food, at consistent times daily.

Injection should only be administered IM; do not give intravenously. Do not give intravenously. Do not mix with any other drugs. Add 1.2 mL of SWI to the vial; shake vigorously until dissolved. To administer a 10-mg dose, draw up 0.5 mL. To administer 20 mg, draw up 1 mL. Discard any unused portion. Inject dose slowly and deeply into a large muscle (e.g., upper outer quadrant of the gluteus maximus or lateral thigh). If possible, keep patient recumbent for 30 min to minimize risk of hypotension.

# **Zoledronic Acid**

zole-eh-drone'ick ass'id ★ Reclast, Zometa ♪ Aclasta, Zometa

Do not confuse Zometa with Reclast; these two products have different indications and dosage regimens.

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: D

Classification: Bisphosphonates

### **MECHANISM OF ACTION**

A bisphosphonate that inhibits the resorption of mineralized bone and cartilage; inhibits increased osteoclastic activity and skeletal calcium release induced by stimulatory factors produced by tumors. *Therapeutic Effect:* Increases urinary calcium and phosphorus excretion; decreases serum calcium and phosphorus levels, inhibits bone resorption.

### PHARMACOKINETICS

### IV INFUSION

Shows triphasic kinetics; plasma protein binding 22%; little to no metabolism; excreted mainly in urine; a high percentage of the dose remains bound to bone. *Half-life:* Early: 1.75 h; terminal: 167 h.

# AVAILABILITY

Zometa Injection: 4 mg/5 mL concentrate for further dilution. *Reclast Infusion:* 5 mg/100 mL solution for IV infusion.

# INDICATIONS AND DOSAGES Hypercalcemia

IV INFUSION (ZOMETA) Adults, Elderly. 4 mg IV infusion given over not < 15 min. Retreatment may be considered, but at least 7 days should elapse to allow for full response to initial dose.

Multiple myeloma

IV INFUSION (ZOMETA) Adults, Elderly. 4 mg IV infusion over a minimum of 15 min. May retreat at 7 days or more if needed for hypercalcemia of malignancy.

### Dose adjustment of Zometa for renal impairment

CrCl 50-60 ml/min: Reduce dose to 3.5 mg.

CrCl 40-49 ml/min: Reduce dose to 3.3 mg.

CrCl 30-39 ml/min: Reduce dose to 3 mg.

CrCl < 30 ml/min: Do not use.

• Osteoporosis, Paget's disease IV INFUSION (RECLAST)

Adults. 5 mg IV once yearly.

### Dose adjustment of onceyearly Reclast for renal impairment

CrCl 35 ml/min or over: No dosage adjustment needed.

CrCl < 35 ml/min: Not recommended due to lack of clinical data. Zoledronic acid is usually contraindicated when SCr > 4.5 mg/dL.

# CONTRAINDICATIONS

Hypersensitivity to the drug or other bisphosphonates, hypocalcemia, pregnancy, severe renal impairment.

# INTERACTIONS

### Drug

**Loop diuretics:** May increase risk of hypocalcemia.

Nephrotoxic drugs: Use with caution due to additive renal effects; aminoglycosides may also have additive effect to lower serum calcium.

**Thalidomide:** Combination use for multiple myeloma may increase risk of renal dysfunction.

# DIAGNOSTIC TEST EFFECTS

Lowered serum calcium. May increase serum creatinine.

# IV INCOMPATIBILITIES

Calcium-containing IV products and infusions (e.g., lactacted Ringer's injection). Do not mix or infuse with any other medications.

# SIDE EFFECTS

### Frequent

Fever, nausea, vomiting, constipation, leg edema, fatigue.

# Occasional

Hypotension, anxiety, insomnia, flu-like symptoms (fever, chills, bone pain, myalgia, and arthralgia).

### Rare

Conjunctivitis; incapacitating joint, muscle, or bone pain.

# SERIOUS REACTIONS

• Renal toxicity may occur if IV infusion is administered in < 15 min.

- · Osteonecrosis of the jaw.
- · Atypical femur fractures.

# PRECAUTIONS & CONSIDERATIONS

Avoid invasive dental procedures, such as dental implants.

Data for use in children are not available; monitor hypercalcemic parameters, ensure good hydration; requires dose adjustment in renal impairment; bronchospasm in aspirin-sensitive asthmatic patients; hypocalcemia; hypoparathyroidism; do not use during lactation; may cause fetal harm so do not use during pregnancy.

### Storage

Store unopened vials or bottles of solution at room temperature. For Reclast, once the bottle is opened, the solution may be stored in the refrigerator for 24 h, but let warm up to room temperature before use.

### Administration

For *Reclast*, give as a 5-mg infusion over no less than 15 min. For *Zometa*, must dilute the IV concentrate, in the appropriate dose, immediately with either 100 mL of 0.9% NaCl injection or dextrose 5% for injection. Do not inject the concentrate directly. Infuse the diluted drug over at least 15 min. When treating hypercalcemia, patient should be well hydrated to maintain urine output of 2 L/day.

For all uses: Patients must receive adequate calcium and vitamin D supplementation; recommendations vary with indication for use. Also, infuse via separate vented infusion line; do not allow contact with any calcium-containing large-volume parenterals or other IV medications. Renal function must be carefully monitored during treatment and before retreatment.

# **Zolmitriptan**

zohl-mih-trip'tan ★ Zomig, Zomig-ZMT, ★ Zomig Rapimelt

# CATEGORY AND SCHEDULE

Pregnancy Risk Category: C

*Classification:* Migraine agents, serotonin receptor agonists

# **MECHANISM OF ACTION**

A serotonin receptor agonist that binds selectively to vascular receptors, producing a vasoconstrictive effect on cranial blood vessels. *Therapeutic Effect:* Relieves migraine headache.

# PHARMACOKINETICS

Rapidly but incompletely absorbed after PO administration. Protein binding: 15%. Undergoes first-pass metabolism in the liver to active metabolite. Eliminated primarily in urine (60%) and, to a lesser extent, in feces (30%). *Half-life:* 3 h.

# AVAILABILITY

Nasal Spray: 5 mg/actuation device. Tablets: 2.5 mg, 5 mg. Orally Dissolving Tablets (ODT): 2.5 mg, 5 mg.

# CONTRAINDICATIONS

Known ischemic or vasospastic heart disease (angina, coronary vasospasm, MI) or other significant CV disease (e.g., uncontrolled HTN, stroke, TIA, and peripheral vascular disease, including ischemic bowel disease). Do not use within 24 h of use of other 5-HT1 agonists or an ergot-type drug. Not for use in hemiplegic or basilar migraine. Do not use during or within 2 wks of MAOI therapy. Hypersensitivity to zolmitriptan.

### INDICATIONS AND DOSAGES Acute migraine attack

# PO

Adults, Elderly. Initially, 2.5 mg or less. If headache returns, may repeat dose in 2 h. Maximum: 10 mg/24 h. INTRANASAL Adults, Elderly. 5 mg (1 spray) into 1 nostril. May repeat in 2 h. Maximum: 10 mg/24 h.

# INTERACTIONS

### Drug

Selective serotonin reuptake inhibitors, ergot-containing drugs (avoid use within 24 h of taking this drug): Potential serotonin crises. Cimetidine: Decreased plasma levels of zolmitriptan.

# **DIAGNOSTIC TEST EFFECTS**

None known.

# SIDE EFFECTS

### Frequent

Oral: Dizziness; tingling; neck, throat, or jaw pressure; somnolence. Nasal: Altered taste, paresthesia.

# Occasional

Oral: Warm or hot sensation, asthenia, chest pressure. Nasal: Nausea, somnolence, nasal discomfort, dizziness, asthenia, dry mouth.

### Rare

Diaphoresis, myalgia, paresthesia, chest pain.

# SERIOUS REACTIONS

 Cardiac reactions (including ischemia, coronary artery vasospasm, and myocardial infarction [MI]) and noncardiac vasospasm-related reactions (such as hemorrhage and cerebrovascular

Zolmitriptan (Generic Name), Zomig (Brand Name)

accident) occur rarely, particularly in patients with hypertension, diabetes, or a strong family history of coronary artery disease; obese patients; smokers; men older than 40 yr; and postmenopausal women.

### PRECAUTIONS & CONSIDERATIONS

Arrhythmias associated with conduction disorders. Renal or hepatic impairment; drug may cause coronary vasospasm Phenylketonuric patients should be informed that ODT form contains phenylalanine (a component of aspartame); caution should be used in lactating patients, elderly patients, and children.

# Storage

Store at room temperature. Keep ODT form in original blister package until time of use; protect from light and moisture.

### Administration

Administer tablets with a sip of water. The 2.5-mg tablets may be broken in half. For ODT form, place on the tongue, where it will dissolve and be swallowed with the saliva; no need to administer with liquid. For the nasal spray, follow manufacturer's instructions for use; each device contains a single dose.

# **Zolpidem Tartrate**

zole-pi'dem tar'trate ★ Ambien CR, Edluar, Intermezzo Do not confuse Ambien with Amen.

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C Controlled Substance Schedule: IV

**Classification:** Nonbarbiturate, nonbenzodiazepine sedativehypnotic

# **MECHANISM OF ACTION**

A nonbenzodiazepine that enhances the action of the inhibitory neurotransmitter γ-aminobutyric acid. *Therapeutic Effect:* Induces sleep and improves sleep quality.

# PHARMACOKINETICS

Route	Onset	Peak	Duration
PO	30 min	NA	6-8 h

Rapidly absorbed from the GI tract. Protein binding: 92%. Metabolized in the liver; excreted in urine. Not removed by hemodialysis. Females have reduced clearance. *Half-life*: 1.4-4.5 h (increased in hepatic impairment).

# AVAILABILITY

Tablets: 5 mg, 10 mg. Controlled-Release Tablets: 6.25 mg, 12.5 mg (Ambien CR). Sublingual Tablets: 5 mg, 10 mg (Edluar). Sublingual Tablets: 1.75 mg, 3.5 mg (Intermezzo).

# CONTRAINDICATIONS

Hypersensitivity, including angioedema or anaphylaxis.

# INDICATIONS AND DOSAGES Insomnia

PO (IMMEDIATE-RELEASE TABLETS) Adults. 10 mg at bedtime. Give adult females 5 mg PO at bedtime. Elderly, Debilitated, Hepatic insufficiency. 5 mg at bedtime. PO (AMBIEN CR) Adults. 12.5 mg at bedtime. Give adult females 6.25 mg PO at bedtime. Elderly, Debiliated, or Hepatic insufficiency. 6.25 mg at bedtime. SL (EDLUAR) Adults. 10 mg at bedtime. Give adult females 5 mg PO at bedtime.

Zolpidem Tartrate (Generic Name)

*Elderly, Debiliated, or Hepatic insufficiency.* 5 mg at bedtime.

Middle-of-the-night insomnia SL (INTERMEZZO ONLY) Adults. 1.75 mg for women and 3.5 mg for men, taken only once per night if needed, and only if at least 4 h of sleeping time remain in the night. Elderly, on other CNS depressants, or hepatic insufficiency. Reduce usual dose to 1.75 mg for men or women.

# INTERACTIONS

#### Drug

#### Alcohol, all CNS depressants:

Increased central nervous system (CNS) depression.

### Ketoconazole and other CYP3A

inhibitors: Increase exposure to zolpidem; consider lower zolpidem dose.

### SIDE EFFECTS

Occasional

Headache.

### Rare

Dizziness, nausea, diarrhea, muscle pain.

### SERIOUS REACTIONS

• Angioedema and anaphylaxis have been reported.

 Overdosage may produce severe ataxia, bradycardia, altered vision (such as diplopia), severe drowsiness, nausea and vomiting, difficulty breathing, and unconsciousness.

 Abrupt withdrawal of the drug after long-term use may produce asthenia, facial flushing, diaphoresis, vomiting, and tremor.

• Drug tolerance or dependence may occur with prolonged, high-dose therapy.

• Complex behaviors such as "sleep driving" (i.e., driving while not fully awake, with amnesia for the event) have been reported; these can cause risk to patient or community.

### **PRECAUTIONS & CONSIDERATIONS**

Use with caution in combination with other CNS depressants or in patients with a history of depression or other mental illness, or in patients with alcoholism or substance abuse. Do not take with alcohol. Use caution in patients with hepatic impairment, mild to moderate COPD, impaired drug metabolism or hemodynamic responses, mild to moderate sleep apnea; monitor closely. Not recommended for use in patients who are pregnant; use caution during breastfeeding. Safety and efficacy not established in children. Females and the elderly or debilitated need a lower dose due to impaired cognitive function and increased sensitivity to CNS depressant effects.

Have patient report any new or unusual changes in thoughts or actions, behaviors, or moods, including depression or thoughts of suicide. Reevaluate if insomnia persists after 7 to 10 days of use. Symptoms of insomnia may recur with rapid dose reduction or discontinuation.

### Storage

Store at room temperature. Keep sublingual tablets in original blister package until time of use; protect from light and moisture.

### Administration

The effect of the drug may be slowed by ingestion with or immediately after a meal. Administer immediately before bedtime unless patient is using middle-of-night dosing product. Swallow extended-release tablets whole; do not divide, crush, or chew. Sublingual tablets are placed under the tongue and allowed to disintegrate; do not swallow and do not take with water. If using middle-of-night dosing, patient should leave product wrapper where they can see it to remember they have already taken the dose, in case insomnia recurs within the same night.

# Zonisamide

zoh-nis'ah-mide ★ 🍁 Zonegran

# **CATEGORY AND SCHEDULE**

Pregnancy Risk Category: C

**Classification:** Anticonvulsant (sulfonamide derivative)

# **MECHANISM OF ACTION**

A succinimide that may stabilize neuronal membranes and suppress neuronal hypersynchronization by blocking sodium and calcium channels. *Therapeutic Effect:* Reduces seizure activity.

# PHARMACOKINETICS

Well absorbed after PO administration. Extensively bound to RBCs. Protein binding: 40%. Primarily excreted in urine. *Half-life:* 63 h (plasma), 105 h (RBCs).

# AVAILABILITY

Capsules: 25 mg, 50 mg, 100 mg.

# INDICATIONS AND DOSAGES

Partial seizures

PO

Adults, Elderly, Children older than 16 yr. Initially, 100 mg/day for 2 wks. May increase by 100 mg/day at intervals of 2 wks or longer. Range: 100-600 mg/day.

# CONTRAINDICATIONS

Hypersensitivity to zonisamide or sulfonamides.

### INTERACTIONS Drug

It has been proposed that drugs that inhibit CYP3A4 enzymes might alter zonisamide serum levels.

Carbamazepine, phenytoin, and other hepatic enzyme inducing medications: Increase metabolism and clearance of zonisamide.

# **DIAGNOSTIC TEST EFFECTS**

Lowered WBC count, platelets. May alter serum bicarbonate.

# SIDE EFFECTS

### Frequent

Somnolence, dizziness, anorexia, headache, agitation, irritability, nausea.

### Occasional

Fatigue, ataxia, confusion, depression, impaired memory or concentration, insomnia, abdominal pain, diplopia, diarrhea, speech difficulty.

### Rare

Paresthesia, nystagmus, anxiety, rash, dyspepsia, weight loss, kidney stones, psychosis or depression, pancreatitis, CPK elevation.

# SERIOUS REACTIONS

• Overdose is characterized by bradycardia, hypotension, respiratory depression, and coma.

- Leukopenia, anemia, and thrombocytopenia occur rarely.
- Kidney stones (rare).
- · Metabolic acidosis.
- · Oligohydrosis and hyperthermia.
- · Unusual changes in mood and

behavior, including suicidal ideation.

# **PRECAUTIONS & CONSIDERATIONS**

There is an increased risk of suicidal behavior in patients receiving anticonvulsants (AEDS). Monitor patients for emerging or worsening depression, suicidal thoughts, or

Zonisamide (Generic Name)

unusual moods or behaviors. Use with caution in hepatic disease, dehydration, and renal impairment and in those predisposed to kidney stones. As a carbonic anhydrase inhibitor, zonisamide may cause metabolic acidosis; this risk may be higher in children. Zonisamide should be used in pregnancy only if the benefits outweigh the risks. Zonisamide is excreted in human breast milk, and breastfeeding during treatment is not recommended. The safe and effective use of zonisamide in infants and children under age 16 has not been established. Cases of oligohidrosis, hyperthermia, and heat stroke have been reported (mainly in children) during clinical trials.

All patients with dehydration, hypovolemia, or other predisposing factors to heat intolerance should have their condition corrected before treatment. Limit exposure to temperature extremes and medications that might aggravate temperature regulation. Somnolence, fatigue, dizziness, and difficulty with concentration may occur, particularly in the first month of therapy. Avoid driving or operating machinery, or performing other tasks that require mental alertness until drug effects are known. Periodically monitor hydration status and serum chemistry.

As with all anticonvulsants, do not abruptly discontinue the drug.

### Storage

Store at room temperature in a dry place protected from light.

# Administration

May be taken without regard to food.

Swallow capsules whole. Maintain good hydration to help reduce risk of kidney stones.

# APPENDIX A FDA Pregnancy Categories

- Medications should be used during pregnancy only if clearly needed.
- A: Adequate and well-controlled studies have failed to show a risk to the fetus in the first trimester of pregnancy (also, no evidence of risk has been seen in later trimesters). Possibility of fetal harm appears remote.
- B: Animal reproduction studies have failed to show a risk to the fetus, no adequate and well-controlled studies have been done in pregnant women.
- C: Animal reproduction studies have shown an adverse effect on the fetus, and no adequate and well-controlled studies have been done in humans.

However, the benefits may warrant use of the drug in pregnant women despite potential risks.

- D: Positive evidence has been found of human fetal risk based on data from investigational or marketing experience or from studies in humans, but the potential benefits may warrant use of the drug despite potential risks (e.g., use in life-threatening situations in which other medications cannot be used or are ineffective).
- X: Animal or human studies have shown fetal abnormalities, and/ or there is evidence of human fetal risk based on adverse reaction data from investigational or marketing experience where the risks in using the medication clearly outweigh potential benefits.

# **APPENDIX B**

# **Normal Laboratory Values**

# **HEMATOLOGY/COAGULATION**

Test	Normal Range
Activated partial thromboplastin time (aPTT)	25-35 seconds
Erythrocyte count (RBC count)	M: 4.3-5.7 million cells/mm <sup>3</sup>
	F: 3.8-5.1 million cells/mm <sup>3</sup>
Hematocrit (HCT, Hct)	M: 39%-49%, F: 35%-45%
Hemoglobin (Hb, Hgb)	M: 13.5-17.5 g/dL, F: 12.0-16.0 g/dL
Leukocyte count (WBC count)	4.5-11.0 thousand cells/mm <sup>3</sup>
Leukocyte differential count	
Basophils	0%-0.75%
Eosinophils	1%-3%
Lymphocytes	23%-33%
Monocytes	3%-7%
Neutrophils—bands	3%-5%
Neutrophils—segmented	54%-62%
Mean corpuscular hemoglobin (MCH)	26-34 pg/cell
Mean corpuscular hemoglobin concentration	31%-37% Hb/cell
Mean corpuscular volume (MCV)	80-100 fl
Partial thrombonlastin time (PTT)	60-85 seconds
Platelet count (thrombocyte count)	150-450 thousand/mm <sup>3</sup>
Prothrombin time (PT)	11-13.5 seconds
RBC count (see Erythrocyte count)	

# **CLINICAL CHEMISTRY (SERUM PLASMA/URINE)**

Test	Normal Range
Alanine animotransferase (ALT, SGPT)	0-55 units/L
Albumin	3.5-5 g/dL
Alkaline phosphatase	M: 53-128 units/L, F: 42-98 units/L
Anion gap	5-14 mEq/L
Aspartate aminotransferase (AST, SGOT)	0-50 units/L
Bilirubin (conjugated direct)	0-0.4 mg/dL
Bilirubin (total)	0.2-1.2 mg/dL
Calcium (total)	8.4-10.2 mg/dL
Carbon dioxide (CO <sub>2</sub> ) total	20-34 mEq/L
Chloride	96-112 mEq/L
Cholesterol (total)	Less than 200 mg/dL
C-reactive protein	68-8200 ng/mL
Creatine kinase (CK)	M: 38-174 units/L, F: 26-140 units/L
Creatine kinase isoenzymes	Fraction of total: Less than 0.04-0.06
Creatinine	M: 0.7-1.3 mg/dL, F: 0.6-1.1 mg/dL
Creatinine clearance	M: 90-139 mL/min/1.73 m <sup>2</sup>
	F: 80-125 mL/min/1.73 m <sup>2</sup>
Free thyroxine index (FTI)	
Glucose	Adults: 70-105 mg/dL Older than 60 yr:
	80-115 mg/dL
Hemoglobin A <sub>1c</sub>	5.6%-7.5% of total Hgb
Homovanillic acid (HVA)	1.4-8.8 mg/day

Test	Normal Range
17-Hydroxycorticosteroids (17-0HCS)	M: 3-10 mg/day, F: 2-8 mg/day
Iron	M: 65-175 mcg/dL
	F: 50-170 mcg/dL
Iron-binding capacity, total (TIBC)	250-450 mcg/dL
Lactate dehydrogenase (LDH)	0-250 units/L
Magnesium	1.3-2.3 mg/dL
Oxygen (PO <sub>2</sub> )	83-100 mm Hg
Oxygen saturation	95%-98%
pH	7.35-7.45
Phosphorus, inorganic	2.7-4.5 mg/dL
Potassium	3.5-5.1 mEq/L
Protein (total)	6-8.5 g/dL
Sodium	136-146 mEq/L
Specific gravity	1.002-1.030
Thyrotropin (TSH)	0.5 to 5 mIU/mL
Thyroxine (T <sub>4</sub> ) total	5-12 mcg/dL
Triglycerides (TG)	20-190 mg/dL
Tri-iodothyronine resin uptake test (TxRU)	22%-37%
Urea nitrogen	7-25 mg/dL
Urea nitrogen/creatinine ratio	10:1 to 20:1
Uric acid	M: 3.5-7.2 mg/dL
	F: 2.6-6 mg/dL
Vanillylmandelic acid (VMA)	2-7 mg/day
